FOREWORD

The Annual Conference of the EuroMed Academy of Business aims to provide a unique international forum to facilitate the exchange of cutting-edge information through multidisciplinary presentations on examining and building new theory and business models for success through management innovation.

It is acknowledged that the conference has established itself as one of the major conferences of its kind in the EuroMed region, in terms of size, quality of content, and standing of attendees. Many of the papers presented contribute significantly to the business knowledge base.

The conference attracts hundreds of leading scholars from leading universities and principal executives and politicians from all over the world with the participation or intervention of Presidents, Prime Ministers, Ministers, Company CEOs, Presidents of Chambers, and other leading figures.

This year the conference attracted about 200 people from over 35 different countries. Academics, practitioners, researchers and Doctoral students throughout the world submitted original papers for conference presentation and for publication in this Book. All papers and abstracts were double blind reviewed. The result of these efforts produced empirical, conceptual and methodological papers and abstracts involving all functional areas of business.

ACKNOWLEDGEMENT

Many people and organizations are responsible for the successful outcome of the 10th Annual Conference of the EuroMed Academy of Business. Special thanks go to the Conference Co-Chairs Prof. Vincent Cassar and Prof. Frank Bezzina and the University of Malta, for accomplishing an excellent job.

It is acknowledged that a successful conference could not be possible without the special co-operation and care of the Track Chairs and Reviewers for reviewing the many papers that were submitted to this conference. Special thanks to the Session Chairs and Paper Discussants for taking the extra time to make this conference a real success.

The last but not the least important acknowledgment goes to all those who submitted and presented their work at the conference. Their valuable research has highly contributed to the continuous success of the conference.

TABLE OF PAPERS

EFFICIENCY IN ITALIAN SAVING BANKS: IS UNITY THE STRENGTH?	29
<i>Alfiero, Simona¹; Elba, Filippo²; Esposito, Alfredo¹; Resce, Giuliano³.....</i>	<i>29</i>
CHILDHOOD MEMORIES, EXPERIENCES AND EMOTIONS: CONTENT ANALYSIS OF CELEBRITY TRAVEL NARRATIVES	36
<i>Alves, Gisela¹; Azevedo, António²</i>	<i>36</i>
THE INTEGRATIVE MODEL OF ONLINE RELATIONSHIP QUALITY	48

ABSTRACT

This study investigates the Italian SBs sector efficiency over the 2010 –2015 period. The measure of efficiency, in the first stage, is estimated via Data Envelopment Analysis – Slack Based Model. In the second stage we compare the performance of SBs belonging to bank groups with those stand-alone via Policy Evaluation. Results show that when comparing SBs belonging to a banks group with stand-alone SBs, although a positive but not significant ATT, we find no relevant differences between the SBs part of group and the stand-alone. However, with reference to Technical Efficiency the stand-alone SBs experience the worst performance while after an insight into the inefficiency decomposition it is clear that difficulties are due to managerial inefficiency.

Keywords: Saving Banks, Efficiency, Data Envelopment Analysis, Policy Evaluation, Average Treatment Effect on the Treated, Performance, Group, Stand-alone

INTRODUCTION

The banking sector is continuing to play a crucial role in countries economies and Saving Banks (SBs), part of it, are fundamental in economic developments (Gardener et al., 1997; Iannuzzo et al., 2010). The competitive pressures led to the restructuring of Italian SBs. The government set the sectorial reform by issuing the Amato Law no. 218 of 30 July 1990 in order to reorganize the sectors legal framework leading to the transformation of public banks into JSCs.

Researchers have investigated the influence of firm ownership structure affecting performance (e.g. Jensen and Meckling 1976, Fama and Jensen 1983). Due to it being commercially competitive, Köhler (1996) pointed out the the relevance of the SBs efficiency evaluation stating that they would require an efficient management and sound earning capacity and be subject to those same competitive forces within the EU banking system.

In Italy, we know that SBs had a congruous influence on local territories. With respect to the present framework, the aim of our study seeks to investigate whether, and to what extent, belonging to a banking group improves performance in terms of efficiency.

Our study, addresses this fundamental research question: is there a relative efficiency recent trend that led the transformation of the Italian SBs and allows for its shifting from a territorial proximity to a territorial branding and finally to a partial sectorial demise?

In Section 2 we trace a theoretical background and a brief note on the Italian SBs sector while Section 3 focuses on data specifications and methodology. Section 4 focuses on the SBs efficiency results of SBs belonging to Groups versus those Stand-alone. Section 5 highlights conclusions and remarks. To the best of our knowledge, this is the only study of its kind.

THEORETICAL BACKGROUND AND A BRIEF NOTE ON THE ITALIAN SBS SECTOR

Studies on the Italian banking sector efficiency are few examples are those conducted by Favero-Papi (1995) and Resti *et al.* (2015) about the determinants as scale inefficiencies and regional disparities while there is one on Italian cooperative banks as per Barra *et al.* (2013). Casu and Girardone (2002) compared results obtained in different countries focusing on commercial banks. Since the work of Sherman and Gold (1985), considered the first on the banking industry, scholars refer to the DEA technique as a useful tool to measure the relative efficiency of banks as in Berger and Humphrey (1997), Fethi and Pasiouras (2010) and Tsolas (2011). Berger and DeYoung (1997) and Williams and Gardener (2003) shows that a low levels of efficiency lead to lack of credit monitoring and inefficient control of operating expenses. The main reason for the use of the DEA technique is the smallest number of observation requirements and because it takes into account multiple inputs and outputs simultaneously, compared to ratios where one input relates to one output at each time as per Thanassoulis (1993). Italian SBs started operating in the nineteenth century as institutions in which the credit and social aspects were intertwined, rooted in social and economic goals. However, at the end of the twentieth century due to sectoral regulatory developments they turn into full joint stock companies operating under complete commercial principle taking into consideration both stakeholder values and shareholder value. In order to add some useful information to the actual banking framework, the Bank of Italy's annual report states that *"At the end of 2015 Italy had 139 banks belonging to 75 banking groups, 424 standalone banks, and 80 branches of foreign banks. Last year the number of banks decreased by 20: there were 16 new licences and 36 terminations, of which 26 were due to bank consolidation, 8 to liquidation and 2 to voluntary termination of the banking licence"* and that *"In November 2015 a solution was found to the crisis of four banks under special administration, holding around 1 per cent of system-wide deposits. The solution was based on the new rules introduced in the Italian legal system in transposing Directive 2014/59/EU on the recovery and resolution of credit institutions and investment firms (BRRD)"* Banca di Italia, (2015).

According to the Bank of Italy's information, the Italian Government after some financial scandals issued the Law Decree on the 22 November 2015, n. 183 (a.k.a. "*decreto salva banche*", 2015) choosing to terminate four banks while setting up four new substitute entities.

DATA SPECIFICATIONS AND METHODOLOGY

The analysis covers the 2010 - 2015 period and the data source is Bankscope (2015).

DATASET SAMPLE	2015	2014	2013	2012	2011	2010
TOTAL SBs	23	29	34	37	40	38
GROUP	11	16	20	22	25	23
NO GROUP	12	13	14	15	15	15

Table 1. *The SBs sample dataset for the 2010 - 2015 period.*

In order to measure banking efficiency there are two main approaches: the intermediation approach of Sealey and Lindley (1977), which considers the bank as intermediators by transforming the production factors into outputs and the production approach. In the first part of the analysis, we evaluate the efficiency of SBs as per the Slacks based Model of Tone (2001) while in the second part we compare the performances of the SBs part of a bank group with the performances of those SBs via policy evaluation tools. Table 2 provides the variables descriptive statistics.

Variables	Type	Min	Median (A)	Max	Mean (B)	Dev. st.	A/B*
Impaired Loans	Input	29	248	4.858	690	979	0,36
Total Assets		584	2.926	50.587	6.492	10.029	0,45
Total Expenses		15	69	1.218	138	209	0,50
Loans	Output	428	2.185	36.029	4.662	6.991	0,47
Pre-tax Profit		-2.169	7	401	0	179	68,26
Total Deposits		274	1.491	27.283	3.033	4.512	0,49

*discounted values at 2010 prices

Table 2. *The whole period 2010 - 2015 dataset descriptive statistics. Data in Mln. of € – Source: Bankscope - Bureau Van Dijk (2016).*

Total assets, operating expenses and impaired loans are inputs variables. With reference to the outputs side we chose the total loans, customer deposits (considered by many as an input and by others as an output) and pre-tax profits. The main reason for the use of Efficiency Frontier Techniques like DEA, a non-parametric technique, lies in the fact that frontier approaches appears to be superior to standard financial ratios analysis (Iqbal and Molyneux, 2005) as, also, per the Basel Committee report (2006) which stated that the frontier efficiency measures provides a better comprehension over traditional ratios, especially on corporate governance issues. We refer to DEA as per Charnes *et al.* (1978) and Banker *et al.* (1984) in a SBM as per the Tone (2001) version with t multiplying all the variables.

The linear program is the following:

$$\begin{aligned}
 \min_{t, \lambda, S, Z} \quad & \tau = t - P_c Z \\
 & t + P_y S = 1 \\
 & x_0 = X\lambda + Z \\
 & y_0 = Y\lambda - S \\
 & \lambda \geq 0, S \geq 0, z \geq 0
 \end{aligned} \tag{1}$$

where the vector of actual inputs is under evaluation, the costs matrix of banks sample, is the vector for inputs excesses, is the vector of firms outputs under evaluation, is the matrix with the outputs of all the firms sample, is the vector with the output slacks, is the vector of intensity and and are the vectors that contains weights. Uncovering the effects of being part of a group on efficiency is arduous because of the merge of a bank does not happens randomly. In order to evaluate this kind of influence, we perform an impact evaluation considering SBs part of a group as the “*treatment*” variable. Our check relies on a set of banking sector ratios measures such as, Impaired Loans to Gross Loans Resti *et al.* (2015), Loans to Customer Deposits (Williams and Gardener, 2003) and Altunbaş and Marqués (2008), and Interest Income on Loans to Average Gross Loans (Foos *et al.*, 2010). Moreover, we add the Cost to Income Ratio (Beccalli *et al.*, 2006), Hess and Francis (2004) and Mathuva (2009) and the Tier 1 Regulatory Capital as per Merle (2013) and Beltratti and Stulz (2009). To address self-selection bias (heterogeneity in treatment propensity that relates to the variables of outcomes), we refer to the PS Matching as per Rosenbaum and Rubin (1983):

$$P(X) = \Pr(D = 1|X) = E(D|X) \tag{2}$$

where is the PS: the conditional probability of receiving the treatment that in our case is being part of group) given certain characteristics.

ITALIAN SBS EFFICIENCY RESULTS AND GROUP VERSUS STAND-ALONE

The figures 1.1 and 1.2 highlights, respectively, the combined relative efficiency level over the 2010 – 2015 period under CRS, VRS and the SE efficiency (adopting nominal values) and the combined and aggregate level of those SBs belonging to a Group or Stand-alone.

SBs combined DEA CRS, VRS and SE efficiency (nominal values) (1.1) **SBs combined DEA efficiency of Group – Stand Alone (discounted values) (1.2)**

Figure 1. *The Efficiency of Italian SBs over the 2010 - 2015 period on the base of two different perspectives.*

The following figures 2.1 and 2.2 highlight, respectively, the combined level of the relative efficiency over the 2010 – 2015 period under CRS, VRS and the SE efficiency (adopting nominal values) and the combined and aggregate level of those SBs belonging to a Group or Stand-alone.

SBs CRS Group vs. Stand-alone (2.1)

SBs VRS Group vs. Stand-alone (2.2)

Figure 2. *The efficiency of Italian SBs over the 2010 – 2015 period, belonging or not to a bank group, on Constant Return to Scale (2.1.) and Variable Return to Scale (2.2) on the base of discounted values.*

Yet we face the first self-selection problem: is the performance difference due to the Groups policies or to the self stand-alone performance? A merger or a takeover is never a casualty. Hence, we choose to compare the last performances by controlling a set of variables using the PS Matching approach. Having estimated the PS and following the Becker-Ichino (2002) algorithm, we detect the ATT, where the treatment is to be part of a group.

Methodology	CRS (Technical Efficiency)				VRS (Managerial Efficiency)			
	ATT	Std. Err.	95% Conf. Interval		ATT	Std. Err.	95% Conf. Interval	
Stratification	0,178	0,086	0,003	0,374	0,231	0,124	-0,049	0,421
Nearest neighbour	0,200	0,078	-0,123	0,319	0,238	0,126	-0,059	0,420
Radius	0,118	0,057	0,006	0,228	0,155	0,062	0,041	0,300
Kernel	0,171	0,077	0,022	0,299	0,222	0,115	-0,012	0,398

Table 4. *The ATT Results, Non-treated (0 – Stand Alone) vs Treated (1 - Group). Confidence intervals are bias-corrected; bold values are statistically significant (95%).*

As table 4 shows, although the ATT is slightly positive but not particularly significant revealing that the economic side controls shows no significant differences between the 20 SBs part of a bank group and the 16 stand-alone.

CONCLUSIONS

Our study shows the level of relative efficiency of the combined Italian SBs over the 2010 – 2015 period. In comparison to their belonging to a group or not we observe no significant differences. In addition, via policy evaluation tools, we find no relevant dichotomies among SBs belonging to groups with those not part of it.

²University of Minho, Braga, Portugal

ABSTRACT

This paper discusses the influence of celebrities travel narratives, which may result from interviews or planned fam-trips articles. Celebrities often play the role of tourism brands endorsers as their stories may generate high levels of engagement and electronic word-of-mouth. The paper also explore the role of the childhood memories on adults' tourism choice decision making. A qualitative study was conducted through the content analysis of 13 interviews published on 2017 in the newspaper "The Telegraph" in the section "Travel: Celebrity Interviews". Some celebrities have vivid childhood memories of significant events linked to tourism journeys. Emotions and sensorial memories involving food are recognized are key elements for designing and co-creating new experiences. Negative circumstances can have a long-term impact on children. Issues related with the airport's security procedures, or how to spend the waiting time for flight are the major concerns and stress sources in the tourists' journey.

Keywords: Tourism marketing, childhood memories, celebrity, travel narratives, content analysis.

INTRODUCTION

This paper discusses the influence of celebrities travel narratives, which may result from interviews or planned fam-trips articles. Travelers' decisions are increasingly dependent on the opinions of travel writers (Williams and Shaw, 1995). According to Dann (1999, quoted by Rozier-Rich and Santos, 2011) "travel narratives offer alluring descriptions of faraway locales; space and time are frequent categories which are generalizable across cultures and eras; narratives focus on the journey; and lastly, from 'writing out' the tourist experience, travel writers connect with the anti-tourist within the reader" (pp. 182-183).

Celebrities act as cultural icons and ambassadors in mass media-driven societies (Lee et al., 2008). If the travel narrative is made by a celebrity, an additional mechanism of persuasion occurs as the celebrity play the role of endorser of the brand of the destination, attraction or tourism operator, producing positive/ negative (electronic) word-of-mouth – eWOM (Lund, Cohen and Scarles, 2017).

The celebrities create a sense of warmth and touch in the minds of travellers, which is also believed to influence their interest and decision to visit tourism destinations (Rajaguru, 2014).

Travel narratives is a phenomenon that have exponentially increased in recent years throughout the media outlets (Rozier-Rich and Santos, 2011): print media (National Geographic, Fodor's Travel Guides, Lonely Planet Travel Guide, Rick Steve's Travel Guidebooks, travel sections in most major newspapers); television (The Travel Channel, The Discovery Channel, The Food Network, Globe Trekker); radio (Travel with Rick Steves, Talkin' Travel, Peter Greenberg's Travel Show); podcasts (Amateur Traveler, Fodor's, National Geographic); in-flight magazines (Sky Magazine, Attaché, Hemispheres, en Route, American Way Magazine, Go Magazine); and countless websites on the Internet (Expedia.com, IgoUgo.com, Orbitz.com, Traelocity.com, Concierge.com).

On other hand, several media have already created a space for common tourists share their travel stories, photos and recommendations providing an opportunity for word-of-mouth and viral marketing.

This paper acknowledges the claim of Rozier-Rich and Santos (2011) that there is a gap in the travel and tourism literature concerning the examination of travel articles. Moreover, the role of the childhood memories on adults' tourism choice decision making has been discussed by Marschall (2012, p.321) who claimed that "memory is a crucial factor in choosing a destination; it impacts on the tourist experience at the destination and on the sharing of the experience with others after the trip, notably through narration, photography, and memory objects, such as souvenirs". Marschall (2014, p.335) refined the conceptualization of 'personal memory tourism' as "a form of travel motivated by memories of one's own past and focused on the revisiting of sites and destinations associated with key moments in a person's life or the retracing of memorable previous journeys".

LITERATURE REVIEW

Travel narratives as a form of publicity

According to Gartner (1993), by utilizing travel articles as a means of what he termed "covert publicity", "credibility is increased as the image is now presented by a person who does not appear to have any connection with the destination except through prior visitation" (p. 201).

Publicity has been defined as "editorial space, rather than paid space, in print and broadcast media, to promote a product, place or person" (Loda, Norman and Backman, 2005, p.64). There are several forms of publicity in travel and tourism context, namely the informative travel articles made opinion-makers, specialists, frequent travelers whose travelling expertise are acknowledge. Rozier-Rich and Santos (2011) also compared the efficacy between travel brochures (advertising) and travel articles (publicity) and confirmed the influence of age and gender in travel narrative processing by measuring

the persuasiveness effect using the transportation scale and SKEP (Skepticism toward advertising scale).

For example, Rozier-Rich and Santos (2011, p.395) defined travel articles “as narratives primarily concerned with providing instruction and interpretation of recent travel experiences written in a non-fictional narrative story format, from a first-person account, and published in regional and national newspapers and magazines”. According to Pera (2017, p.332) highly creative, skilled, collaborative, and connected traveller creates value not only for himself/herself and the company, but also for other travellers. Similarly, Labrecque (2014) applied the parasocial interaction theory (PSI), described as an illusionary experience that makes consumers interact with media representations of presenters, celebrities or characters as if they are present and engaged in a reciprocal relationship.

Conceptualizing the travel experience

If the travel narratives aim to tell a story of the travel experience, it is also important to analyze the notion of *experience*. Volo (2009) followed the notion of Tsai (2005) that the holistic consumer experience can be seen as made of two facets: a phenomenological level – of which consumers are fully aware – and a cognitive level where the transformation and learning happen. Therefore, the experience is composed of all the events that occur between sensation (i.e., an observer’s awareness of an energy form impinging on a receptor physiologically designed to transduce it) and perception (i.e., the interpretation of the sensation), as well as memory (i.e., the subsequent organization and recall of such interpretations), which will have been modified and conditioned in the interim by many if not all of the prior and subsequent occurrences of this ‘sensation, perception, interpretation, sequence.

Based on WTO definition and the insights from tourists’ spontaneous annotations, Volo (2009, p.119) defines tourist experience as “any occurrence that happens to a person outside the “usual environment” and the “contracted time” for which a sequence of the following events happens: energy reflecting the state of the environment impinges on sensory organs, the energy pattern is transmitted centrally and is interpreted and categorized according to one’s knowledge acquired through time and is integrated and may be stored in the form of memory under some conditions (and thus some learning will occur)”.

Moreover, the human capacity of memory allows individuals to anticipate experiences, and their innate ability to categorize dissimilar things, allows them to sort ‘anticipated experiences’ into those they might seek and those they would avoid.

One strong component of the ‘personal memory tourism is about revisiting the house in which oneself was raised, the house to which many childhood memories are attached.

The influence of (tourism) childhood memories on adults’ tourism choice decision-making and behavior

Marschall (2012) introduced the concept of 'personal memory tourism', which revolves around travel associated with personal memories – not only the revisiting of places associated with happy memories, but also the return to sites of personal trauma and suffering in a quest for healing. Marschall (2014) compared it with other similar concepts such as Heimwehtourismus or Heimattourismus, 'homeland tourism' and another form of roots tourism with a strong emphasis on personal or family memory.

Therefore, remembering the adult memories of childhood holidays (Nenga, 2003; Shaw, Havitz and Delemere, 2008; Small, 2008, Yin, Poon and Su, 2017) will help to assess the personal memory tourism related not only to real places but also to a fictional world that made a deep impression on the mind. However, according to Small (2008), till the first decade of this century, the meaning of holidays for children and the role of the holiday in constructed subjectivities were largely absent in academic writings. Small (2008) used the social constructionist research method of memory-work to examine the memories of childhood holidays of Australian women and girls. She concluded that shared, fun, physical activities are common positive memories of childhood holidays across the generations.

The study of Cullingford (1995), who studied the attitudes toward holidays overseas of British children aged seven to 11 years, is the exception to that absence. This author found that children had clear ideas of which countries were attractive as holiday destinations or even the differences in being abroad. Travel meant good weather, eating out, or enjoying the entertainment of a beach holiday with friends (Gram, 2005). Children travelling abroad when taken to the "sights" showed a great deal of interest.

Furthermore, memory researchers have consistently reported that the experiences recalled most frequently are those that are emotional in nature (e.g., Dudycha and Dudycha, 1933; Waldfogel, 1948) or symbolic to the consumer and represent a new lens for viewing brand meaning (Braun-LaTour, LaTour and Zinkhan (2007). These findings are aligned with Agapito, Mendes and Valle (2013) study who pointed out that the sensory dimensions (sight, hearing, smell, taste, and touch) have an important role in the construction of the memories of tourism experiences.

Moreover, research has shown that a childhood event may become experiential and memorable, and influence the adult behavior, as it may impel the desire of recreating nostalgic experiences, involving products and brands associated to symbolic meanings (Braun-LaTour et al., 2007; Kauppinen-Räsänen, Gummerus and Lehtola, 2013).

More recently Kauppinen-Räsänen, Gummerus and Lehtola, (2013) recognized in childhood memories several themes involving eating related to tourist experiences, as well as memories of commensal eating and homemade food. The study suggests that remembered eating and food experiences are characterized by the self, place, food, context and time.

For Sharpley and Jepson (2011) childhood memories, in particular those related with rural countryside (Pesonen and Komppula, 2010), can evoke special feelings and connections to a place, leading to place identity or dependence. In particular, Heintzman (1999, p. 4) concluded that settings that have a 'sense of personal or human history are conducive to spiritual well-being'.

Emotions elicited by places and experiences

According to Servidio and Ruffolo (2016) there is a relationship between emotional involvement and recall of memorable tourism experiences. Pan, Lee and Tsai (2014, p. 60) present the definition of affection attributed to a place, according to Russell and Pratt (1980), as "the emotion induced by a place and is expressed by a person in language". The categories of affective feelings include arousing, exciting, relaxing, pleasant, distressing, gloomy, sleepy and unpleasant (Russell and Pratt, 1980). By the same token, affective image deals with the emotional response of an individual to a place (O'Neill and Jasper, 1992) expressed in mental pictures. Based on the affection-then-action argument, the current study works backward from behaviors to rules, using a process of induction because tourists' real motives may be revealed through observation and reading their travel stories (Dann, 1981). Behavior in this study is represented by the travel taken and the outcome is the photos taken and stories told by the photo suppliers.

According to Volo (2009) tourists' experiences have been usually studied by means of: (a) structured surveys; (b) travel diaries; (c) structured or unstructured interviews; (d) observant participation (e) spontaneous travel narrative on periodicals (e.g., Kim, 2014); (f) memory-work (e.g., Small, 1999). Recently, alternative unobtrusive methods have been used in the field of environmental sciences, varying from diaries to videos, sensory devices and use of GPS systems.

METHODOLOGY

A qualitative study was conducted through the content analysis of 13 interviews (see Table1) published on 2017 in the newspaper "The Telegraph" in the section "Travel: Celebrity Interviews" <http://www.telegraph.co.uk/travel/celebrity-interviews/>.

The interview script usually consists of twelve research questions which are presented below: Q1- How often do you travel?; Q2- What do you need for a perfect holiday?; Q3- What is the earliest memory of travelling abroad?; Q4- What is your most adventurous travel experience?; Q5- What is your favourite Hotel?; Q6- What is the most relaxing destination?; Q7-What is the best holiday ever? Q8- What is your favourite city?; Q9- What is your best travel advice? / Best piece of travel advice? /Best travel tip?; Q10- What are the travel essentials?; Q11- What do you hate about travelling? Q12-

Where do you intend to go next? However, this study will not only analyse the questions Q6, Q8 and Q12.

Table 1- Sample description.

Name	gender	occupation	interview date
Johanna Konta	Female	Tennis player	18th May 2017 4:48 PM
Eleanor Tomlinson	Female	Actress and British model	11th May 2017 6:02 PM
Ian Rankin	Male	Writer	8th May 2017 3:45 PM
Jennifer Saunders	Female	Actress, comedian and English screenwriter	27th April 2017 10:33 AM
Tom Chaplin	Male	Singer	24th April 2017 10:48 AM
Michael Ball	Male	English actor and singer	18th April 2017 12:27 PM
Irvine Welsh	Male	Scottish Author	6th April 2017 12:58 PM
Rankin	Male	Photographer	27th March 2017 9:41 AM
John Blashford-Snell	Male	Colonel - former British Army officer, explorer and author.	24th March 2017 11:31 AM
Dan Snow	Male	British TV presenter	17th March 2017 3:59 PM
Mathew Horne	Male	Actor	8th March 2017 2:13 PM
Alessandra Ambrosio	Female	Super model	2nd March 2017 1:13 PM
Sir Don McCullin	Male	Veteran British war photographer	28th February 2017 1:50 PM

DISCUSSION OF RESULTS

A content analysis performed on the answers to the first question (How often do you travel?), reveals that the majority of celebrities undertake most of the trips, over the course of a year, for working reasons. For the second research question (What do you need for a perfect holiday?) excerpts from celebrities' responses are given:

"Food is a passion, so as long as the food is good, I would be happy anywhere. It doesn't have to be fancy, just fresh, good quality produce. Plus, some chill-out time on a sunny beach." |Johanna Konta|; *"I love both sun and snow holidays."* |Eleanor Tomlinson|;

According to Pearce (2005), there are four common factors in travelling motivations: cultural captivation, immersion into nature, seeking familiarity, and relieving day-to-day stress.

The answers of celebrities are aligned with Cai and Combrink (2007) who proposed the push and pull theory in tourism. Push factors include learning, relaxation, challenge, outdoor activities, status, rest and socialization. Pull factors are understood, such as safety, entertainment, nature, monuments, education, budget and culture are perceived, as determining factors of tourists' motivation.

Next, the content analysis about third question (Earliest memory of travelling abroad?) was carried out. This question operationalizes the major research question of this study. Excerpts from celebrities' responses are given below. *"We used to travel all the time to Wales to see family and had regular trips to the seaside at St Ives or Tintagel when we lived in Plymouth, but we only ever had one holiday abroad: Sardinia when I was eight. I remember climbing to the top of some ancient monument atop a hill in the blistering heat, and having to sit with mum before reaching the top, while dad insisted on carrying on."* |Michael Ball|

This event seems to influence the future decisions as Michael Ball prefers Mediterranean destinations and the sunscreen is one essential object for travelling. He still has concerns about security and comfort.

McCabe (2009), in a social tourism context, examined the reasons for a holiday amongst low-income families and other groups who experience barriers to participation in tourism. Childhood memories were understood as being special because as McCabe (2009, p.677) stated: "they are different to the memories of adults who experience the world differently and perhaps this reflects a desire to provide children with memories of innocent and happy times. Negative circumstances can have a long-term impact on children, and there is a desire that these are not the only things that are remembered."

"When I was about seven, I remember going to Hungary to visit relatives on my own, and being chaperoned around the airports because I was an unaccompanied minor. I remember the seats seemed huge. My family are scattered all over the country. Budapest is a beautiful city and Lake Balaton is another stunning place. I love Hungarian food, because of the wonderful dishes my grandparents served." |Johanna Konta|

Along the interview, Johanna Konta reveals that influence of food remains as an important criterion for the choice of favourite destination, hotel and restaurants.

"Caravan or crofting holidays in Scotland. My mother is from Dalry in Ayrshire. I remember leaping into the freezing sea and running straight back out and being slathered in some foul-smelling gloop to keep the midges at bay." |Jennifer Saunders|

"We'd go on Eurocamp holidays in the south-west of France at Mimizan Plage. My dad loved the big breakers you'd get there to go bodyboarding. I had incredibly fair skin, so inevitably I turned beetroot." |Tom Chaplin|

Some excerpts from celebrities' responses to the fourth research question (Most adventurous travel experience?) were analysed. Most of the experiences belong to the "escapism" category according to Pine and Gilmore (1998) grid as they implied an active participation of the celebrity tourist in activities such as trekking or swimming.

“After filming the first season of Poldark, I went with the cast on a trip to Iceland. We started off in Reykjavik and then went into the mountains and swam in naturally heated pools.” |Eleanor Tomlinson|

“Three weeks in India with Natalie. We hired a driver who took us all over northern India, including the city of Agra where the Taj Mahal is. We stayed in the Oberoi Hotel and swam at night under the moonlight in their pool area. I’d planned on proposing, but was paranoid that the ring would get lost or my surprise would be uncovered. In the end, I chickened out.” |Tom Chaplin|

“Trekking through the Peruvian Andes with my children 10 years ago. We flew to Lima and started from Lake Titicaca. Then we took a train to Cuzco. We wove through the valley floor with the mountains around us – the views were breath taking. We hiked up to Machu Picchu, passing alpacas and camping along the way. I’d love to return to do the Inca Trail.” |Jennifer Saunders|.

The choice for one’s favourite Hotel (RQ 5- Favourite Hotel?) reveals a desire for privacy, moments of relaxation, good food and a beautiful view as we can notice from the excerpts that follow: *“The Fasano in Rio de Janeiro – for work or pleasure. The view from the pool is gorgeous.” |Alessandra Ambrosio|; “The Peponi on Lamu Island in Kenya is beautiful. The food is excellent food and there is a lovely beach offering serene sea views.” |Colonel John Blashford-Snell|; “Hotel Splendido in Portofino the most expensive place on God’s green earth, but it was a birthday treat. Also, the Graycliff in the Bahamas, where Edward and Mrs Simpson stayed. I actually prefer villas, so I can wake up and make my own breakfast and have some privacy.” |Michael Ball|; “I love the Prestonfield Hotel in Edinburgh, when we’re there for the festival. But the longest Natalie likes staying away from Freya is two nights, so spa breaks have become very important. The Lime Wood Hotel in Hampshire is great for that.” |Tom Chaplin|*

From the content analysis about the seventh research question (Best holiday ever?), the majority of celebrities mentioned food; thus, no matter what the research question is, the celebrities almost always mention food as a factor of attractiveness.

“Rome. I have been a few times now. For my first visit, with my parents, we did quite a bit of sightseeing. We visited the Vatican and Colosseum, and found some great restaurants and gelaterias. I have a bit of a thing about gelato.” |Johanna Konta|

“I was caught up in a gun battle in Salvador in the Eighties. I was climbing a roof with soldiers when it collapsed. I ended up falling through the air, and breaking my arm, elbow and the bones in the back of my rib cage; I lay on the ground all night as the battle raged all about me. That, or the occasion I had a burger made out of rat meat –actually, surprisingly good.” |Sir Don McCullin|

“I went to Bestival, on the Isle of Wight in 2007. The music, the weather, the friends – it all made it feel like a proper holiday. I’ve been to Reykjavik five times. New Year’s Eve in 2008 was pretty spectacular.” |Mathew Horne|

From the content analysis about the ninth research question (Best travel advice? / Best piece of travel advice? /Best travel tip?), we can highlight the use of comfortable clothes and shoes and the adoption of some objects that make their trips easier and comfortable such like tea bags. Excerpts from celebrities' responses are given below.

"Dress comfortably. I have some great Asics gear that I wear, and I can't fly without my flight socks." |Johanna Konta|

"Think about airports and work out what you're going to do if it doesn't work out. And buy a pass for one of the lounges so you can escape the chaos". |Jennifer Saunders|

"Having travelled so much, I've seen so many people's suitcases live and die. I invested in a top-of-the-line Tumi suitcase that cost around €900. Everyone laughed and said what a waste of money, but it still looks as good as new and I never have to worry about cramming things in because I bought one larger than I thought I'd need." |Tom Chaplin|

"Use a lightweight suitcase, like those from Samsonite, because they're virtually indestructible and have "smart" technology like charging ports." |Rankin|

From the content analysis about the tenth research question (Travel essentials?), by the Excerpts from celebrities, we can see that most celebrities rank their iPhones followed by books or audio books, among other objects. Excerpts from celebrities' responses are given below.

"My phone, as I read scripts on it, and notebooks, in which I write down thoughts about work." |Eleanor Tomlinson|

"My iPhone because it has all my music on it, decent headphones and a good book, or four. I take books I can leave behind for others to enjoy." |Ian Rankin|

"Credit cards, audio books and podcasts." |Rankin|

According to the excerpts from celebrities, the content analysis about the eleventh research question ((What do you hate about travelling?)), revealed some of the negative emotions celebrities have about traveling specially regarding the security procedures at airports, versus to the positive emotions they stated in previous responses. Excerpts from celebrities' responses are given below.

"When hotels overlook the little details, which can make a difference between a good stay and a great stay. And travelling through American airports: it took me three hours to clear through Atlanta last time. Infuriating." |Tom Chaplin|

"I hate airports with all their red tape, and the power customs officials seem to like, to lord over travellers. I love travelling by train – it's much less hassle." |Dan Snow|

"The night before I go away. I'm not sure why but I get quite anxious. It dissipates once I'm there and settle in." |Mathew Horne|

CONCLUSIONS

This paper highlights the role of celebrity travel narratives as they engage in eWOM recommendations to destinations, hotels, restaurants and experiences. People perceive these celebrities endorsers as role models and opinion makers. Therefore, tourism operators and managers must acknowledge their comments and design new tourism products that meet their expectations.

The content analysis of the interviews allow researchers to identify some patterns and future trends. Some celebrities have vivid childhood memories of significant events linked to tourism journeys. Negative circumstances of childhood may also inhibit the preference for similar destinations, cities or activities.

Emotions and sensorial memories involving eating as Kauppinen-Räsänen, Gummerus and Lehtola (2013) recognized are key elements for designing and co-creating new experiences. Customers' opinions and reviews about tourism service companies are a crucial co-creation tool for customers (Pera, 2017; Wang and Fesenmaier, 2004). The travel experience of a single customer is now accessible to multitudinous community members and, subsequently, shapes their future purchase behaviour.

On the other hand, it seems that the logistic issues related with the airport's security procedures, or how to spend the waiting time for flight are the major concerns and stress sources in the tourists' journey.

Further research should assess the relationship between the variables related with qualitative content analysis and the metrics regarding the engagement and social media eWOM (eg. number of likes and shares).

ABSTRACT

Previous studies examined relationship quality and its determinants and dimensions within specific contexts, thus creating a highly fragmented view on relationship quality. This study synthesized these fragments and suggests an overall model of online relationship quality to be used as a foundation for future research regardless of the industry, type of the organisation, market segment or country. The integrative model of online relationship quality was developed highlighting all the previously validated determinates and dimensions of this debated concept and listing all possible moderators that can influence relationship quality in any type of online contexts. Besides providing an integrative base for academic researchers in the domain of relationship quality, this study offers an online relationship quality matrix for business practitioners. This matrix highlights the main connections between determinants and dimensions of online relationship quality along with the relative strength of these connections, so managers can see clearly the links between antecedents and outcomes, which can assist them building sharper customer relationship strategies for online interactions.

Keywords: Relationship quality, online relationship quality, satisfaction, commitment, trust, relationship characteristics, website characteristics.

INTRODUCTION

In today's fast-paced and highly competitive environment, where customers are looking for instant satisfaction and have prompt access to vast number of alternative sellers online, businesses are increasingly dependent on strong relationships with their customers to achieve success (Morgan and Hunt 1994). The recent evolution of information and communication technologies empowered not only customers, but also enabled companies to offer their services and sell their products online providing them with a significant competitive advantage over others operating only offline. This online 'revolution' created more opportunities for dynamic interaction between the company and its customers, furthermore, it has contributed greatly to reduce the complexity of the transaction and created the possibility for increased level of customisation and sophisticated personalisation (Asgari

Hamid, Asgari and Mousavipour, 2012). The link between online relationship quality and customer loyalty, the ultimate marketing goal (Kotler, Armstrong, Harris and Piercy, 2013), has never been so clear (Walsh, Hennig-Thurau, Sassenber and Bornemann, 2009).

There is substantial literature (e.g. Athanasopoulou, 2009; Brun et al., 2014, 2016; Carr, 2006; Hennig-Thurau and Klee, 1997; Vieira et al., 2008) on how companies can strengthen their customer relations i.e. enhance the relationship quality both in online and in traditional contexts. However, the available literature is critically fragmented. Not only there is no consensus on the definition of what relationship quality means, and what are its main building blocks, but there is also a fierce disagreement on what are the main factors that shapes it. Athanasopoulou (2009) suggests that this strong disagreement is rooted in the fact that relationships quality is highly context specific. This means that a specific environment changes the factors that influence relationship quality, and the relative impact of the determinants is perceived differently in different an industry, organizational environment, culture or in a specific market segment. Thus, Athanasopoulou (2009) recommends that for academics, “the nature of online relationships needs further studying in order to create an established framework for future research in this very complex field” (p. 604) and Vieira, et al. (2008) and Woo and Ennew (2004) add that in order make progress one must first accept a general view of the concept. Following these recommendations, this study conceptualizes an integrative model for online relationship quality based on the synthesis of the available but highly fragmented literature. This model is suggested as a foundation for future research, as it accumulates all the validated determinants and dimensions of online relationship quality, and it also incorporates all the possible moderators. Thus, it can be a very useful starting point to build on regardless of the specific context studied.

RELATIONSHIP QUALITY

The concept of relationship quality has been studied since the 1990s, however there is still no consensus among the academics about its conceptualization. Relationship quality is considered as one of the pillars of relationship marketing (Gummesson, 2002; Hennig-Thurau, Langer and Hansen, 2001) and, it has gained considerable importance as a measure of successful business relationships (Palmatier et al., 2006).

Relationship quality reflects the nature of the relationship between the company and its customers (Hennig-Thurau et al., 2002; Smith, 1998). Relationship quality, as per Crosby et al. (1990), means “that the customer is able to rely on the salesperson's integrity and has confidence in the salesperson's future performance because the level of past performance has been consistently satisfactory” (p. 70). Kim and Cha (2002) argue that relationship quality refers to the customers’ perceptions and evaluations of the service provided, communication and conduct of the company’s representative. For

Liu, Li and Zhang (2010), relationship quality is the extent of the parties' willingness to pursue common interests, mutual understanding, reciprocity, loyalty and long-term cooperation. According to Keating, Rugimbana and Quazi (2003), relationship quality corresponds to the quality of the interactions between the parties (company and its customers), and is viewed as accumulated value of the interactions. Crosby et al. (1990) refers to relationship quality as a complex and multidimensional construct, as it is can be understood as the total value of a relationship reflecting all the different phases, which it passes through (Palmatier et al., 2006).

By reviewing all the above definitions and descriptions of relationship quality, it can be clearly seen, there is no consensus regarding the definition of this concept. According to Hennig-Thurau (2000), one of the possible reasons for this is that there are several different types of relationships in various markets that can be studied and drawn conclusions from. However, the authors do not agree on the definition of relationship quality, all of them stress that there are many benefits associated with this concept, namely loyalty, collaboration, operational improvement, safety and business continuity (Akrouf, 2014).

Dimensions of Relationship Quality

Relationship quality is a debated concept, it manifests not only in the lack of consensus regarding its conceptualization, but also, regarding the definition of the dimensions that build it (Hennig-Thurau et al., 2002; Huntley, 2006). For example, according to Dwyer et al. (1987), Crosby et al. (1990), Moorman et al. (1992) as well as Wray, Palmer and Bejou (1994), trust and satisfaction are the main domains of relationship quality. While, Woo and Ennew (2004) and Song, Su and Liu (2012) argue that cooperation and the environment are the most relevant aspects of relationship quality. Similarly, Rauyruen and Miller (2007) establish that trust, commitment and satisfaction are the key facades and add also the quality of service, but Dorsch et al. (1998) suggest that besides trust, commitment, satisfaction, the essential additions are: customer orientation, minimal opportunism and ethical profile. Also, Smith (1998), Hennig-Thurau et al. (2002), Ndubisi (2014) and Lai (2014) propose that trust, commitment and satisfaction are the main pillars of relationship quality. While, Tsai and Hung (2016) exclude commitment and satisfaction and argue that the main dimensions of this concept should only be based on trust, that flow from cooperation, adaptation and communication.

Based on the disagreement above, it can be concluded that the considered dimensions of relationship quality are diverse and in essence quite different. Woo and Ennew (2004) reasons that it is because there are various definitions of relationship quality, which lead to inconsistency in theorizing regarding the constructs that build it. These authors also advocate that the nature of the dimensions of relationship quality depends on the specific contexts that the relationship is studied, and the different contexts provide different set of constructs.

Despite of the fact that the list of constructs is grouped in a different way, there seems to be a set of dimensions that majority of the studies consider as building blocks of relationship quality: trust, commitment and satisfaction (Athanasopoulou, 2009; Vieira et al., 2008). Building on this notion, this study accepts the relevance and foundational nature of trust, commitment and satisfaction in studying relationship quality, and builds its research on this basis (Table 1).

Authors	Dimensions of Relationship Quality
Dorsh et al. (1998)	Trust Satisfaction Commitment Customer orientation Minimal opportunism Ethical conduct
Smith (1998), Hennig-Thurau et al. (2002), Ulaga and Eggert (2006), Moliner et al. (2007), Vieira, et al. (2008), De Cannière et al. (2010), Rafiq et al. (2013), Ndubisi (2014), Lai (2014), Athanasopoulou (2009)	Trust Satisfaction Commitment
Dwyer et al. (1987), Crosby et al. (1990), Moorman et al. (1992), Wray at al. (1994)	Trust Satisfaction

Tsai and Hung (2016)	Trust
Rauyrueen and Miller (2007)	Trust Satisfaction Commitment Service quality

Table 1 - Relationship Quality Dimensions

Trust

Trust is generally considered as a fundamental element to develop and maintain long-term relationships (Crosby et al., 1990; Dwyer et al., 1987; Palmatier et al., 2006). Trust is critical in a variety of relationships, whether interpersonal or inter-institutional, and is an essential factor in determining relationship quality (Yu and Chen, 2014).

According to Bart, Shankar, Sultan and Urban (2005), trust requires the willingness of one of the actors in the relationship to accept vulnerability and dependence on the other side, with the expectation that they can achieve a particular goal. Aurier and Lanauze (2012) define trust as the belief that the other party will behave in such a way that expectations will be exceeded, interests will be met, and this pattern will be maintained in the long run.

The concept of trust encompasses three other important dimensions: honesty, benevolence (the belief that the other party in the relationship will show benevolence in his actions) and competence (the belief that the other actor will be competent to act in favour of the relationship) (Fynes, Búrca and Voss, 2005; Moorman et al., 1992; Vidal, 2012).

Commitment

Moorman et al. (1992) consider that commitment is essential to maintain a relationship, and it is a key factor in pursuing a successful outcome. Dwyer et al. (1987), in line with Palmatier (2008) and Bobot (2011), propose that the essence of the commitment is the adoption of a long-term orientation that accepts to make short-term sacrifices for long-term benefits. Hennig-Thurau and Klee (1997) describe this concept of commitment as a long-term customer orientation adopted on an on-going basis, and grounded in an emotional bond and the belief that remaining in the relationship would produce greater net benefits than ending it. Roberts et al. (2003) considers that compromise is the main dimension that distinguishes successful relationships from failures, since it is through the compromise that the parties solve the problems of the relationship. Compromise is when one party in the relationship is willing to make extra effort and sacrifice certain personal benefits to maintain the relationship. Thus, committed stakeholders are the most tolerant towards each other (Sun, 2010).

Satisfaction

This dimension of relationship quality represents the emotional perspective of the relationship (Palmatier et al., 2006) and, according to Akrouit (2014), it cannot “function” in the absence of the remaining dimensions (trust and commitment) in building loyalty and lasting relationship (Bettencourt, 1997).

The conceptualization of satisfaction has been widely and fiercely discussed (Hennig-Thurau et al., 2002), but generally refers to the post-purchase process and it is based on the consumers' evaluation of the performance of the acquired product/service. For Crosby et al. (1990) and Dwyer et al. (1987) this concept represents a positive affective/emotional evaluation based on the overall assessment of the performance of the other party in the relationship. So, satisfaction can be described as the sum of the positive and negative outcomes of the relationship. Roberts, Varki and Brodie (2003) stresses the cognitive aspect of this concept, arguing that satisfaction is a cognitive assessment, based on the personal experience of each of the parties regarding all the events occurred in the relationship. So, the relevance of satisfaction within the framework of relationship quality is based on the notion that it offers a summary assessment of past interactions between the parties, and this summary projects expectations for the future interactions; thus, in total, it provides a general evaluation of the relationship (Crosby et al., 1990; Roberts et al., 2003).

Determinants of Relationship Quality

Vieira et al. (2008) proposed a conceptual model of relationship quality based on their review of relationship quality literature. The conceptual model displays four determinant factors (antecedents) of relationship quality: mutual goals, communication, domain expertise, and relational value, as deemed the most important but “additional determinants may need to be included in order to cope with the context specificity of relationship quality” (p. 280).

The concept of mutual goals was originally defined by Wilson (1995) as the degree to which parties share goals that can only be achieved through joint action and maintenance of the relationship. The existence of goal congruity offers the right conditions for both parties to benefit from participating in a relationship (McQuiston, 2001). This concept of mutual goals prompts the development of trust and, consequently, increases satisfaction with the relationship (Vieira et al., 2008).

Communication is next factor driving relationship quality. It has been considered the most basic activity during the exchange relationship, and essential to establish interaction between the parties involved (Williams et al. 1990). Effective communication enhances trust, and so, plays a crucial role in influencing relationship quality (Crosby et al., 1990; Lagace, Dahlstrom and Gassenheimer, 1991; Morgan and Hunt 1994; Parsons, 2002).

Other most commonly used driver of relationship quality is the salesperson’s domain expertise (Crosby et al. 1990; Lagace et al. 1991; Parsons 2002). It is defined as the customer’s perception of the salesperson’s level of technical knowledge and his ability to demonstrate such knowledge (Crosby et al. al., 1990; Parsons, 2002). Empirical research has shown that knowledgeable salespeople are more likely to engender trust in their customers and more effectively meet customer needs, which suggests that expertise influences relationship quality (Parsons, 2002).

Finally, relational value is also another key element in determining relationship quality. Relational value refers to the party’s expected net benefits from a relationship (Dwyer et al., 1987), balancing relational benefits and sacrifices (Gronroos, 2000). According to Hennig-Thurau et al. (2002) and Morgan and Hunt (1994), the parties stay in relationships as long as there are expectations of receiving the promised benefits, which are not only economical but also social benefits (Hennig-Thurau et al., 2002). Empirical work confirms that relationship-specific investment leads to greater commitment (Palmatier et al. 2007).

Links Between the Determinants and the Dimensions of Relationship Quality

The below matrix displays the specific links between the determinants (antecedents) and the dimensions of relationship quality (Table 2), providing a snap-shot view of what dimensions of the relationship can each influencing factor improve. These interconnections, while provide valuable insight for academia, give a very practical guideline for practitioners on how to enhance and in some cases recover relationship quality with customers.

	Dimensions of Relationship Quality			
Determinants of Relationship Quality*		Trust	Satisfaction	Commitment
	Mutual Goals	P+	P-	
	Communication	P	P	
	Domain Expertise	P		
	Relational Value			P

* positive (P), strongly positive (P+), slightly or indirectly positive (P-)

Table 2 - Influence of the determinants (antecedents) of relationship quality on the dimensions of relationship quality in the traditional (face-to-face) setting

ONLINE RELATIONSHIP QUALITY

Online relationship quality is an integrative and multidimensional concept just as relationship quality in the offline context (Brun, Rajaobelina and Ricard, 2014). Asgari et al. (2012) also conceptualise online relationship quality in the same way as offline relationship quality, however, Vieira et al. (2008) argue that the determinants of online relationship quality are fewer than that in the offline context, comprising of communication, transactional and relational functions only. The communication function refers to the interactions between the online company and its customer. This function has a prominent role in the online context due to the recent technological advancements, as it created more opportunities for customer-company contact (Asgari et al., 2012). From transactional point of view, Asgari et al. (2012) suggest that several factors influence relationship quality from the accessibility, security and design of the website, through the content available on the website, to the complexity of the purchase. While the relational function encompasses online service quality and the level of personalise ability of the website (Asgari et al., 2012). Taking these research findings into consideration, online and offline relationships are quite distinct, mainly due to physical distance and the different media used, however, the main principles of relationship marketing, in particular, relationship quality, can and should be taken and applied from the offline to online context (Ching and Ellis, 2006).

Dimensions of Online Relationship Quality

Just as in offline context, online relationship quality is also comprised of several dimensions (Asgari, et al., 2012; Rafiq et al., 2013). While, Asgari, et al. (2012) suggest that online relationship quality consists of only online satisfaction (e-satisfaction) and trust (e-trust), Walsh et al. (2009), Rafiq et al. (2013), Aggarwal and Bhardwaj (2016) as well as Vize, Coughlan, Keneedy and Ellis-Chadwick (2016) argue that the dimensions of relationship quality match in both online and offline environments,

namely, trust, commitment and satisfaction. Walsh et al. (2009), clarify this contradiction by suggesting that the difference between online and offline relationship quality, their relevance and impact is rooted in the fact that the interaction between the customer and the company's representative happens in two different environments.

E-trust

E-trust is described as the level of trust and conviction that a customer has regarding the success of the online purchase (Ribbink, Riel, Liljander and Streukens, 2004). E-trust is a particularly relevant dimension of relationship quality in the online context, where customers increasingly rely on the Internet for information and purchase, and online contact increasingly contributes to customer loyalty (Shankar, Smith and Rangaswamy, 2003).

According to Bart, et al. (2005), trust in the offline context differs considerably from trust in the online context, as the latter relies solely on the online website through the use of technology. However, these authors also suggest that the interaction between a customer and a website is similar to the personal interaction in a physical store, as trust is developed based on the interaction with the company representative in the former case and with website in the online setting. Also, similarly to the offline environment, e-trust is established based on a set of customer perceptions compared to customer expectations about the website. Alike Bart, et al. (2005), Mukherjee and Nath (2007) also consider the concept of trust being different in the two different environments, and point out several aspects justifying this difference, e.g., the absence of human contact; the physical distance between the actors (customer and seller) and between the customer and the product. Li, Jiang and Wu (2014) too supports that this dimension of relationship quality is more relevant in the online environment than offline, as consumers perceive more inherent risks in online purchase, and associate these risks with the lack of physical contact with both the product(s) and the seller(s).

Brun et al., (2014) conceptualize online trust based on the three dimensions of competence (the individual's perception of the partner's skills and abilities), integrity (the belief that the trusted party adheres to accepted rules of conduct, such as honesty and keeping promises) and benevolence (seeking joint gains and being concerned about the other's welfare).

E-commitment

E-commitment has not been considered as relevant in the online setting as it has been for the offline context (Brun et al., 2016), however, Chung and Shin (2010) highlight the importance of e-commitment in both environments.

Ching and Ellis (2006) also support the relevance of e-commitment in the online settings by arguing that online customers are less likely to develop loyalty to the company or the brand due to the high anonymity as well as physical and social distance between the parties involved in the purchase

process. Therefore, the strong sense of commitment is essential for developing and maintaining online relationships (Brun et al., 2016).

Commitment represents “the consumer’s psychological attachment toward the online service provider, along with his/her willingness to maintain the customer-firm relationship” (Liang and Chen, 2009, p. 222). In the offline context, commitment is conceptualized as having three dimensions: affective, calculative and normative, while majority of the studies examining online settings usually focus only on the first two (Brun et al., 2014). However, to ensure the full complexity of commitment in online relationship quality, the three dimensions of affective commitment, normative commitment and calculative (or continuance) commitment should be taken into account (Brun et al., 2014). Affective commitment represents the psychological bond that emerges from favourable feelings toward a firm (Gruen et al., 2000), and develops because the consumer identifies with the company and likes the company’s web site (Meyer and Herscovitch, 2001). Calculative commitment results from a rational and economic calculation (Meyer and Herscovitch, 2001), like it may be difficult for customers to stop using a company’s web site because, for example, they have invested heavily in its use or there are no better alternatives available (Brun et al., 2014). Normative commitment is demonstrated through behaviours rising from a sense of obligation (Gruen et al., 2000), like customers may feel an obligation to continue using a company’s web site because of the benefits previously received (Brun et al., 2014).

E-satisfaction

Evanschitzky, Iyer, Hesse and Ahlert (2004) as well as Szymanski and Hise (2000) suggest that e-satisfaction manifests when clients compare the experience of the online service with offline service provision. Anderson and Srinivasan (2003) define e-satisfaction as customer contentment with the purchase experience at a particular online company. According to McKinney et al. (2002) and Sanchez-Franco (2009), e-satisfaction is associated with the characteristics of the website as the customers perceive it, because there is no other contact point in the online environment. Shankar, Smith and Rangaswamy (2003) have found that the service encounter satisfaction is not statistically different online versus offline, however, overall satisfaction (the cumulative effect of a set of discrete service encounters or transactions with the service provider over a period of time) is higher online than offline. These authors also list the main determinants of customer satisfaction offline, such as ease of obtaining information, frequency of use, service performance and prior experience. Based on their research findings Shankar, Smith and Rangaswamy (2003) suggest that in the online setting satisfaction is influenced, besides the actual service received, ease of obtaining information has a stronger positive effect on overall satisfaction online than offline; frequency of use has a lesser negative effect on overall satisfaction online than offline; and the depth of information at the website

increases service encounter satisfaction, and from there contributes to overall satisfaction with the online service provider.

Determinants of Online Relationship Quality

Brun, Rajaobelina and Ricard (2016) argue that there are several factors that contribute to online relationship quality, and that these factors can be divided into relational characteristics and website characteristics. Relational characteristics resemble the factors of the offline context, which also coincide with and influence the online context (Ching and Ellis, 2006). Website characteristics are composed of factors derived exclusively from the online environment (Chung and Shin, 2010).

Brun et al. (2016) suggest that relational characteristics that promote online relationship quality are communication, conflicts, and the perceived benefits of the relationship. With regards to the characteristics of the website, Brun et al. (2016) have identified convenience, website design, information quality, ease of use, and security/privacy as the most relevant factors contributing to online relationship quality (Table 3).

Relational Characteristics	
Communication	It influences positively the dimensions of online relationship quality, namely online trust (Mukherjee and Nath, 2007) and online satisfaction (Chung and Shin) and also has a positive impact on offline commitment (Palmatier et al., 2006). Although not very significant in its overall positive impact, it exerts significant positive impact on online relationship quality for women (Brun et al., 2016).
Conflict	It negatively influences all dimensions (Palmatier et al., 2006).
Perceived Benefits of Relationship	It influences positively the three dimensions of online relationship quality: trust, commitment and satisfaction (Palmatier et al., 2006).
Website Characteristics	
Convenience	It positively influences trust and commitment, in online context Toufaily and Perrien, 2006). While it contributes to overall online relationship quality, it is found to be the least important antecedent of it (Brun et al., 2016).
Website design	It directly influences satisfaction, in an online context, but indirectly also has an impact on trust and commitment (Chung and Shin, 2010).
Quality of Information (depth of information)	It influences trust (Ladhari and Leclerc, 2013), commitment (Bauer, Grether, and Leach, 2002) and satisfaction (Ladhari and Leclerc, 2013) in online context. The depth of information at the website increases service encounter satisfaction, which increases overall satisfaction (Shankar et al., 2003).
Ease of Use	It is the most important antecedent of online relationship quality (Brun et al., 2016). It influences positively online satisfaction (Casalo, Flavian, and Guinaliu, 2008), online trust (Flavian, Guinaliu, and Gurrea, 2006) and, despite the lower intensity,

	online commitment (Brun et al., 2016). Ease of obtaining information has a stronger effect on overall satisfaction (Shankar et al., 2003).
Security/privacy	It directly influences satisfaction, in an online context, but indirectly also has an impact on online trust and online commitment (Chung and Shin, 2010).

Table 3 – Determinants of online relationship quality

According Brun et al. (2016), website characteristics are more important for developing enduring online relationships than the relationship characteristics, because there is no physical contact during the online experience, so the customer relies only on the website's information content, system design, and technology quality (McKinney, Yoon, and Zahedi, 2002). However, all of these factors, whether they are part of the website's feature set or relational characteristics, influence the dimensions of relationship quality and so, can be considered as antecedents of it (Brun et al., 2016). The ease of use, website design and security/privacy have the greatest total impact on online relationship quality, while perceived benefits, conflict, convenience and communication have the least impact on the overall relationship quality (Brun et al., 2016).

Links Between the Determinants and the Dimensions of Online Relationship Quality

The below matrix (Table 4) displays the impact that each determinant of online relationship quality has on each dimension: e-trust, e-satisfaction and e-commitment. Thus, it provides a practical guide on cause-effect correlations within online customer relationships.

	Dimensions of Online Relationship Quality		
	E-Trust	E-Satisfaction	E-Commitment
Relational Determinant of Online Relationship Quality			
Communication	P	P	P
Conflict	N+	N+	N+
Perceived Benefits of Relationship	P	P	P
Website-related Determinant of Online Relationship Quality			
Convenience	P	P-	P
Website design	P-	P+	P-
Quality of Information	P	P+	P
Ease of Use	P+	P+	P-
Security/privacy	P-	P+	P-

*negative (N), strongly negative (N+), positive (P), strongly positive (P+), slightly or indirectly positive (P-)

Table 4 - Influence of the determinants on the dimensions of relationship quality in the online environment

Moderators of Online Relationship Quality

Athanasopoulou (2009) found in her literature review on relationship quality that only a fraction of the studies (4 out of 47) incorporate moderating variables, however their impact can be significant.

Gender is highlighted as one of the most impactful moderator, since males and females tend to differ in relationship quality perceptions and in the types of antecedents that influence these perceptions (Athanasopoulou, 2009). Ease of use, the most important antecedent of online relationship quality, is particularly critical for women, and communication has significant positive impact on online relationship quality among women (Brun et al., 2016).

Also, the age of the customers as moderator of relationship quality found to be relevant by Obal and Kunz (2013) advocating for significant difference between Generation Y and Baby Boomers in terms of e-trust and how it built. Brun et al., (2016) discovered that the impact of perceived relationship benefits is stronger for Generation Y than for Baby Boomers, and security/privacy is not significant for Generation Y, but it is for Baby Boomers.

Product importance and in general the industry context may also moderate the links within the relationship quality model especially, for example, when the supplied product is critical for the production of the end product, or when accurate service delivery is critical for the customer such as in medical or legal services (Athanasopoulou, 2009). In the comparison of three different industries Gómez, González-Díaz, Martín-Consuegra and Molina (2017) also conclude that the main benefits perceived of relationship quality is specific regarding different services.

The influence of national culture on cross-national buyer-seller relationship has already been identified as a critical (Dash, Bruning and Guin, 2006). High mutual and symmetric interdependence in a buyer-seller relationship is a crucial factor in building trust and commitment (e.g. Kumar et al., 1995; Geysken et al., 1996), but culture-determined power distance moderates this interdependence, and from there affects relationship quality (Dash, Bruning and Guin, 2006).

The most important moderator, however, according to Athanasopoulou (2009), is the age of the relationship, because relationship quality changes with time and as it ripens it can possibly turn to loyalty.

Proposed Conceptual Model

The literature on the determinants and dimensions of online relationship quality is fragmented focusing only some specific links between the determinants and the dimension of relationship quality. Also, hardly any of the studies incorporate the moderators of relationship quality, which found to have significant influence on the overall perception of online relationship quality (Athanasopoulou, 2009; Brun et al, 2016). Furthermore, none of the studies considered multiple moderators and their individual effect on the dimensions on relationship quality. So, this study puts the pieces together and

conceptualizes an integrative online relationship quality model that considers not only previously verified determinants and dimensions of online relationship quality, but also an informed list of moderators that can influence it in the online context. The aim is to advance both academic research in online relationship quality domain, and to offer valuable insight for business professionals providing online services to better care for their customers in this digital age increasing their satisfaction, trust and commitment and ultimately gaining their loyalty.

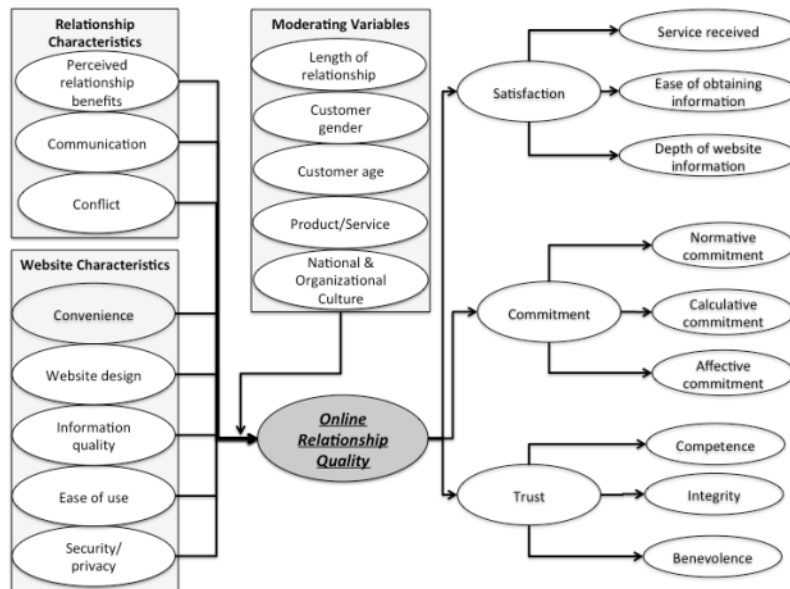

Figure 1 – Integrative online relationship quality model

CONCLUSION

This study proposed an inclusive relationship quality model for the online context built from the fragmented previous literature, where there is hardly any consensus about the definition of relationship quality nevertheless their antecedents, building blocks and moderators. The proposed conceptual model is a generic display of the links and cause-effect affiliations of online relationship quality synthesized from different industries, countries and various market segments. Following Athanasopoulou's (2009) conclusion that the list of variables of relationship quality (determinants, dimensions and moderators) is always context-specific, or building on the findings of this study that the variables of relationship quality are significantly different in online and in traditional contexts (Table 1 - 4) the proposed model (Figure 1) is suggested to be considered for future research as a foundation, and modified based on the specific nature of the context studied. It is expected to be significantly different in various business contexts (B2B or B2C), in various industries and regarding specific services/products as well as in different cultural environment.

However, there are vast differences in the determinants and list of moderators that influence relationship quality, it seems accepted by the majority of the researchers (Table 1) that the core

dimensions of relationship quality, regardless of the industry or online/offline context is the same: trust, satisfaction and commitment. Based on the above analysis of the literature, this study urges future researchers of online relationship quality to consider these main dimensions of the concept, in order to achieve a wider and deeper assessment of different industries and contexts, and realize the benefits of direct comparison.

The main value of the study, besides the inclusive online relationship quality model, is the online relationship quality matrix (Table 4). It collects and points out the main connections between antecedents and dimensions of relationship quality along with the relative strength of these connections. This summary encompasses valuable insight for the business practice deciphering what strategies the company can focus to strengthen a specific feature of their customer relationship. So, rather than *trying* their best and *hoping* for the best, acting *purposefully* and expecting *known* results.

SILOS MENTALITY IN HEALTHCARE SERVICES

Alves, João¹; Meneses, Raquel²

¹Instituto Ciências Biomédicas Abel Salazar, University of Porto, Portugal

²School of Economics and Management, University of Porto, Portugal

ABSTRACT

In the last decades many authors have referred to the importance of silo mentality in healthcare. The functioning of complex organizations such as hospitals requires high levels of understanding and cooperation between professional groups with different professional pathways and expectations. Even though silo mentality appears to be a significant challenge to organizations, employees and clients, there is no empirically supported theoretical framework and a conceptual clarification of the term is in need.

Silo mentality is a consequence of the organizational structure, with departments divided functionally and professionally, and with insufficient communication channels. The silo configuration is essentially matrixial with horizontal silos, the services and the professional classes; and vertical silos, the different hierarchical levels. Silo mentality compromises the efficiency of the organization and promotes conflicts, redundancy and waste. It distresses and demotivates the employees and frustrates clients who receive worse care and do not have their problems solved on time.

Silo mentality in healthcare can be defined as the set of individual or group mindsets that can cause divisions inside a health organization and that can result in the creation of barriers to communication and the development of disjointed work processes with negative consequences to the organization, employees and clients.

These findings suggest that, on the one hand, the benefits of the present healthcare organizations structure should be evaluated and, on the other hand, that strategies to mitigate its insufficiencies in communication, cooperation and work integration should be discussed.

Key-words: corporate culture, healthcare, public administration, silo mentality.

INTRODUCTION

In the last two decades only some authors study the importance of the silo mentality in health care (Hajek, 2013; Kumarasamy & Sanfilippo, 2015; Vatanpour, Khorramnia, & Forutan, 2013), since the normal functioning of organizations with complexity of

hospitals requires very high levels of understanding and cooperation between professional groups with different paths and expectations (Vatanpour et al., 2013) .

With the technical progress and the medical specialization the number of services and departments in the hospitals increased. The competition between units has increased and their unwillingness to share information as well as the way of thinking of its employees, led to a decrease in efficiency and contributed not only to the loss of trust between professionals but also a productive culture (Langley & Warner, 1990; Waldman, 2007) .

The silos can be defined as groups that tend to work by themselves, as an autonomous unit, within an organization, conditioning the interaction of the members of the different units (Vatanpour et al., 2013). If in a farm the silos prevent the different cereals from mixing in an organization lead to a lower productivity, since employees are more reluctant to cooperate and integrate their work into the various functions within the organization (Chopra, 2001, cit. by Vatanpour et al., 2013) . These arise not only in organizations, but also across disciplines, occupations or even methodologies (Fenwick, Seville, Brunsdon, & Resilient, 2009).

The term silo mentality is often used to describe individual or group beliefs that can cause division and whose most common outcome is the creation of barriers to communication and the development of disjointed work processes. This type of mentality can reduce motivation and generate indifference towards the needs of others (Vatanpour et al., 2013). Thus, the emphasis must be placed on the non-physical nature of the barriers.

Although the silo mentality in health services seems to be a significant problem for the organization, employees and users, literature on the subject is scarce. It lacks not only an empirically supported theoretical framework but also a conceptual clarification of the term itself, since terminology plays a central role in communicating what we think about a subject, how we approach it and how we deal with it (Kodner & Spreuwenberg, 2002).

LITERATURE REVIEW

It was Neebe in 1987, the first to use the concept of silo as a metaphor for organizational behavior (Cilliers & Greyvenstein, 2012), making parallel between the grain silos and off manner, isolated and with few roads, as the various parts of some hosts eggs often work. Agricultural silos are large towers, usually without windows, used for storage of grains. These structures are dispersed, being understood that a silo conti cereals can hardly migrate or be moved from one tower to the other (Cromity & de Stricker, 2011).

The different internal cultures of each silo would hinder communication and raise difficulties in cooperation with other silos within the organization as competitors, so as to ensure the silo's

sovereignty and its continuity (AME, 1988). Thus, the classical functions of a manufacturing company: manufacturing, engineering, R & D, marketing, accounting, finance and human resources would be isolated in internal and hierarchical silos.

The silo mentality can be defined as the set of individual or group beliefs potentially causing division within an organization and whose most common result is the creation of barriers to communication and the sharing of information and the development of disjointed working processes (Fenwick et al., 2009). This type of mentality can reduce motivation and generate indifference towards the needs of others (Vatanpour et al., 2013). Cilliers and Greyvenstein (2012), instead of looking for silo as conscious, objective and rational entities, described them using a different paradigm, the psychoanalysis. The silos would represent a cleavage, an invisible barrier capable of containing the collective unconscious of the team and organizational fantasies and emotions. In one way or another, the emphasis is placed on the non-physical nature of the barriers.

Causes of silo mentality

Individual level

Whether within the organization, among organizations or among disciplines, silos have their genesis in human behavior (Fenwick et al., 2009). Under pressure from various interests, conflicts and expectations, often unexpressed (Stone, 2004), there is a natural tendency for isolation and consequent establishment of barriers. These behavioral barriers are in turn the result of the individual's attitudes, motivations, age, environment and culture (Cromity & de Stricker, 2011). The various actors, and the very business areas they represent, have their own agenda, often hidden, the interest of the organization comes naturally after personal interest (Schütz & Bloch, 2006).

Sharing is also part of human nature, and this often occurs spontaneously, whether it is in a meeting, having coffee, or simply having a conversation. Still, if the sharing of information comes into conflict with personal interests, or just time consuming, there is no incentive, to the contrary, to its realization. Add to this the fact that for the most part there is no reward system that encourages this behavior (Cromity & de Stricker, 2011).

It is also important to note that inadequate training and development in interpersonal skills often results in inappropriate communication styles and the inability to build cooperative working relationships (Stone, 2004).

Group level

Functional silos naturally appear as an organization grows and employees specialize in standard functions: production, sales, etc.

The different professions present themselves to the collaborator as a safer and nobler cause, and professionals tend to identify more closely with themselves than with organizations. If a particular function can not be identified by a letter or a technique for at least the security status and are contained in the description of a job. Among professionals with a particular status emerges another layer of silos, for example, between laborers or liberal professionals trade unions and professional orders are established respectively. These distinctions tend to exacerbate communication problems (AME, 1988).

Due to the functional division of labor, any large organization is divided into departments: marketing, product development, sales, etc. The relationship between these is sometimes marked by the silo mentality, since there is no exchange of information and a competitive mentality of the "us against them" type emerges. Over time, departments have a specific culture, with points of view, ways of thinking, work methodologies, goals, values, language and time management, which contribute to the formation and consolidation of these identities and cultures within departments and that just build barriers to inter - departmental communication (Barmyer & Sachseneder, 2013).

Problems tend to arise when these different cultures are not aligned, both among themselves and with the organization's goals (Fenwick et al., 2009). Silos often create an environment in which departmental management interests may take precedent and in relation to the internal well-being of the organization (Stone, 2004). Given the need to distribute funding, and other resources, perhaps more important, power and authority by different departments, disputes are inevitably frequent, often being bitterly caught and with consequences for the public image of the organization (Fenwick et al., 2009). Often it is the compensation itself for achieving certain goals that reinforce non-cooperative behaviors and silo mentality (Vatanpour et al., 2013).

Systematic interaction tendency with the same elements, enhanced by retention of employees in the same function during years (many times throughout all his career), which leads to the development of preferred internal alliances (Sy & Côté, 2004). It is therefore not surprising that employees acquire a pattern of behavior that benefits their unity and those that are close to them, often with prejudice to the organization as a whole (Sy & Côté, 2004). This is enhanced by the fact that employees report to his department managers, who typically are responsible for promotion and incentives (Vatanpour et al., 2013).

For all these reasons, we can claim that silos are not physical, they exist mainly in the minds of employees, who have a shared impression of reality. They believe that if they keep others away they will be able to maintain their environment and their pleasurable reality, create an area of comfort, a barrier that protects them from the outside world, since others "are not like us" (Diamond, Allcorn, & Stein, 2004). With this over-identification with the department, there is a narrowing of

horizons and excessive reactivity to all *inputs* or *feedbacks* from outside, that are interpreted as attacks and the perfect pretext for victimization. Employees individually feel that they are not responsible for any situation and that the causes of the problems are always outside their control (Vatanpour et al., 2013).

Organization level

There are good reasons for a company to organize itself by functions. Technical proficiency comes from specialization. By concentrating knowledge on a particular problem in one place this will be addressed more quickly and efficiently. Specialization can still get to the end of the restricted operator to a single mechanism and eventually limit the technical progress, economic and even personal development of the employee. It is only feasible when there are economies of scale, since enormous infrastructure is needed to generate profits that bear the costs associated with this type of organization (AME, 1988).

When the organizational structures are rigid around the functional areas is necessary to take a much greater effort when interdepartmental work is necessary (Fenwick et al., 2009). Different administrative processes, work organization, modes of allocation resources and different views on who should be responsible for certain task often lead to conflict. The organization's own culture, which tends to be competitive rather than team-oriented, appears as a barrier (Stone, 2004).

The silos arise as a symptom of dysfunction in the existing organization (Fenwick et al., 2009). According to Carrol (Carrol, 1998, by Fenwick et al., 2009), employees of different hierarchical levels have different visions and may have difficulty communicating. This is often because the policies and procedures are being vague, making rise to different interpretations by the employees in accordance with its position within the organization.

Leadership level

The decentralized management can be seen as the root of the problem of silos. Managers seek to respond to the objectives that have been proposed to them, and they will bring their subordinates to their cause. At the end of time the department's interests overlap with those of the organization and when this individual vision predominates over the team spirit the silos emerge. This is a perversion of the concept of decentralized management. The director of the organization sets ambitious goals and endows the managers with the means and the means to achieve them: a manager has the indication to increase sales, another to reduce the costs and a third party will have to keep the finances in order. But this delegation of responsibilities by the director neglects the importance of teamwork in pursuit of objectives (Côté, 2002), contributing itself to the emergence of silos.

On the other hand, it is not uncommon for the personality and management style of the organization's leaders to encourage conflict and be a poor model in respect to the respect and incorporation of the

ideas or needs of others. Equally relevant is the inability of top managers to take a strong position vis-à-vis executives or managers who cause divisions and encourage silos within organizations (Stone, 2004).

Culture

Departmental culture can be defined as the basic set of assumptions of employees in a functional area that expands in the form of cultural values or artifacts and was suggested as the origin of the silo mentality (Wiebeck et al., By Barmyer & Sachseneder, 2013).

Cultures are formed through communication, during frequent social contacts between members of a given group, and essentially consist of a set of ideas, perceptions and own behaviors (Helmert & Knie, in Barmyer & Sachseneder, 2013). Some studies show that these differences increase when the group has a professional background, interests and experience is similar jobs (Chevrier, 2003) since this is associated with a professional identity. In a qualitative study conducted in a large automotive company in Turkey, it was concluded that the objectives of the department are the factor that most strongly influences the culture of the different departments. The culture of a department is better characterized by its objectives than by its professional culture (Barmyer & Sachseneder, 2013).

The departmental culture refers to a single department, although in comparison with other, while the silo mentality with regard to the quality of communication, integration and cooperation with other departments. Departmental culture may be a cause of the silo mentality.

Configuration of silos

Silos can be classified according to the direction in which they are disseminated among the organization's employees as vertical or horizontal (Vatanpour et al., 2013).

Literature disposes the most the silos horizontally, according to the functions that the departments perform within the organization: production, sales, marketing, research and development, etc. (Barmyer & Sachseneder, 2013, Organization, 1988). It also recognizes its vertical dimension, the view of silos as a perversion of decentralized management (Côté, 2002) and the recognition that the problem is deepened by how the power and objectives are distributed by the various hierarchical levels of the organization (Stone, 2004).

There are still organizations that are apparently more complex than typical enterprises in the private sector where economies of scale prevail and where functions are typically compartmentalized by departments. Good examples of these complex organizations are universities and hospitals. In the latter, several professional groups with different academic paths, expectations and functions, classically health care providers, managers and administrative staff, coexist within the same department (Fenwick et al., 2009). The nature of work requires very high levels of cooperation

between different professions, which is a fertile field for the proliferation of silos (AME, 1988). So, silos can have another horizontal dimension, besides the departmental function, the professional class.

Within the departments and a professional group there may be smaller silos, people who share interests, strong personal links or a certain comfort area, and who establish a preferential communication that separates them from the rest of their department (Vatanpour et al., 2013). These can be a particularly strong locking force. In keeping with the example of hospitals, situations in which internal disputes between doctors in the same department have serious consequences for the organization are not uncommon.

The silos can still arise among organizations, a good example of this is what is called organizational haemophilia, the tendency for an organization to relate and form new links with similar organizations (Bevc, Retrum, & Varda, 2015), often according to with the disciplinary or methodological silos to which they belong.

Consequences of silo mentality

The consequences of the silo mentality can be felt on several levels.

At the collaborators level

Departments where the silo mentality prevails, which can not communicate with each other and that in trying, through endless meetings, can not make any decision, produce more friction and tension than work. The time spent in this process depletes employees and tend, extreme further positions (Schütz & Bloch, 2006).

The silo mentality thus reduces the efficiency and motivation of employees. Difficulties in communication lead to error and finger pointing. Employees seeking to distance itself from the errors and reject any responsibilities to not harm credibility and potential career. In the end, all employees feel victimized (Vatanpour et al., 2013).

A wide range of physical and mental reactions to stressful situations, ranging from gastric ulcers to anxiety, asthenia and aggression, are detrimental to the health and well-being of employees. These also become the carriers of the "virus of the silos" (Schütz & Bloch, 2006), since it is they, not the departments themselves, that disseminate the behaviors. The interactions are between people, not between departments, but the consequences are felt throughout the organization.

At the organization level

As the silo mentality sets in the organization, communication difficulties arise, lack of cooperation, loss of confidence, and internal competition. Departments do not interact as part of the same organization, but as competitors following their individual goals, without considering the interaction on other departments outcomes (Barmyer & Sachseneder, 2013, Côté, 2002, Stone, 2004).

Barriers to communication promote the isolation that has a negative impact on the process as there is a lack of functional integration. This is particularly acute in organizations providing services because it compromises the ability to offer integrated solutions to customers. Employees may even be reluctant to refer clients to other services within the organization. Low-cost cooperation has costs for the organization, including time, energy and money (Vatanpour et al., 2013).

With isolation, departments begin to become more opaque and have a distorted view of the value-generating activities of other units. In a short time there will be complaints about how others work and organize, a fertile field for the flowering of all kinds of stereotypes. This same situation was evidenced by a study on interdepartmental conflicts conducted in Germany in which 300 organizations participated, comparing the internal and external perceptions of the different departments (Schütz & Bloch, 2006).

Tunnelled and self-centered vision leads to the inability to achieve common goals and increases the likelihood of duplication of efforts, as there is no coordination through collaboration (Chisita & Abdullahi, 2012). Barriers and blockages will hinder management and restrain creativity and innovation (Stone, 2004).

Not infrequently parts collide. The directors are focused on their own goals and they do not expect help from counterparts to achieve their goals, so they do not care, or do minimal effort, in coordination and cooperation with other managers. Employees are given the message that it is necessary to achieve the goals of the department and that others have to take care of themselves (Côté, 2002).

The silos decrease efficiency and this is more evident in more diverse and large organizations, where the silos are spread across business units. Breaking these barriers would generate value as it would be possible to share services, skills and systems across, encouraging good practice. Even so, the most important would be the reduction of non-productive tensions within the organization (Côté, 2002).

Implementing changes within an organization where silos proliferate is very difficult. Leaders of the business units do not have an organizational perspective as a whole and will undertake this effort in a logic of "winners and losers", this increases tension within the organization. This is because each unit tries to explain the transformations and changes only from its perspective, pointing out how its working methodologies will be affected and what the unit will need to do to make the change successful. This creates a competitive element, with unit leaders trying to be the ones who drive change faster, with less problems, and better *feedback* from hierarchical superiors (Franklin, 2014).

There is no place where the responsibilities and implications for the organization as a whole are discussed and when the various leaders join in steering meetings the changes are already under

way. This is a consequence of a very prevalent type of vision within organizations with very deep hierarchical cultures, that the organization is only the sum of the various parts and that they have to respond individually to the challenges. Any suggestion that one must have a cross-cutting and complete perspective is welcomed with little enthusiasm. The biggest problem with this individualistic view is that often the progress of one unit is made at the expense of the effectiveness and efficiency of another. It is also common to develop the same project, separately, by two business units (Franklin, 2014), which leads to duplication of costs and efforts.

In the market economy only the best products survive. For example, when an organization is not able to connect the world of engineers: development, production and logistics; with the world of sales, marketing and consumer service, it is at risk. Misunderstandings are inevitable since the worlds of engineering and business, because they have different formations, languages and objectives, are different. Nevertheless, its clarification and the establishment of collaborative bridges are fundamental, otherwise the business eventually collapses (Schütz & Bloch, 2006).

At customer level

A customer who has to deal with an organization where silos proliferate easily gets frustrated. The sales department is usually the one that deals with customers and, for example, in the presence of a quality problem, is not who designed or produced the product that interacts with the customer. Difficulties in communication and collaboration within the organization compromise the timely resolution of the customer problem. It is common client feeling like they are dealing with a divided organization (Organization, 1988), where there is a set of small powers, information blocks, and island solutions that make it difficult to solve their problem. In this situation customer probably switch to the competition (Schütz & Bloch, 2006), since he has a relation with the organization as a whole and expects consistency, regardless of the business unit with that interacts (Franklin, 2014).

SILO MENTALIDADE IN HEALTH SERVICES

In the last two decades several authors have talked about the importance of silo mentality in health care (Hajek, 2013, Kumarasamy & Sanfilippo, 2015), since the normal functioning of organizations with the complexity of hospitals requires very high levels of understanding and cooperation between professional groups with different paths and expectations (Vatanpour et al., 2013).

Causes of silo mentality in health services

The conventional medical model is based on autonomy and individualism and suggests that errors can be eradicated through these if allied with a heroic devotion to the profession. The highly hierarchical organization that stems from this model exerts power from top to bottom, focusing on technical proficiency with little reference to other capabilities such as communication or perceiving

the needs of the other. It completely ignores the fact that poor communication is the main cause of clinical errors (Bleakley, Boyden, Hobbs, Walsh, & Allard, 2006; Fletcher, McGeorge, Flin, Glavin, & Maran, 2002).

With the technical progress and the medical specialization the number of services and departments in the hospitals had a great increase. Yet the organization did not abandon the mechanistic conceptions of the nineteenth century, essentially keeping its highly rigid and hierarchical organizational matrix unchanged (Drupsteen, Van der Vaart, & Van Donk, 2013). There has never been inside a logistics chain perspective and the vast majority of general hospitals have adopted a functional organization model, built around medical specialties, mainly anatomical divisions or to segments of the population (Lega & DePietro, 2005).

The neglect of interdependence of a services, in the context of an ambiguous and complex world (Waldman, 2007), had consequences for the efficiency, cooperation and capacity of the organization's communication. The way managers deal with complexity, trying to systematically ignore or reduce it (Ashmos, Duchon, & McDaniel Jr, 2000), further deepened the problem. In this way, the separation between managers, regulators and managers is particularly problematic in health services (Waldman, 2009), resulting in silos appearance.

The rigid structure was being replicated throughout the organization, usually based on multiprofessionalism, rather than a true interprofessional collaboration, contributing to tribalisation of healthcare organizations. An example of this is the typical culture of the operative blocks, characterized by interprofessional frictions resulting from deficient communication and collaboration. This culture is transported to future health care professionals as a kind of hidden curriculum (Paige et al., 2014).

Health services are made up of special interest groups in which their members have specializations, academic backgrounds, social systems and approaches to their own work. The various differences can lead to widespread mistrust that can only be dissipated by working and mingling over time, by building relationships (Drupsteen et al., 2013).

Information silos happen in situation that data systems that do not exchange information with similar data systems (Miller & Tucker, 2014), there are a continuum of the silo mentality prevalent in services, marked by the ambiguity between willingness to share data and the desire for its concealment from other services, often seen as competitors. This situation is mirrored by the results found in a study conducted in the United States of America by Miller & Tucker. This has shown that both large hospitals and hospitals of greater specificity are more likely to share information with the outside world (Miller & Tucker, 2014).

The relationship between the two central components of health services, hospital executives and physicians, the latter as representatives of all health care providers, is explored by Waldman and Cohn (2007). They report a mismatch between the two groups that is embodied in different ways of thinking, priorities, incentives and responsibilities, and whose main causes are the different academic paths, modes of professional socialization and, ultimately, visions of the world.

For these authors providers of care health are committed to providing health care user-centered, free of any constraint. They think that they do what society wants and, as such, deal poorly with the restrictions imposed on them by the organization, managers or regulatory agents. In this way, they direct their discontent and frustration at the most tangible target: the manager (Zuger, 2004).

Executives are responsible for creating the conditions for them to be provided quality health care in a context of limited resources. Their decisions inevitably have an impact on the health care provided. Managers also have their frustrations were educated to an environment in which machines, money and people are simple means to an end and they do not realize the frustration of doctors with resource constraints (Cohn, 2005).

The balance of power in health care has changed. The increase in power and influence of managers has been accompanied by a loss of power on the part of doctors, yet both sides feel they are at the top of the pyramid. This conflict tends to be transported to the communication in a dichotomous model - us / them (Waldman, Smith, Hood, & Pappelbaum, 2006).

If doctors and executives work independently the result can only be one: silos. A problem - based structure is transported to the relationship between them and goes deeper with payment scheme that subvert the fiduciary relationship that supposedly exists between doctors and patients (Waldman & Cohn, 2007). No less important is the issue of the triple standard. Waldman (2009), with triple standard of care, summarizes the communication problems in the health services. Judge a situation by two sets of Golden Rules is called a double standard. Health outcomes are, as a rule, judged by a triple standard: that of the health professional, that of the manager, and that of the legislator. To these it might be necessary to add a fourth, the user, but the author excludes it because it is the substrate on which the system operates and not a component of the system.

Medical culture is authoritative and individualistic, discourages teamwork and is conservative. The manager's culture encourages collaboration, but places little value on scientific knowledge. The outside environment, by which the legislator is governed, is actively hostile to health services, all adverse outcomes are assumed to be due to error and the scientific evidence is used to punish. This makes health services highly risk- averse and discourages experimentation (Waldman, 2009).

Ideally the triple standard should be reduced to a single standard where evidence-based decisions, provided with effective feedback, would apply to all components of health services equally. For this, initial step is mandatory, all the arts must change their way of thinking, however this is the most difficult, as it will change all the *status quo* (Waldman, 2009) .

Consequences of silo mentality in health services

With the technical progress and the medical specialization the number of services and departments in the hospitals had a great increase. The competition between these units has increased and their unwillingness to share information, as well as the way of thinking of its employees, led to a decrease in efficiency and contributed, to the loss of trust between professionals (Langley & Warner, 1990 ; Waldman, 2007) .

The various departments and services involved in the care delivery process are focused on their internal processes and costs. There is no concern with the coordination of activities with those of other departments involved in the process. The result is a discontinuity in the flow to the users, decreasing both productivity and satisfaction (Drupsteen et al., 2013).

The consequences of the silo mentality in the health system are described, specifically in the case of the *National Health Service* , by McCartney (2016). This states that no information sharing and the separation of employees by professions leads to duplication of work without sharing the results and to the pursuit of cross-purposes, very often is all the system that encourages these behavior. And McCartneys notes "Take, for example, the worthy campaign to reduce antibiotic prescribing. Quite right: this should lead to fewer drug resistances. But there's also a campaign to recognise and treat potential sepsis earlier—with antibiotics. The two campaigns inevitably conflict". The pressures that various groups exert toward their goals are often opposites and enter into conflict. When confronted with this situation, the norm is to recognize the value of the opposite recommendation and to blame a third party for the problem (McCartney, 2016).

With technical progress and the development of health systems the risks have increased. In spite of this, user safety management, more specifically risk, quality and safety, is usually fragmented in the image of clinical services. This fragmentation in three parallel silos is due to the different genesis of the three areas (Hajek, 2013). Risk management is derived from the management of insurance and remove portions, the management of quality control and accreditation and the safety management of medical error response. Although they have in common non-necessarily clinical functions, which collect hospital data for their own use and report abroad, each one of them is traditionally managed by a different part of the hospital administration: legal, financial and medical; and embedded in a different infrastructure, which often leads to competing agendas (Hajek, 2013).

CONCLUSIONS

The silo mentality can be defined as the set of individual or group beliefs potentially causing division within an organization and whose most common result is the creation of barriers to communication and the sharing of information and the development of disjointed processes of work (Fenwick et al., 2009) .

Its causes go far beyond human nature and are a consequence, not only of the dimension and division of tasks within the organization, but also of the mechanistic model itself, rigid, hierarchical, segmented into professional groups and with insufficient channels of communication (Barmyer & Sachseneder, 2013, AME, 1988). Other important causes are leadership (in the way decentralized management is interpreted (Côté , 2002)) , and culture (given the relevance of departmental culture (Barmyer & Sachseneder , 2013)).

As for the configuration of the silos this will be essentially matrix: there are horizontal silos, corresponding to the medical and transversal services; and there are vertical silos, represented by the various hierarchical levels within the organization (AME, 1988; Stone, 2004) . There is also a transversal silo to the whole organization, represented by the inability to look outside the organization itself. Professional classes and other interest groups emerge as another horizontal dimension of the silos (Fenwick et al., 2009).

Silo mentality causes a reduction in efficiency at all organization level, difficulties in sharing information, increased challenges in adapting to innovation and commitment of its resilience (Barmyer & Sachseneder, 2013; Côté, 2002; Stone, 2004). At the employee level, the silo mentality causes fatigue, professional dissatisfaction and distrust among professionals (Schütz & Bloch, 2006). In terms of users the silo mentality can cause frustration, since the service may not have the expected quality or is not according their needs, and they may be subject to avoidable errors (Franklin, 2014; AME, 1988; Schütz , 2006) .

In health care the silo mentality is of particular importance since the functioning of complex organizations such as hospitals requires cooperation and understanding between professional groups with different paths and expectations (Vatanpour, 2013). The technical progress and medical expertise led to the increase d the number of services. However, the organization does not changed its structure, which is still organized according the medical specialties, highly rigid and hierarchical (Drupsteen , 2013; Lega, 2005). This situation had consequences for the efficiency and capacities of cooperation and communication within the organization (Waldman, 2007).

THE DOMINANT LEADERSHIP STYLES AND THEIR EFFECTIVE BEHAVIORS ON EMPLOYEES' PERFORMANCE IN THE MIDDLE EAST (THE CASE OF IRANIAN ORGANIZATIONS)

Asadi, Rahil

The Bucharest University of Economic Studies, Bucharest, Romania

ABSTRACT

The present paper is a result of an investigative and descriptive research focused on leadership performances, behavior and competencies, related to the efficacy and impact in job satisfaction, job performance, and the workers desire to change and commit. The data analysis has been managed to develop better leadership competencies inside the organization and improve the business transactions of the organization.

There is lack of literature on leadership research in Middle East countries that manages as limited the understanding of leaders' behavior under the specificity of culture and local organizational climate. Therefore, the research uses samples and data provided by the social security insurance staff organization of Tehran, Iran.

This research explores which type of leadership styles and behavior are more common in Iranian companies and how efficiently the leadership can be improved so that the organizations goals get better and faster results. The definition of objectives is followed by the methodology description and explanation on the survey done. Finally, the validity and the reliability of data explored and processed will sustain the conclusions.

Keywords: leadership style, employees' performance, leader's behavior, job satisfaction

INTRODUCTION

This paper addresses the domination of leadership behaviors and its effectiveness and influence on the employees' performances. Despite the great number of studies on leadership behaviors, styles and performances, explaining the facts in the developed industrial countries from Europe and North America, there are very few that analyze the situation in the Middle East where the organizational culture is part of the local traditions and specific working environment. Therefore, the present study is centered on the Middle East countries' experience, especially that one from Iran.

The investigative research springs from the necessity to analyze and improve the employees' performance and managers' decision. The impact of leadership in business development is still

debatable; according to some researchers there is still a high necessity of enhancing the leadership capability and competencies to improve the impact on the employees' work and their quality performances and use the results as a powerful tool to increasing investment (Wood C.E, *et al.*, 2015). However, as a first step, we need to know more on the effectiveness of dominant leadership behavior and the necessity of developing the leadership competencies especially in the countries with different culture.

The main objectives of the research are directed to develop the perspective on behavioral change models in a leaderships' role and business development, based on solid documentations. They concern:

- the contrast and the comparison of the dimensions and effectiveness of the leadership competencies in the organization and business activities.
- the identification of the most appropriate definition of the employee's perception, the expectation of leadership behavior and the factors linked to the leadership's role and its performance in the organization.
- the study of the relationships between leaders' behavior and the performances of the employees' job and the degree of their satisfaction inside the organization.
- the identification of evidences for effective developing, of the influence of culture and the organization's climate against the leaders' behavioral inside the organization.
- the assessment and evaluation of the desire of both employees and establishments to identify and implement the change.

Based on the research objective, the study falls into three categories: 1) basic 2) applied and 3) research and development. The data used are both descriptive and experimental.

The experimental part of the study analyses the relationship between cause and effect between two or more variables examined while the descriptive part includes a collection of methodologies used to describe better the conditions and the phenomena investigated.

The implementation of the descriptive research may be done merely in order to gain better understandings about the existing situation or help the decision making process, (Saris & Gallhofer, 2014).

The library method was used for documentation and literature review and the questionnaire survey method helped to gathering the information about the studied variables.

The research size of investigation is of 300 persons, social security insurance staff of Tehran organization. The accurate determination of the sample size has been a very important factor in extending the test results to the whole community. There are several techniques for sample size determination, but the most accurate methods are mathematical ones. (Stride, 2008). Whereas the

statistical population framework of the study was limited as well as being in reach, Cochran statistical sample size formula was used to assess the sample size which selected in this research.

The most important data gathering methods which are used in this study are as follows: a) library studies to define the theoretical principles (Stride, 2008); b) field study to collect data and answers. Knowledge, interests, attitudes and believes of individuals related to specific issues have been evaluated through the questionnaire (Saris & Gallhofer, 2014). The questionnaire contains two categories of question: *general* questions (4) to pick up demographic information about the respondents - age, gender, education, work experience and *specific* questions (28 related to the executive leadership style, 18 to examine the employees' desire of change and 11 questions to study their organizational trust (Walker, 2012). *Five-item Likert Scale* was used to design the questionnaire.

IMPLEMENTATION AND ANALYZING OF THE RESEARCH

According to the subject, a statistical sample of employees' has been selected among the social security staff (Tehran). Once the number of samples determined and the questionnaires fulfilled, the information obtained was process using SmartPLS and SPSS19 software. The number of valid collected questionnaires was 170. Since the present study is a survey one, the descriptive and inferential statistical methods were carried out in order to process and analyze the data. SPSS and SmartPLS software were used. (Hair, 2016).

1. *Descriptive statistics*: In this analysis method, the collected data are summarized and classified using descriptive statistical criteria. In other words, in the context of descriptive analyzing method, researchers first summarize the collected data through the prepared frequency distribution tables, then display them, with the help of graphs, and eventually summarize them using other descriptive statistics criteria (Sholihin, 2009).

2. *Inferential statistical method*: In comparative analysis approach, collected data is analyzed in a descriptive manner, and moreover, it will be compared with each other (Vinzi, 2010). After filling out the questionnaire and doing the codifying process, the generated codes were transferred to a computer and were analyzed using SPSS and SmartPLS software. Given that, the *Likert* scale formula was used to examine and assess the workers' attitude and the *Cronbach's alpha* coefficient used to evaluate the reliability and validity of the questionnaire.

Data analysis was done through both the descriptive and inferential statistical methods. In the descriptive statistics, the researcher, first, characterize the statistical population using descriptive statistics index, and then, describes the data with the help of charts and statistical tables and other related indicators of the situation.

According to the inferential statistical approach, after determining the distribution of the variables over the community level, the researcher made the structural equation modeling using *SmartPLS* software and *Kolmogorov -Smirnov tests*, *two-sample T-test* and *Average comparison test of community (ANOVA)*, in order to carry out the hypothesis test (Hair, 2016).

The main hypothesis:

H_0 = Normal distribution. The Leadership style has no positive and significant impact on the desire to efficacy change in social security insurance (Tehran).

H_1 = Not Normal distribution. The Leadership style has a positive and significant impact on the desire to efficacy change in social security insurance (Tehran).

The first hypothesis:

H_0 = Normal distribution. The Humility has no positive and significant impact on the desire to efficacy change in the social security insurance (Tehran).

H_1 = Not Normal distribution. The Humility has a positive and significant impact on the desire to efficacy change in the social security insurance (Tehran).

The Second hypothesis:

H_0 = Normal distribution. The kindness has no positive and significant impact on the desire to efficacy change in the social security insurance (Tehran).

H_1 = Not Normal distribution. The kindness has a positive and significant impact on the desire to efficacy change in social the security insurance (Tehran).

The Third hypothesis:

H_0 = Normal distribution. The Reliability has no positive and significant impact on the desire to efficacy change in the social security insurance (Tehran).

H_1 = Not Normal distribution. The Reliability has a positive and significant impact on the desire to efficacy change in the social security insurance (Tehran).

The fourth hypothesis:

H_0 = Normal distribution. The Service has no positive and significant impact on the desire to efficacy change in the social security insurance (Tehran).

H_1 = Not Normal distribution. The Service has a positive and significant impact on the desire to efficacy change in social security insurance (Tehran).

The fifth hypothesis:

H_0 = Normal distribution. The Leadership style has no positive and significant impact on the desire to Organizational Trust in the social security insurance (Tehran).

H_1 = Not Normal distribution. The Leadership style has a positive and significant impact on the desire to Organizational Trust in the social security insurance (Tehran).

The Sixth hypothesis:

H_0 = Normal distribution. The Organizational Trust has no positive and significant impact on the desire to efficacy change in the social security insurance (Tehran).

H_1 = Not Normal distribution. The Organizational Trust has a positive and significant impact on the desire to efficacy change in the social security insurance (Tehran).

The Seventh hypothesis:

H_0 = Normal distribution. The Leadership style has no positive and significant impact on the desire to efficacy change by organizational trust in the social security insurance (Tehran).

H_1 = Not Normal distribution. The Leadership style has a positive and significant impact on the desire to efficacy change by organizational trust the in social security insurance (Tehran).

HYPOTHESIS RESULTS

The main hypothesis: the leadership style has a positive and significant impact on the desire to efficacy change in social security insurance. The path between two latent variables is recognized using significant z coefficient (3.481) which is significant in effect size of leadership on tendency to change in employees (F. Hair, 2016).

Standardized value of the coefficient for the path from leadership style to the tendency to change in employees is (0.391), indicates that the leadership style variable includes the 39.1% of the variability in tendency for the change in employees. So, at the insurance level of 95%, according to the results of the following table and given that the t-statistic is greater than 1.96, we can say that the main hypothesis is accepted and dynamic leadership style has a positive and significant impact on the tendency to change in employees' of social security insurances (Tehran).

The main Hypothesis	Path coefficient	t	Test result
The Leadership style in the organization has a positive and significant impact on the desire to efficacy change in social security insurance (Tehran).	0/391	3/482	Accepted

The First hypothesis: Service has a positive and significant impact on the desire to efficacy change in social security insurance (Tehran).

The path between two latent variables is recognized using significant z coefficient (1.386) which is significant in effect size of leadership on tendency to change in employees.

Standardized value of the coefficient for the path from leadership style to the tendency to change in employees is (-0.200), indicates that the leadership style variable includes the 20% of the variability in tendency for the change in employees. So, at the insurance level of 95%, according to the results of the following table and given that the t-statistic smaller than 1.96, then we can say that the first hypothesis

is rejected and Service has a no positive and significant impact on the tendency to change in employees' of social security insurances (Tehran).

Hypothesis 1	Path coefficient	t	Test result
The service has a positive and significant impact on the desire to efficacy change in social security insurance (Tehran).	-0/200	1/386	Rejected

The Second hypothesis: Humility has a positive and significant impact on the desire to efficacy change in social security insurance (Tehran).

The path between two latent variables is recognized using significant z coefficient (1.326) which is significant in effect size of Humility on tendency to change in employees. Standardized value of the coefficient for the path from Humility to the tendency to change in employees is (0.196), indicates that Humility variable includes the 19.6% of the variability in tendency for the change in employees. So, at the insurance level of 95%, according to the results of the following table and given that the t-statistic smaller than 1.96, then we can say that the Second hypothesis is rejected and Humility has a no positive and significant impact on the tendency to change in employees' of social security insurances (Tehran).

Hypothesis 2	Path coefficient	t	Test result
The Humility has a positive and significant impact on the desire to efficacy change in social security insurance (Tehran).	0/196	1/326	Rejected

The Third hypothesis: Reliability has a positive and significant impact on the desire to efficacy change in social security insurance (Tehran).

The path between two latent variables is recognized using significant z coefficient (1.102) which is significant in effect size of Reliability on tendency to change in employees. Standardized value of the coefficient for the path from Reliability to the tendency to change in employees is (0.149), indicates that the leadership style variable includes the 14.9% of the variability in tendency for the change in employees. So, at the insurance level of 95%, according to the results of the following table and given that the t-statistic smaller than 1.96, then we can say that the Third hypothesis is rejected and Reliability has a no positive and significant impact on the tendency for change in employees' of social security insurances (Tehran).

Hypothesis 3	Path coefficient	t	Test result
The Reliability has a positive and significant impact on the desire to efficacy change in social security insurance (Tehran).	0/149	1/102	Rejected

The Fourth hypothesis: Altruism has a positive and significant impact on the desire to efficacy change in social security insurance (Tehran).

The path between two latent variables is recognized using significant z coefficient (0.382) which is significant in effect size of Altruism on tendency to change in employees. Standardized value of the

coefficient for the path from Altruism to the tendency for change in employees is (-0.037), indicates that Altruism variable includes the 3.7% of the variability in tendency for the change in employees. So, at the insurance level of 95%, according to the results of the following table and given that the t-statistic smaller than 1.96, then we can say that the Fourth hypothesis is rejected and Altruism has a positive and significant impact on the tendency for change in employees' of social security insurances (Tehran).

Hypothesis 4	Path coefficient	t	Test result
The Altruism has a positive and significant impact on the desire to efficacy change in social security insurance (Tehran).	-0/037	0/382	Rejected

The Fifth hypothesis: leadership style has a positive and significant impact on the Organizational Trust in social security insurance (Tehran).

The path between two latent variables is recognized using significant z coefficient (19.999) which is significant in effect size of leadership on the tendency to Organizational Trust. Standardized value of the coefficient for the path from leadership style to the Organizational Trust is (0.669), indicates that the leadership style variable includes the 66.9% of the variability in tendency for the change in employees. Hence, at the insurance level of 95%, according to the results of the following table and given that the t-statistic greater than 1.96, then we can say that the Fifth hypothesis is accepted and dynamic leadership style has a positive and significant impact on the Organizational Trust of social security insurances (Tehran).

Hypothesis 5	Path coefficient	t	Test result
The Leadership style has a positive and significant impact on the Organizational Trust in social security insurance (Tehran).	0/669	19/999	Accepted

The Sixth hypothesis: Organizational Trust has a positive and significant impact on the desire to efficacy change in social security insurance (Tehran).

The path between two latent variables is recognized using significant z coefficient (0.460) which is significant in effect size of Organizational Trust on tendency to change in employees. Standardized value of the coefficient for the path from Organizational Trust to the tendency for change in employees is (-0.057), indicates that the leadership style variable includes the 5.7% of the variability in tendency for the change in employees. So, at the insurance level of 95%, according to the results of the following table and given that the t-statistic smaller than 1.96, then we can say that the Sixth hypothesis is rejected and Organizational Trust has a no positive and significant impact on the tendency for change in employees' of social security insurances (Tehran).

Hypothesis 6	Path coefficient	t	Test result
The Organizational Trust has a positive and significant impact on the desire to efficacy change in social security insurance	-0/057	0/460	Rejected

(Tehran).			
-----------	--	--	--

The Seventh hypothesis: leadership style has no positive and significant impact on the desire to efficacy change by Organizational Trust in social security insurance (Tehran).

The Coefficients 0.669 and 0/057 shows leadership style by Organizational Trust, 3/8% (0/669*0/057) has a positive and significant impact on tendency to change in employees. The Fifth hypothesis and The Sixth hypothesis are shows the leadership style has a positive and significant impact on the Organizational Trust in social security insurance organization and the Organizational Trust has no positive and significant impact on the desire to efficacy change in social security insurance (Tehran). We can say that the Seventh hypothesis is rejected and dynamic leadership style has a no positive and significant impact on the tendency to change in employees' of social security insurances (Tehran).

Hypothesis 7	Path coefficient	t	Test result
The Leadership style has a positive and significant impact on the desire to efficacy change by Organizational Trust in social security insurance (Tehran).	0/669 -0/057	19/999 0/460	Rejected

CONCLUSION

The research result could become a useful and practical framework, able to provide information for the managers and leaders, to have the effective developing at the leader's competencies in the organizations and business transactions and give a new orientation of the leadership role in the organizations.

The most important results of effective development of the leadership competencies are doing the best change in the employees' performance at the organization for finding out the significant effects of executive leaders' competencies in leading the employees along with the business strategies, and ultimately increase their potential and abilities to achieve goals and aims of the organization.

Furthermore the research method and results can be used and duplicated for other researches in this field to verifying the similarity of leadership behavior and the existing style in the prosperous organizations in different countries of the Middle East or in comparative analyzes with the companies from different European countries.

SOCIAL MEDIA AND MARKETING STRATEGY IN EDUCATIONAL SERVICES

Athanasopoulou, Pinelopi¹; Giovanis N., Apostolos²

¹Sports Organization & Management Department, University of Peloponnese, Sparti, Greece

²Business Administration Department, University of West Attica, Athens, Greece

ABSTRACT

With the advent of social media and the critical role played by consumer generated content for all types of businesses, there is a need to use social media effectively in marketing strategy. The purpose of this study is to analyse the way educational service firms use social media in their marketing strategy. Data is collected through in-depth, personal interviews of key informants in 5 private colleges. Results show that 4 out of 5 have a social media manager whereas all businesses use various measures of effectiveness of social media use. Also, all firms promote their services through social media and provide information about old or new services. Furthermore, most firms cultivate intimate relationships with customers through social media and handle customer complaints. Only one rewards customers for their loyalty, and two use a customer group or Facebook hub page to manage customer relationships. Finally, no firm uses social media formally for new service development purposes. However, 4 businesses channel customer-supplied information to the appropriate departments for use in designing future services and forming long-term strategy. This study extends findings into the way social media use can be formally incorporated into marketing strategy. However, it is limited to a small number of cases in one service industry. Managerial implications are provided.

Keywords: social media, marketing strategy, educational services, consumer generated content, buyer-seller relationships, crm, co-creation, colleges

INTRODUCTION

Social Media (SM) is defined as “a group of internet-based applications that build on the ideological and technological foundations of Web 2.0, and that allow the creation and exchange of user generated content” (Kaplan & Haenlein, 2010, p. 61). SM platforms include Facebook, Twitter, LinkedIn, YouTube, Instagram as well as commerce communities (e.g. Amazon) and blogs and discussion forums (Agarwal & Yiliyasi, 2010). SM also include business networks; photo-sharing platforms; social gaming; microblogs, and chat apps (statista.com, 2017). The power of social networking is such that

the number of worldwide users is 2.46 billion in 2017 and is expected to reach some 2.95 billion by 2020, around a third of Earth's entire population (statista.com, 2017). Facebook is the most popular social medium with 2.06 billion users worldwide (statista.com, 2017).

As the penetration and use of social media increases rapidly around the world, firms realise the importance of incorporating social media into their marketing strategy. First, companies increasingly use social media as part of their promotional campaigns to educate customers and create strong brand reputations (Nevin & Torres, 2012). Also, social networks serve as platforms of customer relationship management (CRM) and are used to enhance relationships with customers (Saperstein & Hastings, 2010; Wright et al., 2010). Finally, since social media enable two-way communication with customers, they also enable and enhance the co-creation process of products and services with customers through the integration of user-generated content in the development process. However, there is limited research on how social media can be integrated into all aspects of marketing strategy and researchers emphasize that in the new millennium the role of the internet and digital technology in marketing strategy are themes that require more research (Celuch & Murphy, 2010; Day, 2011). Also, the educational industry is oriented towards the young generation that is particularly active on social media. Therefore, it is very important for educational establishments to include the use of social media in their marketing strategy. The objective of this study is to analyse the way educational service firms use social media in their marketing strategy and especially in three important areas: interactive communication with customers; customer relationship management (CRM) practices and actions aimed at encouraging customers to take part in the development of new services.

The paper is structured as follows. First, we begin with a literature review on the role of social media in marketing strategy, then we present the methodology used; third, we explain the results and finally we conclude with managerial implications, limitations and suggestions for further research.

LITERATURE REVIEW

Social media have become a rapidly growing, global phenomenon the past several years. In late 2014, there were 1.35 billion Facebook users, 284 million Twitter users, 1 billion Youtube users, and 332 million LinkedIn users (www.statista.com). Businesses and their marketers are increasingly viewing social media as an additional marketing channel through which they can communicate or interact with their customers and prospective customers (Gummerus et al., 2011; Stelzner, 2013). In the marketing context, social media are seen as a phenomenon that is potentially heralding a paradigm shift (Hanna et al., 2011). Wu et al, (2013) stress that although Facebook and Twitter were traditionally designed to connect people, express opinions and re-kindle real life social relationships, they are now used widely as a marketing tool to gain brand awareness or obtain customer feedback.

Many researchers conclude that social media is an online platform which enables customers to create and share content; communicate with one another, and build relationships with other customers (Gordon, 2010; Hennig-Thurau et al., 2010; Libai et al., 2010). The value of social media for marketing is already high and increasing with a fast pace. Smith (2009) classifies social networking as a global phenomenon that is spreading around the world and becoming an important marketing tool. The use of social media is an effective way to engage people and provide them with value (Hudspeth, 2012; Asley & Tuten, 2015) and can provide many tangible benefits for businesses, such as reaching a wide array of customers beyond geographical constraints (Wright et al., 2010), enhancing service quality, facilitating timely and cost-effective research, building and enhancing databases, and reducing costs (Barnes, 2010), improved sales; accelerated new product adoption; higher customer retention or enhanced customer relationships (Harris & Rae, 2009; Maddock & Vitón, 2009).

Consequently, companies try to incorporate social media into their marketing effort by engaging customers on social media in different ways including interactive communication as part of their promotional mix; actions related to the development and nurturing of customer relationships and the exchange of ideas and information regarding new products and services (Hutton & Fosdick, 2011).

Social media have been included in the promotional mix of companies and are considered to be an important marketing channel for many large global brands (Nevin & Torres, 2012; Papasolomou & Melanthiou, 2012). Mangold & Faulds (2009) consider social media to be a hybrid element of the promotion mix in that it combines some of the characteristics of traditional IMC (Integrated Marketing Communications) tools with a highly magnified form of word-of-mouth communications. When marketers discussed word-of-mouth before social media existed, they would talk about how one customer could influence scores of other customers. Now with electronic word-of-mouth (eWOM) created through social media, one customer can influence thousands of people (Bowen, 2015).

Apart from their promotional role, social media can help marketing strategy in two other very important areas. First, social media help to improve communication with customers and through continuous interaction lead to customer intimacy (Saperstein & Hastings, 2010). So, firms can use social media to create intimate relationships with customers (Wright, 2010). If we consider that the development of close, mutually beneficial relationships with customers is considered to be a competitive advantage in today's market and leads to more loyal customers, we can safely conclude that firms who are successful in using social media for CRM purposes will enjoy more loyal customers and become more competitive (Harrigan et al., 2015).

Furthermore, another important area where social media can be used is in the development of new products and services. The ability of consumers to interact with businesses across a variety of digital platforms; mobile; tablet, laptop and so on, and the growth of consumer generated material through

these platforms has created the potential for businesses and brands to research and then use consumer generated content (Quinton, 2013). Therefore, firms cannot neglect the valuable opportunity to utilize social media to communicate and co-create with consumers (Kane and Fichman, 2009). Kao et al (2016) argue that social media can be used as a platform for firms to co-create with consumers and propose a 5-stage process model of social-media-based co-creation. However, there is no research on how companies use social media for new service development.

In summary, although the use of social media provides many tangible benefits for businesses (Wright et al., 2010; Barnes, 2010; Harris & Rae, 2009), researchers note that there is an absence of studies on social media strategy, even in the B2C context, (Ngai et al., 2015; Keegan & Rowley, 2017) and that the knowledge base regarding social media use in organisational settings needs further development (Ngai et al., 2015). Therefore, the business use of the internet and digital environments including social media (Celuch & Murphy, 2010) and the role and centrality of digital technology in marketing strategy (Chang et al., 2002; Day, 2011) are themes highlighted as deserving further research.

In the area of educational services, the use of social media is particularly important since students are part of the younger generation that is highly active on social media. Universities and other educational establishments around the world encourage the engagement of students and alumni in social media through the use of social media pages and groups, blogs, forums, communities etc.

This study aims to analyse the way private colleges use social media in their marketing strategy and more specifically in three major domains: in the communication effort as part of the promotional mix; in customer relationship management and for new service development purposes.

METHODOLOGY

This study is qualitative in nature, aiming to develop a better understanding of how service firms use social media in their marketing strategy. A total of 5 case studies were included in the study involving 5 private colleges that operate in Athens, Greece but also have international affiliations. The ultimate objective of the study is to identify the differences and similarities between the different companies in their use of social media in marketing strategy. Data collection was done with in-depth, personal interviews of employees based on a semi-structured questionnaire. A key informant was used in each business that was either responsible for social media use or the one more closely working on this area. Three areas of social media use were analysed: interactive communication; development of customer relationships, and the development of new services. The interviews were tape-recorded and transcribed in order to retain the rich information provided by respondents. Also, the interviewer analyzed all secondary materials related to the respondent organisations (reports, web site, social media pages, brochures etc.) in order to identify their social media practices and triangulate data.

Data was analysed with thematic content analysis (Holsti, 1969). Using an inductive approach, i.e. moving from data to the development of theory (Kerlinger, 1986), data from each interview was first analysed separately. Then the data from all interviews was tabulated and compared in order to identify similarities and differences between businesses.

RESULTS

All 5 colleges use Facebook, 4 use Twitter, 3 use Google+ and 2 of them also use youtube. Finally, 1 of them uses either LinkedIn, Instagram, Flickr or Tumblr. Facebook is considered as the most effective medium for the colleges mainly due to the high engagement of users and for effective targeting since colleges target students who are among the heaviest users of social media. One respondent emphasized this point by saying that *"Facebook is a well-known and proven communication tool and provides ideal targeting for us since we target students"*. YouTube is used for showing videos and campaigns of the colleges and is powerful due to sound and image properties. To complement the use of social media, all 5 colleges use their own web site and two of them also have their own blogs. Also, some of them use educational; political; informational; and other websites for promotion; google adwords; google campaigns, SEO techniques; email campaigns, and online listings.

Four colleges have a social media manager although only 3 of them are trained for this job. Also, one business outsources to an advertising agency that works closely with the Integrated Marketing Communications Department of the College. Social media managers manage content and links posted on the different media pages, design and implement social media and online marketing campaigns and interact with people on social media.

Furthermore, three of the colleges use social media to inform customers about the educational programs available and the new programs developed. As a respondent emphasized *"..the offered programs are posted in our Facebook page and a link to our site is attached for further information"*. Also, 4 of them use social media for handling complaints and nurturing a relationship with customers. Only one business rewards customers for their loyalty through social media, one has a customer group on social media and another uses its page on Facebook as a hub or meeting place between students, teachers and alumni. As the manager says *"Our page on Facebook serves as a hub where students, teachers, alumni and prospective students can meet and exchange information on the School, not only regarding academic programs but also anything else that the school does such as seminars, new cooperations, events etc"*.

None of the colleges use social media formally for NSD. However, in 4 of the five businesses information from customers is channelled to the organisation and helps in designing future services and forming long-term strategy. Any ideas that are provided through interaction with customers on social media are evaluated by the departments of the business and if deemed valuable, they are used in the future. As a respondent characteristically said, *"Feedback from our fan base is evaluated by the*

relevant departments of our firm and all valuable information is used for setting our long-term strategy”.

However, there is no specific strategy for exploiting social media for NSD purposes.

All colleges evaluate social media statistics such as clicks, impressions, likes etc. and one of them outsources that service to a media company. Furthermore, one college uses Facebook Insights and measures how many people are engaged in Facebook Applications where prospective students can answer carefully targeted questions, communicate with the college and express interest for a specific academic program. Finally, another business evaluates the increase of involvement in events or meeting days organised, gets prospective students to indicate where they learned about the college, monitors the number of engaged users on Facebook and the number of visitors on the college's website. As the respondent very pointedly commented *“The effectiveness of social media use also has a qualitative side. The increase in engaged users and the communication of the college's advantages, through social media and the overall online presence of the school, enhances awareness and creates a continuous communication channel with target customers and our students throughout the year”.*

DISCUSSION & MANAGERIAL IMPLICATIONS

The most commonly used social medium is Facebook with Twitter and Google+ in second and third position. However, in the educational industry some businesses also use Youtube. Furthermore, the use of social media is complemented by the use of a firm's own site; other industry-related sites or their own blogs. These results show that managing the digital presence of a company is a complex task and therefore, there is a need to formalise this process and integrate the information supplied and the message sent across all digital media. Therefore, businesses should aim to develop an integrated digital marketing communication strategy.

Also, it seems that firms should add a social media manager to their employees that is adequately trained and understands the values of the brand and how to interact with customers. Previous research has shown that when there is no person responsible for social media or when this job is an entry-level position, customer relations and brand reputation suffer (Lepp, 2015). Also, other researchers show that if there is a lack of appropriate and dedicated personnel for social media, the firm cannot successfully implement its social media marketing strategies (García-Morales et al., 2014; Choi & Theoni, 2016).

Furthermore, results show that social media are used for promotional reasons, for communicating with customers and developing close relationships and for generating new service ideas or suggestions for service improvements. However, again their use is not formally integrated into marketing strategy and in some cases, it is also limited. For example, few businesses have a customer club or customer group on social media or reward customers for their loyalty through social media.

Also, none of the colleges purposefully use social media for new service development purposes. It seems that interactive communication, customer relationship management and co-creation should be managed together as part of the marketing strategy of the firm because they are interrelated. An increase in interactive communication helps in developing and nurturing relationships with customers. Such customers are more loyal and less likely to switch to another provider. Also, such customers can be approached through social media for new service idea generation.

Finally, the measurement of social media effectiveness is widespread but varies in intensity and mode (quantitative and qualitative measures). However, the selection of measures also differs between businesses. Also, we see no evidence of firms using social media metrics that improve outcomes such as brand awareness, brand loyalty, or positive WOM. A lack of these outcome metrics suggests that social media use is not a strategic decision and therefore, they are not used as a strategic tool (Choi & Theoni, 2016). As a result, firms should incorporate the use of social media into their strategy and start using more outcome oriented metrics.

LIMITATIONS & SUGGESTIONS FOR FUTURE RESEARCH

This study extends findings into the way the use of social media can be formally incorporated into marketing strategy. However, it is limited to a small number of cases in one service industry. Future research can extend the sample and do quantitative studies in order to validate and extend findings. Furthermore, future studies can analyse more deeply the way social media are used in all areas of the services marketing mix.

METHODOLOGICAL ISSUES IN PATIENT SATISFACTION

ASSESSMENT: SOME RECOMMENDATIONS

Azevedo, António

Management Department, School of Economics and Management, University of Minho, Braga, Portugal

ABSTRACT

This paper aims to discuss the methodological issues regarding the evaluation of patient satisfaction in order to highlight some aspects that need improvement. This study made a compilation of the most frequent used questionnaires and classified the dimensions measured. All methodological issues and sources of bias reported by authors were acknowledge and discussed. Recommendations are made in order to mitigate all types of bias. Capturing the voice of the patient/client is an essential element of policy planning which can influence the quality improvement policies and provides an opportunity for organizational learning and improvement of the ability to retain/attract patients.

Keywords: patient satisfaction assessment; measurement errors; methodological bias; healthcare assessment scales; health units' management.

INTRODUCTION

Several authors have made systematic analysis providing us useful recommendations about patient satisfaction measurement (Sitzia, 1999; Reeve et al. 2013; Shirley, Josephson and Sanders, 2016). Nevertheless, this paper aims to complement that work by updating the discussion of several aspects that can influence the expectations and the perceptions of the quality of care.

Nowadays the task of assessing patient satisfaction is still facing some barriers and inhibitors, which cause systematic distortions (Carlucci, Renna and Schiuma, 2013). For example: a) lack of cognitive skills of older patients to answer long questionnaires- which means that sometimes the questionnaire is answered by patient's relatives who are not aware of all relevant incidents occurred during the whole stay; b) lack of time- patients are hurrying to leave the hospital, so they rate their perceptions, not based on conscious and completely honest evaluations, but based on heuristics, influenced by halo or recency effects; c) lack of privacy and anonymity- which may inhibit criticisms because patients are afraid of future negative consequences.

LITERATURE REVIEW

“Healthcare quality” and “patient satisfaction”, “perception” or “experience” are often used interchangeably in the research literature (Beattie et al, 2014). Healthcare is a multidimensional concept, which has different meanings depending on: culture, time of analysis, type of focus in process, structure or outcome or type of target population (patients, relatives, healthcare personnel, administrators or politicians). Several studies confirmed that patient experience is positively associated with patient safety and clinical effectiveness (Brundage et al, 2013). For example, Doyle et al (2013) analyzed 55 studies which demonstrated positive associations between patient experience and self-rated and objectively measured health outcomes; adherence to recommended clinical practice and medication; preventive care (such as health-promoting behavior, use of screening services and immunization); and use of resources (such as hospitalization, length of stay and primary-care visits).

The English National Health Service (NHS) based its assessment in the following dimensions of patient experience: respect, information, communication, physical comfort, emotional support, and access to care (Ahmed, Burt and Roland, 2014). Later Larsson and Larsson-Wilde (2010) made also a very important contribution when they proposed their theoretical framework.

In this paper, the other variables related with the professional groups or other players rather than patients were not included in the analysis. For example, issues related with job satisfaction, burnout, participation of doctors and nurses in education/formation programs, dissatisfaction with salary/wages, financial incentives, rewards indexed to quality and satisfaction, or pay-for-performance schemes (Llanwarne et al, 2013). Moreover, this paper will not be focused in the unintended consequences or managerial implications of patient satisfaction assessment. According to Zgierska et al (2014) the patient satisfaction survey utilization may promote, under certain circumstances, job dissatisfaction, attrition, and inappropriate clinical care among some physicians (including unnecessary antibiotic and opioid pain medication prescriptions, tests, procedures, and hospital admissions). This is concerning, if data from patient experience of care surveys are perceived by physicians as a punitive tool regarding compensation or other negative professional consequences, violating clinicians’ sense of professional integrity.

Since the early years of the development of the quality control theory, scholars and practitioners have widely discussed the constructs and dimensions, which are relevant for health care and hospitals.

Grøndahl et al (2013) developed a model proposing three types of predictors of patient satisfaction: 1) person-related conditions, 2) external objective care conditions and 3) patients’ perception of actual care received. Interestingly, some studies report that treatment satisfaction may rely more on the patient’s perception of met expectations rather than objective medical outcomes.

According to Rathert et al (2015), patient-centered care has often been conceptualized as consisting of eight dimensions: 1) Respect for patients' preferences, values and expressed needs; 2) Coordination and integration of care and services; 3) Information, education and communication; 4) Physical comfort; 5) Emotional support; 6) Involvement of family and close others; 7) Continuity and transition from hospital to home; and 8) Access to care and services.

More recently, Beattie et al (2014), developed a systematic review protocol and utility critique of measurement instruments proposing the following criteria for selection of most adequate instrument: validity, reliability, educational impact, cost efficiency and acceptability.

Qualitative research also offers a variety of methods for identifying what really matters to patients and carers (Pope, van Royen and Baker, 2002). Several methods can be used: individual face to face interview, focus groups, exploration groups, "quality circles", observation based, and narrative based medicine. Although these methods provide deep insights about the expectations and motivations uncovering issues or concerns that had not been anticipated or considered by the researchers, they also have disadvantages because the patient participation is not anonymous. Nevertheless, quality managers will always need to have quantitative support based on higher response rates. Anthoine et al (2014) remembered the need of a priori justification and adequacy of the sample dimension.

The levels of missing data may be correlated with the education level, because patients with higher literacy are used to completing forms. Other aspects related with the design of the instrument (specially the overall length), may decrease the response rates. In order to minimize this problem, response rates can be increased because new developments in technology allow that surveys can be conducted through mobile apps in patients' smartphones, through online surveys, or through the use of handheld devices or kiosks to get real-time feedback (Stoyanov et al, 2015).

This paper provides a compilation of the more relevant measurement tools presented in Appendix 1 Appendix . Moreover, in the literature you will find two types of assessment methods: a) patient reports: patients describe what happened with a Yes/No answer; and b) patient evaluation: patients rate/evaluate their experience (e.g. with a four points Likert scale from very bad to very good).

MEASUREMENT ERRORS, BIAS RESULTING FROM METHODOLOGICAL ISSUES

According to research theory, besides expected random errors associated to sampling there can be several types of systematic errors:

- 1) *Measurement errors from systematic bias* related with: information processing; response and non-response bias; design of questionnaire/ scale items; interviewer; and requested information insufficient for assess the construct. For example, regarding non-response bias, floor and

ceiling effects must be investigated by inspection of the number of respondents validating extreme response categories expressed as a proportion of valid responses obtained (Groves and Peytcheva, 2008)

- 2) Sampling/research design: population specification; respondents' selection procedure. Ratings may be influenced by respondent characteristics (age or educational attainment), by patient's expectations, or by socio- psychological phenomena, such as self-interest, the Hawthorne effect (refers to a situation in which an individual's behavior is altered by the observation itself) (Leonarda and Masatu, 2006) or gratitude. For example, patients report more negative experiences if there are higher proportion of younger patients, ethnic minorities, and patients living in more deprived areas (Ahmed, Burt and Roland, 2014).
- 3) Situational factors: timing of assessment: patients tend to be more satisfied only weeks after discharge and it may also depend on patient illness and recovery (Crow et al, 2002). In-patients are more willing to answer more positively than they would if they answered the questionnaire after discharge. Obstetric patients (young mothers of new born children) are more prone to collaborate while a higher waiting time for administrative discharging may induce a negative mood and refusal to answer.
- 4) Cognitive/memory related bias such as: the recency effect (Baddeley and Hitch, 1993); primacy effect; response order effect (Vriens et al, 2017); amount of information, type of information and mode of presentation (Latorre-Postigo et al, 2017). According Vriens et al (2017, p.221) "primacy refers to an increased preference for items listed in the beginning of the set whereas recency implies higher preferences for items listed last, regardless of the content of the items presented first or last". Latorre-Postigo et al, (2017) concluded that the greater the number of recommendations, the lower the recall; visual presentation does not enhance verbal presentation; lifestyle information is recalled better than medication information; after ten minutes, the percentage of memory decreases significantly; and finally the first and last recommendations are better remembered.
- 5) Other external objective care conditions may have a strong influence on the ratings due to a negative halo effect. For example, critical conditions such as sharing a room versus sleeping alone, having to spend the night in a corridor bed, repeated admissions (Grøndahl et al, 2013) or other adverse events and critical incidents (Agoritsas, Bovier and Perneger, 2005).

CONCLUSIONS AND IMPLICATIONS FOR PRACTICE

In general, the majority of studies provided evidences that the perception of interpersonal-based medical service encounters positively influences service quality and patient satisfaction (Carlucci,

Renna and Schiuma, 2013; Chang, Chen and Lan, 2013). The perception of service quality among patients positively influences their trust which in turn positively influences their satisfaction.

However, this paper aims to provide some recommendations focused in the methodological issues only:

- A few minutes should be spent informing the patient about the purposes of the questionnaire, assuring their privacy and anonymous status by all means (Carlucci, Renna and Schiuma, 2013).
- The healthcare assessment implies the measurement of functional/tangible aspects and relational/intangible assets. The relational issues are related with emotions and feelings, which may be difficult to translate into a scale measure due to their volatility.
- The collection of multi-item health status measures can be time consuming, expensive, and overwhelming. Several comparative analyses demonstrated that single item questions can be a reliable and valid alternative (Cheung and Lucas, 2014) in order to increase the response rate and fit the narrow time window of patient collaborative mood.
- Non-intrusive digital gamified methods (Johnson et al, 2016) may also help to achieve the adequate sample dimension, which must be designed according to survey objectives (Anthoine et al, 2014).
- Quality managers should provide the means to capture all the hidden dissatisfaction and latent negative sentiments amongst patients.
- Hospitals must manage all the claims and micro-crises with responsiveness giving feedback to the patient. Unsolved problems will generate negative electronic word-of-mouth (eWOM) (Wallace et al, 2014).

APPENDIX 1- COMPILATION OF THE PATIENT SATISFACTION MEASUREMENT TOOLS.

Dimensions	Measurement tool / Scale
Doctor–patient communication, clinical team interactions, organizational features of care	The Ambulatory Care Experiences survey (Sequist et al, 2008) Hospital Consumer Assessment of Healthcare Providers and Systems survey (HCAHPS) (Jha et al, 2008; Giordano, Elliott and Goldstein, 2010). Seattle Outpatient Satisfaction Survey (SOSQ) (Fan et al, 2005) Quality of communication questionnaire (QOC) (Slatore et al, 2010) Interpersonal-Based Medical Service Encounter (Chang, Chen and Lan, 2013)
Technical quality of care Physician’s knowledge of patient	Hospital Quality Alliance (HQA) score [20] General Practice Assessment survey (Rao et al, 2006) Components of Primary Care Instrument (CPCI)(Flocke, Stange and Zyzanski, 1998)
Coordination of care and overall experience	Commonwealth Fund International Health Policy Survey (Burgers et al, 2010)
Patient-centered care, access, courtesy, information, coordination, emotional support, physical comfort	VA Survey of Healthcare Experiences of Patients (SHEP) (Meterko et al, 2010) Quality from Patient’s Perspective (QPP) questionnaire, 25 item (Wilde Larsson and Larsson, 2002) English GP Patient Survey (GPPS) (Campbell, Smith and Nissen, 2009)
Undesirable events	Picker Inpatient Survey (Agoritsas, Bovier and Perneger, 2005)

ABSTRACT

The Greek banking system is called to deal with three major demographic shifts that have a direct impact on its sustainability. In this context, the country's ageing population and slow-paced technological transition constitute negative parameters that have an adverse effect on the stability and growth of the Greek banks in today's globalized economic landscape. In this assignment, it is primarily attempted to investigate the impact of demographic ageing of the population that fuels the Greek economy, on the liquidity, specifically, of the domestic banking system. Therefore, the theoretical background of the research study is based on the Life-Cycle Hypothesis (*Modigliani & Ando, 1963*), in which individuals share their consumption and savings behaviour over their lifetime, doing so by increasing savings when earning high incomes and dis-saving when they are retired. The selected empirical approach is followed by applying the method of Multiple Linear Regression to simple time series and panel data referring to the period from 1998 to 2016, which outline the intertemporal character of the phenomenon. Moreover, a comparative exploration takes place of the analysis of data derived from the Greek economy, versus the corresponding data displayed by the Eurozone states, as well as the individual results referring to the global economic crisis of 2008. The statistical findings of the investigation show a mixed picture, demonstrating that demographic ageing can actually affect the banking system of a specific state, especially when the ageing phenomenon is strong or further aggravated by low productivity, which is the case with Greece and other countries of Southern Europe. Whereas, in countries where aging progresses smoothly or in countries where there is a strong demographic aging with simultaneous presence of high productivity and competitiveness indicators, the pressures on the banking system liquidity are weak. On top of that, an investigation takes place in terms of the challenges that emerge as a result of both the population's ongoing shift towards a digital society and the digital transformation of the financial sector, as well as the substantial flight of

human resources and channeling of capital resources abroad, which followed the recent economic crisis.

Keywords: Demographic Ageing, Banking System, Liquidity, Loans over Deposits, Immigration, Technological Progress, Greece, Eurozone

INTRODUCTION

The demographic aging of the modern western world is a current issue that has already affected many countries of Europe, bringing them up against major economic and social problems. This phenomenon, which is referred to as 'double aging', consists literally in the ongoing increase of the proportion of the elderly (aged over 60 years old) over the total population, which coincides with the simultaneous drop in the weight of children (0-14 years old), and probably of the ages in-between (Vyron Kotzamanis, *"Demographic Aging in Postwar Greece"*, EDKA). The change of these relationships is a process that, under normal conditions, develops gradually, and cannot be affected merely through the implementation of long-term national planning. Furthermore, the significance of the problem lies mostly in the economic relationships that exist among generations, i.e. between the active contributors and the non-active pensioners, and affects a number of issues, either directly, such as the substantial increase in funding social security expenses, claims in health expenses, and the redistribution of social burdens among generations, or indirectly, such as consumption, saving, and investment.

By focusing, specifically, on the indirect implications of demographic aging, this survey investigates the effect that an aging society can have on its banking system, as well as on its traditional role as an intermediary. Based on the assumption that the banking system constitutes the primary mechanism that brings together the surplus-producing economic units with the deficit-producing ones (or, otherwise, the lenders with the borrowers¹), it is investigated if the rate of increase of aging of the population can affect the management of the lifecycle of banking products, and whether the banking sector can meet the requirements for the transfer of funds among the different age groups of the same time period, and different generations of different time periods, keeping, at the same time, its liquidity at safe and efficient levels.

A critical factor for the successful intermediating function of the banking system is the choice for saving money over time, that is, how the economic unit changes its consumption or/and investment strategies depending on its decisions for saving, driven by its current needs, and those that it anticipates having in the future. Simply stated, individuals retain wealth, or, in other words, save it, in

¹ Panagiotis Aggelopoulos, *"The Banks and the Financial System (Markets, Products, Risks)"* (Stamoulis Publications S.A., 2nd Edition, Athens 2008).

order for it to serve their daily transactions, provide for their future needs and unpredicted circumstances and, of course, make a profit, planning a constant flow of consumption and living expenses throughout their lifecycle, in line, primarily, with income constraints, that apply to both their intangible and tangible assets.

In summarizing these concepts, the starting point of the analysis that is performed in this paper is the Life-cycle Hypothesis (Modigliani & Ando, 1963), according to which, the life of an individual is made up of three main periods. The first one refers to the early period in the life of an individual, where, an effort is literally made for education and professional settlement. At this stage, the economic unit has limited, to zero, or even negative income, which means that saving is limited, and naturally, it can also be supplemented by borrowing. In the second stage, which is also the most productive part in the individual's life, the individual has settled professionally, and this enables the generation of substantial income. This means that, following the above reasoning, a part of this income is saved, or used to pay off loans that were taken for either productive investments, housing needs, or immediate consumption choices. In the third stage, where there is not any productive income anymore, the economic units enjoy the fruits of the prudence that they showed earlier in life. This means, that they can, at least, live a decent life, and also, depending on the fiscal and microeconomic context of their development, manage a significant portfolio.

On this time dimension of economic behavior lies the intermediating function of the banks, through which, savings from the second, and frequently from the third stage are accumulated and transformed into loans, as well as speculative position management, requiring a significant number of participants, also characterized by a varied age composition, in order for the savers of the second and third stage to cover for the borrowers of the first and second stage. In an economy, however, with an aging population, it becomes clear, that the number of participants in the first two stages has started to fall, and the elderly have begun to predominate. A characteristic example of such an economy is Greece, in the case of which, it is investigated how this aging trend of its population can affect the effectiveness of the intermediating function of its banking system, monitoring the trend of the Loan-To-Deposit Ratio, and comparing the results with the corresponding ones demonstrated by the Eurozone countries.

This survey is divided into the following sections: **1. Literature Review**, **2. Empirical Methodology**, **3. Data Analysis**, **4. Result Analysis**, **5. Conclusions**.

1. LITERATURE REVIEW

Critical issues, such as, for example, how the system will react to the increased liquidation of positions, which is requested by the constantly rising population of pensioners, or where any potential

surplus savings funds will be channeled to, when a decline occurs in the demand for new loans, or even how an unexpected upward trend in the demand for loans will be covered following the end of a long period of birth deficit, comprise the scope of new surveys conducted by the various financial and academic organizations, mostly from the countries that are threatened by the issue of aging. The key literature, however, about this problem has focused, so far, on the changes of private saving.

In an attempt to highlight some of these surveys, special mention should be made to the analysis performed by the International Monetary Fund, which was published in January 2002, under the title: *"Population Aging and its Macroeconomic Implications: A Framework for Analysis"* (Hamid Faruquee), where the macroeconomic implications of aging in the economies of Japan and the United States are examined, as well as their significant differentiation in the movement of capital that is presented by private saving over aging. Another characteristic survey is that conducted by Andrew Mason, Sang-Hyop Lee, and Gerard Russo, under the title: *"DEMOGRAPHY OF AGING ACROSS ASIA"* (Handbook of Asian Aging, Edited by H. Yoon and J. Hendricks - Baywood Publishing Co., New York 2006), where it is reported that the banking system is required to take initiative, in order to meet the financial needs of the aging generations. The survey that was published by the Productivity Commission of the Australian government in 1998 also refers to the same context, and more specifically, to the need to address this demographic issue, in order for the deficit in national saving to be closed. The publication under the title: *"Aging Gracefully: Canada's Inevitable Demographic Shift"* (Toronto, 4th of April 2012), by the Bank of Canada, as well as that under the title: *"The implications of an ageing population for the UK economy"* (Garry Young – Bank of England, London, 2002), by the Bank of England, also fall within the same context, and highlight the need for boosting private saving. Special reference should also be made to the survey conducted by Zheng Liu, Mark M. Spiegel, and Bing Wang, under the title: *"Global Aging: More Headwinds for U.S. Stocks?"* (FEDERAL RESERVE BANK OF SAN FRANCISCO, Economic Letter 2114-38, December 22, 2014), which proves that there is a strong positive relationship between aging and stock prices in the US economy, while the survey conducted by the World Bank in the case of Brazil, under the title: *"Macroeconomic and Policy Implications of Population Aging in Brazil"*, Policy Research Working Paper 5519, Ole Hagen Jorgensen - The World Bank Latin American and Caribbean Region Economic Policy Sector, January 2011, where the findings show that aging is not strong enough as a factor to affect economic growth, leads to the opposite direction.

With regard to the European area, reference should be made to the report of the Council of Europe Development Bank, which was published in January 2014, and refers to the opportunities and challenges that should be addressed by it, and which are caused by the aging of the European population. On top of that, the need for increased saving should also be highlighted, as a

counterbalance to the low core pension benefits that will be provided by the European states in the future, according to what is stated by the World Bank, in its report *"FROM RED TO GRAY - The 'Third Transition' of Aging Populations in Eastern Europe and the former Soviet Union"* (Washington, 2007), since it is confirmed that, the 'life-cycle' theory applies to most European countries, where a decline in private saving occurs during the retirement years.

The article of Stefan W. Schmitz, under the title: *"Demographic Change, Bank Strategy and Financial Stability"*, which was published by the Oesterreichische Nationalbank of Austria, in its report *"Financial Stability Report 13"*, is also in line with the above reports, since it literally deals with the reaction and stability of the banking system towards the implications of aging of the population, highlighting, at the same time, the changes in the macroeconomy, interest rates, financial markets, and real estate markets, as well as the composition of household portfolios and malfunctions in the participation of the banks in the occupational pension funds, with an emphasis on pension products.

In more detail, in this report, it is stated that, due to the upcoming demographic shifts, the demand for loans and basic financial services is expected to decrease, following the trend that has already been initiated in many countries of the OECD since 1980, where a shift has been demonstrated from bank deposits to investment funds (provision of pensions) and bonds. The banks react to this accelerating trend by enhancing the level of innovation of their products, through the application of specific age-targeting long-term management, currently offering on a broad basis many of the services that were within the context of private banking in the past. However, it is evident, that this attempt should be combined with core organizational changes, the improvement of corporate governance, and effective risk management, which, imply, by extent, a higher operating cost.

At the same time, the profitability of the banks is expected to be affected heavily by competitive pressure, the deterioration of the ratio of cost over revenues and the restriction of the intermediating function, which will force the banks to search for other funding sources of – usually – higher cost. This drop in the profitability of the banks will, in turn, reduce their capacity to absorb the shocks from any potential fluctuations, posing a more direct threat to the capital adequacy ratios. Additionally, the increased competition, and the need for differentiated products pose major operating and legal risks, while the attempt for international expansion in new markets intensifies the political and foreign exchange risks. These transformations result in the need for constant monitoring of the implications of the problem of aging and redesigning of the banking sector to be implemented by the regulating authorities.

Moreover, a special differentiation with regard to all the above, due to its specific focus on the function of a particular national banking system, and with notable findings that should be highlighted, is demonstrated by the survey conducted by Michael Berlemann, Marco Oestmann and

Marcel Thum, which was published in CESIFO (working paper no. 2911, category 11: industrial organisation, Munich, January 2010), under the title: *“Demographic Change and Bank Profitability. Empirical Evidence from German Savings Banks”*, through which, the change in profitability of the German banks is examined empirically over the shift in age of its customer base, by applying a forecasting model, which goes through to 2025.

More specifically, the focus was placed on the German economy, both due to its developed banking system and the forecast of a significant demographic shift over the next years, while the survey is essentially focused on how the profits of the banks fall, when the population diminishes, as well as how this change is offset by the fact that the elderly people comprise their most affluent customers. The statistical data also confirm these movements, which could be caused by the net demographic result, and, besides, they also show a positive impact on profits, which is estimated to reach 9% by 2025. In fact, however, given the increased level of competition in the banking sector, and the rising price sensitivity, profit forecasts can be, overall, less optimistic, with a correction that is estimated to finally mark a drop of profits in the region of 3%.

Finally, in moving towards a more specific analysis of the situation in Greece, the survey under the title: *“Private Saving in Greece: Economic and Demographic Determinants”*, by George Hondroyiannis, which was published by the Bank of Greece in its Economic Bulletin (Issue 19) in July 2002, should be mentioned. This paper is one of the few surveys that attempt to analyze the demographic implications to a particular aspect of the banking system of Greece.

More particularly, this survey explores the shift that has taken place in private saving in Greece in recent decades, and attempts to connect it to the issue of aging of the Greek population. It is also reported that, the trend for private saving shifts on a global level as well, depending on the geographical area, and its particular characteristics, providing two different cases as an example; eastern Asia on the one hand, where a significant increase has taken place, and Europe, America, and Japan on the other, where a minor decrease is noted. Regarding Greece, in particular, it is reported that the mean propensity for private saving has demonstrated a substantial decline during the last years of the previous millennium, as opposed to the considerable increase that had taken place during the 1960s and 1970s.

The author also stresses the fact that, this decline has been effected despite the stabilization that had preceded in the Greek economy during that period, with low inflation and high growth rates, and points out, on top of that, the high public debt, which, after a few years, proved to be the biggest wound on the Greek economy. He also states, that over that period, a major credit expansion occurred through the increase of the granting of loans and drop of the interest rates, which, in spite of the high growth rates, did not manage to have the same impact on the level of unemployment in the country. In

focusing, therefore, on these predicaments, he deems the phenomenon of double aging of the population as the catalyst for the further slowdown of the Greek economy. The decrease of manpower and the pressure applied to the insurance funds threaten to further shrink the economy due to the devaluation (impairment) of private and public investments, while, at the same time, the decrease in private saving will further lead to the need to look for foreign funds.

Therefore, on these grounds, the researcher postulates that the study of private saving requires special attention, given the fact that it is directly linked to the domestic financing of development investments, the financing of the fiscal deficit according to the Ricardian equivalence, the deregulation of the financial and credit system, and the uncertainty of the social security system. He also attempts to define the factors that affect private saving, in order to explore its empirical course of progress from the Greek data. Specifically, he mentions, as primary factors that play an important role in private saving, the income and behavior of individuals throughout their lifecycle. As secondary determinants are reported the government budget deficit and the reaction of the economic units to its fluctuations, driven by their awareness of the value of public goods. He also examines the importance that is assigned to the public insurance system, interest rates, financial deregulation, inflation, and, of course, aging, constructing a multivariate linear regression model that includes data from the Greek economy for the period 1961-2000 concerning private saving and its relationship with the total fertility rate, aging index, real interest rate, consumer credit, fiscal result, rate of increase of disposable real income, and inflation.

The statistical controls that result from the regression show that the variables are driven by common trends that cause them to converge in the long run, and that private saving is affected, indeed, by demographic and economic factors in the long run. Regarding, specifically, the demographic factors, it emerges that they have a positive impact on private saving; i.e., an increase of the total fertility rate and the aging index result in a rise in private saving, contrary to the anticipated result, as it is stipulated by the life-cycle theory. This outcome, always according to the researcher's point of view, may be due to the special characteristics of the Greek society, where, parents, on the one hand, believe that it is their obligation to financially support their children throughout their lives, and Greeks in general, on the other hand, consider that public insurance is unreliable and of poor quality, and take care to substitute it through private saving.

2. EMPIRICAL METHODOLOGY

In this paper, the impact of demographic aging on the banking system is investigated, through the relationship between the Loan-To-Deposit Ratio (LDR) and the demographic aging index. The loan-to-deposit ratio is one of the key measurement indicators of the banking system liquidity and the

effectiveness of the intermediating transformation, and is estimated by dividing the total amount of loans by the total amount of deposits (Michael Taillard, 2014). The resulting figure is expressed as a percentage rate, and when $LDR < 100$, the deposits are higher than the loans (high liquidity, low banking expansion); when $LDR > 100$, the loans are higher than the deposits (low liquidity, high banking expansion), and, naturally, when $LDR = 100$, the loans and the deposits are equal. From a demographics perspective, the aging index is used, which, according to the Laboratory of Demographic and Social Analyses of the University of Thessalia¹, is the ratio of individuals aged 65² and over to the population of children aged between 0 and 14 years old, or, stated otherwise, the corresponding number of individuals aged 65 and over, per 100 children, and is expressed as a percentage rate.

The processing of data is performed by the STATA statistical application, through the use of linear regressions. In order to further support the significance of the results, an additional variable is added to the analysis, that is, the GDP growth rate, in order to also partly include the economic determinants of the banking index. This reflection comprises a preliminary approach, which could be normally supported by the addition of more explanatory variables, such as the interest rate, inflation, disposable income, public debt, etc.

The function of the statistical sample is formulated as: “liquidity – $f(\text{Aging Index, GDP Growth Rate})$ ”, and in order for the autocorrelation to be reduced, a lag of 2 years is applied to independent variables, solving a multiple linear regression equation in the form of: $LDR_t = \alpha + \beta \text{AgingIndex}_{t-2} + \gamma \text{GDPgrowthrate}_{t-2} + \varepsilon_t$, by controlling the residuals through the robust and cluster commands. From this relationship, it arises that, if β has a positive sign, then the LDR increases, which means that the banking system liquidity decreases, while the opposite happens when β has a negative sign.

3. DATA ANALYSIS

The data of the total survey are limited to the Eurozone, because of both the common currency and the convergence of the European states under similar rules that regulate the economic function, and the similar techniques that are applied to the economic and statistical measurements conducted by the member states. The major problem that is identified, concerns the lack of statistical data for the Loan-To-Deposit ratio, which, for the sake of uniformity and reliability, is exclusively drawn from the European Central Bank, with its history starting from 1997 onwards. The limited number of the years of recording this ratio poses a significant problem to the survey, taking into account that a long-term representation would substantially reduce any random correlations, and would particularly help to

¹ http://www.e-demography.gr/Metadata/Dictionary/files/pyth_dict_00436_gr.pdf

² According to the United Nations, the 60th year of age is set as the age threshold (<http://www.un.org/esa/population/publications/worldageing19502050/pdf/95annexi.pdf>)

produce forecasts about the progress of the figures in question. The history of the data of the demographic index starts from 1960 onwards, and are retrieved from Eurostat, while for the GDP growth rate, the data are derived from the OECD.

The analysis of the data is divided in terms of time and space, as follows:

– Based on the progress of figures in time, the survey is divided in two periods; the first one refers to the years 1998-2000, and the second one to the years 1998-2016, in order to identify the specific contribution that was made to the progress of the LDR and the rapid change of the denominator of the fraction by the global financial crisis of 2008, as it is reflected in the following diagram:

Loan-To-Deposit Ratio of the Eurozone states (1998-2016)

(Source: <http://sdw.ecb.europa.eu>)

– Based on the space approach, the analysis is performed both on plain time series of individual states, such as Greece and Germany, in order to examine the particular characteristics that affect the survey's sample, and on subgroups of states, such as the group of countries of the South (France, Greece, Spain, Italy, Cyprus, Portugal), which have similar characteristics (Malta is excluded, since it demonstrates considerable differentiation in individual economic variables), the group of countries with a low aging index (Belgium, France, Ireland, Netherlands, Cyprus, Luxembourg, Slovakia, Finland), and the group of countries with a high aging index (Austria, Germany, Greece, Estonia, Spain, Italy, Latvia, Lithuania, Malta, Portugal, Slovenia), as they are depicted in the demographic representation shown in the following map:

Europe's ageing population

PROJECTED OLD-AGE DEPENDENCY RATIO

Number of persons aged 65 as a percentage of number of persons aged between 15 and 64.

Graph 1: Demographic aging of Europe

(Source: EUROSTAT)

4. RESULT ANALYSIS

In this section, the significance of the impact that demographic aging has on the banking system liquidity is investigated, leading to the identification of major divergences and the deduction of mixed conclusions. Considering the overall Eurozone as a point of reference, it is noted that, according to Tables 1 and 2, over the 1998-2008 period, there is some positive relationship, although not statistically robust, which completely disappears, if the years 2009-2016 are also taken into account. In essence, there is not any statistically significant relationship between the two variables, which may be due to the fact that most European countries have a stable banking system, which, combined with the degree of protection and supervision applied by the ECB, currently follows the overall economic growth and productivity, absorbing, in this way, demographic pressures.

Table 1: 19 Countries of the Eurozone (1998-2008)

By checking, specifically, the countries with the higher demographic aging, it is also noted, from Tables 3 and 4, that the findings lack statistical significance, given the fact that they refer to most of the Eurozone members, and these countries may show the same characteristics to those that apply for the countries overall.

Table 3: Eurozone countries with significant demographic aging (1998-2008)

Random effects $u_i \sim \text{Gaussian}$	wald chi2(1)	=	1.69
corr(u_i , X) = 0 (assumed)	Prob > chi2	=	0.1938
(Std. Err. adjusted for clustering on var1)			

loanstodep~o	Coef.	Robust Std. Err.	z	P> z	[95% Conf. Interval]	
agingindex	-.1667492	.1283295	-1.30	0.194	-.4182704	.0847721
_cons	143.7808	17.23064	8.34	0.000	110.0093	177.5522
sigma_u	18.946179					
sigma_e	25.491936					
rho	.35582765	(fraction of variance due to u_i)				

At this point, it should be pointed out that, a different reaction to the aging issue is noted among the member states, which can be either positive or negative, and this results in the mutual offsetting of pressures overall. In other words, by observing the countries with the lowest demographic aging, it is noted, from Tables 5 and 6, that the relationship between the variables demonstrates statistical significance with a negative effect. This could serve as an indication, that, if demographic aging in these countries rises more rapidly than the productivity of the economy and the effectiveness of the banking system, then the latter will face pressures on its liquidity.

In order to give an account of the conditions that cause differences among the countries, in terms of the implications of demographic aging, a number of states are also examined on an individual basis, in order to identify the special characteristics that they demonstrate. By focusing on Greece, which is the basic case of the study, the results in Tables 9 and 10 indicate a statistically significant negative impact on the banking system liquidity. This view supplements the results of the survey conducted by Hondroyiannis, which reported an increased level of saving by the Greeks as they grow older, and shows that aging affects liquidity through the enhanced banking expansion, which is required by an economy that is characterized by low productivity, lack of competitiveness, and deficient state infrastructure. Within this context, the banking expansion, in turn, is transformed to a greater degree

into saving, due to prudence applied in view of the third stage of the life-cycle (in lack of major public infrastructure), and to a lesser degree into investments, which could boost growth and refuel the intermediating function of the banks.

In contrast, by checking the case of Germany, it is noted, from Tables 11 and 12, that there is a considerable boost in its banking system liquidity. This relates to the fact that Germany is one of the most productive economies, and therefore, the growth of such an economy can be self-financed to a large extent by the surpluses that are generated (both by the profitability of businesses and the stable household incomes), resulting in keeping bank lending within controlled levels, and being utilized more effectively and less abusively. This naturally means for the liquidity ratio, that the numerator of the fraction, i.e. the loans, shows stability (or, possibly, even a decrease, in order to justify the drop of the ratio). Moreover, Germany has well-structured healthcare services in place, and the elderly persons do not have to spend much money from their savings, in order to ensure health, care, and wellness, in general. Furthermore, these social structures ensure the provision of important services (education, child benefits), even for the dependent persons of young age, offering a considerable relief to family budgets, and boosting savings and the overall banking system liquidity at the same time.

5. IMPLICATIONS – OUTLOOK - CONCLUSIONS

Demographic aging is a phenomenon that could have a severe impact on the banking system of a country. In the case of Greece, the effects of this phenomenon have temporarily abated as a result of the current mechanisms that have been applied, in order to monitor and support the banks (ESM, ELA). However, when the Greek banks finally cease to be under the control of these mechanisms, they will have to face the overall problem; the outlook, with regard to providing support to the economy and growing their operations will be characterized by an extremely adverse environment. The demographic aging index will have aggravated even further, after the third migration outflow that the country has experienced over the years of the crisis, since it is currently estimated that over 500,000 young Greeks of both genders have migrated to foreign countries (Sophia Lazaretou, "Flight of human capital: The contemporary trend of the Greek migration over the years of the crisis", Bank of Greece, Economic Bulletin, Issue 43, Athens, July 2016), with obvious implications on the marriage rate and the burden on falling birth rates.

In addition, a significant aspect of this trend has been the fact that these new migrants are extremely valuable human capital/resources, derived from the most productive age groups of Greek society that could support the restructuring of production and the growth leap that is much needed by the domestic economy. Therefore, it becomes clear that the banking system will come across a major

shortage of a dynamic customer base that could support the expansion of existing banking operations, along with the development of new business and operational strategies.

At the same time, the issue of the flight of human capital (brain drain) has another critical implication that refers to the failure to achieve the technological shift that the country needs. Within the modern globalized environment, where economies compete with each other on an international level in terms of technology intensiveness, the big question is how the Greek economy will be able - with the remaining population - to assimilate and generate technologies that could set it back to a growth path, as well as how the banks will be able to support investments that could bring the new migrants back (brain gain). Additionally, regarding the domestic banks, in spite of the heavy investment that they have made in new technologies for banking operations over the last years - fintech (Labour Institute of the Hellenic Federation of Bank Employees (OTOE), *"New technologies in banks and their effects on employment"*, Athens 2018), many of which can be characterized as a true innovation for the banking industry, the return on this investment remains doubtful, given the fact that the existing customer base is either fairly aged or technologically and digitally illiterate, to such an extent, that the banks should keep in service quite old technologies and practices that involve a high operating cost.

Therefore, it can be concluded that the implications of the issue are now clearly visible, as they exert strong pressure on the entire banking system, establishing negative conditions that affect its sustainability and growth. As a final word with special focus on this analysis, it is evident that an initial approach has been made towards the implications that result from a key banking parameter, i.e. the liquidity of the system, which also serves as an indicator of the banks' effectiveness as intermediaries. Despite the fact that the growth of the globalization effect has temporarily offset the demographic pressures, through, for example, the establishment of common/integrated economic areas and the free movement of persons, major questions are raised about the long-term response of the banking system to aging economies.

According to the results of the survey, there are indications that, in troubled economies, the banking operation is negatively affected by the aging progress of the population, since both the private and the public sector fail to increase their productivity and competitiveness. Further to that, amidst the lack of any internal surpluses, they are required to survive in a globalized environment, and achieve economic growth along with an increased level of banking expansion, which, however, poses risks to the balance and viability of the banking system itself. It is also noted that although the presence of demographic aging can boost liquidity in strong economies in the short run, it challenges the sustainability of their economic growth itself, due to the shrinking productive human capital, and therefore, questions are raised about the long-term pressures that are going to be exerted on their banking system. There are also significant findings from countries that do not currently face aging

problems, but it is suggested that, if demographic transition moves faster than the rest of the economic and social development, their banking system will be under negative pressure.

Finally, it should be noted, that the existence of the demographic problem could serve as an outlet for the development of new banking products and services that would ensure its sustainability over a new, long period of time. Nevertheless, the significance of such external phenomena, which have unforeseen implications to all the fields of human activity, necessitates their close and intense monitoring, and with regard specifically to the banking system, they could be included within the context of preventive regulations on both a micro and macro level, to be applied to the overall monitoring of the banking sector.

ENGAGING LEADERSHIP AND WORK ENGAGEMENT IN PUBLIC SERVANTS: THE INDIRECT ROLE OF JOB-RELATED AFFECT

Basinska, Beata Aleksandra^{1,2}; Gruszczynska, Ewa²; Schaufeli, Wilmar³

²Faculty of Psychology, University of Social Science and Humanities, SWPS University, Warsaw, Poland

³Work, Organizational, and Personnel Psychology, KU Leuven, Leuven, Belgium and Utrecht University, Utrecht, Netherlands

ABSTRACT

The aim of this study was to extend the Job Demands–Resources model of work engagement by introducing engaging leadership as an organizational resource and job-related affect as a mediator between engaging leadership and work engagement. In line with the positive psychology, we examined the indirect effects of both positive and negative affect in a multiple mediation model. The cross-sectional study was conducted in a sample of 238 public servants. The hypothesized model was assessed with structural equation modelling and the results indicated that positive affect was a significant mediator between engaging leadership and work engagement, but negative affect was not. This means that increased engaging leadership was positively related to a higher positive job-related affect, which in turn was positively related to stronger work engagement.

Keywords: engaging leadership, work engagement, job-related affect, motivation, positive management, structural equation modelling, indirect effect, public administration

INTRODUCTION

Professionals working in public administration have a specific motivation for their work, which manifests itself in the role of serving citizens and society (Esteve *et al.*, 2017). However, public organizations are characterized by a complex bureaucratic structure and are often affected by changes resulting from political reasons (Borst *et al.*, 2017). In the public sector, the main job demands are red tape and illegitimate tasks identified as hindrance job stressors, which are devastating to the meaningfulness of the jobs and the employees' well-being (Crawford *et al.*, 2010; Eatough *et al.*, 2016; Semmer *et al.*, 2015). The maintenance and development of work motivation is an important issue in the management of public administration.

Job Demands–Resources framework

According to the Job Demands–Resources theory (Bakker and Demerouti, 2014; Taris and Schaufeli, 2016), the availability of organizational resources increases work engagement, which is a positive state driving employees to work with dedication, to invest their efforts to fulfil in-role behaviours and to exhibit extra-role behaviour. Job resources, including respect and esteem, leadership style, job security and opportunities for career development, play a role in the achievement of organizational goals. Job resources can also reduce the negative impact of job demands, but most importantly, they stimulate employees' development, learning and personal growth. Work engagement constitutes a motivational process that can be increased by personal resources as well, including personal characteristics (e.g. optimism and resilience) and professional competencies and knowledge (Taris and Schaufeli, 2016; Xanthopoulou *et al.*, 2007). Because motivation is crucial in the management of human resources, managers and leaders should structure and manage the motivational process to achieve positive organizational outcomes, including commitment, high-quality job performance, intention to stay and extra-role behaviour (Schaufeli, 2015).

Work engagement

Work motivation is a psychological state that leads employees to perform tasks that bring positive consequences for the entire organization, including economic benefits, growth and development and prestige. In the public administration sector, work is directly oriented toward serving citizens and society (Esteve *et al.*, 2017).

Work engagement is defined as a positive, fulfilling, work-related state of mind that is characterized by vigour, dedication and absorption (Schaufeli *et al.*, 2002). Vigour represents a high level of energy during work and willingness to invest effort in one's work and cope with difficulties. Dedication demonstrates enthusiasm and involvement in one's work. Absorption is closely related to being fully concentrated and happily engrossed in one's work.

Work engagement is an eudaimonic marker of well-being as it pertains to the work's purpose and meaningfulness and the worker's positive psychological well-being (Bakker and Oerlemans, 2012; Ryan and Deci, 2000). Work engagement is profoundly rooted in intrinsic motivation and personal resources, including resilience and optimism (Bakker *et al.*, 2008). In addition, work engagement is fostered by job resources rather than job demands (Bakker and Demerouti, 2014; Schaufeli and Taris, 2014). More specifically, work engagement is sensitive to changes in organizational resources (Sonnentag *et al.*, 2010a; Sonnentag *et al.*, 2010b). Furthermore, work engagement more often involves evaluating job stressors positively as challenges than as threats (Crawford *et al.*, 2010). Work engagement is also related to positive organizational outcomes, including organizational commitment, job satisfaction and extra-role behaviours (Reijseger *et al.*, 2017). On the basis of the results of their

survey among Dutch public servants, Borst, Kruijen and Lako (2017) concluded that motivation in public service was positively related to work engagement and job outcomes, including affective commitment, and negatively related to turnover intention.

Engaging leadership

Engaging leadership is “a style of leadership that shows itself in respect for others and concern for their development and well-being; in ability to unite different groups of stakeholders in developing a joint vision; in supporting a development culture; and in delegation of a kind that empowers and develops individuals’ potential, coupled with encouragement of questioning and of thinking which is constructively critical as well as strategic” (Alimo-Metcalfe *et al.*, 2008, p. 587). The present study was concerned with conceptualizing engaging leadership from the perspective of Self-Determination theory (Ryan and Deci, 2000). In contrast to other leadership concepts (e.g. authentic leadership or transformational leadership), engaging leadership as proposed by Schaufeli (2015, 2017) is profoundly rooted in this theory of motivation.

Engaging leaders inspire, strengthen, empower and connect their followers. More specifically, they inspire by enthusiasm for their plans and visions, strengthen by delegating responsibility and challenging tasks, empower by learning and sharing knowledge and, finally, connect by focusing on collaboration among team members (Schaufeli, 2015). In short, by inspiring, strengthening, empowering and connecting, leaders promote the fulfilment of followers’ basic psychological needs for autonomy, competence and relatedness (Schaufeli, 2017). Engaging leaders provide their followers with organizational resources and facilitate access to them because they need competent personnel to achieve organizational goals. As a result, subordinates have stronger senses of competence, autonomy and relatedness (Ryan and Deci, 2000).

Engaging leadership is a significant predictor of organizational performance, as it creates positive attitudes in employees toward their work. Specifically, it increases job satisfaction and motivation to achieve, strengthens commitment to the job and the organization and instils individual self-confidence and team spirit (Alimo-Metcalfe *et al.*, 2008).

Leadership behaviour affects staff attitudes and well-being as well (Alban-Metcalfe and Alimo-Metcalfe, 2013; Kim and Beehr, 2017; Schaufeli, 2015). Engaging leadership seems to affect subordinates mainly indirectly, meaning that engaging leaders model and facilitate followers’ attitudes in a more internalized way (Schaufeli, 2015). Engaging leaders also support a developmental culture, building shared vision and focusing on communication and planning for organizational success (Schaufeli, 2017). In addition, they facilitate developing individual potential and making positive use of diversity (Alban-Metcalfe and Alimo-Metcalfe 2013).

Job-related affect

As mentioned previously, leadership affects followers' affective well-being (Schaufeli, 2015), which is often identified as a hedonic marker of well-being, because people seek to experience positive states and avoid negative ones (Diener, 2000). According to the Broaden and Build Theory of Positive Emotions (Fredrickson, 2001), when people experience positive emotions, they grow and flourish. However, it must be emphasised that both negative and positive affect are essential to occupational well-being. In fact, positive and negative affect play different functions in the adaptation process (Lomas and Ivztan, 2015). Positive affect broadens an employee's thought-action repertoire, facilitates explorative behaviours and promotes discovery of novel ideas and social connections, which in turn builds personal resources (Fredrickson, 2001). For instance, in the work context, positive affect encourages employees to craft their jobs (Harju *et al.*, 2016; Tims *et al.*, 2013). In contrast, negative affect warns against danger and mobilizes resources to cope with threats in an attempt to protect health and well-being. Both positive and negative affect are crucial hedonic aspects of occupational well-being. In addition, affect may mediate between job resources and work engagement, which is related to eudemonic aspects of occupational well-being. However, the presence of positive affect seems to be more important to work engagement than the absence of negative affect (Bakker and Oerlemans, 2012).

The present study

The aim of the present study was to extend the Job Demands–Resources model of work engagement by introducing engaging leadership as an organizational resource and job-related affect as a mediator between engaging leadership and work engagement among public-administration professionals. In line with positive psychology, the study examined the indirect effects of both positive and negative affect in the context of the work of public servants. The current study has two important features: first, it theoretically conceptualizes the mediation of positive and negative affect; and second, it tests a multiple-mediation model in which the effect of one mediator is controlled for the effect of the other mediator (Preacher and Hayes, 2008). Such an approach is more ecologically valid, because in real life, mediators usually do not act in isolation.

The following hypotheses were tested.

Hypothesis 1. Positive and negative affect are mediators in the relationship between engaging leadership and the work engagement of public servants.

H1a. Negative affect is a mediator between engaging leadership and work engagement: engaging leadership is negatively related to negative affect, which is negatively related to work engagement.

H1b. Positive affect is a mediator between engaging leadership and work engagement: engaging leadership is positively related to positive affect, which is positively related to work engagement.

MATERIAL AND METHODS

Group and procedure

The sample consisted of 238 public servants between 21 and 68 years of age ($M = 38$; $SD = 9.7$) who had work tenures of between 1 and 43 years ($M = 15.3$; $SD = 10.4$). Of the sample, 74% were women. Most participants had a close relationship with a partner (77%) and children (62%); 19% had a secondary education and 81% had a higher degree.

A professional research agency, was responsible for recruitment and online data collection. The present study was part of a larger project on work engagement among public servants. Participation in which is voluntary and symbolically remunerated. The study was approved by the Ethical Committee of the SWPS University of Social Sciences and Humanities, Warsaw, Poland.

Instruments

Engaging leadership was evaluated using the Engaging Leadership Scale (Schaufeli, 2015), which comprises 12 items describing empowering, strengthening, connecting and inspiring leadership. An example statement is “My supervisor encourages team members to cooperate”. Answers are provided on a five-point Likert-like scale that ranges from 1 (*completely disagree*) to 5 (*completely agree*). Higher scores indicate a higher perception of engaging leadership. In the present study, internal consistency was very high: the Cronbach’s alpha was .95.

Both positive and negative affect in the work context were assessed using the Job-related Well-being Scale (JAWS-12) (Basińska *et al.*, 2014; Schaufeli and van Rhenen, 2006), which was derived from the JAWS-20 (Van Katwyk *et al.*, 2000). The JAWS-12 consists of 12 adjectives that assess how often employees experience positive (e.g. energetic) and negative (e.g. angry) emotions. Respondents were asked to assess how often during the last month they felt a given way regarding various aspects of their work (tasks, co-workers, supervisors, clients, income). They provided their answers on a five-point scale that ranged from 1 (*never*) to 5 (*always*). Higher values indicated more frequent positive or negative job-related affect. Internal consistency for both positive and negative affect were high: the Cronbach’s alphas were .82 and .87, respectively.

Work engagement was evaluated using the ultra-shortened version of the Utrecht Work Engagement Scale (UWES-3, Schaufeli *et al.*, 2017), which measures overall work engagement in terms of vigour (“At my work, I feel that I am bursting with energy”), dedication (“I am enthusiastic about my job”)

and absorption (“I feel happy when I am working intensely”). Each item is rated on a seven-point scale ranging from 0 (*never*) to 6 (*always/every day*). Taking into account the briefness of the scale, its internal consistency could be regarded as satisfactory: the Cronbach’s alpha was .68.

Data analysis

Descriptive statistics and r-Pearson correlations were calculated. No missing data were observed. To assess the model, structural equation modelling was applied. Several indices were used to evaluate the model’s goodness of fit. According to Hu and Bentler (1999), the following cut-off values were adopted: for the Tucker-Lewis index (TLI) and the Comparative Fit Index (CFI), values of at least .95; for standard root mean square residuals (SRMR), values up to .08; and for root mean square error of approximation (RMSEA), values up to .06. The chi-square test was also used. For a model well fitted to the data, its result should be insignificant (Barrett, 2007), but due to the limitations of the chi-square test, its result cannot be considered decisive, even in small samples (Kenny and McCoach, 2003). The total, direct and indirect effects, including the affect-specific indirect effects, were tested (Hayes, 2009). All analyses were performed using Mplus software version 8 (Muthén and Muthén, 2017).

RESULTS

As Table 1 shows that public servants’ perceptions of engaging leadership, job-related positive and negative affect and work engagement all were slightly to moderately correlated with each other. In contrast, the potential confounders (age and gender) were not significantly related to any of the study variables. In addition, all study variables could be regarded as normally distributed.

Variables	M	SD	Skewness	Kurtosis	[1]	[2]	[3]	[4]	[5]
[1] Engaging leadership	3.27	0.89	-0.34	-0.21	-				
[2] Positive affect	2.75	0.53	0.08	0.34	.38*	-			
[3] Negative affect	2.90	0.76	0.31	-0.24	-.36*	-.42*	-		
[4] Work engagement	3.74	0.51	-0.28	0.01	.24*	.48*	-.20*	-	
[5] Sex	0.27	0.20	1.07	-0.86	.08	-.09	-.03	-.16	-
[6] Age	37.91	9.27	0.73	0.13	-.05	-.04	-.16	.08	.01

Note. *M* = mean; *SD* = standard deviation. * $p < .05$ (Bonferroni correction $.05/6 = .0083$)

Table 1. Engaging leadership, job-related affect and work engagement and control variables: descriptive statistics and r-Pearson correlation.

After controlling for sex and age, perceived engaging leadership explained 7% of the variance in employees’ work engagement ($B = .19$; $p = .002$; total effect). In addition, we assumed that both positive and negative affect mediated this relationship. Specifically, perception of engaging leadership

strengthened job-related positive affect, which in turn related to higher work engagement. In contrast, perception of engaging leadership reduced job-related negative affect, and via this path further reduced its negative effect on work engagement. Figure 1 presents the hypothesized model.

Figure 1. *Job-related positive affect, but not negative affect, mediates relationship between perceived engaging leadership and work engagement of public servants*

Note. EL = engaging leadership; PA = positive affect; NA = negative affect; WE = work engagement. Dotted line = non-significant path. All coefficients are standardized. R^2 for PA = .11; R^2 for NA = .11; R^2 for WE = .25. PA and NA correlation $r = -.34$; $p < .001$. * $p < .05$; ** $p < .01$; *** $p < .001$.

The model fit the data very well according to all the indices: $\chi^2(3,238) = 2.79$; $p = 0.43$; CFI = 1.0; TLI = 1.0; RMSEA = 0.0; 90% CI [0.0; 0.11]; SMRM = 0.02. The indirect effect of job-related affect was significant and positive (.14; $p < .001$; 95% CI [.07; .21]). As Figure 1 shows that perceived engaging leadership was associated with job-related positive affect ($B = .34$; $p < .001$) and, in its turn, job-related positive affect was associated with work engagement ($B = .48$; $p < .001$). For negative affect, the relationship was significant only for engaging leadership ($B = -.30$; $p < .001$), but not for work engagement ($B = .08$; $p = .30$). Accordingly, the analysis of specific indirect effects indicated that the mediating effect of positive job-related affect was statistically significant (.16; $p < .001$; 95% CI [.07; .20]) but this was not the case for negative affect (-.02; $p = .31$; 95% CI [-.04; .01]). In addition, the direct effect of engaging leadership on work engagement appeared to be insignificant ($B = .05$; $p = .41$). Additionally, age was weakly correlated with both negative affect and work engagement: older public servants reported lower negative affect and higher work engagement. The inclusion of these data-driven relationships improved the goodness of fit, but it did not change the indirect effects. Thus, the

results showed that positive affect fully mediated the relationship between engaging leadership and work engagement. Therefore, Hypothesis 1 was confirmed with regard to job-related positive affect only (*Hypothesis 1b*).

CONCLUSIONS

In line with the aim of our study, we examined a model of work engagement that included the indirect effect of engaging leadership via two parallel mediators: positive and negative job-related affect. The results partially confirmed the hypothesized model. Specifically, as reported by public servants, job-related positive affect, but *not* negative affect, fully mediated the relationship between perceived engaging leadership and work engagement.

Contributions

The present study had two aims. First, it was intended to contribute to the management of public administration by introducing engaging leadership as a resource for work engagement. Second, it was intended to empirically confirm extending of the motivational process of the Job Demands–Resources model by integrating it with job-related affect as an intermediate explanatory mechanism. The study filled a gap in the management of public administration by examining the indirect role of job-related positive affect in the relationship between perception of engaging leadership and work engagement among public servants. The results showed that the indirect effect of positive affect, but not of negative affect, is crucial to the relationship between engaging leadership and work engagement. Work engagement derives from positive affective states, mainly those with high activation, including excitement, enthusiasm and pride, but not from low or infrequent negative affective states (Bakker and Oerlemans, 2012). Thus, the results of the present study support this specificity of the affective mechanism associated with work engagement. Particularly, they add to our understanding on how some organizational resources, just like engaging leadership, may be related to more frequent positive feelings that motivate public servants to be vigorous, dedicated and focussed, i.e., engaged in their work. The results are similar to those of previous studies that have demonstrated an indirect effect via job demands and other job resources in the relationship between engaging leadership and both job burnout and work engagement (Schaufeli, 2015). However, in the aforementioned study only partial mediation was observed, and significant direct effect of engaging leadership on organizational outcomes was noted, including employability, performance and commitment.

The present study found that public servants' perception of leaders as engaging may increase their positive affect in the work context (a hedonic marker of job-related well-being) and that this may lead to increased work engagement (an eudaimonic marker of job-related well-being).

In a broader perspective, this outcome is beneficial to the entire organization since it stimulates an eudaimonia-driven prosocial behaviours and sustain intrinsic work motivation (Gagné and Deci, 2005; Gear *et al.*, 2017; Ryan *et al.*, 2013).

Engaging leadership can create a favourable organizational climate (Bellou and Andronikidis, 2017), but it never acts in isolation from personal characteristics of an employee (Arora *et al.*, 2017). As it was found in our study, age may be a significant correlate of possible engaging leadership outcomes: the older employees felt the lower negative affect and higher work engagement. Therefore, being older can be considered a resource in this context. It also suggests that younger workers may need an extra support to benefit similarly from engaging leadership or – more generally – that their attitude towards work is different.

The current knowledge indicates that engaging leadership is a significant predictor of positive attitudes in employees (Alban-Metcalf and Alimo-Metcalf, 2013; Alimo-Metcalf *et al.*, 2008; Kim and Beehr, 2017). However, the mechanism of this relationship still needs to be recognised, also because of its great practical value. Thus, our findings add to it by highlighting the role of the positive affect, which is in line with a view that engaging leaders act successfully by creating job environment based on congruent values and inspiring their followers (Schaufeli, 2015). The job-related positive affect could be the key driving force that translates the leader's engaging management style into the behaviours of employees.

Limitations and future research

The present study has some limitations. First, the sample was recruited by a professional research company and is non-representative of the population working in public administration. In addition, participation in the study was voluntary but rewarded. Furthermore, the study's cross-sectional design restricts any causal interpretation. The other pattern of relationship between the variables cannot be excluded, namely that affect changes perception of both leadership and work engagement or that work engagement mediates between engaging leadership and job-related well-being. Nevertheless, the theoretical framework of the Job Demands–Resources (Bakker and Demerouti, 2014) is well-established and confirmed empirically and as such enabled testing of the assumed effects. However, we strongly advocate this model to be tested using a longitudinal design, including potentially reciprocal effects in relationship between positive affect and work engagement. Finally, both employee well-being and organizational behaviour is a function of factors located at different levels (i.e., organization, team, individual), which influence each other within and over time (Bakker and Demerouti, 2018). The models including such cross-level interactions should be the next step in research on engaging leadership to make this knowledge ecologically valid and implementable.

Practical implications

Esteve, Schuster and Albareda (2017) have found that decreasing organizational resources in the public sector is related to decreased work motivation. Engaging leadership can build a positive organizational culture, prepare the organization to cope with change and facilitate a proactive attitude toward implementation of leaders' visions (Alimo-Metcalfe *et al.*, 2008). As such the engaging leadership is an important resource that managers can master to enhance the intrinsic motivation of public servants (Christensen *et al.*, 2017).

Our results suggest that to achieve this leaders should mainly focus on enhancing follower's positive affect, instead of reducing followers' negative affect. Thus, making people feel *less worse* at work is not enough. The aim should be to make them feel *better* at work by cultivating their personal strengths (Bakker and Demerouti, 2018), providing meaning and satisfying needs for competence, relatedness, and autonomy (Gagné and Deci, 2005). This translates knowledge from positive psychology into managerial activities to trigger and maintain the transformation of motivation in the employees.

ABSTRACT

Given that tourism destinations are increasingly competing on an international scale, places need to promote themselves in order to become more attractive. As tourists can choose between a number of different appealing places, destinations are required to provide something special. Therefore, this paper has the objective of analyzing how destinations can be promoted by consumers throughout social media and how this can result in a specific reputation of their brand. Despite several authors emphasize the important role played by social media in tourism sector, this paper offers a further contribution analyzing the impact of social media on brand reputation of a destination. Such analysis is carried out throughout netnography - a qualitative and ethnographic research methodology that allows researcher to understand the authentic consumption experiences by internet users - and it is applied to the case study of Umbria that, thanks to Viralbeat, monitored the *buzz* generated online by the event Travel Blogger Unite. Findings emphasize how travel bloggers' communication can result in specific brand reputation of a destination. This can be a starting point to address future strategies aiming at distinguishing a place from a tourist destination.

Keywords: Brand Participation, Brand Image, Brand Reputation, Destination Branding, Netnography, Social Media.

INTRODUCTION

According to the Reputation Institute (2013, www.reputationinstitute.com), “For companies with strong reputations, 55% of consumers say that they would definitely buy their products and 50% would be willing to recommend their products to others. For companies with weak reputations, these percentages fall to only 31% willing to buy and just 28% willing to recommend”. That is a significant difference, which explains why companies are working so hard to build consumers’ trust in them and not just in their brands. Social media are a probable source of reputation risks, such as brand/reputation damage, legal and regulatory compliance, security and privacy and employee/HR issues. Tourism is a sector with a very close relationship with the new information and communication technologies. In particular, social media and the Internet have fundamentally reshaped the way tourism-related information is distributed and the way people plan on and consume travel (Buhalis and Law, 2008). Social media represent very important information sources for travellers (Xiang and Gretzel, 2010) and online social networking allows users to interact and provide reviews on local tourist attractions, hotels and other travel-related business. The development of information and communication technologies and their increasing use has radically changed the relationship between the destinations and their visitors (Kiráľová and Pavlíčka, 2015). As for companies, online public opinions expressed throughout social media are creating huge challenges also for the tourism industry; tourist destinations are more and more reputation-dependent (Xiang and Gretzel, 2010). This influence on destination reputation on the part of social media is a central topic for tourist managers who try to manage how a destination is communicated: it is clear that social media have forced them to rethink branding strategies (Marchiori and Onder, 2015; Xiang and Gretzel, 2009). Leveraging off social media to market destinations has proven to be an excellent strategy (Kiráľová and Pavlíčka, 2015). Clarifying these issues is critical from both the theoretical and the managerial point of view in order to create a successful brand process for tourist destinations (Chernysheva *et al.*, 2011). For the motivations expressed above, this study addresses

the following research question: *How do social media affect brand reputation of a destination?* In order to answer this research question, this paper first provides a literature review on the topics of brand reputation, destination perception, and the role of social media in destination branding. In a second stage, the methodology is described and results are analyzed and discussed. Finally, we draw conclusions and show managerial implications and limits, providing recommendations for future researches.

LITERATURE REVIEW

The concept of brand destination

The widely accepted definition of destination branding is provided by Blain *et al.* (2005). According to these authors, destination branding is “the set of marketing activities that (1) support the creation of a name, symbol, logo, word mark or other graphic that readily identifies and differentiates a destination; that (2) consistently convey the expectation of a memorable travel experience that is uniquely associated with the destination; that (3) serve to consolidate and reinforce the emotional connection between the visitor and the destination; and that (4) reduce consumer search costs and perceived risk. Collectively, these activities serve to create a destination image that positively influences consumer destination choice” (p. 337). Building the place brand (Byrom, 2015; Anholt, 2010) requires a long-term commitment that calls for the creation of identity and emotional attachment between the venue and potential visitors (Morgan *et al.*, 2003). Depending on the context, different marketing tactics can be employed, such as the ability to spot the brand values perceived by tourists and promote these values through communication campaigns. When designing niche brands, the main problem is to understand the brand values and develop a long-term branding strategy. The brand values of the place must be sustainable, relevant and communicable and of particular importance to stakeholders and potential tourists. A well-designed brand name helps position a

destination or place from the visitor's point of view and convey specific or symbolic indications of the place (Kohli, Harich and Leuthesser, 2004). However, for destinations, the design and management of the brand is sometimes complicated. The branding of a place (Ntounis and Kavaratzis, 2017; Hafeez et al., 2016) requires the need for global product control, control of marketing budgets and political pressures. On the other hand, destinations or places are products sometimes composed of different components such as accommodation, hospitality, attractions, arts, entertainment, culture, heritage, natural environment and problems (Ritchie and Crouch, 2000).

Destination perception

Nowadays, a destination competes on the basis of its perceived image in comparison to its competitors. They represent a complex construct that results from the images of destination projected and perceived (Marchiori and Onder, 2015; Carballo et al., 2017; Adchauer, 2010). Several researchers (Baloglu and Mangaoglu, 2001; Hosany, Ekinici and Uysal, 2006) support the view that image is a multidimensional construct (Lopez et al., 2011) comprising two primary dimensions: cognitive and affective. Cognitive evaluation refers to beliefs and knowledge about an object whereas affective evaluation refers to feelings about the object (Gartner, 1993). Affective element describes what people feel about a place: it is about loving or not loving it (Coban, 2012). According to Echtner and Ritchie (1991), destination image can be defined not only as the group of perceptions about attributes of individual destinations but as the holistic impressions issued by the same destinations. Five elements are considered by Casalegno and Viassone at the basis of the destination image: functional characteristics (Echtner, Ritchie, 2003); holistic aspect (Reilly, 1990); psychological features (Pellicelli, 2009); attributes (Zhou, 2005) and level of uniqueness (Viassone, 2016; Casalegno and Viassone, 2012). To create a positively-perceived image, it is important to understand how the process of promotional destination information is developed by the visitor. When consumers have not previously visited the

destination, they try to reduce uncertainty by acquiring as much information as possible. For this purpose, Internet is one of the most important ways of collecting tourism information and it *“constitutes a communication channel that many traditional information sources leverage”* (Llodra-Riera *et al.*, 2015, p. 319). In fact a web page can become a fundamental instrument to promote destination and it leads to a strong feeling of destination image in the visitor (Cho *et al.*, 2002).

Brand reputation

According to Kasper Ulf Nielsen, Reputation Institute's executive partner (2013), *“we live in a time when word of mouth is the number one driver of sales and competitive advantage”*. However, *“Investing in reputation will pay off on the bottom line.”* Marchiori (2012, 1) started her dissertation with this thought: *“Reputation is a complex construct which reflects the dynamics of a modern society, that is, people use reputation to simplify information processing when they are overwhelmed by information”*. Brand reputation is defined as *“the aggregate perception of outsiders on the salient characteristics of the [...] brand”* (Veloutsou and Moutinho, 2009, p.315). In particular, brand reputation - as well as technical quality - is modeled as direct antecedent of a buyer's loyalty. It is a meaningful element in the formation of customer loyalty and it is the result of constant customer performance (Gounaris and Stathakopoulos, 2004). This concept evolves all the time, and it is mainly created by the flow of information from one user to another (Herbig and Milewicz, 1993). For these motivations, firms compete for brand reputation knowing that those with a strong reputation across their products can assume higher sales prices, thereby being more powerful than another competitor (Loureiro *et al.*, 2017). In particular, with the progress of information communication technologies (ICTs), brand reputation plays an important role in the tourism industry (Sageder, 2018). More and more tourists express their own opinions online about destinations and, in this way, they can influence individuals in the process of choosing destinations (Komšić and Dorčić, 2016). Throughout different platforms (blogs, virtual communities, wikis, SNSs),

tourists review and rate services received and they increasingly rely on Ewom (E-word of mouth) (De Ascaniis and Gretzel, 2013, 156). In particular, online communication affects reputation because (1) it is one more publishing arena, where people access information and form a mediated experience; (2) applications and usages belonging to the so-called Web 2.0 allow individuals to publish online their opinions through user generated contents (UGC) and/or online conversations. Those individual opinions may be seen as instances of reputation (Marchiori, 2012).

The concept of social media

Social media have changed almost every single industry (Alves et al., 2016; Barger et al., 2016; Gensler et al., 2013) thanks to their highly interactive features, but the travel industry is another story. It has been revolutionized by social media because it really delivers the “in-person” experience thanks to selfie photos, check-ins and status updates. Perhaps even more importantly, customer service and, specifically, customer complaints have really taken the travel industry to a new level. Technology aftermaths on the travel industry are widespread. The Internet has provided tourists with the ability to research vacation destinations with tools like Google Maps, Google Street View, YouTube and Facebook, together with easily scouring for images and online reviews. Social media has made a huge impact on the tourism industry. Consumers engage with social networking sites to research trips, make informed decisions about their travels and share their personal experiences of a particular hotel, restaurant or airline. Social media refer to online services existing on the Web 2.0 platform allowing people to interact and communicate in order to create, share and exchange interests, information and activities in virtual communities and networks at a global level (Dawot and Ibrahim, 2014). The social media platforms allow individuals and communities to create, share and discuss user-generated content which showcases people’s likes, dislikes and activities. Kaplan and Haenlein (2010) suggest that social media are a group of internet-based applications that enable users to interact with other like-minded users to exchange user-generated

content. According to Google Search Traveler 2014 (Google, 2014) (see table. 1), suggestions from friends, family and colleagues are the first source of inspiration for the choice of a trip and the second most influential source in planning the vacation (Ben Youssef *et al.*, 2015). According to Tingly Journal (www.tingly.com), blogs are the most used travel planning resource. Travel bloggers always add inspiration and invaluable advice as well as providing first-hand recommendations and specific reviews.

METHODOLOGY

This paper aims at explaining how social media are able to affect brand reputation of a destination. This goal is carried out throughout netnography, a qualitative and ethnographic research methodology that allows researcher to understand the authentic consumption experiences expressed by internet users in order to direct, reinforce and optimize business strategies (Viralbeat, 2012).

Netnography is a sort of ethnography adapted to the complexity of current social world, a sort of anthropological analysis able to make easier the understanding of life in the era of technologically-mediated culture (Kozinets, 2010). It aims at extrapolating cultural insights starting from data produced by users' communicative practices. This allows to understand meanings associated to a certain brand by web users. In particular, this methodology has been applied to the case study of Umbria, given that this region has monitored the *buzz* generated online by the event Travel Blogger Unite, organized in Umbria in the period 22nd – 25th April 2012. Viralbeat got opinion according to the criteria of saturation, structured on two steps: first, all the posts considered meaningless have been discarded; second, they haven't more inserted cases in the sample when they were overloaded.

About 982 opinions have been collected (531 from blogs, forum, websites and 451 from social networks). Data have been analyzed from different blogs and forums,

Travel Blogger Umbria web site, social network Facebook, Instagram, Flickr, Twitter following the hashtag #tbumbr and #umbria.

After the phase of data collection, a manual data classification has been carried out, in order to allow the elaboration of visualizations, with the aim of providing a summary of the information and to orient the stage of interpretative analysis. For each post or conversation, its different semantic units have been evaluated (Viralbeat, 2012).

FINDINGS

Umbria can be considered an important case study in order to describe how brand reputation of a destination is affected by social networks. In this specific destination, Internet can be considered a communication channel that many traditional information sources leverage (Llodra-Riera *et al.*, 2015, p. 319). It shows also how promotion can directly come from travel bloggers and how the latter can generate a specific brand reputation of the destination.

In order to analyze the brand reputation of this destination as inferred from Social networks, Umbria adopted a listening approach (*netnography*), analyzed in a second time by Viralbeat, a Milan-based Digital Agency specialized in the understanding of online consumption cultures, oriented to identify efficient marketing campaigns and to create lasting relationships between people and brands, with the aim of suggesting Umbria some territorial marketing strategies. For this particular destination, online communication affected reputation throughout the sharing of opinions, stories and conversations (Marchiori, 2012). Results of analysis about web reputation online carried out with reference to Umbria Brand collected 494 opinions from blogs, 320 from Instagram, 76 from Facebook, 55 from Flickr, 35 from the website and 2 from forums. Very interesting are the results concerning opinion sentiment, that is the emotional value associated to semantic objects of analysis. The analysis of sentiment results in a very positive global sentiment (Web+SN) towards Umbria (63.7%). The

most appreciated aspects concern suggestive landscapes, food and wine tradition and the peculiarity of medieval folklore. Negative aspects are very limited (1.6%). They are related to a scarce awareness of the Region (a not-so-known destination brand) and of its typical places (i.e. Orvieto), lack of public transportation/accessibility to some destinations (i.e. Assisi) and scarce awareness of local brands, both entrepreneurial and enogastronomic ones. The most discussed topics are the image of Umbria and Assisi and the subtopics related to Nature (with reference to picturesque and photogenic features of Umbria) and to the food and wine sector (discussed in generic terms, with a few specific references to brands of local products). Throughout netnography it has been possible to analyze customers' stories. From their study, throughout the analysis of sentiment towards Umbria and topics and subtopics, it is possible to discover the ideal image of Umbria, declinable in 5 sub-types. They are defined on the basis of words, tones and descriptions used. More precisely, Umbria is described as: *Tiny Umbria*: when referring to Umbria, people often use pet names to recall also aspects of quiet, uniqueness and slowness, that is a world "in small scale"; characterizing aspects are rarity, refinement, slowness, tranquillity; *Quiet Umbria*: according to travel bloggers, Umbria can be described as a paradise for people fond of relaxing walks and slow rhythms; *Umbria station*: placed in the middle of Italy, this region is considered as a forced stop and this can be viewed as an opportunity to link Umbria attractiveness to more famous brands, even when developing its own image; *Umbria "Hidden Treasure"*: this image refers to something hidden but precious, rich of history and art - it would be interesting to understand if this characteristic depends on the fact that it is far from mass tourist flows; *Authentic Umbria*: it is an example of authenticity because original, a region that reserves surprises, a mould-breaker destination (Viralbeat, 2012); in fact, it is the combination of nativeness (*what has always been*) and originality (*what has never been*) that makes it authentic. In conclusion, starting from opinions and stories by destination bloggers, it is possible to summarize the results concerning Umbria reputation (with reference to the event Travel Blogger Unite) throughout the

following SWOT analysis (Viralbeat, 2012): Strengths: nature, food and beverage, landscapes; Weaknesses: destination awareness, awareness of local brands; Opportunities: forced railway station, pristine and amazing region; Threats: identity resulting from the identity of other destinations.

CONCLUSIONS AND SCIENTIFIC/MANAGERIAL IMPLICATIONS

This paper shows that the concept of brand reputation of a destination can create customer-perceived value. This means that territorial brands mostly promoted by tourists and local shareholders inspire a certain degree of authenticity. In this specific case, opinions of travel bloggers allow to identify brand reputation of Umbria (with reference to the event Travel Blogger Unite) that is described as a tiny, hidden and authentic destination. In particular, it is perceived as an authentic destination because described as a destination not compromised by mass tourist flows. Furthermore, it is a precious destination because rich of secrets and not very famous. These results allow to identify important scientific and managerial implications. First, the strong influence played by social networks (and in particular by opinion sharing) in the definition of brand reputation and the higher and higher importance attributed to sensorial and cultural aspects such as food, wine and medieval folklore, that contribute to convey a certain image of the Region. In the specific case of Umbria, these features (preciousness, authenticity, etc) could be used in a promotional campaign able to express the value that a not very famous destination can own in addition to the desire to become bigger and more famous. In general terms, listening to what people say about a destination offer is the key to managing brand reputation of a destination. If people complain about destination offer (products / services) on social media, managers should be able to find this and to act immediately to remedy the situation. In a hyper-connected social world, the risk of not responding to negative comments or conversations could be enormous. A negative tweet or Facebook post that goes viral will do unimaginable damage to brand reputation of a destination.

In addition, the relationship that a destination establishes with consumers and stakeholders also plays an important role in building the corporation reputation (C3Centricity Consultancy, 2013). For this motivation, more and more the creation of blogs or usage of social media should be incentivated by the same destinations.

Anyway, this paper shows important limits: first, it is based on a single specific case study and, as such, it does not offer opportunities for comparisons; second, it is based only on the analysis of opinions/stories on social media about a destination and it does not propose a way to manage these opinions in order to improve the destination reputation. Third, it does not provide a quantification of the importance played by social networks on brand reputation.

This can be considered the base for further researches aiming at describing a strategy able to convert social media feedbacks about a destination into a specific strategy to improve destination reputation. Furthermore, it should be interesting to extend this analysis to important events of other regions, to identify which elements are more discussed and considered more important and to measure how much opinions shared on social networks can affect brand reputation.

ACKNOWLEDGMENT

The authors would like to thank Giovanna Montero, StudioViralbeat, Milano (www.viralbeat.com) for its cooperation and two anonymous reviewers that provided valuable feedback and comments.

ABSTRACT

The paper investigates whether cognitive reflection skills have an impact on the quality of the consumers' decision-making process in a decision context. In the experiment are providing all standard food items and respondents had to decided which food item preferred more. To analyze this situation, we used the questionnaire which contained special questions related to the identification of logical and intuitive respondents. It was expected that people would prefer a wider variety of food items within the main groups: logical and intuitive.

The aim of the paper is to find out whether there are differences in food preferences between intuitive and logical consumers. The questionnaire contained questions about many areas of catering. Due to the scope of the article we will mention only the most important ones - meat and fats.

It was expected that people would prefer a wider variety of food items within the main groups: logical and intuitive. This hypothesis was not confirmed. Both groups of consumers showed completely similar behavior in food consumption in Slovakia. They try to eat healthy preferring healthy fats to less healthy ones. Concerning the meat consumption, the consumers are income-limited, but the structure of meat consumption is identical.

Keywords : food items, meat, oils, cognitive reflection test, consumer behavior

INTRODUCTION

Food cannot be regarded only as a basic need but also as an important resource that has a huge economic impact on the Slovak households. For this reason, it is necessary to gain knowledge on food demand determinants in order to propose a comprehensive framework of food consumption for agriculture and food and social policy options, which would help reduce food waste and make more efficient use of natural resources. The paper seeks to identify consumption habits through primary sources – by using the survey research. The paper is focused on the consumption of meat, oils and fats

as they belong to the basic foods in nutrition and their consumption is dependent on both, consumer habits and their income.

The Slovak population permanently reduces the consumption of meat. For the first time it fell below 50 kilograms in 2014 when only 47 kilograms of meat were consumed per capita. It is about ten kilograms less than the annual consumption recommended by nutritionists. It signals permanent changes in human nutrition. Compared to 1990, the meat consumption has fallen by more than 30 kilograms (Fiľa, 2010).

In Slovakia, however, consumption of the meat is not reduced, but on the other hand is changed species composition of the consumed meat. People still prefer pork but in the past decade the annual consumption of pork per capita fell under 30 kilograms. In spite of that, the recommended consumption of pork is only 22.2 kilograms.

The poultry market is a twin. Its consumption fell after 1989 but then the poultry quickly picked up the pig meat. On the one hand, the reason was economical but, on the other hand, people also listened to doctors who stated that chicken is a dietetic and easily digestible meat. However, the current consumption is less than 20 kilograms, the last numbers speaks for only 17 kilos of poultry consumption. (Rovný et al., 2014; Berčík et al., 2016)

Although people in Slovakia most commonly consume sunflower oil, there has been observed an increase in the consumption of olive oil. This is also related to the changing trend of eating in Slovakia and to the citizens' desire for a healthier lifestyle.

Slovak households use mostly edible oils. Despite the slight decline in GfK (Note. company for gain relevant market and consumer information) in the first half of 2007, slovak households still retained the largest 49% share of the oil and fat market in terms of volume. Edible oils are margarines (33%) and butter (10%).

Slovaks generally do not add the recommended amounts of carbohydrates and crude fiber. Consumption of butter and pork ointment, it is a long-term decreasing trend in the consumption of these vital fats.

The biggest deficiency in our diet is the consumption of up to half as much fat as it is recommended. The annual consumption in the SR is 23 kg. Although it decreased in previous years, the poor fat structure has been highlighted.

Graffeo et al. (2015) were interested in expanding the current knowledge about the characteristics of economic behavior by studying the influence of two cognitive skills: Numeracy and Cognitive Reflection. While it has already been shown that higher levels of cognitive skills (e.g., ability to plan, memory, etc.) are associated with better choices (Burks et al., 2009; Christelis et al., 2010), the comprehension of the link between decision processes and cognitive skills is still limited. In addition,

the association between CRT scores and choices has been little studied in the context of the economic domain – one of the few examples is the study by Finucane and Gullion (2010).

To analyze this situation, we decided to use the questionnaire, which contained special questions related to the identification of logical and intuitive respondents. It was expected that consumers belonging to two main groups, logical and intuitive, would present different preferences in the food consumption.

METHODS AND MATERIAL

The questionnaire was chosen as a method of research. The survey was conducted online via Google Documents or through social networks and email but also at universities in printed version from September to December 2017.

Chi-square test of goodness of fit verify the representativeness of the sample in terms of gender and income. The representativeness has been confirmed. The survey included 280 respondents, who were asked for a questionnaire on the topic of Consumer Behavioral Paradoxes. The questionnaire was sent to the students of our university. The aim was a homogeneous sample of young people. If the questionnaire was filled through social networks, we should have no control over the structure of respondents in terms of age.

Consequently, we analyzed and compared respondents' opinions. We used The Cognitive Reflection Test (CRT) to identify whether the responds are logical or intuitive.

The Cognitive Reflection Test (CRT; Frederick, 2005) is designed to measure the tendency to override a proponent response alternative that is incorrect and to engage in further reflection that leads to the correct response. In this study, was showed that the CRT is a more potent predictor of performance on a wide sample of tasks from the heuristics-and-biases literature than measures of cognitive ability, thinking dispositions, and executive functioning. Although the CRT has a substantial correlation with cognitive ability, a series of regression analyses indicated that the CRT was a unique predictor of performance on heuristics-and-biases tasks. It accounted for substantial additional variance after the other measures of individual differences had been statistically controlled. We conjecture that this is because neither intelligence tests nor measures of executive functioning assess the tendency toward miserly processing in the way that the CRT does. The study argue that the CRT is a particularly potent measure of the tendency toward miserly processing because it is a performance measure rather than a self-report measure.

The CRT is a popular three-item test (Frederick, 2005) thought to assess cognitive reflection because the items bring to mind intuitive but wrong solutions that have to be overridden. The prototypical CRT problem is the bat and ball problem: "A bat and a ball cost \$1.10. The bat costs \$1.00 more than the ball.

How much does the ball cost?" The response "10 cents" is thought to come to mind for most, if not all, people, and many people answer "10 cents." Some people realize that the intuitive response is incorrect, however, and researchers have believed that calculating the correct answer is straightforward at that point: "catching [the] error is tantamount to solving the problem" (Frederick, 2005). Kahneman (2011) called the bat and ball problem "a test of people's tendency to answer questions with the first idea that comes to mind, without checking it". Consistent with this view defines Cognitive Reflection as the tendency to check and detect intuitive errors, and call the hypothesis that it is the important aspect of the CRT, the Cognitive Reflection Hypothesis.

In support of the Cognitive Reflection Hypothesis, Frederick (2005) briefly noted several pieces of unpublished evidence. In particular, people who responded correctly sometimes wrote the intuitive answer in the margin and described thinking about the intuitive answer in verbal reports, indicating that the intuition did come to mind. People who answered incorrectly thought the bat and ball problem was easier than those who answered correctly (incorrect responders judged the proportion of others who answered correctly to be higher than correct responders did), indicating that those who responded intuitively were unaware that the intuition was wrong. Inconsistent with this reasoning, however, De Neys et al. (2013) found that correct responders were more confident about their responses than incorrect responders. Frederick (2005) also noted that some people who perform badly on the CRT nonetheless are able to solve similar problems that do not have incorrect intuitive solutions (e.g., "a banana and a bagel cost 37 cents. The banana costs 13 cents more than the bagel"). However, Bourgeois-Gironde and Van der Henst (2009) subsequently demonstrated that most people answer these problems incorrectly anyway (58% incorrect; see also Mastrogiorgio and Petracca, 2014).

To explain his findings, Frederick (2005) invoked a dual-systems model of decision making. In it, intuitive System 1 processes are quick and effortless, whereas deliberative System 2 processes are slow and controlled. System 1 quickly makes an intuitive response available in decision making; System 2 then may check the response and engage in further reasoning if an error is detected (Kahneman and Frederick, 2002; Kahneman, 2003). Importantly, System 2 is activated only after System 1 processing is complete. This temporal rigidity distinguishes it from dual-process explanations of judgment and decision making that posit more interdependencies between the two modes of thought (Loewenstein et al., 2001; Slovic et al., 2004). Many biases are said to occur due to System 1's incorrect intuitions, so that people who check their intuitions (e.g., those scoring high on the CRT) should be less biased decision makers.

Consistent with this prediction, several studies have found correlations between the CRT and decision biases. In his original paper, Frederick (2005) found that people with lower CRT scores tended to be more impatient and risk averse, therefore failing to maximize expected utility.

Each of these researchers assumes that differences in CRT performance indicated differences in the ability to detect and correct incorrect intuitions (i.e., the Cognitive Reflection Hypothesis). They also implicitly assume that numeric ability is an irrelevant detail when it comes to solving CRT and related problems. Contrary to this view, however, Baron et al. (2014) recently found that traditional CRT problems have no more predictive power with respect to moral preferences than similar arithmetic items without intuitive answers. These findings suggest that numeric ability may be important to CRT performance.

In the present survey, we used following CRT test containing 3 questions:

1. A bat and a ball cost \$1.10 in total. The bat costs a dollar more than the ball. How much does the ball cost? ____ cents
2. If it takes 5 machines 5 min to make 5 widgets, how long would it take 100 machines to make 100 widgets? ____ min
3. In a lake, there is a patch of lily pads. Every day, the patch doubles in size. If it takes 48 days for the patch to cover the entire lake, how long would it take for the patch to cover half of the lake? ____ days

What characterizes these problems is that a quick, intuitive answer comes to mind, but that this quick answer is incorrect. The key to deriving the correct solution is to suppress and/or evaluate the first solution that springs to mind (Frederick, 2005). The solution to the bat-and-ball problem is 5 cents, to the widget problem is 5 min, and to the lily pad problem is 47 days.

In the present research found that according CRT test survey has 142 intuitive respondents and 117 logical respondents. Our intuitive behavior prevails in our sample. Kahneman (2003) writes that those who are guided by intuition in logical problems tend to be more explosive, impatient, and mad after immediate satisfaction. From the point of view of food consumption, these respondents may prefer better and more expensive foods, or follow diet trends and, accordingly, prefer certain types of foods. Logical respondents are more cautious, one might say that they are even more lenient, and this is reflected in their preference for food.

From the methodological aspect was applied Chi square test of independence for identifying dependence between consumption of meat and fats and classification questions.

The aim of the paper is to find out whether there are differences in food preferences between intuitive and logical consumers. The questionnaire contained questions about many areas of catering. Due to the scope of the article will mention the most important - meat and fats.

RESULTS AND DISCUSSION

When looking at the structure of respondents, it can be said that they are mainly young people under the age of 34. In this aspect of the research we later realized that we had put in the questionnaire to "housing with parents." Because many young people are still with their parents. So if marked own housing, it may not be quite true. Hardly any young person under 24 owns their own house or flat. Household income also corresponds to the real statistics of the Statistical Office, but the sample is not homogeneous in all income groups. We are also interested in whether the respondents live in a house or an apartment. This is also the source of many consumer habits. Surprisingly, 60% of respondents live in the houses. Slovakia's housing trend is changing. People are leaving the flats for home, and the survey also confirms this.

Chi-square test of goodness of fit verifies the representativeness of the sample in terms of gender and income. The representativeness has been confirmed. The survey included 280 respondents, who were asked to complete a questionnaire on Consumer Behavioral Paradoxes. The questionnaire was sent to the students of our university. The aim was to get a homogeneous sample of young people. If the questionnaire was shared via social networks, we would not have a control over the structure of respondents in terms of age.

Consequently, we analyzed and compared respondents' opinions. Based on their CRT test response, the respondents were divided into two groups.

The selection of respondents consisted of the following procedure:

In the questionnaire was an intuitive answer springs quickly to mind: "10 cents. But this immediate answer is wrong. Anyone who reflects on it for even a moment would recognize that the difference between \$1.00 and 10 cents is only 90 cents, not \$1.00 as the problem represent. In the next case, catching that error is tantamount to solving the problem as nearly everyone who does not respond "10 cents", in fact, gives the correct answer: "5 cents." In a study conducted at Princeton, which measured time preferences using both real and hypothetical rewards, the respondents answering "10 cents" were found to be significantly less patient than those answering "5 cents." Motivated by this result, two other problems giving the possibility for impulsive and erroneous responses were included together with the "bat and ball" problem to form a simple, three-item "Cognitive Reflection Test" (CRT) shown in Figure 1.

The three items on the CRT are "simple" in the sense that their solution is easily understood when explained, yet reaching the correct answer often requires the suppression of an erroneous answer that springs "impulsively" to mind. The proposition that the three CRT problems generate an incorrect "intuitive" answer is supported by several facts. First, among all the possible wrong answers people could give, the posited intuitive answers (10, 100 and 24) dominate. Second, even among those

responding correctly, the wrong answer was often considered first, as it is apparent from introspection, verbal reports and scribbles in the margin (for example, 10 cents was often crossed out next to 5 cents, but never the other way around). Third, when asked to judge problem difficulty (by estimating the proportion of other respondents who would correctly solve them), respondents who missed the problems thought they were easier than the respondents who solved them. For example, those who answered 10 cents to the "bat and ball" problem estimated that 92% of people would solve it correctly, whereas those who answered "5 cents" estimated that "only" 62% would do so (both were considerably overestimated.) Presumably, the "5 cents" people had mentally crossed out 10 cents and knew that not everyone would do this, whereas the "10 cents" people thought the problem was too easy to miss.

Concerning intuitive respondents, in Figure 1 we can see that the intuitively-thinking respondent prefers butter to margarine and olive oil and sunflower oil to rapeseed oil. As to the meat consumption, it is clear that poultry is consumed the most, followed by pork and fish whose consumption is at the same level. The consumption of beef is a bit lower than the consumption of pork and fish, and the least consumed meat is wild meat, which belongs to more expensive types of meat.

Intuitive respondents show a pattern in their behavior related to a healthy lifestyle dictated by nutritionists. Food items such as margarine or rapeseed oil have long been degraded as junk foods, and it can be also seen in the preferences of respondents.

Respondents who responded logically to the CRT test have similar preferences as intuitive respondents. Figure 2 shows that the majority of logical respondents (103) prefer butter to margarine. 94 respondents prefer sunflower oil and 86 respondents consume olive oil. Concerning the meat consumption, the survey results are quite similar: 112 respondents prefer poultry, followed by pork (98) and fish (86).

Looking at GfK's (Note. company for gain relevant market and consumer information) claims: Sunflower oil still holds the largest share (49%) of the oil and fat market in terms of volume. Edible oils are margarines (33%) and butter (10%).

From our survey it is clear that the consumption of sunflower oil was confirmed as well as the upward trend in olive oil consumption.

On the other hand, although the statistics confirm an increase in margarine consumption, the respondents included in our survey claim the exact opposite.

Similar situation may be observed in relation to the meat consumption. The structure of meat consumption in our survey is similar to that monitored by the Statistical Office of the Slovak Republic. Nevertheless, the results of our survey have not been confirmed again in the case of fish consumption. Our respondents state that they also consume fish, percentage rate in the questionnaire is at the level of pork consumption, but the macroeconomic data on consumption do not confirm it.

The paper would like to confirm statistically the fact that there are no difference in the preferences of food items consumed by logical and intuitive respondents. Mann-Whitney has confirmed in the test that there is no difference in preference between the analyzed groups.

An analysis of preferences or group analysis completes one more analysis, namely, the analysis of preferences in terms of demographic issues. Our effort was to find out if there exists a significant difference in responses in terms of gender, types of housing and income.

Table 2 shows the probabilities of the Chi square test of independence. Values less than 0.05 confirm the dependency between the pairs of examined questions. Dependence was demonstrated between margarine and the types of housing in intuitive respondents. Examined dependence was very weak.

Subsequently, the dependence was confirmed between olive oil and kind of living in the group of intuitive respondents. As it can be seen in Figure 3, the respondents who prefer olive oil live in their own flat or house. As young people who do not expect housing expenditures, they can afford to buy and consume olive oil.

The last dependence was between the consumption of beef and kind of living and income of intuitive respondents. The consumption of beef is very specific in Slovakia. It has gone through a turbulent period in the development of prices that reflected the consumption of beef. It certainly belongs to nutritionally valuable foods. The results of the survey show that the consumption of beef depends on income and housing. Respondents who rent a house, flat or apartment will not be able to buy beef because they spend most of their money on paying the rent. The last observed dependence was confirmed by the impact of the beef consumption on the income. Higher income groups can afford to buy this type of meat.

The research expected people to prefer a wider variety of food items within the main groups: logical and intuitive. This hypothesis has not been confirmed. Both groups of consumers show a completely similar behavior in food consumption in Slovakia. They try to eat healthy, preferring healthy fats to those which are less healthy. Concerning the meat consumption, the consumers are income-limited, but the structure of meat consumption is identical.

The CRT test gave us an interesting selection of respondents. It would certainly be interesting to structure other age groups - retirees or middle-aged people.

CONCLUSION

Consumers often have to decide on the most appropriate economic option from the list of alternatives, and literature shows that they sometimes choose badly in terms of risk and uncertainty (Kahneman, 2003). Consumers also show poor performance when coping with riskless choice. Our research is aimed

at expanding the current knowledge about the characteristics of economic behavior by studying the influence of the cognitive skills: Cognitive Reflection.

The research expected people to prefer a wider variety of foods within the main groups: logical and intuitive. This hypothesis has not been confirmed. Both analyzed groups show a completely similar behavior in food consumption in Slovakia. They try to eat healthy, preferring healthy fats to those which are less healthy.

On the other hand, it must be mentioned that there were differences between options made by the respondents and real data from the Statistical Office of the Slovak Republic. According to JFK's claims: Sunflower oil still holds the largest share (49%) of the oil and fat market in terms of volume. Edible oils are margarines (33%) and butter (10%). From our survey it is clear that the consumption of sunflower oil was confirmed as well as the upward trend in olive oil consumption. Although the statistics confirm an increase in margarine consumption, the respondents included in our survey claim the exact opposite. Similar situation may be observed in relation to the meat consumption. The structure of meat consumption in our survey is similar to that monitored by the Statistical Office of the Slovak Republic. Nevertheless, the results of our survey were not confirmed again in the case of fish consumption. Our respondents state that they also consume fish, percentage rate in the questionnaire is at the level of pork consumption, but the macroeconomic data on consumption do not confirm it.

These findings should be interesting for both marketing experts and consumer policy makers. Furthermore, findings suggest that the attributes that characterize an effective decision-maker include particular cognitive skills.

ACKNOWLEDGEMENT

This paper was carried out with the support of the project VEGA 1/0890/16 "Quantification of sustainable consumption through modelling of consumer behaviour in food consumption" conducted at the Department of Statistics and Operations Research at the Faculty of Economics and Management of the Slovak University of Agriculture in Nitra

A PLANNING AND CONTROL SYSTEM BASED ON SOCIAL WELFARE INDICATORS USEFUL WAY TO GUIDE THE GOVERNANCE FOR SUSTAINABLE HEALTHCARE MOBILITY

Biancone, Pietro Paolo; Secinaro, Silvana; Brescia, Valerio

Department of Management, University of Turin, Turin, Italy

ABSTRACT

New Public Management has changed the way we perceive and at the same time govern public health companies. In a period of economic crisis and reduction of available resources, the new objective is to identify new indicators, including non-financial ones, to plan resource allocation and production choices. The applied method is quantitative subjective, the theory is demonstrated through the focus of a theoretical assumptions. The carried-out elaboration, after having identified the variables considered and the possible mathematical relationship between variables (for example a synthetic index of mobility), defines the relationship between them through linear regression and through a multivariate statistical analysis. All statistical analyses were performed using STATA and p value <0.05 was considered significant for all analyses. The choice of mobility for acute performance in the ordinary regime between regions in Italy is used as case study. Stakeholders could be influenced by non-economic and non-subjective information such as social indicators, by objective indicators such as the achievement of minimum levels of assistance in each region or some objective BES indicators. A positive correlation is observed between the synthetic mobility index and the perception of health. Furthermore, the synthetic mobility index decreases with the difficulty of access to services. The economic factor GDP per capita continues to influence both social indicators and the achievement of minimum levels of service. The challenge of the new millennium is the identification of non-economic indicators useful to support the classic economic indicators that are not always representative of the real welfare of the population.

Keywords: NPM, healthcare mobility index, social index, healthcare production choice, healthcare governance choice, information, acute ordinary regime, LEA, GDP, sustainability.

INTRODUCTION

Theoretical Background

The company is a man-to-man instrument (Ferrero, 1968). Public companies use public resources to provide goods and services to citizens in order to answer to an anthropological need (Puddu, 2001). Accounting, needs and responsibility are closely linked to ethics (Grbac & Lončarić, 2009). The corporatization of public bodies is part of a process launched in Europe between the 80s and 90s aimed at answering to the new requirements of public spending's rationalisation. This process is identified in literature as New Public Management (NPM) and corresponds to the collection of management and leadership practices gradually introduced in the public sector. NPM is a generic term for a variety of management ideas, often borrowed from the private sector, which introduce ideas and tools such as competition, privatization, management by objectives, decentralization, etc. in the public sector (Hood, 1991, 1995). The NPM movement has its origins in a critique of the traditional way of exercising control and management of public organizations as a requirement for greater efficiency in the public sector. Using the tools developed in the private sector to manage public affairs is possible through the implementation of a communication path aimed at all stakeholders and, in particular, at citizenship. In the public sector, information and communication are made possible through reporting and budgeting tools (Biancone et al., 2016). An organization can have many stakeholders and, consequently, a wide range of actual or potential users of financial reporting. The approach to stakeholders spread in the 80s considers the corporate choices not only aimed at maximizing shareholders, but also for the maximum benefit of the community, not only economic, but for all those who have a relationship with the company. Stakeholders are defined, in the first definition, as groups which would cease to exist without the organization (Freeman & Reed, 1983). In the public shareholder and specifically in health companies, the citizen is the subject interested in reaching and satisfying the needs. The involvement of all the stakeholders must create a mapping of the interested parts, the top management in the company governance is required to involve both the passive and the active stakeholders in the decisions (Freeman et al., 2007). The theory based on the rights of the different stakeholders focuses attention on all those groups that might have an interest in the provision of the service (Mitchel et al., 1997). The main users of the health service are citizens, who in a new perspective of public companies answer to the need by providing useful and essential information for the production, becoming themselves producers of the service. Co-production does not simply involve bilateral relations, there are multiple relationships between health service customers and other stakeholders. In the health service, Hyde and Davies (2004) found a complex interaction between organizational design and customer interactions that co-produces care through a series of relationships. Co-production by users and communities has provided an important

integration mechanism, bringing together a wide variety of stakeholders in the public interest, frequently ignored and usually underestimated in its potential to increase the effectiveness of service delivery policies. This framework suggests the need to recontextualize the provision of services as a process of social construction in which the actors of self-organizing systems negotiate rules, norms and institutional frameworks rather than taking the rules of the game as given (Bovaird, 2007). In company planning, access to information by the user could be a key element for the definition of the financing of services and the level of output of the company. Eysenbach and Jadad (2001) hypothesize that decisions and care choices are possible for patients through the use of the Internet, obtaining clinical information on performance and online results is seen as sufficient factor to guide the choice with respect to the doctor or to the most appropriate medicines, however, there is no evidence on the actual choice of the patient with respect to the progress of the health system. Other authors have shown that the availability of information is not sufficient to guide the choice and that there is an information asymmetry between the information that the user has and the choice of treatment (Bloom et al., 2008). The citizen often approaches public management only when needed and is not really aware of all the services provided, of the quality of services and of the capacity of the health service to answer to the need in each region (Pica and Villani, 2010). The theory linked to the type of information useful to guide the planning of the health care company has not yet fully analysed how much information and indicators available to the main stakeholders can affect the service and the choices of production and company governance.

Research question

The conducted analysis aims to demonstrate that social indicators and levels of achievement of business results are related to the choice of consumer care, and whether the choice is also related to the overall perception attributable to each Italian region. Normally the choice of governance of service delivery according to need is based on the collection of health needs. It is assessed whether the allocation of resources based on citizens' perception is possible thanks to social indicators. Paying attention in parallel to the satisfaction of the citizen and the ability of the health company to answer to the need. The essential level of provision of benefits should affect the choice of mobility of the citizen and should no longer be connected to the per capita availability of GDP (gross domestic product) in each region. It is discussed whether the economic perspective is now far from the true satisfaction of the needs and choices of the citizen, or if availability remains an important indicator that directs the choice of active mobility among regions, thus providing a indicator flooded of satisfaction.

MATERIALS AND METHOD

Method

The conducted analysis is quantitative subjective, the theory is demonstrated through the focus of a real case in order to increase the understanding of theoretical assumptions (Burrell, and Morgan, 1979). The carried-out elaboration, after having identified the variables considered and the possible mathematical relationship between variables (for example a synthetic index of mobility), defines the relationship between them through linear regression and through a multivariate statistical analysis. All analyses were verified with a robustness test that confirms the significance of the relationships. All statistical analyses were performed using STATA V.13 (Stata Corp, College Station, Texas, USA, 2013) and p value <0.05 was considered significant for all analyses. The case study takes into account data on regional mobility in Italy in 2014, 2015, 2016, the welfare indicators of the “BES” project for the years 2015, 2016, 2017, data provided by the ISTAT platform “Health for all” on economic variables (GDP), population and mortality index, and finally the LEA indicators defined by the Ministry of Health of Italy for 2014 and 2015.

Used variables

Accountability and sustainability through social indicators

In recent years, scholars and operators compare the different health systems, paying attention to increasing national and regional needs. In particular, a debate has developed around the technical efficiency of health policies, understood as the ability of public policies to pursue quality health performance by making best use of available resources (Retzlaff-Roberts et al., 2004). With the economic crisis of 2008, the descriptive and interpretative efforts of the various health systems increased dramatically, also in comparative terms (Levy and Sobolev, 2016). The scarcity of available resources and the consequent cuts in public spending, indeed, have raised the question of the model and type of health, in the legitimate attempt to identify the institutional structures and production solutions comparatively more efficient than the others, also in relation to the system outcomes. For a couple of decades, economists, sociologists and psychologists have been working together to develop indexes that reflect quality of life developments better than GDP statistics. “Happiness formulas” were also invented by combining various criteria of welfare measurement with measures of subjective perception of individuals about their situation. During this period there has been much theoretical concern for the study of the competitiveness exercised by experts and international bodies by experts from the academic sector and consulting businesses. Most of these studies describe the main determinants of economic performance on competitiveness and the interdependence between a country’s current socio-economic development and its potential growth. Gross domestic product is the most widely used indicator in the measure of economic activity, but has numerous flaws. It is able

to measure only market production, without recourse to market prices, and does not take into account consumer surplus or produced externalities. The current recession did not happen because we could not follow the kind of advice given by this Commission; the current recession took place for a cyclical process that is part of the nature of the economic system (Leunig, 2011). The European Observatory on health systems and policies has published studies that are more complete and methodologically based on comparative analysis, both on the functioning of health systems and on the reforms and political initiatives started or under way in the European countries belonging to the World Health Organization. For its part, in 2008, the Organization for Economic Cooperation and Development (OECD) promoted a sciential survey on governance systems and decision-making, responsibilities and financial resources available in the various OECD countries. (Paris et al., 2010). It is also to be considered that the creation of too many indexes by the created commission could make the relationship not interpretable and not general, returning the role of main indicator of comparison to GDP. The Commission's report on the measurement of economic performance and social progress is vaguely interesting, but offers little in terms of historical economic value. It does not give alternatives over time as the different companies have implemented the shares based on the different indexes. It is estimated that, taken as a whole, changes in per capita GDP may overestimate or underestimate economic performance and social progress, or that this measure is more or less accurate for different countries or for different periods of time. Indicators and composite indexes are increasingly recognized as useful tools for policies because they bring information about a country's performance (Landry et al., 1999). The main advantage of an indicator is its ability to synthesize complex information from our dynamic world into a manageable amount of meaningful information. Some scholars claim that there are no ideal planning tools to achieve sustainability either on a regional or local scale (Keiner, 2006). Recently, politicians have begun to encourage scientists to improve models and develop new techniques to integrate quantitative and qualitative analysis for local and regional planning of sustainable development (Grosskurth and Rotmans, 2007). In particular, the correct choice of indicators is essential to monitor progress towards sustainable territorial development. Accountability is one of the results of NPM and involves those who perform a function of planning, management or control, as a responsible subject towards those who accept the effects of the exercise of these functions (Ricci, 2005). NPM and New Public Management increasingly increase the need for transparency, the citizen wants to know and wants to decide services, but in the health sector is not sure whether he/she is able to perceive and choose on the basis of the information at his/her disposal. With reference to a territory, if it is reported, it is because there are subjects to whom account must be given and, at the same time, there are some subjects who feel the need and the responsibility to report on the actions taken. The social responsibility of the territory is an approach to development that is

being imposed in the search for sustainable models on a global scale. The social sphere is at the centre in its widest and most complete meaning, including and exceeding the economic categories and the needs of profit.

Bes and social indicators

BES is the project to measure fair and sustainable wellness, is part of the international debate on overcoming the GDP, fuelled by the awareness that the parameters on which to evaluate the progress of a company cannot be exclusively economic, but must also take into account the fundamental social and environmental dimensions of well-being, accompanied by measures of inequality and sustainability. The document was presented in its fifth edition on December 15th 2017. BES (Fair and Sustainable Wellness) is based largely on the OECD framework. It represents a demanding challenge in this document because it seeks to integrate wellness with equity and sustainability. This involves significant theoretical problems that need to be clarified and resolved before the technical methodological discussion can be started on how to measure the dimensions present in the various domains. Bes is a process that takes the multidimensionality of wellness as a starting point and, through the analysis of a large number of indicators, describes all the aspects that contribute to the quality of life of citizens. In this context, official statistics must keep up with the growing demand for statistical information of quality. It is then up to citizens and their representatives to choose which dimensions of wellness are able to return more value and on which it is opportune to invest, with the awareness that the achievement of some objectives could compromise or delay the achievement of others. Bes can also assist the public administration in the decision-making process and at the same time provide the citizen with information that guarantees transparency and a reading key also linked to the services that the company offers. It is important the influence that the community and the level of public acceptance have on social indicators and therefore on the possibility of using them for comparison (Jones et al., 2012, Gutierrez et al., 2011). The functions of the public company can therefore be representative on an aggregated level both in quantitative and qualitative terms of achievement of the programmed results, and through a comparison and a key of interpretation as regional statistical indicators of reference on specific activities. In a complex system it is necessary to look for common reading keys and broad indicators that allow to understand the work of Governance, Culture and the Economy of a territory. In our analysis it is possible to consider the 2015 health compound indicator as an effect of the 2014 financial year to assess the perception of health, the same indicator is also present for the year 2016 as an effect of the perception of 2015 while it is not possible comparison with the third year of 2017 as ISTAT preferred not to make this indicator more explicit as a reference to the health perception trend, replacing it with a series of objective measurement indicators. Among the indicators used to evaluate the perception of the different regions also the

composite of education and training, the composite of income and social inequality, the composite of unease, the composite on social relations, the trust in other types of institutions (territorial health and public bodies), the rate of innovation and product of the service on the productive system and the difficulty of access to some services. In 2017 the composite indicators are reduced not allowing an appropriate comparison, although the analysis is still conducted, it is also reported that some indicators are replaced by others. The social indicators BES are both objective and subjective type, the first is based on the objective quantitative evaluation with a ratio between quantitative factors, the second is qualitative based on survey, in this case it is a question of non-objective variables but represent the evaluation of users. Both in 2014 and 2015, the number of residents and per capita GDP can be assessed. In the two years through another ISTAT project called "Health for all Italy", database of indicators on the health and health system in Italy, structured in such a way as to be interrogated by the HFA software provided by the World Health Organization adapted to national needs, it is also possible to evaluate the mortality indicator as an objective indicator of evaluation of health services for each region. The data for 2017, unfortunately, both on the per capita GDP per region and as regards the mortality rate are not yet available, therefore only the data useful for the analysis are represented. The indicators and data available for each year can be identified in Table 1, Table 2 and Table 3 for quick representation and are made up of observable objective variables and subjective variables based on the perception of residents as the perception of wellness (health). The empty boxes in the tables represent the missing data for the BES indicators or not yet available for the other values because not processed by the national statistical service. The indicators and tools used are placed in the international discussion thanks to projects of assessment of governance, accountability and perception by similar stakeholders such as the use of indicators to assess the perception of health, mortality, wealth of families, indicator composed of quality of the service provided in the OECD countries (Biancone et al., 2018). Access to the tables (*Table 1: Mobility and variables for 2014; Table 2: Mobility and variables year 2015; Table 3: Mobility and variables for 2016*) is possible online through the link: <https://drive.google.com/drive/folders/14L5J5FIMX9hvgg5DNiRKFOa9X1-yFvNh?usp=sharing> The choice was made to facilitate the analysis, the tables occupy more than one page. the tables are present in the appendix.

Planning and health systems and Lea

Healthcare funding policy is an integral part of efforts to move to UHC (universal health coverage), but to align health financing policy with UHC prosecution, health care reforms need to be explicitly targeted to improve coverage and the intermediate objectives related to it, that is, efficiency, fairness in the distribution of health resources and transparency and accountability. The unit of analysis by objectives and the objective itself must be the population and the health system as a whole. What

matters is not the way in which a particular funding scheme affects its individual members, but rather how it influences progress towards UHC at the population level. The systematic approach goes through the System expressed in Figure 1 (World Health Organization, 2010), where the objectives expressed influence the planning, programming and control starting from the consideration of need, efficiency, quality, transparency and accountability. All the elements expressed in the graph are considered in the management and preparation of the funding and in the control of production business flows. The key performance indicators represent the achievement of results in healthcare companies and are configurable as the capacity and the level of answer to a need.

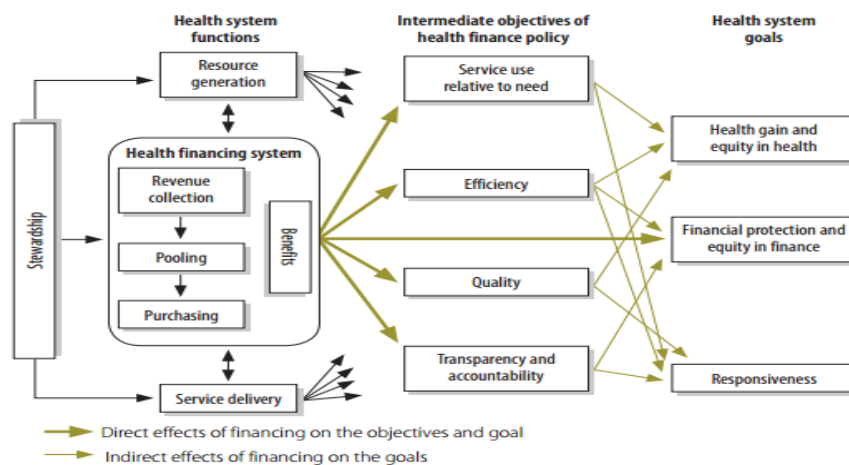

Figure-1. Health system goals and health financing policy objectives (Kutzin, 2008)

In Italy, the complex system of financing health services depends partly on the funding provided by the National Health Fund and partly on regional own revenues. Funding based on per capita share, based on inhabitants, must ensure a balance between available resources and the provision of adequate health services through the essential levels of assistance (LEA) (Costa, 2010). The Regions, as they have done up to now, will be able to guarantee additional services and services compared to those included in the LEAs, using their own resources. LEAs are at the basis of current health planning in Italy and are grouped into three major levels: collective prevention and public health, district assistance and hospital assistance. The certification of fulfilments takes place through the documentation specifically required to the regions through a questionnaire and an analysis of the same integrated with information already available at the Ministry of Health. Certification is carried out by the members of the LEA Committee which also establish compliance and criteria for assessing the fulfilment or non-fulfilment of the regions. The preliminary work is conducted by the offices of the Ministry responsible for matters of compliance, examined and validated by the members of the LEA Committee. An interactive comparison with the regional representatives is foreseen. Specifically, the certification of the fulfilment of the "maintenance in the provision of LEAs" area occurs through the use of a defined set of indicators divided between the three large levels. The regions are placed in the

compliance class if the score obtained is ≥ 160 or between 140 - 160 and no critical indicator while it will be placed in the default class if the score obtained is <140 or between 140 - 160 with at least one critical indicator. In our analysis we will not give evidence of the criticality of each region, but we will use Lea as a representative indicator of objective quality of performance of each region in relation to other variables, evaluating the relationship and the trend. It is possible to evaluate for 2014 and 2015 only the Leas of the Italian regions with ordinary statute.

Inter-regional health mobility and its financial implications

Healthcare planning must take into account the effectiveness of the service and the implications produced on the LEA, in terms of governance and accountability, health mobility is a phenomenon that must be taken into account. Health migration is the movement of patients from the regional territories of residence to other areas considered more equipped from the diagnostic and therapeutic point of view, in order to obtain better assistance. The phenomenon of health mobility is present not only in Italy but also in other countries of the European community and the United States of America. The principle of free choice, by patients, of the place where receiving care to which they are entitled has transformed since 1992 the Italian Health System. The topic concerns both the management of the services in the Health Authorities and those involved in planning at the level of local authorities and, therefore, it needs to obtain adequate information on the level of needs to be met and on accessibility to local public services. Moreover, the transfers of the assisted people among the health services structures of the Regions imply the need to regulate the debit and credit positions with respect to the rates in force for each service. The National Healthcare Fund, which distributes on a share capital, defines through the Ministry of Health the services to be taken into consideration, the characteristics of the information flows (tracked records), the times and methods of data transmission, the system to check the charges transmitted, the procedures for contestation and those provided for the initiation of counter-deductions. The classification of the services is currently carried out by means of the International Classification of Diseases system, in order to standardize the Grouped CMS ICD-9-CM classification system. For the proposed analysis, the information obtained from the SDO database was used, i.e. the national database on hospital admissions, set up at the Ministry of Health and freely available online, which includes information on all admissions. registered in Italy since 1996. Both in table 1 and in table 2 and table 3 it is possible to deepen the analysis by studying the escape and attraction indexes of the individual regions. The proposed method is applicable internationally. The national average value can be assumed as a reference value to evaluate the trend. The synthetic mobility index (ISM) can be calculated as the ratio between the attraction index and the escape index. The ISM always assumes values greater than or equal to zero. It is zero when the attraction is null, that is when in the considered catchment area no non-resident admissions were made. Values between 0

and 1 indicate inter-regional immigration lower than emigration. Values greater than 1 are when the incoming flows exceed the output flows. On an exemplary level, for numerical significance the values that represent the mobility for the acute in the ordinary regime were observed. The synthetic mobility index will be one of the variables used to evaluate the choice of the citizen and the relationship with other regional, economic and qualitative variables of respect for the essential assistance levels.

STATISTICAL ANALYSIS RESULTS

For both the year 2014 and 2015 the combined health index and the relative perception of health in each region increases as the per capita GDP increases, the dependency variable is the health compound index (2014 standard error = 1,332, p value <0.001 and $R^2 = 0.7735$, year 2015 standard error = 1.709, p value <0.001, $R^2 = 0.6626$). For both 2014 and 2015 the synthetic mobility index decreases with the difficulty of access to services, the dependent variable is the synthetic mobility index (2014 standard error = 0.456, p value = 0.011 and $R^2 = 0.307$; 2015 standard error = 0.0500, p value = 0.014, $R^2 = 0.2903$). In 2014 and 2015 the compound health index, and the relative health perception increases with the rise in the number of LEA reached in each region, the health compound index is the dependent variable (year 2014 standard error = 0.051, p value <0.001 and $R^2 = 0.714$; 2015 standard error = 0.0366, p value <0.001, $R^2 = 0.778$). For both 2014 and 2015 there is a positive correlation between the synthetic mobility index and the perception of health, the synthetic mobility index is the dependent variable (2014 standard error = 0.014, p value = 0.001 and $R^2 = 0.439$, 2015 standard error = 0.014, p value = 0.005, $R^2 = 0.358$). For both 2014 and 2015, the LEAs achieved in each region increase as the per capita GDP increases, the Lea are the dependent variable (2014 standard error = 6.142, p value = 0.001 and $R^2 = 0.558$; 2015 standard error = 6.609, p value <0.001, $R^2 = 0.664$). For both 2014, 2015 and 2016, there is no correlation between mobility and the overall perception of each region using the different composite indicators available as independent variables with respect to the dependent variable mobility ($p > 0.05$). There is no correlation between mortality indicator and health perception, just as there is no correlation between perceived quality, quality perception and achievement of LEA.

DISCUSSION

The Italian state as well as other countries has been engaged for a long time in the definition of a series of social indicators aimed at measuring the perception and satisfaction of the needs of citizens. The post-industrial 21st-century perspective focuses on the assessment of well-being aimed at answering to needs, rather than focusing on level and production growth. From 1960 to today several studies have been done on the subject. In particular, we start from the analysis of Land (2012), Glatzer et al.

(2015) by Hagerty and Land (2001), Volger (1999) and Cramm et al. (2012) and finally by Andrews et al. (2015). In Italy the introduction of BES project: the fair and sustainable well-being that has taken place since 2014 by ISTAT CNEL and ISTAT guarantees some reference indicators at national level. The indicators provided in Bes report aim to make the country more aware of its strengths and difficulties to overcome in order to improve the quality of life of its citizens, placing this concept at the base of public policies and individual choices (Biancone et al., 2017). In Italy the Ministry of Health has defined an Essential Assistance Level (LEA) that represents the provisions and services that the National Health Service (NHS) is required to provide to all citizens, free of charge or upon payment of a participation fee (ticket), with public resources collected through general taxation (taxes) and which can represent the capacity of each region to answer to the needs of the resident population (Brescia et al., 2017). Planning and programming the expenditure and the volume of services to be provided is not easy in a system where the economic crisis reduces the available resources. The obtained results show that various information could direct and influence the choices of the stakeholders, affecting the governance choices of the healthcare companies. The corporate social responsibility and accountability provide as a priority element the involvement of stakeholders and in particular in the public community and citizens (Jones et al., 2007; Mohammed, 2013). The economic evaluation has not yet been completely overcome as this could still influence the other variables at stake. The social indicators associated with objective indicators of achievement of minimum performance and GDP trends are all elements to be taken into consideration. The population from the first statistical analyses could be affected by the per capita GDP available in the perception of overall health, but it seems to be aware of the real performance of the number of essential services provided (LEA) during health mobility choices for acute performance in ordinary regime. Just as in the attractiveness given by each region in tourism companies, even in healthcare mobility, GDP influences the choice with a direct impact on perception and relapse (Alonso-Almeida et al., 2016), but it is always necessary to consider several indirect variables, identifying the most appropriate analysis mediators. The degree of satisfaction as in private companies is also important in public companies but should not be used alone to read the results, but must always be associated with objective indicators. The monitoring of access to public services and the collection of information is necessary in real time to obtain results that are always up to date and ready to direct choices. It has been shown that the exchange of information also on the quality of services helps both to change perceptions and to increase the reading capacity of stakeholders and politicians (Glatzer, 2015; Kundu & Datta, 2015; AL Athmay et al., 2016). Furthermore, it seems to be able to direct the choice of active mobility on the basis of the ease of access to public administration services without taking into account the trend and the general perception given by the regional indicators of the different regions. The use of information and

communication technologies in the healthcare sector offers great potential, but many data and indicators have not yet been fully used and put into the system (Aggelidis & Chatzoglou, 2008). The aging of the global population and the reduction of available resources requires public health to better orientate intervention choices and resources according to the needs of each region to increase the sustainable use of resources (Adderley & Mellor, 2014).

CONCLUSIONS

A planning and control system based on social welfare indicators, associated with the economic performance represented by per capita GDP and the level of essential services provided could be useful indicators to guide the governance of the health system and at the same time, which information is useful to meet the needs of NPM represented by a growing need for transparency and accountability of the population and other stakeholders. The challenge of the new millennium is the identification of non-financial indicators useful to support the classic financial indicators that are not always representative of the real welfare of the population, and not always easy to understand for everyone. The diffusion of all indicators that are easy to understand could allow greater perception by orienting choices and reducing the information asymmetry that is often present between the consumer and the public company.

STRENGTHS AND LIMITATIONS OF THE CURRENT STUDY

The study is innovative and no similar studies have been conducted. The use of non-financial information is suggested by the European community to better involve all stakeholders, Directive 2014/95 / EU (EU, 2014). The possible limitation of the proposed model is given by the obsolescence of data at the time of use by politicians and legislators. The study is conducted on Italian indicators, it is important the reproduction and analysis in other countries in which financial, non-financial and social indicators have already been developed.

GREEN MARKETING COMMUNICATIONS IN THE FUNCTION OF SUSTAINABLE DEVELOPMENT

Bratić, Diana¹; Palić, Mirko²; Tomašević Lišanin, Marija¹; Gajdek, Dea¹

¹Faculty of Graphic Arts, University of Zagreb, Zagreb, Croatia

²Faculty of Economics and Business, University of Zagreb, Zagreb, Croatia

ABSTRACT

Modern marketing is oriented on a sustainable development, which is a framework for designing policies and strategies for continued economic and social progress, without harming the environment and natural resources essential to human activities in the future. The green consumer is the focus of all marketing activities that are also shaped to support the overall green business. But the emphasis is on green communication through the sales packaging of products. Green communication is best achieved through ecological symbols on packaging.

This paper is part of a systematic research of consumer relationships towards ecological packaging, ecological symbols and recycling routines. The obtained results point to positive ecological attitudes and actions that contribute to the sustainable development.

Keywords: marketing communication, green packaging, sustainable development, ecological symbols

INTRODUCTION

Marketing begins and ends with a customer. Marketing as an activity monitors consumer needs and desires and, in parallel, follows trends related to the entire market. At the beginning of the 1970s, people began to play an important role in environmental protection and green marketing emerged. With increased consumer awareness of the environment, businesses have had to turn around and make their products ecologically acceptable. But it is not just a product that has changed since the beginning of this eco-conscious era, but all its components as well. The main component has always been the price that is economically compromising for eco-friendly products and is often higher than the price for the classic product. Then the way of advertising and promotion of products and communication between companies and consumers changes. The packaging itself is of great importance. The packaging has more functions, such as protective, sales promotion, economic, distribution and usability, and some changes have also occurred in this reversal. In addition to the new types of materials used, packaging is being reduced to the right dimensions to keep the product safe and yet minimal. Therefore the package is an important link in the communication chain as it transmits visual messages and affects both the

decision to purchase, and post-purchasing behavior of consumers. Storage and recycling of packaging has also become the everyday life of most consumers and is characterized by various symbols and signs of each packaging and facilitates further use or disposal. Today, environmental concerns are part of a culture that in many ways encourages society to move to live in a way that a cleaner and healthier environment will be maintained. According to Grant (2007) main potential role of the “new marketing” is to make more consumers willing and able to go green. This can be established through education and extension of the green culture beyond middle class.

In this paper, we will try to find out the impact of green marketing on recycling habits of consumers through analysis of theory and experimental research. For the purpose of experimental research, a survey questionnaire will be used, from which the data collected will see consumer attitudes and their relation to green packaging and marketing. It will also be seen from the research how many consumers are paying attention to ecological symbols and packaging recycling. Collected data will be statistically processed and interpreted in order to make a conclusion on how much green marketing and packaging really affect consumers and their recycling habits today.

THEORETICAL FRAMEWORK

In the concept of corporate socially responsibility it is necessary that economic entity takes into accounts its economic, social and environmental impact. Achieving competitive advantages and greater productivity contributes to investing in technologies that do not pollute the environment (water, land, air); investing in employee training, better working conditions (health and safety) and building good relationships with employees (Dangelico & Vocalelli, 2017). In addition to this, internal dimensions, socially responsible business has its own external dimension, i.e. positive influence on the local community and other participants (suppliers, business partners, financiers, shareholders, consumers, public administration, associations) (Tolušić, Dumančić & Bogdan, 2014). Consequently, conventional marketing has also been transformed and adapted to new values at the same time satisfying the new needs and desires of consumers and achieving sustainable development (Papadas, Avlonitis & Carrigan, 2017).

There are three broad types of green marketing objectives: green with setting a new standards in responsible products, policies and processes; greener which includes sharing responsibility with customers; greenest which means supporting innovation – new habits, services, business models (Grant, 2007).

With the development of green marketing, the term green consumer appeared. A green consumer can be identified as a consumer who, in meeting their needs and desires, seeks a product that has minimal

negative impact on the human environment (Tolušić, Mikolčević & Tolušić, 2011). These are educated consumers and the target market is very interesting, although a much larger market consists of other consumers who are passive to the preservation of the human environment (Kotler & Keller, 2008). Green marketing tools such as eco-label, eco-brand and environmental advertisement will make easier perception and awareness of green product attributes and characteristics, consequently, guiding them into purchasing environmentally-friendly products. So Rahbar and Wahid (2011) has tried to explore the relationship between consumer's actual purchase behavior and green marketing tools. They concluded that the relationship between trust in eco-label, eco-brand and purchase behavior are significant.

Such consumers are much more concerned about environmental issues when purchasing and using products. They are often very active in their communities, accepting and supporting ecological actions and goals, and they are also willing to allocate more resources for organic products. Therefore, they expect complete information about the product or its packaging, because they are motivated by the desire to protect themselves, members of their families and their neighbors and to secure the future. Green consumer research has resulted in segmentation green and other ecologically aware consumers, according to their interest in an environment protection (Nefat, 2015). Also, consumers believe that purchasing green products or products from green companies may be a way they can help the environmental problems society faces today (Borin, Lindsey-Mullkin & Krishan, 2013).

Evolution in the ecologically conscious consumer behavior (ECCB) also has been investigated by Tilikidou (2013). She emphasized that ECCB is assumed to consist of four distinct, though inter-related, types, namely pro-environmental purchasing behavior, recycling behavior, pro-environmental post-purchasing behavior, and pro-environmental (non-purchasing) activities.

Within the green marketing complete 4P concept can also be based on sustainable development. Except a green product and the green packaging there are green price and a green communications (Ham, 2009). Beside green 4P, green marketing also uses the accepted 3R formula (reduce - reuse - recycle), and in that way through three steps significantly helps to protect the environment and sustainable development (Bačun, 2009; Gittel, Magnusson & Merenda, 2012).

Pressure on companies to "go green" is constantly increasing. It is coming from the market as well as from the governments (Iannuzzi, 2018). There is virtually no global brand that is not environmentally and sustainability conscious. Examples of best practice include Tesla, IKEA, Lego, Timberland, P&G, Tesco and many other. Jacquelyn Ottman, founder of J. Ottman Consulting, developed a list of twenty rules that the company should keep in mind while developing its strategy in the direction of green marketing. These rules make it easier for companies to develop brave, creative and practical

strategies that emphasize the inherent value of products for a successful integration of sustainability (Ottman, 2010).

Kumar and Ghodeswar (2014) found that the respondents possess willingness to support environmental protection, realization of environmental responsibilities, and inclination towards searching green product-related information and learning about green products. Supporting environmental protection, drive for environmental responsibilities, green product experience, environmental friendliness of companies and social appeal are identified as important factors affecting green product purchase decisions. Latif and Omar (2012) in their study find out that is a significant relationship between recycling behavior and collectivism. Also, environmental concern is important towards attitude, and attitude helps to enhance the environmental concern to improve recycling behavior (Jekria & Daud, 2016).

Ertz et al (2016) in their study had identified which variables (such as having more or less time, money, and power available) may be of more interest to modulate, so as to increase pro-environmental behavior. Furthermore, Martin Gonçalves et al (2016) in their study has examined whether consumption values predict green buying behavior. They based the examination on the theory of consumption values and results show that the functional value is almost always necessary but is not sufficient by itself for predicting green buying.

This kind of investigation is a very important because the green consumption among individuals can be an effective way to minimize the negative impact of consumption on the environment (Yadav & Pahtak, 2017).

Given the growing importance of ecological business and behavior, there was a need for scientific research to determine how much consumers are green oriented. Do they understand green concept through the green communication, green packaging and green waste management.

METHODOLOGY OF RESEARCH

The collection of empirical data for this paper was performed during August, 2017. The research was quantitative in its nature. The questionnaire as instrument was obtained by exploratory factor analysis and it consists of 15 questions related to the research topic i.e. green marketing, green consumer, recycling routine, green package and ecological symbols. Reliability of this test based on collected data, Cronbach alpha=0,943, is satisfactory for the purpose of the study. Additional independent variables describing the respondents' characteristics (gender, age, level of education, employment status, and total monthly household income) were added to the survey. A total of 151 completed questionnaires were collected during the study.

Figure 1 shows independent characteristics of respondents. Survey respondents were 78% female and 22% male. Respondents were coming from age groups up to 20 (4%), 21-35 (43%) 36-45 (22%), 46-55 (20%), 56-65 year (8%) while 3% of respondents were older than 65 year.

Figure 1. *Independent characteristics gender and age of respondents*

A total of 56% of respondents achieved at most high-school diploma education, 44% completed undergraduate studies, Bachelor of Science diploma, Master of Science or doctoral diploma. Also a total of 58% of respondents are employed, 30% student, 7% unemployed, and 5% retired as shown in Figure 2.

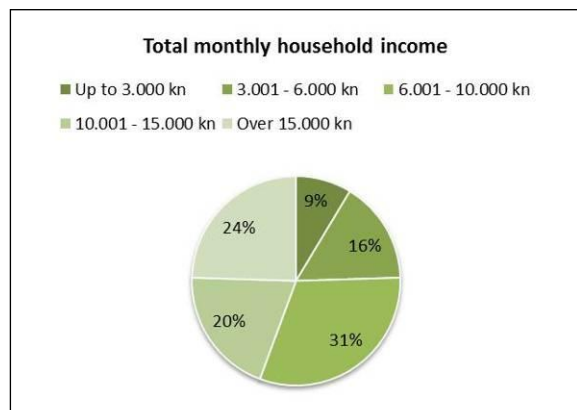

Figure 2. *Independent characteristics level of education and employment status of respondents*

Also a totally monthly household income of respondents was investigated. Figure 3 shows the distribution of income by category.

Figure 3. *Independent characteristics total monthly household income of respondents*

DISCUSSION AND RESULTS

The research was based on two hypotheses:

H1: understanding of the concept of green marketing positively affects the recycling routine of the respondents

H2: being a green consumer positively affects the recycling routine of the respondents

As shown in the Figure 4, majority of survey respondents (39% or 59 respondents) understands the concept of green marketing, 27% or 40 respondents doesn't know what is green marketing, and 34% or 52 respondents are not sure about it.

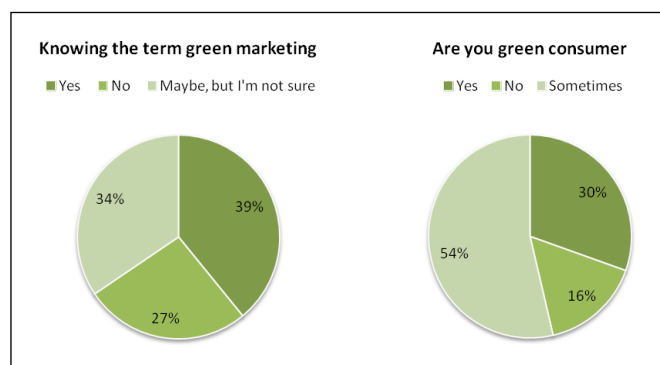

Figure 4. *Independent characteristics "understanding of the concept of green marketing" and "being a green consumer"*

Furthermore, 46 of survey respondents (or 30%) describe themselves as a green consumers, 24 respondents (or 16%) think they are not green consumers, and majority of respondents (54% or 81 respondents) sometimes behave like a green consumer (Figure 3).

The main research question pertained to the recycling routine i.e. frequency of recycling. Figure 5 shows that 52% of respondents (or 79 respondents of survey) recycle packaging, 38% (or 57 respondents) do this sometimes, and only 10% (or 24 respondents) never recycle.

Figure 5. *Dependent characteristics recycling routine*

Descriptive statistics of frequency of recycling routine related to familiarity of the green marketing concept and being a green consumer.

In the first step, descriptive statistics of measured values was made. It was used to determine normality of data and their convenience for further statistical analysis and interpretation.

Table 1. *Number of valid cases*

Between-Subjects Factors		
		N
Green marketing	Yes	59
	No	40
	Maybe	52
Green consumer	Yes	46
	No	24
	Sometimes	81

Table 1 shows number of valid cases of frequency of recycling routine related to knowing the term green marketing and being a green consumer (answers *yes*, *no*, *maybe* or answers *yes*, *no*, *sometimes*).

Table 2. *Descriptive statistics of recycling routine frequency related to familiarity of green marketing concept and being a green consumer*

Descriptive Statistics				
Dependent Variable: Recycling				
		Mean	Std. Deviation	N
Green marketing	Yes	3,1100	,07466	59
	No	2,9760	,32770	40
	Maybe	5,7730	,15377	52
	Total	4,8383	,97431	151
Green consumer	Yes	2,9997	,08011	46
	No	3,4640	,14924	24
	Sometimes	4,3100	,09371	81
	Total	3,5574	,96974	151

Table 2 shows a descriptive statistics of recycling routine frequency related to familiarity of the green marketing concept and being a green consumer (answers *yes, no, maybe* or answers *yes, no, sometimes*).

Standard deviation or absolute measure of dispersion shows that there are low percent deviations in frequency in answers of recycling routine, in comparison to average frequency in answers for both independent variables, knowing the term green marketing and being a green consumer. It shows that the variability is low.

It was concluded from the results that the measured values are appropriate for the further statistical interpretation and analysis of variance. One Way ANOVA test was used.

Univariate Analysis of Variance

Before testing the difference of effects among familiarity with the green marketing and being a green consumer on the recycling routine, Levene's Test of Equality of Error Variances of familiarity with the green marketing and being a green consumer was conducted. This test was used to assess the equality of variances for a variable calculated for two groups, familiarity with the green marketing and being a green consumer. It tests the null hypothesis that the population variances are equal regarding the result of *p*-value, which is less than significance level of .05 as Table 3 shows. It can be concluded that the average values of the tested groups are not equal.

Table 3. *Levene's Test of Equality of Error Variances of familiarity with the green marketing and being a green consumer*

Levene's Test of Equality of Error Variances^a
Dependent Variable: Recycling

F	df1	df2	Sig.
11,003	5	141	,000

Tests the null hypothesis that the error variance of the dependent variable is equal across groups.

a. Design: Intercept + Green marketing + Green consumer + Green marketing * Green consumer

Below are the results of tests of Between-Subjects Effects of familiarity with the green marketing and being a green consumer (Table 4). Observing the level of statistical significance of *p*-value (less than 0.05), it can be concluded that the independent variables of familiarity with the green marketing and being a green consumer are significant. They positively influence the change of a recycling routine of the respondents. It is interesting to point out that the difference in frequency of a recycling routine is around 76,9% in those who know what green marketing is and of those perceiving themselves as a green consumer.

These results fully support H1 and H2 hypotheses that understanding of the concept of green marketing and being a green consumer positively affects the recycling routine of the respondents.

Table 4. *Tests of Between-Subjects Effects of familiarity with the green marketing and being a green consumer*

Tests of Between-Subjects Effects

Dependent Variable: Recycling

Source	Type III Sum of Squares	DoF	Mean Square	F	Sig.	Partial Eta Squared
Corrected Model	131,450 ^a	5	25,115	779,293	,000	,988

Green marketing	28,201	1	28,201	1331,476	,000	,917
Green consumer	77,480	2	38,740	1362,881	,000	,967
Green marketing * Green consumer	9,294	2	4,647	139,992	,000	,769
Error	3,900	141	,029			
Total	2971,300	151				
Corrected Total	144,760	150				

a. R Squared = ,988 (Adjusted R Squared = ,987)

Estimated Marginal Means

Green marketing

In the next step, estimates of dependence of a recycling routine on a familiarity with the green marketing (Table 5) was calculated. Estimated marginal means (3,110 for the answer yes, 2,976 for the answer no, and 5,773 for the answer sometimes) are equal to the means from Table 2. There is no difference between means.

Table 5. *Estimates of dependence of dependent variable (recycling) on familiarity with the green marketing*

Estimates

Dependent Variable: Recycling

Green marketing	Mean	Std. Error	95% Confidence Interval	
			Lower Bound	Upper Bound
Yes	3,110	,020	4,776	4,701
No	2,976	,020	3,692	3,883
Sometimes	5,773	,020	4,990	4,892

Observing the level of statistical significance of p -value (less than 0.05), it can be concluded that the independent variable of familiarity with the green marketing is significant, because the observed arithmetic means of frequency of recycling routine in relation to the independent variable are not the same (Table 6).

Table 6. *Pairwise Comparison of dependent variable (recycling) on familiarity with the green marketing*

Pairwise Comparisons

Dependent Variable: Recycling

(I) GM	(J) GM	Mean Difference (I-J)	Std. Error	Sigma	95% Confidence Interval for Difference ^a	
					Lower Bound	Upper Bound
Yes	No/Sometimes	1,001*	,022	,000	,903	1,171
No/Sometimes	Yes	-1,001*	,022	,000	-1,143	-,927

Based on estimated marginal means

*. The mean difference is significant at the ,05 level.

a. Adjustment for multiple comparisons: Least Significant Difference (equivalent to no adjustments).

F-test was conducted to determine the significance of independent variables, familiarity with the green marketing, and its influence on frequency of recycling routine (Table 7). Level of statistical significance of *p*-value (less than ,05) shows that the change in answer about knowledge about the term green marketing is significant, because the arithmetic means of observed groups are not the same.

Table 7. *Univariate tests of the effects of knowing the term green marketing to the recycling routine*

Univariate Tests

Dependent Variable: Recycling

	Sum of Squares	df	Mean Square	F	Sig.	Partial Squared	Eta
Contrast	31,292	1	35,306	1337,431	,000	,917	
Error	4,100	140	,020				

The *F* tests the effect of knowing the term green marketing. This test is based on the linearly independent pairwise comparisons among the estimated marginal means.

These results once again fully support H1 hypothesis that understanding of the concept of green marketing positively affects the recycling routine of the respondents.

Green consumer

The dependence of a recycling routine on a being a green consumer was also calculated (Table 8). Estimated marginal means (2,999 for the answer *yes*, 3,464 for the answer *no*, and 4,310 for the answer *sometimes*) are equal to the means from Table 2. There is no difference between means.

Table 8. *Estimates of dependence of dependent variable recycling on being a green consumer*

Estimates
Dependent Variable: Recycling

Answer	Mean	Std. Error	95% Confidence Interval	
			Lower Bound	Upper Bound
Yes	2,999	,024	3,666	3,798
No	3,464	,024	4,192	4,643
Sometimes	4,310	,024	5,878	5,992

Level of statistical significance of p -value (less than 0.05) shows that the change of opinion about being a green consumer is significant, because the arithmetic means of observed groups are not the same.

Table 9. *Pairwise Comparison of dependent variable recycling on being of green consumer*

Pairwise Comparisons
Dependent Variable: Recycling

(I) GC	(J) GC	Mean Difference (I-J)	Std. Error	Sig.a	95% Confidence Interval for Differencea	
					Lower Bound	Upper Bound
Yes	No/Sometimes	-,690*	,036	,000	-,922	-,697
No/Sometimes	Yes	,690*	,036	,000	,712	,848

Based on estimated marginal means

*. The mean difference is significant at the ,05 level.

a. Adjustment for multiple comparisons: Least Significant Difference (equivalent to no adjustments).

F -test was conducted to determine the significance of independent variable, being of green consumer, and its influence on frequency of recycling routine (Table 10). Level of statistical significance of p -value (less than 0.05) shows that the change of opinion of being a green consumer is significant, because the arithmetic means of observed groups are not the same.

Table 10. *Univariate tests of the effects of being a green consumer to the recycling routine*

Univariate Tests
Dependent Variable: Recycling

	Sum of Squares	df	Mean Square	F	Sig.	Partial Squared Eta
Contrast	76,431	2	39,974	1441,492	,000	,927
Error	3,800	144	,031			

The F tests the effect of Type. This test is based on the linearly independent pairwise comparisons among the estimated marginal means.

These results confirm such an assumption formulated as H2 that being a green consumer positively affects the recycling routine of the respondents.

Table 11. *Estimates of dependence of dependent variable recycling on familiarity with the green marketing and being a green consumer*

Green marketing * Green consumer

Dependent Variable: Recycling

Green marketing	Green consumer	Mean	Std. Error	95% Confidence Interval	
				Lower Bound	Upper Bound
Yes	Yes	3,620	,030	3,692	3,837
	No	4,790	,030	3,981	4,103
	Sometimes	5,990	,030	6,544	6,681
No	Yes	3,220	,032	3,002	3,121
	No	3,840	,032	3,741	3,898
	Sometimes	4,920	,032	4,231	4,388
Maybe	Yes	3,590	,034	3,228	3,392
	No	3,770	,034	3,871	4,071
	Sometimes	5,380	,034	5,993	6,107

Values in Table 11 can confirm us the results of previous Pairwise Comparisons Tests familiarity with the green marketing concept and being a green consumer on the recycling routine is significant, when we observe the change frequency in answers about recycling routine of the respondents.

CONCLUSION

The research presented in this paper was intended to determine the influence of familiarity with the concept of green marketing and customers labeling themselves as green consumers and the influence on the consumers' recycling routines. Research was based on two hypotheses; that understanding the term of green marketing and describing itself as a green consumer positive affects the recycling routine of the respondents.

One Way ANOVA test was used in order to see whether there is a connection between consumer understanding of a green marketing concept and consumer green behavior. Results of tests of Between-Subjects Effects i.e. observing the level of statistical significance of p -value (less than 0.05), it can be concluded that the both independent variable (familiarity with the green marketing and being a green consumer) is significant, because the observed arithmetic means of frequency of recycling routine in relation to the independent variable are not the same.

Also F -test was conducted to determine the significance of independent variables (familiarity with the green marketing and being a green consumer), and their influence on frequency of recycling routine. Level of statistical significance of p -value (less than ,05) shows that the change in answers about

knowledge about the term green marketing and describing themselves as a green consumer is significant, because the arithmetic means of observed groups are not the same.

They positively influence the change of a recycling routine of the respondents. It is interesting to point out that the difference in frequency of a recycling routine is around 76,9% in those who know what green marketing is and of those perceiving themselves as a green consumer.

The obtained results show that both of the independent variables (green marketing and green consumer) are significant in the way that respondents who understand the green concept largely recycle packaging that contributes to the sustainable development. So both hypotheses prove to be true which is opening a space for finding out if there is connection between understanding ecological symbols on the packaging and recycling routine. Also, it is important to investigate consumer perception of ecological packaging in the way of attractiveness.

Results of this research and mentioned further research are important in a process of creating a green communication and green packaging for companies, and society as well as in hope of better promotion of the sustainable development.

STATUS QUO OF THE ACCEPTANCE OF THE SHARING ECONOMY IN GERMANY

Bremser, Kerstin¹; Alonso-Almeida, Maria del Mar²

¹International Business department, Faculty of Business & Law, Pforzheim University of Applied Sciences, Pforzheim, Germany

²Organisations Department, Faculty of Economics and Business Administration, Autonomous University Madrid, Spain

ABSTRACT

Sharing Economy is a relatively new phenomenon that has developed over the last ten to fifteen years, facilitated by widely available internet access as well as an increased awareness of ecological factors combined with decreased purchasing power due to the last economic crisis. It is composed of a variety of different business models with different impacts on society.

The enclosed research paper gives an overview of the different forms of the sharing economy that have so far been classified and shows a picture of the acceptance of the sharing economy in Germany with a special emphasis on car sharing by pointing out behavioural aspects of consumers and producers as well as regulatory aspects. It points to those sectors that have strongly been impacted by the sharing economy. Germany is one of the most important manufacturing countries worldwide with a strong reliance on exports of the tools and machinery as well as the automotive sector. German customers are known for their demand of high quality products that are well manufactured. Additionally, with terrorism growing in typical former German holiday destinations (Northern Africa, Turkey, France) Germany is also witnessing an increase in domestic as well as foreign tourism. Here companies from the sharing economy threaten existing business models as i.e. car hires, hotels or restaurants. From a cultural perspective, Germans accept material status symbols, i.e. in the form of cars, watches or technical devices. Sharing threatens the German economic model due to the fact that sharing tries to use less of all resources and end-products.

Therefore, this exploratory work is based on a survey undertaken among younger Germans. The survey took place between November 2017 and January 2018.

Keywords: Sharing Economy, Germany, Car Sharing, Tourism, Collaborative Consumption

INTRODUCTION

Sharing in itself is no new phenomenon. For centuries people have shared among others household goods or food with their families, friends or neighbours (Sundararajan 2016, Codagnone und Martens 2016). What is new is the fact that people share their belongings with strangers rather than friends. The sharing economy, also called collaborative consumption (Belk 2014, Botsman 2014), peer- or access-economy (Juul 2015) is a new phenomenon that has attracted lots of interest since the years of the financial crisis.

The sharing economy has its roots on the one hand in the loss of purchasing power wiped away through the financial crisis (Belk 2014) and on the other hand in a growing awareness for societal and environmental problems (Belk 2007, Botsman und Rogers 2010).

As the sharing economy is coming to be established, positive and negative impacts have to be weighed against each other and regulatory concerns start to apply (Codagnone und Martens 2016, Marchi und Parekh 2015, Schor 2014). Within the European Union, different member states have started to regulate the sharing economy in different ways. Whereas Uber has been prohibited by law in Germany (N.N. 2015), it is permitted in other European countries. Airbnb has not been prohibited; however, some German cities have started to restrict the offer of secondary homes for rental to tourists and subsequently Airbnb has terminated the arrangements with several lessors in the German capital (Krex 2016).

The following exploratory paper will shed light on current trends and developments of this economic sector in Germany. The reminder of the paper is structured as follows: the next section starts out with a definition of sharing economy, followed by a chapter on what moves German people to participate in the sharing economy. In the subsequent section the methodology of the survey is explained and results are presented. The last part will draw a conclusion.

LITERATURE REVIEW

Sharing economy - definition

During the last years, several researchers have undertaken the task to define the sharing economy in order to outline the scope and analyze the impacts of this economic sector. One of the first authors has been Belk, 2007 who started out with distinguishing sharing from gift giving and defined sharing from a family viewpoint as pooling of resources in the family. Definitions have evolved since, encompassing the commercial aspects of the transaction (Lamberton und Rose 2012, Sundararajan 2016) as well as the connectivity aspect (Gansky 2010, Belk 2014 or pwc.com/CISSharing 2015). Other authors define sharing economy by relying on the environmental benefits accrued through sharing (van Houten 23.01.2014 or Schor 2014). An overview of the main terms used is listed in table 1.

Σφάλμα! Το αρχείο προέλευσης της αναφοράς δεν βρέθηκε.

Author, Year	Name	Definition
Belk 2007	Sharing	"...the act and process of distributing what is ours to others for their use and /or the act and process of receiving or taking something from others for our use"
Belk 2010	Sharing	" ... we may instead judge whether something is sharing, gift giving, or commodity exchange based on its resemblance to the prototype of each."
Gansky 2010	Mesh	"the Mesh is based on network-enabled sharing—on access rather than ownership", "a type of network that allows any node to link in any direction with any other nodes in the system"
Lamberton , Rose 2012	Commercial Sharing System	"(...) marketer-managed systems that provide customers with the opportunity to enjoy product benefits without ownership."
van Houten 2014	Circular Economy	"... an economic system in which no materials are wasted."
Schor 2014	Connected consumption / Sharing Economy	"Sharing economy activities fall into four broad categories: recirculation of goods, increased utilization of durable assets, exchange of services, and sharing of productive assets."
Belk 2014	Sharing / Collaborative consumption / pseudo-sharing	"There are two commonalities in these sharing and collaborative consumption practices: 1) their use of temporary access non-ownership models of utilizing consumer goods and services and 2) their reliance on the Internet, (...)."
Botsman 2014	Collaborative Consumption	"I define the collaborative economy as a system that activates the untapped value of all kinds of assets through models and marketplaces that enable greater efficiency and access."
pwc.com/ CISSharin g 2015	Sharing Economy	"Sharing economies allow individuals and groups to make money from underused assets. In this way, physical assets are shared as services"
Sundararajan 2016	Crowd-based Capitalism / Sharing	Economic system with 5 characteristics: a) largely market-based, b) high-impact capital, c) crowd-based networks, d) blurred lines between personal and professional, e) blurred lines between different types of labor as well as labor and leisure

Source: Own elaboration

Codagnone, Martens (2016) critics that none of these definitions is connotative, i.e establishes criteria that classify one economic activity as belonging to the sharing economy or not. Instead, they are all ostensive, that is pointing to certain characteristics and complement them with examples. A true

consensus has so far not evolved. It exists however a consensus about certain platforms / activities that all authors classify as belonging to the sharing economy (car-sharing, ride-sharing, apartment-sharing, ...). Furthermore, an evolution takes place and more and more authors are adopting the term sharing economy in their works since it has evolved to be the dominant one. A good classification of the different types of platforms and business models that exist can be found by combining the approaches given by Codagnone, Martens, 2016 and Schor, 2014. Here, sharing economy models are differentiated according to their profitability (for profit vs. not for profit) and the direction of the sharing (peer to peer (P2P) or business to consumer (B2C), respectively to peer (B2P)). Figure 1 shows the different classification including some examples. Interesting from a economic perspective are the “commercial sharing” and “commercial B2C” that threaten existing business models, as for instance car rentals and hotels among others. Non-profit approaches only concern regulation if they include associations or publicly registered clubs.

		Platform concept	
		P2P	B2C / B2P
Performance Orientation	Not for profit	True Sharing (Food Swaps)	Makerspace/ FabLab
	For profit	Commercial Sharing (Airbnb)	Commercial B2C (Car2Go)

Sharing economy in Germany: current situation and future prospects

According to the German Statistic Office (Statistisches Bundesamt, n. d.) in 2016 16 % of German GNP came from trade, transportation and hospitality. Transportation and hospitality were the first sectors where sharing started to take place (apartment-/room-sharing or ride-/car-sharing). Thus, German companies should feel the impact of the sharing economy. On the one hand consumers might buy less because they can share instead of buying; on the other hand they could buy more because they will be able to obtain additional income from sharing. Apart from these economic impacts, the authors have also identified impacts upon labour markets, competition and social relations (Peitz, Schwalbe 2016). This paper forms part of a larger project which intends to measure the impact that this trend has on

German companies. It is planned to survey behaviour of German consumer with regard to sharing economy and measure the main drivers of their participation in the sharing economy. A questionnaire based on a solid literature review was distributed among younger Germans between November 2017 and January 2018.

Research by Statista in 2016 (Brandt 2016) has shown that 20 % of Germans have already participated in the sharing economy. That is more than the EU average of 17 % but far below the acceptance rate of France with 36 % participation. Germans consider ride-sharing (72 %), tool-sharing (70 %), bike-sharing (66 %) and car-sharing (62 %) to be best suited for sharing (Brandt 2016); besides tool-sharing all sectors that could affect tourism. With this high acceptance rates, it is surprising that only 9 % of Germans would offer their belongings to be shared with strangers. The remaining 90 % only share with friends or not at all (Verbraucherzentrale Bundesverband (vzbv) 2015). Therefore, 62 % of Germans state, that they prefer sharing offers from enterprise to those of private persons because here quality and reliability is assured (Brandt 2016, PriceWaterhouseCoopers AG 2015). In Germany, young women are more open towards the sharing economy than men and in 2015 were using sharing platforms more than men (10 % versus 7 %, Gaspar und Castaldi 2015, Hellwig et al. 2015). In general, for Germans, economic (make or save money) and ecologic (environment protection) motives were the drivers to participate in the sharing economy (Scholl 2016, Verbraucherzentrale Bundesverband (vzbv) 2015, Gaspar, Castaldi 2015).

METHODOLOGY AND RESEARCH RESULTS

The method employed to survey tendencies in the German society was an explorative study. Structured questionnaires were distributed to German young people via several different polling agents from December 2017 to January 2018. The survey was run nationwide. It comprised several subsections to measure current use, perceptions and future tendencies within the Sharing Economy. Answers were coded on a 5 point Likert scale. Several demographic variables as i.e. gender, age, income, educational status, consumption preferences allow for detailed segmentation of data.

353 complete surveys were gathered among people living in big cities (100,000-600,000 inhabitants). SPSS v.24 was used to analyse the data. An in deep descriptive analysis, univariate and multivariate analyses were developed. The main characteristics of the sample were:

	Male	Female
Number	124	228
Age (Mean)	25.50	24.22

Table 2: *Main characteristics of the sample*

Source: Own elaboration

As can be seen from the sample, the mean age was very young. The overall mean for both gender was 24.42 years old. As can be seen from table 2 men are a little older than women. Women represent 64.8% of the sample and men 35.2%. In order to better understand the sample behavior regarding car sharing use, the sample was classified among age below and above the mean. Thus, age above the mean represents 39.4% of the sample and Age below the mean represents 60.3%.

An analysis of the sample showed, that the most selected choice was never to use car sharing. In fact, 48.6% of the sample never used car sharing in short distance trips and 40.5% never used car sharing in long distance trips. A Spearman Correlation shows that people who use car sharing in long distance trips also use car sharing over short distances. Thus, these variables are correlated. These values are significantly higher than those reported by Brand (2016) who detected a participation in the sharing economy of 20 %. The fact that the sample in this study was very young most likely contributed to this rise in participation.

The sample shows different values for the use of car sharing according to gender both for long distance as well as short distance trips. In the case of short distance trips, men used more car sharing than women in the case of “always” and “sometimes”. In addition, the percentage of men never using car sharing is lower than that of women. However, in car sharing use in long distance trips, men use more car sharing than women in all categories of response. Thus, the first usual response is never to use car sharing for both men and women, very close to the middle of the sample. Nevertheless, when car sharing users are studied, men use it more than women, especially for long trips. This is contrary to what literature says about the use of the sharing economy in general, where women are the dominant users (Gaspar und Castaldi 2015, Hellwig et al. 2015). This could be attributed to the fact that in general men are heavier car users than women and prefer driving to other methods of transportation (Statista, n.d.).

In order to identify the factors involved in the use of car sharing, 37 variable found in previous research (mainly Barnes & Mattesson, 2017) were analyzed. A factor analysis with varimax rotation was run. All factorial loads are >0.4 , which signifies a good good statistic fit with values for Cronbach's alpha of 0.933. A total of seven factors was found. Table 3 shows factor loads and factors means.

Factors	Environmental	Value for Money	Help others	Responsible consumption	Well Being	Identity	Innovation
Mean	3.69	3.51	3.41	3.15	3.10	3.07	2.90
Women	3.78	3.57	3.47	3.17	3.18	3.12	2.87
Men	3.52	3.39	3.31	3.11	2.94	2.97	2.91

Table 3: *Factor loads and factor means*

Source: Own elaboration

In line with previous research (Scholl 2016, Verbraucherzentrale Bundesverband (vzbv) 2015, Gaspar, Castaldi 2015) economic as well as environmental factors were the main drivers to use car sharing followed – in descending order – by the desire to help others, to consume responsibly, to contribute to personal well-being, to define one's identity and to participate in innovation. The order of the factors is almost identical for men and women with the exception of the third and second to last factor (Identity and Well Being) that are exchanged between the gender. Women score higher on all factors except for the innovation factor where men show higher scores. These differences are significant.

CONCLUSION

As this explorative paper has shown, the sharing economy is known in Germany and will certainly continue to grow and to impact the German economy. However, the use of car research is still restricted mainly to metropolitan areas but not far distributed in German larger cities. People in larger cities in Germany seem to have different vision on car sharing use than people in big cities where car sharing is widely deployed. Since public transport is readily available in Germany and also road infrastructure is well developed with free access to main highways (no toll, unique in Europe) Germans are inclined not to share cars but instead use their own car or use public transportation instead.

Regarding the main drivers of car sharing use, regardless of gender or age, environmental concerns are the main important reason. This finding differs from the research in other countries where environmental issues used to appear in latter positions.

Research on this topic so far has taken different paths. Whereas quite a few authors have intended to give a definition of this sector and to explore motives why or why not to engage in sharing, quantitative research on a country base is still scarce. Studies undertaken by private companies (Gaspar & Castaldi, PWC, Verbraucherzentrale) differ widely with regard to knowledge of the sharing economy as well as usage rates (by gender, age, employment status and living situation). Additionally, analysis of the impacts of the sharing economy have so far centered on regulatory aspects since most of them were sponsored by bodies concerned with regulating the economy. What is still missing, is a comprehensive, quantifiable prognostic of the impact on the economy.

THE IMPACT OF CONSUMER ETHNOCENTRISM ON ATHLETE ENDORSER EFFECTIVENESS – A CROSS-CULTURAL STUDY ON SOURCE CREDIBILITY

Bremser, Kerstin¹; Wendenburg Jana²; Goehlich, Véronique¹

¹International Business department, Faculty of Business & Law, Pforzheim University of Applied Sciences, Pforzheim, Germany

²Faculty of Business, University of Mannheim, Germany

ABSTRACT

The purpose of this study was to investigate the significance of consumer ethnocentrism in the realms of athlete endorsements and its potential effects on endorser credibility. A 3 (consumer nationality) x 3 (endorser nationality) analysis was conducted in a cross-cultural setting in order to explore the effects of an athlete endorser's national identity on the overall effectiveness of an endorsement. The research results suggest that an endorser's national origin has no significant impact on the overall credibility of a spokesperson and that levels of consumer ethnocentrism play a neglectable role in the field of athlete endorsements.

Keywords: athlete endorsement; source credibility; ethnocentrism; endorsement strategy; source models.

INTRODUCTION

Every day, consumers are exposed to 600 to 1,500 advertising messages originating from a wide range of media sources such as radio, social media, television, billboards and many more (Fink, 2011). As a matter of fact, it has become one of the key challenges for marketing practitioners around the globe to cut through the caused advertising clutter and to find effective methods to create and maintain awareness for a company's product or service. One common communication strategy which is pursued to penetrate the overflow of commercial messages is the use of celebrities as endorsers (Shuart, 2007). A celebrity endorser is defined as "any individual who enjoys public recognition and who uses this public recognition on behalf of a consumer good by appearing with it in an advertisement" [McCracken, (1989), p. 310]. Mass media are pervaded with celebrity images paving the way for their symbolization

of idiosyncratic qualities and glamorous images (Giles, 2000). As shown by Erdogan and his associates (2001) celebrity endorsements have proven to achieve far-reaching public relation effects and to be an effective marketing strategy to introduce a new brand to the consumer. Furthermore, they have the potential to generate high recall rates (Ohanian, 1991), boost product images and maximize sales and profits (Agrawal and Kamakura, 1995). All in all, celebrity endorsements have demonstrated to be an effective tool for communicating advertising messages. This is substantiated by the fact that they were used in approximately one of every four advertisements in 1997 (Shimp, 1997); a number which is likely to have even increased since that time. In Asian countries like Korea or Japan, more than 70 % of all television ads feature one or more celebrities nowadays (Kim, 2006). It is undeniable that celebrity endorsement has become a “worldwide advertising phenomenon” [Um, (2013), p.157].

Athletes belong to one of the most frequently used categories of endorsers in advertisement because they “are some of the most recognizable, revered, and imitated celebrities of all” [Shanklin and Miciak, (1997), p.1]. Although athlete endorsements are not a novel approach, they are quickly gathering momentum nowadays. Marketers are increasingly making use of sport stars to promote their products, amounting to more than \$12 billion spent on endorsement deals in 2011 (Livingston and Grant, 2011). With increasing global competition and financial pressure, choosing the right athlete endorser becomes crucial for marketers (Erdogan, 1999). Many scholars have constructed models to ease the selection process; however, celebrity endorsement strategy stays a “two-edged sword” [Erdogan, (1999), p.292]. Whereas effective endorsement deals have been seen to hold various benefits for both the spokesperson and the brand, the risks of poor performance, intolerable behaviour, misconduct and other negative perceptions are casting shadows over the use of celebrity sports endorsers (Lear et al., 2009).

With the celebrity endorsement strategy entering the global playground, marketers find themselves confronted to new challenges. International advertisers often try to standardize advertising measures by making use of identical strategies in different countries (Choi et al., 2005). However, the debate on the standardization of advertising measures involving celebrity endorsers has not yet reached a clear decision. Whereas some scientists such as

Erdogan (1999) believe that the use of celebrities with worldwide recognition can overcome cultural barriers, others argue that “every country has its own culture(s), which may very well affect the importance of [selection] criteria” [Erdogan et al., (2001), p.46]. So far, most research on celebrity endorsement has been based on studies confined to a single culture originating from either the US or the UK (Desmarais, 2014). Therefore, cross-cultural research is urgently needed in order to reveal universally usable practices and noteworthy differences of endorser effectiveness across countries.

In 2005, Chao, Wührer and Werani have demonstrated that an American endorser will not necessarily generate purchase intention in Austria, naming consumer ethnocentrism as a possible explanation for their findings. They suggest that using foreign celebrity endorsers “can actually be a liability, particularly if there are strong ethnocentric tendencies” [Chao et al., (2005), p. 188]. However, the study was only carried out in one country and further research on that topic, focusing especially on athlete endorsers, is lacking. Therefore, this paper investigates whether consumer ethnocentrism is a prevalent phenomenon in the field of celebrity athlete endorsements as it is of major importance for strategic decision making in the global marketplace. Recapitulating the enormous financial implications of celebrity athlete endorsements, theoretical gaps concerning their use in a cross-cultural context need to be filled in order to ensure that companies’ strategies and investments achieve the desired effects.

LITERATURE REVIEW

Source models

Research has identified various models and theories that explain how the endorsement process works and how selection mechanisms should be adjusted to render an endorsement effective (Desmarais, 2014). One of the earliest models that has been presented by scholars is the Source Credibility Model dating back to 1953. This model, which was originally developed for the study of communication, belongs to the category of the so-called Source Models which state that certain characteristics of a communication source may positively influence overall message receptivity (Meenaghan, 1995). The Source Credibility Model developed by Hovland and his associates contends that the effectiveness of an advertisement

message depends on the perceived level of expertise and trustworthiness of an endorser (Hovland et al., 1953). If an endorser scores high on those two attributes, he or she is also perceived as highly credible. The more credible a source is, the more persuasive this person and the featured advertisement is likely to be (Karlins and Abelson, 1970). As defined by Hovland (1953, p. 21) expertise is “the extent to which a communicator is perceived to be a source of valid assertions”. Thus, expertise strongly correlates with the skills, knowledge and experience of an endorser. Supporting the Source Credibility Model, a celebrity that is more expert has been proven to be more persuasive (Aaker and Meyers, 1987) and to generate higher purchase intentions (Ohanian, 1991). The second source characteristic trustworthiness refers to the consumer’s confidence in the endorser for “providing information in an objective and honest manner” [Ohanian, (1991), p.47]. It is closely tied to the integrity, honesty and believability of the source. In general, it has been proven that consumers trust endorsers who are similar to them (Kelman, 1961). An endorser’s ethnic status can therefore influence perceived trustworthiness and brand attitudes as shown by Desphande and Stayman (1994). Their findings suggest that consumers perceive similar ethnicity as an indicator that the endorser holds beliefs that are consistent with those of the consumer and therefore acts within the best interest of the message recipient. Consequently, consumers are more likely to positively evaluate advertising messages from endorsers who are similar to them and who they feel they can trust. Multiple studies have proven that highly credible sources have a positive effect on purchase intentions (Lafferty and Goldsmith, 1999) as well as on consumers’ attitudes towards the advertisement and the brand (Goldberg and Hartwick, 1990). However, the Source Credibility Model is also target for criticism as various scholars argue that the whole spectrum of endorser effectiveness is only partly explained by this unidimensional approach (Ohanian, 1991).

The Source Attractiveness Model is the second Source Model used in the field of endorsement strategy. It contends that the effectiveness of an advertisement message depends on the similarity, familiarity and liking of an endorser (McGuire, 1985). Consumers usually hold positive stereotypes about attractive endorsers which can be explained in terms of the so-called Consistency Theory (Solomon, 1996). The Consistency Theory states that individuals feel more comfortable when all their judgments about a person fit together. An attractive endorser is consequently benefiting from a so-called halo effect. Because of his or

her good physical appearance or personality, the endorser might be assumed to hold more social power, to possess more positive character traits, to have the ability to influence others, and to be more persuasive (Joseph, 1982). Through the increasing use of celebrities as endorsers, attractiveness has become a decisive dimension of source credibility (Erdogan, 1999). It is undisputed that attractive celebrity endorsers enhance attitudes towards the advertisement and the featured brand, but whether they are able to generate purchase intention is still ambiguous as scholars advocate contrary findings (Erdogan, 1999). Similar to the Source Credibility Model, source attractiveness is considered to be incapable of explaining endorser effectiveness in its entirety. Thus, many scientists suggest that the theoretical construct of source credibility should be complemented by endorser-product congruence (Lee and Koo, 2015).

Source credibility

Overall, the term source credibility is used to refer to an endorser's positive characteristics that influence the consumer's acceptance of an advertisement message (Ohanian, 1990). In the field of celebrity endorsements source credibility is mainly based on two models: The Source Credibility Model of Hovland and his associates and McGuire's Source Attractiveness Model. Resulting from those theories three credibility dimensions have been established which enjoy a high level of acceptance in endorser effectiveness research: expertise, trustworthiness and attractiveness. Research evidence suggests that the three source credibility dimensions can make independent contributions to the effectiveness of an endorser (Weiner and Mowen, 1985). An athlete endorser could consequently be perceived as an expert but neither be evaluated trustworthy nor attractive. Even if it seems reasonable to think that the perceived credibility of an endorser is completely subjective and differs from one consumer to another, it has been revealed that a high degree of agreement exists among individuals (Berscheid et al., 1971).

Consumer ethnocentrism

Consumer ethnocentrism originates from the general concept of ethnocentrism which was first introduced in sociology and is defined as "the technical name for this view of things in which one's own group is the centre of everything, and all others are scaled and rated with

reference to it" [Sumner, (1906), p.6]. This definition implies the perception of the other groups' inferiority while one's own group is characterized by feelings of pride and superiority (Siamagka and Balabanis, 2015). Regarding consumption, ethnocentrism usually refers to consumer biases in favour of domestic over foreign products (Shimp and Sharma, 1987). For an ethnocentric consumer purchasing foreign goods is immoral and unpatriotic as it hurts the domestic economy and fellow workers. On the contrary, non-ethnocentric consumers evaluate domestic and foreign goods dispassionately and make purchase decisions based on quality and performance aspects alone.

Multiple scholars have shown that ethnocentrism levels depend heavily on demographic variables such as gender, age, education and income (Balabanis et al., 2001). Older consumers for example, are more likely to be conservative and might be more receptive for messages emphasizing the negative effects of global competition (Tragos, 1998).

Indeed, ethnocentrism seems to function as a "[...] self-defense reflex of local economies, governments, organizations, and individuals against the threat of imports and foreign competition" [Siamagka and Balabanis, (2015), p. 66]. As a result, consumer ethnocentrism is a crucial factor for international marketers in terms of global branding (Guo, 2013), market entry mode decisions (Fong et al., 2014) as well as standardization strategies (Keillor et al., 1996).

So far, the celebrity endorsement process has only been timidly explored from an international practitioner's perspective as most research has been conducted within a certain culture or nation (Desmarais, 2014). However, it seems undisputed, that an endorser's nationality influences the effectiveness of celebrity endorsements (Dom et al., 2016). Nevertheless, neither research nor the companies themselves seem to have found a clear answer on whether it is better to use a domestic endorser or a well-known international but foreign celebrity when advertising in a certain market. On the one hand, there are studies like those of Dom and his associates (2016) which have shown that Malaysian consumers hold positive feelings towards the use of foreign endorsers and rate the correspondent advertisements as more effective than those featuring a national celebrity. While the authors suggest that foreign endorsers do not necessarily cause consumer ethnocentrism, it has to be kept in mind that this statement might only be true for less developed countries such as

Malaysia. Malaysians may associate the use of a foreign celebrity with a bigger scale company and tend to rank products made in developed countries as having higher product quality than local products (Ghazali et al., 2008). But also besides those findings, scholars have suggested that “[...] celebrities with worldwide recognition and popularity [...] transcend national borders and overcome cultural barriers in global marketing communications” [Choi et al., (2005), p. 85].

On the other side, a study of Chao and his associates (2005) revealed that the use of local sports stars might have its legitimacy as well, as they have identified ethnocentric tendencies among their target group. In their research among Austrian consumers a non-celebrity spokesperson scored significantly higher on purchase intentions than an US celebrity endorser. As generally celebrity endorsements are expected to be more effective than non-celebrity endorsements (Kamins, 1935), consumer ethnocentrism was named as a possible explanation for this observation. Another study conducted by Desmarais (2014) confirms the existence of ethnocentrism in the field of athlete celebrity endorsements. Desmarais investigated the endorser selection process by interviewing advertising practitioners of ten countries. His main findings suggest that the selection process is heavily influenced by multiple cultural pressures and that all advertising practitioners across countries exhibit some form of ethnocentrism in their practice. One principal criterion for choosing an athlete celebrity is his or her cultural attractiveness which implies a “[...] fit with a range of culturally acceptable traits for the national audience” [Desmarais, (2014), p.324]. As the interviewed practitioners argued, an athlete endorser’s belonging to the same in-group fosters the identification with the spokesperson and consequently overall endorser effectiveness. Supporting the point of view that consumer ethnocentrism might indeed be a crucial factor for athlete endorser effectiveness, Desmarais concludes that sport star endorsements depend “[...] greatly on the market in which [they] operate and suggests that, to be useful, a celebrity athlete endorser needs to be as culturally meaningful and relevant as possible within the national context it is used” [Desmarais, (2014), p.325].

All in all, it must be noted that the influence of consumer ethnocentrism on endorser effectiveness is barely explored and that findings of existing research are extremely ambiguous.

METHODOLOGY

Hypothesis development

In order to investigate the influence of an athlete endorser's nationality on the endorsement process, the researcher focused solely on the Source Models, as those theories place the celebrity's traits and characteristics in the centre of endorser effectiveness (Meenaghan, 1995). The congruence of product and endorser covered by the Product Match-Up Hypothesis of Kahle and Homer (1985) is barely influenced by an endorser's nationality on the other hand and was evaluated unsuitable for this particular study.

When reviewing both the Source Credibility Model and the Source Attractiveness Model, it appears likely that an athlete endorser's perceived credibility is influenced by a sports star's national background. Already early in research, scholars argued that message sources with the same ethnicity as the viewer might possess higher levels of influence compared to sources with a different race (Brock, 1965). As further indicated by Desphande and Stayman (1994), consumers rate endorsers who have an identical ethnic background as more trustworthy. Trustworthiness as one factor of source credibility might therefore be subject to ethnocentric tendencies. As revealed by McGuire's Source Attractiveness Model (1985), the credibility dimension attractiveness is also closely related to the construct of similarity. If consumers rate athlete endorsers who are similar to them as more attractive, ethnocentrism might be a prevalent phenomenon for this dimension as well. In accordance with these findings, the following research hypothesis is proposed:

H₁: Consumers perceive athlete endorsers with an identical national background as more credible than foreign athlete endorsers.

To investigate whether all three dimensions of source credibility are equally affected by ethnocentrism, the following differentiation is made:

H_{1a}: Consumers perceive athlete endorsers with an identical national background as more *attractive* than foreign athlete endorsers.

H_{1b}: Consumers perceive athlete endorsers with an identical national background as more *trustworthy* than foreign athlete endorsers.

H_{1c}: Consumers perceive athlete endorsers with an identical national background as more *expert* than foreign athlete endorsers.

Research design

The overall research design was a 3 (consumer nationality: German, French and US-American) x 3 (athlete endorser nationality: German, French and US-American) between-subjects design which resulted in the creation of nine experimental conditions. The survey was conducted using a self-administered survey questionnaire. In alternative data gathering situations such as personal interviews, respondents tend to answer based on what they perceive to be more socially desirable instead of indicating their own opinion and behaviour (Zikmund, 1997). When talking about ethnocentric tendencies, some participants might therefore be influenced by a present interviewer. To avoid this manipulation, the presented data collection method was deliberately chosen.

In order to test the research hypotheses, nine experimental conditions were created with the help of three online survey questionnaires in either German, French or English language. With the support of both a bilingual French and a bilingual US-American forward-back translation was used to prevent conceptual dissimilarity of the three questionnaires. In addition, high priority was assigned to the identity of the versions' layout to guarantee equivalence of the research material.

The online questionnaire was prepared in two main sections comprising nine questions. The aim of the first section was to gather demographic information such as age, gender and nationality of the participants. Moreover, participants had to decide upon one of three scenarios to continue with the second section of the questionnaire. Each scenario introduced the participants to an advertisement featuring a sports star with a different nationality. Whereas "Scenario A" always presented an athlete having the same nationality as the respective participant group, the other two scenarios featured celebrity athletes from different nations. The intention behind the creation of two scenarios displaying foreign endorsers was to reveal whether ethnocentric tendencies were equally pronounced for both experimental conditions or whether the national origin had a more differentiated effect. In the beginning of the second section participants were introduced to several stimulus

materials. Firstly, a fictitious advertisement for a protein bar was depicted portraying an imaginary celebrity athlete endorser.

Figure 1: *English stimulus material*

The creation of a fictitious brand had the purpose of eliminating any potential consumer predispositions towards the featured product (Petty et al., 1983). Additionally, the use of a bogus athlete endorser offered various advantages with respect to experimental control (Till and Busler, 2000). When using well-known sports stars, respondents' knowledge and attitude towards the endorser can vary significantly reducing the power of the study. All in all, using both an imaginary brand and endorser minimizes the opportunity for unintended spurious confounds and within-group variations, hereby gaining high internal validity. The focus of the advertisement was clearly on the depicted athlete who in real life is a professional German mountain biker only scarcely known within Germany or on an international stage. The advertised product, a protein bar, was chosen to comply with the conditions of the Product Match-Up Hypothesis (McCracken, 1989). As indicated by various scholars, source credibility and endorser-product congruence need to go hand in hand in order to maximize the effectiveness of celebrity endorsements (Lee and Koo, 2015). As it has been proven, athlete endorsers can be well paired with sport-related products such as energy bars as they are perceived as having high levels of expert power for this specific product type (Natarajan and Chawla, 1997). In order to create the most favourable framework conditions, the fit between product and athlete was hence essential.

The second stimulus material provided was a short information text about the depicted athlete presenting him as a worldwide successful racing cyclist. Furthermore, the text indicated the endorser's nationality which was either French, German or US-American depending on the chosen scenario. Besides the mentioned names and nationalities, the

information text was completely identical for all three scenarios. After being asked to closely examine both the advertisement and the text participants were invited to answer questions on the athlete endorser's perceived credibility making use of Ohanian's Source Credibility Scale (1990). The three credibility dimensions attractiveness, trustworthiness and expertise were measured using seven-point Likert scales.

Participants

In total 354 people from three national backgrounds completed the online survey questionnaires for the research. The average age of participants was 31 years ($\mu = 31.08$) resulting from the fact that the majority of respondents belonged to the group of 15-to-30-year-olds (63.3 %). The age bandwidth ranged from 13 years to 70 years which ensured a feedback from a relatively large group of potential consumers. Of the total study participants 59.9 % ($n = 212$) were female, and 40.1 % ($n = 142$) were male.

Moreover, the final sample consisted of 127 US-Americans (35.9 %), 111 Germans (31.4 %) and 116 French individuals (32.8 %). Among those three national samples age varied slightly. Whereas the average age of French participants was 24 years ($\mu = 23.83$), Germans were, on average, 33 years old ($\mu = 32.71$) and US-Americans 36 years old ($\mu = 36.29$). This difference could be explained by the different recruitment methods. Whereas many of the German and US participants were acquired via mail, French respondents were mainly contacted through social media. As this medium might be preferred by a younger target group, the resulting discrepancy seems reasonable.

RESULTS

Scale reliability

Cronbach's Coefficient Alpha is the most widely used test of internal reliability and was determined in order to examine the utilized multi-item measures. Cronbach's Alpha varies between 0 implying no internal reliability and 1 representing perfect reliability whereas the minimum acceptability of reliability is 0.7 (Burns and Burns, 2008). As it is outlined in Figure 2 all multi-item measures, including attractiveness, trustworthiness and expertise as well as the source credibility scale as a whole exceeded by far the minimum acceptability level. The

high alpha values indicate that the items used to measure each respective construct have a high level of internal consistency and are reliable for this study.

	α
Attractiveness	.834
Trustworthiness	.917
Expertise	.939
Source Credibility	.931

Figure 2: *Cronbach's Alpha*

Hypothesis testing

Hypothesis 1 predicted that consumers would perceive an athlete endorser with an identical national background as more credible than a foreign athlete endorser. Consequently, it was assumed that participants would evaluate the endorser more positively when they were exposed to an advertisement featuring a domestic athlete compared to an advertisement displaying a foreign sportsman. Overall, it was expected, that US consumers would assign the highest credibility ratings to an US athlete, German consumers would evaluate the German athlete most positively and French consumers would assess their compatriot as most credible. In order to compare the source credibility levels between the domestic and foreign endorsers, independent sample t-tests were conducted for all national samples.

Consumer nationality	μ_1 (endorser nationality)	μ_2 (endorser nationality)	p-value*
US-American	4.43 (US-American)	4.53 (German)	0.315
	4.43 (US-American)	4.82 (French)	0.041
German	4.44 (German)	4.41 (US-American)	0.453
	4.44 (German)	4.35 (French)	0.372
French	4.10 (French)	4.09 (German)	0.480
	4.10 (French)	4.19 (US-American)	0.372

* for $\alpha = .01$

Figure 3: *Summary table- Source Credibility*

The results demonstrate that, on average, neither the US-American nor the French consumers rated the endorser with an identical nationality as most credible. Only within the German sample, the domestic endorser was evaluated more positively than his foreign counterparts. As it can be further stated from the table, none of the differences between a foreign and domestic endorser were

statistically significant. On the contrary, the majority of the tests resulted in very large p-values which imply that it is indeed very likely that local and foreign endorsers are perceived equally credible by consumers. Consequently, hypothesis 1 is not supported.

Moreover, hypotheses 1a to 1c predicted that consumers would perceive an athlete endorser with an identical national background as either more attractive (H_{1a}) or more trustworthy (H_{1b}) or more expert (H_{1c}) than his foreign counterparts. Those hypotheses were stated to investigate whether all three source credibility dimensions are equally affected by potential consumer ethnocentrism or whether there are differences in consumers' perceptions. As it can be inferred from Fig. 4 results between the US, German and French samples differed importantly.

Consumer nationality	Credibility dimension	μ_1 (endorser nationality)	μ_2 (endorser nationality)	p-value*
US-American	Attractiveness	4.15 (US-American)	3.90 (German)	0.137
		4.15 (US-American)	4.29 (French)	0.273
	Trustworthiness	4.56 (US-American)	4.58 (German)	0.433
		4.56 (US-American)	4.84 (French)	0.101
	Expertise	4.71 (US-American)	5.12 (German)	0.084
		4.71 (US-American)	5.33 (French)	0.015
German	Attractiveness	3.96 (German)	4.06 (US-American)	0.320
		3.96 (German)	4.20 (French)	0.153
	Trustworthiness	4.71 (German)	4.44 (US-American)	0.170
		4.71 (German)	4.48 (French)	0.227
	Expertise	4.63 (German)	4.73 (US-American)	0.352
		4.63 (German)	4.38 (French)	0.216
French	Attractiveness	3.52 (French)	3.65 (German)	0.306
		3.52 (French)	4.12 (US-American)	0.031
	Trustworthiness	4.21 (French)	4.30 (German)	0.382
		4.21 (French)	4.33 (US-American)	0.366
	Expertise	4.59 (French)	4.34 (German)	0.187
		4.59 (French)	4.12 (US-American)	0.085

* for $\alpha = .01$

Figure 4: Summary table- Credibility dimensions

The US consumers rated the French endorser as most attractive, most trustworthy as well as most expert, whereas the US endorser, their fellow native, received the lowest average ratings for trustworthiness and expertise and ranked only second in attractiveness. The overall picture varied a lot within the German sample. Whereas the German endorser was perceived as most trustworthy with a rating of 4.71, he was evaluated as least attractive and ranked second in expertise. All in all, for the German sample, the French endorser received the highest attractiveness ratings, the German endorser was perceived as most trustworthy and the US-American endorser as most expert. Finally, the French consumers, assigned the highest ratings of attractiveness and trustworthiness to the US-American endorser whereas the French endorser had the lowest average score in those two credibility dimensions. Nevertheless, the French athlete was perceived as most expert, a dimension in which the US endorser was assessed worst.

All in all, there was no unique pattern observable when comparing the different samples. In accordance with the overall source credibility ratings, none of the differences between the credibility dimension ratings were statistically significant. Consequently, the outcomes of the sample t-tests suggest that the perceptions of attractiveness, trustworthiness and expertise do not considerably vary when observing a domestic or a foreign sports endorser. It follows that none of the hypotheses 1a, 1b and 1c are supported.

In addition to the analyses described above, age and gender manipulations were performed in order to verify whether different demographic groups would perceive domestic and foreign endorsers differently. As stated by multiple scholars, ethnocentrism levels depend heavily on demographic variables and might therefore yield significant differences for certain participant groups (Balabanis, Mueller and Melewar, 2001). Following the procedure of the already performed hypothesis testing, individual sample t-tests were conducted for all average ratings including source credibility, attractiveness, trustworthiness and expertise. One by one only answers of female, male, over 45-year-old or 45-year-old and younger respondents were taken into consideration. Perceptions of male and female respondents demonstrated a high degree of similarity among all samples. However, a clear tendency could be identified when comparing the outcomes of the analyses for the younger and older respondents. In most of the cases, the group of the over-45-year-olds, perceived the domestic sportsman as more credible, attractive, trustworthy and expert compared to a foreign one. For the younger respondents group, on the other hand, endorsers often received similar results regardless of their origin. In many cases, the foreign endorser was even rated higher than the local endorser. Within the group of the over 45-year-olds, for example, US-American consumers perceived the US athlete as significantly more attractive ($p\text{-value} = 0.003$) than the German athlete. For the younger fraction of the US consumers, however, the German athlete received even slightly higher attractiveness ratings ($\mu =$

3.91) than the US athlete ($\mu = 3.83$). Still, besides this example, none of the differences between a foreign and domestic endorser were statistically significant for any demographic group. However, it might be worth to investigate the consumers' age effects on endorser perceptions in detail.

DISCUSSION

Discussion of research findings

The purpose of the current study was to examine the influence that an endorser's nationality and potential consumer ethnocentrism exert on the source's perceived credibility. It was hypothesized that, in line with Desmarais (2014), an athlete endorser with an identical nationality as the consumer, would be perceived as more credible and would consequently infer a more effective endorsement deal than the use of a foreign sportsman. However, the results of the analysis contradicted the hypothesized effects of an endorser's national origin. The study revealed that there are no significant differences between the perceptions of a domestic athlete and a foreign one. Consumers reported similar evaluations of an endorser's attractiveness, trustworthiness and expertise which also entailed almost equal source credibility perceptions among all scenarios. These results clearly contradict the findings of McGuire (1968) who stated that similar characteristics between sources and viewers are critical for the viewers' perceptions towards the sources.

These discrepancies might be well explained by the development of global market communications which have experienced drastic changes since the time of McGuire's studies. Especially mass media enabled celebrities such as Michael Jordan to move beyond national borders and to gain awareness and reputation not only in a national context, but around the world (Choi et al., 2005). Therefore, it seems true, that athletes with worldwide popularity or success have the power to transcend feelings of national affiliation and to overcome cultural barriers (Erdogan, 1999).

Therefore, it can be concluded that consumer ethnocentrism has no influence on the overall effectiveness of an athlete endorsement in a cross-cultural setting. This heavily contradicts Chao and his associates' findings (2005) which suggest that a foreign celebrity endorser can be a liability when used in different national settings. One possible explanation for these contrasting results could be the investigated endorser category. Whereas the present study focused solely on the athlete endorser, Chao and his associates based their allegations on the example of a celebrity actor. Consequently, it is conceivable that consumer ethnocentrism might be an important factor within other endorsement categories. Indeed, it seems reasonable that the field of sports symbolizes a special case as well as a unique opportunity for global marketing communications. The main reason for this stand-alone position might be the well-progressed globalization of sports: Athletes from different countries and ethnicities participate in professional leagues around the globe, the number of nations participating in

international sport events is steadily increasing, international sport management firms are growing everywhere and broadcasting rights of both international and national sport events are sold to media firms in countries all over the world (Thibault, 2009). As Miller and his associates explain, “sport is probably the most universal aspect of popular culture” [Miller et al., (2001), p.1].

This also entails important managerial implications. As already stated earlier in the course of this work, the level of consumer ethnocentrism is crucial for strategic decisions on standardization of advertisement efforts. The findings of this study support that standardized advertising across various national markets is a valuable strategy when featuring a worldwide successful athlete endorser. Especially when considering the growing financial pressure and increasing competition going hand in hand with the use of an athlete endorser, standardization could be an important means for saving human and financial resources and for becoming more competitive in a fiercely contested market (Livingston and Grant, 2011). Nevertheless, it should be noted, that the use of a globally successful athlete endorser does not justify the standardization of the entire advertising efforts as different cultural orientations have different impacts on the content and style of an advertisement (Um, 2013). Whereas the same athlete endorser might be used across several countries, his or her positioning within the advertisement might vary widely depending on the cultural framework in which it is used.

Limitations

The current study has a few limitations which need to be recognized. Firstly, incomparability exists among the three national samples of the main study. Whereas the average age of the German and US participants was relatively similar, the French respondents were on average ten to fourteen years younger. As identified during the age and gender manipulation checks, age might be a decisive factor for varying endorser perceptions. Therefore, future studies should consider selecting equal numbers of participants from all age groups. Secondly, the translations of the questionnaires might represent an important limitation of the research. Although translation equivalence was maximized through careful forward-and-backward translation, a perfect translation equivalence is almost unrealistic. Consequently, psychometric properties of the utilized scales might slightly differ between versions and for every analysis.

Furthermore, the use of a fictitious brand and endorser in the course of the main study has led to the loss of economical validity of the research. The use of a real endorser on the other hand would have introduced important within-group variations and minimized construct validity. Nevertheless, participants might have different perceptions towards a real-world athlete. In addition, athlete endorser’s sex might also affect the various ratings. In the current research, the stimulus material only

presented a male athlete endorser. However, a female athlete might provoke differing consumer responses and research results.

Finally, the major limitation is represented by the utilized convenience sampling method. The method was chosen in order to facilitate the distribution of the survey across borders. Nevertheless, the method also implies significant problems concerning the generalization of the research findings to other populations. It follows, that the study should be replicated in another research setting in order to validate the presented results.

Future research suggestions

Based on the current work, several future research suggestions can be made. First of all, future research should verify the study's findings by making use of different sampling methods and various national consumer samples. As the present study only compared perceptions of German, US-American and French consumers, other nationalities should be investigated as well. One interesting aspect could be the comparison of less and highly developed nations as proposed by Dom and his associates (2016). Moreover, actual celebrity athletes of different sex should be used to validate the findings in real-world conditions.

In addition, the identified effects of a consumer's age should be further examined. Therefore, consumers need to be categorized in smaller and numerous age groups to get a more detailed view. Because of the focus of this work, consumers were only classified into two age groups. For a qualified assessment of age effects, the study should be replicated with equal numbers of different age groups which need to be analysed with intense scrutiny.

Moreover, ethnocentric tendencies should be investigated not only with regard to endorser nationality but also to a spokesperson's ethnicity. As proposed by Brock (1965), message sources with an identical ethnicity as the consumer exert greater influence on the viewer compared to sources with a different ethnicity. For the present study, however, only one Caucasian endorser was used for each national sample. To rule out any existence of consumer ethnocentrism in the fields of athlete endorsements, scholars need to investigate endorsement effectiveness in the light of differing athlete ethnicities as well.

Future research should also focus on other endorser types than athletes such as actors, musicians or politicians. It will be interesting to see whether consumer ethnocentrism is a present phenomenon within other categories or whether the findings of the present study could be generalized to a number or even all endorser types.

CONCLUSION

The main objective of this research was to examine the impact of an athlete endorser's national identity on consumer perceptions of source credibility. Hereby, the present work was among the first studies that investigated the effectiveness of athlete endorsements across borders and will therefore add to the body of literature in both cross-cultural marketing communications as well as sports marketing. Especially in the light of the increasing globalization of sports and the accelerating usage of athlete endorsers in marketing communications, the study will be beneficial for advertising practitioners as well as academics worldwide.

The findings provide marketing practitioners with a clear guidance on the selection of an athlete endorser. Marketers should be aware that the national origin of an endorser has a neglectable influence on consumer perceptions and on the overall success of an advertisement. Indeed, this study suggests that an athlete endorser's nationality and his or her classification as 'foreign' or 'domestic' has no significant impact on the effectiveness of an endorsement deal. It follows that national identity and identification can be assumed of only minor priority in the endorser selection process. Thus, from a managerial perspective, standardization decisions should be a major consideration when planning successful international advertising campaigns. Those findings are extremely valuable when considering Desmarais' research results (2014). The scholar investigated the athlete endorser selection process from a practitioner's point of view and revealed that marketers around the globe exhibit some form of ethnocentrism and national categorization in their practices. The current study disclosed that those methods might be extremely ineffective and that practitioners need to urgently reconsider the basis of their selection process in order to stay competitive.

Clearly, more research is necessary before the generalization of the findings; however, the current work has led an empirical path for future discussions and research. Undoubtedly, it has demonstrated that marketing practitioners as well as academics need to reconsider consumer attitudes towards endorsers as cultural phenomena such as sport allow borders to blur and ethnocentric tendencies to vanish.

GREEN CONTROLLING IN SME: FINDINGS OF AN EMPIRICAL STUDY IN BADEN-WÜRTTEMBERG

Britzelmaier, Bernd; Rommel, Pascal; Schlosser, Jana Maria; Weidler, Carolin

Business School, Pforzheim University, Pforzheim, Germany

ABSTRACT

Sustainability has established itself as a term in everyday life. Regulations and laws have led to public reporting. Nevertheless, the planning and management of the three sustainability dimensions still seems to be in its infancy in many companies, especially in small and medium-sized ones. Based on literature and study evaluations, a qualitative study was therefore conducted on the subject of "Green Controlling in SME in Baden-Württemberg". Expert interviews were used for this purpose. The results are interesting and promising at the same time.

Keywords: Green Controlling, sustainability, SME, Baden-Württemberg, Germany, management control, triple bottom line

INTRODUCTION

Sustainability has established itself as a term in everyday life. Standards and laws have led to public reporting. Nevertheless, the planning and management of the three sustainability dimensions still seems to be in its infancy in many companies, especially small and medium-sized ones. To find out more about the status of "Green Controlling" in SME more research seems to be needed. Our paper tries to explore the situation of management control in SME related to sustainability.

LITERATURE REVIEW

Sustainability nowadays is a common and wide-ranging term used in politics, business and society. Despite or perhaps because of its popularity, no clear definition has been able to establish itself so far (Spindler, 2012). The Brundtland report, published by WCOED in 1987 made an important contribution to the debate on sustainability and sustainable development (Corsten and Roth, 2012b). The original text tells: "Sustainable development [...] meets the needs of the present without compromising the ability of future generations to meet their own needs" (WOECD, 1987). The background to this is intra- and intergenerative fairness, which means fairness within the present generation as well as between generations (Carsten and Roth, 2012a). John Elkington developed the

term into the Triple Bottom Line in 1994, which illustrates the increase in value from an economic, ecological and social perspective (Elkington, 2002; Kuhn, 2009). Its relevance in the sustainability debate is also demonstrated by the triple bottom line in corporate reporting, which was called for by the EU Parliament in 2002 (European Commission, 2002). Today the triple bottom line (TBL) accounting approach is widely applied. The expression "bottom line" refers to "profit" or "loss".

Usually management control or "Controlling" is associated with financial planning and control (e. g. Britzelmaier, 2017). Common definitions are given e. g. by the International Controller Association (ICV, 2017), Horváth (2009) or Weber and Schäffer (2016). These different definitions have in common the tasks of planning and control to support corporate goals and management decisions. The controlling tasks in practice have developed in four steps from the German beginnings in the 1950s to the present day. Initially developed as a "success assurance and cost accounting" (Controlling 1.0) and further developed through a "coordination of the management systems" (Controlling 2.0) and a "safeguarding of rationality in the entire company" (Controlling 3.0), Controlling is currently understood as a "partnership of managers and controllers in the age of intelligent networking" (Controlling 4.0) (Steinke and Schmidt, 2017). Even though the final responsibility for the implementation of green controlling lies with the management, the literature agrees that the controllers also take on decisive tasks in its implementation (Isensee and Henkel, 2011; Steinke et al, 2014). Consequently, the tasks are basically to integrate ecological objectives into the existing controlling processes and instruments of individual functional areas in order to ensure transparency, control, efficiency and effectiveness of these (Horváth et al, 2012; Isensee and Henkel, 2011; Steinke and Schmidt, 2017; Weber, 2015). Accordingly, green controlling can be understood as an "extension of the tasks, processes and instruments of controlling to include aspects of ecological sustainability" (ICV, 2011).

Small and medium-sized enterprises are considered as the employment engine and backbone of the German economy, since they contribute significantly to the gross domestic product (Arbeitsgemeinschaft Mittelstand, 2016; IfM Bonn, 2017). Although there is broad agreement on the economic relevance of small and medium-sized enterprises, there is no clear definition of the term in the literature to date. Instead, there are several classification approaches that contain narrower and more detailed delimitations and thus contradict each other (Becker et al, 2015). In this paper the definition of SME by the European Centre of Competence for Applied Small and Medium-Sized Business Research (EKAM) is applied. The definition of the EKAM, formerly Deloitte-Mittelstandsinstitut, at the University of Bamberg combines quantitative criteria with the qualitative characteristics mentioned above and therefore takes better account of the special characteristics of medium-sized enterprises than the exclusively quantitative definitions of the European Commission,

the IfM or the German Commercial Code. By combining the qualitative and quantitative criteria, the definition of EKAM encompasses all "owner-managed companies and family-run businesses as well as manager-managed companies with up to 3,000 employees and/or a turnover of 600 million euros" (EKAM, 2017).

The first studies on the consideration of sustainability were already carried out in the mid-1970s (Schaltegger et al). Rising social costs and increasing criticism of existing accounting systems led Ullmann to the conclusion that companies that only strive for economic goals in the sense of profit maximization would damage their reputation in the long term. He therefore called for new approaches to expand traditional accounting and developed a corporate environmental accounting system for the first time (Ullmann, 1976). Triggered by the World Summit, the Brundtland Report or publications by Pearce, Markandya and Barbier (Pearce et al, 1989), it took about two decades for Environmental Management Accounting to change from a niche problem to a widespread research topic (Schaltegger, 2011).

In both the English and German-speaking countries, two core themes were at the forefront of this process. On the one hand (1) recognition and measurement aspects in the sense of environmental management accounting (EMAS) and, on the other hand, (2) management aspects due to the development of key figures within the framework of environmental management control (Horvath and Berlin, 2016; Schaltegger et al, 2011). It is striking that only a few quantitative studies were carried out, but primarily qualitative studies that were oriented from the outset towards the challenges of practice (Horvath and Berlin, 2016; Schaltegger et al, 2011). At the beginning of the 1990s, for example, Gray and Gray, Bebbington and Walters first explained the effects on accounting in taking ecological aspects into account (Gray, 1990; Gray et al, 1993) before Ditz, Ranganathan and Banks identified environmental costs for the first time (Ditz et al, 1995) and Bennet and James evaluated a large number of case studies in this respect (Bennett and James, 2000). Schaltegger and Buritt rounded off the development of EMAs with the first comprehensive publication on eco-efficient accounting (Schaltegger and Buritt, 2000).

Although the focus up to the year 2000 was primarily on the acquisition and valuation aspects, initial contributions to control aspects were also published at the beginning of the 1990s (Günther, 1994; Hallay and Pfriem, 1992; Schaltegger and Sturm, 1995; Wagner and Janzen, 1991). Conceptual contributions by Hallay and Pfriem (1992) as well as Schaltegger and Sturm (1995) showed early on, using examples, the possible organisational integration and implementation of eco-controlling in medium-sized companies. Above all, however, the expansion of specific controlling instruments since the beginning of the millennium has set in motion a continuous development towards ecologically oriented management of the company (Horváth and Berlin, 2016). First and foremost, the

Sustainability Balanced Scorecard (Deegen, 2001; Fahrbach et al, 2000; Figge et al, 2001) as well as the process costing extended to include sustainability aspects (Herbst, 2001) or target costing (Berlin, 2015; Herbst, 2001) should be mentioned. While initially almost exclusively qualitative studies were carried out, since 2010 the number of quantitative studies to allocate the knowledge gained has also increased (Schaltegger et al, 2011). For example, Pondeville, Swaen and Rongé (2013) as well as Christ and Burritt (2013) investigated factors influencing the development of environmental management control systems in corporate practice.

Despite the huge number of scientific publications, green controlling seems to be a topic that is still almost unrecognised in practice. One possible reason for this is that only a few conceptual contributions, such as those by Bennett, Schaltegger and Zvezdov, address the challenges of green controlling in practice and show how companies can successfully tackle them. In 2010, the ICV took up the topic of greening and since then has been trying to discuss its relevance and practical solutions in its role as a pioneer thinker (Berlin and Stehle, 2015; Steinke et al, 2016). In their second cross-national study from 2016, they looked back on the development of green controlling over the past five years. In the survey of more than 150 large and medium-sized companies, they found out that, controversial to the usual theoretical view, the implementation of green controlling is ascribed not so much to the area of responsibility of controlling, but rather primarily to management and environmental management as a staff unit (Steinke et al, 2014). The areas of finance, accounting and controlling are sometimes even regarded as a hindrance to the ecologically sustainable orientation of a company (Steinke et al, 2014). According to the investigations of the ICV Study 2016, the reasons for this are the lack of drive and ignorance on the part of the controlling department as well as the desire of the management to do without the integration of controlling (supplementary). Further hurdles are the lack of time capacities in Controlling as well as barriers between the functions implied by the organisational plan (Steinke et al, 2016).

Assuming that the studies in question regard environmental management as a practical function carrier, Horváth, Isensee and Michel continue to point out that environmental management is currently undergoing a change to an "inherent cross-cutting task", i. e. that each unit within the value-added chain should make a corresponding contribution and behave ecologically (Horváth et al, 2012). Similarly, the responsibility of ecological sustainability will no longer be bundled in the individual institution of environmental management and thus few people in the future, but will be institutionally anchored as "shared responsibility between corporate controlling and sustainability management" in analogy to the ICV Study 2016, so that a change in practice towards the theoretical view is forecast here (Steinke et al, 2016).

The auditing firm EY researched the current situation and the development of sustainable corporate governance in German medium-sized businesses less specifically from the perspective of controlling and more from the perspective of management. Due to the close integration of controlling and management, which has already been explained, the two studies published in 2007 and 2012 (Englisch, 2012) nevertheless confirm a certain degree of relevance for the subject area of green controlling in SMEs. EY examined the companies with regard to their understanding and anchoring of sustainable corporate management by, among other things, asking them about thematic priorities, management systems, responsibilities, concrete measures and the communication of sustainability. With regard to ecological sustainability aspects, the study from 2012 concluded in particular that companies are pursuing measures in the areas of recycling, waste management and building management. In addition, the companies also indicated actions for the responsible use of water, the reduction of CO₂ emissions, and the selection of transport routes according to environmentally friendly criteria, environmentally friendly vehicle fleets and the use of alternative energy sources in the survey. Another finding of the study was that 40 % of the companies surveyed had an ecological balance sheet and about 30 % were certified according to ISO 14001 (Englisch et al, 2012). As with the above-mentioned scientific publications, EY's two studies have to be attested to an insufficient accuracy of fit for the research field of green controlling. Also the lack of topicality, after all, the publication of the last study is already 5 years ago, can be critically noted at this point.

Despite the increasing number of practice-relevant publications, no study to date reveals the current status of green controlling in German SMEs. Practical examples such as those from Hallay and Pfriem or Schaltegger and Sturm emerged long before the green development of controlling processes and instruments and are now only of limited significance, not least due to other current conditions. The ICV also recognised in 2015 that there is currently no representative study on the implementation of green controlling in Germany. Although their most recent study contains predominantly German companies, this is a first starting point for the current design of green controlling.

RESEARCH QUESTIONS AND RESEARCH DESIGN

The primary objective of this work is therefore to determine the status quo of green controlling in SMEs by means of a qualitative analysis. The questions in which institutions and at which company levels ecological aspects are anchored in the company or whether a predominantly action-oriented approach is pursued are to be answered. This is to be accompanied by the opportunity that companies are hoping to exploit in dealing with green issues. In doing so, the work places special emphasis on the opportunities that arise especially for the SME type of company. In addition, the present and future challenges in dealing with this topic will be explored, as well as the perspective of ecological

sustainability aspects in general and environmental controlling in medium-sized companies. The aim of the work is therefore to answer the following research questions and to derive recommendations for action:

- Current status: How is green controlling currently used in SMEs?
- Challenges: What are the challenges facing SMEs?
- Perspectives: Which developments will green controlling in SMEs take?
- Recommendations for action: Which recommendations can be derived from this?

One method of doing qualitative studies is to conduct an expert interview in the form of a guideline, so-called semi-structured interviews, as in the study presented here. The aim of this is to obtain a broad spectrum of answers to selected topics by answering questions that are as open as possible. Ideally, in the subsequent analysis, correlations can be identified without having guided the interviewees in a specific direction by means of possible answers, so that the best possible objectivity is guaranteed.

In order to be able to achieve good results the target group of the companies surveyed was limited to medium-sized companies that have already become active in the field of sustainability. The aim of this limitation was to ensure that targeted information could be collected in the conducted expert interviews to answer the research questions. For this reason, the Chamber of Commerce and Industry (IHK) of the Northern Black Forest was contacted in a first step and they provided 20 contacts. Another source for the potential expert surveys was the Baden-Württemberg Environmental Award, in which 229 companies have so far been shortlisted or have already been awarded with this award. Consequently, the total number of potential companies, i. e. without any further restrictions imposed by the researchers, amounted to 249. Finally eight interviews could be conducted.

FINDINGS AND OUTLOOK

According to the results of the present study, the origin of the ecological sustainability work can in many cases be traced back to a personal interest of the owners. In addition to management, the shareholders are also extremely important in the further course of events, i. e. both during planning and implementation, in order to enable a consistent top-down approach. It is often the case that the same person in a medium-sized business holds management and ownership. This can prove to be strength, especially against the background of the principal-agent problem. Furthermore, the qualitative content analysis of the expert interviews showed that a consistent establishment of ecological sustainability aspects requires a considerable amount of time, since all the companies examined have been working on this topic for more than a decade. Based on the findings of the study, it is possible to formulate a recommendation for small and medium-sized businesses, especially in

view of the expected increasing relevance of the topic, to deal with the topic at an early stage and to quickly take the first steps in the right direction.

We have to state clearly that this work is not a plea for a complete turning away from the basic economic idea of making profits. Rather, it shows an approach to the long-term integration of ecological sustainability aspects into the strategies of medium-sized companies. Another central statement of the interviewed companies was the fact that ecological goals can certainly stand above economic goals in the short and medium term, but that the securing the company's existence remains the top priority in the long term. The pillars of sustainability (economic, ecologic and social aspects) also make it clear that companies should consider all areas of sustainability in their day-to-day business as well as in strategic management decisions. As we learned in the expert interviews, this is already being put into practice in some cases. None of the medium-sized companies surveyed considered one of the pillars detached from the others. On the contrary, both social and ecological aspects must be perceived and anchored as drivers of economic efficiency. In this way, the company can create a long-lasting, robust and resistant (building) substance in order to once again take up the supporting pillars of sustainability in visual terms. To ensure that this state of affairs does not remain a snapshot, but makes a lasting contribution to the long-term success and survival of the company, continuous efforts are required. The establishment and permanent integration of green controlling can thus contribute to the expansion of existing competitive advantages and the creation of new potential for success. According to the findings of this work, the controllers as (green) business partners of the management could assume an (even more) active role as coordinators of the areas involved in sustainability issues of the company. In this way, they could make a significant contribution to enabling the effective and efficient achievement of strategic corporate goals by optimising the use of available resources. According to the findings of this study, a challenge and an opportunity can be deduced from the outsider role played by the Controlling department to date. A further opportunity for the further development of green controlling in SMEs is emerging from the megatrend of digitisation, the increasing importance of which can also have complementary or positive effects for SMEs on the integration of controlling.

The delta between the status quo found in the companies surveyed and the prospects for the future makes it clear that ecological sustainability work in SMEs is undergoing a considerable process of change. The accompanying change in green controlling discovered in the course of this work could have far-reaching effects on the future institutional anchoring and the role of controlling, which is to be understood as a central insight for the perspective of green controlling in small and medium-sized enterprises. Although the direct benefit of this work is limited in particular by the limited depth of

analysis, it provides some indications as to the potential of this research field in the border area between corporate environmental management and controlling in the future.

CHINESE FOREIGN DIRECT INVESTMENTS IN GERMANY: FINDINGS OF AN EMPIRICAL STUDY

Britzelmaier, Bernd; Armbruster, Joscha; Podolnyi, Nikita; Wiesner, Daniel

Business School, Pforzheim University, Pforzheim, Germany

ABSTRACT

Chinese Foreign Direct Investments in Germany have been discussed controversially in German Mass Media. Based on the analysis of previous studies and literature review this paper attempts to gain an insight-view on the real situation in German companies after a takeover by a Chinese investor. The lead research question is: „What impact does Chinese direct investment have on company-specific factors and the development of the German investment object?“ A qualitative approach is applied by conducting expert interviews in companies concerned. The results are interesting and promising too, all companies have described their previous cooperation with the Chinese investor as positive and a win-win situation and expect it to continue in the future.

Keywords: FDI, China, Germany, M&A

INTRODUCTION

Headlines in the German press nowadays could give the impression that China is pursuing a kind of conquest strategy of the German economy (e.g. Welt, 2017; Manager Magazin, 2013). Takeovers such as those of the German robot manufacturer KUKA or the Bosch Starter Division by Chinese companies have recently generated considerable media interest in business, politics and society (Manager Magazin, 2017). Europeans are increasingly seeing their economic family silver flogged to Asia. Discussions are also being held in political circles not only in the USA as to whether and, if so, how forward-looking technologies or sectors of increased interest for internal security or similar things should and must be protected from being sold out to China. After all, many Chinese companies are suspected of buying up foreign companies only on the basis of their know-how (Zeit, 2017). From the point of view of the employee circles and employee representatives, there are always fears of emigrating jobs, or even of whole sites or company closures, as soon as the know-how has been transferred to the Far East. In addition, many attest to the Chinese a methodical approach that follows a state-initiated plan (Welt, 2017). There seems to be a common fear that the Chinese acquisition waves will increasingly undermine the German economy and that Germany could lose its competitive advantage "knowledge" to Chinese competition. However, most of the discussions are confined to the

possible economic effects of this "takeover wave". However, the impact of a Chinese direct investment on the affected companies has so far only been addressed and discussed in a few studies.

OBJECTIVES

Consequently, this paper is intended to provide an answer to the question of how Chinese direct investment affects company-specific factors and the development of the German investment object.

The few studies that have so far dealt with this topic at the corporate level have different structures (e. g. Golinski et al, 2016; Jungbluth, 2014; Bollhorn, 2015; Emons, 2015; Britzelmaier et al, 2017). Some based on qualitative approaches, others on quantitative approaches or a mixed approach, while others only discussed individual examples. Moreover, the same topics were rarely addressed by several studies. In addition, the studies show a heterogeneous field of results and there are obviously contradictions between the studies. Finally, the age of some publications can be seen as a problem, since the form and expression of the effects may have changed in the meantime. Building on these facts, our paper aims to review, update and refine the previous theses and results of the published studies. Furthermore, contradictions should be eliminated as far as possible in order to provide potential target groups with a basis for further research or decisions. In addition, the main objective is to identify and illustrate inductive factors, which have not been included in any of the studies so far, in order to be able to discuss possible new areas of impact.

LITERATURE REVIEW

Today, China is one of the world's largest economies, due to the wonder of growth it has experienced over the past four decades (Zhang and Chang, 2016). The average annual GDP (gross domestic product) growth rate between 1978 and 2015 was 9.72%. If one compares this with the global growth rate of 2.84%, it becomes clear how rapidly the Chinese economy has developed (UNCTAD, 2017).

China's joining the World Trade Organisation (WTO) and the announcement of the "Going Global" policy in 2001 have drastically changed the Chinese business world and had a decisive influence on the development of IFDI and OFDI.

In the tenth 5-year plan, the "Going Global" project was established and incentives were created to increase the OFDI flow of certain industries. In particular, activities supporting the export of Chinese raw materials, parts and machinery in heavy industry, such as textiles, machinery and electronic equipment in light industry should be rewarded with export tax rebates, direct financial assistance and foreign currency support (Buckley, 2010).

The flow of Chinese outward foreign direct investment has developed rapidly in the period following WTO membership. The annual OFDI flow has risen from USD 0.45 billion in 1986 to USD 132 billion

in 2015. China ranks third in terms of annual outflow of direct investment worldwide after the USA and Japan (UNCTAD, 2017). According to estimates by the Mercator Institute for China Studies (MERICS) and the Rhodium Group, the OFDI flow approached USD 200 billion in 2016 and has once again made a significant leap forward (Hanemann and Huotari, 2017).

The first registered investment from China in Germany was recorded in 1995 (Schwarzer and Zuberer, 2016). In recent years, the business activities of Chinese investors in the EU have grown sharply. Germany, as one of the main target countries for Chinese investments, has recently experienced a strong wave of takeovers by companies from China. Despite the continued slowdown in economic growth since 2013, this does not deter the Chinese from making further investments (Otto and Heck, 2015). In 2016 alone, company takeovers in Germany increased by 74 % to a total of 68 acquisitions. Measured in terms of the number of transactions, Germany displaced Great Britain (47) for the first time from the first place of Chinese OFDIs. By 2015, there were still 40 transactions in Germany (Kron and Sun, 2017).

The available previous studies dealing with Chinese direct investment in Germany or Europe have been conducted using both quantitative and/or qualitative research approaches. In applying the quantitative research approach, secondary data was frequently used and analysed. The studies by Emons (2015) and Jungbluth (2016) refer to statistics from the Ministry of Commerce of the People's Republic of China (MOFCOM) or to figures from the United Nations Conference on Trade and Development (UNCTAD), but mostly in combination. It should be noted here that data from both institutions on the same aspects, such as the investment volumes of Chinese companies in Europe or Germany, the number of transactions, etc., differ greatly in some cases.

The existing studies must be separated into general and company-specific effects. Hanemann and Huotari (2017), for example, from the Mercator Institute for China Studies (MERICS) and the Rhodium Group, dealt with the general development. Among other things, they investigated the investment volume of Chinese companies in Germany and Europe, the investment targets and the preferred sectors of Chinese investors (Hanemann and Huotari, 2017). Their studies disregarded company-specific effects. Various management consulting and auditing companies such as EY or PWC also analysed the development of the investment volume with regard to Chinese companies in Europe and Germany, e.g. Kron and Sun (2017) or Otto (2013)

Other important studies on this subject are the ones of Sohn et al (2009), Britzelmaier et al (2017), Knoerich (2010), Bollhorn (2015) and the meta-study by Franz et al (2016).

RESEARCH QUESTIONS AND RESEARCH DESIGN

Based on the research results of existing studies and literature, various research gaps could be determined and the need for further in-depth research was identified. In total, ten studies (two of the ten are taken from a collective work) could be identified, which dealt more closely with the effects of Chinese direct investments on a company-specific level. Further studies have addressed on the macroeconomic impact of investments in China. Since this work focuses on the effect on individual German companies, the results of these studies were omitted.

The empirical studies analysed on Chinese direct investments in Germany show that several different insights have already been found in various thematic aspects. From these, six different categories (Management, company structure, employees, company culture, financial aspects, synergies) could be derived, in which the majority of these studies focused on. However, it became clear that not every publication covered all categories. In addition, there are significant differences in the depth with which certain aspects of the topic were dealt with. The studies examined here showed that some of the results are already relatively out-dated and may no longer reflect current reality. If one were to focus only on studies that are not older than five years, for example, the number of existing studies would be significantly reduced. This shows that, in this respect, there is a further need for additional studies to be carried out in order to highlight the relevance of this issue. Although only a small number of studies on this subject have been carried out so far, it has been possible to establish that there are sometimes considerable contradictions between the research results analysed. There is therefore a specific research gap in this respect, since certain findings cannot be based on a broad basis. Furthermore, it cannot be ruled out that the categories analysed so far, which were derived from the studies and on which effects could be determined, are definitive. In this respect, this may mean that there is a research gap in that no other factors have been identified or taken into account to date.

In summary, it can be said that studies published to date on the effects of Chinese direct investment in Germany have not yet made it possible to build a kind of theory upon it as to how they affected German companies. The low number of studies, with results that are sometimes controversial and out-of-date, and the lack of depth with which certain aspects were analysed, make this much more difficult.

Out of study's and literature review the following research question was conceived:

What impact does Chinese direct investment have on company-specific factors and the development of the German investment object?

The main objective of this research work is to find an answer to this research question and to close existing research gaps as a secondary objective. The aim is to find out whether the prevailing opinions and points of criticism, as well as the findings of other studies, are correct and whether Chinese direct

investment is dangerous or rather beneficial for German companies. The results of this elaboration can be useful for various target groups. For example, companies should then be able to form a neutral picture of whether they want to consider a Chinese investor. Politicians could then be able to decide whether more restrictions would be recommendable for Chinese investors or whether it would be advantageous to further liberalise existing laws. On the one hand, this work aims to bring current research findings up to date.

One method of doing qualitative studies is to conduct an expert interview in the form of a guideline, so-called semi-structured interviews, as in the study presented here. The aim of this is to obtain a broad spectrum of answers to selected topics by answering questions that are as open as possible. Ideally, in the subsequent analysis, correlations can be identified without having guided the interviewees in a specific direction by means of possible answers, so that the best possible objectivity is guaranteed.

Out of existing studies and literature a category-based interview-guideline was developed and tested. Target companies were identified and contacted. Eight interviews could be conducted. Out of the analysis of the transcripts findings could be derived.

FINDINGS

The most important findings could be derived in the categories „management“, „company structure“, „employees“, „company culture“, „finance“ and „synergies“.

Contrary to the findings of previous studies, an exchange of **management** is not uncommon as a result of the takeover. The introduction of a dual management system, consisting of a Chinese and a German managing director, is also common practice. As far as the decision-making power is concerned, it has been shown that this remains to a large extent within the German company, both operationally and strategically, which is often due to a solid basis of trust or depends on the company's results. In the case of strategic decisions, however, investors are more likely to interfere, but only in the form of coordination and exchange.

In terms of **company structure** the aspect of location and job security was looked at in more detail and it became clear that most companies have either a direct (contract) or indirect protection, the latter predominating. An indirect safeguarding of the location is assumed by the investor's investments in the German location, since a rational behaving investor would not voluntarily invest money to close the location afterwards. In the course of this process, it was also found that the majority of Chinese investors are investing in expansion or modernization projects.

On the one hand, it turned out that the number of **employees** in the acquired companies tended to increase over the long term. On the other hand, it was discovered that as a rule there are no salary changes, but that there is still an orientation towards current industrial or standard wages.

Cultural conspicuities were generally determined, which arise due to different understandings or opinions. The indirect expression of the Chinese poses a particular problem, which can lead to the loss of face of the other person in case of disregard. Image effects are another soft factor. Here, it was possible to observe changes in the behaviour of various interest groups of the German company as a result of the Chinese takeover, which are often only of a short-term nature. These include, on the one hand, negative image effects such as employee fears about job losses or customer fears about poorer product quality. On the other hand, positive effects, such as an increase in the number of applicants or the rescue of the location could be recognised.

Financial parameters are another issue. It turned out that almost all companies experienced an improvement in their economic situation and corporate success. There could be a possible connection with the financial support that the majority of companies receive from the Chinese investor. On the whole, access to external funding, such as bank loans or promotional funds, seems to be worsening, as external lenders still often have reservations about Chinese investors. A new point gained from the survey material is the outflow of liquidity to China, e.g. in the form of dividends. However, no trend could be established on this point, as an outflow of liquidity could not be detected for some companies.

Synergies resulting from the acquisition were investigated. It was found that the Chinese investor extended access to the Chinese market, but also in part to international markets. As a result of the larger sales market, companies will be able to obtain a better order situation and capacity utilization and will also be able to position themselves better in general. In addition to the sales market, synergies could also be identified in the procurement market. For example, a large number of companies gain access to the Chinese procurement market with the help of the investor. Cost advantages resulting from lower purchase prices can improve the competitiveness of companies. Synergies can also be observed in the area of know-how exchange, as some German companies benefit from an inflow of knowledge and technology from China. This is contrary to the general fear that Chinese investors only want to transfer know-how and technologies to China. An actual loss of know-how could only be ascertained in a few companies and if so, this was not regarded as negative. What is closely linked to the above-mentioned increase in knowledge from China is an increase in innovation capacity. This was found in a large part of the companies and resulted from increased expenditures and investments in R&D, which are supported by the investor. The capacity for innovation has not yet been examined in any studies. Nor was there any mention of a change in the product portfolio. The survey showed

that the majority of the companies in the majority of the survey showed that the Chinese takeover led to a change in their product portfolio, mostly in the form of an expansion or broadening of the portfolio.

The assumption or fear circulating in media and political circles that Chinese takeovers only lead to a know-how drain, a reduction of jobs or the complete closure of locations could not be determined in this study. On the contrary, if you look at all the effects and findings, you can see that the positive aspects clearly outweigh the negative aspects and that the companies were able to benefit from the Chinese takeover. The result was a better economic and strategic positioning and a favourable starting position for future development. It is therefore not surprising that all companies have described their previous cooperation with the Chinese investor as positive and a win-win situation and expect it to continue in the future.

CONCLUSIONS AND OUTLOOK

Our investigation revealed a picture that differed greatly from the reports of many media. The small number of interviews certainly does not lead to a representativeness of the results, but gives a first well-founded insight into the affected companies. A larger number of companies could be surveyed for further insights. The results of a broader qualitative investigation could then lead to a qualitative investigation that could falsify or verify the obtained findings in a statistically valid way. It would also be interesting to carry out country comparisons.

ABSTRACT

The aim of this paper is to investigate the competitive capacities of cooperative lending banks that are attributable essentially to the human capital dimension. Emphasizing the importance of human capital in the economies of businesses, local or global, as "suppliers" of knowledge and of the ability to use process and product technologies, means, in our opinion, offering a new perspective from which to observe the dimension of the company. The study starts from these observation; the reinterpretation of the size concept, in the face of both profound changes in reality and new concepts of globalization, complexity and turbulence, is dealt with in our research according to a new analytical perspective, that of the "subjective" path in the study of the corporate-size phenomenon. The present work can be considered a position paper of a wider research project aimed at assessing whether the competitive advantages of the Credit Cooperative Banks (CCBs) - in an increasingly global market, regulated and subject to strong competitive pressures - can be sought in intangible advantages and, again, if they can find some justification in the pursuit of increases in production capacity.

Keywords. Cooperative Credit Banks – Size – Knowledge - Human Capital

1. INTRODUCTION

The competitive and environmental context, the theater of decisions and complex corporate behavior, lends itself to analysis of undoubted interest. The dynamics that are progressively characterizing the markets and the continuous pursuance by companies of behaviors that achieve, maintain, restore or improve their economic, financial and balance conditions require careful evaluation (Artis and

Hoffmann, 2008; Calomiris and Neal, 2013). The increased environmental turbulence and the greater internal complexity echoes, in fact, a variety of strategic choices that lend themselves to a not simple or univocal interpretation. On the basis of these premises, our objective is to investigate the competitive capabilities of credit cooperative banks (CCBs) that can essentially be traced back to the human capital dimension. It is obvious that the interest of economic-business studies on this issue is not new; there are, however, few studies referring to the banking sector.

Moreover, the choice of investigating cooperative credit banks arises from the awareness of the enormous weight that these hold in the Italian, French and German banking markets (EACB 2016). The size indicates the weight of each company on the market; consequently, we pose the question of whether knowledge, as a strategic resource for any company to be present on the market, can influence its dynamics and future development. The emphasis on human capital, which generates business knowledge, has led to the identification of the distinctive element of each company in this resource. The company dimension can, then, according to our hypothesis, be adequately interpreted if it refers to the individuals that produce knowledge at every level in the company. The reinterpretation of the size concept, in the face of profound changes in reality and in the new concepts of globalization, complexity or turbulence that have occupied considerable space in the literature, has necessarily been perceived and dealt with in a new analytical perspective.

First of all, it seemed to us that the theme of size is still important, which has assumed quite specific characteristics, accentuating aspects already present and highlighted in the past in the literature (Cavalieri, 1990; Marchini, 1995; Donckels and Miettinen, 1997; Paolini and Cerruti, 2009; Coad, 2010). The study of the company size can no longer be exempted, in fact, from the consideration of elements that are both important and delicate when the company is trying to position itself in a global market or to strengthen its position in the local area by exploiting intangible advantages, including cognitive advantage, which give rise to broad spectrum of competitive advantages (Hartley and Lauster, 2010). Starting from these observations, our aim was to find the most opportune perspective for observing CCB size, that referring to human capital. Few studies have adopted an observation perspective centred on the "individuals" that produce and acquire information and the effects of the knowledge thus generated on the size development traits.

Hence our research idea: to investigate the contribution of human capital to the process of size growth, recommended by the Supervisory Authorities; a role, that of human capital, made even more meaningful by the current trend towards "market de-territoriality". (Chomsky and Dieterich, 1997). In according to Grandinetti and Rullani (Grandinetti and Rullani, 1996), human capital can not only be

considered the lever for the competition of local and global markets but can itself also become the main reason for globalization (Caselli, 1997).

From a methodological point of view, the analysis of intangible assets is well suited to favouring a "subjective" approach to the study of the phenomenon investigated. (Finkelstein *et al.*, 2009; Helfat and Peteraf, 2014). The CCBs size must significantly express the features of the time phenomenon which is the company; this concept must therefore be extended to the causes of the life manifestations of companies and the effects of the recovery of intangible economies.

Some Authors (Emery *et al.*, 1994; Feng *et al.*, 2009) have shown how companies can be different even if the production capacity is identical; the conscious role of the cognitive knowledge asset therefore needs to be carefully observed.

The practical addresses and guidelines presented in the paper are the result of theoretical studies, empirical research and field surveys. The scientific contribution thus becomes an instrument able to provide useful food for thought to the scientific community and to the world of companies and banks, with reference to the competitive dimension of the CCBs, decorrelated by the purely quantitative aspect.

2. RESEARCH QUESTIONS, SOURCES AND STRUCTURE

The present work can be considered a position paper of a wider research project aimed at assessing whether the competitive advantages of the CCBs - in an increasingly global market, regulated and subject to strong competitive pressures - can be sought in intangible advantages and, again, if they can find some justification in the pursuit of increases in production capacity

The research focuses on the main effects that a redefinition of the (local or global) size of the markets implies on the interpretation of the company dimension. Training and the availability of human capital is the most important and essential specific resource for the development of local banks in that it can enable them to take advantage of globalization and for global companies to immerse themselves in socio-cultural contexts that are profoundly different from those of the country of origin (Vaccà, 1997). Hence the consideration of the profound meaning of the human resource that is translated into the analysis of what makes this resource central for both local and global businesses, and therefore a new perspective from which to observe the company dimension. (Vaccà, 1997).

The paper can be within the body of financial strategy studies and of resources intangible (Emery *et al.*, 1994; Feng *et al.*, 2009; Caselli, 1997). According to Caselli (1997), every change determine a significant impact on the information flows required and consequently on the structure of data base informative. The interpretation of data and the transmission of information within the business unit thus contributes, in the last step, to strengthening customer relationships which, in one way or another, leads to an increase in the bank's production capacity (Stefancic, 2011).

By information, we have seen, was meant the face of knowledge referring to concrete facts which have therefore a "local" and contingent nature: the dimension of the information assets available to companies is linked, as can easy be understood, as a first approximation, to company organization and to the specific characteristics of the markets (Chari and Henry, 2008); the information in the different phases of the evolution of the markets has been the means available to the organization to deal with the complexity manifested by them. The problem of information, a producible resource, and that of dimension, therefore, find their natural intersection at the point where environmental complexity is emphasised. In particular, the recovery of important economies (of information) through dimensional changes leads to the prioritising of "greater size" so that the production and use of this resource can be more efficient.

Local banks, in the sense of intermediaries with an operating dimension limited to a given area, turn to their advantage, with respect to large size, their roots in a given area and their considerable knowledge of the clientele. However, the need for them to combine dynamically the "efficiency - localism" duality in maintaining competitive positions in the market system, needs to be reinterpreted in the light of changes in the markets. The predictable complexity of a global market cannot be fought against or faced by changes in size in the sense of a simple quantitative variable (Arrighi and Silver, 2003; Helpman, 2011). Rather, local banks aware of their privileged position with regard to information should be responsive to banks by exploiting, among other things, even size changes, that is, uncompetitive relationships with other local banks (Stefancic, 2010; 2011; Perulli, 2009).

The research questions that the study will try to answer are the following:

1. Can information be understood as the side of knowledge referred to concrete facts therefore with local and contingent nature?
2. Can "knowledge" influence the dynamics and dimensional development of a territorial vocation banks?
3. Can human capital then be considered a lever for the competition of CCBs in the local markets?

The sources used are of a both primary and secondary type. The primary sources used are the principle and the documents released by the European Association of Co-operative Banks (EACB

2016) the European Banking Authority (EBA, 2016) and Bank of Italy (Banca d'Italia, 2016, 2017). The secondary sources are the main national and international literature.

Based on these premises, the work is structured as follows. Paragraph 3 provides a review of the existing literature regarding the topic of the human capital in the research of optimal bank size into the competitive market; Paragraph 4 identifies the main changes that will be determined by the research of competitive size of CCBs in local market, while the concluding remarks, and future developments will be presented in the final Paragraph.

3 . LITERATURE REVIEW AND BACKGROUND

Size represents one global and complex characteristic of business management, while its regulatory content could be found significantly in the local characteristics of banking management. Limited banking size, identifiable as a circumscribed local phenomenon, initially constitutes the prerequisite for a closer link to the area of operation and enhances the "local" vocation of local banks, redefining the link between the banking and operating dimensions, that is, between the small bank and the local bank. The link between the local bank and the local business area tends to focus on the needs of the development of small businesses and the financial maturity of families, thus significantly representing the needs of a privileged interlocutor. The structure of the financing of companies is evidently closely linked to that of investments and therefore to the capacity for economic growth. Support for company investment and, even more important, the careful evaluation of the new and ever-changing needs mean that the dynamism of local banks, the result of a cultural leap in "the approach to banking", is indispensable (Perulli, 2009; Stefancic, 2011; Barbagallo, 2015).

It is undeniable that the spread of financial innovations is also linked to the stimuli provided by small and medium-sized companies, and therefore from the knowledge and culture that distinguish them; the removal of these barriers is also the responsibility of local banks, whose role, no longer restricted to adapting with traditional tools to the needs of local companies, must also be reflected in the provision of services and information to its customers, benefiting from their existing links with them. In this way, local banks, in carrying out the typical banking functions will perform the role of vehicle for the development of the economy in which they operate, as primary links in financing chain. The "localness" under discussion is not, therefore, necessarily linked to smaller size, but rather to the strong relationship of dependence between the bank itself and the economic system in which it is established. This link, it was said, is immediately perceptible from the composition of balance sheet assets characterized by loans to local manufacturing companies and by financial investments to the advantage of intermediaries operating in the same area; in addition, it is strengthened by local management placed at the helm of the bank as well as by the composition of the staff and by the

ownership structures characterized by a high degree of local representation (Perulli, 2009; Stefancic, 2011; Barbagallo, 2015).

The data provided by the EACB give us an extremely interesting and objective overview of the presence and competitive dimension of the BCC. The importance of this banking institution, referring to 2016 data, is particularly marked in France, with Crédit Agricole, Crédit Mutuel, and subsequently in Germany with BVR (Bundesverband der Deutschen Volksbanken und Raiffeisenbanken), which hold deposits of 991,935 million for France and 739,218 million for Germany. Followed by Holland with Rabobank, with 593 million euro, England with the Building Societies Association (335,386million), Austria with Österreichische Raiffeisenbanken (182,316 million) and Österreichischer Volksbanken (22.342 million) totalling 204.658 million euro of customerdeposits. Italy, has sixth place in this classification with Federcasse (161.800 million), followed by Spain with Unión Nacional de Cooperativas de Crédito (70,469 million) and Banco de Crédito Cooperativo (31,895 million). In relation to the level of debt in the world of European cooperative credit, the country that operates prevalently with capital that is not its own is Spain with a total of 14.1%, of which 8.1% of Unión Nacional de Cooperativas de Crédito and 6.0% belonging to Banco de Crédito Cooperativo (BCC). Followed by France with a total leverage ratio¹⁷⁸ of 11.9%, Italy with 11.7% and the countries of North-Eastern Europe, Poland (9.7%), Lithuania and Bulgaria (8.20%). With reference to cost/income ratio values. The European country that has the highest value is Denmark with 41.9% by the Danish Nykredit, followed by Cyprus (43.9%), Finland (53.0%), the English Building Societies Association (57%), Lithuania (57.5%) and the Italian Federcasse (59.2%), with a value on average lower than the rest of Europe. In relation to the total capital ratio, among the most solid BCC in Europe there is France (36.6%), then Austria with the Österreichische Raiffeisenbanken where a tier 1 ratio of 9.3% is considered in the analysis and the Austrian Österreichischer Volksbanken with 15.4%. Among the cooperative banking institutions then, the countries of Northern Europe: Denmark with 23%, Holland with 23.2% and Finland with 22.9%.

The unquestionable centrality in the peripheral financial circuits (King and Levine, 1993; Carlin and Mayer, 2003; Rousseau and Sylla, 2003; Beck and Levine, 2004; Berger *et al.*, 2004), which allows local banks to provide the maximum impulse to entrepreneurial initiatives operating in the area of establishment through the mediation of local resources, is founded on and is consolidated thanks to the knowledge acquired over the years, to the awareness of the level of integration existing between businesses and the local area and, last but not least, to the close relationship with their local markets.

This last consideration, however, requires reflection, since the processes of globalization, financial innovation and market integration could lead to a reappraisal of the concept of the local market (Flores, 2005; Beck, 2005; Sennet, 2006). The global market has very precise characteristics that need to

be interpreted and is not, therefore, the product of the peculiarities of national markets, but rather, given the evidence for its peculiarities, the complex expression of the competition in which all national markets participate or to which they are subject (Cavalieri, 1990; Giaccardi and Magatti, 2002). In the global economy there are national, local, company and individual differences which cannot be reduced to uniformity; in the debate, however, we can not overlook the position of those who see in the processes of globalization the generalization of a dominant cultural and economic model, with the consequent standardization of local economies. The socio-cultural and industrial political values internalized in the production processes differentiate the corporate functions even when the goods and services are equivalent for each area of the global economy. The existence of these differences, as we will see in the continuation of this paper, cannot be overlooked either by local companies or by global companies. The current economic context has directed attention onto the genesis of global competition, that is, onto the effects of globalization on “local” competition.

In particular, the drive towards globalization has opened up the field to interpretive models of global companies that include the strategic approach dating back to Ohmae (1990) and Porter (1991) for whom a global company or one that aspires to become such is obliged to take into account the complexity and intensity of global competition. The strategic approach shared by the two scholars, regardless of the conclusions they reach, has raised widespread interest and brought about a heated debate about the forces that must be contemplated in the context of global competition.

In a global competition regime, according to Porter and Kramer (2011), the strategic actions of a company in a national market are not independent of those undertaken in the other markets in which the company operates. Unlike Ohmae (1990), for whom the customer is central to the strategy of the global enterprise and supply capacity has to be adapted his/her needs, Porter and Kramer (2011) assert that a global strategy is successful when the competitive advantage created within the market home is effectively and efficiently integrated into an international dimension: the competitive positions of companies can be determined, ultimately, by the local conditions of competition or by the interrelation of international competitive situations. The forces that drive globalization do not in any way cancel out the values that can be developed at the local level; on the contrary, local values projected into a global dimension can provide important elements of differentiation for companies in which a correct matching is achieved between the variously distributed needs and their managerial, financial, technological and commercial skills (Guatri, 1990). It is obvious that the transition towards globalization has effects both on companies oriented towards a dynamic international competition, but also on traditionally domestic companies (Ghedini, 1991).

The problem is particularly delicate for those companies that operate or intend to operate on a global market: for them, in fact, the excessively widespread exercise of government lead to tardive and

incisive actions (Perulli, 2009). However, in the face of the changes that are taking place, the qualities of corporate governance are essential for successfully managing changes: the qualities are, of course, rooted in broad and different cultural models: cultural pluralism and the specifics of local values must be recognized and exploited in such a way as to consolidate local production processes or allow progressive penetration into the areas of the global economy (Kumar *et al.*, 1999; Sull, 2009; Rigby and Vishwanath, 2006; Barbagallo, 2016).

4. ON THE COMPETITIVE DIMENSION OF CREDIT COOPERATIVE BANKS (CCBS)

Environmental changes require a review of the way in which the bank pursues its objective of integration within the socio-economic context in which it operates, still benefiting from consolidated relationships with customers (Raggetti, 1983; Barbagallo, 2015). The widespread diffusion over a local area and the consolidated patrimony of relationships with customers are, undoubtedly, strong points, but no longer sufficient to guarantee adequate advantages within the reference markets: the new products and business areas must be complemented by the search for appropriate organizational solutions that make it possible to pursue the desired productive changes. The systematic evaluation of internal resources and the monitoring of environmental variables, by means of adequate information supports, are indispensable for the pursuit of corporate goals even in a smaller “local” market.

Local banks, even in the presence of imperfections associated with the so-called informational asymmetries for which the acquisition of soft information becomes difficult (Sabani, 1993; Galassi and Di Salvo, 1997), still manage to have privileged access to this type of information compared to non-local banks (Zou and Xiao, 2008); this because they can take advantage of the central position in the market, the continuous and constant presence on the market place, the lack of mobility of the staff and the strong bond with the local area, that is, by taking advantage of a set of factors from which is derived the favourable nature of customer relationships that they succeed in establishing (Cavalieri, 1987; Corigliano, 1991). Having roots in the territory, together with the characteristics assumed by the customer relationships (continuity and trust, exclusiveness of the relationship), allows them to acquire a considerable wealth of soft information and knowledge which places them in a privileged position with respect to large banks and favors them in the implementation of successful strategies (Castelli *et al.*, 1995; Quintiliani, 2016; Gibilaro and Piatti, 2012; Caselli, 2014). These resources, in the sense of knowledge of local affairs and variables over time, in order to be used at different times or in different places need to be developed in such a way as to enhance significantly their validity. The information available to local banks, then, could be abstracted through a language that summarizes the experience accumulated in the local context in a given period.

If, as we shall see later, the processes of globalization will lead to the coexistence of a generally global market and of generally local markets, local banks are destined to become stable and competent partners for small and medium-sized businesses, ensuring the link with the local economy and acting as a support for development. The needs of the global market and those of the local markets require, however, a review of the organizational and production structures of the banks in question to be pursued in multiple ways and choosing from them the one that best enhances and operational flexibility and makes it possible to offer the products that exist on the global market (Barbagallo, 2015; 2016).

The irrelevance of national boundaries has reduced the sense of the concept of dimension traditionally accepted in the literature referring to objective elements (downsizing); the new technologies, as well as favoring the reduction of the company size in the specified meaning, lead to a greater recourse to external resources (outsourcing), the attribution of powers to collaborators (empowerment), automation and organization of distance work (networking) (Brandolini, 1996). In this complex dialectic between company and market (Local or global) "management is the crossroads of company activity and decision-making" (Lepak *et al.*, 2007): the importance of decisions and strategic choices leads to considering all the stakeholders who have weight in carrying out the activity of governance (Parbonetti, 2006; Galeotti and Garzella, 2013; Filatotchev and Nakajima, 2014).

A redefinition of the (local or global) dimension of the markets ultimately implies an impact on the interpretation of the company dimension. Training and the availability of human capital is the most important and essential specific resource for the development of local businesses as it can take advantage of globalization and for global companies to immerse themselves in socio-cultural contexts that are profoundly different from those of the country of origin (Vaccà, 1997). Hence the consideration of the profound meaning of the human resource that is translated into the analysis of what makes this resource central for both local and global businesses, and therefore a new perspective from which to observe the company dimension. Ultimately, the only significant factor that can be used by companies of whatever type in their development and survival strategies, is "knowledge", which however can only be used through the intellectual and professional abilities in human work.

4.1. The cognitive approach in the globalization of markets

Knowledge, referring to an abstract and rarefied (virtual) context through an appropriate codification process, acquires a meaning that is comprehensible not only to those who have shared the experience, but to anyone who understands the code or language (semantic knowledge). However, the practical effectiveness of a branch of knowledge, i.e. the traceability of the information encoded in different contexts at different times, is only one, though fundamental, part of the construction of competitive advantage. For the remaining part, the ability to operate successfully in a market depends on an

unconscious process of adaptive learning that contains within it formal information stratified and developed by individual companies or business individuals, identifiable in the relationships that organize the context, the systems or social groups according to the services to be supplied to the outside (Ferraris Franceschi and Cavalieri, 2000). The importance of knowledge within the company has been amply highlighted by the doctrine (Teece, 1987; Quagli, 1995): the knowledge generated by a system of information relating to the company and to its relations with the players of the market and the environment is filtered by the personality of the individuals operating in the company and learned and sedimented by the organizational structure. The analysis of the meaning and role of the business factor "knowledge" can, then, be effectively carried out by observing its objective and subjective dimensions, the first in terms of the quantitatively and qualitatively available information and the second by considering the individuals working in the company and their ability to "incorporate" information and knowledge.

In this sense Quagli's definition (1995, p.15) seems particularly appropriate and exhaustive. According to it knowledge can be considered "a system of information, learned and distributed in the company in different ways and related to each other by functional links, such as to allow operators to interpret the various environmental and internal situations in a manner appropriate to the economic conditions of the production combination and consequently to orient their own judgments of convenience ". The centrality of knowledge within the system of intangible assets has been variously discussed by the doctrine in the literature and investigated by other scholars who have preceded us (Itami and Roehl, 1987; Vicars, 1989; Parr, 1992; Nonaka 1994; Corno, 1996; Ferrando *et al.*, 1998): the technical-industrial, commercial, managerial, financial and social assets are founded and interpreted, above all, on the basis of the knowledge possessed by individuals. The management conditions capture and accentuate the essence of the company in a global market, in our opinion so that, if they essentially revolve around knowledge, it is our belief that the characterization of the company today revolves around the individuals in the company.

The problem of knowledge management transcends the aims of this work. However, the analysis of this resource, considered also in its subjective aspect requires clarification. Studies with an emphasis on individuals such as owners and managers of resources are carried out in the knowledge that tacit and codified knowledge is first and foremost business knowledge: there exists individual knowledge which is the subject of economic-business analysis provided it is instrumental to the pursuit of the corporate purpose and characterizes individuals' criteria for choice. The individual knowledge explicated and used generically by the recipient-company can usefully lead to the orientation of the studies on aspects that are also subjective. Therefore, the link between information and knowledge, between objective and subjective approaches in the study of the intangible resource leads us to a new

reading of the aggregative behavior favored by many companies in a context directly or indirectly revolutionized by global trade. The development of formal knowledge by various individuals becomes the second important stage in the projection of the company in a global market or in the maintenance or strengthening of positions acquired in a local market. The awareness of the role of information and therefore of knowledge for companies is the first goal: the cultural and managerial distance referred to previously represent the first obstacle to competitiveness for companies. The attitude of companies should, in our opinion, be that of confronting and interacting on a global basis with a wide and differentiated range of productive forces in order to exploit opportunities that would otherwise be precluded and, therefore, of using and sedimenting information codified on a worldwide basis in order also to fortify the local circuit.

These considerations lead, in addition, to interpreting the process of globalization from a new perspective. Knowledge can, in fact, project the company and strengthen its position in a global market, or it can strengthen the positions acquired in a local market. The resource under discussion can be seen as the lever for the competition of local or global markets, but can itself become the main reason for globalization (Grandinetti and Rullani, 1996; Caselli, 1997). Only the process of globalization can guarantee the maximum range of information, that is, provide the maximum benefits deriving from the replication of information.

5. CONCLUSION REMARKS AND FUTURE DEVELOPMENTS

This work contributes to the debate over the research of competitive sizes in the banking industry, essentially related to human capital. However, the choice to investigate cooperative banks arises from the awareness of the enormous weight that these have in the Italian, French and German banking markets. The emphasis of work in progress paper is on the novelty of the work, not completeness.

We have focused on three main issues:

- a) the relevance of size that is still prominent in the scientific debate; however, in a global context, the neoclassical theory, aimed at the objective analysis of the company system, is inadequate for interpreting the evolutionary characters of the company;
- b) the role of information, understood the aspect of knowledge that refers to concrete facts and is therefore of a local and contingent nature;
- c) the concept of size in this interpretation refers to the information assets available to companies. In particular, the recovery of important (information) economies by means of size variations leads to the prioritizing of "greater size" in order for the production and use of this resource to be more efficient.

In fact, the explanation of the processes of globalization, dealt with from a cognitive perspective, has led to an emphasis on the evolution of relationships between companies without operational boundaries and stakeholders or to the strengthening of these relationships within circumscribed contexts for companies with a "local" vocation. The circulation of global knowledge also in local areas, thanks to the disruptive effect of the information systems, for example, has led to favouring discrimination between tendentially local companies or those of a markedly global nature, because the evolution towards the global circulation of information or the local specialization of these are not clearly separable. The cognitive approach adopted in the reading of globalization processes has left local spheres in which we see the circulation of the codified experiences of multinational origin and markets without boundaries, where local specificities are important in the process of transforming information into business knowledge.

Emphasizing the importance of human capital in the economies of local or global companies, as "suppliers" of knowledge and of the ability to use process and product technologies, means, in our opinion, offering a new perspective from which to observe the company size. Human resources, increasingly creative, diffused throughout the organization, able to produce information and able to contextualize the codified knowledge in local situations play a fundamental role in the local or global development of the company. Globally considered human capital gradually generates new business knowledge. This hypothesis has as an obvious consequence the analysis of the meaning and the dimension of human capital for the interpretation of the company dimension.

Finally, we have highlighted how this perspective leaves a problem open: the emphasis on the dimension of knowledge, therefore of intangible assets, opens the way to interpreting the problem of size in qualitative terms. In this sense, we have indicated how quantitative analysis can still play a supporting role in identifying the level of information disseminated in the company, as well as the degree of diffusion of technological innovation. However, the prevalence of qualitative aspects now suggests that the solution to the problem is acceptable provided the research method is scientifically correct. The impossibility of offering a quantitative solution to the interpretation of the size problem, not only does not invalidate the scientific nature of the research, but does not allow us opt for the classical (objective) approach in the study of the size problem, in that it is inadequate in the face of the upheavals that are affecting the internal and external conditions of the company.

We now come to some final reflections. The global scenario is undoubtedly characterized by peculiarities not found in the realities and markets considered singly and not detectable as a synthesis of local qualitative and quantitative traits. The identification and awareness of a completely new market that does not represent the sum of local markets, but in which national borders have lost significance, requires companies to find new ways of seeking competitive advantages. The same

corporate purpose also in a global space requires the formation and formulation of business strategies in view of non-local nature of the market de-territoriality.

We are therefore convinced that knowledge assets and intangible assets in general are not linked to any dimension of productive capacity. The large company like the small one is competitive in a global market regardless of the number of its employees or the amount of turnover. The global or local orientation of the production units imposes a parallel awareness of the competitive advantage that can be recovered in the cognitive advantage. Only when the concept of corporate size becomes a concept that is unrelated to any reference to objective elements can it congruently reflect the weight of companies in the markets.

The appropriate application of this in the delimitation of the field of investigation has emphasized the objective perspective according to normative purposes. However, only when dimension can be related to the human factor, and therefore to the skills and knowledge of individuals, can it be considered relevant for the purpose of achieving economic efficiency. This leads us to conclude that the "de-territoriality" of the market is also the "de-territoriality" of the company, whose size in terms of capacity is only relevant for the purposes of maintaining, restoring or improving the conditions of economic equilibrium.

The problem of the "optimal dimension", if ever a solution to it has been found, today demonstrates its irrelevance. This leaves the road open to some questions: the growth process is not linked to size growth (of capacity); indeed, in the face of global upheavals the only imperative that should affect large and small companies, regardless of the sector in which they operate, is to seek competitive advantages in intangible and no longer traditional advantages. In fact, the human factor can guarantee companies competitive positions in a non-exclusive, but at least significant, manner. What, therefore, is sense of those processes of expansion (of capacity) for the growth and competitiveness of companies? It is not easy to grasp the essence of vertical and horizontal integration processes conducted in the pursuit of economies of scale, but also of scope and variety, and not consciously aimed at consolidating its intangible assets.

On the other hand, quantitative growth, it was said at the beginning of our paper, tends to be coherent with the company's underlying strategic orientation and in tune with current trends and behavior patterns. This leads us to conclude that the phenomenon of transversal relationships (informal, on a contractual or patrimonial basis) can still find justification in the pursuit of increases in production capacity.

ABSTRACT

The present paper aims to answer the following research questions: i) is the knowledge of a city environment a stimulus for entrepreneurship? ii) which knowledge profiles of cities are more propulsive in order to stimulate entrepreneurship? In order to answer the aforementioned research questions, two multidimensional indexes have been created: KBCDE - Knowledge Based City Developing Entrepreneurship and Entrepreneurship (ENT). The sample includes all capital cities in the EU28. The presence of cities from EU28 countries is important to foster the entrepreneurial attitude in each European Country. We have also included 32 non-capital cities in the EU that are important hubs, contributing to a sample formed of 60 cities. Our work tries to contribute to the debate on urban economic development and entrepreneurship, providing implication for academics and urban policy makers. The empirical results show that the social and cultural environment may significantly improve the entrepreneurship in EU cities, moreso than others factors that are usually connected to economic development.

Keywords: Entrepreneurship, knowledge economy, knowledge city, key factors, statistical index

INTRODUCTION

Following the extant economic and managerial literature, the determinants and the effects of entrepreneurship on economic development present a national or regional perspective (e.g., Audretsch and Fritsch 2002; Crescenzi et al. 2007; Glaeser et al. 2010, 2014; Acs et al. 2014). Recent political and academic issues on entrepreneurship highlight, instead, the need to focus the aforementioned topics at city level. In recent years European Urban Policy has encouraged urban policy makers to create the supportive conditions to incentivise the creation, development and maintenance of entrepreneurship (e.g. "The State of European Cities Report", 2016). The economic literature on entrepreneurship at city level is still scarce: the main studies on the effects of

entrepreneurship in cities tend to focus on North American or emerging economy cities (Glaeser et al. 2010, 2014; Florida 2002; Florida et al. 2008), while only a few academic contributions are addressing the economic and social effects of entrepreneurship (Audretsch et al. 2015) and the drivers of the creation of an entrepreneurship ecosystem in the European cities (Audretsch and Belitski, 2017). In this vein, the present paper focuses on the role of urban environment in promoting entrepreneurship from a knowledge economy perspective. It is commonly recognized that in knowledge economy cities are characterized by a growing proportion of knowledge workers and by the service-orientation of the economic activities (Sassen, 1994; Hendriks, 1999; Madon and Sahay 2001; Turok 2008; Glaser et al. 2010; 2014). At EU level, Lever (2002) has found a positive correlation between economic development and knowledge “attitude” in European cities. From this perspective, urban policies and governance should be oriented to nurture a strong “people climate” in order to attract and retain talent in urban areas to form analytical, synthetic, and symbolic knowledge bases (Florida, 2002).

Knight (1995; 2008), Perry (2008) and the Yigitcanlar (2011) have defined the concept of Knowledge Based Urban Development - KBUD as new development paradigms of the global knowledge economy aimed at creating economic prosperity, socio-economic order, sustainability and good governance in cities. The goal is to construct a knowledge city (Carrillo et al., 2014) that is a city which is focused on knowledge-based development, by continuously encouraging the Knowledge Management processes (Carrillo et al., 2014; Penco, 2015; Edvardsson et al., 2016).

In this approach the relationship between the paradigms characterizing the global “knowledge city” and their effects on the entrepreneurship does not explicitly emerge; therefore, the impact of the knowledge economy basis in the urban development and the creation of “new entrepreneurship” is an understudied topic. In light of these considerations, the present contribution aims to answer the following research questions: i) is the knowledge city environment a stimulus for entrepreneurship? ii) which profiles of knowledge cities are more conducive to stimulate entrepreneurship? The research is carried out on a sample including all capital cities in the EU28. The presence of cities from every EU28 Country is important to foster the entrepreneurship attitude in each European Country. We also include 32 non-capital cities in the EU that are important hubs, reaching a sample formed of 60 cities. The paper is organized as follows. Section 2 reviews extant literature on knowledge cities and entrepreneurship. Section 3 explains the research design and method, describing the construction of the indicators and shows the major empirical findings. Section 4 discusses the outcomes, bringing implications for academics and practitioners, before concluding.

LITERATURE REVIEW: CITIES AND ENTREPRENEURSHIP

The evolution of cities is becoming an actual topic in itself, due to the intense increase in the recorded

urbanization rates both in Advanced and Developing countries (Madon and Sahay 2001; Turok 2008; Glaser et al. 2010). Recent analyses carried out by leading consulting companies confirm the trend towards an Urban World, as cities' contributions to the economy and global society - in terms of wealth creation and population concentration – have grown in the last thirty years (McKinsey 2016). In other terms, the world is characterized by a level of urban development unprecedented in human history, considering that since 2008, the majority of the world's population live in urban areas (Russ et al., 2017).

The relevance of the phenomenon has therefore attracted the attention of researchers (mainly regional and industrial economists and urban planners) and practitioners, as well as public administrators, who have attempted not only to interpret explanatory factors and the path leading up to this phenomenon, but also to perceive/identify the social and economic effects of urban concentrations. In recent years, academic studies have found the relevance of “people climate” in order to attract and retain talent in urban areas to form analytical, synthetic, and symbolic knowledge bases (Florida, 2002). In this vein, Carrillo (2004) coined the concept of knowledge city to identify metropolitan areas which –similar to a production system– are able to facilitate the creation of knowledge. In contrast to other concepts of cities (e.g., Smart city, Digital City), knowledge cities are particular focused on the human dimension, e.g. people, education, learning and knowledge (Cocchia, 2014). A knowledge city “is a city that is aimed at knowledge-based development, by continuously encouraging the KM (knowledge management) processes. Literature has stated that knowledge cities are the most capable of producing sustainable economic growth. Cities, where relationships between people are more extensive, provide the most natural environment in which to look for evidence of knowledge spillovers so emphasized by the endogenous growth theory (Audresch et al., 2015). Literature has defined framework and indicators aimed at measuring and achieving the development of an urban contest in a knowledge perspective. Knight (1995; 2008), Perry (2008) and the Yigitcanlar (2011) have defined the concept of KBUD as new development paradigms of the global knowledge economy aimed to create economic prosperity, socio-economic order, sustainability and good governance to city (Yigitcanlar, 2011; Yigitcanlar et al., 2015). Following the KBUD, Garcia (2012) has illustrated the MAKCi (Most Admired Knowledge City) framework is basically a knowledge-economy model, which involves an assessment of value based on which the future development of a city is made possible. Mendez and Moral (2010), studying the cities in the knowledge economy, have identified the key components of a knowledge city, analysing the most important municipalities in Spain. Víctor-Raúl López-Ruiz et al. (2014) adopted Knowledge City Indicator (KCI), aimed to assess not only the sustainability and social wellbeing, but also intangible factors such as human development, economic structure, trade, image and innovation.

In the aforementioned frameworks, the relationship between the paradigms of the global knowledge city and the effect on the level of entrepreneurship doesn't explicitly emerge. Even if case histories of entrepreneurship in cities are concretely common (e.g., De Groot et al. 2009; Rosenthal and Strange 2004; Bosma and Sternberg, 2014), the factors and the mechanisms that stimulate entrepreneurship in urban areas remain under-examined (Beaudry and Schiffauerova, 2009). In the sphere of economic and regional studies, there is considerable literature focused on the territorial dimension of the entrepreneurship phenomenon, in particular on the determinants and the impact of entrepreneurship on the economy and the development of territory (Audretsch 2003; De Groot et al. 2009; Acs et al. 2009; Glaeser et al. 2010, 2014; Andersson et al. 2011; Stam 2014). It is commonly recognized that the predominant studies are focused on countries or on regional level (e.g., Audretsch and Fritsch 2002; Stam 2014; Crescenzi et al. 2007; Glaeser et al. 2010, 2014; Acs et al. 2014). The recently developed Global Entrepreneurship and Development Index (GEDI) (Acs et al., 2013) and REDI index (Szerb et al., 2013) are aimed at capturing the interaction between individuals and the economic-structural environment at national and regional levels. The recent trend in entrepreneurship policy (e.g. "The State of European Cities Report, 2016 - Cities leading the way to a better future"; <https://ec.europa.eu/futurium/en/urban-agenda>) and academic research (Glaeser et al. 2014; Mason & Brown, 2014)) has boosted the attention not only on the national and regional prospective to study entrepreneurship, but also on local-urban perspective. Cities are an appropriate environment for entrepreneurship (Szerb et al. 2013) by providing a relevant socioeconomic and institutional context within the entrepreneurial ecosystem (Audresch et al., 2017).

The most important appeal of large metropolitan areas that are able to affect the development and for the settlement of entrepreneurship is linked to agglomeration economies (Glaeser et al. 2014) which enable higher externalities and spillovers (Audretsch et al. 2006; Ghio et al. 2014), economies of scale and incentives to innovation and growth (Audretsch 2007; Szerb et al. 2013; Feldman 2014). In contrast to Marshallian economies in industrial districts, urban agglomeration economies are "knowledge agglomerations" (Penco, 2015).

Cities provide amenities and infrastructures that are attractive to its high human capital residents (Florida, 2002; 2008). Physical conditions and amenities increase social life and a perceived improvement in quality of life (Glaeser and Gottlieb, 2006; Warnaby and Davies 1997; McKee and McKee 2004; Benninson et al. 2007; Turok 2008). Transport links either foster or constrain interaction between the agents of the entrepreneurial ecosystem (Turok 2008; Audretsch et al. 2015c).

The main studies are focused on the effects of entrepreneurship in North American cities or those in emerging economies (Glaeser et al., 2010,2014; Florida 2002; Florida et al. 2008; Andersson et al. 2011). The contemporary European urban context (Dijkstra et al. 2013) has however been studied less (see

Acs et al. 2014; Bosma and Sternberg, 2014). Moreover, the entrepreneurship phenomenon in the knowledge city context is not directly studied even if it is commonly recognized that the knowledge development context is one of the most important feature in entrepreneurship development. On the basis of the aforementioned premises and literature gap in the relationship between the knowledge city framework conditions and the entrepreneurial development, our work follows the KBUD framework (Yigitcanlar, 2011; Yigitcanlar et al., 2015) and the entrepreneurship research (Stam et al, 2014; Szerb et al. 2013, Levie and Autio, 2014), connecting and extending their works in three important ways. Firstly we create 4 domains of Knowledge Cities “entrepreneurship oriented”. Secondly, we create an innovative index for measuring the entrepreneurial action at city level. Thirdly, we explain the relationship between each dimension of knowledge city at an entrepreneurship level, trying to identify any bottlenecks and policy implications (Levie and Autio 2014).

METHODOLOGY

The sample includes all capital cities in the EU28. The presence of cities from every EU28 Country is important to foster the entrepreneurship attitude in each European Country. We also include 32 non-capital cities in the EU that are important hubs, reaching a sample formed of 60 cities (Bannerjee et al 2016). We decided to create an innovative multidimensional index (KBCDE - Knowledge Based City Developing Entrepreneurship) in order to better explain the different dimensions of “Knowledge cities” following a consolidated methodology (Nardo et al. 2005; Ivaldi et al. 2016a), which defines different stages in order to develop a composite indicator. The selected dimensions really cover the multidimensional nature of “knowledge”: they are sufficiently different, fully describing the multidimensionality of the phenomenon and thus the risk of self-correlation is avoided.

We have considered it appropriate to construct an index based on currently available data, which does not require ad hoc surveys, with the double benefit of avoiding additional costs and also being able to easily and regularly update it (Ivaldi et al. 2016;). The analysis of the literature offers several ways to derive *a priori* which should be the most suitable variable to insert the index (Yigitcanlar et al., 2015), even if the choice is conditioned, of course, both by the availability of data and the purpose of the index itself. Data is obtained from Nesta, European Venture Capital Association, Crowdsurfer, World Bank, Cushman-Wakefield, Ookla, ITU, European Statistical System: CensusHub2, Ghtorrent, Eurobarometer, GP Bullhound, CB Insights, QS University Rankings, Numbeo, DG Regio, Teleport, Global Entrepreneurship Monitor, Eurostat, Meetup.com, Gust, Open Axel, Seed DB, European Business Angels Network. Data collection was carried out in 60 European cities: all capital cities in the EU28 and 32 non-capital cities in the EU that are important hubs of digital entrepreneurship

(Bannerjee et al 2016). Finally we decided to consider 28 indicators grouped in the 4 dimensions (Table 1).

Variables containing outliers were treated so that the largest/smallest value was transformed to have the same value as the second largest/smallest value until skewness and kurtosis fell within the acceptable limits, respectively 2 and 3,5 (Bannerjee et al 2016). All the variables are normalised to within an identical [0,1] range by subtracting the minimum value and then dividing by the entire range of values for that indicator using the Min-Max normalisation method (Han et al. 2012). About 99% of the data was complete and missing data was replaced with the mean of the other variables in that theme obtained for that city in order that for cities containing missing values, the theme scores obtained using imputed data were the same as those that would have been obtained had the variables containing missing values been excluded from the Index (Bannerjee et al 2016). In the absence of dominance of one dimension over all others, some combination or aggregation is necessary in order to make "Knowledge" inter-individually comparable. The weighting of the relevant life domains is deemed a crucial (Nardo et. al 2005), but very difficult issue and we have opted for equal weighting for different reasons. First of all, the theoretical scheme attaches to each indicator the same adequacy in defining the variable to measure; secondly it does not allow hypotheses consistently derived from differential weightings and the statistical and empirical knowledge is not sufficient for defining weights; finally there is no agreement as to the application of alternative procedures (Maggino 2009). Indeed, even though it would be desirable to assign different weights to the various domains considered, there is no reliable basis for doing so and in any case this does not mean no weighting as equal weighting does imply an implicit judgment on the weights being equal (Nardo et al. 2005).

We carried out the study using a non-compensatory index: *DP2 Distance* because in the construction of composite indicators, when the symmetry of variables or their weight is to be kept relevant and interpretable, it is necessary to use non-compensatory methods (Munda and Nardo 2005). A non-compensatory index considers the variables as non-substitutable and it assumes no probability law regarding the distribution of variables.

The Pena Distance Index (DP2), although non-compensatory, is a parametric index, because its formulation is based on the application of the linear regression model. Proposed by Pena in 1977 (Pena 1977), DP2 use is increasing after Somarriba and Pena (2009) published a paper in English using DP2 criticizing both Principal Component analyses (PCA) and Data Envelopment Analysis (DEA). Some refinement of the method has been proposed (Montero et al. 2010). The DP2 method is an iterative procedure that weighs partial indicators depending on their correlation with the global index. The DP2 method has been used in different arguments: economic and social cohesion (Holgado Molina et al. 2015); environmental quality (Montero et al., 2010); quality of life (Somarriba and Pena, 2009;

Sommariba and Zarosa, 2016), welfare systems (Martinez-Martinez, et al. 2016), political participation (Ivaldi et al. 2017a), deprivation (Landi et. al 2017) and measure of objective and subjective health (Ivaldi et. al 2017b). This construction solves a large number of problems, for instance, aggregating variables expressed in different units of measurement, arbitrary weights, the treatment of missing values and duplicate information (Pena 1977; Somarriba and Pena 2009; Montero et al. 2010). Moreover, this method is considered more robust than traditional methods such as Principal Component Analysis and Data Envelopment Analysis, as demonstrated by Somarriba and Pena (2009). The DP2 distance synthetic indicator also has many properties: non-negativity, commutativity, triangular inequality, existence, determination, monotony, uniqueness, transitivity, invariance to change of origin and/or scale of units in which the variables are defined, invariance to a change in the general conditions and exhaustiveness and reference base. (Nayak and Mishra 2012).

Dimensions	Variables						
Social and Talent-cultural perspective (STC)	Multicultural Diversity (Percentage of population that are foreign-born)	Access to graduates (Percentage of population aged 25-64 with tertiary (level 5 - 8) education attainment)	English language skills (Percentage of city's population who can communicate in English)	Quality of research institutions (Number of research intuitions in top 200)	Size of potential mobile-based market (Number of active mobile-broadband subscriptions per 100 inhabitants)	Culture & recreation (Average scores attributed to diverse cultural facilities)	
Economy and Knowledge economy perspective (EKE)	Online collaboration (Number of GitHub Users within the last 12 months)	Labour costs* (Average salary for: Software Developers, Web Designers, Web Developers, Business Developer, Content Marketing, Sales Manager, Customer Support (€ per annum)	Access to ICT employees (Number of employees in ICT sector/working population)	Access to Support Employees (Number of Employees in: Legal and Accounting Activities; Advertising and Market research; Office administrative, office support and other business support activities/working pop.)	Ease of doing business (Time and cost associated with doing business (Distance to Frontier score)	Cost of office space* (Average rental cost or price of commercial property (€/Sqm/Year)	Research & Development intensity (Expenditure on R&D (thousands of PPS)
Environmental and Infrastructural perspective (ENI)	Internet download/upload speed (Broadband speed (MB/Sec)	Cost of broad band * (Fixed broadband subscription	Mobile internet download/upload speed (Speed of mobile internet (MB/Sec)	Standard of living (Quality of life index score)	Commute (Average travel time and distance to work)	Train Connectivity (Total population that can be	Airport Connectivity (Score based on number of flights from

	charge (\$ / Month)					reached within 3h of train travelling)			local airports)
Urban innovation system perspective (UIS)	Availability of early-stage funding in PPP (Amount of seed and start-up funding raised (€ thousands)	Availability of late-stage funding in PPP (Amount of later-stage funding raised (€ thousands)	Availability of BA investment in PPP	Availability of crowdfunding (Amount pledged to successful campaigns through any models)	Networking and mentoring events (Number of meetups events in the last year per capita)	Access to accelerators (Number of accelerators per capita)	Availability of early-stage assistance (Number of Business Angels per capita)	Public sector information (Public Sector Information Score)	

1. * Inverted variables

Table 1 – Dimensions and variables used (Source: Our elaboration)

The basis of the synthetic indicator is a mathematical function expressed as $I = F(x_1, x_2, \dots, x_n)$, where I is the synthetic indicator and n is the number of variables, x , that contribute information to our index. Starting from a matrix X of order (j, i) , where j – the rows – is the number of the areas considered in this paper and i – the columns – is the number of variables considered. Each element x_{ij} of this matrix represents the state of the variable i in the area j . The DP2 indicator, providing the distance of each region from a reference base, which corresponds to the theoretical area achieving the lowest value of the variables being studied, is defined for area j as follows):

$$DP_{2j} = \sum_{i=1}^n \left\{ \left(\frac{d_{ij}}{\sigma_i} \right) \left(1 - R_{i,i-1,i-2,\dots,1}^2 \right) \right\} \quad \text{with } i = 1, \dots, n; \text{ (areas) and } j = 1, 2, \dots, m \text{ (variables)}$$

$d_{ij} = |x_{ij} - \min_i x_i|$, being the difference between the value taken by the i -th variable in the area j and the minimum of the variable in the least desirable theoretical scenario, namely the reference value of the matrix X .

σ_i is the standard deviation of variable i ;

Note that the quantity $\frac{d_{ij}}{\sigma_j}$ is merely a change in the origin and scale, and one may also use zero as the reference ρ point and $[max_i(x_{ij}) - min_i(x_{ij})]$ instead σ_j as a scaling factor, without any adverse effect on the formula (Montero et al. 2010).

$R_{i,i-1,i-2,\dots,1}^2$ is the coefficient of multiple linear correlation squared in the linear regression of X_i over $X_{i-1}, X_{i-2}, \dots, X_1$, and it indicates the part of the variance of X_i explained linearly by the variables $X_{i-1}, X_{i-2}, \dots, X_1$. This coefficient is an abstract number and it is unrelated to the measurement units of the different variables.

$(1 - R_{i,i-1,\dots,1}^2)$ is the correction factor, which shows the variance part of X_i not explained by the linear regression model. This factor ensures that the composite synthetic indicator includes only the new information from each variable, avoiding the duplication of information already contained in the preceding variables.

Therefore $(1 - R_{j,j-1,\dots,1}^2) \cdot R_{j,j-1,\dots,1}^2$ with $j > 1$ is the coefficient of multiple linear correlation squared in the linear regression of the first chosen j over the successive other indicators included one by one. The first variable obtains an absolute weight of unity $(1 - R_1^2)$, the subsequent variable $j = 2$ obtains a weight $(1 - R_{2,1}^2)$, the third $j = 3$ $(1 - R_{3,2,1}^2)$, and in general, the j th variable obtains a weight $(1 - R_{j,j-1,\dots,1}^2)$. The chosen j is regressed over other indicators included one by one. The resulted $R_{j,j-1,\dots,1}^2$ for any J is used as a sort of weight. In this way the weight assigned to each indicator follows a precise rule that has the goal of reducing the duplicity of information that often affects aggregation methods (Somarriba and Peña 2009; Montero et al. 2010). Concerning the weights, the

first variable obtains an absolute weight of $(1 - R_1^2)$. The subsequent variable $j=2$ obtains a weight $(1 - R_{2,1}^2)$. In general, the j^{th} variable obtains a weight $(1 - R_{j,j-1,\dots,1}^2)$. Thus, the weights assigned to a variable depend on its position in the order, making DP2-based composite synthetic indices indeterminate and arbitrary (Montero et al. 2010). It is worth noting that the weights assigned to a variable will depend on its position in the order, making DP2-based composite synthetic indices indeterminate and arbitrary (Nayak and Mishra 2012). Montero et al. (2010) try to suggest the following procedure to solve the indeterminacy problem:

1. Initialize the weight vector, $w_j = 1 \forall j = 1, 2, \dots, m$ and define $\varepsilon = 0.00001$.
2. Define $\partial_{ij} = \left(\frac{d_{ij}}{\sigma_j}\right) \forall j = 1, 2, \dots, m$ and $i = 1, 2, \dots, n$.
3. Obtain $DF_i = \sum_{j=1}^m \left[\left(\frac{d_{ij}}{\sigma_j}\right) w_j\right]; i = 1, 2, \dots, n$.
4. Compute Karl Pearson's coefficient of correlation $r(DF, \partial_j)$ between DF and $\partial_j \forall j = 1, 2, \dots, m$. Arrange $|r(DF, \partial_j)|$ in descending order and re-index the associated variables ∂_j accordingly.
5. Compute $Z_i = \sum_{j=1}^m \left[\left(\frac{d_{ij}}{\sigma_j}\right) w_j\right]; i = 1, 2, \dots, n; w_j = (1 - R_{j,j-1,\dots,1}^2)$ for $j = 2, 3, \dots, m$ and $w_1 = 1$.
6. If $\sum_{i=1}^n (DF_i - Z_i)^2 \geq \varepsilon$ then replace DF by Z go to 4), otherwise: finish.

This construction of KBCDE solves a large number of problems, for instance, aggregating variables expressed in different units of measurement, arbitrary weights, the treatment of missing values and duplicate information (Pena 1977; Somarriba and Pena 2009; Montero et al. 2010). Higher scores represent situations of good "knowledge" rather than lower scores. In this way, we complete the index for each dimension, as well as for the aggregate global indicator of knowledge (Ivaldi et al 2016b). We used the same methodology to create the index of Entrepreneurship (ENT) using three variables: New-business density, Absence of negative perception of entrepreneurship (% of population) and History of highly successful digital companies (per capita).

RESULTS AND DISCUSSIONS

The findings show the different ranking of the samples EU cities (Table Annex 1A). London appears as the best performer, in terms of Social and Talent-cultural perspective (1st; STC=16.8038), Urban innovation system perspective (1st UIS=6.049993) and then on the basis of "KBCDE - Knowledge Based City Developing Entrepreneurship synthetic measures (1st; 8.224808); these profiles stimulate the leading position in Entrepreneurship (1st; ENT=4.18), confirming previous academic contributions (Table 2). Consistently with the main literature (Ergazakis et al. 2004; Edvinsson et al., 2006), Stockholm follows London in KBCDE (2nd; 8.648025), thank to the good position of the social aspect

(2nd; 13.80082) and in the creation of a good innovative system (2nd; UIS=5.824475). London and Stockholm are followed by Oxford, Paris, Amsterdam, Copenhagen and Helsinki. It is no coincidence that the top cities in KBCDE have recently implemented dictated policies, making the city governments' activities more coherent. Some of these cities have implemented explicit policies in order to earn the "status of Knowledge Cities". These policies aim to enhance the competitiveness of these cities and the national system in which they are located, as well as to realize a harmonious development with the other neighbouring towns. In the contemporary economy, in fact, cities are in competition with each other in attracting investments, business, inhabitants and tourists and to improve citizens' satisfaction. In order to deal with this competition, cities use different tools: strategic planning, marketing strategies, city branding, etc. In particular, having dictated policies brings the following value to cities: increased competitiveness, resulting in a positive impact on investment, jobs, inhabitants, visitors and events; higher returns on investment in real estate, infrastructure and events; coherent city development, as the physical, social, economic and cultural aspects combine to deliver the brand promise; pride in the city as the inhabitants, businesses and institutions experience a new sense of purpose and direction. These results confirm that the top cities are located in Northern Countries; policies aimed at enhancing the level of quality in social, economic, environment-sustainability and in supportive interventions for new firms have stimulated the creation of a knowledge-based context. It was also chosen to compare, through the Spearman rank correlation coefficient, KBCDE results with ENT. Pearson's correlation is moderately good (0.534). The component more correlated with ENT Index is described by STC (0.645) and partially from UIS (0.383) (Table 3). The findings demonstrate that a high score in KCBED is a valuable predictor of ENT attitude at city level, confirming that a knowledge city environment is a stimulus for the development of entrepreneurship.

Table 3 – Correlations

In order to understand which profiles of knowledge cities are more propulsive in order to stimulate entrepreneurship, first, as the Social and Talent-cultural perspective (STC) help to attract and retain talents, the empirical outcomes corroborate the positive association between a good social environment and entrepreneurship attitude at city level. Moreover, the outcomes test the relevant role of the creation of interventions and measures aimed at developing an Urban innovation system perspective (UIS) in shaping entrepreneurship.

CONCLUSION AND FURTHER RESEARCH

In conclusion, challenging the theme of entrepreneurship in the urban context, our study yields several insights. First, we have created a new composite index called KBCDE and we have applied this model to 60 EU cities (capital cities and other important cities). Secondly, on the basis of a set of sub-indexes, we have studied a relationship between each profile of knowledge cities and entrepreneurship, on a sample of 60 EU cities. Third, our work tries to contribute to the debate on urban economic development and entrepreneurship, providing implication for academics and urban policy makers. The empirical results test that the social and cultural environment may significantly improve entrepreneurship in EU cities, more than others factors that are usually connected to economic development. This contribution presents some inherent limitations, which might be challenged in future research. Firstly, the investigation is performed only on EU cities; further studies are therefore required to enlarge the sample of cities, including other urban areas and to make a comparison with other relevant Countries (e.g., Emerging Economies/Advanced Economies). In addition, the number of variables and attributes referred to each dimension might be expanded, embodying also additional perspectives, which could reasonably contribute to achieve a better understanding of the determinants affecting the development of entrepreneurship at urban level.

²Deloitte Consulting, Milan, Italy

ABSTRACT

This paper proposes to analyze the correlation between the reputation of the investment banks, and the quality of the services offered by the latter as advisors in an M&A operation. It starts from an analysis of the literature that shows the general theory concerning M&A operations. Subsequently, the research focuses on the role of the advisor, and therefore of investment banks, with specific reference to the main factors that have led the top financial banks to success. To what extent is it really advantageous to recruit a top investment bank compared to a bank that has a lower reputation? This empirical analysis covers a specific period, whose middle point is to be considered that event, one of the most significant of today's finance, which has distinguished the financial world of recent years: the failure of Lehman Brothers. The analysis focuses, in fact, on the six years preceding the crisis that began precisely following the bankruptcy of Lehman Brothers, and over the six years following this crisis. The answer to this question is exposed after the empirical analysis that pulls the strings of the research and gives a well-founded answer, based on methodologies and analysis, exposing results aimed at demonstrating that the creation of value for the shareholders of the acquirer and target company does not it can be found in the advice offered by the top investment banks. In the statistical research some other variables are found significant for value creation.

Keywords: M&A; value creation; European countries.

INTRODUCTION

One of the most discussed fields to date and certainly listed among those most relevant to the modern financial world is the M&A activity. In fact, the relevance of the M&A phenomenon is such that, only in this activity, it is estimated that, in 2016, more than 3.8 trillion dollars were used⁴.

⁴ The volume of global mergers & acquisitions (M&A) activity in 2016 fell 18 percent from the record high seen in 2015, according to a review published by Dealogic. Moreover, the fall – from \$4.66 trillion in 2015 to \$3.84 trillion

Among the main players in the major merger and acquisition transactions, we mention the investment banks, which have taken on the role of advisors for the counterparties involved, from time to time, in the operations. Indeed, the largest investment banks, more precisely the top ten at global level, have in fact found a large profit margin due to their participation as advisors in the most significant transactions on the market. This figure gives us a clear idea of the strong hierarchy of the sector: a small circle of banks, the so-called top investment banks, govern and regulate the global investment banking service. The latter have earned, over the years, a reputation that can be considered as the greatest experts in the capital markets and, theoretically, it is considered plausible that they would be able to guarantee its customers also services performance considerably higher, compared to those of the most economical competitors, against considerably higher commissions (Chemmanur and Fulghieri, 1994).

This paper aims to analyze the correlation between the reputation of the investment banks, and the quality of the services offered by the latter as advisors. This empirical analysis covers a specific period, whose middle point is to be considered that event, one of the most significant of today's finance, which has characterized the financial world of recent years: the failure of Lehman Brothers. The analysis focuses, in fact, on the six years preceding the crisis that began precisely following the bankruptcy of Lehman Brothers, and over the six years following this crisis.

The sample of analysis includes deals among only listed companies: this is because negotiations between listed companies require a greater degree of disclosure of information and adaptation to more stringent provisions and procedures by sector authorities, which further increase the complexity of the deals and the need to have qualified and highly professionalized consultancy skills.

One of the main question is if the selection of a bank occupying the first positions of the league table actually generates greater value for the acquirer and the target shareholders? "Are good financial advisors really good?" (Ismail, 2010).

The answer to this question is set out in the analytical part, which, in addition to containing the empirical analysis, the real heart of research, pulls the strings of research and gives a well-founded answer, based on methodologies and analysis, exposing results aimed at demonstrating that the creation of value for the shareholders of the acquirer and target company cannot be found in the advice provided by the top financial banks.

in 2016 – followed three consecutive year-on-year increases. And while volume fell 18 percent, M&A revenue was down by only 2 percent. Dealogic, January 05, 2017

LITERATURE

The M&A activity consists of supporting the advisor to the company interested in buying or selling a business unit or branch, or two or more companies that want to give life to a new subject deriving from them, through the assignment of complexes and / or company branches. M&A is a strategic business area whose main feature is the management of a process, divided into a first "technical" part (from the first approach to the counterparts) and a second negotiating part (from the offering memorandum to closing): the advisor must therefore combine a medium level of technical skills and high negotiating skills.

The judgment and experience of an "independent" advisor can have a fundamental weight on the negotiations' success, and the company considers the consultant not only in terms of previous relationships, but also in terms of track record and the so called "beauty parade", which it can be facilitated by the fact that the nature of the M&A transaction lends itself to define the relationship between company and consultant through a contract that regulates the remuneration with a double level of commissions (the success fees linked to the success of the transaction to align the interests of the parties involved and the retained fee for the analysts' processing of the economic-financial and strategic-organizational profiles of the target company) to avoid the opportunistic behavior of the company aimed at disposing of the technical expertise (strategic evaluation and also of marketing) free of charge (Zara et al., 2001).

M&A activities include a range of services offered by financial intermediaries to support a rather wide range of interventions on corporate assets of companies, including: acquisitions, mergers, transfers and spin-offs, split offs, equity carve-outs, issuance of tracking stock, demergers, public purchase and exchange offers, seasoned offers and stocks buy-backs.

M&A transactions belong to the macro-category of "Extraordinary Finance" transactions, as transactions carried out for objectives different from those pursued by the "Ordinary Finance" of the company: acquisition of financial resources necessary for the performance of the core business of enterprise, the use of excess liquidity and treasury management.

There are many reasons and explanations why a company's management decides to undertake M&A transactions. One of the main reasons is expansion: acquiring a particular company that operates in a specific business, in a specific geographic area, in which the buying company wants to expand, can be a much faster strategy than internal growth (Gaughan, 2011). Corporate acquisitions therefore represent a way to pursue an alternative growth objective, compared to the strategic option represented by autogenous growth. In particular, when the disadvantages of internal growth appear to be predominant over advantages, then space is created for the activation of external growth paths and, therefore, for the realization of a M&A operation, such as, for example, the acquisition of a

company, or of a business unit or, again, of specific assets of the target company (Capizzi, 2007). The acquisition through external channels can also be part of a business diversification program in cases the purchasing company intends to move within a new business sector.

The explanations that companies provide in order to justify the implementation of M&A transactions focus not only on the possibility of faster growth, but also on the value creation. The term "synergy" is used to indicate the possibility of generating advantages through the combination of bidder and target; advantages that companies, considered individually, would not have been able to achieve.

Both acquirers and sellers expect benefits as a result of an M&A operation. Ravenscraft and Scherer (1987), simply wrote that sellers sell when buyers make sufficiently attractive offers. A spontaneous question arises: why should a company, a buyer, make such an offer? Still, what are the motivations that determine the convenience of carrying out mergers and acquisitions? First of all, it is important to point out that the M&A activity is often influenced by a number of factors. These are basically factors that in some way act as a trigger, creating the conditions for change and the economic and strategic opportunities that make an extraordinary finance operation attractive. These factors include, among others, regulation, the markets size, technological innovation, fluctuations in financial markets, and financial innovations. Stimuli, opportunities and threats that are generated within the market, can then be translated into strategic options, sources of synergies, that determine the convenience of an operation. Moreover, these strategic options presuppose a good degree of rationality in the markets and in the behavior both of managers and shareholders. However, sometimes it happens that corporate acquisitions are driven by irrational motivations, linked to the psychological sphere of the decision makers, which often lead to an operation failure. Leaving aside the subjective and irrational motivations, which are briefly reviewed later in this chapter, it is possible to group together the possible objective determinants of M&A transactions in five macro categories (Capizzi, 2007), undoubtedly partly correlated to each others, considering that a M&A operation can satisfy multiple reasons at the same time.

Many of the previous studies on the role of investment banks in M&A transactions have examined the effect of banks' reputation on the return to shareholders of client companies. In particular, the past researches focused more on the hypothesis which, historically, the literature referred to as "the superior deal hypothesis". This hypothesis argues that banks, with a better reputation, have the ability to identify both the best counterparts and to structure optimal deals, increasing the potential creation of value of an extraordinary financial transaction (Ismail, 2010). As a result, this hypothesis predicts a positive relationship between the reputation of the investment banks and the creation of value for shareholders.

The idea is therefore based on the idea that top investment banks are able to provide superior quality services. Considering that the quality of the most important activities falling within investment banking services is critically dependent on the experience of a bank (Ma, 2006), this is why the role of league tables in measuring the reputational capital of the banks becomes important. The top investment banks that have had the opportunity to be involved in a greater number of transactions have, inevitably, compared with multiple sectors, countries and customers and the know-how gained by them and certainly greater than that of minors banks. Moreover, thanks to the greater experience, bankers of the top investment banks should have superior negotiation skills that would result in better results for their clients.

Secondly, taking up the concept of reputation and certification role played by the financial intermediary, in the literature the certification hypothesis, defined in terms of investment banking activities, suggest that the most prestigious intermediaries, which are confirmed in the first positions of the league tables, should reduce the uncertainty of the markets on the actual quality of the transaction. Taking into consideration the new economic-financial context following the financial crisis, and considering the division of the analysis into two symmetrical periods, it is assumed that in the pre-Lehman period, characterized by a strongly growing market and an intense activity of M & A, the reputation of the banks was not necessarily an expression of better shareholder returns, as the market was highly irrational, and the certification effect was losing importance. Instead, banks are expected to play a more important role in certifying the value of a given transaction in a period (the post-Lehman one, in which the financial crisis has spread) in which uncertainty becomes an important feature of the market.

METHODOLOGY

A sample of M&A transactions included in a 12-year time frame, from September 15, 2002 to September 15, 2014 has been collected. For the purposes of the analysis, the time span has been divided into two sub-periods, corresponding two symmetrical periods: the 6 previous years and the 6 years after September 15, 2008 on which Lehman Brothers was placed under bankruptcy protection. The data was collected thanks to the Zaphyr financial data provider, which contains information on M&A, IPO, Private Equity and Venture Capital transactions and relates to announcements of transactions, then completed, between companies residing in one of the eighteen countries of Europe Western, listed below: Austria, Belgium, Denmark, Finland, France, Germany, Greece, Ireland, Iceland, Italy, Luxembourg, Norway, Holland, Portugal, United Kingdom, Spain,

Sweden, Switzerland (the same 18 countries considered by STOXX Europe 600 Index⁵, or the market index which, as will be seen below, has been taken as a benchmark).

Membership in these countries is relevant for both the target and the acquirer. To this first initial sample, other criteria were then applied for selection in order to obtain a sample with desired characteristics. In particular, were excluded transactions: with a deal value of less than € 1mln and were excluded transactions where target and acquirer were not both listed. Being interested in transactions involving the transfer of control, only those in which the acquirer initially owned less than 50% of the shares were considered and reached a share of more than 50% post-acquisition. Moreover, having to study the relationship between the results of the transaction and the reputation of the advisors goes without saying that all the transactions for which the provider did not give indications of the advisor were excluded from the sample. The literature refers to these operations by defining them in-house deals (Servaes and Zenner, 1996). Finally, to avoid distortions in the results due to the particular economic situation of the most recent of the two periods observed, all the transactions involving targets or acquirers belonging to the financial services sector were cancelled from the sample.

The event study methodology

The present study is conducted experimentally and aims to fully understand the values of stock price returns recorded during the period close to the date of the transaction announcement (event window); in the following pages the following aspects will be analyzed and critically evaluated:

- Analysis of average abnormal returns and cumulative average abnormal returns with the aim of determining if they are significantly different from zero.
- Comparison of the abnormal cumulative returns of the target companies with those of the acquirer companies.
- Examination of abnormal returns, both for the acquirer companies and for the targets, in relation to the involvement of a top Financial Advisor in the execution of the transaction.

Considering that the event of interest in our analysis is the announcement of a merger or business acquisition, identifiable on a specific day, it goes without saying that the study of events was based on data with daily frequency. In order to estimate the parameters α (Alpha) and β (Beta) of every share /security, a time window, estimation window, was used before the event (announcement of the operation), in order to avoid excessive contamination deriving from the effects of the spread of any rumours on the operation. The Beta, which expresses the behaviour of a security with respect to a reference market, in statistical terms is the angular coefficient of the regression line of the yields

⁵ The STOXX Europe 600 Index is derived from the STOXX Europe Total Market Index (TMI) and is a subset of the STOXX Global 1800 Index. With a fixed number of 600 components, the STOXX Europe 600 Index represents large, mid and small capitalization companies across 18 countries of the European region

of the security in relation to the returns of the market index used as a benchmark. A Beta equal to 1 indicates that the stock moves in perfect line with the reference market (Allen, Brealey, Myers and Sandri, 2007).

The beta coefficient (β) measures the aptitude of a security to vary according to the market (systematic risk) while the alpha (α), the intercept of the regression line, expresses the aptitude of a security to vary independently from market (specific risk). In order to calculate the parameters, it was decided to use a time period of 230 days, ranging from 250 to 20 days before the event date (date of the announcement) except for some special cases in which the period in question was reduced. a few days because of the lack of financial data. This happened because the company involved in a certain M&A transaction was still unlisted when the financial data were collected. The first step in implementing the analysis was to perform a regression between the returns of a given security i and the returns of the market index m (the STOXX Europe 600). The angular coefficient β_i , is the value of the Beta, while α_i is the intercept, on the axis of the ordinates, of the regression line. Assuming a constant Beta for a given title i , we calculate the expected yield of the title i , for each day of the event window, according to the following formula:

$$1) \bar{E}_{it} = \hat{\alpha}_i + \hat{\beta}_i R_{mt}$$

Where \bar{E}_{it} is the expected return at time t , R_{mt} is the daily return of the market index m at time t , $\hat{\alpha}_i$ and $\hat{\beta}_i$ parameters of the regression.

The actual yield of a security i is defined as:

$$2) R_{it} = \hat{\alpha}_i + \hat{\beta}_i R_{mt} + \varepsilon_{it} \quad \text{with} \quad E(\varepsilon_{it}) = 0, E(\varepsilon_{it})^2 = \sigma_\varepsilon^2$$

Therefore, the abnormal return (abnormal return) is defined as the difference between the effective return of a security i (R_{it}), observed on the market at a particular time t (and conditioned by the particular event), and its expected return \bar{E}_{it} at the time t (not influenced by the event). Thus, the abnormal return of an i -th title at time t is given by the equation:

$$3) AR_{it} = R_{it} - \bar{E}_{it} = \varepsilon_{it}$$

Where R_{it} is the effective return of title i at time t . The abnormal return can be considered as a direct measure of the unexpected change in the wealth of shareholders in association with the event. The cumulative abnormal return (cumulative abnormal returns) of a security i is given by the sum of the daily abnormal returns observed in a given period (event window) $[t_0, t_1]$:

$$(4) CAR_{it}(t_0, t_1) = \sum_{t=t_0}^{t_1} AR_{it} = \sum_{t=t_0}^{t_1} \varepsilon_{it}$$

The average abnormal return is the average of the abnormal returns calculated for each observation, for each day t of the event window: $AAR_t = \frac{1}{N} \sum_{i=1}^N AR_{it}$

The average of CARs is instead defined as cumulative average abnormal returns:

$$(5) \quad CAAR_i(t_0, t_1) = \frac{1}{N} \sum_{t=t_0}^N CAR_{i,t_0 t_1} = \sum_{t=t_0}^{t_1} AAR_t$$

In this section, the calculation of the CARs was based on a time window (event window) of five and eleven days (Ismail, 2010, Golubov et al., 2012). These five days include the two days prior to the announcement, the date of the announcement (the time zero) and the two days after the announcement (-2, + 2). The eleven days include the five days preceding the announcement, the date of the announcement (the time zero) and the five days after the announcement (-5, + 5). The willingness to enter data prior to the announcement is linked to the possibility of rumours that could affect stock returns. The data following the announcement instead find explanation in the possible presence of a lag between the announcement and the market reaction. To verify that the resulting CARs are statistically different from zero (ie meaningful from a statistical point of view), the statistical test t-test and its p-value are used. With the t-test it is possible to obtain a probabilistic measure regarding the coincidence of the sample average with that of the "t student" distribution. What we intend to verify, that is the null hypothesis H_0 , is:

$$H_0 : CAAR_{t_0 t_1} = 0$$

$$H_1 : CAAR_{t_0 t_1} \neq 0$$

Through the identification of the p-value it was then established whether to reject the null hypothesis or not. In the case under examination, it was decided to reject the null hypothesis with a p-value lower than the 5% level, accepting the risk of committing an error of the first species (rejecting the null hypothesis when true) with a probability of 5 %. When the p-value is lower than this threshold it is possible to say that the average of the CARs is statistically different from zero.

THE RESULTS

Let's now analyze the results of the event study and the statistical test. Generally, in the previous literature, a positive effect was found for the target while the market reaction for the acquirer was negative or not significant. According to the literature, average and positive CARs were observed for the targets and CARs in general not significantly different from zero for the acquirer companies. In the case under examination, however, it is curious to note what happens when we go to test the null hypothesis by considering different time intervals (respectively pre and post Lehman). First of all, if we consider the entire time span of our sample (ie all 226 observations), we see a strongly positive and statistically significant return for the targets and a non-statistically significant result for the purchasing companies (Table 3). In particular, we note that for the event window (-2, + 2) and (-5, + 5) the targets get, on average, a cumulated return of 4.90% and 5.61% with a p-value equal to 0,000. The average yield for the acquirers, however, does not differ significantly from zero

and the p-value (equal to 0.84 and 0.66) confirms the null hypothesis according to which the CARs are not statistically different from zero.

CARs	Test value = 0				
	Number of Observations	Average	Mean squared error	t	P-value a due code
CAR Acquirer (-2,+2)	226	-0.000500	0.03761	-0.19986	0.8418
CAR Acquirer (-5,+5)	226	-0.001417	0.04845	-0.43951	0.6607
CAR Target (-2,+2)	226	0.047601	0.08497	8.42215	4,38E-15
CAR Target (-5,+5)	226	0.056150	0.09864	8.55727	1,81E-15

Range: entire period

Table 1.

However, when we consider the sample of observations divided into the two intervals, we obtain different results. It is recalled that the 226 total observations are subdivided into 127 pre-crack observations and 99 post-crack observations. As for the targets, however, the results are not very different: Medium CARs strongly positive for both time intervals. Despite this, in detail there are slightly higher average returns for the post-crack period (Table 5) and slightly lower in the pre-crack period (Table 4) for the acquirer. This could be interpreted by alluding to greater prudence in the period of the crisis in undertaking M&A transactions; greater prudence that would have led to more detailed evaluations and greater selection in favor of the only operations that guaranteed greater synergies. On the other side, for the target we observe average returns, significant, slightly higher returns for the pre-crack period (Table 4) and slightly lower in the post-crack period (Table 5).

CARs	Test value = 0				
	Number of Observations	Average	Mean squared error	t	P-value a due code

Range: pre (0) post (1); Lehman bankruptcy = 1

Table 3.

It is possible to analyze the model results also from another point of view. In particular, the average CARs and their respective significance are observed after having segmented the sample according to whether the observations correspond to deals supported by first tier banks or not (Table 7 and Table 6). On average, the targets supported by top-level investment banks show a lower performance. Specifically, the average cumulative abnormal yield for the targets passes respectively from 5.44% and 6.22%, without top-advisor, to 3.17% and 3.97% in the presence of at least one top advisor (always with a p-value of 0,000). As for the buying companies, however, we obtain p-values always higher than the level of significance of 5%. Finally, although statistically meaningless, it should be noted only indicatively that the CAR is on average positive in the case of presence of a first-tier investment bank (Table 7), and negative and statistically significant, otherwise (Table 6).

CARs	Test value = 0				
	Number of Observations	Average	Mean squared error	t	P-value a due code
CAR Acquirer (-2,+2)	137	-0.001693	0.04371	-0.45326	0.6511

CAR Target (-5,+5)	79	0.039774	0.06714	5.26503	1,20E-06

Ranking: first tier (1) second tier (0) advisor = 1

Table 5.

The result that the cumulative abnormal returns are on average negative for acquirers who do not use a top-advisor is in contrast to Srinivasan (1999), who made opposing considerations but in agreement with many other studies in the literature. On the other hand, unfortunately, the p-value does not allow us to make significant considerations with regard to the opposite scenario. These univariate comparisons, however, can be misleading as they do not take into account any other variable than the advisor's reputation. As you can see in the sample description section, for example, it was found that top level advisors are used for larger transactions. Thus, both firm and deal specific variables need to be taken into account in order to verify the effective influence of the "reputation" variable on our dependent variable of interest (the abnormal yield). In this regard, multivariate standard regression models have been developed (see next section).

Regression models

This section examines the relationship between the reputation of the advisor and the CARs of targets and acquirers through the use of regression models (multivariate OLS). The central point of the analysis consists in a comparison of the models obtained for targets and acquirers considering the two symmetrical periods, extensively discussed above, corresponding respectively to the six pre and post Lehman crack years. The variables used in the regressions derive for the most part from the previous literature. Regarding the dependent variable, we chose to use the CARs, expressed as a percentage, calculated over a time horizon of five and eleven days, corresponding to the event windows $(-2, + 2)$ and $(-5, + 5)$. This choice partly reflects the methodology used in recent studies by Ismail, (2010) and Golubov et al. (2012). The following are the independent variables considered:

- **First level:** this is the variable of greatest interest for research. It is a dummy variable that has a value equal to one when an investment bank, which supported a company in a transaction of the sample, is among the top ten positions of the classification of the investment banks. This variable is considered twice, once for the acquirer and once for the target (First level Acquirer and First level Target);
- **First vs second:** this variable, the only one that assumes different values depending on whether the model refers to the behavior of the target rather than the acquirer, is a dummy variable that assumes a value equal to one when we are faced with a situation in which one of the counterparties has at least one first level advisor while the other party has only second tier advisors. When both counterparties use at least one reputable advisor, the variable has a value of zero.;
- **Same country:** this is a dummy variable that has a value equal to one when target and bidder reside in the same country. Doukas and Travlos (1988) found evidence of abnormal returns positive in their studies in cases of international acquisitions (cross-border);
- **Deal value:** the value of the transaction. It is a continuous variable, the deal value could indicate the complexity of the operation. Transactions of a relatively larger size are considered by literature the most complex;
- **Same sector:** it is a dummy variable that has a value equal to one when target and bidder, involved in a particular extraordinary finance operation, operate in the same macro-sector. In this regard, it is recalled that Morck, Shleifer and Vishny, (1990) showed that the creation of value for the buying companies is greater in cases where the target operates in the same business related to that of the acquirer. Later Berger and Ofek (1995) argued that sector diversification generally destroys value;
- **Cash or share:** it is a dummy variable that has a value equal to one when the percentage of the payment in cash is greater than that of shares. The market reaction is therefore assumed to be

better in the case of cash payments. One explanation comes from the fact that cash deals are usually associated with debt issuance, which encourages management to be more disciplined;

- **Total advisor number:** variable that corresponds to the total number of first-tier investment banks involved in the supporting transaction, either of a target or a buyer. From the presence of a very large number of investment banks belonging to the first category, we can deduce a greater complexity of the deal;
- **Relative size:** it is the ratio between the total assets of the target and the total assets of the acquirer. Since the integration of a relatively large target, during an acquisition/merger, most likely involves a greater internal struggle for the allocation of capital to the various divisions, a negative relationship is expected between that variable and the cumulative abnormal returns (Rajan, Servaes, and Zingales, 2000);
- **ROE acquirer:** is an index of profitability of the acquiring company's own capital. It expresses, in a nutshell, the economic results of the company. It is a percentage index for which the net income produced is compared to the net capital.
- **ROE target:** as already specified, it is an index of return on equity of the target company;
- **Debt acquirer:** it is the ratio between the indebtedness and the total assets (total assets), that is to say the total value of the assets included in the balance sheet assets. The solidity of the company grows as the ratio decreases, the economic literature shows that the ideal value of debt ratio should not greatly exceed the value of 0.5.
- **Debt target:** it is the ratio between the total debt of the target and the total assets of the same.

Interpretation of multivariate OLS results

As this work focused on both the counterparts of an M&A operation, the analysis and interpretation of the regression models were divided into two sections: target and acquirer. For both types of companies involved in a merger or acquisition, it has been verified whether the creation of value, at the announcement of M&A transactions, is linked to the reputation of the bank supporting the deal and how this phenomenon varies between the period precedent and the period following the bankruptcy of Lehman Brothers. The proxy of value creation considered, the dependent variable, corresponds to the cumulative abnormal returns (CARs), also used in the previous literature, calculated according to the market model methodology, over a five-day time window as in the recent Ismail studies (2010) and Golubov et al. (2012).

Target

The regression model for the CARs (-2, +2) corresponding to the pre-crack period Lehman (Scheme 1) consists of 121 observations and 13 independent variables. The R^2 is equal to 28.03% (the

adjusted R² is 19.29%) and the model as a whole is very significant. The test F, which measures a link between the complex of the selected variables and the dependent variable, has an associated p-value close to zero (0.000424). Enclosed you can see the results on the CARs (-5, + 5) (Schemes Appendix 7, 8, 9), it was not considered necessary to comment on them in full as they show results that match the CARs analysis (-2, + 2). Analyzing the significance of the variables, we observe that four of the thirteen variables considered are significant. These are the variables First Level Acquirer Relative Size, ROE Acquirer and ROE Target respectively significant to 10%, 10% to 1% and 5%, to be noted that all significant variables have a negative coefficient. In particular, the negative coefficient of the First Acquirer variable indicates that, in the acquisitions where the acquirer is assisted by a first-level financial advisor, the return for the target's shareholders is reduced by 5.44%, which highlights the strengthened position of the buyer company under negotiation. This may derive from the fact that the advisor, facilitating a greater availability of information, reduces any problems of information asymmetries and allows the acquirer to arrive at a better and more correct evaluation of the target.

Variable	Coefficient	Error Std	Statistic t	p-value	
Const	0.122667	0.03271	3.7496	0.00029	***

Log-Likelihood = 141,54

Akaike information criterion = -255,08

Bayesian criterion of Schwarz = -215,939

Hannan-Quinn criterion = -239,183

Table 6.

The coefficient of the variable *Relative Size* indicates a negative relationship between this variable and the cumulative abnormal returns, as the size of the target increases, the difficulty of

incorporating it within the purchaser or the economic group that the latter represents increases. Operations involving the acquisition of control and/or the integration of a relatively large target with respect to the acquirer are more complex and lead to an inferior creation of value. This variable is significant at 10%, in fact the value of the p-value is equal to 0.07763.

The most significant variable, with a p-value of 0.24%, is ROE Acquirer. The value of the negative coefficient (equal to -6.49%) indicates that the profitability of the acquiring company is negatively correlated with the CARs of the target company. Moreover, even the ROE Target is significant with a negative value, this result, at first glance a little rare, may be due to the fact that sometimes the acquiring companies complete non-optimal transactions, and are willing to pay a higher price to the shareholders of the target in order to take control of it.

Finally, it is to highlight how the multivariate regression related to the time interval preceding the Lehman crack shows some evidence for which it can be said that the identity and reputation of the investment bank is an important variable in determining the reaction of the market and the related value creation for the target when M&A transactions are announced.

Moreover, the result is in agreement with the analysis carried out on the CARs. In fact, from the comparison between the tables (Table 8 and Table 9) illustrated below, it is possible to notice that the average of the CARs varies in the transition from a pre-crisis scenario without top advisor to a pre-crisis scenario with top advisor.

With reference to the same time frame considered in the regression model, targets supported by a top investment bank obtain average abnormal cumulative returns of 3.65% (-2, + 2) and 4.69% (-5, + 5), around 34.93% lower and 29.26% lower than the CARs average in the absence of at least one top advisor. This is an important result and finds a tendency in contrast to some of the previous studies.

	Entire period	Pre crisis	Post crisis
CAAR (-2,+2)	0.0318	0.0365	0.0221
CAAR (-5.+5)	0.0398	0.0469	0.0252

Target advisor = 1

Table 7.

	Entire period	Pre crisis	Post crisis
CAAR (-2,+2)	0.0544	0.0561	0.0527
CAAR (-5.+5)	0.0623	0.0663	0.0582

Target advisor = 0

Table 8.

Instead, the results of the regression model and of the CARs analysis with reference to the post-crack time period are different (Scheme 2), that is the period of the "financial crisis". In the post Lehman period, in fact, there is a different scenario. First of all, note how the R^2 gets worse,

reaching 16.85%. It should be noted that, as the R^2 decreases, the adjusted R^2 decreases from 19.28% to 2.24% significantly.

Specifically, the model relating to the period following 2008 as a whole is not significant. The F test on the combined significance of the regression coefficients is equal to 1.153, with an associated p-value equal to 0.331.

Analyzing the significance of the variables, it should be noted that only one of the thirteen variables considered, ie ROE Target, is significant with a p-value of 5.49%. The value of the positive coefficient equal to 0.048 indicates that the profitability of the target company is positively correlated with the CARs thereof.

Bayesian criterion of Schwarz = -143,825

Hannan-Quinn criterion = -164,535

Having said that, in this new scenario, it is important to underline how the model does not indicate any effect between the reputation of the investment bank (advisor) on the cumulative abnormal returns (CARs) of the target. Moreover, the result is in agreement with the analysis carried out on the CARs. In fact, from the comparison between the tables (Table 8 and Table 9) illustrated above, it can be seen that the average of the CARs varies in the transition from a post-crisis scenario without top advisor to a post-crisis scenario with top advisor. With reference to the same time frame considered in the regression model, targets supported by a top investment bank obtain average abnormal

cumulative returns of 2.21% (-2,+2) and 2.52% (-5,+5) , around 58.60% lower and 56.70% lower than the CAR average in the absence of at least one top advisor. However, the fact that this positive contribution is not even found in the post-crisis sample generates food for thought.

Acquirer

As for the buying companies, it is right to remember how the literature before Golubov et al. (2012) was struggling to highlight a positive relationship between the advisor's reputation and the creation of value through mergers and acquisitions. The innovation of the scholars, in the recent work, was that of carrying out a verification for the cases of only transactions between listed companies, or excluding the cases in which the acquirer was preparing to acquire unlisted targets. As in the case of the target analysis, also for the acquirer companies there are two very different results depending on whether the model refers to the pre- or post-Lehman crack period. Specifically, the model relating to the period before bankruptcy (Scheme 3), as a whole, is not significant. Enclosed you can see the results on the CARs (-5, +5) (Schemes Appendix 10, 11,12), it was not considered necessary to comment on them in full as they show results that match the CARs analysis (-2, +2).

The *F test* on the combined significance of the regression coefficients is equal to 0.541661, with an associated p-value equal to 0.893. However, it is also not possible to link this phenomenon to a sample size problem with respect to the relatively large number of predictors considered, since, similarly to the case of targets, the generally accepted historical rule is met, for which at least 10 are required. subjects per predictor (Harris, 1985). Similarly to the scenario observed for the targets, even in the case of acquires the multivariate regression model suggests that the advisor's reputation is not an extremely important factor in influencing the creation of value for shareholders.

In the case of pre-Lehman acquirers there is no empirical evidence that advisor reputation plays an important role in determining value creation for shareholders. The result, among other things, is also confirmed by the T-test carried out on the CARs segmenting the sample both with respect to the period and the presence or absence of an advisor. The output referring to the post-crack period (Scheme 4), on the other hand, assumes particular importance. Compared to the previous model, in this case both the R² and the adjusted R² increase considerably and take on relevant values. In particular, the R² goes from 6.17% to 29.81% while the adjusted R² from -5.22% to 17.49%. Furthermore, the model as a whole is associated with a p-value below the 1% threshold.

Looking at the coefficients of the variables that are significant, we note the positive coefficient of the *Same country* variable, which shows that the creation of value for the acquiring company is greater in cases where the target operates in the same nation of the acquirer. The coefficient of the variable *Relative Size* indicates a positive relationship between this variable and the cumulative abnormal returns, as the size of the target increases, the difficulty of incorporating it within the purchaser or the economic group that the latter represents is recurring. Operations that involve the acquisition of control and / or the integration of a relatively large target with respect to the acquirer are complex memos and lead to a higher value creation. These results are contrary to those found in the case of

the pre-crisis target society. This variable is significant at 1%, in fact the value of the p-value is equal to 0.00004.

Moreover, even the *ROE Acquirer* appears to be significant, with a negative coefficient value, this result, at first glance strange, may mean that, sometimes, the companies with high ROE levels may achieve non-optimal operations, that would reduce the profitability of equity capital. Consistent with the literature, which attributes to the target the majority of the benefits of an operation, it is not surprising that the value creation enjoyed by the acquirer, availing itself of a leading investment bank, is considerably lower than that of the target. This evidence is also supported by what emerges from the CARs t-test (Table 22 and Table 23).

	Entire period	Pre crisis	Post crisis
CAAR (-2,+2)	0.0011	0.0009	0.0017
CAAR (-5,+5)	0.0028	0.0015	0.0058

Acquirer advisor = 1

Acquirer advisor = 0

Table 13.

A noteworthy finding was to highlight that the CARs of the acquirers who availed themselves of a top investment bank recorded a better performance. This last result was recorded both for the pre- and post-crisis periods; naturally, it must be pointed out that the intensity of this difference was not statistically significant and different from zero. Furthermore, in the appendix, it is possible to consult the results of the regression models obtained on the CARs for the entire time span of the twelve years taken into consideration (Figure 5 and Figure 6). From an initial analysis it is clear, clearly, that none of the independent variables relating to the advisor's role is stochastically significant. In particular, no relationship can be found between the abnormal returns obtained and the explanatory variables of the consulting work performed by the first level investment banks.

CONCLUSIONS

At the end of the research work on M&A, we can draw the first conclusions on the analysis conducted. Firstly, the first conclusion that comes out of sight is that, in the two pre- and post-bankruptcy periods of Lehman Brothers, top investment banks are not significantly associated with better service and greater value creation for shareholders. In the six years preceding the crisis, targets backed by a top investment bank get average abnormal cumulative returns of 3.65% (-2,+2) and 4.69% (-5,+ 5), less than approximately 34.93% and 29.26% compared to the CARs average in the absence of at least one top advisor. This result, in contrast to a large part of the economic literature, is also found on the post-crisis sample. Specifically, the fact that this positive contribution of the top investment banks is not found even in the post-crisis sample should generate important food for thought.

On the other hand, in the case of acquirer companies, the results that emerge appear to be absolutely in contrast with those of the target companies. An important result was to highlight that the CARs of the acquirers who availed themselves of a top investment bank recorded a better performance. This last result was recorded both for the pre- and post-crisis periods; naturally, it must be pointed out that the intensity of this difference was not statistically significant and different from zero.

It should also be remembered that such a divergence between the results obtained before and after the crisis could be linked to distortions deriving from choices made during the mapping of the

analytical sample. In this section it is therefore opportune to dwell on the main limits found in the empirical research conducted. The results obtained must be contextualized within the time frame in which the analysis is concentrated, within the geographical area of reference and the type of company considered. It is reasonable to remember that a larger sample, in terms of geographical location, type of society considered and a longer time span, would lead to conclusions that are very far from those identified up to here. However, despite an increase in the number of deals taken into consideration may lead to a more robust result, our sample consists of 226 transactions and is therefore to be considered sufficiently heterogeneous and complete.

In this sense, a critical element to be found is that the involvement of the investment banks does not end with the publication date of the transaction but is continuous and covers the entire time period in which the deal remains open. In addition, the analysis conducted emphasizes on deals that have been concluded and does not take into account those transactions that have not actually been finalized: this is why most of the targets have been delisted as a result of the transaction. A sample that includes not only the deals actually concluded could lead to further results.

To go beyond from the empirical analysis of this research, which has led to the aforementioned results, it is interesting to advance further reflections that can stimulate new studies and in-depth analysis of the topic. First of all, it is important to bear in mind that the crisis in the global financial system has helped to redesign and change the rules of the game within investment banking. The evolution of a new system based on new logic and on more stringent rules systems, will probably lead to a new equilibrium that today it is difficult to imagine with certainty. Moreover, in order to survive in an increasingly competitive arena, reputational capital, historically a powerful marketing tool for business banks to influence the choice of advisor by potential client companies, is destined to play an increasingly important role. and must also be fed to the detriment of profitability. A market trend that supports this hypothesis is the downward war on the fees required for investment banking services. Among the drivers of the choice of the advisor in times of crisis, the companies must necessarily consider the remuneration requested by the investment banks. The decline in the number of transactions in the period of the crisis thus pushes the investment banks who want to maintain their leadership position, in terms of market share, to ask for very low commissions in order to be credited in the league tables a greater value of the processed transactions.

A starting point for investigating the issues related to investment banking and a natural continuation of the research carried out can therefore be linked to studies concerning new drivers that support the choice of advisor and/or research that analyzes the trend of fees requested by top advisors. Moreover, it seems that the investment banks that enjoy the possibility, at least on paper,

to directly provide financing to support extraordinary finance transactions are climbing the peaks of the league tables. Access to credit and the ability of the advisor to provide adequate financial resources to complete a given transaction may, in fact, have become more important in a context of credit crunch and slow recovery in trade. Further researches that consider these variables, in addition to being of great relevance, would certainly make an important contribution in expanding the literature on extraordinary finance transactions.

APPLICATION OF NEURO-MARKETING TECHNIQUES TO THE WINE TASTING EXPERIENCE

Caratù, Myriam¹; Cherubino, Patrizia²; Mattiacci, Alberto¹

¹Department of Communication and Social Research, University of Rome "Sapienza", Italy

²Department of Molecular Medicine, University of Rome "Sapienza", Italy and BrainSigns srl, Rome, Italy

ABSTRACT

Neuro-marketing (neuroscience applied to marketing aims) has been already used for evaluating consumers' preferences within the food and agricultural sector (Cherubino et al., 2017), in food tasting and olfaction experiments (Di Flumeri et al., 2016, 2017), as well as in the wine tasting (Horska E., et al, 2016). Aim of this pilot study is to investigate whether or not the sense of olfaction represents a statistically significant variable in the experience of wine tasting. In order to do so, the research has envisioned an experimental protocol that takes into account methods and techniques typical of the neuroscience: an electroencephalographic index, assumed as an indicator of approach or withdrawal (AW) motivation (Davidson et al. 1990), and an autonomic index (Emotional Index – EI), deriving from the matching of heart rate and galvanic skin response activity - considered an indicator of emotional involvement (Vecchiato et al., 2014). The experiment has provided the degustation of two types of Italian wines, and the process has been divided in two phases as well: smell and tasting (tasting that, in turn, has been subdivided in the phases: tasting with Open Nose and tasting with Closed nose). Results of this pilot research showed a statistically significant increase of the EI values in correspondence of the wine smelling phase in comparison with the other two phases of tasting with and without olfactory component (Smell phase ($p < 0.01$) and a trend of major approach attitude in correspondence of wine tasting with the olfactory component in comparison to the others two conditions.

Keywords: neuro-marketing, wine, aroma, emotion, pleasantness, product experience.

1. INTRODUCTION

Food companies and wine producers are operating in an highly competitive market, where only enterprises capable of retaining and improving their position, as well as reaching high production process efficiency (Bielik & Hupkova 2011; Raz et al. 2008) are able to survive. To thrive and match customers' preferences, though, these companies' marketers also need to understand their consumers'

behaviour, so they continuously try new tactics and methodologies able of influencing and assessing this behaviour.

In such a context, neuro-marketing is a new-born discipline that permits to study the consumers' perception about the product, as well as the customer experience (Horska E., et al, 2016), by watching what happens in the human brain and body, through techniques typical of the neuroscience - like the electroencephalogram (EEG), the heart rate (HR) and the galvanic skin reaction (GSR): altogether, these techniques have given birth to the so-called "autonomic indexes" (e.g. Emotional Index – EI, approach or withdrawal motivation - AW) that let marketers understand whether or not the consumer has been "sensitive" to the product/service. Neuro-marketing, thus, allows the abovementioned companies to create a positive emotional connection between the customers and their brand(s), product(s), point(s) of purchase (Malär et al. 2011) and understand the factors that contribute to the consumers' buying decisions, among which there is the Perceived Value of the product/service and the Pleasantness and Emotion arisen when using/experiencing it.

2. WINE MARKETING AND NEURO-MARKETING

In fact, wine marketing is an area where not only the economic, but also the non-economic factors - such as emotions and hidden reactions of a customer - play a decisive role. Even in the modern times, when it seems that the economic indicators are of great importance and affect both business and consumer decisions (Bielik, 2014), still exist other values that can affect choosing a bottle of wine: for instance, making a good impression during special occasions, (hedonistic values) or, according to Olsen et al. (2012) caring about the planet (environmental values). The affect that the consumers experience also cannot be adequately measured by the self-reported verbal indicators, due its complexity (Zajonc 1980; Panksepp 1998; Davidson 2004). Therefore, neuro-marketing methods are meant to measure the hidden and inexpressible, unconscious consumer reactions at the process of buying - but also consuming - certain products. In particular, when it comes to wine – especially high-value wines, which are considered a luxury item – the consumers' preferences are based on the following aspects: a) Representation and Attention, b) Predicted Value, c) Experienced Value, and d) Remembered Value and Learning (Plassmann, Ramsøy & Milosavljevic, 2012). The first two parameters mostly refer to the extrinsic features of a bottle of wine – typical of the marketing discipline - as in, for instance: the label or the provenience and production information, which can influence the intention-to-buy (Sáenz-Navajas, Campo, Sutan, Ballester & Valentin, 2013) with the so called "country-of origin-effect", as well as the customers' willingness to pay (Vecchio, 2013). In fact, Reimann, Zaichkowsky, Neuhaus, Bender & Weber (2010) found out that aesthetics and brands/labels can influence consumers' perceptions of reward – thus stimulating their appreciation of the product/service. The second two parameters above

mentioned (experienced and remembered value) fall within the category of the “wine intrinsic features”, which arouse a chemosensory stimuli (Small, 2012) within the body of a person undergoing wine tasting: that is the already mentioned Experienced Value. These wine intrinsic features are the following: texture, volatile composition - which finds expression in the “wine aroma and bouquet” - and colour. For what regards the volatile composition, it is obvious that olfaction is the most involved sense when tasting a wine and smelling its aroma or bouquet: not by chance, for the wine testing, sommeliers typically use both gustation and olfaction - the latter through a direct olfactory stimulation (by the nose) and a retro-nasal pathway (accomplished by air inhalation while swirling the wine around in the mouth). The variable of olfaction during an eating or drinking experience has also interested neuroscientists (Kohler et al. 2007), who have focused on the relationship between emotion and odour, finding out that - like emotions - odours may have a positive (appetitive), negative (aversive) or neutral valence: these close connections are related to cerebral substrates common to the two. As a result, assessing the contribution of the olfaction during the process of wine tasting is essential in order to study the consumers’ perception of its aroma (which leads to the construction of the Experienced Value). This is the frame where this pilot study is collocated: its aim is to investigate the reaction to the smell of wine and its degustation, with and without the direct contribution of the olfaction.

3. METHODOLOGY

The experiments, conducted in September 2017 in the Industrial Neuroscience Laboratory of Sapienza University of Rome, measured the brain activity and the emotional engagement of individuals during a degustation of two types of Italian wines: *Sangiovese* and *Morellino di Scansano*. The techniques and indices utilized have been: the electroencephalographic index, assumed as an indicator of approach or withdrawal (AW) motivation (Davidson et al. 1990), and the emotional involvement (EI), deriving from the match of heart rate (HR) and galvanic skin response (GSR) activity (Vecchiato et al. 2014). The AW index has been already applied to the food tasting (Di Flumeri et al. 2017) and odor (Di Flumeri et al., 2016; Kim & Watanuki, 2003; Henkin & Lect, 2001). With regard to the emotional index, a list of 16 emotional words has been defined by a behavioural categorization study using the model of circumflex affect (Russel & Barrett, 1999); the words were in fact classified on the basis of pleasantness/unpleasantness and arousal (high/low) describing the wine tasting (Ferrarini et al. 2010). The IE was previously applied, instead, in neuro-marketing studies on advertising (Cherubino et al. 2016a,b) and antismoking public service announcement (Cartocci et al. 2017), supporting the appropriateness of its use to product testing. Participants to the experimental tests were 6 non-professional wine-tester subjects, balanced for gender, with an average age of 37.5 ± 15.52 .

4. EXPERIMENTAL DESIGN

The experimental procedure consisted in a total of four wine tests: after smelling every type of wine – each for 10 seconds - the testers were asked to taste it, by drinking from the glass, and to keep it into their own mouth for 10 seconds before swallowing (Fig.1). They repeated the latter operation twice: the first time in an Open Nose condition and the second time in a Closed Nose condition. Wines were randomly assigned to the participants, served at room temperature - so as to avoid unwanted temperature-related effects (Craig et al. 2000) and in the quantity of 20 ml for each test (before each trial, participants were told to drink a glass of water, in order to wash their mouth from the previous flavor).

Figure 1. The picture represents one of the participants equipped with the EEG band on the forehead and the autonomic sensors on the fingers during one of the wine tasting trial.

4.1 - EEG Recording and Signal Processing

The EEG signal was recorded Hz by the BrainVision LiveAmp amplifier (Brain Products GmbH), with a sampling frequency of 250 by 8 EEG electrodes (Fp1, Fpz, Fp2, AF3, AFz, AF4, ground and reference), following the 10-20 International System, and the impedances were kept below 10 k Ω . Each EEG trace was then converted into the EEGLab format in order to perform signal preprocessing such as artefacts detection filtering, and segmentation. The EEG signals have been pass filtered at 2-30 Hz and depurated of ocular artifacts, by using the independent component analysis (ICA). The individual alpha frequency (IAF) has been calculated for each subject in order to define four bands of interest, according to the method suggested in the literature (Klimesch, 1999). Such bands were reported in the following as IAF+, where IAF is the Individual Alpha Frequency, expressed in Hertz, and is an integer displacement in the frequency domain, which is employed to define the band ranges. In particular, we focused the present analysis on the alpha bands (IAF-4, IAF+2). To summarize the activity from all

these electrodes, the Global Field Power (GFP) was computed. This is a measurement introduced by Lehmann and Skrandies (1980) to summarize the overall activity over the scalp surface. GFP is computed from the entire set of electrodes by performing the sum of the squared values of the EEG potential at each electrode, resulting in a time-varying waveform related to the increase or decrease of the global power in the analyzed EEG. The cerebral appreciation has been monitored in the target population by using the Approach-Withdrawal index, according to the theory related to the EEG frontal asymmetry theory (Davidson, 2004). The AW index is correlated to the unbalance of the right and left prefrontal activity. The formula that has been used is the following:

$$AW = GFP_{\alpha_right} - GFP_{\alpha_left}$$

Where the GFP_{α_right} and GFP_{α_left} stand for the GFP calculated among right (Fp2, AF4) and left (Fp1, AF3) electrodes, in the alpha band, respectively. The waveform of AW cerebral index has been estimated for each second and then averaged for all the duration of the stimuli. The AW index was then standardized according to the baseline EEG activity acquired at the beginning of the experiment. Positive AW values mean an approach motivation toward the stimulus expressed by the subject, while negative AW values a withdrawal tendency. The AW index was in fact normalized returning a z-score values across all the experiment for each subject. In fact, such index has been defined by taking into account the frontal EEG asymmetry theory by Davidson and colleagues (2004).

4.2 - The Autonomic data recordings and signal processing

The Blood Volume Pulse (BVP) and Galvanic Skin Response (GSR) have been recorded with the Shimmer System (Shimmer Sensing, Ireland) with a sampling rate of 52 Hz. For the recording of these signals, three were placed to the palmar side of the middle phalanges of the second and third fingers, on the non-dominant hand of the participant, according to already published procedures (Boucsein et al. 2012). In order to obtain the Heart Rate signal from the BVP, it has been used the Pan-Tompkins algorithm (Pan & Tompkins, 1985). The constant voltage method (0.5V) was employed for the acquisition of the skin conductance and by using the LEDA lab software (Benedek & Kaernbach, 2010), the tonic component of the skin conductance (Skin Conductance Level, SCL) was estimated. In order to match GSR and HR signals producing a mono-dimensional variable which returns the emotional state of subjects, the Emotional Index has been defined by taking into account the GSR and HR signals (Vecchiato et al. 2014). We refer to effects plane (Russell & Barrett, 1999; Posner et al. 2005) where the coordinates of a point in this space are defined by the HR (horizontal axis) and the GSR (vertical axis). Several studies have highlighted that these two autonomic parameters correlate with valence and arousal, respectively (see Mauss & Robinson, 2009 for a review). The interpretation of the EI implies that the higher the value the more positive the emotion experienced by the subject and vice versa.

5. RESULTS

Results of the research showed: 1) a statistically significant increase of emotion (EI values) in correspondence of the smelling phase (Graph 1)

Graph 1. The graph shows the average EI values reported by the experimental group in the three wine tasting conditions (Smell, Closed Nose, Open Nose).

2) a trend of major pleasantness/approach attitude (AW values) in correspondence of wine tasting in an Open Nose condition. However, here there is not statistical significance, due the relative high variance of the estimates. The AW Index results provided evidence of a trend characterized by the Approach tendency, in the condition where people taste the wine with the Open Nose, while a tendency of Withdrawal in the condition without the contribution of olfaction (Closed Nose) and during the smell phase (Graph 2).

Graph 2. The graph shows the average AW values reported by the experimental group in the three wine tasting conditions (Smell, Closed and Open Nose).

6. DISCUSSION

The importance of the variable “olfaction” during the tasting experience has been already intuitively proven by the fact that people are not recommended to drink wine when they have cold (the closed nose decreases the pleasure of drinking). The present data numerically support such old observation: in this study there is a clear interaction between the two sensory modalities of taste and olfaction, since it was observed an increased emotional and cognitive appreciation of the wine tasting experience with the Open Nose when compared to the Closed Nose condition. Thus, both emotional and cognitive appreciations were increased on average by allowing the volatile substances of the wine to proper target the olfactory areas. On the other hand, it is interesting to note that, indeed, the Smell condition produced in the participants a higher Emotional Involvement (EI), suggesting a parallel intense emotional reaction to such condition.

7. CONCLUSIONS

From this exploratory analysis, it can be stated that - in the wine tasting experience - olfaction is a significant variable, which could be investigated in further studies aimed at identifying emotional and cognitive aspects of the wine degustation itself. For instance, it would be interesting to further investigate the extrinsic properties of the wine by the EI and the AW neurophysiological indicators – since previous scientific studies have proven that the “experienced emotion” for the wine smell tasting

results from intrinsic properties (such as the molecular composition of a drink) and the personal state (for instance, being thirsty: see Allison & Uhl, 1964), together with extrinsic properties of products (such as price): Plassman and colleagues (2008) found out that the variation of price of wine affects the bold activity in the medial orbitofrontal cortex, an area associated to primary taste. In conclusion, overall it can be stated that the achieved results confirm neuro-marketing being a useful tool in helping wine producers and sellers at offering products that can match at the best their customers' expectations.

8. ACKNOWLEDGMENTS

This work was partially carried on under a grant agreement by the Fondazione Banfi, Montalcino Italy, accorded to the Laboratory of Industrial Neuroscience of the University of Rome "Sapienza" for the study of the neurometric signature of the wine tasting.

FACTORS AFFECTING INNOVATION PERFORMANCE

Chatzoglou, Prodromos; Polyzogopoulou, Zoi; Chatzoudes, Dimitrios

Dept. of Production and Management Engineering, Democritus University of Thrace, Xanthi, Greece

ABSTRACT

The aim of this study is to empirically investigate the impact of specific factors on various dimensions of innovation management. The contribution of this research is important because it attempts to shed some light on the way several firm related factors are related to innovation management. A new theoretical framework has been designed and empirically tested using data from one hundred and thirty five Greek SMEs firms. Four hundred and twenty-six employees from these firms have participated answering a structured questionnaire. The results of the Structural Equation Analysis revealed that both Organizational Innovation and Innovation Performance affect Organizational Performance. Furthermore, Strategic Innovation Orientation, R&D, Knowledge-oriented Dynamic Capabilities, Organizational Learning Practices and New Product Portfolio Innovativeness are the factors that mainly affect Organizational Innovation and Innovation Performance.

Keywords: Innovation Management, Innovation Culture, Knowledge Management, Organizational Learning, Leadership, Strategic Orientation.

INTRODUCTION

Nowadays, innovation is important for increasing firms' competitiveness. As consumers have become more sophisticated in seeking innovation in all markets and countries, businesses need to constantly redesign their management and marketing strategies and practices in order to improve and maintain their competitive positions. As a result, product life-cycle stages become shorter (Ersun et al., 2013).

Many different definitions can be found in literature. Thus, according to Hassan and Al-Hakim (2011), innovation is defined as "a knowledge-based process for creating new ideas, markets, products and services with a view to overall organizational performance improvement." Innovation is, therefore, the process where a creative idea is followed and transformed into a useful product, service, or workflow (Robbins et al., 2012).

However, successful innovation is the creation and implementation of new processes, products, services and methods of delivery that result in efficiency, effectiveness or quality (Kumar et al., 2014).

Organizations that successfully innovate have the following characteristics (Bessant and Tidd, 2017): a) explore and understand the different dimensions of innovation, b) manage innovation as a process, c) create conditions that enable them to resume innovation (development capacity), d) use this ability for business development (innovation strategy), and e) create dynamic capacity (ability to maintain or adapt their approaches to an ever-changing environment).

Small and medium enterprises (SMEs) are the main innovative organizations. They are more effective than large companies in innovation because they urgently require innovation. The ability of SMEs to respond to growing consumer expectations is largely based on their ability to innovate and produce new products at competitive prices. The level of innovation in small businesses may vary considerably depending on the strategic goals and the capacity of their leadership. Just as large enterprises can be distinguished between high innovation and non-innovative entrepreneurs, small businesses can range from very innovative business types to more conservative types (Mazzarol et al., 2010).

LITERATURE REVIEW AND CONCEPTUAL FRAMEWORK

Organizational innovation refers to the creation or adoption of an idea or behavior and its successful implementation within the enterprise (Noruzi et al., 2013). There are different types of innovation, but only three are the most important: a) administrative or technical, b) product or process, and c) radical or gradual (Liao and Wu, 2010). Product innovation is also defined as the innovation associated with the introduction of new products (or services) that incorporate a substantially different technology from that used for existing products (Kim et al., 2012). Product innovation is about the success of the product and it is associated with business success (Wang and Ahmed, 2004). Innovation performance can be measured in various ways, such as the achievement of a competitive advantage, the satisfaction of customer needs, the achievement of business goals and the revenue growth rate (Blindenbach et al., 2010). Organizational performance is defined as the process of assessing a company's progress in achieving pre-determined goals and its efficiency of organizational goals (Hassan and Al-Hakim, 2011).

The proposed new conceptual framework includes some of the most important factors that have been found in the relevant literature. It consists of twelve independent factors, which are measured using twenty-one sub-factors, and one dependent factor (Innovation Performance).

Firm characteristics may affect both the use and effectiveness of management specific practices. These practices are often aimed at removing specific barriers affecting the implementation of an innovation (Blindenbach et al., 2010). Some of the characteristics that are generally considered to support

innovation are high degree of professionalism, decentralization of decision-making and high degree of internal and external communication.

Further, Leadership is related to innovation and organizational effectiveness (O'Regan et al., 2006). Further, transformational leadership can play an important role as it allows employees and businesses to create and exploit opportunities (Noruzy et al., 2013) and, thus, to innovate. The innovative ability of a business belongs to the intelligence, imagination and creativity of its employees. Their activities are indispensable for the development and application of innovation (Jiménez-Jiménez and Sanz-Valle, 2008).

Moreover, Knowledge Management (KM) is a set of activities, initiatives and strategies that companies use to create, store, transfer and apply knowledge to improve organizational performance (Donate and Guadamillas, 2010). Knowledge is an asset that can effectively increase firms' ability to implement an innovation. Knowledge acquisition and knowledge transfer is important as it promotes innovation activities (Donate and de Pablo, 2014), since the availability and implementation of knowledge dissemination practices entails a higher level of innovation for the enterprise (Donate and Guadamillas, 2010). In general, a knowledge-based organization is more able to be innovative (Lee et al., 2013).

Businesses that adopt an innovation culture apply new ideas and processes and use new systems to produce their products or provide their services (O' Regan et al., 2006). The innovation culture is a corporate culture that leads to innovation (Spacey, 2016). This culture fosters the exchange of ideas, knowledge and experimentation, while it is the core of exploration and exploitation activities for innovation (Donate and Guadamillas, 2011). Organizational learning is a process that involves acquiring, sharing and utilizing knowledge. Knowledge, which originates from both external and internal learning, is integrated into the knowledge base of the enterprise and plays an important role in the innovation process (Alegre et al., 2011). In particular, organizational learning enables the company to develop capabilities that enhance innovation (Jiménez-Jiménez and Sanz-Valle, 2011).

Dynamic capabilities are knowledge-oriented organizational and strategic routines (Sicotte et al. 2014), which help businesses redefine knowledge management practices and adopt flexible ways to develop new knowledge management systems and, as a result, enable them to be innovative.

Strategic innovation orientation leads a company to achieve a sustainable competitive advantage through the application of innovations. Such an orientation affects firms' innovation management philosophy (Talke et al., 2011). Strategic innovation orientation refers to management innovation, proactive innovation orientation and customer relationship management capability. With the growth of market-oriented companies, greater priority is given to radical innovation. A proactive customer

orientation increases the introduction of new products. Technological orientation leads to products that are technologically more innovative (Talke et al., 2011).

Research and Development (R & D) concerns all activities related to corporate innovation and is the first stage in developing a possible new idea for a product or service. When an enterprise invests in R & D, it acquires a huge inflow of knowledge. That knowledge is useful and it can be used by the firm to further develop its product lines. R & D is really important and relates to innovation as it directly supports the development of knowledge and technology (Wikipedia, 2017).

In addition, products' portfolio innovation, the originality of a company's new portfolio of products, is a key concern for innovation management and is related to New Product Development (NPD). Portfolio innovation includes aspects of technology, market, internal and external resources (Schultz et al., 2013). New product portfolio innovativeness can increase performance, as new products can satisfy customer needs and, thus, increase their value. These products differ from competitors' products, which can lead to increased sales, prices and, ultimately, higher profitability and steady growth (Talke et al., 2011).

All the findings of the previous researches presented earlier, provide sufficient evidence supporting the following hypotheses:

Hypothesis 1: Firm characteristics positively influence the innovation performance.

Hypothesis 2: Leadership positively influences the innovation performance.

Hypothesis 3: Knowledge management positively influences the innovation performance.

Hypothesis 4: The innovation culture positively influences the innovation performance.

Hypothesis 5: Knowledge-centered culture and practices positively influence the innovation performance.

Hypothesis 6: Knowledge-oriented dynamic capabilities positively influence the innovation performance.

Hypothesis 7: Organizational learning positively influences the innovation performance.

Hypothesis 8: Strategic innovation orientation positively influences the innovation performance.

Hypothesis 9: Organizational innovation positively influences the innovation performance.

Hypothesis 10: Research and Development positively influences the innovation performance.

Hypothesis 11: New product portfolio innovativeness positively influences the innovation performance.

Hypothesis 12: Innovation performance positively influences the organizational performance.

RESEARCH METHODOLOGY

A structured questionnaire was used to collect the primary data. The measurement of each of the thirteen factors of the proposed conceptual framework was conducted with the use of multiple questions (items) that were adopted from the international literature. More specifically, in its first section, there are nineteen (19) questions concerning the main characteristics of the sample, while in the other sections one hundred and sixty (160) questions (five point Likert scale) are used for measuring the thirteen (13) main factors with their twenty-one (21) sub-factors. The questions used for measuring these factors were mainly adopted from Battor & Battor (2010), Donate & de Pablo (2014), Donate & Guadamillas (2011), Kim et al., (2012), Lai et al., (2013), Liao & Wu (2010), and Lin et al., (2010).

The population of this survey consists of employees of Greek enterprises from all economic sectors. The response rate of the companies to which an invitation to participate was addressed was 88.46%. In total, four hundred and forty four (444) replies were collected, while eighteen (18) were deducted from the final sample due to their extreme values or missing information. Therefore, the final sample of this survey consists of four hundred and twenty six (426) questionnaires.

RESULTS OF EMPIRICAL RESEARCH

Sample Characteristics

The sample consists of men (67.6%) and women (32.4%) who are 42 years old (mean score) and well educated (64.8% hold a university degree and 12.7% more hold a Master's Degree). With regard to their job position in a company, 31.0% are employees, 19.7% are managers and 16.9% are owners. They have 15.5 years of work experience (with a minimum of 3 years), while 8.5% of the respondents have about 20 years of work experience.

The majority the respondents work for manufacturing (52.1%) and small firms (49.3%) (with an average of 78 permanent and 11 seasonal employees). On average, they produce 5 main products, while their market share is 22% and 27% (at national and local level respectively). Surprisingly, and despite of their size, 33.8% of the participating firms have an independent R & D department, while only 9.9% of them do not employ anyone who is responsible for doing research on new products, and 18.6% more have one or two employees for this purpose. This leads to the conclusion that most the firms in the sample are sufficiently engaged in product innovation activities.

This conclusion is supported by another finding that shows that only 8.5% of the companies have not launched any new product in the market the last three years, while 16.9% have launched up to three products. Moreover, only 22.5% of the firms have not made significant changes to their existed

products over the last three years. However, only 19.7% of these firms launched first a new product, although, the percentage of new products in their existing portfolio is 14.1%, and despite the fact that 81.7% of them have invested in new machine & equipment purchase in the last three years.

As far as the mean scores of the factors and the sub-factors examined is concerned, participants argue that the leadership of the business they work for is knowledge-oriented (mean = 3.92), transformational (mean = 4.12), human resource oriented (mean = 4.04). In addition, these firms manage knowledge to carry out their activities (mean = 3.52), i.e. they try to acquire knowledge (mean = 3.57) and apply knowledge dissemination practices (mean = 3.39).

In general, these firms have a culture of innovation (mean = 3.52) combined with the adoption of knowledge-based culture and practices (mean = 3.50). Besides, business knowledge-oriented dynamic capabilities (mean = 3.25) and the ability of external (mean = 3.10) and mainly internal (average = 3.40) learning are relatively satisfactory. The same applies with organizational learning (mean = 3.82). It is also noticed that the participating companies are applying innovations in strategic orientation (mean = 3.44) and administrative innovations (mean = 3.51), and less in organizational innovation, i.e. radical product innovations (mean = 3.16), radical process innovations (mean = 3.30), and marketing innovations (mean = 3.13). Finally, they apply satisfactorily R&D activities (mean = 3.78), while innovation performance (mean = 3.64) and organizational performance (mean = 3.91) are at a high level.

Factor and Reliability Analysis

Principle components factor analysis was performed for assessing Construct validity. More specifically, sampling adequacy was examined using the 'Kaiser-Mayer-Olkin' (KMO) score (values over 0,6 are acceptable - Son, 2011). Further, to test the convergent validity, factor loadings were calculated (with acceptable values higher than 0,6). Also, Total Variance Explained was calculated (values over 60,000 are acceptable - Nandagopal et al., 2007). Construct reliability was assessed using Cronbach's α -value (acceptable values greater than 0,7 - Nunnally, 1978, or greater than 0,6 - DeVellis, 2003). The results (Table 1) show that the factors created are compact and reliable structures.

Factor	KMO	TVE	Loadings	Cronbach a	Mean	St.D.
B. Firm Characteristics	,562	61.510	,573 - ,844	,671	3,40	,650
C. Leadership	,676	69.444	,776 - ,873	,779	4,03	,604
D. Knowledge Management	,722	80.010	,870 - ,922	,873	3,49	,689
E. Innovation Culture	,674	77.412	,794 - ,920	,850	3,52	,828
F. Knowledge-Centered Culture and Practices	,771	54.174	,677 - ,795	,788	3,50	,654
G. Knowledge-Oriented Dynamic Capabilities	,500	77.842	,882 - ,882	,715	3,25	,841
H. Organizational Learning	,777	72.260	,724 - ,895	,839	3,82	,767
I. Strategic Innovation Orientation	,703	79.141	,842 - ,925	,867	3,44	,751
J. Organizational Innovation	,776	59.520	,749 - ,787	,772	3,27	,711
K. R&D	,732	62.169	,602 - ,890	,790	2,78	,875
L. New Product Portfolio Innovativeness	,741	61.458	,636 - ,870	,838	3,07	,770
M. Innovation Performance	,727	81.425	,887 - ,928	,879	3,64	,694
N. Organizational Performance	,710	74.316	,827 - ,881	,826	3,91	,619

Table 1: Factor Analysis

Correlation analysis

First, it is observed (Table 2) that only the position and the educational level of the respondent are significantly related with organizational performance (N), while only position to innovation performance (M). Overall, position, education and work experience seems to be the only characteristics of the respondents that are related to a rather limited number (2 out of 11) of the independent factors of the model (F and E for position, E and I for education, and D and H for work experience). Further, as far as firm characteristics are concerned, only foundation year (age of the firm) is positively related to both organizational performance (N) and innovation performance (M), as well as to four of the independent factors (F, D, G and K). On the other hand, all the innovation related firm characteristics (the existence of an independent R&D department, investment in new machinery, number of new products produced in the last 3 years, number of old products with changes in the last 3 years, products that first entered the market and percentage of new products to the product portfolio) are statistically related not only to innovation performance (M) and organizational performance (N), but almost to all the independent factors of the model.

	Position	Gender	Age	Edu- cation	work experience	Sector	Foundation year	National Market Share	Local Market Share
B									,241*
F	-,238**						,289**		
C									
D					-,211*		,305**	-,234*	
E	-,174*			-,190*					
H					-,286**	,178*			
I		,198*							
G							,266**		
J				-,227**					
K							,188*		
L									
M	-,183***						,207*		
N	-,183*			-,179*			,202*		

Table 2: Correlations of factors and sample characteristics

Structural Equation Modeling

Then, Structural Equation Modeling (SEM) was used to test the proposed model. The prediction power of the proposed model (see Figure 1) is extremely satisfactory. More specifically, the factors account for 76% of the changes in the main dependent factor Innovation Performance (M) ($R^2 = 76\%$), where Organizational Performance (N) is also interpreted by 47% and Organizational Innovation (J) by 66%. It is therefore reasonable to claim that the modified research model accurately reflects the antecedents of innovation management with in the Greek SMEs framework.

The following indices for checking the goodness-of-fit have been used: Minimum Sample Discrepancy / Degrees of Freedom (CMIN/DF), Relative Fit Index (RFI), Comparative Fit Index (CFI), Normed Fit Index (NFI), Root Mean Square Residual (RMR) and Root Mean Square Error of Approximation (RMSEA). All indices are within the acceptable level which indicates that there is a good fit for the proposed model. The proposed model is presented in Figure 1, where path coefficients and the relationships between the factors of the model are included.

$CMIN/DF = 2,168$, $CFI = ,958$, $GFI = ,924$, $TLI = ,936$, $RMR = ,027$, $RMSEA = ,091$

Figure 1: Modified conceptual framework

Eight of the twelve initial research hypotheses are confirmed by the analysis of the empirical data. In particular, the following factors are found to have a direct impact on Innovation Performance (M): G (Knowledge-oriented Dynamic Capabilities), I (Strategic Innovation Orientation), J (Organizational Innovation) and L (New Product Portfolio Innovativeness), while it is confirmed that Innovation Performance (M) directly affects Organizational Performance (N). Simultaneously, a number of new causal relationships have emerged between the original factors, many of which indirectly affect the Innovation Performance (M). Of course, it should be underlined that the remaining eight (8) initial hypotheses are indirectly confirmed, due to the existence of strong indirect relationships between the factors examined.

	Effect	B	C	F	D	H	G	E	I	K	J	L	M
I	Total	,404	,367	,270	,478	,095	,739	,182

Table 3: *Effects between factors*

Innovation performance (M) has the strongest direct effect ($r = 0.438$) on organizational performance (N). Consequently, H12 is confirmed by the empirical data. The direct impact of innovation performance on organizational performance has been studied by several researchers. For example, Roxas et al. (2014) examined the relationship between innovation and organizational performance and concluded that innovation has direct positive effects on organizational performance. Furthermore, Organizational Innovation (J) has also an immediate positive effect ($r = 0.282$) on organizational performance (N). This is explained by the fact that if an enterprise applies innovations at an organizational level, some positive results will emerge and, thus, the performance of the organization will be improved. This view is also supported by Noruzy et al. (2013).

As mentioned above, there is an immediate positive relationship between innovation performance (M) and four (G, I, I and L) of the independent factors. Therefore, hypotheses H6, H8, H9, and H11 are accepted. These results have been also confirmed by a series of previous studies. Alegre et al. (2011) supported the direct and positive impact of firms' knowledge-oriented dynamic capabilities on innovation performance. Also, Talke et al. (2011) agreed that when innovation has a strategic orientation, firms have the ability to obtain a competitive advantage. Finally, Schultz et al. (2013) argued that the aspects (e.g. environmental) chosen for the understanding of new product portfolio innovativeness influence the relationship between portfolio innovativeness and its performance.

The results presented in Table 3 highlight the fact that all independent factors, apart from the New Product Portfolio Innovativeness (L), indirectly affect Innovation Performance (M). Thus, Knowledge Management (D) strongly (0.419) influences (indirectly) innovation performance. Therefore, it is reasonable to accept H3. It is known that businesses are more effective when they effectively manage knowledge (exchange, acquire and use their knowledge) because it is possible to create new ideas utilizing their knowledge. This, in turn, may lead to import innovations (product, process and administrative), something which, in the long run, will benefit (financially or/and non-financially) the organization. This result is also supported by other researchers, such as Gloet and Terziowski (2004),

who have claimed that firms' knowledge management has a positive effect on innovation performance.

Further, Leadership (C) (indirectly) affects innovation performance (H2 is accepted). Knowledge-based leadership promotes learning through experience and knowledge acquisition from the external environment. Moreover, with the implementation of transformational leadership, businesses have a primary goal to find new opportunities. Finally, it is observed that firm characteristics (B) indirectly influence innovation performance (acceptance of H1).

CONCLUSIONS

The present study shows that innovation performance has a positive impact on the performance of the whole organization. This is because, with the implementation of effective product and process innovations, a company is capable of satisfying and, thus, retaining its customers, increasing the quality of its products and achieving high financial and non-financial performance.

Further, it was observed that organizational innovation does not simply affect the performance of innovation but, also, has a direct and quite strong impact on the performance of the whole organization. This means that radical product and service innovations, radical innovations in the production processes, administrative innovations, and marketing innovations that are implemented at a firm's market level create a high performing innovative enterprise.

Also, it is important to mention that firms knowledge management, culture, practices and dynamic capabilities play an important role affecting both innovation performance as well as organizational performance. This is achieved by exchanging knowledge with the internal and external environment. The role of knowledge-oriented dynamic capabilities within an enterprise is extremely important in terms of its impact on innovation performance. In particular, knowledge-oriented dynamic capabilities have a direct (0.195), but mainly indirect (0.452), impact on innovation performance. This practically means that a firm has developed the ability to create dynamic capabilities through organizational learning and knowledge management (whether it comes from internally or externally) and to improve organizational innovation and innovation performance.

Strategic innovation orientation plays a very important role because it directly affects both organizational innovation and innovation performance. When strategic innovation orientation is related to organizational innovation (product innovation, process innovation, administrative innovation, marketing innovation), it indirectly and positively affects innovation performance. This is easily explained because strategic innovation orientation is an important part of any innovative strategy. In conclusion, firms that carry out proactive activities are more able to anticipate customer

needs and produce specific products that meet their needs. In this way, firms effectively manage their customer relationships as customers are involved in the development of new products and, thus, most product innovations help firms satisfy new customer needs as they offer unique advantages over competitors.

Moreover, knowledge management positively influences knowledge-oriented dynamic capabilities, as knowledge acquisition and knowledge dissemination practices are related to a firm's ability to use the knowledge from its internal and external environment. In addition, knowledge-oriented culture and practices positively influence knowledge management, because when its culture and practices focus on knowledge, a firm receives useful information for the application of innovations and, thus, is able to effectively manage knowledge.

CODE, ETHICS AND CROSS-CULTURAL DIFFERENCES: CHALLENGES OF AMERICAN'S MNC IMPLEMENTING OF CODE OF ETHICS IN SINGAPORE SUBSIDIARY

Chew, Grace

Business Administration, International School of Management, Paris, France

ABSTRACT

Is there a universal business code of ethics? What is ethical in Singapore may not be considered as ethical in America and vice versa. This paper attempts to trace the origin and development of business code of ethics until the current practices in both countries. The second aim was to find out whether the cultural differences in the subsidiary company are taken into consideration and thus the ethical code of conduct is adapted to them, or whether the subsidiary, despite the local cultures and norms, have to follow strictly the ethical code of conduct, developed by the parent company. It will also examine the challenges facing American companies in localizing their operations in Singapore to stay competitive and successful, while staying with U.S. FCPA (Foreign Corrupt Practices Act) compliance guidelines.

The research is conducted and objectively accomplished by using qualitative approach. An empirical part of the research, which the focus stays on one multinational organization by using interviews through story telling to gather the information. The results show that ethical trainings, monitoring and reporting are essential in the subsidiary. However, the leaders of an organization and their commitment to ethical behavior play the most significant role in the embedding process. The cultural differences play important role between the parent company and its subsidiary. It imposes a challenge in implementating the ethical codes, and thus it must be seriously taken into consideration. Lastly, the research shows that most of the multinational organizations have only one universal ethical code of conduct, which they push through to their subsidiaries despite subsidiaries' own local standards and norms.

Keywords: code of business, ethics, cultural differences, national culture, corruption, multinational, subsidiary

INTRODUCTION

In an increasingly globalized environment, multinational companies face challenges to implement and

balance the standardization of policies across the borders with serious consideration of specific norms of cultural context (Bartlett and Ghoshal, 1998; Enderle, 1997). Today, it is part and parcel of company's efforts to put in serious consideration of culture contexts related to ethics especially managing the multinational employees and subsidiaries with different cultural background. (Kaptein, 2004; Weaver et al., 1999). Although research on business ethics has a long pedigree in business studies (cf. Graves, 1924; Taeusch, 1932) but typically it is categorized as normative or empirical in outlook (Trevino and Weaver, 1994). In international business ethics, most research has been normative orientated, which means the focus is more on addressing the evaluation questions that concerning the business practices that related to ethical issues. For example, (Donaldson and Dunfee, 1994) studied the issues of transcultural normative theories and (Frederick, 1991) talked about code of ethics. There are very few scholars emphasizing the necessity to take cultures into account when dealing with ethics in business. Most typically, it involved comparative study that examined the impact of culture or national identity on specific forms of ethical behavior. For example: (Langlois and Schlegelmich, 1990) examined how corporate code of ethics content varies across cultures, (Biogoness and Blakely, 1996) studied how cross-national differences were related in managers' response on a widely used survey of ethical values. (Carasco and Singh, 2003; Kaptein, 2004) focused on the content of corporate code of ethics in multinational corporations. (Hood and Logsdon, 2002, p. 883) concluded that: "Cross-cultural business practices and ethical standards will undoubtedly become more important for understanding and facilitating business outcomes." From all the studies, it seems that the integration of code of ethics from multinational corporation head offices to implement the American practices to non-American situations often face challenges, misunderstanding and resistance in the process. It appears that there is a lack of attention to people (especially from different cultural background) within the company who are supposed to live up to the code of ethics.

THE MAIN THEORIES OF BUSINESS ETHICS

Business ethics is a specialized branch of ethics focusing on how moral standards apply to business organizations and behavior. (Velasques 1998) Properly speaking, it cannot be understood separately from the general ideas of ethics, and the general ethical theories apply to business ethics as well. (Lähdesmäki 2005) Thus several theories can be used to study business ethics of organizations.

Normative theory hypothesizes or other statements about what is right and wrong, desirable or undesirable, just and unjust in the society. Normative means relating to an ideal standard or model, or being based on what is considered to be the normal or correct way of doing something. Moral pronouncements cannot be objectively shown to be true or false, since value-judgments are subjective preference, outside the realm of rational inquiry. Thus in Max Weber classic statement of the role of

values in sociological research, he informed his audience that, “ If Tolstoi’s question recurs to you: as science does not, who is to answer the question: “ What shall we do, and, how shall we arrange our lives?”then one can say that only prophet or a savior can give the answers’(Science as Vacation, 1919). Normative ethics in one of three main component areas of inquiry of philosophical ethics, the two others being meta-ethics and applied ethics. Normative ethics, also known as normative theory, or moral theory, intends to find out which actions are right and wrong, or which character traits are good and bad. In contrast, meta-ethics, as the term suggests, is a study of nature of ethics. A meta-ethical study would be concerned, amongst other things, with determining the meaning and objectivity of moral concepts of right and wrong, or good and bad. Applied ethics is just the application of normative ethics to particular issues of practical concerns such as abortion, cloning, animal rights and criminal punishment, sometimes using the conceptual tools of meta-ethics as well. (Buckler 2010;156) Normative thinking typically invokes principles with respect to how we should conduct and organize ourselves; as such, it seeks to provide norms that prescribe appropriate ways of acting individually and collectively. Four normative theories exist which are utilitarianism, Kantianism, ethical intuitionism and virtue ethics. If we were to accept division of normative theories into teleological and non-teleological theories, then utilitarianism and virtue ethics would count as non-teleological theories, whereas Kantianism and intuitionism as non-teleological theories.

(Kaptein 2009) Utilitarianism with the principle of utility as the basic moral principle is related to consequences, primarily focusing on the effects and results of the actions of agents. The theory emphasizes the leader’s actions; behavior and/or conduct have positive outcomes. This means that the outcomes connected to person’s behavior establish whether the behavior was ethical or unethical (Hesselbein 2012). Kantianism with the categorical imperative as a fundamental moral principle is basically a principle of consistency, demanding that we act on reason, which all rational agents could endorse, that is, universally acceptable reasons. Ethical intuitionism says that we can directly intuit or apprehend moral principles; it is epistemological and undoubtedly belongs to meta-ethics. But, ethical intuitionism has another sense in which it can be considered to be part of normative ethics as it methodologically refers to unranked pluralism that claims that there are a plurality of moral principles, and that none of these moral principles is more basic or important than any other.

Theory of moral rights claims that people have certain fundamental rights, also known as human rights, that should be respected in all decisions, such as: the right to life, the right to free consent, the right to free speech, freedom of thought and freedom from slavery. (Budd 2004) The morally correct behavior is the action that a person has a moral right to do, that does not violate the moral rights of others, and that promotes the moral rights of others. (Schumann 2001) Thus a manager making

decisions based on this theory should avoid violating the rights of other who may be concerned by the decision.

Virtue ethics refers to morally proper actions result from having the proper character traits or habits (virtues), such as courage, moderation, wisdom, justice, and truthfulness. A virtuous person will be able to judge what is right thing to do, which related to leaders and who they are (Kaptein 2009; 602). These virtues can be learned and retained through experience and practice. The learning usually occurs in an individual's family and in the various communities with which an individual interacts throughout his or her lifetime.

The famous Game theory, established by two Princeton wizards as an important influence in applied mathematics, has made an inroad into ethics and promoted by many business theorists though some scholars have criticized the fundamental of the theory itself. Solomon (1992, p.5) argued that Game theory, like mathematical models in physics, purports to help us to understand the diverse and complex phenomena, in the case of ethics, it supposedly rational behavior of that singularly abstract specimen of humanity, sometimes called "rational man". However, human behavior might not behave rationally especially when it comes to monetary issues. One can behave very differently and reflects in their personal preferences, which includes the attitude toward their job and other habitual activities. To be rational, one might not seek to satisfy one's own advantage or seek one's own preferences. In general, people do change the way in which they evaluate a moral problem. Human beings undergo experiences that force them to change their moral beliefs, and when those moral beliefs change, how they subsequently evaluate a moral problem changes. In addition, in a world in which most of us are uncertain about our future, it is rational that we attempt to obtain the most accurate information when making decision. One component of the information gathering process will be to acquire the best model for evaluating moral problems. Acquiring the best model will require that one changes whatever moral assumptions are in the model that do not maximally fit with other information available to the agent.

THE ETHICS OF THE ORGANIZATION AND CODE OF CONDUCT

Business code of ethics

Before we talk about the business code of ethics, first we wonder what ethics itself are. Generally speaking, ethics are the branch concerning on the issues of how we ought to act under certain circumstances with decision that needs to make. Perhaps the example of Ten Commandments from the Bible served as a guide for us to use as measurement of ethics by many today. In particular, the injunctions to truthfulness and honesty or the prohibition against theft and envy are directly applicable. A notion of stewardship can be found in the Bible as well as many other notions that can be and have

been applied to business. Business ethics are moral principles that guide the way a business behaves such as dealing with employees' rights, corporates' obligations, advertising, and intellectual property. Acting in an ethical way involves distinguishing between "right" and "wrong" and then making the "right" choice. It is relatively easy to identify unethical business practices. For example, companies should not engage in bribery. Anglo American has played an active part in initiatives to set out principles and practices for ensuring that a company's need to ensure the security of its employees and operations at cross border does not adversely impact upon the local population. However, it is not easy to create hard-and-fast definitions of good ethical practice based on different cultural definition. (Cragg, 2005, pg.26) The nature of modern corporation accounts with the responsibility of ethical obligation. Milton Friedman acknowledged that corporations have the ethical responsibilities with four elements: an obligation to maximize profits; an obligation to honor certain fundamental rules of game; an obligation to respect the law and an obligation to respect local ethical custom. (The Times 100) Although companies recognizes that the objective is to make profit but this objective must take account of ethics as shown in its statement on corporate responsibility: *"Though providing strong returns for our shareholders remains our prime objective, we do not believe that these can or should be achieved at the expense of social, environmental and moral considerations. Indeed a long-term business such as ours will only thrive if it also takes into account the needs of other stakeholders such as governments, employees, suppliers, and communities."*

WHAT IS CORPORATE CODE OF CONDUCT?

What is corporate code of conduct? (Salbu, 1994) Corporations or collectivities of corporations adopt corporate code, usually unilaterally and as a result of a decision taken in the top management decision. The outcome of the decision is to modify its conduct and image to demonstrate the ability of the corporation to adhere certain good practices to the market in the business context environment. The corporate code of conduct is normative (Getz, 1990). They reflect the behavior or choices of the board of directors, managers and employees, who are closely related to the suppliers, subsidiaries, distributors and subcontractors and government agencies. The code is often drawn up in consultation with governments, employees, local communities and other stakeholders. It deals with business practices, relationship with employees and public official, environmental issues, human rights or all of these (Gordon and Miyake, 1999). The obligation to maximize profits has led corporation to play within certain rules intentionally or publicly to become profitable organization and good ethics are seen as good business. Ethical management has instrumental value and is strategically seen as good management. Therefore, corporation commits to code of ethics such as honesty and integrity to portray good image and generate good public relations. Company expects that individuals and firms adhered to the code with certain standard and abstains to violate the standard. To certain extend, the act can be

vulnerable when the violation occurred – employees will be dismissed or disciplined and suppliers contract will be terminated.

(Cragg, 2005, pg. 51) Although most corporate would like to roll out the best practices with high standard, but the enforcement mechanism seems to lack, they often appeared to be merely didactic or hortatory. For example: the languages in the book of code of conduct are too vague to give specific understanding and useful guidance to those who wants to comply with the rules. The content or languages used need to take into consideration the local custom and cultural context. The personnel who implement the process are seldom well trained in *cultural sensitivity*. Most importantly, company seldom establishes proper procedures to guide staff in compliance with the desired ethics.

HISTORY OF AMERICA BUSINESS ETHICS

In order to understand the importance of business ethics in the 20th century, one should analyze the Protestant ethical percepts, which were elaborated by Max Weber. Luther, Calvin, and John Wesley, among other Reformation also discussed trade and business and led the way in the development of the Protestant work ethic. Protestant (particularly Calvinist) ethic influenced large numbers of people including Americans to engage in works in the secular world, developing their own enterprises and engaging in trade and the accumulation of wealth for investment. In other words, the Protestant work ethic was an important force behind the unplanned and uncoordinated mass action that influenced the development of capitalism, in which formed the foundation of the American value system. (Tawney, 1926) Tawney argued persuasively that religion was an essential part in the rise of individualism and commerce to the modern economy. However, in the modern period, the secular, business and politics have divorced from religion. In general, America focuses on the moral or ethical actions of individuals. When people talked about business ethics, it relates to the immoral or unethical activity by individuals. Many American businessmen are strongly influenced by their religious beliefs and the ethical norms that they have been taught as part of their religion, and apply these norms in their business activities.

HISTORY OF SINGAPORE BUSINESS ETHICS

Singapore business landscape was a mixed of British ethical code under the colonization of British and influence of Chinese culture (which primarily was Confucius culture). The question is whether British ethical code had any influence in shaping Singapore Company Code of Ethics. (Zhou, 2007) Since the early days, after the founding of modern Singapore in 1819, the administration in Singapore appointed by Great Britain was basically invisible to the masses of the immigrants due to both the lack of fluency in local languages and the small size of the administration itself until 1867. The majority of the immigrants were Chinese although Singapore was located in an ethnically Malay region. Many ethnic

Chinese in Singapore are descendants of fortune seekers from Southern China who came during British administration. Throughout the period of Colonial rule, though the colonial masters were British, the Chinese community conducted business among themselves and their business ethics (influenced by Confucius culture) were basically identical to what was practiced in Southern China. Until Singapore gained self-rule in 1955 and finally independence in 1963, the Chinese community in Singapore by and large was not influenced by British business ethics saved for the minority of Strait-born Chinese (Peranakan) and Chinese who were converted to Christianity. The Peranakan were largely educated in English and the majority served as civil servants under the British administration.

(Kong, 2010 p.90) Confucian ideology guided by the principle that “ the benevolent care for people’ has established a well-established ethical system. Zhong (loyalty) preached by Confucius was very much practiced by the Chinese community. Zhong (loyalty) basically included two components between individuals, as well as the relations between individual and the collective. The principles are based primarily on loyalty and obligation to friends, family (father and son, husband and wife, as well as between siblings), or superiors, rather than on a system of rules. These are the fundamental moral and ethical forms of dealing with each other. Chinese immigrants migrated from the province of Southern China to Singapore to seek fortune and became businessmen; many of them were guided by principles of loyalty to take care of their own kinsmen. Among the business community, there is a traditional preference for building relationships rather than just focusing in making business deals. The relationship-based approach often involves time and energy, caring and giving to each other with the expectation of reciprocal actions. It remains the most effective way today in many contexts including doing business. Some other key principles of Confucian teaching that influence Chinese are reciprocation of greetings, favors and gifts, respect for tradition and protecting one’s face. At other social context, for example: when people go to hospital to seek treatment, it is a cultural practice among the Chinese to offer gratuity in a form of “Ang Pow” (money in red packet) to the caretaker. This is a form of appreciating the caretaker’s effort in looking after the patient (their family members). However, in order to receive preferential treatment, people often out give the norm. By doing so they have crossed the line of appreciation to corruption. This is even prevalent in the business dealing, when it involves relationship-based approach. It could be seen as corruption under the rule-based system, which is normally practiced in the Western culture.

THE US FOREIGN CORRUPT PRACTICES ACTS (FCPA): GLOBALIZATION MARKETS

Globalization has encouraged the growth of economy both in the developed and developing world. Due to globalization, it is well known that the rate of corruption in the developing world has seriously

exacerbated. The American government attempts to regulate the standard of conduct of American companies by prohibiting the law of bribery for foreign public officials. US dollars acts as a main nominal of worldwide currency and international stature of US dollar is backed up by US worldwide industrial dominance, which accounts for 40 percent of the worldwide industrial output and 20 percent of its export. The worldwide demand of US dollars has given the American government and multinational corporations the power to establish their international standards of business practices and conduct. (Cragg and Woff, 2005) FCPA was laid in the domain of U.S. policy:

Bribery of foreign officials by some US companies casts shadow on all US companies....and creates severe foreign policy problems. The revelations of improper payments inevitably tend to embarrass friendly regimes and lower the esteem for the United States among the foreign public. It lends credence to the worst suspicions sown by extreme nationalists or Marxist that American businesses operating in their country have a corrupting influence on their political systems (US Senate 1976).

FCPA has imposed the moral burden on many American MNCs, which they have criticized that this burden is unfair, as many believed that they have no control over the situation of the countries' business practices. However, FCPA serves as important guidelines and compliance in the company when American MNCs operates across the border.

CORRUPTION FROM NATIONAL AND CULTURAL PERSPECTIVE

Numerous researchers have developed conceptual models and proposition that support culture's influence on corruption and ethics (i.e, Vitell, Nwachukwu, and Barnes, 1993; Wines and Napier, 1992). However, few empirical studies of this relationship have been performed. A number of relationships between culture and corruption were also identified.

When Singapore government took over from the governance of British, corruption was one of the main challenges to tackle. Public officers were poorly paid, population were less educated and many did not know their rights and the only way to get things done was through bribery or through relationship to gain reciprocate of actions. What did Singapore's government do to stop corruption? In the paper of 13th international training course on the criminal justice, Khoo Teck Hin, Deputy Director (Operations), Corrupt Practices Investigation Bureau (CPIB), Singapore mentioned that in 1952, Singapore government set up anti-corruption bureau to curb the prevalent corruption activity. The government realized that as a small nation, it was vital for Singapore to control corruption for survival. The main purpose was to provide a conducive climate and level playing field to attract foreign investment like American multinational companies to Singapore to spur the country's economic growth. The strong anti-corruption statement was made by PM Lee Kuan Yew in 1979, which best explained the need for a corruption-free Singapore: "The moment key leaders are less than incorruptible, less than stern in

demanding high standards, from that moment the structure of administrative integrity will weaken, and eventually crumble. Singapore can survive only if Ministers and senior officers are incorruptible and efficient. Only when we uphold the integrity of the administration can the economy work in a way which enables Singaporeans to clearly see the nexus between hard work and high rewards.” And again emphasized by the then Prime Minister Mr Goh Chok Tong in Parliament in 1993 when he said: “I have every intention to make sure that Singapore remains corruption free. I will not let standards drop. And everyone should know that corruption in any form would not be tolerated. I expect all Ministers, all MPs and all public officers to set good examples for others to follow ...” This is still the same position today and the will of Singapore government to stamp out corruption wherever it may be is still very strong. Obviously, political will was the key ingredient to tackle the corruption and national culture comes into play. Many Singapore top political leaders were educated overseas and many were influenced by British colonial culture. It is not surprising to see that Singapore is a mixed of Western and Chinese culture in many social context.

American tends to be universalist in its outlook: every society works, or should work, essentially the same way. Its business practices, for example, should be based on a market system that is characterized by transparency and regulated by laws that apply to everyone. A country that fails to conform to this model is seen as underdeveloped or dysfunctional. The reality, however, is that different cultures use radically different systems to get things done. While American cultures are primarily rule-based, most of the world’s cultures are functioning by relationship-based. American tends to trust the system, while people elsewhere trust their friends and family. Businesses are organized around discrete deals that are drawn up as contracts or agreements and enforced by a legal system. On the other hand, other cultures like Singapore might organize the business around human relationships that are cemented by personal honor, filial duty, friendship, or long-term mutual obligation. Rule-based cultures are universalist precisely because they are rule-based. While relationship-based cultures invest authority in human beings, rule-based cultures respect the rules for their own sake.

As mentioned by (Hooker, 2008) behavioral differences result partly from different norms, and partly from a failure to live up to these norms. Cultures sometimes truly differ in what they value. The common view that cultures agree on the basics but differ on the details is simply false. The differences are fundamental because they rooted in different conceptions of human nature. At the same time, cultures fall short of their ideals. It is not that some cultures are “less ethical” than others, but that every culture has its own characteristic.

DIMENSIONS OF NATIONAL CULTURES

Based on (Hofstede, 2010) Dimensions of National Cultures finding, I have attempted to identify and highlight a few areas like the Citizen and the State, Business and Ways of Thinking and The Workplace in relations with uncertainty avoidance, short-term and long-term orientation, individualist and collectivist and power distance which most likely related to this paper and the case story below. The purpose is give an overall pictures and comparison of U.S. and Singapore cultural differences.

Although Singapore is classified under weak uncertainty avoidance for the citizen and the state, in general Singapore tolerance level for uncertainty is low, people are not good in dealing with ambiguity. The giving and acceptance of small gifts have been part of the culture, people have to be told explicitly with strong message that it is not allowed to do it excessively if cross the border line, then they will stop doing it.

America	Singapore
1. The Citizen and the State Weak Uncertainty Avoidance	Weak Uncertainty Avoidance
Few and general laws or unwritten rules.	Few and general laws or unwritten rules.
If laws cannot be respected, they should be changed.	If laws cannot be respected, they should be changed.
Outside observers perceive less corruption.	Outside observers perceive less corruption.
2. Business and Ways of Thinking Short-term Orientation	Long-term Orientation
Managers and workers are psychologically in two camps.	Owner-managers and workers share the same aspirations.
Meritocracy, reward by abilities.	Wide social and economic differences are undesirable.
Concern with possessing the truth.	Concern with respecting the demands of virtue.
There are universal guidelines about what is good and evil.	What is good and evil depends on the circumstances.
3. The Workplace Individualist	Collectivist

Management is management of individuals.	Management is management of group.
Every customer should get the same treatment. (universalism)	In-group customers get better treatment. (particularism)
Task prevails over relationship.	Relationship prevails over task.
4. The Workplace Small power distance	Large power distance
Hierarchy in organizations means an inequality of roles, established for convenience.	Hierarchy in organizations reflects existential inequality between higher and lower levels.
Subordinate-superior relations are pragmatic.	Subordinate-superior relations are emotional.
Privileges and status symbols are frowned upon.	Privileges and status symbols are normal and popular.

STATEMENT OF PROBLEM

This paper provides some insights of the dilemmas in the implementation process of business code of ethics when dealing with employees. The aim is to share how the receivers of codes experienced in the process of execution when cross-cultural aspects are involved especially in the context of introducing corporate codes of conduct crafted in another country. When the codes of conduct are applied universally across all cultures without adaption it could be very costly for the company in business operations and talent retention.

RESEARCH METHODOLOGY

The research is conducted and objective accomplished by using qualitative approach. In qualitative approach, it is typical to study existing documents or texts as part of the research. (Vromen 2010; 261) The analyzed documents and texts are either primary sources or secondary sources. Primary sources are original documents produced by political actors ranging from executive, parliamentary or judicial arms of governments to non-government organizations. Secondary sources in turn are for example books and scholarly journal articles. (Ibid. 2010; 262) In this research, the primary sources include company's website information, documents and articles. The secondary sources include books, journals and articles by scholars as reference and source of information. In addition, some previous surveys, which relate to the same topic than this research, will be analyzed. When using qualitative

analysis, the researchers tend to focus on a single or very few cases or examples in order to gain an in-depth understanding of their research subject. (Vromen 2010; 255) Although the theoretical part plays a bigger role in this thesis, it will have an empirical part in the end of the research in which the focus will be on one multinational organization by using interviews through story telling. Watson and Weaver (2003) highlighted in the organization normally presented by the voices of the top managers. The views of corporate issues are often picked up from standardized questionnaires (Arnold et al., 2007; Singh et al., 2005). Stories from the field are rare, and qualitative and ethnographically styled studies of corporate code of ethics in the context of globalization are lacking (Hood and Logsdon, 2002). In this paper, story-telling approach is being used to narrate an incident that happened in an organization (Boje, 2001; Czarniawska, 1999; Gabriel, 2000). Stories are “the most localized element” and often triggered “because something has happened, and people in the organization feel they have to react to it” (Czarniawska, 1999,pg. 79). Czarniawska (1997, p. 95) writes that: “Ideas do not diffuse; it is people who pass them on to each other, each one translating them according to their own frames of reference. The interviews with story telling help to gain more personal opinions and experiences from individuals and this way give better understanding of the research subject. Moreover, interviews leave the interpretation and analysis to the investigator (DiCiccio-Bloom and Crabtree 2006). The case story tells how an American MNC dealing with it’s subsidiary, which two or more different cultures co-exist in the country like Singapore and how the code of ethics were implemented. Six managers were interviewed during the same day, face to face and one at a time. Eight questions were asked with the managers across different departments (see Appendix 1). Each interview took approximately 45 minutes to be completed. The findings of the interviews through story telling are presented in this paper. Due to the promise to the company to maintain the interview with confidentiality, the research is unable to reveal the names of the interviewed managers, the name of the company or any details from which the company is recognizable.

CROSS-CULTURAL CASE STORY OF A MULTINATIONAL ORGANIZATION

Helin and Sandstrom’s (2008) studied the cross-cultural aspects of the implementation of an American company’s code of ethics into a Swedish subsidiary through story telling and interview from the employees and they had found out and categorized eight type of cross cultural stories from the same company: 1) The legal and social systems in the America and Sweden are different 2) Inconvenient of content 3) Inconvenient style 4) The risk of being sued and of ending up in jail 5) Trust and mistrust 6) The cultures and values are different 8) We need/ed an adapted translation 9)What the code says is self evident and we basically have the same values as they do. The similar patterns related to cross-cultural aspects of the implementation of code of ethics of an American’s MNC to its subsidiary in

Singapore have been found to be not very far away from the above mentioned American's MNC implementation of the code to its subsidiary in Sweden, though both are different companies. Therefore, in the cross-cultural case below, through interviews, eight types patterns are observed in Singapore subsidiary. The intent is to find out how employees at the target subsidiary view ethical issues.

The target organization is a global private enterprise, which comprises over 30 subsidiaries worldwide. In 2015 the company had almost 30,000 employees worldwide of which 30% comes from the company's home country America. The company subsidiary in Singapore operates as its Asia Pacific head office with over 200 employees. Six managers of a multinational organization were interviewed for this research during the same day, one at a time. Due to confidentiality, the names of the managers cannot be published. Therefore the Managing Director, Regional Manager, Production Manager, Marketing Manager, Quality Manager and Human Resource Manager are used to represent the respondents.

Case Story and Interview Results

The question concerned the business cultural differences between the head quarter and the subsidiary (see Appendix 1, Question 7). A Regional Manager of the company was involved in a charitable event in a personal capacity. She had approached the company's suppliers and customers for donation to buy gifts for an old folks home. Before she approached the suppliers and customers, she had asked the subsidiary's Managing Director for permission. She highlighted to the suppliers and customers that her act to participate in the charity drive is on her personal capacity. Due to the aging population, Singapore as a society on the whole was very active in promoting social support to old folk's activity. One supplier and another customer were willing to donate S\$300 each to the Regional Manager in supporting this good cause. (*The cultures and values are different: In the high collectivism, high Confucius dynamic and relationship-based culture like Singapore, people showed their supports to each other and sometimes was to "give face" to their friends and business partners.*) Six months later, due to some other incidents, America head quarter sent an investigator to investigate on the Regional Manager. After the investigation, the American investigator concluded that the Regional Manager had violated the code of ethical conduct. She was viewed as misusing her position and power to influence the supplier and customer to support her. There was an implicit implication that the supplier and customer won't want to offend her when she approached them for the donation. In the ethical code of conduct manual, the statement was very clear that the employee should not receive any money or gifts from external party.

The questions (see Appendix 1, Questions 2, 3, 8 and 9) were asked in relation to whether the whole company has a uniform and identical ethical code of conduct or whether it has been modified so that it is more applicable in this subsidiary. The Regional Manager said: "I was asked to sign the code when I

joined the company, the Human Resource Manager passed me the ethical code of conduct manual without much explanation or training. *Inconvenient content:* A Marketing Manager sounded: "Some of the content was not relevant to Singapore when Human Resource Manager asked us to sign the code, but it is *the American way* of doing things, if we want to work with American company we have to conform, take it or leave it." A Production Manager claimed: "Let them be, they do no harm, American is here to create jobs for us." *But what the code says is self-evident and we basically have the same values as they do:* The Quality Manager said: "I have no problem with the actual spirit of the code, nobody will disagree with the principles and everybody signed. Americans has the same ethics like Singapore". *We needed an adapted translation:* The Regional Manager felt that the ethical code was vague and it did not really apply in this case as her intention was not taking the money to enrich herself.

The question (see Appendix 1, Question 1) was asked in relation to the differences of the legal system between America and Singapore. She decided to fly all the way to America head quarter in the hope of meeting the Senior VP of Human Resource and Internal Audit/Legal Department to explain herself. However, they insisted that to be in compliance with FCPA, American's subsidiary had to obey the American law. And unfortunately she had violated the corporate code of conduct, by receiving money from the supplier and customer. The company had to execute the disciplinary action; and she had to leave the company despite her years of contribution to the company. *The legal and social systems in the U.S. and Singapore are different:* After she left the company, she approached a lawyer thinking of suing the company to seek justice. However, she discovered that Singapore labor law seemed to support U.S. multinational companies instead of protecting the employees. The lawyer advised her that the case is vague and she should take serious consideration whether to pursue the charges. The head office in U.S. requires its Singapore subsidiary to follow the U.S. legislation in the implementation of the code of ethics. Another example was the demand to make Singapore consultants, distributors and entrepreneurs who had business collaborations with the case company to sign the code of conduct in order to make sure that the business partners were aware of the ethical practices of the company, but this was not supported by Singapore laws.

The last question (See Appendix 1, Question 6) concerned of what is the trust level of between the company and employee. *Trust and mistrust:* The local subsidiary Managing Director was very upset with the decision made by America head quarters to dismiss the Regional Manager. He exclaimed: "I have managed the company for more than 20 years, it seems that now the Human Resource and Audit/Legal Department do not trust me anymore. I have lost a hardworking and good contributor to the company. Americans do not understand the local culture, take my advice and give me face to manage the incident." He felt that the situation was mishandled and decision made was an injustice to

his subordinate. He was so upset that he decided to resign from the company; he originally wanted to stay with the company till his retirement.

A few months later, the Internal Audit /Legal Department sent their officers to Singapore to conduct face-to-face training for the whole company's employees to ensure that everyone understand the content of code of conduct manual. In 2013, the company produced a very comprehensive code of conduct manual to share with all the employees the responsibility of knowing and accepting the principles of integrity and ethical behavior. The content of the code of conduct included many different scenarios in the different cross-cultural setting. In the manual, the Chairman of the Board and CEO of the company stated this message to the worldwide employers: "We are obligated to understand the basic principles and the specific policies that govern company operations. No one will be exempted from these principles."

FUTURE RESEARCH AND PROPOSAL

The empirical part of this research focused only on one multinational organization. In addition, the research was conducted from a subsidiary's point of view, which was located in Singapore and the head quarter in America. The research was conducted through interviews and story telling, however, another method that could have been used is the comparative method (Hopkin 2010). Comparison across several cases (across among Singapore's and America's employees) enables the researcher to establish social scientific generalizations, not just interpretations from one case. The interviews conduct in both sides will provide two different points of views. However, due to time limitation, and the size of the study, it was not possible to interview employees in two companies. If two companies would have been compared to each other, the research questions should have been different. Furthermore, we need to provide more studies that are less pre-determined about what cross-cultural differences and their effects are, in order to give their occurrences more attention.

DISCUSSION

From the case story, there are two issues here, understanding of the cultural differences and the implementation of the code of conduct. (Hofstede and Minkov 2010, p. 221 -222), what is called corruption is a matter of definition. Corruption is when people misuse the power and their position to illegally enrich themselves. In Chinese cultures, like China, Taiwan, Hong Kong including Singapore, the giving of gifts is an important ritual, but the borderline between giving gifts and bribing is gray sometimes. Arm with the distinctive on rule-based and relationship-based culture, the perspective of how American/West view certain things done in the non-American/East culture, as corruption might be customary practices at the non-American/East culture. The question is where is the line when a token

given as a form of appreciation for the help or services provided crosses the line whereby is taken as a payment to corrupt the other party in giving favors.

It seems that integration of norm-systems across borders within a multinational corporation can be quite challenging and problematic. The process of implementation might expect resistance and misunderstanding of cross-cultural issues from both parties. Thorne and Saunders (2002, pp. 11–12) discussed problems that might occur when multinational corporations tried to integrate systems and routines in all subsidiaries to promote the corporate goals “while at the same time remaining responsive to the local organizational norms and routines, in order for subsidiaries to operate effectively and smoothly in the local environment.” In addition, even though the parent organization has to be familiar with the different cultural norms of its subsidiaries, and especially their national legislation, it does not mean that the ethical code of conduct has to be adapted to them. The consequences of the mishandling can be costly for the company. In the case story, the code becomes “the American code” instead of perceived as code of the whole company. The receivers present themselves as Singaporean and not the employees in the group and they have no choice but to sign the codes of the company if they would like to be employed. The discussion will be universalism versus relativism in code work. Should there be one code for the entire multinational corporation (universalism) or separate codes for each country’s subsidiary (relativism) (Donaldson, 1989; Robertson and Fadil, 1998; Thorne and Saunders, 2002) Langlois and Schlegelmilch (1990, p. 533) conclude that “management needs to consider whether national identity is part of the company’s culture.” Clegg et al. (2007, p. 117) warned about: “An organization that desires a centrally controlled ethics will only stifle the possibility of a reflected and considered ethics.” Company has to take into consideration that when the receivers of the code in the subsidiary signed the code, it makes sure the receivers understand the code and back up the criticism from the subsidiary’s employees by initiating a dialogue or face-to-face training on ethics in relation to the codes and any cross-cultural differences.

CONCLUSION

Although Singapore has often prided itself being a good example of multiculturalism at work, the truth is that multiculturalism is premised on respecting differences that conform to neat categories of race and religion. As Singapore is a global trade and hub with many American’s MNCs establishing their business here, people have adopted cosmopolitan culture in balance to preserve the traditions. Continuing to embrace strong business ethics as a clean state is an inevitable effort in the country and business communities.

Although it seems that till today American MNCs still do not have the full understanding in the cross-cultural differences issues for implementation of ethical codes across the border, including in Singapore, corporation needs to develop intercultural intelligence to manage and establish an integrated system of rules and routines to achieve the goals and values of the company without forcibly imposing, at the same time remaining sensitive and responsive to the norms in the local cultural context so that the business can function efficiently (Thorne and Saunders, 2002). The case story was quite similar with the empirical research of (Helin and Sandstrom, 2008), which compared the U.S. and Sweden company and the arguments of Palazzo (2002, p. 211), which compared the U.S. and German programs in business ethics, that “American-style business ethics programs are [...] not directly transferable to German companies without significant adjustments. An unadjusted application would most likely lead to nothing but resentment and misunderstanding.” The content in the code of conduct has to take the cross cultural perspective into consideration with alignment of basic values, the implementation of code of conduct calls for being “careful in dealing with business ethics” and for “a high level of employee participation” since “ethics can not be prescribed top-down” (Palazzo, 2002, p. 211–212). It is worthwhile to develop a ‘universal’ code that works for every country between cultural relativism and universalism and formulate a “core of ethical norms for business that can be applied worldwide” (Thorne and Saunders, 2002, p. 12). In order to successfully implement the code, the receivers of the code need to have mutual understanding and open-minded with smooth integration spirit to make it works. This research has provided the insight that multinational organizations have created coherent and global standards and rules, in other words, have a similar code of conduct. They do not take local cultures, standards and norms into consideration to adapt the code of conducts. Moreover, headquarter of organizations have increasingly demanded that their ethical code of conduct is strictly followed in every subsidiary. What the organizations are concerned is to reduce unethical behavior in the organization, which might tarnish the company reputation. Although they might claimed to take the local norms, cultures and standards into consideration but do not try to adapt them.

APPENDIX 1: INTERVIEW QUESTIONS

- 1/5. What are the differences of legal and social system between America and Singapore?
- 2/3. Are the ethical codes provided by the head quarter relevant to Singapore context and do they caused any inconveniences in business operation?
4. What is the American way of doing business in Singapore?
6. What is the trust level between America headquarters and Singapore office?
7. How different are the cultures and values between US and Singapore?
8. Was the codes of conduct adapted to Singapore?
9. Do you clearly understand the codes of conduct and do you think the American's values system is the same as Singapore?

DRIVING AUDIT COMMITTEE DISCLOSURE - LEGISLATION VERSUS BEST PRACTICE

Coetzee, Philna¹; Erasmus, Lourens J.²

¹College of Accounting Sciences, University of South Africa

²Department Financial Governance, College of Accounting Sciences, University of South Africa

ABSTRACT

An explosion of corporate and public sector governance failures has dented the credibility of governance and its oversight bodies. Shareholders of companies and the general public have no alternative than to rely on the credibility and effectiveness of governance and oversight structures to protect their interest. The audit committee is such an oversight committee. Where scholars are stressing the shift from compliance disclosure to more substantive information regarding the performance of the audit committee, this study investigates whether the expectation for expanded disclosure (voluntary above force) have been adopted as part of organisational culture. The evolution of audit committee guidance in the King reports and prominent global guidance documents were analysed and compared to current legislation governing all sectors within South Africa. A document analysis in the form of a structured content analysis was conducted to determine, based on disclosure, adherence to the King guidance by South African organisations in private and various public sectors, after which optimal scaling was applied to determine dimensions of disclosure, with respect to audit committee best practice. Lastly, the level of adherence to legislation versus adherence to best practices is gauged within each dimension. The study adds to the body of knowledge on voluntary disclosure of audit committee best practice to be considered by policy makers and management on what may strengthen the credibility and effectiveness of audit committee oversight as perceived by the stakeholder. The result also presents a foundation for further research within this area.

Keywords: Audit committee; Voluntary disclosure; Force disclosure; Legislation; Best practice; Optimal scaling

INTRODUCTION

In the last two decades Enron and Worldcom (Rezaee *et al.*, 2003; Ahluwalia *et al.*, 2016) lifted the lid on corporate governance oversight failure. Since then an explosion of corporate and public sector governance failures has dented the credibility of governance and their oversight bodies (Faull, 2017).

This is also true for South Africa, where in the private sector, examples include Sharemax (Heystek, 2015), African Bank (Donnelly, 2016) and Steinhoff (Rossouw, 2017). For the public sector, examples include the arms deal debacle (Corruption Watch, 2014) and the Nkandla estate (African News Agency, 2016). Most recently, also the numerous major public entity governance scandals at amongst others, the South African Airways, South African Broadcasting Corporation, Passenger Rail Agency South Africa, Transnet and Eskom - all linked to so-called “state capture” allegations (Faull, 2017). In many of these incidences the auditors and per implication the audit committees were accused of neglecting their oversight role (Moneyweb, 2017; Rossouw, 2017).

Stakeholders have no alternative than to rely on the credibility and effectiveness of governance by management, and oversight structures to protect their interest. The audit committee is such an oversight structure whose existence stem from the need to protect the interest of stakeholders as per the agency theory’s principle-agent problem (Al-Rassas & Kamardin, 2016; Setiany *et al.*, 2017), by providing assurance on good governance. The formal manner of communicating with stakeholders is disclosure in the annual report of organisations. Stakeholder perception on the effective functioning, and thus credibility, of the audit committee may be based on what is being disclosed to them.

To ensure the effective functioning of a credible audit committee, scholars have debated, *inter alia*, its structure, role and responsibility as well as its effect on the performance of the organisation (e.g. Alleyne *et al.*, 2006; Al-Matari *et al.*, 2017; Setiany *et al.*, 2017). Scholarly research, together with pressure to strengthen investor confidence, culminated in guidance documents, commencing with the United Kingdom’s Cadbury report (The Committee on the Financial Aspects of Corporate Governance, 1992) and South Africa’s first King report (IoD, 1994), to name a few. Some governments have decided to formally incorporate guidance in legislation, such as the Sarbanes-Oxley Act of the United States of America (USA, 2002) and South African legislation, to enforce compliance on what is deemed the composition requirements and role of an effective audit committee.

After years of research on ‘best practice’ that are incorporated in guidance documents and legislation, scholars opine that mandatory rules can result in the symbolic display of conformity (Bédard & Gendron, 2010; Contessotto & Moroney, 2014; Brennan & Kirwan, 2015). Bédard & Gendron (2010) argue for more exploratory and explanatory studies opposed to the numerous relational studies on audit committee effectiveness. Relational studies do not improve the understanding of why and how the association between audit committee characteristics and its effectiveness happens. The reasoning is plausible in the light of continuous governance scandals globally and the increase in mandatory audit committee requirements. However, Bédard & Gendron (2010) caution that investor (stakeholder) perceptions are still influenced by the supposition that audit committees can improve stakeholder confidence in the information presented to the stakeholders by the organisation. The

stakeholder confidence is increased when it is perceived that the audit committee adopts practices that are considered by the market as 'best practices' – no matter their substantive impact on information quality. The question arises whether audit committee disclosure is based on best practices (the so-called 'voluntary disclosure') or on adherence to legislation (also referred to as 'by force').

Scholars have investigated elements relating to audit committee best practice (e.g. Martinov-Bennie *et al.*, 2015; Dewayanto *et al.*, 2017) and audit committee disclosures (Rezaee *et al.*, 2003). It is also recognised in practice that organisations have generally increased voluntary disclosure on the role and activities of audit committees (Deloitte, 2017). However, no study investigated whether disclosure on audit committees are driven by best practice or by force. The objectives of this study, supported by the legitimacy theory, are first to establish whether the King reports on governance may be regarded as best practice for audit committees. If so, secondly, to determine which areas of best practice are being disclosed (or not) and how these areas relate to legislative requirements. To achieve the first objective, the evolution of audit committee guidance in the King reports and prominent global guidance documents were analysed and compared to current legislation governing all sectors within South Africa. To achieve the second objective, a document analysis in the form of a structured content analysis was conducted to determine, based on disclosure, adherence to the King guidance by South African organisations in various sectors (hereinafter referred to as spheres since the public sector has been divided into three categories), after which optimal scaling was applied to determine dimensions of disclosure, with respect to audit committee best practice. Lastly, the level of adherence to legislation versus adherence to best practices is gauged within each dimension.

The rest of the paper is structured as follows: the research methods followed are explained; the theoretical framework and the finding to address the first objective and the results and supporting literature regarding the second objective are presented; the conclusion, implication and recommendations are discussed.

RESEARCH METHOD

To achieve the first research objective, two document analyses were conducted, namely 1) the three King reports and three prominent global guidance documents were analysed and 2) the King III requirements (IoD, 2009) were compared to legislative requirements. (Although a fourth King report was issued in 2016, its inaugural application succeeds the data collected for this study.) The aim is to determine whether the King III can be viewed as a form of 'best practice' guidance. First, the three King reports were compared to the leading corporate governance documents issued in the United Kingdom. Thereafter, King III was analysed, identifying 47 items on audit committee requirements. These items were compared with requirements from the Companies Act, no. 71 of 2008 (RSA, 2008),

the Public Finance Management Act (PFMA), no. 1 of 2000 (RSA, 1999), its supporting Treasury Regulations (RSA, 2005) and the Municipal Finance Management Act (MFMA), no. 56 of 2003 (RSA, 2003), to determine whether King III requirements (voluntary disclosure on best practices) are more comprehensive than legislative requirements (forced). These acts represent the South African private sector and different public sector spheres.

To achieve the second research objective, a document analysis in the form of a structured content analysis were conducted on the 2014/15 annual reports of private and public sector organisations. The sample consisted of: 41 listed companies, selected based on their market capitalisation ranking; 21 major public entities as listed in Schedule 2 of the PFMA (The reason for major public entities being selected was due to major public entities being established to operate independent of the fiscal budget (RSA, 2015) and any regression in the entities' financial position would entail that these entities have to be assisted by government financial guarantees or funding (RSA, 2016)); all central government departments (39) that were in existence in the 2014/15 financial year; for the provinces, based on previous audit reports (AGSA, 2015), the departments of two sound provinces (Western Cape (14) and Gauteng (13)) and two weak provinces (Limpopo (13) and North West (12)); for municipalities, all the metropolitan municipalities (8), district municipalities for which annual reports could be obtained (33), and one or more local municipality (37) for each of these districts were selected. Due to the sheer number of annual reports that had to be analysed this method of sampling was selected for feasibility. The sample is broken down as follows: from the central and provincial departments (39%), followed by local municipalities (34%), private sector (18%) and lastly the public entities (9%).

The annual reports were analysed for adherence to the 47 King III requirements. Adherence were coded as a '1' and non-adherence were coded as a '-1'. Certain items, for example number of committee members and number of meetings were recorded as ratio data. In order to convert the 47 items to dimensions, optimal scaling was applied using Cronbach's alpha (threshold 0.6) and the eigenvalue (threshold 1). It is deemed satisfactory for exploratory analysis if the Cronbach's alpha threshold is 0.6 (Hair *et al.*, 2010), measuring the consistency or reliability of the items relating to the identified dimensions. The eigenvalue is a measure of how much of the variance of the observed items a dimension explain. Any dimension with an eigenvalue of greater than one explains more variance than a single observed item. The optimal scaling exercise presented four dimensions before the Cronbach's alpha registered below the satisfaction level.

THEORETICAL FRAMEWORK AND FINDINGS: BEST PRACTISES VERSUS LEGISLATION

This study leans on legitimacy theory in terms of audit committee disclosure – voluntary versus force. System-orientated theories, such as legitimacy theory, stakeholder theory and institutional theory assume that an organisation is influenced by, and in turn have influence upon, the society in which it operates (Deegan, 2002). These theories are often used to explain management's motivation to make voluntary (unregulated) disclosures (Deegan, 2014). Disclosure policies represents an important means by which management can influence external perceptions about their organisation (Suchman, 1995). For this study, leaning on legitimacy theory expands the users of disseminated organisational information from shareholders to the society in which the organisation operates. In particular, since organisational failure, whether private or public, have a societal impact. The notion, therefore, is that organisations may seek societal legitimacy by disclosing information on what society may perceive as advancing good governance, in addition to mandatory disclosure (Shehata, 2014).

Although many studies have investigated the phenomenon of voluntary disclosure, including that of the audit committee (Allegrini & Greco, 2013), most of these studies focus on the disclosure of selected activities of the audit committee. This is due to most guidance documents only addressing a few important aspects of audit committee disclosure (Ghafran & O'Sullivan, 2012). With many of the prominent governance documents, listing requirements as well as legislation including guidance on audit committees, the question arises, what can be seen as 'best practices' in a global context. With the issuing of the second (IoD, 2002) and more so the third (IoD, 2009) King reports, many international scholars (Jackson, 2005; Jones & Solomon, 2013; Atkins *et al.*, 2015) expressed their views that the guidance captured in these reports are viewed as global leading guidance. To determine whether the three King reports were ahead (or at least on par) of their times, they were compared to similar guidance issued in the United Kingdom, due to its Cadbury Report in 1992 being the first globally recognised guidance document on governance. In Table 1, the concepts embedded in the three King reports are compared to the Cadbury Report (The Committee on the Financial Aspects of Corporate Governance, 1992), the Combined Code (FRC 2003) and the UK Corporate Governance Code (FRC 2010), indicating the evolution of audit committee guidance as documented in these guidance documents.

From the presentation it is clear that the King reports have kept up to date with the changes in the audit committee guidance domain, with concepts such as "effective" audit committee; including the public sector sphere into the guidance; and the comprehensive guidance on the functions of the audit committee as well as the chair, all motivating that King III can be seen as 'best practice' of its time. To further address the first objective of the article, the King III requirements for audit committees were

compared to relevant South African legislation with the findings indicating that the best practice requirement is not covered by the relevant pieces of legislation. Of the 47 items, 31.9% were addressed in the Companies Act, 44.7% in the PFMA and 36.2% in the MFMA. Furthermore, no additional items could be identified in these documents that are not included in the King III report. This clearly indicates that the King III report (IoD, 2009) is much more comprehensive in its guidance to audit committees. In some instances, the legislation guidance is even questionable and directly in contrast with sound governance, e.g. where the Accounting Officer (equal to the CEO) appoints audit committee members in consultation with the Executive Authority (equal to the Board).

Therefore, the first objective of the study, to determine whether King III can be regarded as best practice when it comes to audit committee guidance, is achieved.

Table 1: Evolution of audit committee guidance

Element	Cadbury (1992)	King I (1994)	King II (2002)	Combined Code (2003)	King III (2009)	UK CG Code (2010)

RESULTS AND SUPPORTING LITERATURE ON DISCLOSURE

To address the second objective, namely to develop variables by which adherence to audit committee best practice may be measured for future use by researchers, organisational stakeholders (audit committees, boards, management, etc.) and related professional bodies to provide guidance to their members, optimal scaling was applied. This resulted in four dimensions and two items. The support for the four dimensions is presented in Table 2.

Table 2: Support for dimensions

Dimension	Eigenvalue	Cronbach's alpha
1	15.601	.956
2	6.706	.869
3	4.097	.772
4	2.392	.595

Although the fourth dimension's Cronbach's Alpha is still acceptable for exploratory research purposes, it also indicated that it was not possible to explore a fifth dimension. Tables 3 to 6 present the four dimensions and their factor loadings and the separate items.

Table 3: Dimension 1 – Financial reporting quality mechanism

King requirement	Loading
Terms of reference approved by Board	0.536
AC meets with external audit annually	0.258
Independence and capacity of AC members	0.212
Chairman of AC is not chairman of board	0.588
AC may consult specialists or consultants subject to a board-approved process	0.342
Board fills AC vacancies	0.321
Board elects AC chair	0.235
Chairman of the audit committee should be present at the AGM	0.349
AC regarded all factors and risks that may impact integrity of integrated report	0.760
AC review disclosure of sustainability issues in integrated report	0.513
AC recommends to the board to engage an external assurance provider on material sustainability issues	0.360
AC ensure that combined assurance received is appropriate to face all significant risk	0.547
AC monitors relationship between external assurance providers and company	0.790
AC performs annual review of the finance function	0.710
Results of finance function review is disclosed in integrated report	0.691
AC oversight of financial reporting risk	0.616
AC oversight of internal financial controls	0.679
AC oversight of fraud risk related to financial reporting	0.524
AC oversight of IT risk related to financial reporting	0.419
AC approves terms and fees of engagement and remuneration of external auditor	0.545
AC monitors and reports on independence of external auditor	0.639
AC informed of reportable irregularities identified and reported on by external auditor	0.352
AC review quality and effectiveness of external audit process	0.450
AC reports to shareholders its satisfaction with independence of external auditors	0.699
AC reports to shareholders whether internal financial controls are effective	0.378
AC recommends integrated report for approval to the board	0.803

Active Total	15.601
% of Variance	33.193

Dimension 1 consists of 26 of the 47 items (55.3%). The dimension was labelled “financial reporting quality mechanism” and may be regarded as the priority focus of audit committee best practice guidance (Contessotto & Moroney, 2014). When analysing the 26 items, three strong themes supported by literature on the audit committee function emerge. First, the audit committee’s interaction with the external auditors (six items), the main assurance provider to external stakeholders. Where Contessotto and Moroney (2014) focus on the association between the effectiveness of the audit committee and external audit risk, their findings suggest that external auditors recognise the substance of governance over its form where the audit committee is concerned. The shift from form to substance is further argued by Turley and Zaman (2007) that audit committees should go beyond what is immediately observable from external disclosures through enhanced informal interactions with the external auditors to strengthen its influence and power relations, to maximise the impact of the audit committee on governance. Secondly, the audit committee’s external reporting oversight responsibilities (Rahman & Fairuzana, 2006; Deloitte, 2017), to ensure information quality (Al-Shaer & Salama, 2017), features strongly in this dimension represented by 14 items. Bédard and Gendron (2010) in particular exerts that the usefulness of increased regulation (compliance approach) regarding, *inter alia*, improved information quality is being questioned and that information on how and why associations happen may provide more insight into the effectiveness of the audit committee in exercising its mandate. The third theme, represented by six items, relates to the independent status of the audit committee (De Zoort *et al.*, 2002; Bédard & Gendron, 2010; Contessotto & Moroney, 2014), supporting the credibility of external audit reporting. De Zoort *et al.* (2002) in particular express the importance of an independent audit committee in ensuring financial reporting quality since it theoretically provides a strong foundation pursuing audit committee effectiveness. However, disclosure with regard to objectivity measures on the composition of the audit committee may recently be preferred above regulated independence characteristics. The expectation is, thus, that organisations disclose more than what is regulated to improve its credibility and enhance stakeholder confidence (Brennan & Kirwan, 2015).

When viewing the disclosure pattern of Dimension 1 the result from the optimal scaling present that out of the 26 items that formed the dimension, 50.2% of the organisations disclosed only eight or less of the items listed. Also, that only 25.5% of the organisations disclosed 20 or more of the 26 items listed in this dimension and 20 organisations disclosing no items. Thus, even though the “financial reporting quality mechanism” dimension may be regarded as a primary responsibility area of the audit committee, disclosure patterns by the organisations in the sample are not high. When comparing the items prescribed by legislation (potential 2 652 disclosure items based on the number of analyses

per legislative sphere) versus the items driven by best practices ($231 \times 26 = 6\,006$), only 2 453 responses were identified by means of the content analyses. Therefore it can be concluded that some organisations did not even disclosed all legislative requirements, and it can be assumed that voluntary disclosure would be even less.

Table 4: Dimension 2 – Functionality and judgement responsibilities

King requirement	Loading
Established AC	0.249
AC meetings minimum of two meetings	0.375
AC members keep up to date	0.324
AC consists of minimum three members	0.220

AC provide summary of role, details on composition, number of meetings and activities in integrated report	0.474
Active Total	6.706
% of Variance	14.268

Dimension 2 consists of 13 of the 47 items (27.7%). Two strong themes emerged, namely the functionality of the audit committee represented by seven items addressing the functioning of the audit committee as well as reporting thereon. In terms of legislated audit committee requirements as well as best practice guidance, audit committee functionality is always one of the first aspects covered. It is only logical that requirements of responsibility can only follow after the functional aspects are established. The second theme namely, “judgement responsibility” represented by six items, refers to activities where in addition to oversight, a higher level of involvement in external reporting is required. Brennan and Kirwan (2015) asserts that the role of the audit committee should shift from performing a review to performing an examination, where stakeholders begin to emphasise the disclosure of praxis (what you did), opposed to reporting on compliance (what you do).

Viewing the disclosure pattern of Dimension 2 the result from the optimal scaling present that out of the 13 items that formed the dimension, 57.2% of organisations disclosed information on 12 or all 13 items and 86.2% disclosed information on eight or more items. Since seven of the items refers to functionality that is mostly present in legislation it is a good indication that organisations disclosed information relating to aspects where the audit committee has a judgement responsibility. Considering the numbers, legislation drives a possible 1 345 disclosure items for all four spheres, when 2 445 disclosures were made for the items in this dimension from a possible 3 003 (261×13),

indicating that, apart from legislation, with regard to judgement responsibility, organisations also disclosed items driven by best practice.

Table 5: Dimension 3 – Internal audit quality

King requirement	Loading
AC meets with internal audit annually	0.162
AC is responsible for the performance assessment of the CAE	0.344
AC ensures that IAF is subject to independent quality review	0.345
Active Total	4.097
% of Variance	8.717

Dimension 3 consists of three of the 47 items (6.4%). The dimension was labelled “Internal Audit Quality” with all items related to oversight of the internal audit function and its head the CAE. The responsibility of the audit committee regarding the internal audit function is well documented (Zaman & Sarens, 2013). Zaman & Sarens (2013) continues the theme of Turley and Zaman (2007) on the value of informal interactions by the audit committee with organisational stakeholders - this time with regard to internal audit functions, stressing the role that informal processes in addition to formal mechanisms play a significant role in good governance.

For this dimension, most organisations disclosed only one or two items (75%), with 49 organisations disclosing none of the items. Furthermore, it seems that the disclosure compares with legislative compliance with 82 legislative disclosures for all four the spheres (only two items for private sector companies), yet there are 291 disclosures identified across the four spheres from a possible 693 (231 x 3). Therefore, although weak, it seems that organisations are not only driven by legislation, but also by best practices.

Table 6: Dimension 4 – Independence of assurance providers

King requirement	Loading
AC is responsible for the appointment/ dismissal of CAE	0.258
AC nominates external auditor for appointment	0.174
AC define policy and approves non-audit services by external auditor	0.209
Active Total	2.392
% of Variance	5.089

Dimension 4 consists of three of the 47 items (6.4%). The dimension identified a single theme that was labelled “independence of assurance providers” with all items related to the appointment of internal and external auditors. Literature strongly identifies the independence of assurance providers as a main responsibility of the audit committee (Bédard & Gendron, 2006; Zaman & Sarens, 2013; Deloitte, 2017). In fact, it may have been one of the very first motivations for the establishment of an audit committee when in the late 1930s the New York Stock Exchange recommended on the back of the McKesson and Roberts Inc. fraud, that external auditors should be selected by a special committee composed of non-officer board members (Ghafran & O’Sullivan, 2013). In Dimension 4, most organisations disclosed two of the three items (90.5%). Also, of the possible 190 disclosures for all four

spheres, 471 disclosure items were identified during the content analyses from a possible 693 (68%). This indicates that not only legislation is driving the disclosure, but also, to a larger extent compared to the other dimensions, best practices.

Additional to the above four dimensions, two items could not be classified into any of the four dimensions. For the item 'AC approves internal audit plan', both the MFMA and the PFMA (190 organisations) drives disclosure with 130 organisations (68.4%) that did comply. As the items 'AC chair involved in setting/agreeing AC agenda' is not a legislative requirement for any of the spheres, disclosure was not further investigated.

CONCLUSION, IMPLICATIONS AND RECOMMENDATIONS

Scholars debate for a new dawn for research on audit committees, including research on the wider governance role, its broader social responsibility role and its relevance to stakeholders other than shareholders. With disclosure being the primary means of conveying information to various stakeholders, this paper, underpinned by the legitimacy theory, ties in with this new expectation by determining whether disclosure on audit committees are driven by voluntary disclosure (best practices) or by force (legislation). First, the term 'best practice' for voluntary disclosure for audit committees is established, supporting the notion that the King III guidance can be seen as world leading.

Results from this study support the assertion from practice (Deloitte 2017) that organisations have generally increased disclosure. This is supported by three of the four dimensions with 1) internal audit quality; 2) independence of the assurance providers; and 3) functionality and judgement responsibilities, being driven beyond legislation. Especially the latter dimension, refers to high level activities performed by the audit committee, on top of the normal oversight duties. For the dimension, 'financial reporting quality mechanisms', including the committee's interaction with the external auditors; the committee's external oversight role; and its independence, disclosure is limited. Results confirm that disclosure on this dimension does not even cover the legislated requirements and it can thus be assumed that best practices are probably not covered. As this is the largest dimension, covering 55.3% of all the items, whether disclosure has really increased (as indicated in the Deloitte report) is debatable. The disclosure patterns for Dimension 1 are concerning. Although it cannot be deduced that the activities are not being performed (or it has just not been disclosed), it is only through disclosure that information can be shared with stakeholders to enhance confidence and peace of mind.

Although the results of this study supports the legitimacy theory for audit committee disclosure, more could be done. Policy makers, management and the audit committee should take note that although the study supports the notion of voluntary disclosure, there is still areas that needs improvement. The study adds to the body of knowledge on voluntary disclosure of audit committee best practice to be considered by policy makers and management on what may strengthen the credibility and effectiveness of audit committee oversight as perceived by the stakeholder. The result also presents a foundation for further research within this area, in particular focusing on expanded disclosure within the recommended framework for substantive information on the quality of the audit committee function, opposed to compliance.

CORPORATE VALUATION OF SAAS COMPANIES: A CASE STUDY OF SALESFORCE.COM

Cohen, Benjamin; Neubert, Michael

ISM International School of Management, Paris, France

ABSTRACT

This paper seeks to identify the critical factors determining the valuation of SaaS companies. This newly created business model renders many evaluation metrics inapplicable. This creates a unique sub-industry of such companies for corporate valuation purposes. Salesforce.com is used as the focal company of evaluation, allowing use of and reference to actual data and prices. This paper aims to evaluate the accuracy and relevancy of specific valuation techniques and identify those best suited for a SaaS company. This study uses a single case study research design, allowing for a deeper level of analysis. This paper has found that standard valuation techniques were successfully able to evaluate a stock share price using quarterly financial data. The relative valuation efforts were unable to derive a price range for the company. The peer analysis showed the importance of key factors like growth or profitability or other lifecycle phase at the same time, which becomes evident in the calculated metrics. The calculations performed in this paper shed light on the level of disconnect within the SaaS business model and standard valuation techniques. Companies experiencing higher growth will not compare well with companies of greater profitability. This paper brings momentum toward defining an improved relative valuation metric that more robustly represents the value forecast of a SaaS company, provides technical support for the valuation of SaaS companies, and furthers the discussion of creating new valuation metrics for fast growth start-up firms.

Keywords: SaaS, software as a service, corporate valuation, international finance, global marketing, international business, pay-per-use, pricing strategy, software industry, cloud-based software.

INTRODUCTION

The accurate valuation of companies is vital to ensure that stock markets are reliably efficient and that merger, acquisition, and divestiture events are handled fairly and appropriately. Without this fundamental expectation, stock market volatility and liquidity would suffer. However, not all industry segments can be evaluated using the same criteria, nor will analyst companies fully adhere to the same set of valuation criteria. Due to these factors, as well as overall global economic stability and individual

market crises, a multitude of valuation metrics and processes have been developed, and continue to evolve through the emergence of new business industries and business models.

In particular, the emergence of companies employing the new software as a service (SaaS) business model has created a disconnect between the valuation methods used within this sub-industry and elsewhere. Because this collection of companies has flourished in recent years, thus becoming permanent additions to the corporate landscape, the valuation techniques warrant further understanding. By uncovering these processes, insights are sought to lead to improved accuracy of valuing this particular sub-industry.

For this purpose, this paper shall proceed by discussing the different price-setting models, strategies, and practices and valuation methods of SaaS firms in the literature review. Following this shall be insights found through the application of different valuation methods on the case study firm. This paper concludes by providing the overall comparison of public valuation methods found to be the most effective.

This paper originated from calls for research from Schoenberg (2006) and Weinhardt, Anandasivam, Blau, Borissov, Meinl, Michalk, & Stößer (2009). Schoenberg (2006) analyzed the approach to corporate valuation from the standpoint of an acquisitions company. His research focused on the importance of accurate valuation in order to fairly incorporate performance metrics in which to arrive at a price both parties would agree. One of these performance variables is “price” (Weinhardt, et al., 2009; River Cities, 2017). Weinhardt, et al. (2009) focus on the difference in business models used in SaaS companies over existing technology companies. They directly call for further research comparing valuation methodologies based on business models implemented.

LITERATURE REVIEW

SaaS Pricing Model

This survey has selected salesforce.com as a single case study firm, because it is one of the most famous international high-tech firms using a SaaS price-setting model and due to its stock exchange listing, it grants access to high quality financial data.

SaaS is the abbreviation of software as a service. Instead of investing in salesforce.com’s customer relationship management software, clients acquire a subscription-based license of a cloud-based software package. The license fee can be considered as an operating instead of a capital expenditure.

The first part of this literature review focuses on the theoretical framework to describe the SaaS price-setting strategy, practice, and model of the case study firm.

For the purpose of this survey, the theoretical framework of Neubert (2017a) and Cohen & Neubert (2017) (see also figure 1) will be used to describe the SaaS of salesforce.com as a pay-per-use price-setting model (see also Hollensen, 2016).

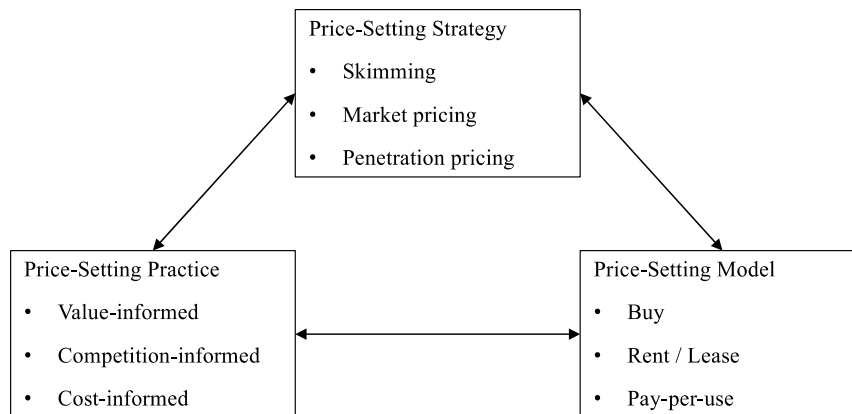

Figure 1. Price-setting practice, strategy, and models (source: Neubert, 2017a)

Accion (2015) presents a report showing the fundamentals of price-setting practices and how they apply to SaaS companies. The article defines the differences between the price-setting practices of cost-informed, competition-informed, and value-informed, then identifies the value-informed price-setting practice as the predominant strategy used by SaaS companies, with the competition-informed price-setting practices used in mainly mature markets. Salesforce.com operates as a pioneer and market leader in the customer relationship management software market using predominately value-informed pricing practices within their skimming based price-setting strategy.

Huang (2014), who performed an industry research covering the range of price-setting models offered, the pricing mechanisms are either usage-based (= pay-per-use), time-based (rent / lease), or a hybrid of the two. A pay-per-use license contract like the one of salesforce.com can use a combination of fixed monthly licensing fees, which are billed annually, plus additional cost if the usage exceeds the defined limit (e.g. number of users) or the client asks for product adaptations or individualizations. Time-based license contracts consist of clients making extended time period reservations, typically for one to three years. Cloud-based SaaS service providers like AWS or salesforce.com carefully balance their pay-per-use fees depending on different factors like for example data storage, data retrieval, or data upload volume (Deelman, Singh, Livny, Berriman, & Good, 2008; Neubert, 2017b). SaaS firms use a buy price-setting model for additional services like for example consulting, training, data storage, or hosting to generate additional revenues (Hall, 2008).

Valuation of SaaS Firms

The valuation of a corporation is influenced by many different variables and each valuation method takes each different variable to a higher or lower (if at all) extent into consideration. This is especially

important for the valuation of high-tech firms with innovative business models, like salesforce.com as an example for a young, fast growing firm, which uses a SaaS pricing model for their cloud-based software products. Thus, this second and final part of the literature review focuses on the impact of a SaaS price-setting model on corporate valuation.

The selection of an appropriate valuation method depends on the lifecycle stage of each firm (Trichkova & Kanaryan, 2015). In every lifecycle stage, growth rates and profitability differ. The case study firm salesforce.com can be characterized as a relatively young firm at the growth stages of its corporate lifecycle using suitable price-setting strategies, practices, and models. In this development stage, the revenue growth rate tends to be higher and the profitability is lower (Neubert & van der Krogt, 2017).

Newton & Schlecht (2016) present historical data for SaaS companies from 2005 to 2016 that indicates a strong trend of total enterprise value (TEV) remaining stable above a 5x multiple over last twelve-month (LTM) revenue. Through use of regression models, they suggest revenue growth is more than twice as important for the valuation of SaaS companies as EBITDA margin. The authors then propose the following formula for predicting a company's TEV/LTM revenue valuation multiple using the two values of LTM revenue growth (percent) and LTM EBITDA margin (percent):

$$\text{Valuation Multiple} = 2.6 + 10.8(\text{LTM Rev. Growth \%}) + 4.7(\text{LTM EBITDA Margin \%})$$

Gardner (2016) confirmed this finding in identifying the revenue growth rate as one of the key factors that go into assessing a firm's revenue multiple for corporate valuation. In the time period, in which this survey analyses the valuation of Salesforce.com, it is profitable but doesn't pay any dividends. Feld Thoughts (2013) presents a combination of revenue growth and profitability that states that a SaaS company's combined monthly recurring revenue (MRR) plus EBITDA profit margin should add up to 40% or above.

Figure 2. Key metrics for valuing SaaS companies (source: Newton & Schlecht, 2016)

In addition to Newton & Schlecht (2016), Smale (2016) discusses the typified classification of SaaS businesses as having annual profit (seller discretionary earnings, SDE) multiple within the range of 2.5x – 4.0x. This range is a function of many variables, most notably the age of the business, required time of owner involvement, growth trend of business and customer churn rate (Smale, 2016). Tunguz (2016) provides historical data tracking the enterprise value (EV) multiple of SaaS companies over time and identified during this time period sharp changes of the EV / forward revenue multiple void of any notable economic crises or widespread instability. Other key factors to assess the corporate valuation of SaaS firms are size of the target market, customer retention rate, gross margin, and capital efficiency (Gardner, 2016). Smale (2016) further elaborates that a large amount of intrinsic corporate value lies within intangible or qualitative measures of the firm. Examples of this include stability of the earning power, owner-specific business relationships, business traffic attributable to search engines and their algorithms, level of competition within the business niche, and type of customers targeted by the company.

Bancel & Mittoo (2014) asked 356 European valuation experts about their assumptions and estimation methods for their valuation practices. Of the survey respondents, 65% reportedly perform company valuation by using two or three different methods, while 20% of respondents only use one. In defining the debt maturity, roughly 40% of respondents reported using a 10-year maturity while an equal number use a 5-year maturity. The selection of which sovereign bond to use for a risk-free rate is split 63% using the firm's country sovereign bond while 30% choose a AAA country sovereign bond. When calculating the beta of a stock, the selection of the time-period and return intervals vary significantly. 48% of respondents use monthly values, 20% daily, and 19% annual return intervals, while at the same time 53% use a time-period between one to three years, 37% use more than three years. Then, 46% of all respondents do not adjust the historical beta to estimate future beta as is called for in the CAPM model. The survey also highlights the difficulty in arriving at the same input values for the models. Focusing on one of the most critical model inputs, market risk premium, the results show how the financial crisis of 2008 negatively influenced the accuracy of estimations. The precise variability of this input may not be evident; however, the trend of survey responses is much more so (figure 3):

Figure 3. Survey respondents' estimation of market risk premium changing in the years around the 2008 financial crisis (source: Bancel & Mittoo, 2014)

Kellogg (2013) presents the case for growth driving SaaS companies principally because of the early stage of development both for the sub-industry as well as the individual companies. Kellogg (2013) and Shah (2014) provide supporting evidence as to why profitability is not a key driver in company valuation by calculating a cross-plot of forward EV/revenue multiple versus forward revenue growth rate to illustrate the strength of correlation between the two metrics (figure 4).

Figure 4. Cross-plot of SaaS company EV multiple relative to revenue growth (source: Kellogg, 2013)

The results find that even when the textbook standard models for company valuation are used, the textbooks don't fully define how to derive all input variables and key factors (Festel, Wuermseher & Cattaneo, 2013). In addition, the company lifecycle is discussed as a means to justify the ease of transition between ownership or to create a sense of urgency (also compare to Trichkova & Kanaryan, 2015).

As the literature research has shown, significant amounts of research have been made towards the three principle areas of this study; SaaS business models, SaaS price-setting practices, and SaaS corporate valuation. However, no prior research has been performed that investigates the intersection of these three. Therefore, this survey contributes to the impact of pricing decisions on corporate valuation of SaaS firms using the following adapted theoretical framework (see figure 5).

Figure 5. The intersection of SaaS business models, price-setting practices, and SaaS corporate valuation (source: the authors)

RESEARCH METHODOLOGY

This survey uses a qualitative single case study research methodology (Scholz & Tietje, 2002; Yin, 2015). Individual stock and market index data were collected from publicly available websites. The main stock in focus was then analyzed using widely accepted evaluation equations, followed by advanced analysis techniques gathered from more recent academic literature and reputable online sources, partially in comparison to selected peers. The findings from these techniques are then discussed to compare valuation estimates as well as applicability towards the SaaS profit model.

The purpose of this qualitative single case study has led to the following research question:

How do relative and DCF-based corporate valuation methods reflect the stock price value of SaaS software firms?

For the purpose of bringing specific discussion points and values to this paper, the company salesforce.com is chosen to be the focal company of evaluation. In actuality any young and growing company in the sub-industry would suffice, and no particular bias towards this company shall be given. This paper aims to be objective and insightful towards the accurate portrayal and valuation of this and any other SaaS company.

CORPORATE VALUATION

Corporate valuation equations and metrics have been derived, defined, and further developed continuously since the advent of stock markets. Understanding a company's fundamental metrics and profitability became the basis of comparison with its peer companies. Most every modern economics textbook covers the breadth of these calculations. Therefore, without providing derivations or explanation for the following calculations, the standard valuation metrics are provided below.

Discounted Cash Flow

The corporate valuation calculations can be separated into two main groups: the discounted cash flow (DCF) method (including variants), and relative valuation (RV) framework (Bancel & Mittoo, 2014). The first method involves calculating the net present value (NPV) for the stock's dividend, current cash flow, and forecasted cash flow growth. The summation of these three values is the resulting valuation of the company. Specific to salesforce.com, there have been no dividends granted to date, thus related metrics each calculate to zero.

As seen in figure 6, the calculations match considerably well with the actual price history. Because of the year-over-year equations being used, most of the short financial history is insufficient for calculating corporate value. However, in the four quarters that are computed the calculation accuracy is within 5%, substantially within the margin of error when taking into account non-financial sources such as news releases, macro-economic forces, and price change momentum.

The DCF method was successfully used to derive a corporate valuation of Salesforce.com of \$78.91 per share using data through Q4 2017 fiscal quarter (31 January 2017). This estimation compares amazingly well to the stock price of \$79.10 per share on the same day. This corresponds to a 0.24% difference (compare to figure 6).

Figure 6. DCF-based valuation of the case study firm

Although the cash flow being generated by the company has created value, the bulk of the valuation comes from the free cash flow growth rate being experienced and the expectation for continued growth in future quarters, which is in line with the findings of Newton & Schlecht (2016). This important finding shows the shareholders and managers of SaaS software firms how to increase their corporate valuation. One growth driver is the use of a SaaS price-setting model (River Cities, 2017). As the example of our case study firm salesforce.com shows, every additional user or every additional activity a user performs (e.g. increase of required storage or download volume), immediately result in higher sales revenues.

The calculations of the DCF-based valuation use the CAPM model using the formula: $r_a = r_f + \beta_a (r_m - r_f)$. Figure 7 shows the parameters, results, and input factors and figure 8 additional support for these calculations.

		rf	rm	β	ke

					7,500	10,085	39.1%	5.28%
					43%	57%		

Figure 7. WACC calculations within the standard CAPM model (source: the authors)

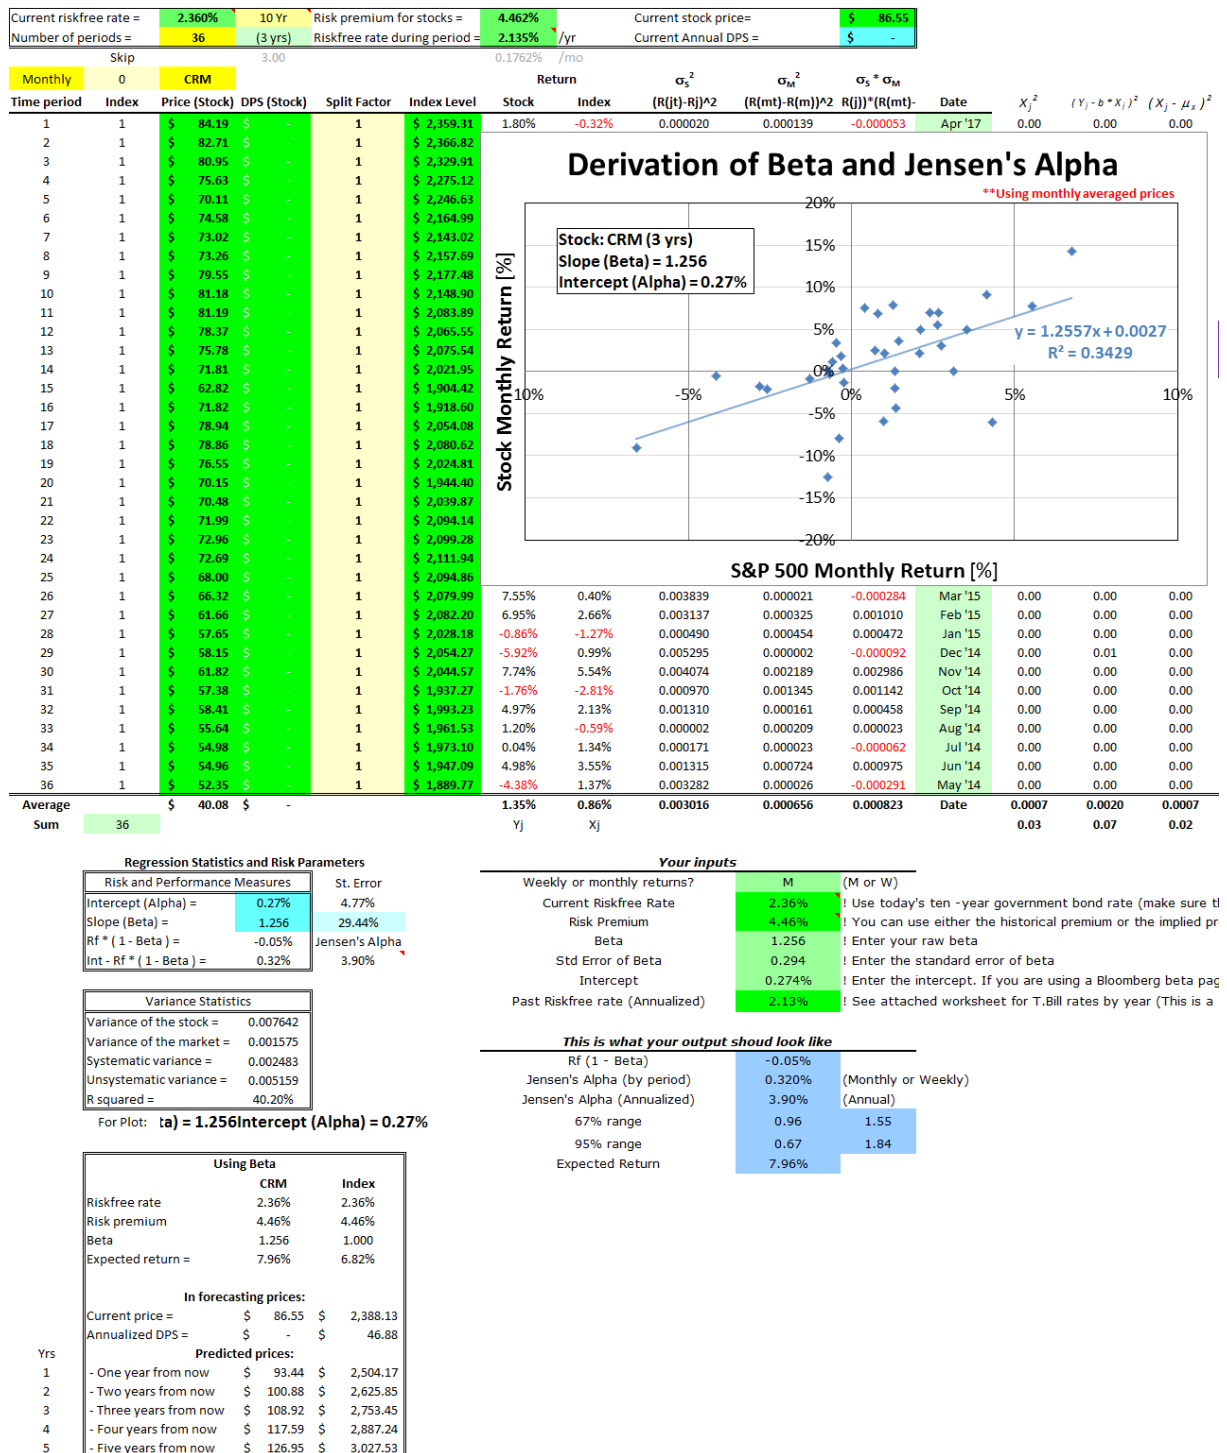

Figure 8. Derivation of beta and Jensen's alpha using 36 month period (source: the authors)

Relative Valuation

Relative valuation methods are based on the valuation of stock-listed companies within the same industry, also called peers or comparable companies, and with similar characteristics (Atrill, 2005). Relative valuation methods might be used for the valuation of both stock-listed and private companies (Atrill, 2005). This qualitative single case study uses six relative valuation methods: Price-Earning-Ratio

(PER), Forward PER, Price-Earning to Growth-Ratio (PEG), Price-Sales-Ratio, Price-Book-Ratio, and Price-Cash-flow-Ratio. The equations used to apply these methods in this qualitative single case study are:

- Price-Earning-Ratio (PER) = Price per Share / Earnings per Share (EPS)
- Forward PER = Price per Share / Forecasted EPS
- Price-Earning to Growth-Ratio (PEG) = PER / EPS Growth
- Price-Sales-Ratio (PSR or sales / revenue multiple) = Price per Share / Sales per Share (generally over a 12-month period)
- Price-Book-Ratio = Price per Share / Book Value per Share (where book value per share = (total assets – total liabilities) / number of shares)
- Price-Cash-flow-Ratio = Price per Share / Cash flow per Share

Relative valuation does not provide a method of calculation for precisely valuing a company. Instead, it provides a range of value metrics of a company's peer group from which reasonable price estimates can be bracketed. The selected peer group consists of SAP, Adobe, Citrix, DXC, Blackbaud, Cognizant, and VM Ware (compare to figure 9).

With these estimations, it is possible to gauge if a stock is valued high, low, or on target relative to its peer/comparable companies. Caution is to be used with this method to ensure validity in company comparison, particularly taking into account the company size, sub-industry, business model, growth focus, lifecycle phase, location, accounting policies, accounting years, operational, and dividend policies (Atrill, 2005).

The findings of the relative valuation suggest that traditional relative valuation methods will not work at this point in the company's lifetime with this peer group set. In fact, the relative valuation methods don't take into consideration the above-the-average expected free cash flow growth rate shown in the DCF valuation. Thus, the selection of an appropriate corporate valuation method for a SaaS firm depends on the stage of a firms' development (Trichkova & Kanaryan, 2015).

Figure 9. Relative valuation comparison between CRM and seven comparable peer-group companies (source: Morningstar 2017)

As observed in the below graph (figure 10), all six of the relative valuation metrics estimate a corporate valuation below the current stock price. These six relative valuation metrics are: Price-Earning-Ratio (PER), Forward PER, Price-Earning to Growth-Ratio (PEG), Price-Sales-Ratio, Price-Book-Ratio, and Price-Cash-flow-Ratio. Thus, it can be assumed that the traditional relative valuation methods don't reflect the full price paid at a stock exchange of fast growing high-tech firms.

Figure 10. Relative valuation of salesforce.com using six metrics from seven comparable companies
(source: authors)

CONCLUSIONS

The standard valuation calculations were successfully used to derive a corporate valuation for Salesforce.com of \$78.91 per share using data through Q4 2017 fiscal quarter (31 January 2017). This estimation compares well to the actual stock price of \$79.10 per share on the same day. This corresponds to a 0.24% difference.

The relative valuation process did not favorably estimate the valuation of salesforce.com through comparison with comparable peer companies. The four closest comparisons estimate a valuation of \$67.42 per share, or 17% difference with the price at the end of Q4 2017. This discrepancy is perceived to be due to the higher growth phase of salesforce.com as compared to the comparable companies, and thus suggests that company lifecycle is of greater importance when selecting a peer set.

The literature search highlighted several additional concerns for company valuation that cannot be quantified. Such important characteristics of a company emphasize the human component required in the valuation team, and no clear and conclusive conversion to a mathematical formulation has been derived.

The guidelines on using rule-of-thumb estimates is that they are only valid when the situation is analogous to when the rule was first derived. The changing financial climate of the increasingly interconnected and interdependent world is creating situations more complex than ever before. All observations made here are strictly limited to SaaS companies and within the short timeframe of the

past ten years. Their applicability toward the future is only as valid as the assumption that the future shall be stable and predictable.

The reliability, validity, and generalizability suffers from the traditional limitations of single case study research designs. Therefore, we call for further research about this interesting topic with other comparable SaaS companies. Further, future studies would highly benefit from the analysis of more than four financial quarters.

DIFFERENT METHODS TO ESTIMATING THE COST OF EQUITY. AN ANLYSIS ON A SAMPLE OF TOO BIG TO FAIL BANKS

Coluccia, Daniela; Fontana, Stefano; Solimene, Silvia

Business and Law Department, University of Rome Sapienza, Rome, Italy

ABSTRACT

In this study a comparison was made between the Capital Asset Pricing Model, the most widely used methodology, and an actuarial method with the use of Credit default swaps and the method based on the inverse of the multiple P/E. These three models are used to estimate the cost of equity. The comparison was made on a sample of 24 banks selected among the largest for assets in the world (Too big to fail banks) belonging to eleven different countries.

The results show that the CAPM estimates a premium for the higher risk than the one obtained with the actuarial method and the method based on the inverse of the P/E (except for 2013).

Keywords: Cost of equity, CDS, probability of default, Price to Earnings Ratio

1.INTRODUCTION

The methods based on expected flows, both income and financial, are those most used in professional practice for the estimation of equity value. In applying these methods, the discounting rate is the "critical factor" because an incorrect estimate can lead to misleading results in determining the economic value of a company (Guatri, 1998; Koller et al., 2010; Zanda et al., 2006)

This paper presents a comparison between different methods for determining the cost of equity: the Actuarial Method based on the determination of the probability of default (PD) by means of Credit default swaps, the C.A.P.M. and finally the method based on the use of P/E.

2.SAMPLE SELECTION

The comparison is carried out on a sample of 24 large international banks (the so-called too big to fail) for a period from 2012 to 2014. The selected banks are in ascending order of total value of assets (table n. 1).

Banks	Country	Totale Assets US billions \$
HSBC Holdings plc	UK	2,627,027,600
JPMorgan Chase & Co	USA	2,573,126,000
BNP Paribas	France	2,503,748,814
Barclays Bank plc	UK	2,108,682,111
Bank of America Corporation	USA	2,104,534,000
Deutsche Bank AG	Germany	2,057,845,491
Credit Agricole S.A.	France	1,918,232,414
Citigroup Inc.	USA	1,842,530,000
Royal Bank of Scotland plc	UK	1,634,301,221
Societe Generale	France	1,574,349,661
Banco Santander S.A	Spain	1,504,391,973
Lloyds Banking Group plc	UK	1,325,155,280
ING Groep N.V.	Netherlands	1,199,167,024
UBS AG	Switzerland	1,057,768,565
Credit Suisse Group AG	Switzerland	927,027,630
The Goldman Sachs Group Inc.	USA	851,059,000
Royal Bank of Canada	Canada	832,445,848
Morgan Stanley	USA	801,510,000
Banco Bilbao Vizcaya Argentaria	Spain	749,112,552
Standard Chartered plc	UK	725,394,883

Nomura Bank International plc	Japan	421,498,488
Macquarie Group Ltd	Australia	141,925,236

Table n.1

The banks belonging to the sample belong to 11 different countries and they are distributed according to the following table:

Country	# Banks
Australia	1
Canada	1
Denmark	1
France	3
Germany	2
Japan	1
Netherlands	1
Spain	2
Switzerland	2
UK	5
USA	5
Totale	24

Table n.2

3.THE DETERMINATION OF THE COST EQUITY USING THE ACTUARIAL METHOD BASED ON THE DETERMINATION OF THE PD THROUGH CREDIT DEFAULT SWAPS

According to the model proposed by Bierman and Hass in 1975 and Cheung in 1999, a similar approach is used in the following to estimate a risk-adjusted rate for the equity. Assume that:

- o investors are risk-neutral;
- o p is the probability of default;
- o entrepreneur/equity investors receive nothing in the case of default;
- o there is no tax.

So the model to calculate the cost of equity is:

$$K_e = (i_1 + PD)/(1 - PD) \quad [1]$$

Where:

K_e is the cost of equity;

i_1 is the free-risk rate as benchmark is used the 10 years Government bond;

PD is the probability of default.

The first phase was the determination of the 5-year default credit spread of the chosen sample for a period of three years (2012-2014). As it can be seen in the table n. 3 there are, for each year, the prices of Credit default swaps spreads and related ratings provided by Moody's.

Banks	Country	2012		2013		2014	
		5Y CDS	Moody's	5Y CDS	Moody's	5Y CDS	Moody's

Table n.3

The second phase consisted in determining the PD based on the relationship based on the work of two Fitch researchers (rating agency) Grossman and Hansen (2010). The model is the following with the Loss severity equal to 60%.

$$PD = CDS5y / \text{Loss severity} [2]$$

In the following table the probability of bankruptcy for the years examined was determined.

	2012	2013	2014
Banks	PD	PD	PD
BBVA	6.52%	2.70%	1.47%
Banco Santander S.A	6.16%	3.23%	1.47%
Bank of America Corp.	3.63%	1.68%	1.20%
Barclays Bank plc	3.12%	1.97%	1.13%
BNP PARIBAS	3.48%	1.82%	1.15%

UBS AG	3.28%	2.77%	1.48%

Table n.6

4.THE DETERMINATION OF THE COST OF EQUITY THROUGH THE CAPM.

The cost of equity can be calculated through the use of the famous Capital Asset Pricing Model (CAPM) (Sharpe, 1964), according to the well-known formula:

$$K_e = i_1 + \beta * (R_m - i_1) \quad [3]$$

Where

K_e is the cost of equity;

i_1 is the free-risk rate as benchmark is used the 10 years Government bond;

β is beta factor that represent the systematic risk;

$R_m - i_1$ is the equity risk premium (ERP).

In this case, the "beta-factors" provided by Datastream-Thompson Reuters for the years 2012, 2013 and 2014 were used. The results are summarized in the following table:

	2012	2013	2014
Banks	β	β	β
BBVA	1.611	1.644	1.513
Banco Santander	1.510	1.491	1.340
Bank of America	2.345	2.409	1.928
Barclays Bank plc	2.710	2.730	1.880
BNP PARIBAS	1.387	1.409	1.588
CITIGROUP	2.949	3.011	2.038
Commerzbank	1.921	1.934	1.611
Credit Agricole	1.760	1.822	2.101
Credit Suisse Group	1.676	1.677	1.553
Danske Bank	1.690	1.740	1.450
Deutsche Bank	1.570	1.591	1.403
HSBC	1.227	1.336	0.973
ING GROEP	2.497	2.665	2.322
JPMorgan Chase	1.521	1.517	1.425
Lloyds Banking	2.420	2.530	2.080
MACQUARIE	1.809	1.718	1.315
MORGAN STA.	2.263	2.322	1.789
Nomura Bank	1.600	1.670	1.780
Royal Bank of Can.	0.890	0.910	0.770
Royal Bank of Scot.	2.500	2.510	1.520
Societe Generale	2.010	2.125	2.404
Standard Chart.	1.350	1.290	1.260
The Goldman Sachs	1.500	1.489	1.519
UBS AG	1.858	1.724	1.520

Table n.7

The market premium (E.R.P.) for the years 2012, 2013 and 2014 of the countries belonging to the banks, it is taken from the work of Fernandez, Linares and Fernandez Acín (2014).

	Equity risk premium %		
Country	2012	2013	2014
Australia	5.90	6.80	5.90
Canada	5.40	5.40	5.30
Denmark	5.50	6.40	5.10
France	5.90	6.10	5.80
Germany	5.50	5.50	5.40
Japan	5.50	6.60	5.30

5.THE DETERMINATION OF COST OF EQUITY THROUGH THE USE OF THE INVERSE OF THE MULTIPLE P/E

The estimation method in question takes its cue from Gordon's well known formula, in perpetual regime; for determining the value of a company. The formula is:

$$P = D / (K_e - g) \quad [4]$$

Where:

P = price;

D is the average expected dividend flow of the company taken into consideration;

K_e is the cost of equity;

g the expected growth rate.

Since the dividend is the part (the percentage is defined as the payout ratio) of income distributed to shareholders. So you can write the [4] as:

$$P = E * \text{Payout} / (K_e - g) \quad [5]$$

Where:

E = Expected average earnings (Earnings);

Payout ratio = Profit distributed/Total income.

If we consider the reinvestment rate of the "c" profits, the complement to one of the latter represents the payout ratio. The equation [5] becomes:

$$P = E * (1 - c) / (K_e - g) \quad [6];$$

$$P/E = (1 - c) / (K_e - g) \quad [7]$$

Since the growth rate "g" can be determined as a product retention rate or reinvestment rate "c" and return on equity (ROE), (Maccario, Sironi e Zazzara, 2002).

$$g = c * ROE = (1 - \text{payout}) * ROE \quad [8]$$

If the ROE is considered as the rate of return on capital, in the medium and long term it can be compared to the cost of equity "K_e". So we can write $g = c * K_e$ and then the [7] becomes:

$$P/E = (1 - c) / (K_e - c * K_e) = (1 - c) / (1 - c) * K_e \quad [9]$$

we obtain that the cost of equity is equal to the inverse of its P/E.

$$K_e = 1/PE \quad [10]$$

To this end, the values of the leading P/E were provided by Datastream-Thompson Reuters for the years 2012, 2013 and 2014. The data shown in the following table refer to P/E multiples and to the determination of cost of equity using the method in question.

	2012	2013	2014	2012	2013	2014
Banche	P/E	P/E	P/E	Ke	Ke	Ke

Table n.10

6.A COMPARISON OF COST EQUITY THROUGH THE USED METHODS

Three methods have been examined that are based exclusively on market data and through these the different cost of equities have been estimated. At this point we proceeded to a comparison between the three models in the following way:

- o difference between the values obtained through the use of the CAPM and the values resulting from the use of Credit default swaps was calculated.
- o difference between the values obtained through the use of the CAPM and the values resulting from the use of the inverse of the multiple P/E has been calculated.

The results are shown in table n. 11

	2012					2013					2014

Table n.11

As can be seen in table n. 19, for each year and for all banks, the estimate of the calculation of the rate of reasonable remuneration was summarized using the three approaches used. It is evident that the difference between the application of CAPM and the approach with the use of CDS shows significant differences, on average of 6.5%, 9% and 7.6% respectively in 2012, 2013 and 2014. Furthermore, the correlation matrix between the three variables is presented (tab.12).

Correl. Prob.	2012			2013			2014		
	Ke_CAPM	Ke_CDS	Ke_P/E	Ke_CAPM	Ke_CDS	Ke_P/E	Ke_CAPM	Ke_CDS	Ke_P/E
Ke_CAPM	1 -----			1 -----			1 -----		
Ke_CDS	0.5501 0.0054***	1 -----		0.3729 0.0726**	1 -----		0.3148 0.1340	1 -----	
Ke_P/E	0.2800 0.1849	0.0960 0.6530	1 -----	0.1493 0.4861	-0.0194 0.9281	1 -----	0.2529 0.2331	-0.1926 0.3671	1 -----

Table n.12

Table n. 12 shows that there is a positive and significant correlation, both in 2012 and in 2013, between the model based on the CAPM and the CDS-based model. While the correlation between the model based on CAPM and the model that uses the inverse of P/E is positive but not significant, on the other hand, it is important to note that the correlation between the CDS model and the model based on the inverse of P/E, in 2013 and 2014, presents a negative but not significant value.

The analysis seems to confirm, as in previous works, that for companies that are "safe" from the point of view of credit risk, the CDS model tends to underestimate the risk (Zanda et al. 2010). Conversely, the comparison between the method based on the CAPM and the use of the inverse of the CAPM showed instead a much smaller difference. In 2013 and 2014 the use of CAPM offers values of 3% and 1.90% higher than the method based on the inverse of P/E. In 2012, however, the situation is reversed because the method based on P/E has a higher yield, on average, of 2.87% and these results are very similar to those found by King in 2009.

The following chart shows the average values of cost of equity based on three models analysed (fig.1).

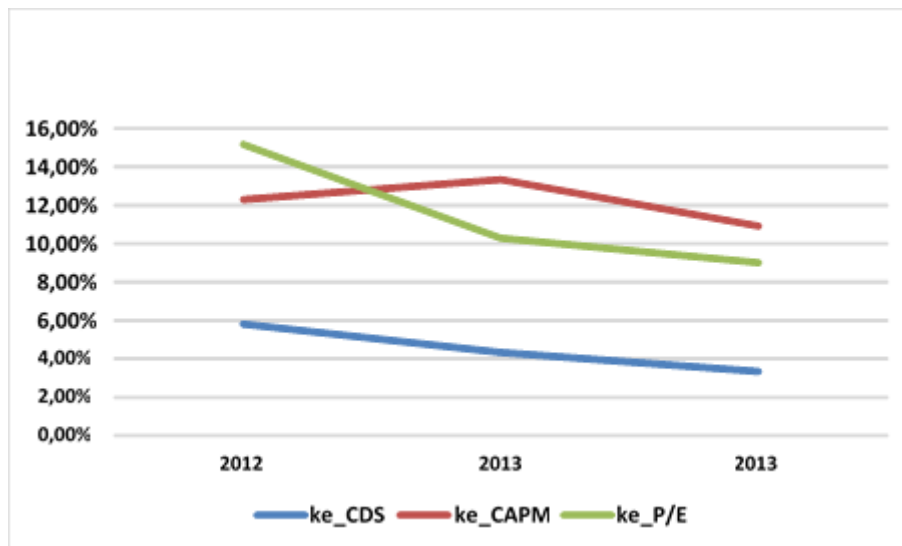

Fig.1 – Comparison trough the models

It is possible to point out that the average trend in the cost of equity based on the three methods chosen is decreasing (except for the CAPM method which in 2013 shows a trend in countertendency). It is important to remember that for the CDS-based method there are two levers: PD and ten-year government bond rates. The average PD of all banks, on average, had a decreasing trend. With regard to government bonds, it should be noted that there has been a double trend: for banks that we could define as Anglo-Saxon matrix (UK, USA, Australia and Canada), risk-free interest rates at 10 years showed a trend in rise, in virtue of the expansionist policies implemented by its Central Banks (Quantitative Easing operations). On the other hand, for banks of European origin there has been an opposite trend, ie a decrease in government bond yields in relation to the sovereign debt crisis of 2012 of the so-called PIGS countries (Portagallo, Italy, Greece and Spain). On average, this effect meant that the trend in 10-year interest rates had a minimal effect on the general trend in rates of discounted remuneration calculated using the CDS method.

Fig.2 – Beta factor average

In fact, as can be seen from Figure 2, the trend cost of equity of the selected banks, calculated with the CAPM; is basically determined by the beta coefficient since in the analyzed period the trend of the Equity risk premium was less variable as shown in Figure 3.

Fig.3 – Equity Risk Premium average

As regards the analysis of 10-year risk-free interest rates, the same applies to the CDS-based method. Finally, as regards the method based on the inverse of P/E, it can be a good point of reference in the event that there may be the presence of strong changes in interest rates without risk, as occurred during the period 2011-2012. Europe.

CONCLUSION

In this study a comparison was made between the Capital Asset Pricing Model, the most widely used methodology, and an actuarial method with the use of Credit default swaps and the method based on the inverse of the multiple P / E. The comparison was made on a sample of 24 banks among the largest for assets in the world belonging to eleven different countries.

The results show that the CAPM estimates a premium for the higher risk than the one obtained with the actuarial method and the method based on the inverse of the P/E (except for 2013). This is because the CAPM determines the economic risk not only as a risk of bankruptcy, but also as a risk of price volatility compared to the market average. The CDS-based method, on the other hand, showed that for companies considered to be not very risky in terms of creditworthiness, the method tends to underestimate the risk since the probability of default is very low. The CAPM remains the most used method, although limits have been highlighted over time, both of a theoretical nature and of an empirical nature. Finally, given the limits shown here by the methodologies described above in certain scenarios, the method based on the inverse of the multiple P/E can be used if not as the main method at least for control.

EMERGENCE AND EVOLUTION OF AN ENTREPRENEURIAL ECOSYSTEM: THE CASE OF PORTO

Corbo, Leonardo¹; Almeida, João²

¹Católica Porto Business School & CEGE, Porto, Portugal

²Católica Porto Business School, Porto, Portugal

ABSTRACT

Current work on entrepreneurial ecosystems is still underdeveloped, focusing prevalently on successful case studies such as Silicon Valley and less on peripheral areas where entrepreneurship is a nascent but growing phenomenon. In this paper, we examine the emergence and evolution of the entrepreneurial ecosystem of Porto, a city located in the north of Portugal, which has historically been an industrial hub but has witnessed a proliferation of start-ups in recent years. We find that for an entrepreneurial ecosystem to emerge it is of critical importance that one or more players assume the role of entrepreneurial hubs, even if in the initial stage interaction between these actors is limited. However, for an entrepreneurial ecosystem to grow additional factors are necessary including a wide range of experienced investors and a strong level of interaction within the ecosystem. We discuss the implications of our findings for research on entrepreneurial ecosystems and outline a possible avenue for future inquiry.

Keywords: Entrepreneurial ecosystem; start-ups; evolution; cluster; entrepreneurship; Portugal

INTRODUCTION

As several entrepreneurial clusters have emerged or are emerging globally beyond the well-known success story of the Silicon Valley, researchers have progressively used the term entrepreneurial ecosystem (EE) to describe the geographical agglomeration (i.e. co-location) of actors involved in entrepreneurial activity. Examples include cities like Berlin, London, Singapore, and Tel Aviv. Despite its popularity, however, most work on EEs has remained theoretical (Pitelis, 2012; Brown and Mason, 2017) which calls for additional empirical work to explain how EEs emerge and evolve. Additionally, there is little understanding of the reasons behind the success of entrepreneurial ecosystems (Feldman and Braunerhjelm, 2006) perhaps because each ecosystem is unique with its own distinctive idiosyncrasies and characteristics that are spatially, relationally, and socially embedded. Particularly urgent and intriguing, we believe, is the study of contexts that have so far been at the margins for

what concerns entrepreneurial activity and the assessment of the drivers and the obstacles to the formation and evolution of entrepreneurial ecosystems in these contexts.

In this paper, we address this gap through an in-depth analysis of an ecosystem that is not at the core of the global start-up scene, namely Porto's entrepreneurial ecosystem in Portugal. To illustrate the process driving the emergence and evolution of Porto's entrepreneurial ecosystem, we rely on the taxonomy used by Brown and Mason (2017) who classify EEs based on several variables including the presence of dominant actors, the nature of interaction within the ecosystem, the availability of funding, and the nature of entrepreneurial recycling. Through these elements, two types of EEs are identified, namely embryonic and scale-up ecosystems. We provide an overview of Porto's EE dividing our period of analysis in two distinct phases, namely emergence and evolution. Based on interviews conducted with key actors within the local entrepreneurial ecosystem as well as archival material and direct observation, we identify the main actors and factors that acted as triggers for this ecosystem's emergence as well as the obstacles preventing the ecosystem to evolve to a more mature stage. We discuss the implications of our findings for research on entrepreneurial ecosystems in the last section of the paper.

LITERATURE REVIEW

The entrepreneurial ecosystem concept has been often defined using the biological metaphor (Moore, 1993) because the choices of entrepreneurs deciding where to establish their start-up mimic the behavior observed in nature by biologists with respect to biological ecosystems. Starting from this principle, several definitions of EEs have appeared with some scholars noting that we still lack of common understanding of what EEs are and that there has not been enough sufficient rigorous theoretical and empirical analysis (Stam, 2015). Among the various attempts made to define the concept, EEs have been defined as a "set of interconnected entrepreneurial actors, entrepreneurial organizations, institutions and entrepreneurial processes which formally and informally coalesce to connect, mediate and govern the performance within the local entrepreneurial environment" (Mason and Brown, 2014: 5). Another broader definition of EEs views them as a "set of interdependent actors and factors coordinated in such a way that they enable productive entrepreneurship" (Stam, 2015: 1765).

In an effort to shed some clarity, recent reviews have stressed out the importance to distinguish between geographical and non-geographical contexts (Mason and Brown, 2017). Scholars studying entrepreneurial ecosystems without focusing on the spatial agglomeration of firms, view ecosystems as facilitators of innovation where actors interact to co-produce new knowledge (Zahra and Nambisan, 2011). Apple's iOS and Google's Android innovation ecosystems are frequently used as

examples of this phenomenon. The majority of studies, however, focus on the geographical dimension of ecosystems to explain why certain locations exhibit higher levels of entrepreneurial activity (e.g. Stam, 2015) and have roots in the cluster approach that focuses on geographic concentrations of interconnected companies, specialized suppliers, service providers, firms in related industries, and associated institutions (Porter, 1998: 197).

For scholars interested in the geographical dimension of entrepreneurial ecosystems, a fundamental aspect is the physical co-location of firms that share a common vision, exhibit intra- and/or inter-sectoral linkages, and are embedded in a supportive socio-institutional setting (Pitelis, 2012). For entrepreneurial ecosystems to emerge one important pre-condition is the co-location and embeddedness of firms and other actors in a cluster (Nelson, 1993). This implies that the decision to set up a firm usually involves a locational dimension and that the choice of a location will be done after an assessment of its advantages and disadvantages. The international business literature has often discussed how the choice of where to locate a firm is influenced by the potential advantages that may follow (e.g. Dunning, 1980). These advantages include, among others, availability of resources (e.g. financial, human), effective transportation, and a well-developed communication infrastructure. Once a location has been chosen based on the above factors, it is possible to argue that we already have an ecosystem in the making. The selection of the location suggests that other entrepreneurs may decide to establish their start-ups in the same location for the same reasons, but now with the additional advantage of being surrounded by pioneering early-stage firms (Pitelis, 2012). Based on the above, it is possible to conclude that the definition of entrepreneurial ecosystems as “a set of interdependent actors and factors coordinated in such a way that they enable productive entrepreneurship within a particular territory” (Stam and Spiegel, 2016) perhaps best reflects the geographical dimension of entrepreneurial activity of an ecosystem.

EMPIRICAL SETTING

Porto is the second largest and populated city of Portugal, divided into 17 municipalities that are home to more than 1.5 million citizens accounting for 16.5% of the Portuguese population (Pordata, 2016). The city has a major industrial area, extremely relevant for the Portuguese economy, representing a growth value added of €14 million (Pordata, 2016).

The purchasing power per capita of the region is above the Portuguese average being equal to 104.8% (Portugal's purchase power index normalized at 100%) (Pordata, 2015). However, citizens purchase power has been relatively constant for the last 10 years, which coupled with rising housing prices for both renting and buying a house, can have a dilutive effect. Although the cost of living in Porto has been increasing recently, the city remains extremely competitive when compared with other European

cities. For example, Porto has a score of 51.02 on Cost of Living Index Rate by Numbeo, ranking in the 337th position out of 545 cities, which is far from the most expensive cities across the world.

The city of Porto has been attracting the interest of both corporations and young companies due to its skilled labor and a competitive cost of living. Both the amount of companies present in the city as well as their life expectancy have been increasing in the last few years. In total, Porto accounts for 17.1% of the total number of Portuguese companies with 7.091 new companies being constituted, and the number of insolvencies and closures dropping 12.1% and 16.8% respectively, for the same period of time (DB Informa – Barometro, 2018). The ratio of companies' constitutions for each closure is 3.1, meaning that for each company that closes 3.1 new ones are born which is crucial for the growth and sustainability of the entrepreneurial ecosystem (DB Informa – Barometro, 2018).

The reinforcement measures taken in recent years towards the development of entrepreneurial initiatives have been attracting more young entrepreneurs and startups to the city which has been adapting its framework to provide support, guidance, training, and streams of investments to entrepreneurs. Aiming to stimulate and develop its 300 startups, the city relies on 14 co-working spaces, 20 incubators, 5 investment entities, 55 higher education institutions, 68 R&D centers, and 38 business associations which drive Porto towards the goal of becoming an international hub for innovation and a respected startup ecosystem (ScaleUP Porto, 2018). As the city's Mayor, Rui Moreira, explained when illustrating the progress of the city's entrepreneurial ecosystem: "Cities working as living labs are a unique showcase platform to support the link between companies and the city but also companies and the world. The city of Porto is engaged in the development of a strategy to foster the local entrepreneurship ecosystem focusing on the scaleup phase but aiming higher." (Porto start & scale guide, 2016).

RESEARCH DESIGN

In this paper we used an inductive approach through an in-depth and explanatory case study (Yin, 2015). Through this approach, we did not aim to test the external validity of our assumptions but rather aimed to illustrate their usefulness to provide insights into the emergence and evolution of entrepreneurial ecosystems. Several scholars have highlighted the usefulness of case studies to illustrate and discuss theoretical insights (e.g. Bogenrieder and Nooteboom, 2004). To improve the validity of our findings, we relied on a triangulation of interviews, document reviews, direct observation as well as in-depth informal discussions with different stakeholders associated with the ecosystem. We used a semi-structured interview protocol from which we conducted 10 interviews. The protocol was designed to understand the factors that facilitate the emergence of the EE as well as to identify any actors that played a crucial role in the ecosystem's early stages. Moreover, it aimed to

assess what where the major obstacles for the ecosystem to evolve into a more mature phase. This type of interview format gave more control over the discussion and allowed for more description by participants (Lindlof and Taylor, 2002).

CASE STUDY ANALYSIS

The origins of Porto's entrepreneurial ecosystem

In the initial stages of an ecosystem, the creation of the conditions that might lead to its development rest more on individual rather than collective action. Incubators and accelerators, for instance, have been shown to play a pivotal role in fostering entrepreneurship (Bollingtoft and Ulhøi, 2005) with potential positive impacts on the ecosystem in which they are embedded. In our empirical context, a major role was played by a university incubator named UPTEC in the late 2000s. As one entrepreneur revealed to us: "I think UPTEC played a crucial role in centralizing a lot of the startup activity that started to take shape in Porto. They were very connected to the university as they still are today and I think that all the big startups in Porto, in some shape or form, were touched by UPTEC. So, I think that it was really key for Porto's ecosystem to have a place where people would gather and I think that's probably where and how it all started." (*Informant 2, co-Founder*).

While entrepreneurial activity was already taking place in the city before UPTEC, it is noteworthy to highlight that the lack of initiatives that would support early stage ventures prevented several individuals from pursuing the entrepreneurial path. A project manager working for one of the startups incubated at UPTEC noted: "I think we had a lot of people with interesting projects but not the opportunity to develop them. With UPTEC, those opportunities started to appear. For a person with an interesting project and a small budget, the possibility to have a place to work with good infrastructure and support is great. The University of Porto understood that talented people were leaving the city or following less innovative careers just because of lack of support and UPTEC was the way to tie people to the city and give them opportunities. Then, all the different actors came along and the ecosystem started to have much more knowledge transfers which helped with its development" (*Informant 6, Project Manager*).

The incubator, however, was not the only actor playing an important role in shaping Porto's EE. Other spontaneous and often isolated initiatives were also important toward that goal: "Startup Pirates was important to start the mobilization of the ecosystem but also Porto Startup Coffee which started in 2010 and had at least once a month a guest entrepreneur speaker sharing her story with our community [...]. I think this and other projects allowed the spread of knowledge and experience that opened the door for more and better initiatives" (*Informant 4, Adviser*).

The evolution of Porto's entrepreneurial ecosystem

For an ecosystem to evolve and pass from an embryonic to a scale-up stage, several factors have been deemed to be relevant. Among them, the nature of ecosystem interactions is perhaps a key element as ecosystems ultimately thrive and prosper when their actors do not work in isolation. Although some level of interaction is taking place within Porto's entrepreneurial ecosystem, one interviewee noted that compared to other EEs, Porto's ecosystem is still very fragmented. While structural fragmentation creates opportunities for newcomers to enter a specific arena, it is only through cohesion that relationships can be cemented and become stronger.

The evidence collected on Porto's EE suggests that its network configuration is more similar to a star network where one key actor (i.e. UPTEC) acts as a hub maintaining relationships with other players, whether strong as in the case of the Founders Founders initiative – a start-up community initiated by five start-ups formerly incubated at UPTEC – or weaker ties as is the case of some startups that have been incubated in the past but with which interaction is not frequent. Several actors including co-working spaces, universities, and associations have important roles but are loosely connected to other members of the ecosystem. However, more recently another actor has been increasingly assuming an orchestrating role between the different projects and initiatives scattered in the ecosystem. Specifically, Porto's City Hall has been indicated to act as a bridge between the ecosystem's actors through initiatives such as ScaleUp Porto: "It was born two or three years ago I think and started gathering Porto startups under the same "umbrella" for the promotion of innovation and new initiatives. A good example of that is "Boom Week" where players like ANJE, Founders Founders, Porto Design Factory, among others, came together to develop a major event all of them under the same brand and with the same goal of helping Porto entrepreneurs. So, I believe that Porto ecosystem is evolving its forms of cooperation and the City Hall is performing well its function of gathering and mobilize the ecosystem" (*Informant 4, Adviser*). Another more recent phenomenon in Porto's ecosystem has been the creation of co-working spaces which have been indicated as relevant conduits of knowledge and information, especially for early-stage start-ups. As a community manager of one of these co-working spaces put it: "I think co-working spaces only became more visible in the middle of the process, so four or five years ago, but had a big impact because they are places where people who have the same interests gather, exchange ideas, work together and learn from each other" (*Informant 5, Community Manager*).

While Porto's EE emergence was triggered and shaped by the entrepreneurial action of the key actors identified above, its development and evolution is dependent on several other factors that are not necessarily linked to the ecosystem's pioneers. We now turn to an analysis of these factors that so far have acted as constraints to the ecosystem's growth but represent significant opportunities for the

future. The first obstacle identified is the availability of funding, which previous research has shown to be one of the main factors for scaling up an entrepreneurial ecosystem (Brown and Mason, 2017). There was a general consensus about the quantity of funding available with few interviewees lamenting also a lack of experienced investors. One investor we interviewed highlighted this element in particular: “One of the problems that I’m personally involved is the lack of professional investors. There are only a few people with knowledge on international investment landscape, and what happens is that startups want to play in the first league, but they train in the third division, and with lack of mentoring, this will not end well most of the times” (*Informant 1, Investor*). With respect to the scarcity of funds available, it was also highlighted that there is a lack of privately funded sources. An investment manager explained to us the need to reduce the reliance on publicly funded initiatives and increase the amount of private investments coming from Portuguese entrepreneurs who have already sold their previous venture: “If we, for example, see Talkdesk being sold, the entrepreneurs will collect millions, and this can be the start of new private funds reinvesting into the ecosystem and its new startups, with the difference that those entrepreneurs have the experience of building a successful startup. [...] We need more companies that are not dependent on public money and government, and in our case, almost everything is (programs, incubators, etc.)” (*Informant 7, Investor*).

While skilled investors can help a start-up scale faster, it is also noteworthy to highlight that the entrepreneurial team plays a major role in a new venture’s performance. Previous studies have highlighted, for instance, the importance of building diverse and heterogeneous teams, indicating that functional diversity is positively related to a variety of performance measures including growth and employment rates (Hmieleski and Ensley, 2007). Being the majority of start-ups of Porto’s EE technology-oriented, founding and entrepreneurial teams are often well-equipped with respect to software aspects but lack experience and/or competences in other equally critical aspects for venture growth such as sales and product development. As noted by one professional working for a private non-profit association that promotes entrepreneurship within Porto’s ecosystem: “One factor that I would like to refer and that I think is blocking us is the lack of sales expertise. We are really good at creating new technology but we don’t know how to do market or product development” (*Informant 3, Project manager*). Another relevant aspect related to human capital is access to talent in the technological domain. While the city’s largest university offers a sufficient amount of graduates that can be deployed in software development, the establishment in the city of large foreign companies is seen with skepticism as it would increase the so-called war for talent and create a shortage of resources. At the same time, there is a general consensus on the need to attract more talents from abroad to work for local start-ups.

An additional factor preventing Porto's entrepreneurial ecosystem from passing onto a more mature stage is to be identified in the lack of substantial exits which limit the opportunities for learning for other nascent ventures. As one of our interviewees put it:

"Porto's startups ecosystem is still amateur, because the truth is, we don't have many success cases or enough experienced people to share their knowledge. It is not something we can learn at the university, you need to learn from people who made it in the real world and not "by the books" [...]" (*Informant 1, Investor*). The ability to generate the so-called blockbuster exits is thus an important element for an ecosystem to develop as it creates the conditions for entrepreneurial re-cycling (Brown and Mason, 2017). Once exits take place, entrepreneurs can either reinvest in creating new ventures within the ecosystem or invest in other ventures and act as a knowledge repository for to-be entrepreneurs. This process enables a virtuous cycle whereby an ecosystem becomes stronger, generating more entrepreneurs which strengthen the ecosystem (Isenberg, 2011).

Porto's EE is still at an early stage as the amount of success stories –particularly exits – is extremely limited compared to other European ecosystems. An entrepreneur highlighted one of the principal differences between Porto's EE and other European ecosystems by focusing on the lack of success stories: "We don't have a real success story, for example companies that were built here and didn't move. I know that people can say that Farfetch is an example, but I don't think it's a good one, because, although it was built in Porto, they had to move to grow, and that is not a success for Porto, because startups should be able to stay and grow here. Our market is not dynamic enough and that is what we should learn from other major cities in Europe" (*Informant 2, co-Founder*).

Although not included explicitly in the taxonomy proposed by Brown and Mason (2017), our interviews revealed that culture is an important aspect in the passage from one stage to another in the evolution of an entrepreneurial ecosystem. Previous research has identified culture as one of the main domains of an entrepreneurial ecosystem noting that culture includes both societal norms (e.g. tolerance of risk, mistakes, failure) as well as success stories (e.g. visible successes) (Isenberg, 2011). One of our interviewees highlighted an important difference between Porto's EE and other ecosystems abroad: "At mentality level, we still have that idea of not sharing ideas or projects as we fear that someone can steal them. I think that is closing some doors. We can see already some differences in Lisbon, because of the city's internationalization level [...]. I have some contacts with people in Berlin's ecosystem and there's a huge difference in openness. Anyone who has a business idea, quickly shares it with five or six people and within a few weeks, they have something much more consistent and well structured, almost ready to market, something that probably was not happening if no one shared ideas" (*Informant 5, Community Manager*).

DISCUSSION AND CONCLUSION

The increasing focus on entrepreneurial ecosystems can be ascribed to the proliferation of start-ups even in countries that do not have a strong tradition in the generation of successful new ventures. In particular, researchers have tried to go beyond the well-studied phenomenon of the Silicon Valley, and more broadly of the United States, in an effort to understand how other realities can give birth to successful start-ups. To that respect, a particularly understudied phenomenon we believe is the emergence and development of entrepreneurial ecosystems in countries and cities that are traditionally more marginal with respect to entrepreneurial activity. With this goal in mind, this paper focused on the case of second largest city of Portugal, Porto. Using a case study methodology, we explored the drivers and obstacles to the emergence and evolution of this ecosystem which then helped us illustrate the evolutionary process of an entrepreneurial ecosystem.

Our findings point to the pivotal role played by pioneers in the initial phase which then became less relevant as additional players appeared in the ecosystem, creating instead the need for deeper interaction between actors involved in start-up activity. In the second stage, we found that a network orchestrator can be beneficial as self-organizing can be limited by elements such as lack of sufficient resources or individualism. In our setting, for instance, one such role has been assumed by the City Hall through initiatives such as ScaleUp Porto. Additional elements such as the presence of experienced investors and entrepreneurs are of critical importance for scaling up an ecosystem. In our setting, we found that both quality and quantity of investors and seasoned entrepreneurs need further development.

While the findings of our study offer some initial insights on the emergence and evolution of ecosystems in peripheral countries, there is ample room for additional empirical research on the topic. An interesting analysis conducted by Acs *et al.* (2017) identified the number of unicorns (i.e. companies that have reached a \$ 1 billion valuation) per city as a proxy for the health status of an entrepreneurial ecosystem. While it is not surprising to see that the Silicon Valley (which includes San Francisco, Palo Alto and Mountain View) accounts for almost one third of the total number of unicorns in their list, it is interesting to notice that unicorns are also positioned in smaller countries with a much smaller internal market such as Israel and Czech Republic. Thus, a large internal market is neither a necessary nor a sufficient condition for a highly productive ecosystem (Acs *et al.*, 2017) as the examples above demonstrate. Future research should explore these ecosystems and derive generalizable lessons and applicable frameworks that may serve as roadmaps for the entrepreneurial ecosystems wishing to enter this list.

A LEADERSHIP COMMUNICATION VALUE CHAIN MODEL

Mulder, Dalmé; De Lange, Lucrezea

Department of Communication Science, UFS, Bloemfontein, South Africa

ABSTRACT

This study focuses on the role of communication in the leadership process. The point of departure is Kaiser and Overfield's (2010) leadership value chain (LVC) as this model reflects the link between leaders and organizational effectiveness. Although communication is described as the underpinning foundation of all the leadership domains, it does not feature at any point in the LVC. As the essence of leadership is communication, the goal of this study is to develop a leadership value chain model that incorporates communication. This study unfolded in five phases and included a literature review, an evolutionary conceptual analysis of leadership communication, and a phenomenological research strategy. During the fifth phase of the research, the insights gained from the empirical research were merged with the data from the first two phases to propose a framework and guidelines for integrating communication into a leadership value chain model.

Keywords: Leadership communication, Leadership value chain model (LVC), Leadership communication value chain model (LCVC), Phenomenology, Conceptual analysis, strategic integrated communication

INTRODUCTION

Leadership effectiveness is critical within organizations, with leader communication ranking as top critical driver of organizational results (Madden 2011). It is therefore essential that organizational leadership consist of capable communicators as this can play a significant role in the value creation process of the organization. Unfortunately, discussions on the topic of leadership communication in business literature are rare, which highlights the fact that the field of organizational communication has had limited engagement with the world of leadership (Tourish & Jackson 2008). The point of departure in this study is the leadership value chain (LVC) (Kaiser & Overfield 2010:165) as this model aims to reflect the link between leaders and organizational effectiveness. Although literature describes communication as the underpinning foundation of leadership, it does not feature at any point in the LVC. This study addresses this void and focuses on the role of communication in the leadership process.

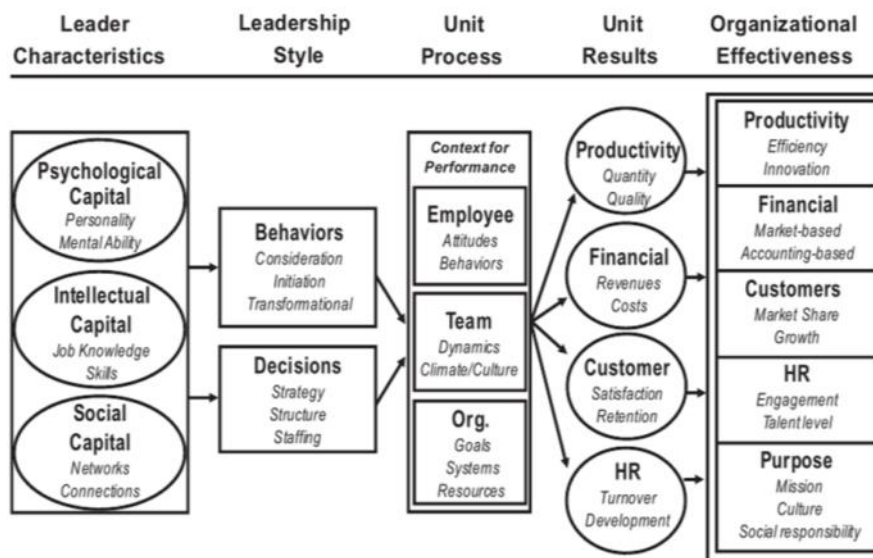

LEADERSHIP IS COMMUNICATION

Communication is key in relationships and coexistence in environments where results are expected. Communication is also critical for accelerating change and improving organizational performance, particularly when it comes to aligning and motivating employees. A company's leadership behavior has a direct impact on the bottom line, and poor leadership communication hits the bottom-line far harder than good leadership communication helps with enhancing it (Ketchum Leadership Communications Monitor 2013). Communication-based leadership research has significantly challenged some of the managerially focused, universalist presumptions of traditional leadership research (Fairhurst 2001). Hall (2007:197) emphasizes leader talk in organizations and its role in constructing collaborative, context-driven meaning for organizational members. Fairhurst and Sarr (1996) constructed the leadership role as creating and managing meaning in the organization that influences the reality experienced in that specific organization. With this, these authors have placed communication at the core of leadership.

In 1998 Anderson predicted that human capital would become a core commodity in complex and competitive landscapes. Today, it is an accepted fact that employees make significant contributions to the overall success of an organization. Research indicates that organizational performance markedly improves when communication is permitted to flow uninterrupted and employees are empowered, provided incentives, and given the necessary resources to perform at optimal level (Ahmed, Shields, White, & Wilbert 2009). Contrary to the view that is usually assumed within the majority of the literature on leadership, that communication is an essential component or aspect of the leadership relationship, a prime leadership skill (Ashman & Lawler 2008), or one of the most important tools in a leader's toolkit (Tourish & Jackson 2008), in this study leadership is equated to communication.

PROBLEM INVESTIGATED

Despite the fact that many well-documented examples of research indicating the correlation between leadership and organizational effectiveness exist, it is still unclear exactly how leaders make a difference to the organisation's bottom-line (Joyce, Nohria & Roberson 2003). In an attempt to establish this, the need for the LVC was identified. Kaiser (2005:3) defines leadership as fundamentally concerning influencing individuals to transcend their selfish short-term interests, and contribute to the long-term performance of the group, therefore building a team and guiding it to outperform its rivals. Communication is essential in both these instances. It was therefore disconcerting to find that the role of communication in the leadership process is not included at any point in the LVC (Figure 1).

Figure 1: The leadership value chain

Source: Kaiser and Overfield (2010:168)

RESEARCH OBJECTIVES

The goal of this study is to develop a leadership communication value chain model. In order to attain this goal the following research questions are relevant:

What does the leadership value chain model entail? (Contextual research question)

Which organizational communication approach would enhance leadership communication? (Contextual research question)

What is leadership communication? (Conceptual research question)

How does employee's perceive leadership communication? (Normative research question)

How should leadership communication be applied to be more effective? (Theoretical research question)

RESEARCH METHOD

This study was approached from a qualitative paradigm and is exploratory, descriptive and contextual in nature as it attempts to explore and describe leadership communication from within a strategic integrated context. The research was divided into five phases: Phase I consisted of two sections, a literature review of the leadership value chain, and a literature review of organizational communication. The rationale of this phase was to explore the context in which leadership communication takes place. Phase II of the research entailed an evolutionary concept analysis (Rodgers 2000) of leadership communication. During Phase III the data gathered during the first two phases was synthesized to develop a LVC model that incorporates communication and is applied

from within a strategic integrated communication perspective. Phase IV comprised a hermeneutic phenomenological study. In-depth interviews were conducted with respondents regularly exposed to leadership communication. Groenewald's (2004:12) phenomenological research questions were put to participants during phase IV to explore experiences, feelings, beliefs and convictions. (These questions are indicated in the results section.) Groenewald's (2004) five step explication process were used in Phase IV. A final step was added in which the results were validated. The unit of analysis was employees exposed to leadership communication. The population of the sampling design was members of the Free State chapter of PRISA (Public Relations Institute of South Africa), who are employees of organizations in the services industry, on the receiving end of communication from leadership. The sample was drawn by means of non-probability and purposive sampling (Welman & Kruger 1999). The inclusion criteria were first of all that the participants were members of the Public Relations Institute of South Africa's (PRISA) Free State chapter, because these individuals work within a communication context which should make them more sensitive to communication related matters. Secondly, only members of the PRISA Free State chapter, employed in organizations in the services industry, exposed to leadership communication from top or middle management, were included. A theoretical sample was drawn based on "saturation of categories" Charmaz (2006:189), i.e. theoretical saturation. The sample size for phase IV was 12 (participants). During Phase V the insights gained from the empirical research (in Phase IV) were merged with the model proposed in phase III to create a leadership communication value chain model.

RESULTS AND FINDINGS

This section is structured around the research questions of the study.

What does the leadership value chain model entail?

The primary use of the LVC (see Figure 1) is to identify factors to consider that influence the way in which individual leaders contribute to organizational effectiveness. Although the LVC is a valuable measuring instrument for determining the impact of leaders on organizational outcomes, there are still certain areas of leadership that need to be addressed. Leadership communication was not included at any point in the LVC. This leads one to construe that the majority of business leaders, and academic scholars alike, fail to understand the important role that communication plays in the leadership process.

Which organizational communication approach would enhance leadership communication?

A review of organizational communication literature highlighted the importance of an integrated approach (Einwiller & Boenigk 2012). Strategic integrated communication (SIC) is needed to enhance the establishment of strong and trusting relationships with stakeholders. An integrated

communication strategy also contributes to consistency of, and strategic intent in messages, which have a positive influence on the organizational reputation and image (Fombrun, Gardberg & Sever 2000). However, for SIC to be successful, it should be an organization-wide endeavor implemented on a strategic level. This requires that leaders grasp the absolute importance of the strategic and systematic management of an organization's communication. The overview of literature provided sufficient reasons to conclude that a strategic integrated approach to organizational communication are beneficial to an organization, as it could potentially impact the bottom-line and add value (Niemann & Grobler 2007).

What is leadership communication?

It was established that leadership today should be approached from a socially constructed and relational point of view (Fairhurst & Grant 2010) where meaning is co-created by the leader and those that he/she is communicating with. Leadership communication was found to be a unique and complex form of communication that directly impact the organizational bottom-line (Fairhurst & Connaughton 2014) and is not easily applied in practice. The very close relationship and inseparable nature of leadership and communication was also established (Tourish & Jackson 2008). From the historical evolution of the concept, it was concluded that, contrary to the past, leadership communication's focus is not merely on the influence of the individual leader, but also on the leader's interaction with the individual, the group and team, and the organization as a whole. This underlines the importance of the human element in organizational communication. It was further found that in order for leadership communication to be effective it should be authentic, ethical and communicative in nature. It is therefore imperative that it should be a transactional and people-centered endeavor that is dialogical and transparent. In other words, a communicative approach to leadership communication, where the establishment of relationships with all stakeholders is of the essence, should be followed. Respect and clear values should be an integral part of this process.

The lack of definitions of leadership communication indicated that this important phenomenon did not receive the attention it deserved. It is important for leaders to take note and be aware of the implications that effective leadership communication can have for the organization. Despite the realization that no one management or leadership approach will be sufficient to meet existing challenges, it was concluded that a fundamental principle agreed on is the need for communication. Effective leadership communication is focused on a constructionist and relational approach where meaning is co-created and where communicative leadership, dialogue, listening and understanding as well as sense-giving is of the essence. The need for leadership communication to be an integrated and strategic endeavor was also emphasized. Only when applied in this manner would the formation of relationships of trust and mutual respect between employees, other stakeholders, and leaders be

possible and would organizational functioning and value addition be improved. Furthermore, when leadership communication is effective it enhances organizational commitment and positively influence the organizational culture and climate.

In this study, leadership communication is defined as a highly complex, socially co-constructed and interactive phenomenon that takes place on different organizational levels between a leader and an individual, group/team, and/or organization (Barrett 2008, 5). It involves strategy, engagement and execution and has as its purpose the controlled transfer of meaning (DeChurch, Hiller, Murase, Doty & Salas 2010). Leadership communication uses the full range of communication skills and resources to overcome interferences and to create and deliver messages that guide, direct, motivate or inspire others to action" (Barrett 2008: 5).

When considering the attributes, antecedents and consequences of leadership communication uncovered in the concept analysis, it was concluded that attention should be paid to these aspects to improve the quality of leadership communication in the organization. This in turn could add value to the organization as it was clear from the findings that effective leadership communication positively influences the organizational bottom line.

How does employee's perceive leadership communication?

Respondents indicated that many problems were experienced with the communication received from leadership in their different organizations. It also became evident that the majority of the leaders that were referred to did not have the necessary communication skills to be proficient communicators. Communication was also not a top priority on their to-do lists. It seemed that the communication received from these leaders affected the morale and job satisfaction of respondents, as well as their performance in the workplace. The conclusions related to each interview question will now be discussed.

<i>How do you experience the leadership communication of your organisation?</i>

The communication received was perceived as problematic and basic communication principles were found absent. A general *lack of communication* existed and an *absence of communication* was also detected. Communication was mostly *one-way* and *no provision was made for feedback* from respondents. *Top-down communication* seemed to be the norm. Communication received was also of *poor quality* and often *insufficient and unclear*. A *lack of interpersonal communication skills* compounded the problem, as leaders exhibited *insensitivity to non-verbal cues* and *were also unable to establish meaningful relationships with employees*. Furthermore, communication was perceived as *unsupportive, condescending, cold, detached* and *strained*. Respondents did not always receive information necessary for the proper execution of their jobs, and indicated a total *disregard for communication* from some leaders.

Responses included statements such as:

**...but the communication does not come from management. We as communication practitioners are there to help leaders to communicate, not to communicate on their behalf, but we communicate on their behalf.*

**In our department the communication is exceptionally pathetic. No communication takes place.*

**They hardly ever share information and when things change you are not aware of it. You function by trial and error.*

A silo approach to communication was reported by some respondents, with *interdepartmental communication* described to be *inadequate*. This resulted in little integration of work activities which was very *demotivating* to respondents as certain tasks had to be repeated. This had a serious *effect on the work teams* as an absence of team spirit was reported.

A very important point that surfaced was the fact that communication was experienced as *unethical, disrespectful* and *dishonest*. This has serious implications for the establishment of relationships of trust between leaders and their followers. Where trust is absent communication cannot be successful as leaders will be perceived as inaccessible, and employees will not have the confidence to approach them about important organisational issues.

Finally, an overall *lack of or under-utilisation of communication structures* had an impact on the communication. Without a proper communication structure and integration of messages, there will be *no message consistency* to internal and external stakeholders alike. Different departments did not know what was expected of them, and messages to external stakeholders were also not effective. It was concluded that organisational structures did not always provide the necessary support. The lack of communication structures also led to respondents not knowing where to report and what channels to follow when communicating.

<i>How does your leader's communication make you feel?</i>
--

Interaction between leaders and the respondents was *found lacking* and *hardly any positive relationships existed*. It seemed as if the leadership communication employed had a very *negative impact on the respondents' wellness*. The feelings reported by the respondents led to the conclusion that the quality of the leadership communication influenced employees negatively and that frustration, distrust and unhappiness prevailed. The way in which some leaders communicated caused respondents to feel inferior and powerless, which in turn led to disheartenment and respondents feeling demoralised. Respondents also indicated that they *regularly felt stressed* and unsafe in the workplace, which affected their functioning. It can be concluded that this led respondents to feel *emotionally abused, not good enough* and *disrespected*, as well as unhappy in their work environment. This had an impact on the respondents' job satisfaction. Examples of responses included:

**It has an influence on your attitude towards your work. It makes you negative. You don't want to support work initiatives.*

**It makes me feel as if the road is not level. There are obstacles in the way.*

**I feel rebellious.*

How should an effective leader communicate?

In this section, four themes emerged from the data. Firstly, it was found that leadership communication should be *communicative* whereby communication is the central aspect of leadership and constitutive of leadership. It was stated that leaders should pay attention to important aspects such as dialogue, effective listening and understanding when communicating with subordinates. The importance of supplying feedback on communication received from employees, as well as receiving feedback with an open mind and without a preconceived agenda, was stressed. Furthermore, the respondents expected communication to be an *inclusive process* that is *meaning-centred* and *interactional*, and where *interpersonal exchanges* between the different parties are of the essence. The necessity of *frequent* and *adequate* communication was also indicated.

The second theme emphasised the importance of taking a *relational approach* to communication. The importance of *interpersonal communication skills*, being able to communicate in a professional manner, as well as being diplomatic and tactful, was indicated. *Emotional intelligence* was seen as one of the prerequisites for being an effective communicator, as this would allow the leader to *show insight and understanding* when communicating, and enables the leader to *adapt the communication to a specific context*, and be *audience and recipient sensitive*.

Thirdly the importance of *authentic and ethical communication* were viewed as very important as this allows for *transparent, honest and unambiguous communication* that would lead to the establishment of *trusting relationships*.

A final theme highlighted was the need for communication to be used *strategically*. The need for a *communication structure* and the inclusion of communication in the overall organisational strategy, as well as the need for a *communication strategy*, were mentioned repeatedly. It was also suggested that communication should be *integrated* into all the organisational functions to encourage the establishment of a culture of collaboration to enhance teamwork and team spirit, and counter silo functioning.

What is the contribution that effective leadership communication can make to an organisation?

The responses to this question were categorised into two sections. The first section pertained to the *impact* of the leadership communication *on the organisation*, and the second section pertained to the influence that effective leadership communication could have *on the individual*. These findings are presented in table 1 below.

Table 1: Synopsis of consequences derived from conceptual analysis and employee responses

Impact of more effective leadership communication on the organisation:	Impact of more effective leadership communication on the individual:
- Higher productivity and efficiency	- Positive employee identification
- Improved organisational effectiveness	- Group and task cohesion
- Establishing an environment of trust and respect	- Improved leader-member relationships
- Enhancing a positive organisational culture and climate	- Employee and job satisfaction
- Positive impact on organisational reputation	- Innovativeness amongst employees
- Provides direction to employees	- Freedom of expression by employees
- Increase turnover of organisation	- Collaboration amongst employees
- Better informed workforce	- Organisational commitment
	- Improved susceptibility to change
	- Empowered employees
	- Enhanced emotional well-being
	- Motivated employees
	- Improved employee wellness
	- Improved efficiency
	- Improved service delivery
	- Foster loyalty towards organisation
	- Improved morale amongst employees
	- Sense-giving

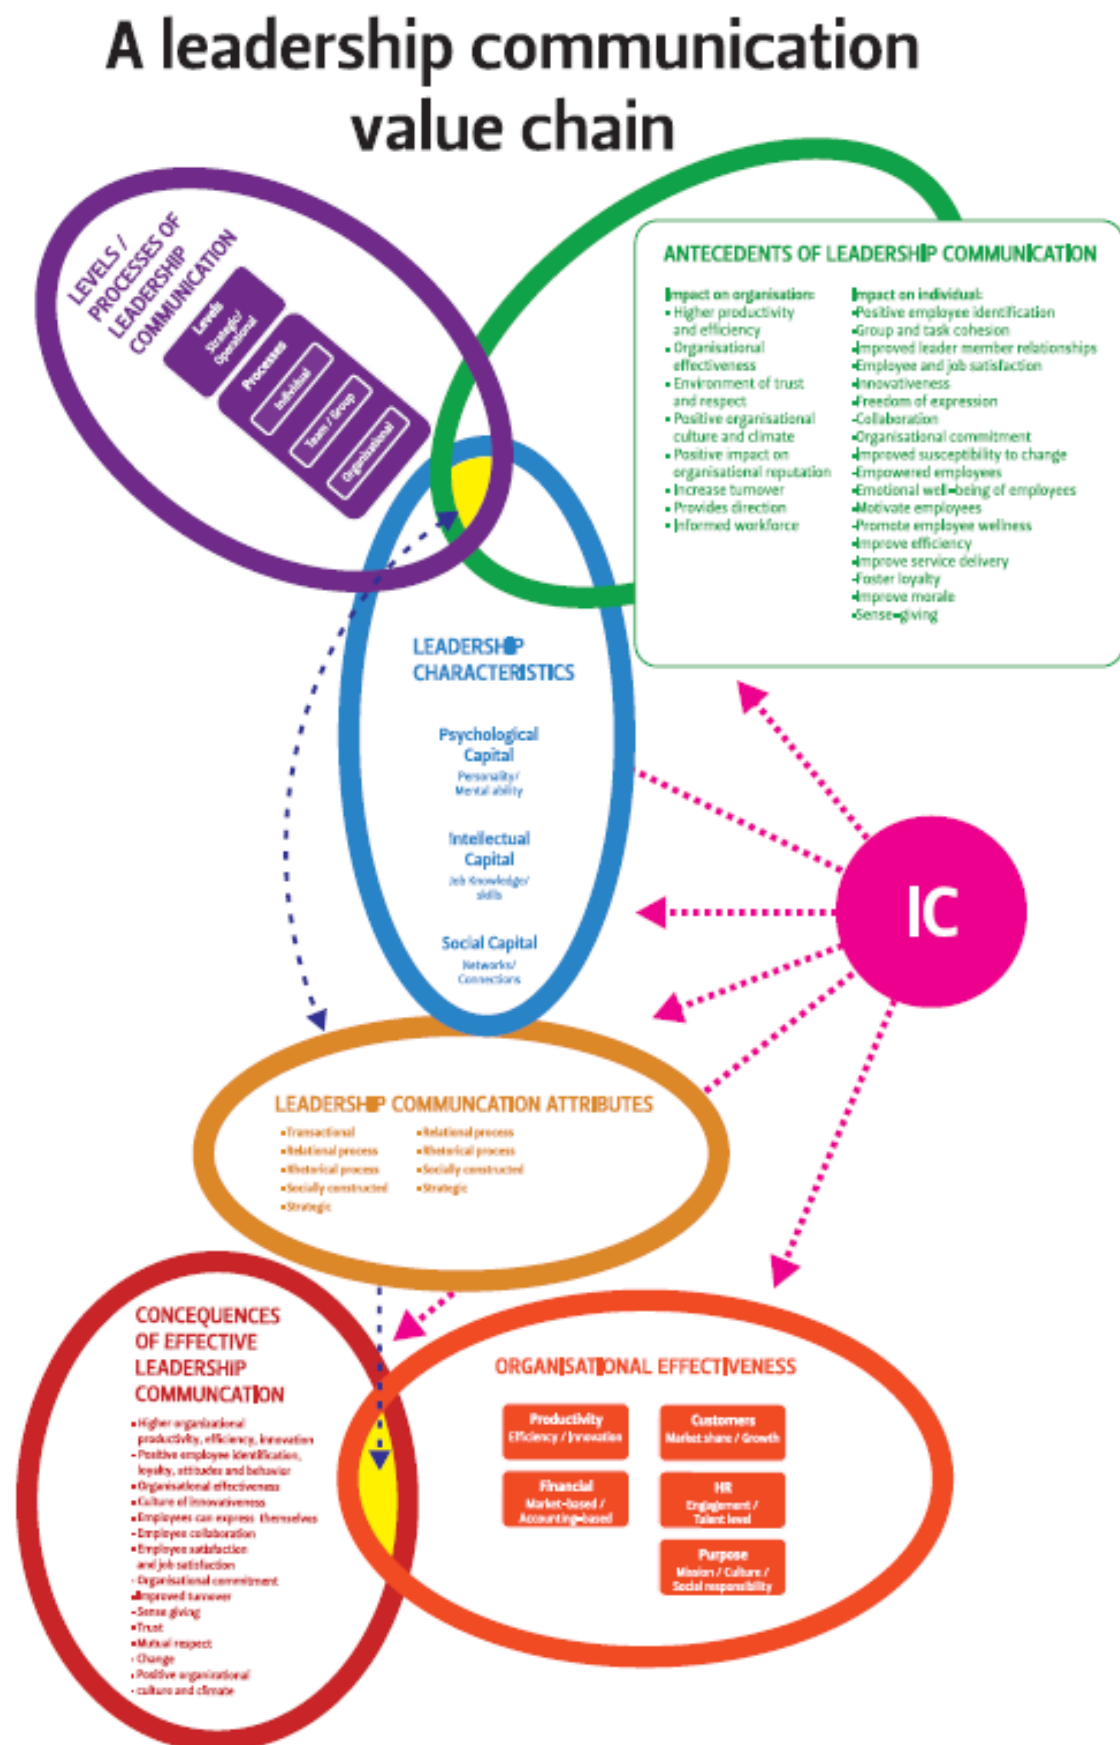

Aspects that were not established during the concept analysis, but surfaced in the data, were added to the conclusions made. In connection with the influence of effective leadership communication on the organisation it was added that effective communication from leaders *provided employees with direction*, and assisted in having a more *informed workforce*. All of the abovementioned aspects ultimately contribute to the emotional well-being of employees.

PRACTICAL MANAGERIAL IMPLICATIONS AND RECOMMENDATIONS

Research by KETCHUM done since 2013 up to 2016 has shown that CEOs and organizational top management constantly rate communication as one of the top three skills that a leader should possess. It is therefore clear that there is a greater awareness of the importance of leadership communication. Unfortunately, it is still not receiving the attention that it warrants. The omission of communication in a measuring instrument such as the LVC is proof thereof. Leaders should use all available resources to add value to their organizations to survive in the harsh and evolving conditions. The LVC was developed with the intention of assisting leaders in this daunting task. In the ensuing section the LCVC model (see figure 2) is presented in reaction to the final research question, namely:

How should leadership communication be applied to be more effective?

Figure 2: A leadership communication value chain model

The significance of having an IC strategy in place has never been as important as in the current organizational environment where survival has become a constant struggle. An IC approach to communication enhances strategic consistency, and is focused on portraying a unified and consistent message to all organizational stakeholders. The value of IC lies in the competitive advantage that it can assist the organization to obtain (Niemann & Grobler 2007). As IC is an organization wide endeavor, it is important that leaders have a thorough understanding of the concept of IC, and what it entails as this will enable them to underwrite and support the strategic implementation thereof. As stated above, an IC approach can assist in adding value to the organizational bottom-line by providing a competitive advantage. It is therefore suggested that leadership communication should be applied within an SIC context. A leadership communication value chain model is suggested to enhance the effectiveness of a leader's communication (Figure 2). Each of the different domains are depicted in the circles of the model.

Domain 1: Leadership characteristics

A leader's characteristics are the distinguishing features that make him/her unique and that influences how he/she leads. Kaiser and Overfield (2010) divided the leader characteristics into three types of capital, namely psychological, intellectual and social capital. The first domain of the proposed model refers to these three variables. Communication can and does play an important role in all three types of capital. Interpersonal communication skills, as well as communication competence, are essential aspects required to enhance leadership characteristics.

Domain 2: Leadership communication attributes

As with the first domain, this second domain is specifically focused on the leader as individual. The attributes of leadership communication, as were discovered through the concept analysis, supply the characteristics of the phenomenon. In order for a leader to communicate effectively in any context, a number of guidelines are presented to improve leadership communication. These entail that leadership communication should be:

- Communicative, where communication is deemed central to leadership, defines leadership and is constitutive of leadership
- Meaning-centred, in order to frame the situation and provide employees with a "map" or direction for action
- Dialogical, to establish relationships through high quality contact between leaders and followers that are open, creative and meaningful, and can lead to ethical organisational learning and change

- Discursive, to allow for the co-construction of meaning through talk and through social interaction processes that allows leaders and followers to work together in meaningful ways to reach desired outcomes
- Dyadic, to ensure the formation of unique one-on-one relationships between a leader and each of his followers through interpersonal exchanges
- Interactional, as this assists in structuring organizational reality and influence leadership perceptions among employees
- Interpersonal, to establish relationships and to enable parties to converse and negotiate definitions for their relationships as they share the roles of sender and receiver and become connected through mutual meaning creation
- Transactional, to ensure an ongoing and changing process in which sender and receiver roles are interchangeable and senders and receivers are able to influence each other's interaction
- Relational, as leadership is co-constructed in a social interaction process and is neither leader, nor follower-centric
- Rhetorical, where humans as symbol-using creatures, use language to make sense of reality, while providing techniques to build connections with other human beings
- Socially constructed, as meaning is created through dialogue among groups of people in a particular context
- Strategic, to ensure the shaping of meaning, building of trust, creation of reputation, and management of symbolic relationships with internal and external stakeholders through the communication of strategic decisions and the creation and communication of a vision of the future;
- Sense-making, as a process that is discursive and can assist in generating a point of reference against which a feeling of organization and direction can emerge
- Communication competence, as leadership is enacted through communication, and only when the necessary knowledge and skills are present can this process be executed successfully
- Authentic, being open, accurate and transparent
- Proficient providing continuous, frequent, and timely messages

Domain 3: Antecedents of leadership communication

Concept antecedents are events, conditions, or precursors that are evident prior to the occurrence of a concept, in other words antecedents are the aspects that need to be in place in order for leadership communication to be successful and add value to the organisation. Domain three focuses on the organisational context and conditions required for leadership communication to be more successful.

Based on the antecedents of leadership communication, guidelines to enhance such a context entail the creation of:

- A culture of ethical and caring behaviour where others are treated with dignity and respect preside.
- An environment that supports respectful engagement where interaction conveys a sense of value and worth to those being communicated with.
- Enabling conditions where processes, structure, social interaction and organizational wide relationships are of the essence.
- Alignment between the goals of the individual and the higher level objectives of the organisation
- Sustainable engagement that receives continuous attention
- An awareness of the context and sensitivity to the context in which leadership communication is taking place
- The most relevant leadership communication style
- A cultural sensitivity where cultural barriers and differences receive attention
- Network relationships which are important as leaders are positioned in networks in different ways
- A nurturing organisational culture where employees feel safe and protected.
- Sensitivity towards the importance of emotional intelligence being part of the leader's make-up.

Domain 4: Levels and Processes of leadership communication

The purpose of this domain is to highlight the importance of recognising the different levels and processes in which leadership communication take shape. Leadership communication is performed at the strategic and operational levels of an organization. The strategic level generally refers to *what* should be done and is concerned with the integration of interactions in an organisation. The operational level is focused on *how this should be done*, and underlines the characteristics necessary for individuals to work together in a cohesive and meaningful way. The processes relevant to leadership communication are socially constructed and bound by systems characteristics. The complex systems perspective is incorporated in this domain and involves individual, team/group, and organizational processes. This domain reflects the complex and multi-dimensional nature of leadership communication.

Domain 5: Consequences of effective leadership communication

Domain 5 provides an overview of the probable consequences of effective leadership communication. The impending results of effective leadership communication (on the individual as well as organizational level) are indicated in the proposed model.

Domain 6: Organisational effectiveness

The ultimate aim of this study was to incorporate communication into the leadership value chain model to enhance organizational effectiveness and add value to the organizational bottom-line. Most research on how strategic leaders affect organizational performance is based on a financial perspective rather than value creation in multiple spheres. Focusing on the Triple Bottom Line (TBL) has become essential for business success. The final domain reflects five organizational spheres where the impact of effective leadership communication becomes visible and can be experienced. The five spheres include productivity, financial, customers, human resources and purpose. These spheres are aligned with the elements of the TBL as the financial sphere in the model represents the financial aspect of the TBL which signifies profit; the stakeholder sphere is embodied by the people aspect; and the purpose sphere denotes the planet component. Domains 5 and 6 focus on the consequences of effective leadership communication and the way in which it can enhance organizational effectiveness.

CONCLUSIONS

All of a leader's actions communicate meaning to subordinates, indicating the symbiotic relationship between communication and leadership. This paper adds to the body of knowledge defining the concept, and clarify the important elements of leadership communication. The proposed model serves as framework to enhance or add value to organizational effectiveness. Further research that focus on the practical application of this model as training and/or measuring instrument is suggested.

²Queensland University of Technology, QUT Business School, Australia

ABSTRACT

Even though management education has a long tradition, it has received an immense amount of attention from both scholars and practitioners in the last few decades. Most research efforts have aimed at improving classroom education processes, programs and outcomes. Only a limited amount of research has focused on extracurricular activities such as mentoring top talented students for international business case competitions. This paper aims to examine the knowledge flow between mentors and strategic management undergraduates while they prepare for international business case competitions. This flow provides the opportunity for the development of phronetic skills, knowledge and leadership potential of undergraduates. To understand the flow, 55 mentors worldwide were examined to provide evidence of their mentoring practices, perceived development of undergraduates and reverse learning of the business schools' top talents. Our results indicate that extracurricular mentoring of business case competitors strongly affects their development and creates recursive effects on the development of mentoring activities.

Keywords: mentoring; reverse mentoring; competition; case method (teaching technique); college students

INTRODUCTION

'Homines dum docent discunt' – Latin for: 'People learn while they teach'

-Seneca (Epistulae morales ad Lucilium, Letter 7, section 8)

Strategic management and leadership education has been a focal point of recent scholarly and practical research (Wright, Paroutis and Blettner 2013; Bower 2008; Doh 2003). Recently important questions have been raised on the effectiveness of strategic management educational processes (Starkey, Hatchuel and Tempest 2004; Mintzberg and Gosling 2002), needs for more practically applicable strategic tools and techniques (Greiner, Bhambri and Cummings 2003; Ghoshal 2005), and further use of these tools and concepts in the workplace (Jarzabkowski, Gulletti, Oliveira and Amoo

2013). The example from Singapore showed that an innovative way of teaching to students can affect the development of regional innovative systems in higher education institutions (Lombardi et al. 2017).

Even though case study analysis method has not always been constantly growing over the last century (Bridgman, Cummings and McLaughlin 2016), it still seems to be the most advocated approach in strategic management education (Garvin 2003; Raelin 2009). Academics posit that case studies provide authentic, active and pragmatic applications of theory to school practices (Sudzina 1997). The focus of this study is on the specific use of case method in undergraduate business case competitions. The rationale for analyzing the case study method in this niche context is the promotion of awareness and use of evidence-based management concepts (Gamble and Jelley 2014).

Corner et al. (2006) finds that grounded learning in strategy can be achieved by incorporating business case competitions into the classroom. It is further noted that case competitions play an important role in the future development of managerial skills (Sachau and Naas 2010). Although business schools frequently use business case competitions, only a sparse amount of scholarly and practical research has put an emphasis to this phenomenon.

We aim to fill the gap in the present body of knowledge by examining the process of knowledge transfer from mentors to undergraduates and reverse knowledge flows after undergraduates 'close the academic-practice gap' (Rynes, Bartunek and Draft 2001: 348) at business case competitions.

-Despite the importance of these topics, to the best of our knowledge, a study has never been conducted in this space. For the construct of our model we were inspired by the multistage mentoring process theory (Humbert and Ros 2016), the importance of reverse mentoring as a way of social exchange between generations (Marcinkus Murphy 2012), and the importance of teacher leadership identity development (Sinha and Hanuscin 2017).

In the succeeding sections we build a case for premier global business case competition as a context for our study. We then develop a theoretical background, review works related to mentoring, case contesters' development, and reverse mentoring. Afterwards, we thoroughly elaborate on methodology and present study results. Finally, the discussion will explore the context of our main findings, present theoretical and practical contributions, implications, strengths and limitations of the study. We offer several areas for follow-up research studies.

STUDY CONTEXT

Prior to elaborating on a theoretical model, we will set the context by highlighting the benefits of premier global case competitions. Presently, many business schools use business case competitions for strategic management education as well as other business specific disciplines. Case competitions

originated in the United States and participation was restricted to national schools, but the phenomenon has diverged around the globe in last two decades (Hadler 2011).

As an evolving concept, there is limited evidence on which business case competitions can be truly classified as 'premier' contender. The most comprehensive list of premier global business case competitions currently available, was compiled by the Auckland University (see Appendix 1). The real world cases at these competitions highlight strategic challenges faced by global business leaders. The ranking provided by the Auckland Universities is based on a survey among mentors from competing schools worldwide. Statistics show the number of annually organized premier international case competitions has increased from 13 in 2011 to 22 in 2016.⁶

Although the case format may play an important role in business case competitions (Menna 2010), it only differs slightly between the premier global competitions. Each team is provided with a real-business case(s), which they have not seen before and are sequestered in a room to prepare for a limited timeframe. Each business school selects a team of four students from diverse backgrounds specializing in the fields of marketing, finance, accounting, economics, information technology, engineering or international business (Damnjanovic, Proud and Ruangwanit 2016). The tasks they need to solve are strategy-based, which makes them complex and unstructured by nature (Umble, Umble and Artz 2008). Business case competitions require a deeper level of experiential and integrative exercises for students (Navarro 2008). Each team needs to present their case solutions to a jury panel judged by outside company executives (usually top management or consultants). Participants in all of the varying formats exercise skills and knowledge on a real-world case from an actual organization, with support of corporate representatives who can provide some facts and insights and occasionally limited professional advice.

A jury panel evaluates the solutions presented by competitors as well as a specific question and answer component. The jury evaluation rubrics usually cover the content, presentation skills and the question and answer part.

The undergraduate student teams are mentored prior, during and after the competition. Mentoring is not limited to faculty academics but may include other university staff, graduate students (alumni), peers or management consultants (Zalaquett and Lopez 2006). Mentors are academic or business 'veterans' highly prepared for educative roles at competitions (Stanulis, Little and Wibbens 2012). Mentoring case competitors is a challenging task which encompasses high commitment regarding the selection of team, and development of leadership and technical skills within the team (Dlacic, Damnjanovic and Ribaric 2017)

THEORETICAL BACKGROUND

Mentoring Business Case Competitors

Mentoring has received immense attention from scholars ever since Kram formally introduced the concept into the literature (Kram 1985). Scholars still struggle to find consensus on the definition, main attributes and outcomes of mentoring (Crisp and Cruz 2009). Roberts (2000: 162) generally defines mentoring as “a formalized process whereby a more knowledgeable and experienced person [mentor] actuates a supportive role of overseeing and encouraging reflection and learning within a less experienced and knowledgeable person [protégé or mentee], so as to facilitate that person’s career and personal development”. From an educational point of view, Murray (2001) stresses the purpose of learning and developing more phronetic skills and practice-based competences of a protégé.

Based on our experiences from mentoring business case testers, case competitions are centered on educating undergraduates and developing their integrated strategic approach to solving real-world problems. The logic and the structure of case competitions provide a myriad of learning benefits for students. As advocated by Corner et al. (2006) they include creating a real-world experience, optimizing learning transfer, integrating theory and practice, and shifting learning responsibility to the students. Additional values of global competitions include: familiarizing participants with multi-cultural environments (Köhler et al. 2013), memorable experiences, peer bonding, social capital development, and exposure to job opportunities (Gamble and Jelley 2014).

Nonetheless, joining the premier league of global business case competitions requires high outcomes and the ‘competition part’ in business case competitions certainly plays an important role. In order to achieve high scores and rankings, business school teams [mentors and competitors] need to gain and maintain their strategic educational competitive advantages. Winning at global case competitions requires the creation of dynamic capabilities – connecting multidisciplinary knowledge and specific, and difficult to imitate skills created within business schools.

Styles and Outcomes of Mentoring Business Case Competitors

Mentoring has been examined from the different developmental stages of a protégé. Eby et al. (2008) explains the difference in youth, academic, and workplace mentoring. From this point of view, business case competitors are a transitional cohort, sliding from study to the career-entering phase. On one side, the style and operating mode of mentoring business case testers is academic by nature (Van Dyne 1996; Ortiz-Walters and Gilson 2005). On the other side, at the transitional phase from the early adulthood to workplace entrance, a protégé is focused on building a stable professional identity (Levinson et al. 1978). Accordingly, the aim of business case mentoring shows great similarity to workplace mentoring, as it aims to enhance personal and career development (Kram 1985), rather than psychosocial support (Waldeck et al. 1997). Huwe and Johnson (2003) report that students who

establish strong mentoring relationships with their academic advisors and experience enhanced personal and professional development.

The scholarly voices are unequivocal about the possible outcomes of the mentoring process. Mentoring has been viewed as a mechanism for knowledge transfer (Fleig-Palmer and Schoorman 2011). Cunningham (1995) indicates that mentoring programs at business schools are aimed at professional preparation of students. Therefore, the minimum mentoring outcomes are centered on the advancement of protégés phronetic (industry and labor market-based) knowledge and skills. Accordingly, we hypothesize that:

H1: Case competition mentoring improves mentees' knowledge of theory and practice of management

An important prerequisite for good mentoring practices is the excellence in mentor-mentee communication, particularly at global case competitions. Mentors need to encourage appropriate communication present material in a format appropriate to the role, the task, skills with other team members, and the audience and interpersonal skills - working with others. Exploring the effects of case-based learning on communication skills and learning motivation in mentoring at case competition we should underline that case-based approaches cultivate analytical thinking, increase understanding of core managerial principals, and enhance communication skills and self-motivation for both students and mentors. Reflections from past participants (students) suggest that the competition is a more memorable university experience than are obligatory prerequisites for career qualifications. (Ali, Grund and Koplan 2011). Case study competitions improve teamwork, critical thinking and communication skills, which are the skills that employers want from their new employees (Burke, Carter and Hughey 2013). Mentors participation in case study competitions can enhance their communication skills, making students more suited to negotiate an increasingly competitive work environment and job opportunity. The concept of "leadership communication," an approach to business communication is create to help senior managers be better leaders in the organizational context (Barett 2006). Therefore, we hypothesize that:

H2: Good case study mentoring improves mentees' communication skills

Nevertheless, these are not the only outcomes that mentoring provides to business students. Even early studies in mentoring report on psychosocial benefits, such as leadership development. Dziczkowski (2013) states that "many of the world's finest and most successful leaders have trusted mentors". Also, Lester et al. (2011) conducted an investigation in the United States Military Academy and reported positive mentoring impact on leadership efficacy development. This study provided a good analogical context for our study. As the roots of strategic management are in a military strategy, military education could be helpful in strategic management education as well. Following the aforementioned, we hypothesize that:

H3: Good case study mentoring improves mentees' leadership potential.

According to research from Qatar (Al-Sada, Al-Esmael and Faisal, 2017) better understanding of organizational culture and leadership styles influence on better satisfaction, commitment and motivation.

Developmental Relationships and Reverse Mentoring

In the last decade, mentoring scholars and professionals have been focused on a specific inverted type of mentoring – learning from current or former protégés. This type of mentoring is called 'reverse mentoring' as it reverses traditional roles in mentoring (Cotugna and Vickery 1998). The emphasis in reverse mentoring alters from the unilateral transfer of knowledge from the expert to the less experienced to the reciprocal intergenerational learning (Tempest 2003). Reverse mentoring may exhibit some overlaps with traditional mentoring. However, it has some distinct features including the unequal status, knowledge sharing styles, emphasis on professional and leadership skills and commitment to the shared goal of support and mutual learning (Marcinkus Murphy 2012).

Humbert and Rose (2016) theorized that reverse mentoring is the final phase of the initiation-cultivation-separation-redefinition mentoring process. The main features of this phase are reciprocal information sharing, personal and professional feedback, confirmation and emotional support (Kram 1985). Naturally, only some, but not all mentoring relationships will eventuate to a peer-based relationship (Kram 1983). Kennecke, Hauser and Weisweiler (2016) find transformational leadership to have an important mediating effect on reverse mentoring.

Once new knowledge is created among business case competitors it is likely to outflow vertically, similar to the knowledge flows in organizational subunits (Schulz 2001). Reverse mentoring is a forward-thinking organizational tool for cross-generational learning (Harrison 2017). From a theoretical perspective, at this phase a specific form of social exchange of knowledge emerges. Mentoring may explain how knowledge is transferred in the organization, but it takes reverse mentoring to explain how the organization [business school] learns (Lankau and Scandura 2002).

Reverse mentoring elevates the knowledge by leveraging the expertise of both mentors and protégés (Chaudhuri and Ghosh 2012) and inspires the knowledge circulation between the generations (Gerpott et al. 2016). Until now, only a few research studies have tackled the relationship between reverse mentoring and mentoring activities. For instance, Chen (2013: 205) finds reverse mentoring to have positive effects on mentoring and learning outcomes.

Based on the previous literature body and our own set of assumptions we have verbalised additional set of hypotheses that are scrutinised in this study:

H4: Good case study mentoring results in good reverse mentoring.

H₅: The higher the level of mentees' knowledge of management theory and practice the stronger the reverse mentoring they provide.

H₆: The higher the level of mentees' communication skills the stronger the reverse mentoring they provide.

H₇: The higher the leadership potential of the mentees, the better reverse mentoring they provide.

METHODOLOGY

Research Instrument

We based our study on primary data and employed a questionnaire as a research tool. The questionnaire had five sections: demographics of examinees, mentoring activities, leadership potentials and development, knowledge and skills development, and reverse mentoring activities. To ensure the construct validity relevant constructs from other studies were adapted. Some items were slightly modified to best fit the context of strategic management education of business case competitors. All the items were measured on a Likert-type scale (responds were coded from 1 – strongly disagree, to 7 – strongly agree).

Mentoring activities encompassed seven inquires based principles for good practice in undergraduate education developed by Chickering and Gamson (1987). These principles entail: encouraging contact between students and faculty, developing reciprocity and cooperation among students, encouraging active learning, giving prompt feedback, emphasizing time on task, communicating high expectations, and respecting diverse talents and ways of learning.

Leadership potential and development was developed following Higgs and Aitken (2003) and Greenhalgh (2007). The main dimensions of students' leadership development were: strategic leadership, leading capability building, leading political/stakeholder interface, leading change, intellectual leadership, leading culture awareness, building relationships and reputation, and building personal learning.

Knowledge and skills development was developed as a combination of two constructs. The knowledge development measures originated from the learning objectives of the case study assessment given in Jerrard (2005: 31). The skills development part follows the study of Melling and Gurjee (2013). A 13-item list is given in Appendix 2.

Reverse mentoring items were reworded from the Marcinkus Murphy (2012) study. These items include: knowledge sharing, coaching, exposure and visibility, skill development, challenging ideas, networking, support and feedback, acceptance and confirmation, friendship, and affirmative encouragement.

The questionnaire was pretested by 8 faculty members to ensure question readability. Accordingly, we slightly modified and refined the questions resulting in the final questionnaire used for data collection.

Data Collection and Sampling Procedure

The question was distributed to mentors in an e-form via email. As the total population of case competition mentors is unknown (to the best of our knowledge there is no global database of case competitors' mentors), we based the study on a "snowball" sampling technique (Biernacki and Waldorf 1981). This sampling relies on peer-to-peer recruitment of study participants and formation of a referral chain (Bodin et al. 2016). Although it can be a subject of various biases (see Avrachenkov, Neglia and Tuholukova 2016), the referral chain was actively controlled – particularly its initiation, progress and termination. Using the coded questionnaires, the number of referrals was controlled to limit the clustering within countries. The final distribution of answers per country is displayed in Table 1.

Table 1 Distribution of examinees per global regions and countries

Region	Frequency	Percent	Countries
Asia-Pacific	12	22%	Singapore, Thailand (4), Hong Kong (3), Japan (1)
Australia & Oceania	8	15%	Australia (5), New Zealand (3)
Europe & Middle East	18	33%	Serbia (6), Denmark (3), Norway (2), The Netherlands, Spain, Portugal, Switzerland, Ireland, Hungary, Lebanon (1)
North America	17	31%	Canada (9), USA (8)
Total	55	100%	

The main field of expertise of examined case competitor mentors, was Management and Strategy (30.9%), followed by Finance and Accounting (21.8%), and Marketing and Communication (18.2%). Mentors had on average 7 years of experience in coaching case competitors (SD=5.85).

RESULTS

Overall Model

The model was constructed and analysed using the SmartPLS 3 (Ringle, Wende and Becker, 2015) that supports partial least structural equation modelling (PLS-SEM). Partial Least Squares approach has already been widely used in strategic management (Hulland, 1999) and knowledge transfer literature (Ko, Kirsch and King 2005). "The PLS-SEM algorithm estimates the path coefficients and other model parameters in a way that maximises the explained variance of the dependent constructs" (Hair et al. 2017: 82). PLS-SEM is particularly useful: (a) when working with extremely small samples such as one

in this study ($n=55$); (b) when model includes formative constructs, and (c) when the main purpose is exploration. Our sample size of 55 observations is sufficient under the 10 times rule. Given that the maximum number of arrows pointing at a single dependent construct in this study is four, we need at least 40 observations to achieve a successful path model estimation. This requirement was successfully met. The idea of the model shown in Figure 1 is to identify and explore a number factors that have a potential to explain substantial portion of variance of reverse mentoring as a focal phenomenon of interest.

Figure 1 Structural model of reverse mentoring

Table of constructs, construct definitions, items, and item labelling is provided in Table 2. All items were observed on 1-7 Likert scales.

Table 2 Table of constructs, construct definitions, construct types, items, and item/variable names

Constructs	Construct definition	Construct type	Items (given on a 1 to 7 Likert scale)	Variable name
Mentoring	Extracurricular activities of leading and coaching business case competitors.	Reflective	Developing reciprocity and cooperation among students	Cooperation
			Encouraging active learning	Active learning
			Giving prompt feedback	Feedback
			Respecting diverse talents and ways of knowing	Talent development
Practical strategic management knowledge	Phronetic (industry and labor market-based) knowledge of undergraduates.	Reflective	Systematic industrial and labor related thinking	Systematic knowledge
			Analyzing the complex industrial and labor relations environment	Phronetic analysis
			Demonstrating an understanding of theory covered in the subject	Theoretical knowledge
			Improving Learning and Performance	Learning & performance
Communication skills	Soft skills which make undergraduates more suited for presentations and negotiations.	Reflective	Demonstrating appropriate communication skills with other team members	Peer-to-peer
			Present material in a format appropriate to the role, the task, the audience	Presentation
			Interpersonal skills -Working with others (Team building)	Interpersonal
Leadership potential	Development of leadership efficacy of business case competitors.	Reflective	Development of teamwork skills	Teamwork
			Development of time management skills	Time management
			Development of presentation skills	Presentation skills
			Development of leadership skills	Leadership
Reverse mentoring	Reciprocal intergenerational learning to and from talented undergraduates.	Formative	Challenging ideas	Challenge
			Support and feedback	Support

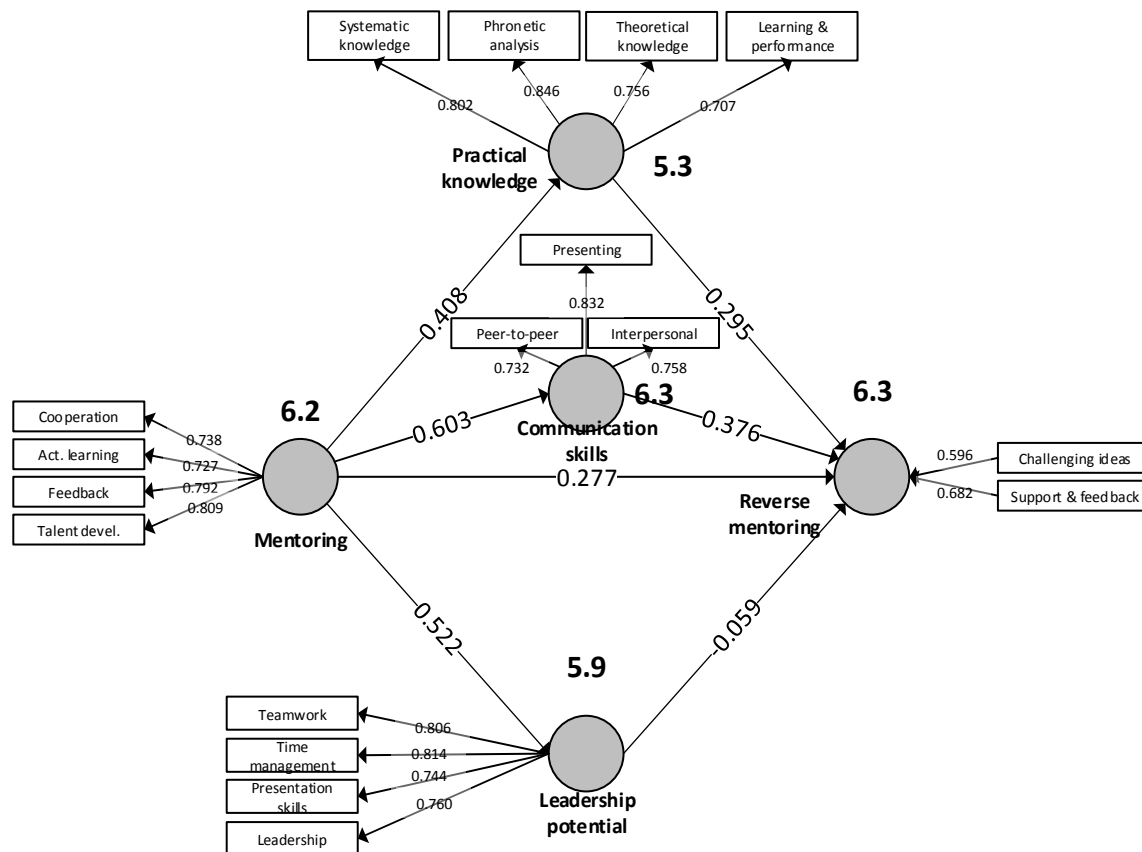

Figure 2 Model of reverse mentoring with path weights

Assessment of Reflective Measurement Models

The initial step to the assessment of reflective measurement models is the analysis of convergent validity and internal consistency. The four multiitem scales used in this model were found to have sound psychometric properties. Namely, all the reflective indicators had loadings above .70 and were significant at the .01 significance level. Each reflective indicator scored higher than .50 on the indicator reliability test, which implied that the underlying latent variables explained more than half of their observed reflective indicators' variance, while the smaller portion of the variance remained unexplained. The only exception is Learning & performance that scored borderline value of .499 on indicator reliability. This indicator was kept as its removal did not scale consistency reliability of Practical strategic management knowledge as a construct. Furthermore, all scales scored well above .50 for average variance extracted (AVE). According to the results obtained on loadings, indicator reliability and AVE, the scales and their reflective indicators have demonstrated convergent validity. Both composite reliability (CR) and Cronbach's α were significantly above the threshold value of .60 confirming excellent internal consistency of scales. According to our tests, all reflective measurements were well constructed (see Table 3) and well conceptualised.

Table 3 Convergent validity and internal consistency scale assessment

		Convergent validity			Internal consistency reliability		Discriminant validity
		Loadings	Indicator reliability	AVE	Composite reliability	Cronbach's Alpha	
Latent variable	Indicator	>0.70	>0.50	>0.50	0.6-0.9	0.6-0.9	HTMT confidence interval does not include 1
Communication skills	Peer-to-peer	0.732	0.535	0.601	0.818	0.668	Yes
	Presentation	0.832	0.693				
	interpersonal	0.758	0.575				
Practical strategic management knowledge	Systematic knowledge	0.820	0.673	0.615	0.864	0.790	Yes
	Phonetic analysis	0.846	0.715				
	Theoretical knowledge	0.756	0.572				
	Learning & performance	0.707	0.499				
Leadership potential	Teamwork	0.806	0.649	0.611	0.862	0.792	Yes
	Time management	0.814	0.662				
	Presentation skills	0.744	0.554				
	Leadership	0.760	0.578				
Mentoring	Cooperation	0.738	0.545	0.589	0.851	0.769	Yes
	Active learning	0.727	0.529				
	Feedback	0.792	0.627				
	Talent development	0.809	0.655				

The traditional methodological complement to convergent validity is discriminant validity (Hulland 1999). The results for discriminant validity testing is given in Appendix 3.

After assessing convergent validity, internal consistency and discriminant validity, we assessed formative measurement model. To assess the quality of one formative construct we had (Reverse mentoring) we have performed assessment for collinearity issues and the assessment of the significance and relevance of the formative indicators. When it comes to the items assigned to Reverse mentoring there were no collinearity issues identified as variance inflation factor (VIF) was well below the threshold value of 5 (see table 4). Tolerance on the other hand was well above 0.20.

Table 4 Assessment of Reverse mentoring's items collinearity

Items	TOL	VIF
Challenging ideas	0.978	1.022
Support and feedback	0.978	1.022

When it comes to Reverse mentoring's items significance and relevance, as shown in table 5 all the weight was significant at .01 significance level, while 95% confidence interval did not contain 0. Based on the findings in Tables 4 and 5 we have concluded that formative construct Reverse mentoring was well constructed and has good statistical properties.

Table 5 Assessment of Reverse mentoring's items significance and relevance

Items	Wight	t statistic	p value	95% conf.	Interval	Significance
Challenging ideas	0.595	3.035	0.003	0.238	0.982	0.010
Support and feedback	0.682	3.771	0.000	0.186	0.910	0.010

Given that our measurements were well defined we proceed to path model assessment.

Path Model Assessment

We firstly assessed structural model for collinearity issues. For this step, we used the latent score estimates. When assessing the structural model for collinearity issues it was necessary to observe groups of exogenous latent variables that explain/predict particular endogenous latent variable. The results provided in Figure 4 shows that there were no collinearity issues in the path model, given that for all predictors TOL was well above .20 and VIF was well below 5.

Table 6 Collinearity diagnostic for the exogenous latent variables

Endogenous	Exogenous	TOL	VIF
Reverse mentoring	Communication skills	0.610	1.639
	Practical strategic management knowledge	0.712	1.404
	Leadership potential	0.629	1.590
	Mentoring	0.591	1.692

After testing for collinearity issues, we assessed the significance and relevance of the structural model relationships. The bootstrapping procedure showed that 7 out of 8 inner path weights were significant (see Figure 3 and Appendix 4). However, the Leadership potential → Reverse mentoring path coefficient had a small and insignificant weight which was unexpected. The reasons why this might have happened will be discussed in the following section.

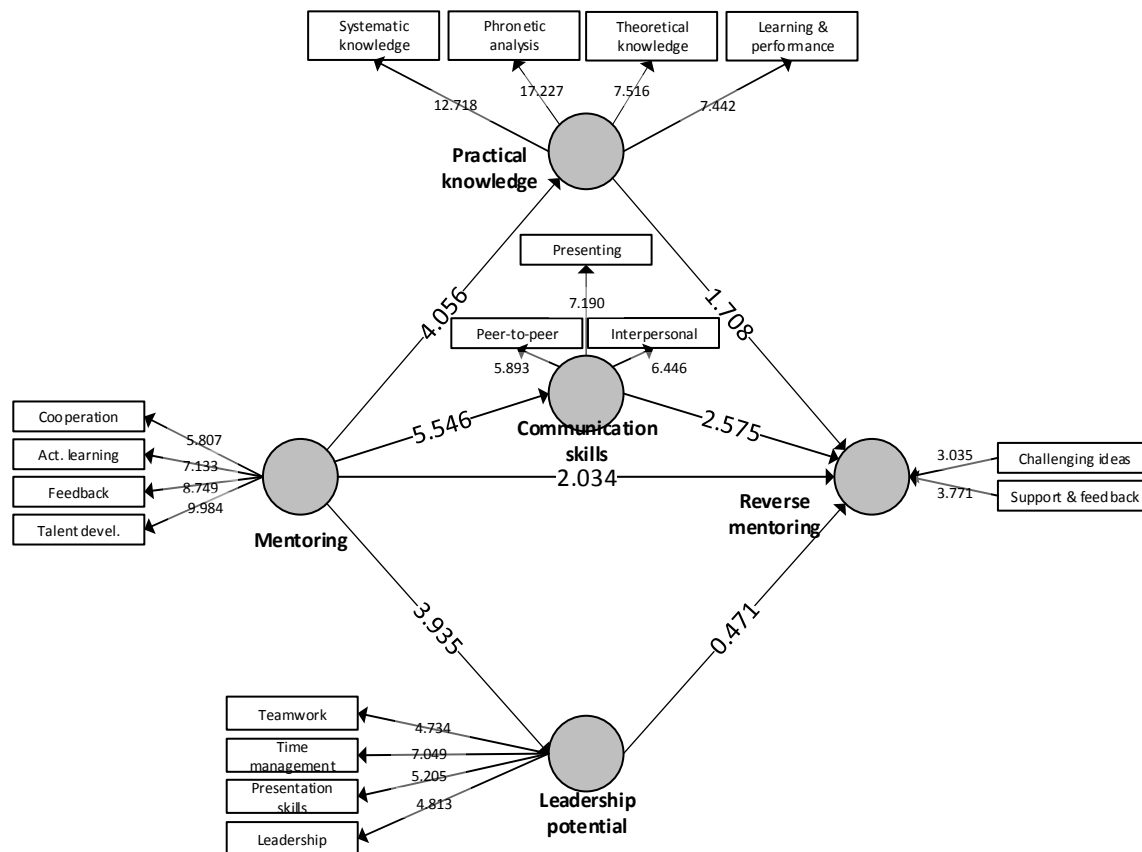

Figure 3 T values for the path weights

Then, we assessed the level of R^2 . In total, there were four endogenous latent constructs. Of particular interest for prediction and explanation by the model was Reverse mentoring. In the case of Reverse mentoring, the model explained 53% of its variance which is according to the marketing studies using PLS-SEM considered to be a substantial amount of variance explained (Hair et al., 2017). Furthermore, the model explains 36.3%, or more than third of the total variance of Communication skills and 27.2% of Leadership potential. The levels of explained variance in all of the endogenous constructs are very satisfactory given that we had a parsimonious model. However, if this study was considered as a customer behaviour study where models that explains 20% or more of some focal phenomenon is considered to have an excellent predictive and explanatory capability, the R^2 scores for Reverse mentoring, Communication skills and Leadership potential would be deemed more than satisfactory.

Table 7 R^2 of the endogenous latent variables

Endogenous constructs	R^2	R^2 adj.	Determination
Communication skills	0.363	0.351	Moderate
Practical strategic management knowledge	0.166	0.151	Weak
Leadership potential	0.272	0.259	Moderate
Reverse mentoring	0.530	0.496	Substantial

We assessed the effect sizes. Effect sizes (f^2) show the size of the predictive impact of an exogenous latent variable on an endogenous latent variable. When speaking of Reverse mentoring, Communication skills is the most important predictor, followed by Practical strategic management knowledge and Mentoring. Communication skills has a medium predictive impact on Reverse mentoring, while practical strategic management knowledge and Mentoring have a small predictive impact. It was surprising to find out that Leadership potential had no predictive impact. Also, it was very interesting to discover that Mentoring has large predictive impact on Communication skills which points to the fact that mentoring of case study competitors significantly improves their communication skills. As already mentioned, business case competition are an instrument for the development of analytical thinking, and profoundly improves the implementation of core strategic management principles learned in the classroom which supports self-confidence and enhances undergraduates' communication skills.

Table 8 f^2 of the endogenous latent variables in the second-step customer's value creation path model

	f^2	Size
Communication skills -> Reverse mentoring	0.174	Medium
Practical strategic management knowledge -> Reverse mentoring	0.131	Small
Leadership potential -> Reverse mentoring	0.004	No effect
Mentoring -> Communication skills	0.571	Large
Mentoring -> Practical strategic management knowledge	0.199	Medium
Mentoring -> Leadership potential	0.374	Large
Mentoring -> Reverse mentoring	0.092	Small

Finally, we assessed the model's predictive relevance (Q^2). Using blindfolding procedure, model's predictive relevance was estimated. It was found that model has moderate predictive relevance for Reverse mentoring and Communication skills, and small predictive relevance for Practical strategic management knowledge and Leadership potential (Table 10). This is satisfactory given model's parsimony. Improved Q^2 could be achieved by introducing more latent constructs i.e. predictors.

Table 9 Model's predictive relevance

	Q^2	Size
Communication skills S	0.171	Medium
Practical strategic management knowledge	0.087	Small
Leadership potential	0.122	Small
Reverse mentoring	0.228	Medium

DISCUSSION AND CONCLUSION

Key Findings

The aim of our study was to examine the development of business case competitors' (leadership potential and phronetic knowledge and skills) through mentoring activities and a recursive effect of reverse mentoring. By examining 55 mentors from the business schools in 18 different countries that competed at premier global business case competitions, results confirm that mentoring has a high impact on business case competitors. Given all indicators discussed about, the model has good performance given its parsimony.

Table 10 Structural model summary

Hypotheses	Decision
H1: Good case study mentoring improves mentees' knowledge of theory and practice of management	Confirmed at 1% confidence level
H2: Good case study mentoring improves mentees' communication skills	Confirmed at 1% confidence level
H3: Good case study mentoring improves mentees' leadership potential	Confirmed at 1% confidence level
H4: Good case study mentoring results in good reverse mentoring	Confirmed at 1% confidence level
H5: The higher the level of mentees' knowledge of management theory and practice the stronger the reverse mentoring they provide	Confirmed at 10% confidence level
H6: The higher the level of mentees' communication skills the stronger the reverse mentoring they provide	Confirmed at 1% confidence level
H7: The higher the leadership potential of the mentees, the better reverse mentoring they provide	Not confirmed

As shown in Table 11, the results support the thesis that mentoring strongly affects development of phronetic knowledge and skills of case testers. Current body of knowledge on mentoring is marshaled around the idea that mentoring is a carrier of knowledge (Swap et al. 2004) and a catalyst of cognitive, skill-based and affective learning (Hezlett 2005). As indicated by Lankau and Scandura (2002) personal learning is a strong mediator between mentoring function and various organizational consequences. In the context of our study, personal learning tends to stimulate further knowledge flow and create distinctive competencies of business schools. These competences are created within the teams, but then transferred to new testers via reverse mentoring.

The results indicate that mentoring strongly affects the development of case competitors' communication skills. Teaching strategic management generally emphasizes the importance of good communication. Mentors themselves need to be great communicators, and to use their enthusiasm and provide trainings for students to excel their communication skills.

The results also provide the evidence that mentoring has high positive effects on the development of leadership potential of talented strategic management undergraduates competing at premier global business case competitions. Our findings are in line with prior studies examining the effect of

mentoring on developing tomorrow's leaders (Sosik and Lee 2002; Lester et al. 2011). Mentoring is advocated as a powerful tool for developing leadership behaviors (Solansky 2010). It should be noted that mentoring business case contesters requires intensive mentor- protégé relationships. Accordingly, we confirmed that mentoring is a powerful tool for enhancing leadership skills but requires mentors to heavily invest their resources to mentoring activities. Similar findings were reported by Solansky (2010).

Additionally our study shows that some mentoring has its dynamics and may end up with reverse mentoring (Humbert and Rose 2016). The combined effect of leadership and phronetic knowledge and skills development among case competitors significantly affects the development of inverse mentoring. The findings are subject to the context, namely a specific kind of mentoring where protégés are highly talented management students. As talented students are a scarce resource, these kinds of mentoring relationships generally lack 'the Paradox of Equal Inequalities' (Feldman 1999: 253). Reverse mentoring becomes a knowledge transfer mechanism as it evolves to a peer-based relationship (Bryant 2005). The strong support of business schools for business case competitor mentoring provides a fertile soil for the development of knowledge circulation relationships. This support is an important institutional glimpse of hope for the full development of supportive and recursive mentoring (Eby, Lockwood and Butts 2006). Ending up with a peer-type mentoring is not a finding to be generalized to all mentoring activities and processes.

The only hypothesis (path) not confirmed by the study results is that leadership development will affect reverse mentoring. We can only speculate on the reasons. It might be that once the students enter premier global case competitions they become slightly narcissist. Maccoby (2000) argues that narcissist leaders have a distaste for mentoring as they lack of empathy and seek for extreme independence. Additional speculation is that business case competitions develop transformational rather than transactional leadership styles (Vera and Crossan, 2004). Further knowledge flux and learning require transactional modes of leadership.

Contributions and Implications

Our study makes three important theoretical contributions to strategic management education. First, we emphasized a specific niche of strategic management education – learning through competing at global business case competitions. We delineated the generic competition process, and raised awareness of an emerging method for strategic management education. As a developing method of strategic management education it brings new peculiarities to the education process. However, preparing teams for these competitions requires immense efforts and resources of business schools and significant extracurricular mentoring activity. Second, we clarify the knowledge flux between mentors and business case contesters' by exploring the causal relationships between mentoring,

undergraduates' development and reverse mentoring. More importantly, we stress relevant and practically applicable strategy education (Rynes, Bartunek and Daft 2001; Jarzabkowski and Paul Spee 2009). Third, our study contributes to the dynamic capabilities theory. Business schools cannot create distinct competencies in classrooms as the knowledge is public. However, small teams of business case contesters working in a multicultural environments tend to create unique and hard-to-mimic knowledge (Hajro, Gibson and Pudelko 2015). Further on we will highlight the theoretical and practical implications in these fields.

Emphasis on global business case competitions and contesters' development. Business schools that compete at case competitions usually apply case studies in various courses: finance, strategy, marketing which helps students to develop problem solving skills and be familiar with using the case methods. Working with students in the classroom is not sufficient to prepare a team for a case competition. Some business schools that were investigated in our study have a course dedicated to case studies at their university. Other mentors work with students' through additional extra-curricular activities. Another important practice is that some mentors who prepare students for competition usually invite consultants to help them to stimulate students to overcome lack of knowledge when it comes to assumptions and educated guessing through solving case studies in strategic management (examplifying leading consulting houses such as McKinsey, BCG, PwC, KPMG, EY, Bain) (Ammerman 2012). For example, the use of the strategic problem-solving model of McKinsey explains the role of business need (strategic problem of client company), analyzing and presenting data, developing strategic implementation as a solution and align with leadership - vision of client company (Rasiel and Friga 2001). Case studies also provide business schools an avenue to improve collaboration between academic work and practice.

Knowledge flux at business case competitions and relevant strategic management education. Mentoring is a useful tool in specific forms of strategic management education. Still, knowledge generation is a two-way relationship and simultaneously affect both mentors and protégés (Ragins and Verbos 2007). The main practical implications of our study are related to knowledge and skills improvement of both mentors and undergraduates. Although not explicitly investigated, undergraduates at case competitions interact with professionals from the practice, and network and friend up with their peers from different cultures. This also creates a body of phronetic skills and develops leadership potentials. This knowledge flux ultimately leads to business school learning and improves the reputation of business schools internationally.

Learning from others mentor on an international level is crucial for the business school as it improves practical knowledge of strategic management analysis, decision, implementation and control. Experiences at case competitions show that business schools have different perspectives regarding

structure, strategic analysis, choosing key criteria for strategic decision making and implementation plans of strategic recommendations and developing key performance indicators for measuring results. Mentors and their teams use a combination of theoretical knowledge acquired at university and new knowledge that they receive at competitions from other colleagues. Recently a pertinent example occurred at an international case competition in Porto. The winning team received the opportunity to work on implementing their recommendation in the real world. This is important way of applying international knowledge on other foreign – local market to help organizations to build better strategic direction for the long term (Hedler 2011). This example indicates the practical relevancy of strategy learned at business case competitions.

Creating business schools' competencies and reputation. An important implication of this study is that growth could be attributed not only to mentors and undergraduates, but to business schools as well. Our study supports the thesis that business schools create their distinctiveness by 'exemplary attitudes and dispositions their professors champion and display in encouraging the pursuit of knowledge and the practical efficacy of action' (Chia and Holt 2008: 484). Dedicated mentors and top talent undergraduates need to follow their mission in the process of creating a competitive advantage in the business education environment. Participating in premium global case competitions is an innovative strategic management educational project that will improve a mentor's practical knowledge, skills and leadership development and lead to improved image and reputation of the business school at a global level.

The study also acknowledges that the support from the mentors plays a vital role in the actual development of important competences and managerial skills among students. (Damnjanovic, and Mijatovic, 2017). Mentors becoming more competitive on the job market because of international experience and network that they build and leadership approaches that they adapt at the different case competitions. Global case competitions help educational institution to develop better connection between academia and practice (Burke, Carter and Hughey, 2013) with providing innovative way of teaching using the real business examples.

Strengths, Limitations and Further Recommendations

An important strength of our study is its global overview. Globalization of management education is highly on the agenda of both scholars and practitioners (Doh 2010). Furthermore, studies covering global issues in management education are sparse (see Erez, et al. 2013). More precisely, we reported the findings from 18 countries from four large geographic regions. This feature, nonetheless, drives certain flaws. The cultural differences in mentoring/reverse mentoring activities were not captured by this study. This creates an important avenue for further research. Further studies should concentrate on the specificities of the examined phenomena in different cultural settings. Another study limitation

is the fact the findings only represent the mentor point of view. Future research studies should include the opinion of students as well, providing a clearer image of this relatively new innovative learning method.

Another quality of our study is the focus on a particular strategic management education niche - mentoring of premier global business case competitors. Even though many schools conduct business case competitions, management education literature is rather sparse in this area (Orlitzky and Benjamin 2003). Global business case competitions are almost entirely beyond the scope of the existing scholarly publications. Focusing on a narrow niche elevates the issue of the sample size. The relatively small number of interviewed mentors raises a question of generalizability of our findings. Further studies should examine mentors from other business case competitions in order to improve the validity of findings. It should also be noted that this study is cross-sectional by nature, and was done at a specific point in time. For a more prolific study, a longitudinal analysis would be needed. Only then would the evolutionary characteristics of mentoring, case competitor development and reverse mentoring be captured.

Additional value this study provides is rigor and analytical development of research instruments. Nevertheless, a myriad of different forms of educational activities have been unexamined. Follow up studies should focus on incorporating other educational activities outside the realm of mentoring to provide more comprehensive findings.

APPENDIX 1. THE COMPILED LIST OF PREMIER GLOBAL CASE COMPETITIONS

Table 11 The compiled list of premier international case competitions (<http://www.champions-trophy.co.nz/international-results/>)

Date	Competition	Venue	Teams
Feb 16	Champions Trophy Case Competition	University of Auckland	12
Feb 16	BI International Case Competition	BI Norwegian Business School	12
Feb 16	Heavener International Case Competition	University of Florida	20
Feb 16	John Molson Undergraduate Case Competition	Concordia University	24
Feb 16	CBS Case Competition	Copenhagen Business School	12
Mar 16	McGill Management International Case Competition	McGill University	15
Mar 16	Sauder Summit Global Case Competition	UBC Sauder School of Business	9
Mar 16	Scotiabank International Case Competition	Ivey Business School	12
Mar 16	University of Navarra International Case Competition	University of Navarra	16
Apr 16	International Case Competition@Maastricht	Maastricht University	16
Apr 17	The Global Business Case Competition	University of Washington	12
Apr 18	Belgrade Business International Case Competition	University of Belgrade	16
May 16	Chulalongkorn International Business Case Competition	Chulalongkorn University	12
Jun 16	HSBC/HKU Asia Pacific Business Case Competition 2016	Hong Kong University	30
Aug 16	SDS Queenstown International Case Competition	University of Otago	12
Aug 16	Asian Business Case Competition	Nanyang Business School	9
Sep 16	UOB-NUS Case Competition	National University of Singapore	16
Oct 16	Thammasat Undergraduate Business Challenge	Thammasat University	16
Oct 16	Citi- HKUST International Case Competition	Hong Kong University of Science and Technology	18
Oct 16	Global Business Case Challenge	Ritsumeikan Asia Pacific University	13
Nov 16	Australian Undergraduate Business Case Competition	University of Melbourne	16

APPENDIX 2. THE 13-ITEM LIST OF PHRONETIX KNOWLEDGE AND SKILLS OF BUSINESS CASE CONTESTERS

Items
Critical and strategic thinking
Systematic industrial and labor related thinking
Analyzing the complex industrial and labor relations environment
Demonstrating an understanding of theory covered in the subject
Understanding specific roles in managerial practice
Demonstrating appropriate communication skills with other team members
Present material in a format appropriate to the role, the task, the audience
Improving learning and performance
Information-communication technology (ICT) skills
Leadership skills (Communication)
Interpersonal skills -Working with others (Team building)
Conceptual skills (Problem solving and decision-making)
Functional skills (for example, strategic management)

APPENDIX 3. DISCRIMINANT VALIDITY

Each of the 15 individual reflective items had the highest loading on the scales they were originally assigned to. Furthermore, the results of Fornell-Larcker test demonstrated that all the scales were distinctive, meaning that they indeed measure and represent different latent phenomena (the square root of AVE for each scale was higher than its correlations with other latent constructs in the model – see table below).

Discriminant validity test using Fornell-Larcker criterion					
	1	2	3	4	5
Communication skills	0.775				
Practical strategic management knowledge	0.390	0.754			
Leadership potential	0.510	0.503	0.728		
Mentoring	0.603	0.408	0.522	0.767	
Reverse mentoring	0.628	0.525	0.426	0.593	Formative construct

Additional screening for discriminant validity were performed using HTMT tests (table below). HTMT scores for all pairs of reflective latent constructs were below the threshold of .85 while the 95% confidence interval did not contain number 1. Thus, it was concluded that all of the scales present in the model achieved discriminant validity meaning they observe semantically different constructs.

Heterotrait-Monotrait Ratio (HTMT)						
	HTMT	t value	p values	95% conf.	Interval	Significance
	0.534	4.895	0.000	0.393	0.804	0.01
	0.669	4.528	0.000	0.382	0.953	0.01
	0.609	4.957	0.000	0.426	0.881	0.01
	0.822	6.573	0.000	0.447	0.989	0.01
	0.518	4.663	0.000	0.333	0.770	0.01
	0.646	4.491	0.000	0.354	0.894	0.01

APPENDIX 4. SIGNIFICANCE AND RELEVANCE OF THE STRUCTURAL MODEL RELATIONSHIPS

	Path coefficient	t value	p values	95% conf.	Interval	Significance
Communication skills -> Reverse mentoring	0.376	2.575	0.010	0.062	0.635	0.01
Practical strategic management knowledge -> Reverse mentoring	0.295	1.708	0.088	0.020	0.684	0.10
Leadership potential -> Reverse mentoring	-0.059	0.471	0.638	-0.459	-0.006	No signif.
Mentoring -> Communication skills	0.603	5.546	0.000	0.376	0.796	0.01
Mentoring -> Practical strategic management knowledge	0.408	4.056	0.000	0.227	0.630	0.01
Mentoring -> Leadership potential	0.522	3.935	0.000	0.251	0.759	0.01
Mentoring -> Reverse mentoring	0.593	4.601	0.000	0.303	0.805	0.01

KNOWLEDGE-INTENSIVE ENTREPRENEURSHIP AND BIG DATA: IMPLICATIONS FOR SMART TOURISM DESTINATIONS

Del Vecchio, Pasquale; Mele, Gioconda; Ndou, Valentina; Passiante, Giuseppina; Giustina

Secundo

Department of Engineering for Innovation – Laboratory of Management Engineering, University of Salento, Lecce, Italy

ABSTRACT

The paper aims to contribute at the debate on the Knowledge-intensive Entrepreneurship at the light of the emerging paradigm of Big Data. Focusing on tourism, as knowledge-intensive industry with several implications for the regional growth, the study shows as the huge amount of data available for, from and about tourists can nurture the process of Knowledge-intensive entrepreneurship and sustain the creation of a Smart Tourism Destination. The paper presents the empirical evidences related to Apulia, a Southern European region and destination of growing popularity. By adopting a mixed methodological approach based on action research and business analytics, the study proposes the comparative analysis of digital tourism initiatives related to unconventional tourism experiences to demonstrate how it is possible to create and capture social Big Data produced by stakeholders in a certain destination for supporting knowledge-intensive entrepreneurial processes.

Keywords: Smart Tourism; Smart Destination, Big Data; Knowledge-intensive Entrepreneurship; Business Analytics.

INTRODUCTION

Knowledge-intensive Entrepreneurship and Big Data are two of the most representative paradigms of the so-called knowledge economy and represent emerging fields of investigation for researchers and practitioners. Characterized by turbulence, the continuous changing in the offer and demand of good and services, the emerging of new types of jobs and market's rules, the knowledge economy is, in a neo-schumpeterian perspective, an expression of the key enabling technologies. It is the knowledge-intensive nature of such technologies to determine the profile of the knowledge economy, also defined entrepreneurial economy (Audretsch and Thurik, 2001; Thurik, 2008; Romano, et al., 2014). In this context, the competitiveness of individuals, organizations and territories results to be more and more depending by the capacity to manage the large amount of knowledge continuously created over the world. Big Data identify this large amount of data, but if there is a consolidating set of works

concentrated on the comprehension of the technological dimensions of the phenomenon, its implications in an entrepreneurial perspective is still lacking.

The emergence of Big Data is a common trend for all industries, but it is especially relevant for information intensive ones, such as tourism. In this venue, the recent debate on Smart Tourism has attempted to demonstrate the several areas of implications and challenges that Big Data can offer to the competitiveness of tourism destinations and companies. Characterized by advanced services, high degree of innovation and the presence of open, integrated and shared processes for enhancing the quality of life for both residents and tourists (Shapiro, 2006; Caragliu et al., 2009, Wang and Xiang, 2012, Micera et. al 2013), smart destinations can compete by activating processes of knowledge creation (Shaw and Williams, 2009) as well as by the way the large amount of knowledge is really processed and transformed in competitive assets. All these confirm the growing relevance of data in the successful positioning of tourist companies and destinations as well as the need of sustaining a process of Knowledge-intensive Entrepreneurship able to drive the process of development of Smart Tourist Destinations (Wood, 2002; Vargo et al., 2009).

Framed in the above premises, the paper aims to understand how the exploitation of Big Data can represent a base of opportunities for the creation of Knowledge-intensive Entrepreneurial processes for the growth of a Smart Tourism Destination.

In this vein, the paper presents some empirical evidences coming from a research project aimed to sustain the creation of Knowledge-intensive Entrepreneurship for the smart growth of the Apulia destination. The remaining of the paper is structured as follows: the literature background summarizes the emerging trends in the debate on Knowledge-intensive Entrepreneurship, Big Data and Smart Tourism Destination; the methodology presents the analytical framework adopted to investigate trends related to a set of regional digital local experiences; in the discussions and implications, the evidences resulting from the analysis will be presented together with the aim to identify emerging opportunities for creating Knowledge-intensive Entrepreneurship; conclusions summarize the main evidences and limitations of the study.

LITERATURE BACKGROUND

Knowledge-intensive Entrepreneurship

The issue of Knowledge-intensive Entrepreneurship is nowadays central in the academic and institutional debate. Due at the nature of technologies addressing the creation and execution of an entrepreneurial process, the Knowledge-intensive Entrepreneurship is configurable as the socio-economic process performed by knowledge operators, able to leverage on a consolidated knowledge base, the integration of different expertise and domains (Malerba, 2010). The Knowledge-intensive

Entrepreneurship requires individual capacities, competencies and attitudes to transform new ideas, technologies and inventions in economic and social value, through innovative business models. Embedded into complex and articulated networks of relationships, Knowledge-intensive Entrepreneurship presents risks due to the difficulties to evaluate market potential (business risks), and the reliability of the technology-based offerings (technology risks) (Byers, et al., 2011).

The Knowledge-intensive Entrepreneurship is so identifiable into the process emerging from the mixture of individual talents skills, such as creativity, instinct, courage, capabilities of vision, practical sense, passion for innovation and challenges, passion for experimentation and leadership with technical, managerial and financial assets to satisfy customers' needs (Venkataraman, 2004).

Another element of the Knowledge-intensive nature of the entrepreneurship can be identified into the scientific debate on the relevance of the entrepreneurial learning. As argued by Cope (2005), Minniti and Bygrave (2001), since the centrality of the knowledge is confirmed by the nature of the competitive dynamics and trends in the current scenario, the process of entrepreneurship shows a growing relevance as process of learning, in all the phases of an entrepreneurial process. As such Knowledge-intensive Entrepreneurship depends on individual and organization abilities, intelligence, creativity and tools to elaborate data coming from the internal and external environment, the emerging paradigm of Big Data results to be a field of great opportunities for taking inspiration, grasping insights and knowledge from employees, customers, suppliers as well as to nurturing a continuous innovation process. In the paragraph that follows, an overview of the Big Data is provided with the aim to identify emerging trends and elements of relevance for the creation of Knowledge-intensive Entrepreneurship and the development of Smart Tourism Destinations.

Big Data: overview of a phenomenon of growing complexity

The term Big Data refers to any set of data that, with traditional systems, would require a large amount of time to be analyzed (Laney, 2001; Gandomi and Haider, 2015). They are characterized by the large size of dataset (terabyte and more), the presence of structured and unstructured data, the short life-cycle of contents (Laney, 2001). More power and decreased costs have enabled firms to store ever greater amounts of data and conduct more in-depth analysis on a regular basis, either through their own IT systems or in the cloud (Vance, 2011).

Big Data is dramatically changing into a well consolidated offering of servers and software for knowledge management using new databases forms, new programming languages, new hardware architectures, for processing data, and new generation of distributed processing tools and intelligent software has emerged (Del Vecchio et al., 2014; Erickson and Rothberg, 2015).

According to White (2010), Big Data are now diffusing into all the areas of a company becoming a strategic factor for companies' competitiveness. Jin et al., (2013) argued as Big Data are radically

changing the world, affecting daily life of individuals, companies and public institutions. With the aim to afford the complexity of the technological and managerial dimensions of Big Data, a set of variables arose in the literature such as the 6 Vs: Volume, Velocity, Variety, Veracity, Variability and Value. The first three Vs are more focused on the technological perspective of Big Data (Laney, 2001; McAfee and Brynjolfsson, 2012), while the second three ones are the result of a research more concentrated on the managerial implications, challenges and exploitation actions and strategy aimed to create organizational value (McAfee and Brynjolfsson, 2012), to sustain the innovation of products (Mayer-Schönberger and Cukier, 2013), to make more effective firms' predictive activity (Kaisler, et al., 2013) and to offer opportunities for customization (Brown et al., 2011).

The availability of Big Data has created a new era also for data analysis and elaboration to discover unknown patterns, to find out what customers want, what they evaluate, to get closer to customers, to gain a wealth of information about their behaviors and preferences, as well as to identify new market trends and new opportunities to remain competitive (Ndou and Beqiri 2014).

However, while it is largely recognized the relevance of the paradigm, how to transform all those data in concrete input for the entrepreneurial development is still low considered (Schutt and O'Neil, 2013; Jin et al., 2015). Creative ideas, qualified human capital able to combine technical abilities, managerial skills and industry and technological knowledge are necessary elements to afford the challenges associated to Big Data. This is a trend common to all the industries, but assumes more relevance information intensive ones, such as tourism.

Smart Tourism Destination

In the current scenario, characterized by the large diffusion of the ICTs and by the knowledge as primary asset of the competition of individuals, organizations and regions, tourism arises more and more as a knowledge intensive service industry. This is because tourism, as personal experience resulting from the visit in a certain area, results to be composed by a growing number of services and products with a growing relevance of knowledge. As argued by Buhalis and Law (2008), the issue of the adoption of ICTs in tourism is a well consolidated field of study, however their implications in terms of enabling factors for the emerging nature of tourism as service-based and knowledge intensive industry are still unexplored.

Defined as local tourism system characterized by advanced services, high degree of innovation and the presence of open, integrated and shared processes for enhancing the quality of life for both residents and tourists (Komninos, 2002; Florida, 2003; Shapiro, 2006; Hollands, 2008; Caragliu et al., 2009; Wang and Xiang, 2012; Micera et. al 2013), Smart Tourism Destination is nowadays the object of a deepen analysis aimed to derive models, tools and strategies to sustain the process of intelligent configuration of destinations (Buhalis and Law, 2008; Sigala et al., 2012; Law, et al., 2014; Xiang et al., 2015).

A Smart Tourism Destination is not based simply in technologies and the new approaches to data collection, management and sharing, but it encompasses technology, people and institutions and it is increasingly related to human capital (their creativity, diversity and education) and social capital, which facilitated and supported by ICT infrastructures fuel sustainable growth and enhance the quality of life (Nam and Pardo, 2011). Therefore, the creation of a Smart Tourism Destinations requires the integration of technologies, systems, services, and capabilities into an organic network that is sufficiently multi-sectorial and flexible for future developments, and moreover, open-access (Albino, et al., 2015).

Buhalis and Amaranggana (2014;2015) defined a Smart Tourism Destination as the result of the interconnection of tourism destination and stakeholders' communities through dynamic platforms and knowledge intensive flows of communication and enhanced decision support systems to maximize destination competitiveness and tourist satisfaction.

Neuhofer et al. (2013) focused on the "technology enhanced tourism experiences" as integrative conceptual framework to describe tourism of our days as combination of "experiences, co-creation and technology" (Neuhofer et al., 2013).

With the arise of ICTs and social network platforms tourists have not only the possibility to know and compare their intentions of trips and journeys, but also to share and learn from the other, to acquire suggestions and recommendations for maximizing their time in the destinations, to explore them before to be there and continue to be linked to them also after the vacation. The analysis of Big Data generated by consumer on these social network platform, so called social media analytics (Ducange et al., 2018) represents a new challenge for companies and a new requirement for competition in global market. The debate on the innovative entrepreneurship previously recalled suggests some interesting implications in the field of tourism: to operate as an innovative entrepreneur in the tourism means to provide the right attention at the social and environmental dimension of the socio-economic processes performed, also in a technological perspective.

Focusing on Big Data as enabling perspective and main challenge for a Smart Tourism Destination, the paper assumes the Knowledge-intensive Entrepreneurship as the key process for its effective deployment. Framed in those premises and focusing on Apulia, as Southern European region and destination of growing popularity, the paper provides empirical evidences related to a set of digital local experiences with the aim to identify opportunities and dynamics supporting the emergence of Knowledge-intensive Entrepreneurship.

RESEARCH METHODOLOGY

In order to comprehend how the exploitation of Big Data can represent an opportunity for the creation of Knowledge-intensive Entrepreneurship and sustain the smart growth of a destination, the paper adopts a mixed methodological approach.

An action research method (Myers, 1997) based on the explorative analysis of digital tourism initiatives related to unconventional experiences has been used in order to create and capture the Big Data produced by different tourism actors, and to identify areas of entrepreneurial development. This phase covered a period from April 2015 to February 2016 and has seen the involvement of the research team of Laboratory of Management Engineering at the University of Salento and the larger community of partners associated to the research project titled Puglia@service. The active involvement of researcher in this phase has consisted in: the co-designing of the initiative, the training of storytellers and definition of transmedia communicational strategy, the sharing of social media track, business analytics for monitoring ongoing and the redaction of a final report.

Data collection in this phase was based on the integration of traditional interviews with key informants, the analysis of primary sources (official websites and social profiles, etc) and secondary sources, and business analytics (Chen, et al., 2012). About the in-depth interviews, they have been structured in the following phases: *plan, develop instrument, collect data, analyse data* and *disseminate findings* (Boyce & Neale, 2006). The interviews have been conducted with a flexible approach through a semi-structured schema and following an inductive and iterative process (Miles & Huberman, 1984; Strauss & Corbin, 1990). The interviews have been addressed to at least one responsible of each the digital event observed, identified as key informants (Kumar et al, 1993). Useful to support organizations in the comprehension of their business and social environments and making more effective the decision making process, business analytics is a large family of technologies, methodologies and approaches to analyse Big Data (Chen et al., 2012). Specifically, business analytics has been used in order to collect, monitor, analyze, summarize, and visualize social media data through the use of a Keyhole.com, a free version of a proprietary tool for social tracking and cluster analysis.

The activity of business analytics has required the identification of official pages, accounts and keywords (#) to monitor on the three main social networks (Facebook, Twitter and Instagram). After the setting of the parameters related to the time of observation, the tool operated the data extraction, collection and analysis by providing statistics regarding the socio-demographics, the behaviours manifested by users and followers of the event in terms of timeline, the main topic and the most followed one, types of device used for sharing, and a preliminary form of clustering of issues debated in the form of a tag cloud. After a process of data reduction and synthesis and in accordance to

Eisenhardt (1989), we conducted a final iteration between data collected, both from social analytics and interviews, and the literature on Smart Tourism, Knowledge-intensive Entrepreneurship, and Big Data to identify the theoretical foundations for our arguments.

The context of analysis

The context of analysis, in the whole research, has been identified into the Apulia, a Southern Italian region, and destination of recognized and growing reputation. Due to the presence of a favourable environmental factors, cultural heritage, agro-food industry, infrastructures, Apulia is a region vocated to tourism as argued by Pedrini (1984). About the digital local experience, the sets of study identified are presented in the following table 1:

	Appiedi	MyGargano Experience	365Puglia Days	Carnevale di Putignano 2016
Nature of the experience	Slow tourism, walking and discovering of ancient roots, from Brindisi to Matera (South of Italy) along the old roman "via Appia" in coincidence with the "via Francigena" of South of Italy.	Instagram tour for the valorization of naturalistic, agrifood and cultural heritage of Gargano area (the norther area of Apulia) and for its deseasonalization.	Blogtour for discover the Apulia region (Bari and Valle d'Itria areas) through social and digital marketing tools, in a deseasonal perspective.	Carnival and goliardic experience in one of the most ancient Italian carnivals 622nd edition).
Promoters and Partners	Edeno Association and Brindisi Local Chapter of the Italian Touring Club. GAL-Gargano, IgersItalia and Pugliapromozione, others partners	Gal-Gargano, IgersItalia and Pugliapromozione, others partners	Italica Turismo Spa and Laboratory of Management Engineering at the University of Salento, others partners	Foundation of Putignano' Carnival, Pugliapromozione and Municipality of Putignano, others partners.

Table 1. *Digital Local Experience*

About the socio-economic profile of the region, it is important to note as Apulia is a Southern European region belonging to the area of convergence as characterized by structural delays. In affording to the challenges of the intelligent growth required by the EU within 2020, as stated in the "Smart Specialization Strategy" (McCann and Ortega Argiles, 2011; Foray et al., 2011; EC, 2012), Apulia is called to promote the development of Knowledge-intensive Entrepreneurship by moving from the valorization of key enabling technologies in its vocational industry and by this to increase its socio-economic wellness and achieve the intelligent and sustainable growth (McCann and Ortega Argiles, 2011; Foray et al., 2011).

RESEARCH FINDINGS

The cases can be classified as unconventional events based on the valorisation of the different regional assets. They are commonly characterized by the adoption of social networks as enabling platform of

dialogue with visitors and customers for their feedback exchange, knowledge repository and sources of inspiration for travellers, companies and destination makers. Their analysis and identification has been carried out in the frame of an ongoing research project with the aim to assess the digital readiness of the region as well as to promote strategic models and knowledge-intensive business services for the competitiveness of the Apulia destination.

In the figure that follows an example of the outputs resulting from the analysis of each digital local experience is provided.

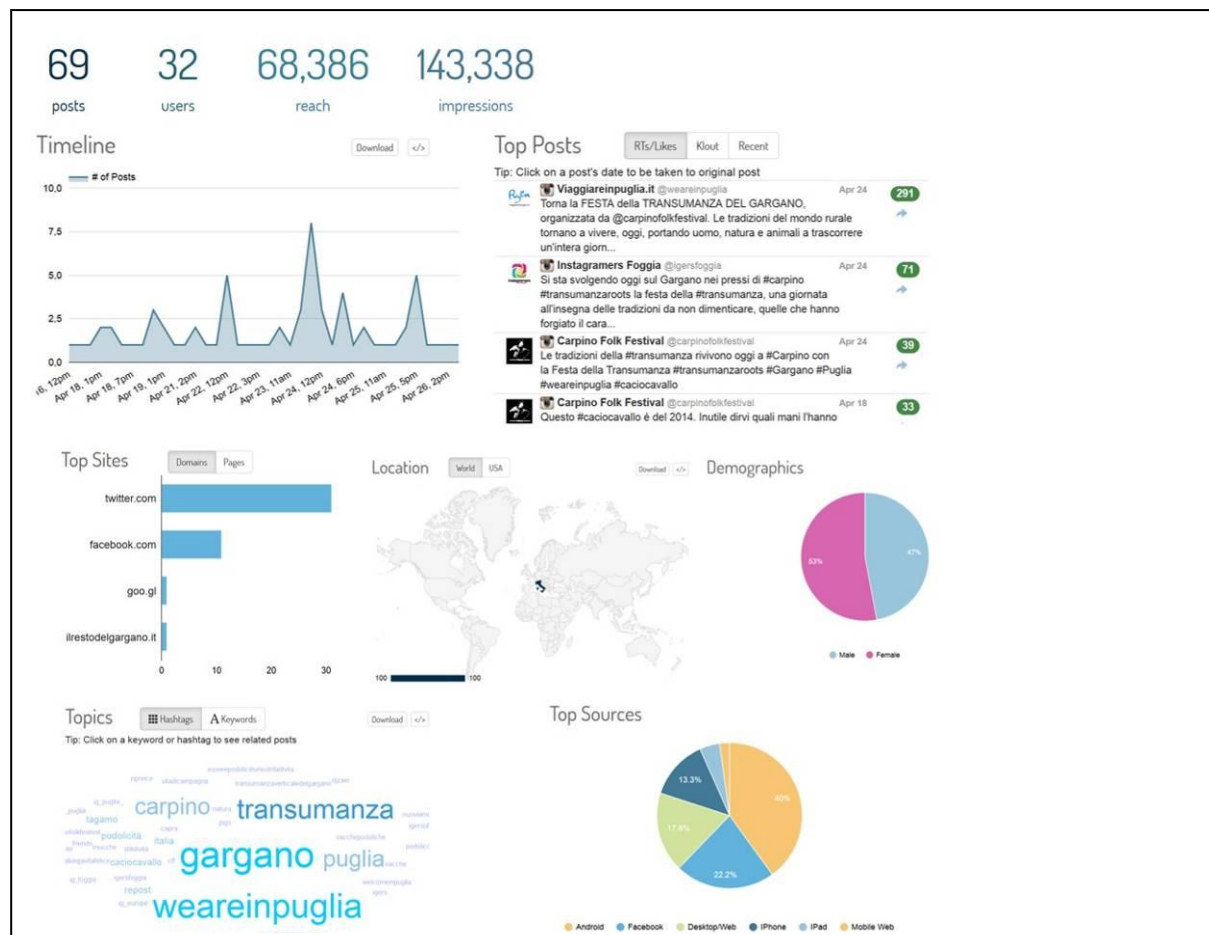

Figure 1. Examples of analysis.

Almost all the cases are promoted by no-profit organizations, with the exception of #365Pugliadays created by private company, with the inclusion of a wide community of stakeholders as the regional agency for tourist promotion (Pugliapromozione), the Italian Touring Club (in the case of #Appiedi), the Laboratory of Management Engineering at the University of Salento, other agencies and association. The involvement of strategic actors has produced positive results in terms of organization of the digital campaign, visibility and follow-ups.

Each initiative has been labelled with official specific hashtags. With the exception of #carnevaledi putignano2016, in all cases, a nucleus of storytellers involved. In some of the event

analyzed, those storytellers present the profile of top influencers (#mygarganoexperience, #365pugliadays), in some other the official tellers are voluntarily involved on the basis of their cultural backgrounds (#appiedi), in other tellers were hired by the promoters of the event to assure the continuous updating of digital experience offered (#365PugliaDays).

About the social performances observed: all the events have registered an hype in the days of the programs; the type of social track more appreciated was represented by post or tweet associated to photos; the audience in terms of nationality was conditioned by the idiom used for the hashtag and promotional strategy (this has implied a coverage of the Italian market in all the cases, although in some of them there have been foreign users); Instagram is in absolute the social network more used (only in the case of #365pugliadays, Twitter is the more influent); in almost the cases, the difference of gender between users is very low; the tagclouds (preliminary result of a semantic analysis of the experiences in terms of more frequently used words) suggest the importance of creating conjoint initiative of promotion and offering by leveraging on different assets and attractiveness of the regional destination.

In the table that follows, the main evidences collected for, from and about each digital local experience are synthetized in terms of social analytics metrics (reach, impression, number of posts or tweets, comments, etc), n. of storytellers (if presented), official social accounts, geographic area of coverage, profile of audience (gender, age, country, etc), type of post more appreciated, tag cloud.

DISCUSSIONS AND IMPLICATIONS

The analysis of social Big Data generated by the digital local experience in the Apulia destination, offers interesting evidences for the goals of the study. The need of competing at global level with a more and more sophisticated demand of services and products highlights the emergence of areas of improvement as well as the space for creating Knowledge-intensive Entrepreneurial ventures.

This is due to nature of technologies at the basis of the trends in tourism, at the technological and managerial challenges associated to Big Data as well as to nature of tourism as regional sector largely interested by the pervasive adoption of the ICTs.

The analysis of digital local experiences performed in our study has allowed to derive first important elements of development of the destination in a smart perspective. But they need to be consolidated and deepened, in order to overcome the risks that they remain limited to communicational initiatives without sustainability. It is important to overcome the isolation of the events and to transform data created for, from and about the digital experiences into valuable assets for companies and territories.

The differentiated set of digital experiences identified demonstrate the potentiality of the destination and the several paths of development at which Apulia region can look. In the meantime, the follow-ups of the monitored events, also in the circumstances of long and consolidated experiences (#carnevalediputignano2016) do not present evidences of concrete entrepreneurial spillovers.

With the right approach, all they can represent sources of large insights about consumers' preferences and elements for qualifying and innovate the tourist offering. They also can be used as tools to build connections with individual tourists, to co-create personalized packages. All this solicits the need of innovative capacities of analysis and interpretation. Without the right information and a very good targeting approach, also the best social advertisement will not produce economic and financial results. Tourism is such a fast-paced industry, which really drives the need for speedy data analytics and quick decisions. In tourism, any demands need to be addressed instantly in order to still be relevant for travelers, which makes Big Data so important.

Framed in the above premises, some of Knowledge-intensive Entrepreneurial opportunities can be identified by matching Big Data with the current profile of Apulia destination. Preliminary, those opportunities can be identified into innovative services and products suitable to:

- *Make more effective the decision making process* of private companies, public agencies and associations. All those might benefit from the increased speed of Big Data processing offered by new technologies. Innovate the single offering and the whole experiential packages of products and service: Big Data might be used to co-create personalized products and services for tourists.
- *Reinforce the customer relationships*: overcoming the fragmentation of data available on customers the aggregation and filtering of data should create better customer relationships, and more revenue from customers from better-targeted products and services. Through predictive analytics, the most-favored destinations, lodging and dining preferences, ancillary service needs, and tourism experiences can be identified for each passenger. Online analytical services such as price prediction and desirability rankings can increase the likelihood of purchase.
- *Identify new market niches* by capturing and processing data available online, mainly on social networks, Big Data can allow to identify unsatisfied demands and profitable areas of serving.

The opportunities discussed are representative of processes of improvement for existing companies operating in tourism, but they could be assumed as a valuable source of opportunities for creating new entrepreneurial ventures by innovative entrepreneurs. Those promising entrepreneurial areas of development could be configurable into consulting strategic services of different types (related to the communication, branding, targeting, etc) customization of proprietary and open sources technologies for Big Data processing, training of employees and top manager.

CONCLUSIONS

Aimed to discuss how the exploitation of Big Data can represent a large base of opportunities for the creation of knowledge intensive entrepreneurial processes to sustain the smart growth of a tourist destination, the paper has focused on the Apulia, a Southern Italian region and destination of growing popularity and attractiveness.

The analysis performed has allowed to identify emerging areas of entrepreneurial opportunities, in terms of more effective decision making, reinforcement of customers relationships, identifying new market niches.

Elements of value can be identified into the tentative of putting together in an analytical frame different interdisciplinary theoretical frameworks to analyze the phenomenon, such as Big Data,

Knowledge-intensive Entrepreneurship and Smart Tourism Destination. Specifically, in contributing to the recent debate on Big Data through the lens of the Knowledge-intensive Entrepreneurship, together with the insights and suggestions coming from the social media analytics this is a further element of value of the research. Finally, the study has offered a wide large set of implications and insights for the agenda of regional development. The opportunity of Big Data for the intelligent growth of Apulia destination requires the need of removing obstacles and barriers to adoption of technologies available as well as to transform the entrepreneurial culture and policies of actors, public and private, interested in tourism.

THEORETICAL MODEL: PERFORMANCE OF NEW TECHNOLOGICAL PRODUCTS

Duarte, Tânia; Alves, Gisela

IPAM Porto (European University, Laureate International Universities), Porto, Portugal

ABSTRACT

The purpose of this article is to present a critical and holistic literature review of the background of new product performance over the years. After the survey, it exposes the model with the seven key elements that professionals and companies holding new products must take into account in the definition of their strategy and that will have direct implications in the performance of these products. It exposes six elements: strategic decisions, tactical decisions, market orientation, knowledge management, launch strategy and personal characteristics. The confrontation of several literature perspectives also points to a seventh element, which corresponds to the company's resource structure, suggested by Hsieh et al. (2006) in their previous study of a successful launch strategy, so it will be relevant to demystify their consequent influence on the performance of the new product. In parallel, it provides a table with the relevant tactical variables for high-technology products, which integrates not only the known 4-p's, the element of assistance and information support to the client, which is considered to have increased importance in this context and therefore should be included in the tactical decision making. Furthermore, an analysis of the high technology marketing environment that involves innovation and the development of new products, with particular interest in clarifying the critical and unique components such as competitive volatility, technological uncertainty and market uncertainty, interpreting an elucidating guide to managers' decision-making, reducing the risk of failure in introducing new products.

Keywords: technological products; performance of new products; high technology marketing

INTRODUCTION

Innovation is constituted by the introduction of new products or new processes and it represents an essential framework for economic growth (Romer, 1990; Solow, 1956).

Several studies indicate that the higher percentage of profits of companies, mainly those that commercialize products of high technology comes from recent products. In this sense, Loch et al. (1996) refer that in the electronics sector 90% of revenue comes from products under 5 years.

To mitigate the growing complexity of the marketing environment that surrounds innovation and parallel technology across all sectors of activity, this research will focus on the study of the launch and background of new technology products.

Therefore, in the first place will be the study of the marketing-mix of high technology products and their role in defining the strategy of launching new products (Talke and Hultink, 2010). It is the presentation of the elements to be contemplated in the product launch decisions, which over time have been reiterated in the literature, which distinguishes two groups, the strategic launch decisions and the tactical launch decisions (Guiltinan, 1999; Hultink et al., 1997b). Alongside this, different views of strategies related to the performance of new products will be compared and taken into account by all the professionals involved in the launching of new products. This section congregates on the presentation of the critical elements that precede the performance of new products and with particular relevance in the design of concrete guidelines for professionals in this area.

In order to respond to the constant variation of the needs of the consumers, innovation seems to be the key and assumes various typologies. However, in this study we will consider only the radical innovation that refers to totally new products that transpose a remarkable change in basic technology, these are innovative ideas that can open the doors to new markets (Mohr et al. 2010).

It so happens that the characterization of the environment of marketing of high technology and its singularities occur and incite to a readaptation of the launching. Thus, the high technology products, their particularities, forms of communication, message and the target audience are addressed.

Therefore, the research provides to the professionals in launching new technological products, a tool with a practical, useful and extensible application in the current marketing environment so that they can have a solid decision making and with a positive impact in the performance of the product, materialized by the model introduced here.

MARKETING-MIX OF TECHNOLOGICAL PRODUCTS

The marketing-mix concept was introduced by Borden (1964). The American Marketing Association (2017) defines this concept as a set of controllable marketing variables, that integrate the well-known 4 P's (product, price, place and promotion) proposed by McCarthy (1964) and which the company uses to achieve the goal of sales ambition in the target market. Patil (2017) adds that the marketing-mix is a support tool, indispensable in the process of understanding and preparing the real product offer.

The concept described here is part of the leading conceptual reality (Londhe, 2014), which over time has undergone consecutive changes associated with the growing market dynamism apparent in the inclusion of variables and consecutively, adjusted with improvements or mutations. Thus, the intellectuals Dovleac and Bălăşescu (2012) argue that the marketing-mix of high technology products

beyond the traditional four P's should include the fifth element: assistance and information support for customers.

Table 1 shows the five elements of the marketing-mix to be taken into account, when it comes to a high technology product, and described in the previous paragraphs.

Table 1- Categorization

Categories	Subcategories	Literature/Authors
Marketing-mix of high-tech products	Product	Borden (1964) McCarthy (1964) AMA (2017)
	Price	Borden (1964) McCarthy (1964)
	Place	Borden (1964) McCarthy (1964)
	Promotion	Borden (1964) McCarthy (1964)
	Service and support of customer information	Dovleac and Bălăşescu (2012)

Source: Self-elaboration

To sum up, the marketing-mix is an essential marketing tool and plays an important role in allocating available resources to the various marketing-mix elements that ensure competitiveness (Londhe, 2014).

Following this, there will be a section regarding the launching of the product itself.

PRODUCT LAUNCH

The product launch phase is faced by Gans et al. (2003) as it often corresponds to the first moment in which the company clarifies its strategy and positioning, as well as being referred to by several authors as a critic for increasing the competitiveness of companies (Chiu et al., 2006; Zhang and Guan, 2017) and of greater importance for innovative companies (Talke and O'Connor 2011).

Although of all the stages of the development process, the launching of new products is the most expensive in most cases (Beard and Easingwood, 1996; Di Benedetto, 1999; Guiltinan, 1999; Hultink et al., 1997b), it provides a greater contribution to the success of the new product (Di Benedetto, 1999; Guiltinan, 1999; Hultink et al., 1997a).

In this sense, the literature of the development of the new product distinguishes two main groups of launching decisions (Guiltinan, 1999; Hultink et al., 1997b). In first place, the strategic launch decisions, made in the beginning of the new product development project, bring together the product strategy, the market strategy, the competitive strategy, and the company strategy. In second place, it is said that the tactical decisions of launching naturally follow those of a strategic nature that often influence them,

which is related to the elements of the marketing-mix which are easily changed after the process of developing new products (Hultink et al., 1997b).

Therefore, any consistent product launch should contemplate strategic and tactical launch decisions mutually (Narvo, 2017).

BACKGROUND OF THE NEW PRODUCT PERFORMANCE

Different authors analyse several elements that affect the performance of the innovation and so are precedents of the success of the new product launching (Cooper et al., 1994; Hultink and Robben, 1995; Ingenbleek et al., 2010).

Hultink and Robben (1995) argue that there is a direct effect of the company scope and the personal characteristics on strategic and tactical launch decisions, which in turn impact the success of the new product. In addition, the entry strategy implemented has an impact on the launch, even though it is less pronounced, according to the same authors.

According to Di Benedetto (1999) the strategic decisions are those that have the greatest contribution to success in the launching of new products. Among the several, the role of multifunctional teams in the marketing and production decision making was highlighted, as well as the logistic functions in the planning of the entire process of developing the new product. The author added that the increased focus on the company, the competition and the customers at the time of the launch are factors of increased importance in the success of the launch, as Calantone and Di Benedetto (2012) later points out. Although it was the stage of gathering information that brought particular emphasis to the successful launches.

From Ottum's (1996) perspective, the strategy that culminates with the desired product performance requires strong planning and well-defined segmentation and positioning objectives that clearly determine subsequent tactical actions. Whilst for Talke and Hultink (2010), the mind-set of the company influences the strategic decisions of launching, therefore it assumes particular importance in the performance. The structure of the company's resources is defended by Hsieh et al. (2006), whilst Hultink and Langerak (2002) propose the market orientation as decisive for the launch decisions adopted.

The authors Talke and Hultink (2010) have shown that launch decisions that relate to the marketing-mix elements affect the performance in the new product. On the other hand, Asterbo and Michela (2005) affirm that the success of the product is strongly related to the survival in the market.

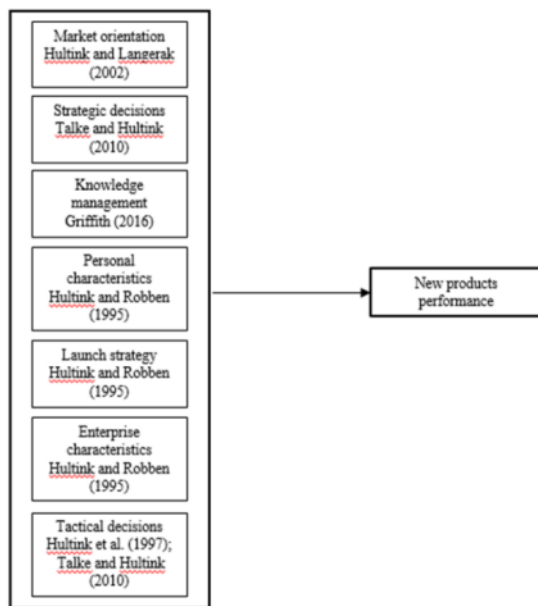

Furthermore, the literature points out that choosing the appropriate price improves significantly the effects of the launch performance on the product (Ingenbleek et al., 2013) especially when the products

are perceived as complex which derives from the incompatibility with consumer values and therefore with no relative advantage (Rogers, 1995).

The distribution, in turn, must be in line with the positioning of the product and adjust the channels to the characteristics of the target segment, which led Danaher and Dagger (2013) to propose a framework that assists in the choice of the channel that represents greater profits for each company.

Talke and O'Connor (2011) studied the types of information contained in the communication strategy that lead to the process of adopting new industrial products. They concluded that positive perceptions of the attributes of innovation constitute a central point in its adoption, as well as usability information and financial justifications. However, they have argued that the technicality of the message does not produce desirable effects on the market performance.

To resume, there is a extensiveness of antecedents that directly affect the performance of new products according to previous studies, so this research brought together this group of elements in the figure below, in order to provide to all professionals in the field of the launch of new products, a simple and intuitive epilogue of the variables to be taken into consideration by the entire organization when faced with this reality. The model presented by this study reiterates seven elements directly related to the performance of new products, and six of them corroborated by the literature, which are: strategic decisions, tactical decisions, market orientation, knowledge management, launch strategy and personal characteristics. The existence of yet a seventh element, resource structure of the company studied by Hsieh et al. (2006) which refers to its direct impact on the launch strategy, so it will most likely influence the performance of the new product. Therefore, the test and validation of this as a precedent of the performance of the new product has high relevance and therefore should be considered in later studies.

Figure 4- Background affecting the performance of new products

Source: Self-elaboration.

NEW PRODUCTS

According to Hultink et al. (1997b) the products differ in the degree of novelty. Later Guiltinan (1999) found that this circumstance has different impacts from the launch process in demand.

According to Micheal et al. (2003), the new products present a distinct configuration considering the level of novelty that characterizes them. Thus, they refer to two distinct groups: new products for the company and no novelty for the market and products that constitute adjustments for the company and therefore are not new to the market. On the other hand, the study by Haji and Assadi (2009) distinguishes truly new products from partially new products.

In this context, the research results of Zhang and Guan (2017) highlight the classification of the products as an important step and with a positive impact on the company's profitability.

HIGH TECHNOLOGY MARKETING

Nystrom (1990) defends that high technology marketing should leverage a future vision that the market is aware to the detriment of a particular product.

The high technology market is characterized by a highly volatile environment and high levels of uncertainty, in which the technology and marketing strategy must be integrated and the marketing tactics, as well as technological vision, overlap with the company's strategy (Beard and Easingwood, 1996). In addition to this, the complexity of high technology marketing dictates the importance of

fostering improved marketing actions, even though frequent lack of essential marketing knowledge, lack of support and of resources compromise the effectiveness of the marketing activity (Dutta et al., 1999a).

On the other hand, speed is perceived as a key element in this environment, which results in the reduction of the time period between the development and product placement in the market, with improvements to the product being delayed during the marketing process (Bahrami and Evans, 1989). Gilbert and Strebel (1989) reiterate this last aspect, affirming as being crucial to the success of these type of products, the adaptation of the marketing-mix throughout its commercialization.

For Gupta et al. (1986), the level of innovation of the company is as high as the integration of marketing in the research and development of innovation, as well as the uncertainty of the market. The innovation lies in a strategy based on broad sources of information, established on the market, for customers and non-customers, in the industry and technology sector, according to Drucker (1999) represent particular emphasis on the change that arises in the external environment of the company. Moreover, the most recent active involvement of clients in the creation and development of innovation, so-called co-creation corresponds to an external perspective generating innovative ideas (Mohr & Sarin 2009).

Hence, innovation and market orientation are particularly relevant in the context of high technology marketing (Mohr and Sarin, 2009).

HIGH TECHNOLOGY PRODUCTS

Beard and Easingwood (1996) claim that when it comes to a new technology, segmentation is a critical element. The attention should be directed to the innovators segment, who are more receptive to technology and influence the implementation of the rest. Therefore, it requires that there be market education, with the disclosure of the existence and benefits of the technology, the subsequent adoption is expected.

With the same logic, the authors Easingwood and Harrington (2002) presented four steps involved in the launch of high technology products. The first one concerns the preparation of the market, the second concerns the segmentation of the market, the third one coincides with the launch itself and the last one takes place after the product launches.

Following this are several authors, including Zhang and Guan (2017), who restate the critical role of customer relationship strategies in launching new products, that is, leading marketing efforts across

different market segments. For this, there are several segmentation methods that have emerged over the years as the 20/80 rule and the RFM model based on the following criteria: recency, frequency and monetary value (Ekinici et al., 2014; Hughes, 1994).

In this field, Nienaber and Schewe (2014) evaluated the role of trust and perceived risk in the launch of a product, and validated the strong positive effect of trust in the commitment of the relationship due to the intensity of contact. That is, the contribution has resulted in the premise that management must rely on trust to ensure the commitment of the relationship, in detriment of perceived risk reduction.

DISCUSSION

Mohr et al. (2009) attribute three particularities to the high-technology marketing environment, which is interlinked with each other, specifically, market uncertainty, competitive volatility and the technological uncertainty. In this sense, we are facing a challenging environment for the introduction of new products, although it is of additional importance for each innovative company and in specific for the clear determination of its competitive position (Talke and O'Connor, 2011; Zhang and Guan, 2017).

In this sense, the adaptation of the marketing-mix throughout the commercialization (Gilbert and Strebel, 1989), dictates the success of the high technology products. In addition, each innovation requires segmentation (Ottum, 1996; Beard and Easingwood, 1996), which includes a systematic process to foster the adoption, which concerns awareness. In parallel, building the customer relationship (Zhang and Guan, 2017) is a critical factor in launching innovations. When it comes to a radical innovation, the suppliers play a key role in boosting the adoption. Also emphasize the importance of internal characteristics of the company in adoption.

It is concluded after analysing several positions that the market innovation and orientation are particularly relevant in the context of high technology marketing (Mohr and Sarin, 2009). Given that the degree of innovation varies over time, the understanding and adoption of innovation is its consequence.

CONCLUSION AND SUGGESTIONS FOR FUTURE RESEARCH

The confrontation of the various positions related to the marketing-mix concept confirms the extreme functionality of its application by marketing professionals, enhancing the company's competitiveness.

However, it should be noted that in the case of high technology products, the variable assistance and information support for the client, as advocated by Dovleac and Bălăşescu (2012), is added to the four P's (McCarthy, 1964). The latter translates the relevance of analysing and deepening the needs and capacities of the user is greater compared to other types of innovations (Drucker, 1985), since the innovation is knowledge centred. In this sense, technological superiority together with improved marketing are regulating conditions to success in the high technology markets (Baker and Sinkula, 2005; Dutta et al., 1999a).

In Guiltinan's (1999) perspective, the tactical variables of the product clarify their relative advantages and improve the compatibility for the target segment taking into account their needs and perceptions. This way, the marketing-mix must be aligned in accordance with the defined strategy, in order to convey a coherent brand image at the launching (Calantone and Di Benedetto, 2012).

After analysing and comparing the proposed positions by the literature in the product launch field, seven factors were identified that were directly related to the success of the new product, namely: market orientation, knowledge management, launch strategy, company characteristics, personal characteristics, strategic decisions and tactical decisions. The author Hsieh et al (2006) also points out to the structure of the company's resources as an element that has an impact on the new product strategy and with an interest in later evaluating its impact on the performance of the new product.

In this context, a conceptual model emerges that clearly portrays the key elements that affect the performance of the new product, as stated by academics in this area of knowledge. However, the contribution explained here needs to be tested and empirically validated by companies and professionals who are directly involved in the launch of new technological products. Therefore, future studies will focus on the practical validation of the theoretical model suggested here, which will have an extremely important contribution in improving the rate of failure in launching new products and in the definition of marketing efforts, providing a credible and flexible basis to the daily reality of companies and professionals. It is recommended that the model validation is accompanied by a market survey to which it will apply as it is adjusted and adapted as best as possible to the reality, and henceforth a useful and simple tool to be applied by anyone in charge of the launch of new products, regardless of whether or not the training is marketing.

Finally, it is proposed that the test and validation be carried out, in the specific case of high technology products. This is a reality that has been increased by innovative companies, where as far as we know, there is no guidebook to provide valid guidelines for what directly affects the performance of these type of products, and therefore has a relevant applicability.

ABSTRACT

In this paper we explore how firms' productivity is affected by spatial features such as agglomeration of firms, clustering of innovation and localisation of FDI in Turkey. We also control for the impact of firm characteristics on firm productivity (specifically the role of size, ownership and firm innovation). The firm's absorptive capacity is taken into account by interacting the main variables of agglomeration and innovation at region-sector level with size and technology level of the firm. We use an unbalanced panel for 2006-2013 based on national data at firm level. Our analysis builds upon similar specifications of panel estimates for output by GMM system methodology to address simultaneity and endogeneity between agglomeration and productivity. Overall, the estimation results suggest some robust findings: there are significant productivity enhancing agglomeration effects, in particular there are significant spillovers between firms operating in the same sector and region, spillovers from innovation at local level are also strong, and a higher output of foreign firms produce positive spillovers on productivity in the province. However, spillovers are specific to technologically more sophisticated firms.

Keywords Multifactor Productivity; Size and Spatial Distributions of Regional Economic Activity; Innovation; Multinational firms.

1. INTRODUCTION

The aim of the proposed study is to investigate how firms' productivity in Turkey is affected at spatial level by agglomeration of firms, clustering of innovation and localisation of FDI. The choice of Turkey is based on the relevance that economies of agglomeration play in this economy. Turkey is a very interesting case study also due to the emerging role over the last decade of science parks, innovation

¹ Part of the Project titled "Spatial proximity and firm performances: how can location-based economies help the transition process in the Mediterranean region? Empirical evidence from Turkey, Italy and Tunisia", funded by EU Commission (euro 10.000) under the 2015 Internal Competition for the FEMISE project on "Support to economic research, studies and dialogue of the Euro-Mediterranean Partnership" as per the Contract signed between the Commission and the FEMISE association no. ENPI/2014/354-494 ("Commission-FEMISE contract"). The purpose of this agreement is to provide an original research work in the fields of social and economic analysis by the Team Leader Anna M. Ferragina. Members of the team: Erol Taymaz, Ünal Töngür, Sofiane Ghali, Habib Zitouna, Giulia Nunziante, Fernanda Mazzotta, Anna Ferragina.

clusters, incubators, and by an increasing presence of foreign multinational corporations. Besides, Turkey is among the countries of the South Mediterranean region most integrated into the global manufacturing markets, with a strong human capital base, a large number of engineers and skilled workers. However, the country is also marked by a very high regional unemployment and strong provincial inequalities. The regional inequality in Turkey has become more persistent after the 1980 liberalization. Filiztekin (1998), Dogruel and Dogruel (2003), Karaca (2004), Gezici and Hewings (2007), Yıldırım and Öcal (2006), Kılıçaslan and Özdoğan (2007), and Filiztekin and Çelik (2010) all focus on the way regional income gaps evolved concluding that even though there are small signs of convergence, they are far from successful and the east-west duality is an ongoing problem to the Turkish economy.

Given this background, several questions are worth being investigated. Do firms localised in clusters of production exhibit a higher productivity? How far concentration of innovation of firms in the same cluster is likely to increase productivity? How far concentration of foreign multinationals in such clusters has a stronger productivity spillover? How firms are able to benefit from spillovers and enjoy agglomeration effects depending on their size, technology and ownership? Is there a different firms' absorptive capacity? Hence, we interact the main variables of agglomeration and innovation at region-sector level with firm size (measured by the number of employees) and with innovation investment. These interaction variables reveal whether large firms and innovation performers benefit more from agglomeration effects and spillovers.

Our analysis aims to provide a measure of spillovers on productivity from geographical and sectorial clustering of firms and from their innovation. To this purpose, we build specific indices of agglomeration and innovation activity at territorial level. We also use indicators of innovation performed by domestic and by foreign multinationals at the spatial level of analysis adopted.

The specific additional insights of this analysis are the focus on agglomeration economies and innovation spillovers taking into account a multidimensional approach, both at spatial and firm level, in the effort to catch at the same time regional characteristics of the economic systems and firm heterogeneity. The analysis at firm level is crucial to detect agglomeration economies as some factors are firm-specific and driven by factors related to the individual skills of owners, workers and managers, to different sizes, specific approaches to production and different innovation strategies (Bloom and Van Reenen, 2010). Hence, we control for the impact of firm characteristics (specifically the role of size, ownership and firm innovation). Furthermore, we also check whether the regional endowment of territories where firms are located and in particular their R&D and location of foreign multinationals exert a positive effect on firms' productivity.

The research, by focusing on the agglomeration economies in the local context within which firms operate, and at the same time concentrating on firm-specific determinants of productivity, fills a gap in the literature. There is an almost complete lack of studies addressing such issues for Turkey at micro level: most of the studies are carried out at industry level (Coulibaly et al., 2007; Önder et al., 2003; Öztürk and Kılıç, 2015) or at province level (Çetin and Kalayci, 2016).

We adopt panel estimates of output by GMM system methodology controlling for time fixed effects. Using system GMM dynamic panel estimation techniques we try to address simultaneity and endogeneity on inputs and also the possible endogeneity between agglomeration and productivity. We use an unbalanced panel data including all private establishments employing 25 or more people for 2006-2013. Spatial unit of analyses are the provinces.

The following chapter is organised as follows. After a literature review of the main strands of analysis on spatial agglomeration, innovation and firm performance and on the specific studies carried out on localisation economies in Turkey on the topics of interest, we describe in section 3 the data and in section 4 some stylised facts on firm clustering, spatial innovation and productivity in Turkey, showing the features in terms of spatial concentration of firms, employment, FDI, innovation and relationships between these variables. Further, we develop the country specific analysis and describe our methodology (section 5) and our results (section 6) by considering the specific empirical model and the econometric specification carried out to catch regional innovation, productivity spillovers and productivity dynamics and differentials deriving from the geographical and sector clustering of firms, innovation spillovers and performances. Conclusions and policy implication follow.

We find support that in an open economy agglomeration leads to higher efficiency. In particular, our results confirm the outcome that firms in the same industry benefit more from each other as they are more technologically similar. Hence, the sector distance matters as this may facilitate the flow and absorption of knowledge among firms. We also found that FDI impact is positive albeit limited, the territorial and social redistribution depending on the firm level of technology¹ The technology play a critical role due to lower absorptive capacity of less technology sophisticated firms.

The results from the overall empirical analysis emphasises what are the policy recommendations in this context regarding promotion of agglomeration, localised innovation and foreign investment, which may support the structural transformation of the economy.

¹ This might also occur because firms opened to the foreign market are in general a subcontractor which don't have the autonomy to conduct neither technological nor non-technological innovation.

2. LITERATURE REVIEW

2.1. Spatial agglomeration, innovation and firm performance

Clustering of economic activities has been traditionally seen as a crucial mechanism for employment, firm growth and resilience. The clustering of industries in specific areas has improved industrial productivity in a number of countries. According to the Marshall theory, specialization economies increase the interaction between firms and workers, and speed up the process of innovation and growth, as firm agglomeration in the same sector produces positive externalities and facilitates the growth of all manufacturing units within it. These advantages are mainly based on information sharing and intra-industry communication. On the other hand, according to the Jacobs theory (1969), knowledge externalities are associated with the diversity of neighbour industries (urbanisation economies). Clustering can also be an important driver of R&D via a broad range of processes like learning-by doing, externalities on inputs, labour markets pooling and R&D cooperation between firms (Baltagi et al., 2012). Porter (1998) also emphasized cluster's significant role in a firm's ongoing ability to innovate and further enhance firm's productivity. Besides, an extensive literature shows that firms' behaviour depends on the spatial availability of territorial resources devoted to innovation and growth (Henderson et al., 2002).

The literature on agglomeration economies effects is extensive and dates back to a few seminal papers (Marshall, 1920; Glaeser et al. 1992; Porter, 1998; Jacobs, 1969; Audretsch and Feldman, 1996) which describe the positive effects related to technology transfers and to pro competitive forces (increased competition, reallocation of resources towards more productive firms, productivity improvements of incumbent firms).

The theory surrounding agglomeration economies and spillover effects mainly identifies two types of externalities: localization (or specialization) economies and diversification economies. The localization economies may rise from industry specialization available to the local firms within the same sector (the Marshall- Arrow-Romer or MAR externalities) and by the emergence of the intra-industry transmission of knowledge (Glaeser et al. 1992) as firms learn from other firms in the same industry (Porter 1998). These economies explain the development of industrial districts (ID). Unlike localization economies, however, Jacobs (1969) economies indicate that the diversity of industries and knowledge spillovers across geographically close industries promote innovation and growth via inter-industry knowledge spillovers (Acs et al., 2007). The latter reflects external economies passed to enterprises as a result of the large-scale operation of the agglomeration, independent of the industry structure. For instance, relatively more densely populated areas are more likely to house universities, industry research laboratories and other knowledge generating facilities.

It is recognized that clustering is especially important as a driver of R&D via a broad range of processes like learning-by doing, externalities on inputs, labour market and knowledge, R&D cooperation between firms (Rosenthal and Strange; 2001; Ellison et al., 2010; Baltagi et al., 2012). The theory on agglomeration economies also argues that positive knowledge spillovers are more likely to occur if firms are located in the same area, as geographical proximity encourages the diffusion of ideas and technology due to the concentration of customers and suppliers, labour market pooling, worker mobility, and informal contacts (Greenstone et al. 2010). Technology transfers (intra and inter industry knowledge spillovers) may occur via vertical linkages (along the supply chain and the creation of specialized suppliers) and horizontal linkages (collaboration among firms, imitation, concentration of customers and suppliers; labour market pooling and workers mobility; informal contacts).

The nexus between spatial agglomeration and knowledge spillovers has been largely investigated within the “geography of innovation” literature, which concentrates on measuring localized spillovers from R&D spending (Griliches, 1979; Breschi and Malerba, 2001; Bottazzi and Peri, 2003; Audretsch and Feldman, 2004). Within this literature, the private technology of individual firms spills over to other firms and becomes public knowledge increasing the productivity of all firms. Rosenthal and Strange (2001) and Ellison et al. (2010) consider the importance of input sharing, matching, and knowledge spillovers for manufacturing firms at various levels of geographic disaggregation, and other studies have found that knowledge spillovers tend to vanish rapidly as distance increases (Audretsch and Feldman, 1996; Keller, 2002). The concentration generates dynamic processes of knowledge creation, learning, innovation and knowledge transfer (diffusion and synergies). As a result, the cluster becomes a center of accumulated competence across a range of related industries and across various stages of production (De Propris and Driffield, 2006).

Another important strand of research related to these topics of analysis is the large literature which has focused on detecting spillovers from the presence of multinational enterprises, where horizontal and vertical spillovers can be inferred indirectly, though the estimation of their effects on firms’ total factor productivity. The location choice of foreign Multinational Enterprises (MNEs) as source of potential spillovers from FDI is stressed by a large amount of research through a range of different channels including the creation of forward and backward linkages, competitive and demonstration effects, transfer of skilled workforce, transfer of (pecuniary and non-pecuniary) externalities to local firms (Aitken and Harrison, 1999; Gorg and Greenaway, 2004; Haskel et al., 2002; Javorick, 2004, Ferragina, and Mazzotta, 2014). These spillover effects from MNEs, either intra- or inter-industry ones, are more likely to materialize when firms are geographically closer.

2. 2. Studies on localisation economies in Turkey

There is a limited number of studies on productivity for Turkish manufacturing. These generally focus on the relationships productivity and export, FDI, trade, or technical efficiency (see Aslanoğlu, 2000; Taymaz and Saatçi, 1997; Taymaz and Yılmaz, 2007; Lenger and Taymaz, 2007). FDI is found to be an important channel for transfer of technology and that the modern, advanced technologies introduced by multinational firms can diffuse to domestic firms through spillovers.

Taymaz and Saatçi (1997) is among the first attempt to identify the effects of regional agglomeration. They estimated stochastic production frontiers with efficiency effects and found that regional agglomeration of firms enhance technical efficiency.

Önder et al. (2003) analyzed spatial characteristics of TFP in Turkish manufacturing. They investigate technical efficiency, technical change and TFP changes by estimating a trans-log Cobb-Douglas production function employing stochastic frontier analysis (SFA) methodology using regions' share in production, population density and a specialization index based on the value added to represent regional characteristics. Their findings suggest that average firm size and regional characteristics are the main determinants of technical efficiency. They also indicate that firms operating with a larger scale are more efficient than small scale ones, and that industries located in metropolitan areas are more technically efficient than their peers in the peripheries.

Coulibaly et al. (2007) attempt to capture the relationship between productivity and agglomeration using two-digit Turkish manufacturing data for 1980-2000 period and several proxies such as accessibility, localization and urbanization. The estimation results suggest that both localization and urbanization economies, as well as market accessibility, are productivity-enhancing factors in Turkey.

Karacuka and Catik (2011) examine productivity spillovers from foreign and domestic companies based in Turkey and also report spillover effects from neighbouring companies. Quite different the Öztürk and Kılıç (2015) analysis of the link between productivity and agglomeration employing Ellison and Glaeser index and Total Factor Productivity to represent agglomeration economies and productivity levels in Turkish manufacturing industries on 1980-2001. Their results indicate that Turkish manufacturing industries stand as an example of negative externalities.

Çetin (2016) employs spatial econometric methods in analyzing intra and inter industry knowledge spillovers in industrial zones and concludes that there are spillover effects in the industrial zone of Ankara, and that more than half of the spillovers are due to geographical factors.

Çetin and Kalayci (2016), investigate the effects of R&D spillovers at province level also using spatial econometrics. The results of the analyses suggest the presence of R&D knowledge spillovers at provincial level in Turkey, shown by spatial spillover effects in nearly one third of the total effects.

Being literature only based on regional, industrial or provincial analyses the novelty we propose is the investigation at firm level of the impact of localisation economies on co-located firm performances based on the emphasis on the complementarity between the micro and the macro dimension.

3. DATA DESCRIPTION

We use an unbalanced panel data of all enterprises¹ that either employ at least 20 people or have at least 3 local units during the 2006-2013. Spatial unit of analysis is the “region” defined at the NUTS 2 level (a typical NUTS 2 region covers 3-4 provinces). The data source is the Turkish Statistics Institute (TurkStat) Longitudinal Database. The database is unbalanced because of exit from and entry into the industry and/or the database.

Table 1 contains the number of all firms, domestic firms and foreign firms² from 2003 to 2013 and the share and the number of R&D performers among all these three groups. Foreign firms are more likely to conduct R&D. About 4-5% of domestic firms perform R&D whereas about 18-19% of foreign firms perform R&D. However, there is a decline in the share of domestic R&D performers after the 2009 crisis in spite of an increase in the number of firms doing R&D.

Table 1. Number of firms in Turkey sample

	Number of firms			Share of R&D performers		
	All	Domestic	Foreign	All	Domestic	Foreign
2003	13936	13499	437	3.4	2.9	18.1
2004	16869	16318	551	3.1	2.7	15.1
2005	20060	19442	618	3.8	3.4	17.6
2006	21215	20428	787	3.3	2.9	14.9
2007	20556	19780	776	4.0	3.4	17.3
2008	22533	21772	761	4.2	3.7	17.5
2009	19526	18812	714	5.4	4.9	18.2
2010	23735	22896	839	5.4	5.0	16.9
2011	28657	27691	966	4.9	4.5	17.5
2012	30867	29927	940	5.0	4.5	19.3
2013	33630	32634	996	4.5	4.1	18.5

Table 2 shows the share of foreign firms in total number of firms, employment and value added, and their relative size and labor productivity. The share of foreign firms both as number and as employment and value added decreased after the 2009 crisis mainly because of the increase in the number of domestic firms (entry rate for domestic firms is higher than for foreign firms after 2009). Foreign firms are about 4 times larger than domestic firms (in terms of the number of employees per firm) and 2 times more productive (in terms of value added per employee). However, the sectoral distribution highly explains this asymmetry.

¹ We use the terms “firm” and “enterprise” interchangeably.

² A firm is “foreign” if at least 10% of its shares is held by foreign agents. Note that the most of the foreign firms are majority owned, i.e., foreign agents own more than 50% of shares.

Table 2. Share of foreign firms, 2003-2013

	# of firms %	Employment %	Value added %	Relative size	Relative labor productivity
2003	3.1	11.7	24.1	3.7	2.1
2004	3.3	12.0	25.8	3.7	2.2
2005	3.1	11.2	24.1	3.6	2.2
2006	3.7	13.4	28.6	3.6	2.1
2007	3.8	13.5	28.5	3.6	2.1
2008	3.4	13.1	25.9	3.9	2.0
2009	3.7	13.1	27.0	3.6	2.1
2010	3.5	11.7	23.8	3.3	2.0
2011	3.4	12.2	23.4	3.6	1.9
2012	3.0	11.6	23.0	3.8	2.0
2013	3.0	11.1	22.2	3.8	2.0

In table 3, where the sectoral distribution of foreign firms is described for the 2011-2013 average, it appears that foreign firms have larger shares in Tobacco products, Chemicals, Pharmaceuticals and Motor vehicles. Foreign firms are two to five times larger, on average, than domestic firms. Foreign firms' labor productivity is almost equal to that of domestic firms in pharmaceuticals, basic metals, computers, and other transportation equipment industries. The productivity differential (the productivity of foreign firms relative to the productivity of domestic firms) is higher than two in non-metallic mineral and fabricated metal industries. There is a weak positive correlation between relative size and productivity of foreign firms across industries, i.e., productivity differential between domestic and foreign firms is explained partly by differences in firm size.

Table 3. Sectoral distribution of foreign firms, 2011-2013 average

		Firms %	Employment %	Value added %	Relative size	Relative labor productivity
10	Food	3.34	12.35	20.35	3.70	1.65
11	Beverages	6.57	30.86	48.98	4.70	1.59
12	Tobacco products	34.21	59.54	99.49	1.74	1.67
13	Textiles	1.77	3.02	3.62	1.71	1.20
14	Wearing apparel	0.85	4.36	7.82	5.13	1.79
15	Leather products	0.78	1.76	1.98	2.24	1.13
16	Wood products					
17	Paper products	5.69	15.13	23.52	2.66	1.55
18	Printing					
19	Coke and refined pet					
20	Chemicals	12.47	24.22	33.76	1.94	1.39
21	Pharmaceuticals	19.05	37.46	43.08	1.97	1.15
22	Rubber and plastics	4.08	13.41	25.94	3.29	1.93
23	Non-metallic mineral	2.31	8.39	22.22	3.63	2.65
24	Basic metals	3.16	10.09	10.49	3.19	1.04

25	Fabricated metal	2.65	6.69	14.32	2.52	2.14
26	Computers, electronics	5.65	17.73	15.89	3.14	0.90
27	Electrical equipment	4.97	17.39	28.34	3.50	1.63
28	Machinery	3.54	15.91	30.25	4.49	1.90
29	Motor vehicles	11.53	47.90	64.38	4.16	1.34
	Other transport equipment	6.95	14.16	15.45	2.04	1.09
31	Furniture	0.76	1.83	3.32	2.42	1.81
32	Other manufacturing	3.62	9.51	17.60	2.62	1.85
33	Repair and installation	2.93	4.23	8.44	1.44	1.99
Total		3.12	11.61	22.80	3.73	1.96

4. STYLISTED FACTS ON FIRM CLUSTERING, SPATIAL PRODUCTIVITY, AND INNOVATION IN TURKEY

We provide a preliminary descriptive part as a background for our econometric analysis. We illustrate the pattern of clustering using maps that exploit information on the exact location of firms (also considering foreign firms location). They picture at province level the concentration of value added, the foreign firms shares, the relative labour and TFP productivity, suggesting a high firm clustering and the unique nature of Turkish economy in terms of strong regional imbalances.. The number of foreign and domestic R&D performers give us a hint on spatial innovation spillover.

Maps 1-8

Furthermore, figures 1-3 help investigating in a preliminary unconditional way the benefits of regional agglomeration using the correlations between some of the variables mapped above. TFP growth and employment growth maps give us a preview of the potential benefits of clustering. In particular, fig. 1 shows the positive correlation between regional agglomeration (log regional share of value added) and regional relative productivity. The picture suggests that more concentrated regions are more productive. In fig. 2 regional agglomeration (log regional share of value added) is instead put in correlation with employment growth: here quite surprisingly more developed regions achieve lower employment growth from 2006-7 to 2011-12. This could be explained mainly with the less developed regions have higher population growth but it could also be due to the fact that concentration enhances productivity but not employment. In fig. 3 regional agglomeration is compared with the share of foreign firms in regional output: it appears evident that more concentrated regions attract more foreign firms.

5. EMPIRICAL METHODOLOGY: GEOGRAPHICAL AND SECTORIAL CLUSTERING OF FIRMS, INNOVATION SPILLOVERS AND PRODUCTIVITY

The issue we want to analyse is the relationship between agglomeration, innovation and firms' productivity. This entails considering proximity between firms, agglomeration indicators and R&D spillovers. The questions are: do firms localised in clusters of production exhibit higher productivity? Is there a complementarity between domestic and foreign firms? Firms should benefit from the experience of other firms in the vicinity, especially from the one of large foreign multinational firms. So we ask how localisation of firms nearby multinationals operating in the same localised cluster would contribute to develop their productivity and would allow innovation to circulate. Besides, we investigate how far concentration of innovation of co-located firms in the same cluster is able to increase productivity.

In addition to considering innovation measures at firm level, we build specific indexes of innovation activity at territorial level (provinces). We also use indicators of innovation performed by domestic and by foreign multinationals at the spatial level of analysis adopted.

We directly contribute to the wide literature on productivity spillovers from agglomeration economies, as well as to the literature on localized knowledge spillovers from innovation checking for spillovers between firms taking place within regions and controlling for regional features being more conducive to productivity growth. In order to distinguish between the two effects we have used a proxy for regional attractiveness, i.e. the value added per head. This controls for initial regional factors. We also include time dummies.¹

We use panel estimates for output (by GMM-system), controlling for time fixed effects. Simultaneity and endogeneity is hence addressed using system Generalized Method of Moments (GMM) dynamic panel estimation techniques. This methodology allows us to distinguish the direction of the nexus clustering and productivity and to focus on whether more regional clustering lead to higher productivity, ruling out the other direction of causality, i.e. that higher productivity leads to more regional clustering.

We consider different externality transmission channels, and which variable available in the data might best capture that. The first most important channel is to catch the spillovers between firms in the same industry (horizontal spillovers). Three variables are adopted to this purpose: the regional share variables by sector, i.e. the output share of the region in the sectors output, the number of firms by sector-region and the output of firms by sector-region.

¹ However, we do not include regional dummies as controlling on average across the years for regional fixed effects might absorb some of the regional and sector externalities we are trying to estimate.

Then, we look at the R&D/innovation performed by domestic and by foreign firms which can be considered as an innovation spillover channel. The share of output of R&D performing domestic and foreign firms in the region/sector and the number of R&D performing domestic and foreign firms in the region/sector are the two proxies considered.

The third important issue is related to the presence of spillovers by foreign firms. We consider to this purpose the shares of foreign firms in the region and in the sector.

As not all firms are able to benefit from spillovers and enjoy agglomeration effects it is important to also control for the role of firms' absorptive capacity. Hence, we interact agglomeration and spillover variables with firm size (measured by the number of employees) and with innovation variables. These interaction variables will reveal if large firms and innovation performers benefit more from agglomeration effects and spillovers. For example, if large firms benefit more, the coefficient of firm size-agglomeration effect interaction variable will be positive.

5.1. Model and descriptive statistics

In order to test the effects of agglomeration economies and spillovers, a Cobb-Douglas production function is estimated:

$$q_{i,t} = \alpha_i + \alpha_{Lq}q_{i,t-1} + \alpha_{Kq}K_{i,t} + \alpha_{LK}K_{i,t-1} + \alpha_{LL}L_{i,t} + \alpha_{LL}L_{i,t-1} + \alpha_M M_{i,t} + \alpha_{LM}M_{i,t-1} + D_i + \sum \beta_j X_{ij,t} + e_{it} \quad [1]$$

where q is real output, K capital, L labor, M inputs, D time dummies, and e the error term. Subscripts i and t denote firm and time, respectively. α_i 's accounts for unobserved, time-invariant firm-specific effects. X is a vector of variables that explain total factor productivity, and it includes the variables that measure agglomeration effects and spillovers.

The *output variable* of the production function is the value of production (sales adjusted by changes in final product inventories). It is deflated by sectoral prices indices at NACE 4-digit level to find real output.

Inputs of the production function are capital, labor and inputs (raw materials, parts and components). Capital is measured by depreciation allowances, labor by the average number of employees, and inputs by the value of all inputs adjusted by changes in raw materials and work-in-process inventories. The capital variable is deflated by investment price index whereas the input variable is deflated by sectoral price indices.

We use GMM-system method to estimate the production function that controls for the endogeneity of inputs, autocorrelation and heteroscedasticity. The methodology we use, GMM system, takes care of endogeneity of input by creating instrumental variables from existing variables. In the case of GMM-system, two equations are estimated jointly, the differenced equation and the level equation where first differences are used as instruments.

The GMM-system model is defined as a dynamic model: it includes the lagged values of the dependent variable (output) and all inputs. This specification allows for a flexible functional form and incorporates various adjustments.

The output and all input variables are used in log form. Therefore, the coefficients of input variables give us short-term factor elasticities. The long run factor elasticities are defined by

$$\varepsilon_i = (\alpha_i + \alpha_{Li}) / (1 - \alpha_{Lq}) \quad [2]$$

where ε is the long-term elasticity of factor i , α_i the coefficient of factor i , α_{Li} the coefficient of the lagged value of factor i , and α_{Lq} the coefficient of the lagged value of output.

The returns to scale parameter is defined by

$$\kappa = \varepsilon_K + \varepsilon_L + \varepsilon_M \quad [3]$$

where κ is the returns to scale parameter, and the subscripts K, L and M denote capital, labor and inputs, respectively. There are constant returns to scale when $\kappa = 1$, increasing (decreasing) returns when $\kappa > 1$ ($\kappa < 1$).

In order to capture the effects of all shocks and exogenous technological change, all models include time dummies, i.e., a dummy variable for each year.

A dummy variable for foreign ownership is included into the model to capture the effects of foreign ownership on productivity. Foreign firms are, by definition, multinational firms, and are able to transfer technology from abroad, mainly from the parent firm. Therefore, foreign firms are likely to be more productive than domestic firms.

Technological activities of the firms is captured by a dummy variable that is equal to 1 if the firm performs R&D activities, and 0 otherwise. Since the firm can generate new products and/or processes as a result of R&D activities, the R&D dummy variable is expected to have a positive coefficient, i.e., R&D performers would be more productive.

Since the main purpose of our study is to analyse the effects of agglomeration and spillovers, especially from foreign firms, we use a number of proxy variables that are expected to capture the effects of these factors. Note that there are a number of alternative proxy variables. For example, agglomeration can be measured by the density of firms (the number of firms), or by the density of production activities (output). Therefore, we experimented with a number of alternative variables, and replaced a set of explanatory variables by another set.

The first set of proxy variables for agglomeration effects includes the (log) numbers of domestic and foreign firms in the same sector (defined at the NACE 4-digit level) and region (defined at NUTS 2 level). These variable will have positive coefficients if agglomeration of firms leads to higher productivity. We use the number of domestic and foreign firms separately because the extent of spillovers could differ between domestic and foreign firms.

We use two additional variables, the number of domestic and foreign R&D performers in the same sector and region to test if R&D performers are more likely to spillover knowledge and technology to other firms that operate in the same sector and region.

The second set includes the (log) output of domestic and foreign R&D performers in a given sector and region. This set defines agglomeration in terms of output instead of the number of firms as defined in the first set. The number of firms variable would be meaningful if spillovers takes the form of imitation, whereas the output variable could reflect spillovers in the form of externalities and labor turnover.

The third set includes a number of variables about output shares. “Regional share (sector)” is the share of the region in total output of the sector in which the firm operates. The “Foreign share (sector)” and “Foreign share (region)” variables are defined similarly for foreign firms. If there are agglomeration economies in a sector, the firms located in a region where that sector is concentrated in would be more productive. If there are spillovers from foreign firms within a sector, then the “Foreign share (sector)” variable will have a positive coefficient. However, if spillovers from foreign firms have a geographical dimension, then the coefficient of the “Foreign share (region)” variable will be positive.

Benefiting from spillovers is not a passive process, and firms cannot enjoy agglomeration effects to the same extent. To control for the role of the absorptive capacity, we interact agglomeration and spillover variables with firm size (measured by the number of employees) and R&D dummy variable. These interaction variables will reveal if large firms and R&D performers benefit more from agglomeration effects and spillovers. For example, if large firms benefit more, the coefficient of firm size-agglomeration effect interaction variable will be positive. Finally, we also include into the model the output share of large firms in the same sector and region to test if spillovers originate only from large firms.

Descriptive statistics for all the variables for the period analysed are presented in Table 2. Note that with the exception of dummy variables (FDI and R&D performer) and share variables (Regional output share, Foreign share sector and Foreign share region), all variables are in log form. As shown in the table, the share of foreign firms was 3.2% and the share of R&D performers 4.6%. The average number of domestic firms in the same sector and region is 36.9 ($e^{3.608}$). In the most concentrated case of the agglomeration of domestic firms, it reaches 1663, i.e., 1663 firms operating in a sector are located in the same region.

The average number of foreign firms in the same sector-region is much smaller (only 2.1) and its maximum value becomes 33. The average number of R&D performing domestic (foreign) firms in the same region/sector is 2.01 and 1.16 respectively. Although the number of foreign firms is small, the average sectoral share of foreign firms is 11.4%, and the average regional share of foreign firms is

19.7%. The significant difference between the number and output of foreign firms shows that these two measures could reflect different aspects of agglomeration effects and spillovers emanating from foreign firms.

Table 4. Descriptive statistics on Turkey sample

Variable	Mean	Std dev	Min	Max
Output	14.634	1.790	-1.265	23.018
Number of employees	3.664	1.153	0.000	9.663
Capital stock	11.074	1.983	-0.604	20.111
Inputs	14.400	1.970	-1.295	22.968
FDI	0.032	0.175	0.000	1.000
R&D performer	0.046	0.210	0.000	1.000
Number of domestic firms (region/sector)	3.608	1.756	0.000	7.416
Number of foreign firms (region/sector)	0.740	0.869	0.000	3.497
Number of R&D performing domestic firms (region/sector)	0.700	0.784	0.000	3.332
Number of R&D performing foreign firms (region/sector)	0.148	0.372	0.000	2.398
Regional output share	0.291	0.281	0.000	1.000
Foreign share (sector)	0.114	0.156	0.000	1.000
Foreign share (region)	0.197	0.106	0.000	0.534
Output of domestic firms (region/sector)	16.385	4.848	0.000	21.364
Output of foreign firms (region/sector)	0.351	2.435	0.000	21.810
Output of R&D performing domestic firms (region/sector)	3.052	6.975	0.000	24.097
Output of R&D performing foreign firms (region/sector)	9.994	9.233	0.000	24.395

Notes: All variables are in log form.

FDI and R&D performer are dummy variables.

Regional output share, Foreign share (sector) and Foreign share (region) are in percentage.

5.2. Estimation results

Estimation results are presented in Table 5a (without interaction effects) and Table 5b (with interaction effects). We included agglomeration and spillover variables in blocks of variables to check the effects of correlations between explanatory variables.

Estimation results for the production functions are quite robust and sensible. The returns to scale parameter is around 1.05 for almost all models that indicates that there are mild increasing returns to scale in Turkish manufacturing. The (long run) elasticities of capital, labor and inputs are around 0.055, 0.356 and 0.635 which are reasonable. The coefficient of the lagged output variable is small (around 0.2), i.e., output adjusts quickly.

The coefficients of foreign ownership and R&D variables are statistically significant¹ in all models. Foreign firms in Turkish manufacturing are around 13% more productive than domestic firms. As may be expected, R&D performers are more productive than non-R&D performers, and the average productivity differential between R&D performers and non-performers is around 5-6%. Hence, FDI is found to be an important channel for transfer of technology which confirm previous studies on

¹ Unless otherwise noted, "statistically significant" means statistically significant at the 1% level.

Turkey on the relationships productivity and FDI (Taymaz and Saatçi, 1997; Taymaz and Yılmaz, 2007; Lenger and Taymaz, 2007).

Estimation results suggest that there are productivity spillovers from foreign firms operating in the same sector-region. The coefficient of the number of foreign firms operating in the same sector-region is positive and statistically significant. If the number of foreign firms increase by 1%, productivity of all firms operating in that sector and region increases by 0.04% (Model 4, Table 5a), i.e., these effects are economically significant too.

We also find that the number of domestic firms operating in the same sector-region seems to have a negative effect on productivity when the model includes the variable on foreign firms (compare models 3 and 4, Table 5a). There could be congestion or negative competition effects due to agglomeration of domestic, and, most probably, technologically inferior firms. This confirm another study which examine productivity spillovers from foreign and domestic companies based in Turkey and also report negative spillover effects from neighbouring companies (Öztürk and Kılıç, 2015). However, our analysis does not confirm the results of Taymaz and Saatçi (1997), Karacuka and Catik (2011), Çetin and Kalayci (2016), which suggest the presence of R&D knowledge spillovers at provincial level in Turkey.

In order to check if agglomeration and spillovers effects differ by firm characteristics, we use the number of R&D performing domestic and foreign firms in the same sector-region instead of total number of firms (Model 5, Table 5a). In that case, the coefficients of both domestic and foreign firms become positive and statistically significant. The coefficient of the number of R&D performing foreign firms is almost equal to the coefficient of the number of foreign firms (around 0.04), but the coefficient of the number of domestic R&D performers is somewhat smaller (0.008). These results reveal that the extent of spillovers from R&D performing and non-performing firms is quite similar. Domestic R&D performers generate positive spillovers, but they are weaker compared to those generated by foreign firms.

In another group of regressions, we used proxy variables defined in terms of total output instead of total number of firms produced by domestic and foreign firms in the same region. Model 7 shows that when the outputs of both domestic and foreign firms are higher in a sector-region, firms operating in that sector-region are likely to be more productive. These results, when compared to those of Model 4, support the congestion and competition arguments for domestic firms. If there are more domestic firms in a sector-region, it creates negative effects, but if total output produced by domestic firms increase in a sector-region, then firms become more productive. Note that, in this case too, the coefficient of output of foreign firms is higher than the coefficient for domestic firms, i.e., foreign firms' output generate more spillovers.

When the output variables are replaced by the output of R&D performers, the results are the same: there are strong spillovers from the output of both domestic and foreign R&D performers, and the spillovers from foreign firms are stronger than those from domestic firms.

Finally, we redefined agglomeration and spillover variables separately at the sectoral and regional level instead of narrower sector-region level. In this case (Model 6) the “Regional share (sector)” variable shows the share of that region in the sectors’ total output, the “Foreign share (sector)” the share of foreign firms in the sectors’ total output, and the “Foreign share (region)” the share of foreign firms in the regions’ total output. Therefore, for example, the “Foreign share (region)” variable shows if there are regional spillovers from foreign firms that benefit to firms operating in the same region but in different sectors, whereas the “Foreign share (sector)” variable shows if there are spillovers from foreign firms that are beneficial to all firms operating in the same sector irrespective of its location.

Estimation results show that there are pure agglomeration effects (“Regional share (sector)”), i.e., if a region’s share in a sectors’ total output is higher, the firms operating in that region and sector are more productive. Moreover, there are additional spillovers from foreign firms to all firms operating in the same sector, and to all firms operating in the same region, i.e., there are spillovers at the sectoral and regional level independent from each other.

In Models 9 and 10 (Table 5b), different variables used to capture agglomeration and spillover effects are included into the model to check the robustness of estimation results. There is no significant change in estimation results. The only exception is that the coefficient of the output of foreign R&D performers becomes insignificant when the model also includes other variables about spillovers from foreign firms.

Finally, Models 11-14 (Table 5b) include interaction variables that are used to understand if absorptive capacity is important in benefiting from agglomeration effects and spillovers. Most of the variables interacted with firm size have statistically insignificant coefficients at the 5% level, i.e., firm size does not matter in benefiting from spillovers. The only exception is the interaction with “Foreign share (sector)” variable that has a negative and statistically significant coefficient. It seems spillovers from foreign firms operating in the same sector are more important for small firms than large firms. This result does not confirm the study by Önder et al. (2003) which also analyzed spatial characteristics of technical efficiency, technical change and TFP changes by estimating a trans-log Cobb-Douglas production function employing stochastic frontier analysis (SFA) methodology using regions’ share in production, population density and a specialization index based on the value added to represent regional characteristics. Their findings suggest that firms operating with a larger scale are more efficient than small scale ones.

Regarding the interactions with R&D performers variables, the estimation results show that R&D does not matter much for benefiting from spillovers. It seems that R&D non-performers benefit more from spillovers from foreign firms operating in the same sector (Model 12), but when we look at spillovers from foreign R&D performing firms in the same sector-region, R&D activity enhances absorptive capacity, i.e., absorptive capacity created by R&D activity matters for spillovers from other (foreign) R&D performers. These results may indicate that there could be spillovers specific to technologically sophisticated firms.

Models 15 and 16 are estimated to check if only large firms generate spillovers. When the output share of large firms in the same sector-region is the only spillover variable (Model 15), the estimation results suggest that there are spillovers from large firms to others operating in the same sector-region. However, when three aggregate spillover variables are included into the model (Model 16), the coefficient of the output of large firms in the same sector-region becomes insignificant, i.e., the existence of large firms does not create more spillovers.

All variables are in log form. There are 123,947 observations (32,739 firms) in the sample.

FDI and R&D performer are dummy variables.

Regional output share, Foreign share (sector) and Foreign share (region) are in percentage.

All model includes time dummies.

GMM instruments: From the 2nd lag for output, labor, and inputs, and from the 1st lag for capital.

5.3. Productivity dynamics and differentials

The previous section summarizes the results of production function estimates that reveal which factors contribute to total factor productivity. In this section, we will look at the dynamics of productivity by region and firm size.

By using the estimated coefficients of the production function, the (log) level of total factor productivity for each firm-year is calculated as follows:

$$TFP_{i,t} = q_{i,t} - \alpha^*_{Lq}q_{i,t-1} + \alpha^*_{K}K_{i,t} + \alpha^*_{LK}K_{i,t-1} + \alpha^*_{LL}L_{i,t} + \alpha^*_{LL}L_{i,t-1} + \alpha^*_{M}M_{i,t} + \alpha^*_{LM}M_{i,t-1} \quad [4]$$

where $TFP_{i,t}$ is the (log) TFP level of firm i at time t . α 's are estimated values of production function coefficients.

We estimated TFP levels by coefficients estimated for all models, and checked if there are significant differences between TFP levels calculated for each model. The coefficients of correlation between TFP levels are above 0.99 for all models, i.e., all models give similar TFP estimates at the firm level. We use the coefficients of Model 9 (Table 5b) in the following analysis.

We ranked all regions by GDP per capita and formed 5 regions on the basis of their ranking. Region 1 has the highest and Region 5 the lowest GDP per capita. Figure 4 presents the mean TFP levels for those five regional groups for the period 2006-2013. It seems that regions 1 and 2 have similar TFP levels, whereas regions 3, 4 and 5 lag behind the more developed regions. It is interesting to observe that the economic crisis in 2009 had a stronger negative effect on less-developed regions (especially the least developed one) in terms of productivity level whereas the developed regions (1 and 2) were able to increase their productivity throughout the period. The less developed regions, after stagnation until 2011 achieved a rapid increase in productivity in 2012 and 2013.

Figure 5 presents similar data grouped by firm size. All firms are classified into three groups, large (employing 250 or more people), medium (50-249 employees) and small (20-49) categories. There are significant productivity differentials between large firms on the one hand, and small and medium-

sized firms on the other. Small and medium-sized firms have, on average, similar productivity level. The effect of economic crisis on productivity across size categories is similar to that for regions. Less productive categories (small and medium-sized firms) felt the effect of economic crisis more than large firms did. Although the TFP level for small and medium-sized firms stagnated before and during the crisis, it increased almost continuously for large firms throughout the period.

6. CONCLUSIONS AND POLICY IMPLICATIONS

We investigated what are the benefits of clustering estimating the effects of aggregation and other localisation variables on firms' productivity. First of all, we considered how far intense competition and polarisation in clusterised areas is able to promote higher productivity. Overall, our results emphasise the relevance of agglomeration economies in Turkey. More in detail, there are positive externalities from foreign firms' agglomeration, conversely the externalities from agglomeration of domestic firms are negative suggesting congestion effects.

Important localised innovation spillovers are also found. Besides, there is evidence on the usual outcome that firms in the same industry benefit more from each other as they are more technologically similar and the sector closeness also matters as this may facilitate the flow and absorption of knowledge among firms. We also found that the territorial and social redistribution of spillovers may be limited in particular from foreign multinationals. This might also occur because firms opened to the foreign market are in general subcontractor which don't have the total autonomy to conduct technological neither technological innovation. We also consider innovation spillovers by type of

firms (SME/large, high/low innovating and hence with high/low absorptive capacity). Hence, we interact agglomeration and spillover variables with firm size (measured by the number of employees) and innovation variables. These interaction variables reveal that the innovation performers benefit more from agglomeration effects and spillovers, as in most of our estimations the coefficient of firm innovation-agglomeration effect interaction variable is positive.

Polarization of activities, is confirmed to be an enhancing factor of firm performances. A model of development based on strong polarization, is confirmed to be enhancing in most cases firm performance and growth.

However, recent decades witnessed an increasing unbalanced process of regional growth in Turkey which led to large income and employment gaps across regions, consequent massive migration, concentration of population in large cities and along the coast, degradation and isolation of internal areas, environmental impoverishment and abandonment.

Implications of the analysis lead to crucial policy questions spurring from this analysis:

- Unbalanced process of regional growth in most Mediterranean countries has to be avoided as it can only led to large income and employment gaps across regions, consequent massive migration, concentration of population in large cities and along the coast, degradation and isolation of internal areas, environmental impoverishment and abandonment to which all have seen that recent decades witnessed.
- While a reallocation of resources to less developed regions could be costly and counterproductive giving that regional tax incentives to poor regions may shift jobs away from territories that do not receive the subsidy, rather than create new ones, the policy target for the government should rather be investing in transportation infrastructure, ease access to housing and develop regional complementarities. Such policies would expand job opportunities for the people outside the coastal region and lead in the long term to a more sustainable convergence of standards of living among regions.
- The experience drawn from this analysis may also give support in identifying key drivers and patterns of localised production and to provide a benchmark to analyse the issue of efficiency of clusters of SMEs in South Mediterranean countries drawing some general directives and policy advices. In particular, results may be useful within the Euro-Med cluster cooperation on industry and innovation framework. The emerging innovation clusters based in Tunisia, Morocco and Lebanon, the CBDs in Tunisia, the Special Economic Zones and the role of MNCs are key elements in this context given the relevance that innovation appears to play to benefit of agglomeration spillovers.

- These results also represents the economic underpinning of policy analysis aimed at fostering innovation at regional level. In spite of the challenges of globalization, place still make the difference and can emerge as laboratories of new partnerships: local/global, private/public driven.

EMPLOYER BRAND BUILDING FROM THE INSIDE-OUT: HOW EMPLOYER VALUES CONTRIBUTE TO EMPLOYEE ENGAGEMENT

Ferreira, Pedro

Univ Portucalense, Research on Economics, Management and Information Technologies - REMIT,
Oporto, Portugal

ABSTRACT

Employer Branding is a concept that is gaining importance within the Human Resources field mainly due to its potential for retaining and attracting talent to boost organisations capabilities and competitiveness. According to the brand management literature, building a brand must start from within, and the employer brand should also function as a reference for a company's current employees. Thus, taking this assumption into account, the main goal of this paper is to understand how employer branding contributes towards employee engagement. In order to address this research problem the authors based the research on a leading manufacturing company in cosmetics, personal care, beauty, homecare and healthcare products and a major supplier of tinplate and plastic packaging, that is going through a process of employer brand building. Field research developed in two steps. First, the HR department and some members of the Board defined the main attributes of the brand as an employer. Second, a survey was administered to senior managers to assess the level of engagement and how they perceive the employer brand attributes. Data dimensionality was reduced using factor analysis and regression analysis tested the relation of employer brand attributes and employee engagement. Factor analysis revealed three main groups of employer brand attributes: Innovation & Growth, Work Environment and Socially Responsible Practices. Employee engagement is mainly explained by Innovation & Growth attributes. The least relevant group of attributes is Socially Responsible Practices. These results contribute to better understand the relation between employer brand and employee outcomes and the importance of defining and managing employer brand attributes to foster employee engagement.

Keywords: Employer Branding, Employee Engagement, Employer Values, Employer Brand Attributes

INTRODUCTION

Companies have sought ever since to fill their human resources needs with the most fit to the job. Taylor and scientific management already stated the need to put the right person in the right job. Nevertheless, the task of attracting candidates has been treated in different ways across the last century.

More recently a new perspective, coined as employer branding, has emerged based on the assumption that a company should approach the labour market in the same way, or based in the same principles, as it approaches the consumer market. Inheriting some basic concepts from marketing, companies should make efforts to build a brand not only for consumers but also for their employees and candidates. Within this context building a strong brand as an employer is at the core of a strategic approach to human resources management.

Employer branding can be viewed from an inner perspective (i.e. how organizations retain talent) and an outer perspective (i.e. how organizations attract talent) (Ferreira and Real de Oliveira, 2013). Most of the research on employer branding follows an outer perspective approach (e.g. (Elving et al., 2012; Van Hove et al., 2013; Jain and Bhatt, 2015; Knox and Freeman, 2006; Kuchеров and Zamulin, 2016; Reis et al., 2017; Wilden et al., 2010; Xie et al., 2014)), by examining issues related with brand image or organizational attractiveness and focused on potential employees. Only a few examples are based on investigating the effects of employer brand on employees' outcomes and behaviours (e.g. (Christie et al., 2015; Maxwell and Knox, 2009; Schlager et al., 2011; Tanwar and Prasad, 2016)).

The present research contributes to the less examined perspective on employer branding – the inner perspective –, and tries to understand how employer branding attributes influence employee outcomes, namely employee engagement. It is commonly accepted that a brand should be built from the inside-out, that is, its main attributes should be found at the core of the company and the way employees live and feel their own employer brand (Maxwell and Knox, 2009). Thus, it should be expected that perceptions of brand attributes might have some impact on employees' behaviours.

The relationship between brand attributes and the impact on employees assumes particular relevance. Specifically, brand attributes should be a source of employee engagement with the company, since those attributes should reflect organizational culture and values, reinforcing its identity and fostering employee engagement (Backhaus and Tikoo, 2004).

Social Identity Approach to Organisational Identification (SIA), an application of the social identity theory (Tajfel & Turner, 1979) and the social categorization (Turner, 1987) to the organizational context (Maxwell and Knox, 2009), frames the approach developed in this research paper. The main assumption of SIA is that the organization, as a social group, offers the means and context for individuals to develop a sense of self-identification with organizational characteristics (organizational identity), which in turn can predict individual and collective behaviours.

Accordingly, the employer brand attributes can function as elements of organisational identity with which employees may, or may not, develop a sense of self-identification. The right employer brand attributes will strengthen the organization-employee relation, which in turn will promote specific attitudes and behaviours, such as employee engagement.

This research paper aims to understand what employer brand attributes are more valued and how they relate with employee engagement. Data collection was made in a specific company that is going through an employer brand building process, thus making the research more contextualized and relevant by providing a practitioner context.

In order to address the research problem, the literature review starts by discussing employer brand, with an emphasis on the inner directed perspective, and goes on to present the concept of employee engagement. Methods are described, namely the way the attributes were defined and selected and the data analysis procedures of data reduction and hypothesis testing. Finally, results are presented and discussed.

Since the paper is based on a specific case, it is expected that the example and experience taken out from this specific company, may illustrate the application of some of the employer brand theoretical assumptions. These include the process of defining the most relevant employer brand attributes, and setting out a strategy that makes the most of the employer brand building by leading to better employee outcomes. Also, it is expected that this results can serve as a benchmark for other companies in order to develop employer brand attributes capable of fostering employees' engagement, thus contributing to companies' outcomes.

LITERATURE REVIEW

Employer Brand

The "employer brand" concept was defined by (Ambler and Barrow, 1996) as "the package of functional, economic and psychological benefits provided by employment and identified with the employing company", with the primary role of "provide a coherent framework for management to simplify and focus priorities, increase productivity and improve recruitment, retention and commitment".

Although employer branding is a concept related with employees and potential employees, its origins can be traced to the notion of corporate brand. More importantly, corporate brand is an important element of a company strategy (Balmer and Gray, 2003) and represents a senior management concern. Another field of study that initially addressed this concept was internal marketing, which gradually shifted towards internal branding. This concept takes more of an "inside-out", value-based approach and seeks to develop and reinforce a common value-based ethos, typically attached to some form of corporate mission or vision (Mosley, 2007).

Since the search for good employees is as fierce as the search for customers, organizations have to be able to differentiate themselves in order to attract and retain the best (Berthon et al., 2005). The notion of employer attractiveness, according to the same authors, is closely related to employer branding. This

could be considered as an outer directed perspective of employer branding (Ferreira and Real de Oliveira, 2013) concerned with aspects such as possible factors affecting the attractiveness of an organization (Lievens et al., 2005), the employer brand as a package of instrumental and symbolic attributes (Lievens, 2007), and a set of characteristics that applicants as well as employees associate with a given employer (Lievens et al., 2007).

Nevertheless for the purpose of this paper we are more interested to look at how employer branding is used towards existing employees. This inner directed perspective of employer branding is characterized by looking at developing a brand from the within, in order to retain talent and to develop a corporate reputation, linking values to employees' behaviours and motivations (Ferreira and Real de Oliveira, 2013).

Studies undertaken within this perspective look at how to retain best workers in order to sustain competitive advantage and to improve business performance (Cardy and Lengnick-Hall, 2011). What are the employees' role in reputation management (Helm, 2011) and how corporate reputations and good governance are built from the inside-out (Martin and Hetrick, 2009). Another emerging field is looking at how employees relate to organizational values. It's not enough to project authenticity to customers – employees must personally subscribe to the brand's values (Wallace, de Chernatony, and Buil, 2011; Weinberger, 2008). Values are communicated to employees via overt internal communications, the ripple effect, senior management example/involvement, HR activities and external communications (Chernatony and Cottam, 2006), and as such a number of failure factors could occur which could hinder the communication of values to employees. Corporate values can motivate employees, but handled incorrectly they can do just the opposite (Edmondson and Cha, 2002).

Employee Engagement

Employee engagement has emerged in recent years either in the practitioner and academic perspectives. Seen as a positive psychological state with behavioural consequences, research shows that employee engagement can have a positive impact on several organizational and individual outcomes, such as discretionary effort and turnover (Shuck and Wollard, 2010), or job satisfaction and organizational citizenship behaviour (Saks, 2006), justifying its raising popularity.

Although there is no widely accepted definition, employee engagement can be understood as “an individual employee's cognitive, emotional, and behavioural state directed toward desired organizational outcomes” (Shuck & Wollard, 2010, p. 103), thus enclosing itself the notion of a kind of motivation clearly expressed in positive behaviours that contribute to the organization as whole.

Work engagement can be defined as a positive, fulfilling, and affective-motivational state of work-related wellbeing. In fact, engagement has emanated from the positive psychology that stresses the need to investigate and find effective applications of positive traits, states and behaviours of employees

within organizations (Bakker and Schaufeli, 2008). As such, engagement can be considered the antipode of burnout (Maslach et al., 2001). Employee engagement is sometimes mistaken with commitment and involvement, mainly due to interchangeable use of the expressions, especially by the practitioners approach (Shuck, 2011).

The measurement of employee engagement is also bone of contention among scholars. (Viljevac et al., 2012) investigated the validity of two measures of work engagement (the Utrecht Work Engagement Scale (UWES) and the (May et al., 2004) scale) that have emerged in the academic literature. They found some evidence for convergent, discriminant and predictive validity for both scales, although neither showed discriminant validity with regard to job satisfaction. They contend that important differences in measuring engagement raises questions on how to measure the construct and the results will be specific to the measures used, limiting generalization.

However, the UWES is one of the most used construct to measure engagement. (Schaufeli, Martinez, et al., 2002), p. 74) defines work engagement as “a positive, fulfilling, work-related state of mind that is characterized by vigour, dedication, and absorption”. The construct has been used in several contexts and countries (e.g. (Bakker et al., 2007; Chung and Angeline, 2010; Ouwenel, 2012; Petrou et al., 2012; Salanova et al., 2005; Salanova and Schaufeli, 2008; Schaufeli, Salanova, et al., 2002).

METHODS

Perceptions of employer brand formed by employees and their work engagement are at the centre of this research paper. The construction of an employer brand can be understood as a reflection of several factors, namely the perceptions that employees have of their own employer, which can be translated into brand attributes. Within this framework, the goal of this research paper is to test the relation that Employer Brand Attributes may have with Employee Engagement.

To test this general assumption the research was conducted within a specific organization that is involved in the process of building a strategic approach to their brand as an employer. Colep is part of the RAR Group, and is a leading manufacturing company in the European and Brazilian markets of cosmetics, personal care, beauty, homecare and healthcare products and a major supplier of tinplate and plastic packaging. Colep is present in several countries, namely Portugal, Brazil, Germany, Poland, Spain and the United Kingdom and employs around 3.600 people. Colep's mission is “working with customers to deliver comfort to consumers”, and their stated values include “customer focus”, “ethical and socially responsible”, “learning organization”, “openness, trust and fairness”, “creativity”, and “value creation”.

Measures

The employer brand attributes were specifically formulated for the project under development in the company. The HR team and top management participated in a brainstorm meeting to list the main characteristics of Colep's brand as an employer. For this brainstorm participants were invited to think and discuss the company's employer brand, based on the main distinguishing organizational culture and values and how they could be translated into real practices and be reflected in work environment. The agreed list was then discussed and validated with the CEO and other members of the Board. The final list comprised 19 items (see appendix), and was included in the questionnaire; respondents were asked if the company provided employees with the attribute, rating each item on a 5-point Likert scale (1=totally disagree to 5=totally agree).

Employee engagement was measured using the Utrecht Work Engagement Scale (UWES) (Schaufeli, Salanova, et al., 2002). The construct comprises three dimensions. Vigour refers to the levels of energy (e.g. "At my work, I feel bursting with energy"), mental resilience and persistence. Dedication is about the mental and emotional state that reflects on experience a sense of significance, enthusiasm, inspiration and pride (e.g. "I am enthusiastic about my job"). Finally, absorption means being completely concentrated in ones work (e.g. "I feel happy when I am working intensely"). The original scale is made of 17 items measured in a 7-point Likert scale (1=Not probable; 7=Most probable), but was reduced to 9 items maintaining the original dimensions and good psychometric properties (Schaufeli et al., 2006). For the short version scale, see Appendix.

Participants

For the purpose of this study the target population was line managers from the three higher report levels with leadership functions, according to the company's organizational structure. This option is based on the fact that it would be almost impossible to collect data from lower level employees, since employees are dispersed in several countries and the questionnaire was made available online. The survey was sent by email to all the targeted population and data was collected in June and July 2013.

The total population accounted for 303 senior managers distributed across Portugal, Germany, Poland, UK and Spain. From the total target population, we obtained 170 responses (a 56.1% response rate). The majority of respondents are from Portugal (61%), followed by Germany (20%) and Poland (11%). The United Kingdom (5%) and Spain (3%) are the less represented. Although the company origin is Portuguese, respondents are natives from each of the countries in the sample.

Data analysis

Since employee engagement is measured using a tested scale, exploratory factor analysis was performed to check if the construct's dimensions could be confirmed, followed by reliability analysis and mean scores calculation. Also, the employer brand attributes were subjected to dimensionality

reduction through exploratory factor analysis in order to check if and how the attributes could be grouped in major core brand attributes, thus reflecting main core-values. Finally, and since the main goal is to assess the relationship between the attributes and employee work engagement, a set of regression analysis were performed to assess the relation between the groups of attributes, the general employee engagement and each of the three dimensions.

RESULTS

Employer brand attributes are presented in the following figure. According to respondents the most important attributes of the company's brand are "multicultural environment" (M=4.09; S.D.=.837), "opportunity to belong to a company with an interesting portfolio of products" (M=3.96; S.D.=.763), "openness for proactivity actions" (M=3.88; S.D.=.737) and "informal & healthy relationships" (M=3.86; S.D.=.688). On the opposite, the least relevant attributes are "compensation attractiveness" (M=3.10; S.D.=.841), "recognition/rewards for performance" (M=3.19; S.D.=1.004) and "attractive benefits' package" (M=3.25; S.D.=.934).

Employer Brand Attributes	M	S.D.
EBA01 [Multicultural environment]	4.09	.837
EBA02 [Work / life balance respect]	3.75	.740
EBA03 [Informal & healthy relationships]	3.86	.688
EBA04 [Long term sustainable practices]	3.64	.762
EBA05 [Freedom to innovate]	3.66	.812
EBA06 [Openness for proactivity actions]	3.88	.737
EBA07 [Recognition / rewards for performance]	3.19	1.004
EBA08 [Respect for differences]	3.74	.719
EBA09 [Opportunities for career growth]	3.42	.925
EBA10 [Good work environment]	3.72	.806
EBA11 [Opportunity to belong to a company with an interesting portfolio of products]	3.96	.763
EBA12 [Attractive benefits' package]	3.25	.934
EBA13 [Opportunities for skills development]	3.63	.830
EBA14 [Compensation attractiveness]	3.10	.841
EBA15 [Healthy and safety conditions]	4.01	.799
EBA16 [Meaningful and interesting functions]	3.83	.718
EBA17 [Social and environmental responsibility]	3.79	.775
EBA18 [Job security]	3.74	.845
EBA19 [Openness, trust and fairness in the relation with others]	3.66	.854

Figure 1. *Descriptive Statistics for Employer Brand Attributes*

In order to reduce data dimension of the Employer Brand Attributes, the 19 items were computed into an exploratory factor analysis. The first attempt reduced data to three components (PVAF=57.3%; KMO=.903; $\chi^2=1429.224$, Sig.=.000). However, items EBA09 and EBA11 were withdrawn since they

loaded less than .500 (.491 and .340, respectively). Also, items EBA08, EBA10, EBA14, EBA15 and EBA16 were also withdrawn since they did not clearly loaded on one factor.

A new factor analysis was performed with the remaining items. Three factors were extracted (PVAF=63.6%; KMO=.875; $\chi^2=751.210$, Sig.=.000).

Figure 2. *Factor Analysis of Employer Brand Attributes*

Following the description of items grouped in each component, and since this an exploratory analysis with no reference to a specific theory, we decided to name components as follows. All components have considerable internal reliability.

Component 1: Innovation & Growth ($\alpha=.827$)

Component 2: Work Environment ($\alpha=.695$)

Component 3: Socially Responsible Practices ($\alpha=.774$)

Figure 3 presents the mean, standard deviation and correlations for all the employee engagement items. It is worth to note that correlation values range from .332 to .711 and all items show significant moderate intercorrelations ($p<0.01$).

	M	S.D.	EE VI1	EE VI2	EE DE2	EE DE3	EE VI3	EE AB3	EE DE4	EE AB4	EE AB5
EE VI1 [At my work, I feel bursting with energy]	5,40	1,278	1								
EE VI2 [At my job, I feel strong and vigorous]	5,54	1,185	,613*	1							
EE DE2 [I am enthusiastic about my job]	5,75	1,233	,490*	,711*	1						
EE DE3 [My job inspires me]	5,37	1,285	,451*	,644*	,760*	1					
EE VI3 [When I get up in the morning, I feel like going to work]	5,38	1,332	,389*	,600*	,617*	,641*	1				
EE AB3 [I feel happy when I am working intensely]	5,92	1,002	,370*	,454*	,373*	,430*	,465*	1			
EE DE4 [I am proud of the work that I do]	6,06	1,127	,397*	,591*	,670*	,667*	,544*	,405*	1		
EE AB4 [I am immersed in my work]	5,80	1,100	,332*	,454*	,459*	,449*	,456*	,433*	,533*	1	
EE AB5 [I get carried away when I am working]	5,41	1,213	,339*	,465*	,511*	,551*	,524*	,474*	,531*	,536*	1

Note: * $p < 0.01$

Figure 3. *Descriptive statistics for Employee Work Engagement*

The 9-items of the short version of UWES were subjected to an exploratory factor analysis in order to check the construct robustness and also the three dimensions' structure suggested by the literature. Data is suitable for factor analysis (KMO=.915; Barlett Test Sig.= .000) and all items group in only one factor with PVAF of 56.9%, with factor loadings above .400. Thus the 9-item UWES short version scale seems to be robust since the one factor result shows that items reflect the construct of work engagement, which is confirmed by the Cronbach's Alpha ($\alpha=.903$).

After computing the mean for the constructs of Employee Engagement (and respective dimensions) and the three components of Employer Brand Attributes, the following figure presents the mean, standard deviation and correlations for all the variables. The items of employee engagement and employer brand core attributes present a significant moderate intercorrelation ranging from $r=.304$ to $r=.498$ ($p < .01$). Also, employer brand attributes show a significant moderate intercorrelation ranging from $r=.526$ to $r=.609$ ($p < .01$). A paired samples t-test indicated significant differences between EBA1 and EBA2, $t(167)=-6.451$, $p < .0005$, and between EBA2 and EBA3, $t(167)=-6.399$, $p < .0005$. However, the differences between EBA1 and EBA3 are not significant. Work Environment (EBA2) has a higher mean score ($M=3.9$; $S.D.=.594$) than Innovation & Growth (EBA1) ($M=3.6$; $S.D.=.654$) and Socially Responsible Practices (EBA3) ($M=3.6$; $S.D.=.640$).

Figure 4. *Intercorrelations of study variables*

To test the hypotheses for the relationship between Employer Brand Attributes and Employee Engagement, multiple regression analyses were conducted where the general employee engagement, vigour, absorption and dedication dimensions were the dependent variables and the three core Employer Brand Attributes the independent variables. As shown in the following table, Innovation and Growth (EBA1) explains a significant amount of variance of the general employee engagement ($\beta=.350$; $p<.0005$), but also of vigour ($\beta=.296$; $p<.005$), absorption ($\beta=.284$; $p<.005$) and dedication ($\beta=.350$; $p<.0005$). On the other hand, Work Environment (EBA2) attribute explains a part of the variance of the general employee engagement ($\beta=.171$; $p<.05$) and of the dedication dimension ($\beta=.245$; $p<.01$). Finally, Socially Responsible Practices (EBA3) only explain a part of variance of the absorption dimension ($\beta=.216$; $p<.05$).

Figure 5. *Regression Analysis predicting Employee Engagement*

DISCUSSION AND CONCLUSIONS

The goal of this research was to understand the relation between employer brand attributes and employee engagement. Based on the assumption that a brand must consider the inner dynamics of the company, namely its shared core values and the impact that those values may have on employees' behaviours, this study examined the contribution employees may have in building the employer brand, but also on the potential effect that the employer brand can have on positive employees' outcomes.

The study subject was based on a company that went through the process of strategically building their brand as an employer. This choice was based on two assumptions: first, the need to bridge theory and practice, the academic and practitioner views; second, because this specific company is implementing their employer brand, allowing to follow closely a real case.

After conducting the dimension reduction of data, regression analysis revealed that the core attribute most relevant for explaining employee engagement is "Innovation & Growth". This group presents two interconnected facets of the company. On the one hand, employees recognize that they work in a company where openness to innovate and the challenge to do new things are at the core of company's brand attributes. On the other hand, employees perceive that the company promotes a rewarding environment, through recognition for performance and development opportunities. Thus it can be said that employees tend to feel more engaged if their work is challenging, enriching and rewarding.

Being able to take proactive actions and to innovate is related with job characteristics, since they imply autonomy and problem solving. Some literature supports that job characteristics are related with employee engagement. For example, job characteristics such as autonomy, task variety and significance, or job complexity have a positive influence on engagement (Bakker et al., 2007; Christian et al., 2011).

Learning also plays a pivotal role in this core employer brand attribute. Having opportunities for skills development contributes to employees' engagement. In fact, human resources development practices are considered to be related with higher levels of employee engagement, which is supported by the literature (Fairlie, 2011; Rana et al., 2014; Shuck et al., 2011).

The final component of the "Innovation & Growth" core employer brand attribute is the existence of recognition and rewards for performance. The literature presents mixed results regarding the impact of rewards on engagement (Yalabik et al., 2017). Some literature suggests that extrinsic rewards may damage engagement (Bakker et al., 2006), while others (Gorter et al., 2008) have found a positive link between them. Crawford, based on a meta-analytic study of the antecedents and drivers of employee engagement suggests that the influence of extrinsic rewards on engagement depends on the presence of intrinsic motivation, since the former can have a negative impact on the latter.

“Work Environment” also contributes to explain general engagement. Promoting work-life balance and healthy relationships reveals a concern with well-being, which is valued by this company’s employees. The importance of well-being for employee engagement is documented in the literature (Shimazu et al., 2014; Shimazu and Schaufeli, 2009; Shuck and Reio, 2014), showing that work engagement is an enhancer of several well-being indicators such as life satisfaction, health (reducing psychological distress and physical complaints), psychological well-being, either as an antecedent or as a moderator. In some research work engagement can even be considered a dimension of work-related wellbeing (Robertson and Cooper, 2010; Rothmann, 2008).

Two dimensions underlying wellbeing at work are activation (ranging from exhaustion to vigour) and identification (ranging from cynicism to dedication) (Schaufeli, Salanova, et al., 2002). Accordingly, “Work Environment” also contributes to explain the dedication dimension of employee engagement. Dedication is about significance, enthusiasm, inspiration, pride and challenge (Schaufeli, Salanova, et al., 2002) and work environment includes aspects such as the respect for work-life balance and healthy and informal relationships, which may foster employees’ dedication.

Finally, the “Socially Responsible Practices” core attribute, specially connected with internal CSR (Oliveira et al., 2013), is not so relevant when it comes to promote engagement, just contributing to explain one dimension of employee engagement. Most research tends to relate socially responsible practices with higher levels of employee engagement (Chaudhary, 2017; Mirvis, 2012; Tsourvakas and Yfantidou, 2018). However, when it comes to link internal social responsible practices with employee engagement, some research does not clearly demonstrate this relation (Ferreira and de Oliveira, 2014). The social responsible practices core attribute also included “job security”. The literature also supports the relation of job security (or insecurity) with work engagement. For example, in a study about job insecurity and job performance, (Wang et al., 2015) found that job insecurity was negatively associated with job performance through work engagement when organizational justice was low. Also, (Bosman et al., 2005) examined the relation of job insecurity with work engagement and burnout when mediated by affectivity (either positive or negative). The results showed that higher levels of either cognitive or affective job insecurity were associated with lower levels of work engagement.

Thus, since aspects of socially responsible practices, either internal or external are present (such as job security or Social and environmental responsibility), it would be expected that this core brand attribute would have more impact on employee engagement. However, it just contributes to explain absorption. This dimension of employee engagement is characterized by being fully concentrated in one’s work but with an intrinsic enjoyment. On the one hand, taking into account that this group includes aspects such as job security and attractive benefits package, employees feel a sense of security, which may free them to concentrate on their own job. On the other hand, this group includes long-term sustainable practices

and social and environmental responsibility which may contribute to the intrinsic enjoyment attached to absorption.

These results present some implications. Theoretical implications include the contribution to the understanding of employer brand, namely its contribution to employee and organizational outcomes. These results support the idea that employer branding may be the (new) strategic tool for managing human resources. In terms of practical implications, this research contributes to the importance of managing employer brand as companies manage consumer brand, since understanding the attributes of the employer brand can help companies not only to reflect on their own brand identity, but also manage that identity in order to foster employees' behaviours and performance.

Nevertheless, there are some limitations to be pointed out. This research was based on a single company with its own specificities, making impossible to generalize the results and conclusions; however, it offers some insights to other companies wishing to build a strong employer brand. Despite its widely use, another limitation regards the use of UWES scale to measure engagement since it does not allow isolate job engagement and organization engagement (Saks, 2006). Finally, the procedures to choose the employer brand attributes to be included in the survey may have been biased by the insider perspective of the participants.

Despite the limitation pointed out, this paper makes a specific contribution in linking employer brand attributes to employees' outcomes, namely employee engagement.

PUBLIC-PRIVATE COOPERATION IN WINE TOURISM - A TERRITORIAL MODEL FOR SMALL MUNICIPALITIES IN ITALY

Festa, Giuseppe¹; Cuomo, Maria Teresa¹; Metallo, Gerardino¹; Benvenuti, Paolo²

¹Department of Economic and Statistical Sciences, University of Salerno, Italy

²National Association of "Wine Cities", Siena, Italy

ABSTRACT

From a quantitative point of view, Italy as country is the largest producer of wine in the world. Similarly, wine tourism, as additional business opportunity related to wine production in the strict sense, is a phenomenon of great success in Italy, but it has not yet reached the high levels of other countries (especially the New World of Wine). One of the main limits of this delay, even in the presence of significant performances, is the lack of synergistic collaboration, at widespread level, among the operators of the sector. This research intends to investigate in particular the reliability of a possible collaboration model for wine tourism with a 'public' basis that is, from the point of view of the municipality engaged in the promotion of the wine tourism industry insisting on its own territory. The survey, which has proposed a territorial model derived from previous studies on the subject conducted by the authors, has showed the substantial reliability of the model, bringing out, at the same time, a clear difference of perception between non-small municipalities and small municipalities. A recent legislation in Italy, just focused on small municipalities, might help overcome these gaps, freeing in the territory new energies, from both planning and financing point of views, for an even more important development of wine tourism in Italy.

Keywords: Wine business, wine tourism, collaboration networks, territorial networks, territorial systems, small municipalities, public governance, public-private partnerships.

INTRODUCTION

2017 will be remembered by the operators of the Italian wine industry as a very special year, in which the evidence of climate change has been felt with great impact (for all the following information cf. OIV, 2017): a very dry weather, which has brought the Italian production to be around 40 million hectoliters. In terms of quantity, also other 'traditional' wine countries have suffered; if for Italy, always according to OIV data, experts have estimated a decrease of 2018 on 2017 around 23%, for France the decrease is around 19% and for Spain around 15%. The countries of the New World of Wine, however, remain largely stable in terms of production quantities. The only positive exceptions

are Argentina (+25%) in the New World and Portugal (+10%) in the Old World, while in other cases increases refer to previous values that are presumably low and thus suspected of distortions in the calculation evidences (e.g., +169% in Brazil or +64% in Romania). In addition to the summer drought (to be honest, also in other periods of the year), other atmospheric hardships have hit Italy in 2017 (frost, storms, floods, etc.), not everywhere and not with the same intensity, but in any case, contributing to make a very difficult vintage. In many places, however, we can highlight obvious reductions as regards quantity, but also a good if not excellent quality of grapes and wines, with a significant increase of the purchase prices, due to these factors altogether.

These major changes have happened only in one year (please consider that the Italian wine production in 2017 was around 50 million hectoliters, for a reduction from 2017 to 2018 equal to the entire production of South Africa). In addition to the wine sector in the strict sense, 2017 has produced great change in Italy also with regard to the world of wine in general, and wine tourism in particular. In fact, in 2017 the Italian Parliament has approved three very important laws: the Consolidated Law on Vine and Wine, the Small Municipalities Act, and the amendment to the Financial Law for 2018 on wine tourism taxation. These new regulations are of considerable interest: somehow, their integrated use could produce a sort of 'revolution' for Italian wine tourism.

The following study is a scientific derivative of the annual survey – on the state of the art of wine tourism in Italy – conducted every year by the National Association of "Wine Cities". Interviewees have been involved in the evaluation of a framework for wine tourism development that has been thought especially (but not only) for small municipalities (i.e., in Italy, municipalities with less than 5,000 inhabitants). The aim of the research is to emphasize a sort of 'Italian' model for wine tourism, made of beautiful places, delicacy specialties, and environmental habitability. In this mix, it is essential to plan, organize, and manage adequate 'networks of collaboration' among public and private operators, to give the highest value to the *terroir* not only for wine, but also for the entire wine-tourism supply-chain of the territory.

LITERATURE REVIEW

Wine tourism in Italy is a very important phenomenon, arriving at counting, according to the most authoritative estimations (Wine Cities, 2016), more than 14 million accesses for year (considering altogether tourists in the strict sense and hikers) and at least 2,5 billion euro of total value (considering altogether the wealth produced by the operators of the entire wine-tourism supply-chain). Several limitations, however, are still hampering the complete development of wine tourism in Italy: lack of service orientation (Tommasetti and Festa, 2014), absence of a systemic view (Romano and Natilli, 2010; Festa *et al.*, 2015), delay in considering wine tourism as a real business model (Festa *et al.*, 2016).

Moreover, this is a common situation for many countries of the Old World of Wine (i.e., Europe), which are focused very much on wine production and very little on wine tourism, at least if compared with the countries of the New World of Wine (USA, Argentina, Chile, South Africa, Australia, and New Zealand) (Gomez *et al.*, 2018). One of the most important characteristics of 'Italian' wine tourism should reside in the global sustainability of the overall experience (Annunziata *et al.*, 2018; Flores, 2018), adhering to an "Italian Way of Wine" (Festa and Mainolfi, 2013) focused on beauty, quality, and authenticity (Romano and Natilli, 2010; Sasso and Solima, 2018). Even more specifically, as investigated below more in details, rural areas seem to become finally a subject of considerable interest for the activation of new tourism business models in general, and wine tourism in particular (Salvatore *et al.*, 2018).

However, it is not easy to overcome "... the lack of material and non-material resources often associated with such towns" (Rauhut Kompaniets and Rauhut, 2013). From a structural point of view, in truth, this limit seems unsolvable: wine tourists, even earlier than 'wine', are 'tourists' (Tommasetti and Festa, 2014), and they need/desire in general sufficient service, even though not always with best quality standards, given the authenticity spirit of rural tourism. While, from a systemic point of view, new opportunities may arise, also as concerns new tourism strategies, e.g. modularity (del Vecchio *et al.*, 2018). In fact, if a sufficient set of operators/services is almost impossible for small territories, their subjects of governance, also thanks to their natural leadership on the territory (Khodabandehloo, 2014), could collect them through a Resource Based View organization that would involve even other territories (Rauhut Kompaniets and Rauhut, 2013). This would be even truer especially if – and that should just the case of small municipalities – these resources are valuable, rare, inimitable, and organized, according to the VRIO model (Barney, 1995), especially for wine tourism (Casas-Romeo *et al.*, 2016).

RESEARCH METHODOLOGY

At the basis of the annual survey conducted by the National Association of "Wine Cities" on the state of the art of wine tourism in Italy is a structured methodological approach, whose pillars are the following.

- 1) The survey has concerned the municipalities that are members of the National Association of "Wine Cities" (throughout the entire country), being the main promoters, even only for identification, of wine tourism territories. All the municipalities present in the database of the association have been contacted (420), invited to respond once via e-mail notice (universe) and then via telephone reminder (sample). At the end of the survey, 'true' respondents have been 85 (in other words, respondents whose responses have nourished correctly the research database). Thus,

the survey perimeter covers 85 municipalities of 420 (i.e., 20.24%). From these considerations, it is evident that the data collected from the field have been derived from a sample that has been selected first with the non-probability sampling technique of convenience, and secondly, with the non-probability sampling technique of judgment. As regards the statistical reliability of the survey, in the case of simple random sampling, the sample thus obtained would have been representative for 89.90% of cases with a maximum of 8% of error (0.08 on a unit basis).

- 2) Beyond an overall analysis of the wine tourism phenomenon, and from an exploratory point of view, the survey has proposed also a possible model of wine tourism development based on 'collaborative' networks among public and private operators, in which to highlight the key players of the wine tourism industry and the main problems/opportunities in terms of collaboration.
- 3) The territorial model of 'collaborative network' and the related questionnaire is result of the scientific activity of a research group pertaining to the Postgraduate Course in "Wine Business" of the University of Salerno. The questionnaire consists of 18 questions globally. Before distributing the questionnaire in the field, having prevailing institutional value, it has been tested, verified, and validated by the staff persons in charge of the National Association of "Wine Cities".
- 4) The entire questionnaire procedure has been online, by using a software platform. This has generated a) the links to get to the questionnaire, b) the web masks for compilation (accessible from computers, tablets, and smartphones), and c) the spreadsheets displays, so to simplify respectively the filling of the fields, the accuracy of the answers, and the subsequent setting up of the database. For reasons of mere approximation/rounding of the percentages, some data have not perfectly added up to 100%, but 99.99% or 100.01%.
- 5) The above methodology can be replicated efficiently in further investigations, even trans-national if considering the more and more intense collaboration between "Wine Cities" (the National Association of wine municipalities in Italy) and "Recevin" (the International Association of wine municipalities in Europe).

RESEARCH OBJECTIVE

This study aims to provide a possible answer to the following research question: "What is the relational context of reference of the municipality engaged in wine tourism?" Therefore, the perspective of the survey is specifically that one of municipalities (and not of other actors, public or private, involved in the overall wine tourism offer), because of two fundamental reasons:

- 1) wine tourism, of course, must be developed in a territory with some interest about wine; but, at the same time,

2) the only wine offer, intended as cultivating grapes, transforming grapes into wine, and bottling wine, is not enough, because wine tourism is first and foremost 'tourism'.

In developing such exploration, furthermore, identification, activation, and management of a relational context are strategic operations that constitute a valuable interpretation key of the wine tourism territory. In fact, the subject of governance (first of all, the municipality) should tend ever more to shift the dynamic behavior from a government perspective (top-down) to a facilitation perspective (bottom-up).

In this research, therefore, the first problem for the municipality (of the wine tourism territory) is to define the relational context from a wine tourism point of view. This is the portion of macro- and micro-environment that the subject of governance of the municipality, even only as regards wine tourism, considers a system of activities/services able to co-create wine tourism value. For this reason, the exploratory research, which has investigated the municipalities belonging to the National Association of "Wine Cities", presents the following setting.

First, moving from previous studies (Pellicano *et al.*, 2015; Festa *et al.*, 2015), a possible list of actors, public and private, which should cooperate 'theoretically' with the municipality to propose an effective wine tourism offer (cf. Fig. 1), has been proposed.

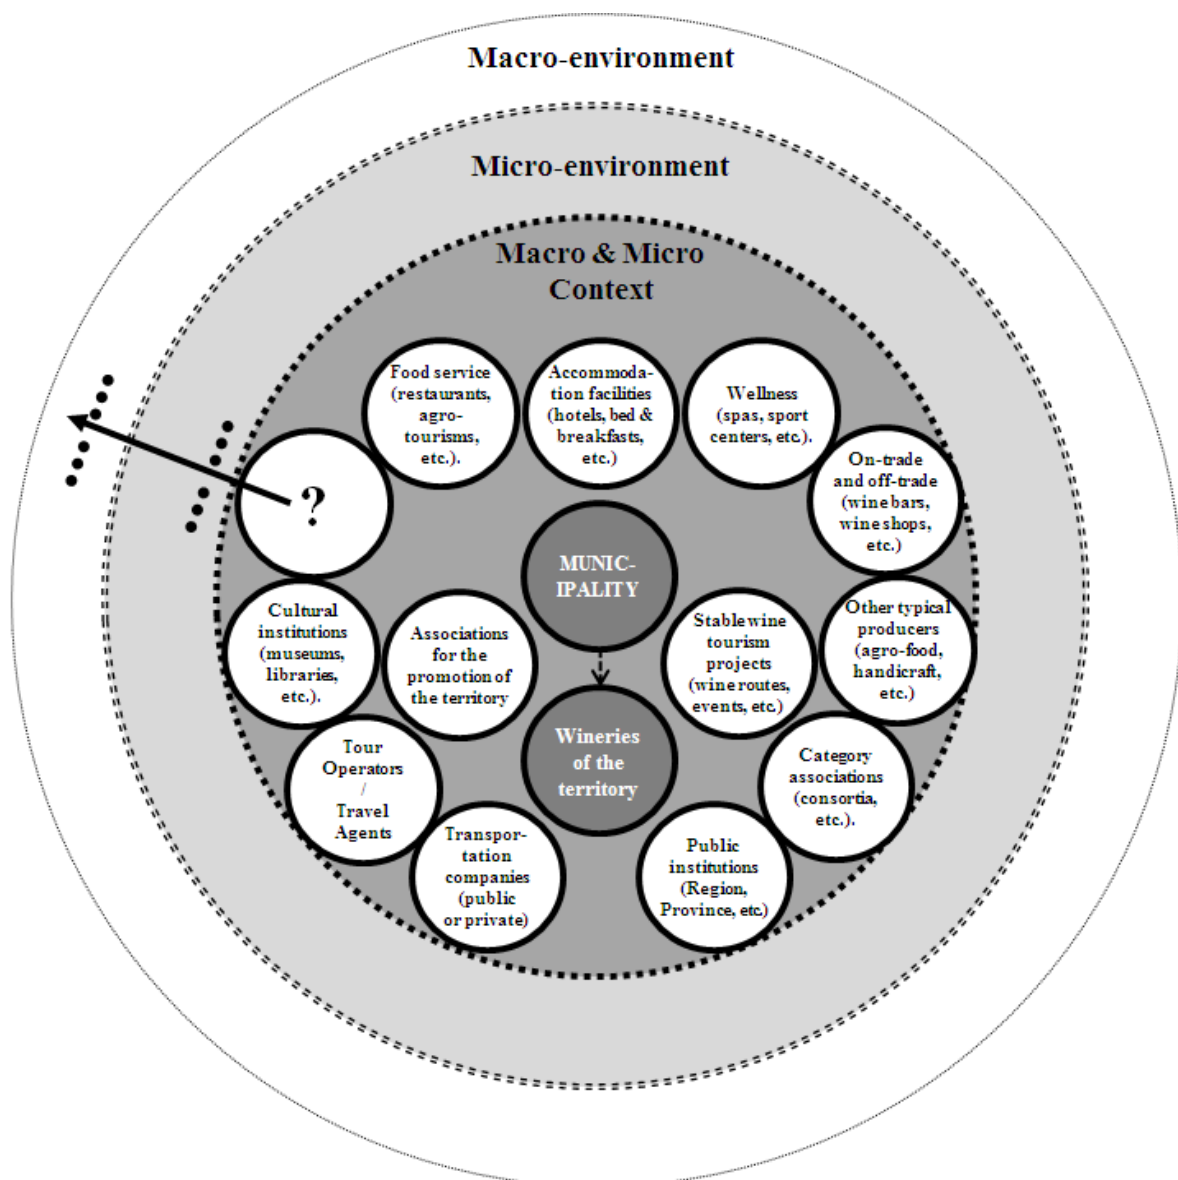

Fig. 1. Synopsis of the territorial model for wine tourism based on 'municipalities' (contextual reworking of the authors from Festa et al., 2015).

Of course, interviewees have had the possibility to add other actors that are not present in the list, but that are relevant in their opinion. Then, next to each category a rating scale (from 0 to 10) indicates how much important 'in theory' the interviewee considers each operator for the collaboration with the municipality (for purely wine tourism aims).

ANALYSIS OF THE RESULTS

Table 1 illustrates synoptically the main findings of the survey. In order to bring out a particular highlight for small municipalities, distinction exists among "all municipalities", "non-small

municipalities”, and “small municipalities”, finally indicating the perception spread between non-small municipalities and small ones.

Category of wine tourism operators on a territorial basis	Strategic relevance of the category from the point of view of the ‘municipality’ (average values, from 0 to 10)			
	ALL MUNICIPALITIES	NON-SMALL MUNICIPALITIES	SMALL MUNICIPALITIES	SPREAD (NON SMA)
Wineries of the territory	8.47	8.65	8.28	0.37
Food service (restaurants, agro-tourisms, etc.)	8.11	8.65	7.53	1.12
Accommodation facilities (hotels, bed & breakfasts, etc.)	7.73	8.18	7.25	0.93
Wellness (spas, sport centers, etc.)	5.12	5.65	4.56	1.09
On-trade and off-trade (wine bar, wine shops, etc.)	6.55	7.41	5.63	1.78
Other typical producers (agro-food, handicraft, etc.)	6.86	7.32	6.38	0.94
Category associations (consortia, etc.)	6.65	7.35	5.91	1.44
Public institutions (Region, Province, etc.)	7.15	7.44	6.84	0.60
Stable wine tourism projects (wine routes, events, etc.)	7.48	8.03	6.91	1.12
Associations for the promotion of the territory	7.42	7.59	7.25	0.34
Transportation companies (public or private)	6.15	6.59	5.69	0.90
Tour Operators / Travel Agents	6.71	7.24	6.16	1.08
Cultural institutions (museums, libraries, etc.)	6.50	7.03	5.94	1.09
Other (if ‘Other’ please specify)	Interviewees have proposed no additional categories			

Tab. 1. Perceived relevance of the collaboration with the individual category of wine tourism operator.

All the categories of operators provided by the model have been considered sufficiently relevant (receiving an assessment in terms of perceived relevance that is equal to or greater than 6 on a 10 basis), except that one relating to “Wellness” (spas, sport centers, etc.). The deep analysis of the assessments emerging from non-small municipalities and small municipalities does not reveal substantial differences on the average of the assessments for each category, but reveals instead a substantial, because systematic, evidence. In fact, the average of the assessments concerning the perceived relevance for each category of operators of the potential wine tourism offer, when expressed by small municipalities, is always lower than that one expressed by non-small municipalities. The higher ‘spread’ concerns “On-trade and off-trade” (wine bars, wine shops, etc.) for a value equal to 1.78, and “Category associations” (consortia, etc.) for a value equal to 1.44. The third highest spread

value (1.12) concerns both “Food service” (restaurants, agro-tourisms, etc.) and “Stable wine tourism projects” (wine routes, events, etc.).

A possible reason for this difference could be that wine tourism is more ‘restricted’ with respect to food-and-beverage tourism in general (and then, with a potential minor impact in more restricted areas), but two additional evidences seem demonstrating the opposite. First, this reflection should be true also for non-small municipalities; second, there is a spread concerning also the relevance of “Wineries of the territory”. Thus, our consideration is that small municipalities simply perceive lesser relevance about the operators of the entire wines tourism offer, most probably for cultural and strategic reasons.

Instead, this territorial model can be useful most of all for small municipalities because it is oriented to overcome the lack of resources (i.e., operators) emerged from the literature review. In this, there is a confirmation of what previous studies have highlighted, while a possible contribution of this research relies in proposing a different methodology for overcoming this natural difficulty, i.e. putting together the necessary services/activities for wine tourism in small municipalities not only from a private point of view, but also from a public-private point of view. A practical example of this potentiality is the hospitality solution of ‘Albergo Diffuso’, which physiologically implies collaboration with private operators and public authorities and which is nowadays a success story in many Italian small rural towns (Morena et al., 2017).

RESEARCH LIMITATIONS AND SCIENTIFIC/MANAGERIAL IMPLICATIONS

From the investigation on the field and the subsequent analysis of the results, two substantial evidences have arisen.

- ⊙ Except “Wellness” (spas, sport centers, etc.), all the operators provided by the proposed territorial model for wine tourism, developed from the point of view of the municipalities, have been considered significant for the overall wine tourism offer of the territory.
- ⊙ Average assessments about the perceived relevance are quite similar, but a systematic evidence is present: the relevance perceived by small municipalities as concerns the operators of the entire wine-tourism supply-chain is always lower than that one perceived by non-small municipalities.

These evidences, thanks to the sampling procedure, seem to show substantial reliability. From a strictly scientific point of view, however, since the sampling have been conducted according to non-probabilistic manner, it is not possible to extend with certainty the obtained results to the whole universe of the municipalities associated to “Wine Cities”, and even less, of course, to the entire

universe of Italian municipalities. Subsequent studies, therefore, are necessary to increase the reliability of the results of the current research, which remains exploratory.

As regards scientific and managerial implications, it seems that there is an orientation of small municipalities to consider the operators of the sectors that are 'adjacent' to the wine sector in the strict sense, on average, as non-relevant for the overall wine-tourism supply-chain. In the above disarticulation, from the point of view of the small municipalities, five categories out of ten do not reach the sufficiency score (Wellness, On-trade and off-trade, Category associations, Transportation companies, and Cultural institutions). The evidence is comprehensible: in a territory with limited size (at least for the population), the 'core' of the wine tourism offer is the winery, while the other categories of operators of the overall supply chain, when they exist, play a secondary or even marginal role (i.e., lower than 6/10).

In any event, the competition potentiality of a wine tourism destination that would pose its territorial attraction only on wine seems at least risky, since service orientation of the wine tourism industry and collaboration among the partners of the wine-tourism supply-chain nowadays seem to be common principles in the wine tourism economy. For the Italian territory in particular, it is possible that an important role would belong to the above-mentioned Small Municipalities Act, of which some 'collaborative' applications seem feasible in order to increase wine tourism cooperation, obviously from the point of view of the governance of the small municipality.

CONCLUSION

The focus on a proposal for a wine tourism territorial model has highlighted a different propensity of small municipalities in evaluating, for wine tourism purposes, the relevance of the industry players (wineries and other operators). Small municipalities particularly, however, could represent a 'point of reference' (even only thanks to their high number) for an 'Italian' model of wine tourism to operate in territories with limited size, completely different one from another, and based on beautiful sceneries, fine cuisine, and environmental sustainability.

The Italian Law No. 158, dated 10 June 2017 and published in the Official Gazette on 2 November 2017, has been intended exclusively for small municipalities, providing funds and designing possible scenarios of action (Small Municipalities Act). Among the possible applications of this law, some solutions are especially suited for wine tourism. Nevertheless, skills, experiences, and projects available at the service of local governance, including ad hoc training for public operators, are necessary in order to make even more attractive and competitive the wine tourism offer of small municipalities in Italy.

ABSTRACT

In an increasingly globalized market environment, there is an impetus for many companies to look to foreign markets in order to maintain and expand margins and competitive advantage. Once embarked on this endeavor, organizations are involved in governing and managing the complex and vast competitive and institutional net of finance, production, communication, and distribution related relationships that constitute globalization. The push to engage in international development is imperative and even small and medium enterprises (SMEs) feel the need to extend their business activity beyond conventional local markets, identifying and employing distinctive yet accessible competitive advantages to be able to compete. One such possible factor is exploration and interaction with the local territories in which they reside.

This study analyses this territorial issue as a distinctive factor through which the concept and practice of the label of 'Made in Italy' operates. Specifically, it considers the role of inter-territorial collaborations – outsourcing activities with smaller added value whilst preserving and enhancing history, style, and talent that constitutes the essence of Italian 'quality' – as pillar of the Italian territorial capitalism, operating with a 'glocal' approach. The research investigates this Italian phenomenon through an investigation on SMEs that compete successfully abroad (although also in the domestic market) with a 'glocal' approach, through the formula of industrial districts.

The findings conclude that international expansion is always complex (as, in truth, every growth/development strategy is). For SMEs, however, territorial capitalism could emerge as a specific factor of competitiveness, clearly and most of all when the territorial reputation is noteworthy, like the case of 'Made in Italy' is.

Keywords: Italy, Made in Italy, country of origin effect, made in effect, territory, territorial capitalism, SMEs, international competition, globalization, glocalization.

INTRODUCTION

Within contemporary globalization processes, enterprises operate in institutional atmospheres that are ever more complex and environments that are ever more competitive. Much of this dynamics derives from the impact of new technologies, which have provided enhanced capacities for transportation, travel, and communication, with direct influence on knowledge circulation, whose consequence is the emersion of global markets (Levitt, 1983; Green et al., 2012; Kiss et al., 2012; Kinser, 2015). At first glance, these developments could undermine the reasons for the successful existence of local markets, products, and firms, but localized dimensions can be indeed a privileged source of differentiation (Porter, 1986; Dossi et al., 1994; Schiele and Ebner, 2013). Moreover, within the evolution of globalization, competition exists also among geographic areas and their abilities to guarantee specific operating conditions for enterprises (Di Cimbrini, 2008).

Thus, internationalization choices, starting from the mere exportation, are more and more complicated and sophisticated, in particular for smaller enterprises that wish to extend their activities beyond the domestic market. However, from a cognitive point of view, the territorial dimension of business development provides also a basis on which knowledge is available locally, decoding markets stimuli, and discerning 'common languages' from and within the total system (Ernst and Kim, 2002; Di Cimbrini, 2008; Hong et al., 2017). Small and Medium Enterprises in particular (i.e., as per European Union definition, enterprises with less than 250 employees) are well placed to derive this new competitive advantage through their size and structure. In fact, they are naturally oriented to a tight interaction with their territory, communities, and economies, engaging continuously exploratory learning as well (Ahlström-Söderling, 2003; Belussi et al., 2008, Fernández-Esquinas et al., 2017).

Furthermore, if considering the peculiarity of the 'Made in Italy' effect, in order to consolidate the presence of Italian SMEs on the worldwide market, development strategies and policies must consider very accurately the factors connected to the territory. These can be, for example, entrepreneurial abilities, human and social capital, and infrastructure nets (Schiuma and Lerro, 2008; Del Baldo, 2012; Salvador et al., 2014; Demartini and Del Baldo, 2015). To this end, the power of 'Made in Italy', with all the positive aspects associated, has arisen, and its consolidation is mainly due to the distinctive equilibrium between specific technical-economic components (involving characteristic clusters of skills and knowledge) and specific territorial-cultural components (drawing on socio-historical elements). In fact, every 'product' presents both tangible (raw materials, production techniques, and so on) and intangible (social methods of working, territory of origin, and so on) elements (Lawless and Fisher, 1990; Peneder, 2002; Qureshi, 2017), clearly positively or negatively.

Based on the above premises, this study analyzes territoriality as an element to describe and characterize 'Made in Italy' within the process of globalization of SMEs. However, within this remit

there are significant challenges: Italian SMEs should aim to preserve their typical territorial specificities (as discussed), but, in a changing global environment, they may need to embrace collaborations with enterprises/territories that are further afield. In so doing, they should outsource activities with smaller value whilst maintaining and preserving all those factors (Italian culture, tradition, history, style, and talent) that characterize an Italian product of quality (Goodman et al., 1989). Thus, this study focuses on territorial capitalism (as local structural capital) as a strategic component of 'Made in Italy' (as global reputational capital), aiming at highlighting their most important connections, from a structural (*statics*) and systemic (*dynamics*) point of view, for the international success of Italian SMEs, most all when active in aggregation forms.

LITERATURE REVIEW

An overview about 'Made in Italy' on a SMEs basis

Speaking in general, the 'Made in Italy' concept refers to Italian handicraft and industrial productions that have often excelled in international business competition. In fact, many Italian products have been recognized significant quality of workmanship, attention to details, design of forms, and so forth. Just as evidences, when talking about large enterprises, successful examples of 'Made in Italy' can be Gucci, Prada, and Armani about fashion; Ferrari, Maserati, and Alfa Romeo about automotive; Ferrero, Barilla, and Lavazza about food; and so on (Brand Finance, 2018). When talking about SMEs, successful examples of 'Made in Italy' can be MooRER (personal luxury goods especially in Japan), Pantofola d'Oro (footwear especially in the USA), and MGM Mondo del Vino (support to the wine industry especially in Russia), and so on (Sace-Simest, 2018).

In truth, beyond the power of single Italian brands, nowadays well known throughout the world, it is to highlight that the real essence of the 'Made in Italy' concept is due mainly to SMEs. First, because they better represent the current 'reincarnation' of handicraft producers of the past, and for example it is almost impossible to distinguish between micro firms (that is, enterprises with less than 10 employees) and artisan firms (Longoni and Rinaldi, 2008; Schilirò, 2017); and second, because SMEs constitute the huge part of the Italian industrial structure (calculations from ISTAT data). Thus, it is possible to affirm that Italian SMEs, most of all when embedded in industrial districts, are at the basis of the success of 'Made in Italy' (Fortis, 2007; Fortis, 2016).

Many scholars have analyzed competitiveness in relation to 'Made in Italy', but the success of Italian SMEs (as highlighted above, at the heart of 'Made in Italy') is not completely clear:

"As is well known, the long standing success of Italian exports was a puzzle. According to the Balassa indices, Italy is the only large OECD country still specialized in the export of "traditional" goods like textiles, clothing, furniture, shoes, jewellery, and so on, as well as

mechanical equipment directly involved in the production cycle of these. This goes back to the 1970s at least" (Ninni et al., 2006: 8).

A peculiar aspect of 'Made in Italy' is that most Italian firms do not operate in major sectors or in sectors where scale-economies or science supremacy are critical success factors. In fact, many of them present significant strengths about (for example) technology or brand, with an extraordinary influence on exportations. This is particularly true for the most successful sectors of the Italian internationalization (3Fs: Food, Fashion, and Furniture), showing a strong conceptual link with handicraft and the consequent development of specialized areas (e.g., industrial districts).

Most probably, 'Made in Italy' products can be considered as complex commodities (Esposito, 2005), in which there is a mix of aspects connected to style, design, organization, and most of all culture of the territory of origin of the production. This process about the 'socialization' of products and productions is presumably one of the winning factors of 'Made in Italy', also considering that Becattini (1998) underlines that Italy has had several shortages about industries characterized by capital and technology intensity, while major competitive advantages have been achieved in lightly intensive production processes. In such socialization contexts, emerge certainly external economies of production, with socio-economic benefit for the territory, but also internal economies of production if considering not the single firm, but rather the overall network/aggregation/district (Asheim, 1996; Rabellotti, 1997; Whitford, 2001; Belso-Martínez et al., 2011; Diez-Vial and Fernández-Olmos, 2014; Nicotra et al., 2018).

In fact, 'Made in Italy' products are usually realized for small niches, which, although small, are often more competitive than what similar conditions could suggest. However, precisely because of their size, too small to justify higher investments, these niches remain prerogatives of SMEs, which, in turn, are capable also to generate innovations to adapt their business to new trends (Guercini, 2004; Schilirò, 2011; Bertoli and Resciniti, 2012).

According to Becattini (1998) these capabilities are possible also thanks to i) the diffused flowing of Italian SMES in industrial districts, and ii) the consequent agglomerations of Italian SMEs in specific supply-chain-organized productions (Pironti et al., 2010) that ensure an extraordinary competitive advantage to 'Made in Italy'. Such dimensions, naturally together with other ones, contribute to that Italian territorial capitalism that could arise as critical for the international success of 'Made in Italy' (Bonomi, 2006a; Celaschi et al., 2009; Gaddi and Dell'Acqua Bellavitis, 2010).

Glocalism, internationalization forms, and the SMEs

In recent years, the idea of *places* (national, sub-national, and local entities of a territorial configuration) has begun to interact with the concept of *flows* (goods, services, capitals, people, and knowledge) that traverse them. Moreover, such places have also begun to interconnect, establishing

and developing networks and alliances (Bressi, 2003). To this end, the meaning of territorial economy, not only as concerns boundaries, but also as concerns values, principles, and cultures, has achieved salience, enhancing the connection of local actors' activities with the institutional, social, and anthropological elements of a specific place. This innovative conception of territory has been highlighted by the diffusion of 'glocalism' (Bauman, 2005), which can be intended as "... an alternative view, allowing description of the conjunction between de-territorializing processes and the territorial reconfiguration determined by globalization" (Salone, 2013: 208).

From an economic point of view, glocalism has favored also the development of new forms of internationalization that interact side-by-side with more traditional ones. In the global context, in fact, internationalization processes, at the beginning considered as an élite phenomenon, have now become a mass phenomenon, with globalization interesting not only large-scale multinational companies, but potentially every firm, and then, also SMEs (Julien et al., 1994; Audretsch, 2003; Nummela, 2004; Lee et al., 2012; Foghani et al., 2017).

As previously discussed, for SMEs the territory can assume a strategic role, from a proactive and not only limiting point of view. This dynamics is possible because the concept of territory has evolved from a strictly physical and geographical meaning, to an approach that enhances also if not most of all the related intangible resources. These can be imagined as the social capital that arises from the territorial combination of values, cultures, organization, knowledge, creativity, and so on (Wojan et al., 2007; Camagni and Capello, 2009; Storper and Scott, 2009; Camagni, 2017; Clarke and Gholamshahi, 2018).

Therefore, the local context becomes an *open system* of relationships for the production and diffusion of social capital. This can emerge as the essential differential factor for a territory and most of all for the entrepreneurship that is present in, working as an inextricable *milieu*, which continuously takes-in and takes-out pieces of local, but even global, knowledge (Tregear and Cooper, 2016; Trippel et al., 2017; García-Villaverde et al., 2018).

In this local-global evolution, a fluid connection inevitably exists between traditional competitive strategies on one side (cost leadership, differentiation, focus, and service leadership: Porter, 1985; Sciarelli, 2017) and traditional internationalization strategies on the other one (export, holding, global, and transnational: Valdani and Bertoli, 2014), mainly thanks to economies of knowledge and relationship (see Figure 1). In this complexity, the glocal environment operates not only in the form of a generic availability of technical intangibles (competence, experience, proximity, and so on), but also as the development of reciprocal and pragmatic interactions of territorial social capital (affinity, trust, cooperation, and so on) (Pizzorno, 1999). Figure 1 illustrates the positioning, within the traditional

schemes of international competition strategies, of the most likely international competition models for 'Made in Italy', focused on quality, peculiarity, and reputation of a specific territorial capital.

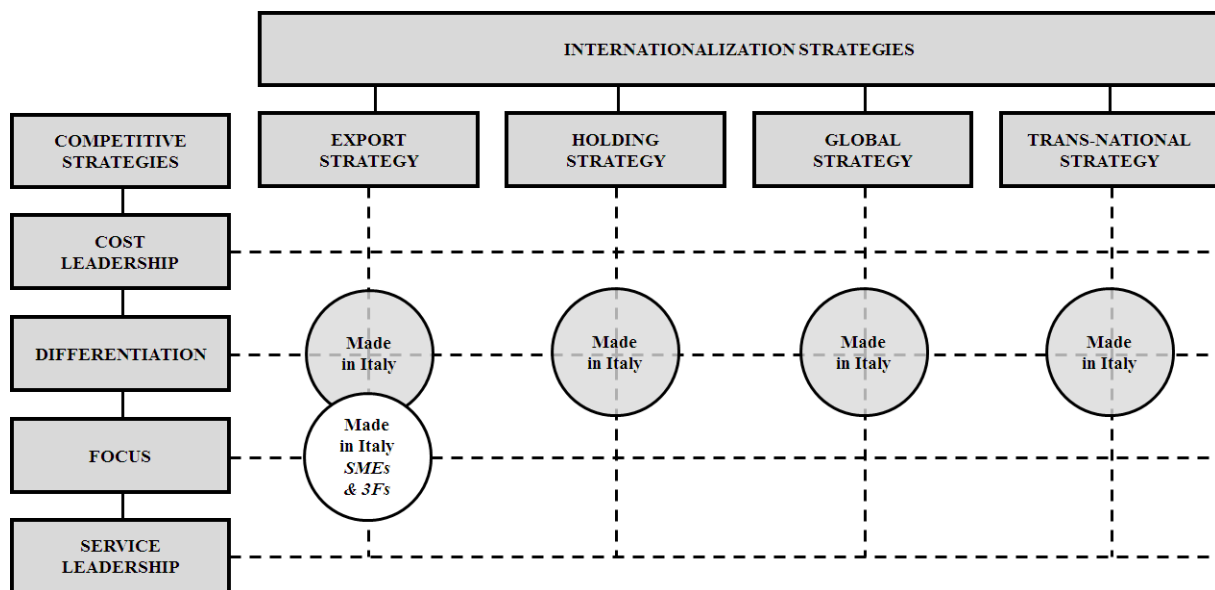

Figure 1 - 'Made in Italy' in internationalization models (authors' elaboration from Porter, 1985; Valdani and Bertoli, 2014; and Sciarelli, 2017).

The above represented strategic categories (most of all, focus for export, and more in general, differentiation for all the others) are appropriate in particular for an Italian industrial system, whose main characteristic is an entrepreneurial structure with the presence above all of micro, small, and medium enterprises. In fact, national statistical data highlight that in 2015 in Italy only 3,666 of 4,338,085 are large enterprises (0,08%), while 21,256 are medium (0,49%), 176,332 are small (4,06%), and 4,136,831 are micro (95,36%) (calculations from ISTAT data). These entities are increasingly adopting various models of development that are more sensitive to 'making global' the territorial knowledge of 'Made in Italy' (Cooke et al., 2011; Strambach, 2012). Such *milieu* influences material, but even immaterial, assets, in association with territorial, social, and economic flows, whose propagation, even outside a geographic area, connects all the operators along a 'shared' supply chain, from a cultural, organizational, and entrepreneurial point of view (Rullani, 2006).

Consequently, the internationalization process that runs along the nodes of such networks is a dynamic cognitive phenomenon that does not encounter barriers with physical nature. The peculiarity of a territory can move in a transnational space, effectively allowing enterprises to reside in their own notional or conceptual 'territory of origin' whilst turning their vision towards more and more far horizons (Lash and Urry, 1994). In this expansion of their spaces of action, enterprises move knowledge along the pipelines of the suppliers-customers chains, or along their available communication channels (Rullani, 2006; Del Giudice, 2014; Castro, 2015). Thus, they are able to create networks, aggregations, and even industrial districts, which Italy is renowned about (Goodman et al., 1989; Schmitz and Musyck, 1994; Rabellotti, 1995; Asheim, 1996; Chiarvesio et al., 2010). These new

industrialization and internationalization models have facilitated the introduction of processes that promote the sharing of knowledge among all local actors in a given 'place', activating further processes of social modernization and technological innovation (Bencardino, 1997), in conjunction with the valorization of local productive resources and endogenous entrepreneurial qualities (De Rita and Bonomi, 1998, Camagni, 1999; Trigilia, 2005).

The territorial social capital in business competition

In the knowledge-based economy, combinations of factors such as society, culture, people, communities, and enterprises have a direct role to play in the patrimony of local competences that, expanding environmental boundaries, can generate forms of bottom-up development (Bonomi, 2002; Moulaert and Sekia, 2003; Crevoisier and Jeannerat, 2009). In relation to an ever more intense competition, territory is not a secondary element for entrepreneurship, becoming an active strength that can influence local, national, and international competitiveness (Guatri and Vicari, 1994; Camagni, 2002; Dicken and Malmberg, 2009).

The concept of territory as a competitive device plays an active function in incremental processes of knowledge building, and moves along two main guidelines (Rullani, 2004). First, as a repository of localized knowledge sharable by several stakeholders; and second, as a catalyst for locally produced externalities based on the sharing of local contexts, symbols, and codes that are implicit in that peculiar territorial *milieu*.

In fact, the patrimony of tangibles (morphology, natural resources, infrastructures, and so on) and intangibles (shared values, quality of life, reputation, and so on) of a territory expresses specific determinants that can contribute hugely to the success in the international competition (for example, proximity efficiency, local services, and contextual skills). These factors evidently influence the productivity capabilities and the differentiation abilities as competitive factors (Caroli, 2006).

The territorial patrimony of tangibles and intangibles appears strategically decisive for Italian entrepreneurship. It is well known that the reputation of 'Made in Italy' at international level derives most of all from human factors (e.g., the 'Italian design genius'), but also from environmental factors (for example, the leather industry of Valdarno Superiore - Tuscany, the jewellery industry of Valenza - Piedmont, the glasses industry of Belluno - Veneto, and so on).

Thus, combining the traditional and innovative categories of internationalization strategies with the evidence of the success of 'Made in Italy' in specialized, but also territorially rooted, productions, an important consequence should be clear. In international competition, ever more complex with the emersion of new and vast economic regions, competitive advantages for SMEs, particularly in the case of 'Made in Italy', depend not only on specific firm resources, but also from territorial resources, both tangible and intangible.

Naturally, the approach of Italian SMEs to territory is not univocal. Some invest in the strong identity of their own territory as a system of peculiar resources, relationships, and knowledge (Cedrola, 2005). Others enhance it, in relation to internationalization processes specifically, by developing direct and/or indirect exportation with many collaborations in the local and potentially international value chain (Cantù and Gavinelli, 2008).

Focusing specifically on territorial capital as a competitive factor, in the scientific literature there are several considerations focusing on what are 'real territorial resource' (Becattini, 1989; Becattini and Rullani, 1993; Becattini, 1999). As intangible resource, territorial capital is a 'relational good' wherein the territory is formed as an organizational system of local actors who invest on local cognitive patrimony (Vespasiano, 2005). Assonance with the concept of social capital (Coleman, 1990; Putnam, 2000; Trigilia, 2005) evidently arises, arriving at developing the concept of 'territorial social capital' (Celata and Coletti, 2014; Hvižďáková and Urbančíková, 2014, Sansone et al., 2015; Obrecht, 2016; Romano et al., 2017).

This concept refers to the overall set of social relations that exist over a specific territory. Thus, it is not an element available for transfer from a territory to another one, because this kind of capital is strictly typical of that specific territory, and obviously, each territory is different from another one. Moreover, this condition is even truer for Italy, where territorial differences, considering the 'global' cultural dimension of the different areas of the country, are largely diffused.

RESEARCH OBJECTIVE AND METHODOLOGY

Starting from the above premises, the research aim at highlighting the possible contribution of territorial social capital – potentially embedded in the global set of intangible entrepreneurial resources – to the success of 'Made in Italy' on international markets, especially for SMEs. The specific research question is the following: «Is territorial social capital a discriminant competitive factor for the international performance of SMEs active on 'Made in Italy' markets?».

The discriminant variable for the analysis is exportation, commonly used for measuring the success of the international performance of SMEs (Lu and Beamish, 2001; Fernández and Nieto, 2005; Zucchella and Siano, 2014), whose prevalence will give answer to the question research. The adopted methodology is quantitative, descriptive, both cross-sectional and longitudinal, so to highlight differences in space (global exportation or industrial districts exportation) and time (globally speaking, from 2008 to 2017).

EMPIRICAL HIGHLIGHTS FROM THE FIELD

To get evidence from the real economy about the role of territory in the success of 'Made in Italy' on international markets, a summary overview of focused data can give a useful contribution. In the following synoptic representation (see Figure 2), several pieces of information, summoned up by different sources into a global framework, highlight the key importance of 'industrial districts' in the Italian economy, with consequent specific considerations on their connection to 'Made in Italy' exportation.

In fact, in our reasoning two fundamental aspects seem noteworthy. First, "... industrial districts are socio-territorial entities constituted by a community of enterprises and people, as well as by territorial relations and socio-economic ties that such co-presence generates. These companies belong mainly to the same sector of economic activity, which defines its main industry, and are characterized by small and medium size" (our translation from ISTAT, 2015). The so-called "territorial relations and socio-economic ties" qualify without doubt the essence of territorial social capital.

Second, the main part of the acknowledged Italian industrial districts (by the law, and they can change over time) concerns 'Made in Italy' (130 over 141, according to ISTAT, *ibidem*). Thus, from our point of view industrial districts are a considerable object of investigation for a coherent analysis that combines territorial social capital and 'Made in Italy'.

Unfortunately, at least through normal availability or even more to the best of our knowledge, no detailed data are available for analytical comparison between dynamics of Italian global exportations and Italian exportations of 'Made in Italy' from Italian industrial districts. Thus, we have produced an overall representation that combines and compares different data from different sources in different times, in our opinion however achieving satisfying and replicable investigations.

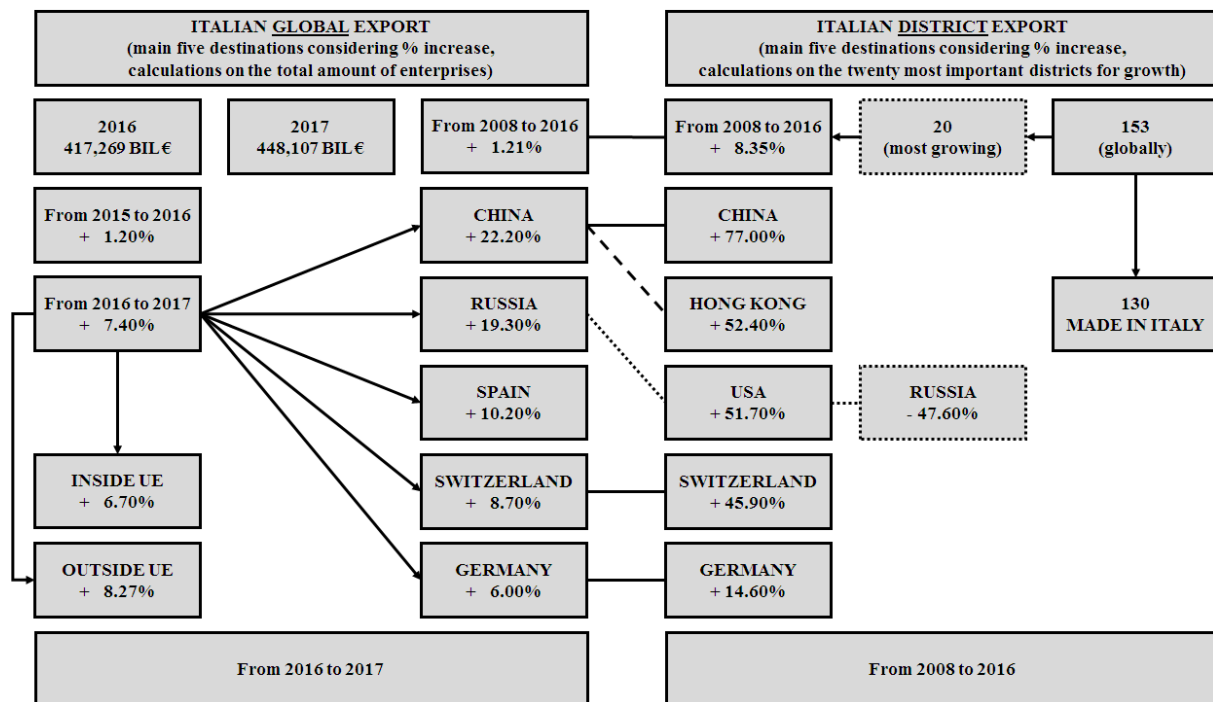

Figure 2. Analysis and comparison of export from Italy (2008 - 2016 and 2016 - 2017). Authors' elaboration. Data from ISTAT (2008); ISTAT (2015); Intesa-Sanpaolo (2018); MISE (2018); and Padua Chamber of Commerce (2018).

At least two evidences emerge clearly from the analysis. First, Italian industrial districts are mainly based on 'Made in Italy' productions, considering that the industrial districts representing 'Made in Italy' are 130 (Istat, 2015) over 153 (Intesa Sanpaolo, 2018), at least from the used databases; this is particularly true for the 20 most growing industrial districts (*ibidem*). Second, the orientation to export of Italian industrial districts in the period from 2008 to 2016 is major than the orientation to export of Italian enterprises considered altogether ($8.35 > 1.21$). Naturally, the bias related to the different basis of calculations (8.35% only considering the 20 most growing industrial districts) can distort a coherent comparison, but two considerations seem useful. First, it is the only available comparison (always at the best of our knowledge), and second, it is an even more interesting value if compared with the increase rate of Italian GDP, which is 3.32% if considering 2016 on 2008, and only 0.51% if considering an average rate from 2008 to 2016 (see Table 1).

Italy	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016
GDP (USD Billion) (*)	2,203.0 0	2,391.0 0	2,185.0 0	2,125.0 0	2,276.0 0	2,073.0 0	2,130.0 0	2,152.0 0	1,833.0 0	1,859.0 0
€ / \$ (**)	1.37	1.47	1.39	1.33	1.39	1.29	1.33	1.33	1.11	1.11
GDP (EUR Billion)	1,606.8 6	1,625.4 2	1,568.5 6	1,601.3 6	1,635.0 6	1,611.9 8	1,603.9 2	1,619.2 6	1,651.3 5	1,679.3 1
Year on Year Increase Rate	-	1,16%	-3.50%	2.09%	2.10%	-1.41%	-0.50%	0.96%	1.98%	1.69%
From 2008 to 2016 Average Increase	0.51%									
2016 on 2008 Increase Rate	3.32%									

Table 1. Evolution of Italian GDP from 2008 to 2016 (Billions). Source: authors' elaboration. (*) World Bank. () Padua Chamber of Commerce (Italy).**

In other words, even though with all above mentioned limits, Italian industrial districts focusing on 'Made in Italy', in the period under analysis, have been growing much faster than the rest of the Italian economy. Thus, considering other conditions as equal, it is quite likely that their competitiveness could be due to the territorial capitalism underlying their global functioning, allowing answering "yes" to the fundamental research question of this study.

From the research, confirmation of previous studies arises with reference to the following aspects. Necessity/opportunity of collaboration among SMEs (most of all during the recent financial and economic crisis); evidence of 'Made in Italy' as glocal competence (still popular on foreign markets); and internationalization success of focused organizational aggregations (20 most growing Italian industrial districts) versus general productions (Italian global economy). Specific contribution of the research is the consideration of territorial social capital not only as source of intangible resources for the enterprises of the territory (thanks to their relational capital), but also as strategic component of the structural capital of further level entrepreneurial aggregations (e.g., industrial districts). This double meaning should be fruitful most of all, if not exclusively, in presence of strong personality, identity, and image of these entrepreneurial aggregations (e.g., 'Made in Italy').

RESEARCH LIMITS AND FUTURE DIRECTIONS

The quantitative section of the research uses secondary data that unfortunately are not directly comparable, because their extraction derives from databases that refer to different time intervals. This limit is due to the lack of authoritative secondary data on export performances of industrial districts that focus in particular on 'Made in Italy' – naturally, to the best of our knowledge. In fact, the different institutional reports normally available insist on specific objectives of investigation, without

allowing building a general overview on this specific topic. However, the main finality of the research, which is the evidence of the competitiveness of territory-based capitalisms through the example of industrial districts for 'Made in Italy', has clearly emerged.

About possible development of the research, one of the most intriguing future direction could be the investigation upon the 'spider' metaphor. In fact, a possible challenge for an enterprise active in the 'Made in Italy' competition is to become 'fly' or 'spider' (Bonomi, 2006b). A 'fly' perspective is substantially a transactional perspective, focused on adding production, distribution, and communication value from partners and markets to the commercial offer. Instead, a 'spider' perspective is substantially a relational perspective, focused on co-creating value into the global offer with partners and markets.

Accordingly, the 'spider' metaphor could be applicable not only to enterprises, but also to districts and even to territories, but only under condition to evolve in the direction of a system that integrates enterprises, districts, and territories into a peculiar network of resources, connections, competences, values, and cultures (Saviolo, 2004). Clearly, this ambition requires also a fundamental participation of the governmental institutions that must supply all the political incentives to enhance the various talents of the territory.

SCIENTIFIC AND MANAGERIAL IMPLICATIONS

From a scientific point of view, territory emerges ever more as an asset for corporate social capital, not only when well recognized (in domestic markets), but also when far from a cultural angle (in global markets). Naturally, this is even truer both from a technical perspective (for example, industrial districts with all their business connections) and from a symbolic perspective (for example, the reputational power of 'Made in Italy').

From a managerial point of view, professionals, managers, and entrepreneurs, most of all of micro, small, or medium enterprises focused on 'Made in Italy', must pay ever more attention to overall relationships with the territory. In fact, they should consider not only its structural strengths (transportation, logistics, organization, and so on), but also its reputational potential, as territorial social capital, in domestic and foreign markets. Naturally, this potential is due also to the interactions of the same firm with the territory, taking reputation from a 'halo' effect in a top-down perspective, and giving reputation from a 'synthesis' effect in a bottom-up perspective.

CONCLUSION

During recent decades, the evolution from an economy based on simple production to an economy based on complex interactions is demanding a renewal of business development models, causing

crises for those enterprises that are not able to overcome standardized production rules (Rullani, 2004). In the specific case of Italy, a focus on high success productions has highlighted that 'Made in Italy' – for Italian enterprises, but unfortunately also for those enterprises active on unfair practices of 'Italian sounding' – can provide a strong reputation-based platform for competing in global markets, mainly through differentiation or focus strategies, and even for SMEs.

In these scenarios, the specific value of Italian productions throughout the world is due to a strong sense of territorial imagination. This perception involves both a general territory ('Italy' as reputational capital), with the social capacity to evoke positive emotions and to imprint its products through customs, life-style, and globally speaking, culture (Imperatori, 2007), and a specific territory (e.g., the industrial districts), with the social capacity to activate structural and relational resources. Naturally, knowledge networks on the territory play a key role in the concept of territorial social capital (Cantù and Gavinelli, 2008), enabling traditional and innovative interactions inside and outside enterprises, and along value chains, supply chains, business networks, and then, inside and outside specific territories (Schmitz and Knorringa, 2000).

WAYS TO INCREASE THE EUROPEAN FUNDS ABSORPTION AND CONTRIBUTION TO A SMART, SUSTAINABLE AND INCLUSIVE ECONOMY. THE CASE OF ROMANIA

Gabroveau Vladoi, Janina Mirela

The Bucharest University of Economic Studies, Bucharest, Romania

ABSTRACT

This paper presents an analysis of the fact regarding the way in which, aware of the causes that led to a low absorption rate in the previous programming period, it is possible to act through the measures that will be taken so that during the programming period 2014 -2020 to avoid the dysfunctions found in the previous period and Romania to enjoy an increase in the absorption of European funds, the objective being to participate alongside the other national measures in order to achieve a smart, sustainable and inclusive economy.

Given that Romania is trying to ensure good governance in conjunction with the reduction of regional disparities, the proposed measures have been aimed at reducing regional disparities through complementary use of funds so that all instruments lead to the same objective, namely to increase smart, sustainable and inclusive growth across Romania.

At the same time, the paper will also present innovative financing tools introduced to support local /regional development, respectively Local Development under Community Responsibility (LDCR), Integrated Territorial Investments (ITI), how they will be applied and the expected effects. Last but not least, the impact that actions, approaches by decision-makers can have on the evolution of the economy can be presented.

The paper develops firstly the current context of the funds allocation for Romania for the 2014-2020 programming period and continues with the presentation of the measures identified to be applied during this programming period outlining in the last part the expected results leading to transform the country into an inclusive economy.

Keywords: smart, sustainable and inclusive economy, innovative financing tools, good governance.

INTRODUCTION

The analysis of the absorption rate of funds, allocated by the European Commission for the emerging country during the 2007-2013, outlines (2014) that Romania is ranked among the last countries that didn't know the benefit of the advantages provided and didn't access enough funds to change the image of its society. The European Union reports mentions different causes identified, such as: a dramatically reduced number of proposal submitted and projects contracted, serious delays identified in the project implementation that caused the funds reimbursement, an insufficient training of both specialists called for the implementation of the projects and companies' representatives involved in the activity of submitting proposals and monitoring the works' development, the lack of timely information of the beneficiaries, the lack of a financial flow allowing the timely reimbursement of the eligible expenditures made by the beneficiaries. The politicians' decision transformed into measures of acceleration the spending rate of the European funds, if well understood and put in practice, could contribute to increasing the absorption rate to 72.5% by the end of 2020 and will cover the 100% by 2023.

Romania was the 11th signatory state member of the 28s with which the European Commission signed the Partnership Agreement, in August 2014. The framework documents set the financial allocation at 31 billion Euros of the Structural and Investment Funds (FESI) for the coming years, starting with 2014 until 2023.

The purpose of the funds allocated is to create the premises for Romania to be able to cope with the medium and long-term development and challenges and to contribute to the reduction of the regional and social disparities that still exist in Romania. This can happen by:

- stimulating the activities of innovation and the enterprises' competitiveness,
- stimulating the growth and the job creation,
- investing in human capital and supporting the access of the population to the labor market, as well as improving its skills
- improving the performance of the research and innovation system, including the quality of higher education
- developing the agricultural potential, at present highly concentrated on activities with low added value,
- supporting the process of restructures the agricultural holdings and providing the necessary workforce in other competitive sectors.

LITERATURE REVIEW

The analysis of the socio-economic context within the Member States, according to the European Commission Report outlines the major role of employment and social developments assistance for the evolution of the economic and societal development. (EC, 2014). There ways these areas benefit of development have been monitored and, despite the progress made, plenty of problems have been identified and retained for the general attention. The reports conclusions are obvious: the labor market need structural and modern transformations to be able to integrate a growing number of people. The recommendations state clearly the need to support the vocational education and training to reduce the unemployment rate and improve the public services, bring guarantees for young people, and modernize all forms of education (formal, informal, alternative).

The common employment report captures the social and labor market trends and challenges and proposes to the Member States measures and employment indicators to eliminate the identified risks regarding the labor market and social trends by increasing accountability and better involvement by all stakeholders, including the social partners.

At the same time, the Commission recommended pursuing an economic and social policy based on three main pillars: boosting investment, renewing commitment to structural reforms and ensuring budgetary accountability.

In terms of employability and social inclusion, the EU has monitored the implementation of the social and structural reforms on the labor market undertaken by the Member States. In the field of employment and social affairs, the European Commission has urged the Member States to identify the opportunity to apply the youth guarantee as one of the priorities and urgent measures, being one of the measures proposed to reduce youth unemployment. To increase the young people employment and diminish the scholars' abandon, the European Commission has recommended the Member States to step up their efforts to reduce unemployment through active labor market measures, strengthening public employment services and supporting training and apprenticeship systems.

The youth guarantee was one of the most important and urgent structural reform measures the Member States have taken to tackle youth unemployment and to improve the transition from school to work. This measure aimed at providing the possibility of having a quality job, continuous education programs, apprenticeships or internship within 4 months of graduating from the school or from joining the unemployed young people up to 25 years old. In order to identify the estimated results and avoid future costs with this disadvantaged category, the

Member States have taken firm steps to implement the youth guarantee. For this purpose, the necessary amounts of money were allocated to national budgets for this mechanism, with the EU completing the Member States' expenditure through The European Social Fund and The Youth Employment Initiative with an allocation of EUR 6 billion.

Analyzing the impact this initiative has had in three years since the Youth Guarantee, it has been found that the functioning of the labor market for young people has improved significantly. In this respect, from the European Commission's statistics it can be stated that over the three years:

- the number of unemployed young people has dropped by 1.5 million, while the number of young people who are not professionally trained and who do not have any education or training program has fallen by 900 000;
- the youth unemployment fell from 24.4% in the first quarter of 2013 to 18.9% in the second quarter of 2016;
- the percentage of young people aged 15-24 who are not professionally employed and do not have any education or training dropped from 13.2% in 2012 to 12% in 2015. Even if these trends have to be interpreted taking into account the cyclicity of certain factors; the Youth Guarantee accelerates the progress by giving young people more chances.

Taking into account the need to continue reforming the labor market insertion of the youth and reducing the youth unemployment during the 2014-2020 programming, funds have been allocated to reduce the youth unemployment through the European Social Fund (Euros 12 billion annually) and the Youth Employment Initiative (Euros 6.4 billion for 2014-2020). The ESF will support the fight against the youth unemployment, 68% of the budget being allocated to the youth projects.

Another agreed mechanism for their integration into the labor market is the youth employment initiative targeting the young people who do not work and do not attend any education or training program in regions where the unemployment rate of young people was over 25%. This initiative seeks to help young people directly by creating jobs, providing internships and apprenticeships, and supporting start-ups.

The 2014-2020 Partnership Agreement (FED) comprises five European Structural Funds and European Investment Funds (ESI funds): the European Fund for Regional Development (ERDF), the Fund for Cohesion (CF), the European Social Fund (ESF) the European Fund for Agriculture and Rural Development (EAFRD)) and the European Fund for Marine and Fisheries (EMFF) in line with the specific strategic objectives goals and activities adopted by the European Commission for this running period.

.The amount of funds earmarked for these programs over the period 2014-2020 is as follows:

- € 22.4 billion under Cohesion Policy (ERDF, ESF, Cohesion Fund);
- € 106 million from the Youth Employment Initiative (together with an identical allocation from the ESF);
- € 168 million were approved for the EMFF Program (EC, 2014).

The purpose of allocating these funds is to provide Romania with the capacity to cope with medium and long-term development challenges, reduce existing regional and social disparities in Romania, provide viable solutions to social challenges and fight against poverty. In this respect, among the priorities identified in the PA, an essential role is to direct investments to innovation and competitiveness in enterprises, to stimulate cooperation with the business sector and private investment to increase their added value, to stimulate the growth and create jobs, developing human capital by increasing the employment rate among graduates.

Investments in these areas will be essential to help Romania, on the one hand, implement country-specific recommendations in line with reforms in the sectors concerned and, on the other hand, respond to the priorities of the Europe 2020 Strategy.

METHODOLOGY

When analyzing the present social context in Romania where social problems are strongly present in the socio economic environment where unemployment is quite high, the problems faced by the persons who are in a vulnerable group are easily visible and easy to identify. For example, they live in poverty; most of them are unemployed or work without official documents, have a low self-esteem, are not benefiting of social insurance and have great difficulties in finding a place to work. They do not stay too long in a job because those who live on the minimal income have little or no competences at all

The lack of competences of the people who come from vulnerable groups make it almost impossible for them to stay in a long-term job. At a regional but also a national level there is a lack of structures which can offer assistance to vulnerable groups, no matter the category they belong to, structures which should assist these persons in order to help them find a job. The economic crisis, the reform in the social assistance, as well as the poor budgets has contributed to the persistency of these problems.

The lack of budgets and that of instruments capable of facilitating the socio professional insertion of these people from the vulnerable groups will never add value in their lives.

Entrepreneurship is considered to be a form of professional insertion which can add a considerable amount of added value in economy. Social entrepreneurship is a much promoted solution in the EU and is regarded as a sustainable solution for creating some instruments capable to promote social economy and to facilitate the long term professional insertion of the persons who come from vulnerable groups.

The suggested solution is to create a sustainable structure which can give them a set of competences both from the business zone and the social zone which can facilitate the professional insertion of the persons who come from vulnerable groups. The solution can be considered as being adapted to the present socio-economic situation and can be considered as an answer to the imperfections of the economic systems and as a possible contribution to the decrease of social inequities.

RESULTS

Analyzing the socio-economic context corroborated with the identified results and the evolution of Romania as a result of accessing and using the funds made available by the European Commission during 2007-2013 the programming period, Romania, by the measures it has undertaken, will support the achievement of the objectives established in other development challenges - competitiveness, infrastructure, administration and governance and will contribute to achieving the objectives of the Europe 2020 Strategy for smart, sustainable and inclusive growth.

Under the Partnership Agreement (2014-2020 PA), the Human Capital Operational Program (HCOP) is the operational program that sets out the investment priorities, specific objectives and actions undertaken by Romania in the field of human resources. In order to meet Romania's objectives in the context of the Europe 2020 Strategy for smart, sustainable and inclusive growth, the HCOP comes with proposals that respond to real and immediate needs as well as to medium and long term interventions in the field of social inclusion and combating discrimination by:

- ensuring the availability of a work-ready workforce that responds to the growing needs of the business environment;
- increasing the employment rate in all regions of Romania, especially among young people;
- setting up new businesses and social enterprises, especially in less developed regions and in rural areas, in order to help alleviate poverty and social exclusion;

- creating the legal framework for correlating the education system with the needs of the labor market;
- providing training / retraining courses to provide participants with the basic knowledge and skills essential to participation in social life, as well as the skills and abilities needed to get a job;
- encouraging lifelong learning, contributing to prolonging active life, increasing the labor market opportunities and, in general, ensuring a better quality of life;
- supporting young unemployed aged 16-24, registered with the Public Employment Service to support the employment growth;
- supporting the vulnerable groups (unemployed and inactive people, elderly workers (55-64 years old), people from the Rom minority, people with disabilities, people with low levels of education, people in the environment for the employment growth;
- providing training / retraining / initiation courses to improve the skills of the unemployed and inactive, elderly workers (55-64 years), Roma people, individuals with disabilities or with a low degree of education, those registered under social and professional (re)integration to improve their knowledge and acquired competences to get employed;
- supporting employment by stimulating entrepreneurship and business start-ups, developing the social economy and promoting the social entrepreneurship;
- supporting the enterprises in order to respond to the changes in the business environment, taking into account the priority sectors with competitive potential identified according to the National Competitiveness Strategy and the National Strategy for Research, Development and Innovation;
- ensuring integrated measures to reduce the number of people at risk of poverty and social exclusion. (EU Strategy for 2020).

CONCLUSION

In the context of the changes made in the last decades and taking into consideration the structure of society, there was identified the need to intervene in the field of social, economic, political organization through the formulation of new policies and strategies of governance at local, regional and national level, realistically adaptable to the new social phenomena identified.

In this respect, the analysis of all the non-profit establishments and the correlation of their activity with that of the public sector, identified the necessity of adapting the legislative

framework that will allow the approach of new areas of interest such as the development of the culture of social entrepreneurship by introducing new legal forms for the social economy structures and defining the legal framework for their functioning. Investing in human capital and supporting the access of the population to the labor market, as well as improving its skills will be one of the main priorities of Romania.

IRRADIATED FOODS BETWEEN CONCERN AND ACCEPTANCE IN THE ITALIAN MARKET

Galati, Antonino¹; Moavero, Pietro²; Crescimanno, Maria¹

¹Department of Agricultural, Food and Forest Sciences, University of Palermo

²University of Palermo

ABSTRACT

Consumers have always shown a marked concern for the novel technologies. The treatment of foods with ionizing radiation, not entirely new, has always been a major concern among consumers for the impact that the consumption of treated food could have on health. The aim of this paper is to investigate Italian consumer attitudes towards the irradiated food and in particular the perceived risk and the acceptability of these technology. A survey was carried out in Italy by administering an on-line questionnaire to a sample of 392 consumers. The results of the study highlight a low level of knowledge of food irradiation, often associated with nuclear radiation and doubts about the effect that the consumption of irradiated food can have on human health. Moreover, there is a marked need, expressed by interviewees, to acquire more information on the technology and the benefits that can be obtained. This study has some political, managerial and ethical implications.

Keywords: Food irradiation, Attitudes, Food safety, Consumer behavior, Novel technologies.

INTRODUCTION

In recent years, several case of food contamination of food, such as dioxins and BSE, have negatively affected the consumers' behavior and have resulted in a major loss of confidence in food products, resulting in a contraction of the demand (Rosati and Saba, 2004). To respond to the need of food safety, many processing methods have been developed for example to prevent food spoilage and raise safety by providing better guarantee to the consumers, among these drying, smoking, salting, pasteurization, canning, freezing, refrigeration, chemical preservatives, and food irradiation (Agrios, 2005).

Food irradiation is a physical treatment of food with energy ionizing radiation, that produces the same benefits as when it is processed by heat, refrigeration, freezing, ore treatments with chemicals (Parlato et al., 2014). The process is useful to improve food safety, inactivating micro-organisms, virus, bacteria and insects, increase food security, reducing the speed of ripening, spouting and aging of fruits and vegetables contributing to reduce food losses and wastage, and offer an opportunity as

phytosanitary treatment for food moving across international or national borders (Lima Filho, 2016; Parlato et al., 2014; Roberts, 2014; Fan and Sommers, 2013).

The multiple benefits of food irradiation have been recognized by international bodies (World Health Organization, Food and Agricultural Organization, International Atomic Energy Agency), but the commercial application of this technology is still limited because of potential risks perceived by consumers. In particular, food irradiation technology is particularly widespread in the United States and in several Asiatic countries (Eustice, 2018). In the European Union (EU) the use of this method, regulated by the Directive 1999/2/CE of the European Parliament and of the Council of 22 February 1999, is very uncommon as emerge by the small quantity of foodstuff irradiated in the year 2015 in the EU countries, which amount to 5,685.9 tons (EU, 2016). The main raisons of the low utilization of the food irradiation technology in the EU countries is the lack of proper knowledge of such technology among consumers, processors and distributors. As emphasized by Nayga et al (2005) the awareness about the nature and benefit of food irradiation led to positive changes in consumers' perception affecting their decision to buy irradiated food.

In this context takes on fundamental importance the learning of the level of knowledge and consumers' acceptance of food products treated with ionizing radiation taking into account that the understanding of the benefits produces and the acceptability of this food technology is crucial for the development and strengthening of the same process in the food industry. Whit this in mind, the aim of this paper is to investigate Italian consumers attitudes towards the irradiated food and in particular the perceived risk and the acceptability of these products.

LITERATURE REVIEW

The consumer acceptance of novel food technologies or new products and the public perception of risk and trust in information associated to theme may be important discriminants of consumer reaction and are crucial for the assertion of these innovations. Analyzing a range of food technologies, emerging worldwide in food production, processing and preservation, several authors show that not all of these are equally accepted by consumers (Frewer et al., 2011; Siegrist, 2008). Among the novel food technologies, food irradiation has drawn attention of scientist and several studies have been conducted to explain through empirical evidences the consumer awareness and concerns about irradiated foods showing different results. These studies have been mainly focused on the analysis of the consumer knowledge, opinions, neophobia, thoughts related to food treated with ionizing radiation. As emerge from the economic literature, consumers' knowledge about the irradiation technology depend on several factors both demographics and related to the geographical area in which the consumers live. Resurreccion et al. (1995), through a direct survey conducted in the Metro-

Atlanta area in USA on a sample of 446 consumers, found that 72% of the respondents had heard of irradiation, but 87.5% of these consumers didn't know much about this technology. Similar investigations conducted in other countries show, on the contrary, that the consumers' knowledge about food irradiation is very low. Gunes and Takin (2006) for example on a sample of 444 Turkish consumers show that only 29% of them were aware of irradiation. Junqueira-Goncalves et al. (2011) found that only 33.5% of 497 consumers in Chile had heard of irradiation as a treatment for food preservation. A similar result has been obtained by Rosati and Saba (2004) in the Italian market and more recently by Lima Fihlo et al. (2016) in their empirical survey carried out in a small city located in Brazil. The lack of knowledge of the treatment of food with ionizing radiation is to be put in relation to the insufficient information about this technology, which leads to a negative perception of the irradiated products. Most consumers who do not know the process or who have little knowledge of it, show greater uncertainty about safety of the irradiated food and often believe that irradiated foods become radioactive and have harmful compounds (Resurreccion et al., 1995; Resurreccion and Galvez, 1999; Gunes and Takin, 2006; Ornellas et al., 2006; Behrens et al., 2009; Junqueira-Goncalves et al., 2011; Lima Fihlo et al., 2016). Therefore, the central role that can have a correct information on the perception and attitudes of consumers towards irradiated foods emerges. Precisely for these reasons, as pointed out by Behrens et al. (2009) the terms "Cold pasteurization" could be more widely accepted by consumers than irradiation. Therefore, the central role that can have a correct information on the perception and attitudes of consumers towards irradiated foods emerges. Indeed, as found Junqueira-Goncalves et al. (2011) almost all respondents reveal that they might become consumers of irradiated food if they would know that this process increase food safety and does not causes short term and/or long terms health problems. Consistent with those, Gunes and Takin (2006) and Pohlmann et al. (1994) highlight that after having informed the consumers about the food irradiation benefits the willingness to buy tends to increase.

Several studies show that while the willingness to pay (WTP) and the actual purchase are affected by the information related to the safety and by the handling instruction on package label and appearance, the intention to purchase is mainly influenced by the demographic characteristics. An empirical investigation conducted in Texas in 2001 on a sample of 270 consumers show that are the woman that reveal a greater WTP for irradiated beef because they consider food irradiation as an assurance of safety and quality. This finding is inconsistent with that obtained by Rimal et al. (2013) according to which woman showed a higher level of concerns about food irradiation and are less likely to buy irradiated products such as beef. In addition, studies show that educational level and the monthly family income positively affect the attitudes of consumers towards irradiated foods and the

intention to purchase (Resurreccion et al., 1993; Resurreccion et al., 1995; Gunes and Takin, 2006; Rimal et al., 2013).

An interesting thing that emerges from the economic literature about the food products treated with ionizing radiation is linked to the consumers' perception of the "Radura" symbol on the label of the marketed products. Resurreccion et al. (1995) show that 81% of the USA consumers considers the information contained in the label of great importance, although approximately half of consumers considers that the "Radura" symbol is inadequate to inform the consumers that the food has been irradiated. Furthermore, if on one hand, as emerged in the study of Junqueira-Goncalves et al. (2011), this symbol gives to the consumers the sensation of confidence and safety, on the other hand, the same is considered by consumers as a warning, influencing the willingness to pay for products treated with radiation (Nayga et al., 2004).

DATA COLLECTION AND SURVEY INSTRUMENT

A survey was carried out in Italy to analyze the attitudes of consumers living in Italy towards food treated with ionizing radiation. Data have been collected by administering an on-line questionnaire to a sample of 392 consumers. Respondents have been invited to participate to this survey through an e-mail and a message promoted through the most important consumer associations operating in Italy. Even though it is an on-line survey, the number of the respondents reflects the distribution of the resident population in all 20 Italian regional capitals.

The survey was carried out between January and March 2018. The questionnaire administered was structured in three sections. The first, includes a series of questions aimed to analyze the perceived risk of consumers related both to the novel technologies and the use of additives and others substances in the open field that feed concerns among consumers. In the second section we collect several information in order to understand the level of knowledge of irradiated food, the perceived risk associated to the consumption of food products treated with this technology, and the acceptability of these products after a brief description of the potential benefits offered by the irradiation process. Several questions were measured on a five-point Likert scale, where 1 means "Strongly disagree" and 5 "Strongly agree". Finally, the last part includes all variables concerning the socioeconomic features of the interviewees, such as age, gender, education, number of household members, employment, and monthly household net income in euros.

RESULTS AND DISCUSSION

4.1. Profile of the respondents

The survey was carried out in Italy and a total of 392 interviews were completed. The numbers of male and female participants in the survey exactly the same (50% respectively) and represented a wide range of age categories. In particular, most participants were between 25 and 44 years (52.3%), is part of a household of 4 people (38.0%), have a higher level of education taking into consideration that 57.9% of the respondents have a degree or a second level master degree. As regards their occupation, the majority of the respondents are employed (44.1%), while only 17.9% were students. In terms of monthly family income 40.1% of the respondents have an income between one thousand and two thousand euros.

4.2. Consumer risk perception and knowledge and attitudes towards irradiated food

The majority of consumers (69.6%) associate the food risk to the food products treated with chemical fertilizers and harmful to health, while 30.4% associate the food risk to the food products with additives and preservatives in quantity higher than normal. In particular, is the use in the open field of substances such as pesticides, plant protection products, hormones and other chemical products during the production and processing phases to determine a greater perception of health risk by respondents (4.4), followed by the use of additives and preservatives added to food (to color, preserve or improve the appearance, taste, color and smell of the product) (3.4) (Figure 1). On the contrary, the use of technologies for foods preservation, such as ionizing radiation, microfiltration and hot pasteurization, is perceived as less negative by consumers (2.8).

Figure 1 – Consumers risk perception

Source: Our elaboration on collected data

The main concerns expressed by respondents and therefore the highest levels of risk are found for foods containing pesticides and medicinal residues (4.5), for those not properly stored (4.3) and for counterfeit foods (4.2) (Figure 2). In contrast, consumers do not consider foods containing additives and those treated with ionizing radiation particularly worrying for health. Our findings are consistent

with the results of Resurreccion et al. (1993), Resurreccion et al. (1995) and Lima Fihlo et al. (2016) according to which consumers have some level of concerns for problems linked to the pesticides, hormones, bacteria, than irradiation.

Figure 2 – Risk perception and typologies of products

Source: Our elaboration on collected data

84.2% of the Italian respondents did not know of treatment processes of food products with ionizing radiation and 83.2% of them is not aware that in Italy are sold food products previously treated with ionizing radiation. The low level of consumer's knowledge about food irradiation has been revealed in several empirical researches (Gunes and Takin, 2006; Junqueira Goncalves et al., 2011; Rosati and Saba, 2004; Lima Fihlo et al., 2016). 62 respondents who know the treatment of food products with ionizing radiation, are mainly resident in the Southern Italian regions, are part of households with an average of 4 members, and have a high level of training. Although there is a low level of knowledge of the treatment of food products with ionizing radiation, 86.0% of the respondents affirm that these are products treated with ionizing rays in order to safely eliminate microorganisms, fungi and pests for human health (Figure 3). On the contrary, 46 respondents (11.7% of the total) said that they are product contaminated with substances harmful to health and only 9 respondents (2.3%) replied that it is a product contaminated with nuclear radiation. Several studies showed that often consumers associate food irradiation to radioactivity, cancer, and nuclear accidents (Resurreccion et al., 1995; Resurreccion and Galvez, 1999; Gunes and Takin, 2006; Ornellas et al., 2006; Behrens et al., 2009; Junqueira-Goncalves et al., 2011; Lima Fihlo et al., 2016).

Figure 3 - Interpretation of the concept of product treated with ionizing radiation

Source: Our elaboration on collected data

The low level of knowledge on the treatment is also reflected on the knowledge of the symbol included on the label of the marketed products. In fact, as emerges from the survey, 85.2% of respondents do not know the symbol "Radura".

In order to understand the effect of a greater knowledge of the treatment of food products with ionizing radiation on the acceptability and attitude of consumers towards irradiated foods, in a special questionnaire box, the technology and benefits that can be obtained in terms of food safety and food security were presented. After acquiring this information, the majority of consumers (39%) show a certain degree of uncertainty about the effect that the consumption of irradiated foods can have on human health in the long period (Figure 4). 36.7% of respondents, however, do not associate the consumption of products irradiated with problems for human health. On the other hand, 24.2% of respondents perceive such products negatively, so much so that they believe that the long-period intake of irradiated products can cause problems for human health. Several empirical evidences emphasize that if the consumers is informed about food irradiation benefits, their willingness to accept and by irradiated food tends to increase (Gunes and Takin, 2006; Pohlmann et al., 1994).

Figure 4 – Risk perceived for irradiated food consumption

Source: Our elaboration on collected data

The level of uncertainty prevalent on the possible impact on human health of irradiated foods means that 26.5% of respondents, despite having acquired information on the benefits produced by the treatment, would not buy any irradiated food product. This is the case of consumers with a secondary school mainly and with a medium-low income level. The remaining 288 respondents say they would be willing to consume if treated with ionizing radiation, fruit and vegetables (69.8%) and cereals and derivatives (60.4%), followed by meat (44.1%), water (42.4%), milk and derivatives (40.3%) and fish, crustaceans and mollusks (39.6%) (Figure 5). The product that consumers would be less willing to consume with the knowledge that it was treated with ionizing radiation are eggs (30.9%).

Figure 5 - Products that consumers would be willing to buy with the knowledge that they were treated with ionizing radiation

Source: Our elaboration on collected data

89.5% of the Italian respondents believe that, taking into account the benefits of the irradiation technology, an effective awareness campaign is necessary. Indeed, our findings show that 89.3% of the respondents is interested in acquiring more information on agro-food products treated with ionizing radiation and 95.4% of them is interested to have more information on how to recognize a treated product than conventional food products. 93.1% of the respondents is interested in a better understanding of the differences between the different food technologies. Therefore, a clear informative need emerges from the interviewed subjects. In fact, 88.5% believe that the introduction of elements that lead back to the treatment of products during production processes is fundamental in the labels of fresh and processed products.

Lastly, the interviewees were asked whether the terms irradiation could influence their purchase intention and whether the replacement of the terms irradiation with cold pasteurization could change their opinion on these products and their purchase decision. 59.4% of the respondents consider that the expression irradiated food affects the purchase intention, and 58.4% of people interviewed thinks that changing the term "irradiation" with "cold pasteurization" can positively change his opinion and his choice of purchase on irradiated products. Our findings are consistent with Beherens et al. (2009) according to which cold pasteurization is more widely accepted by consumers than irradiation.

CONCLUSIONS

This study analyzes the level of knowledge of the irradiation technology applied to food products among Italian consumers and the perception of the risk associated by themselves to the consumption of products treated with ionizing radiation. The survey carried out in Italy shows, in accordance to the results of empirical surveys conducted in other countries, that the main Italian consumers concerns are associated to foods containing pesticides and medicinal residues, not properly stored, and counterfeit foods, and less to irradiated foods or products containing additives. This low level of risk perception is related to the low level of knowledge among the consumers of the food irradiation technology. Indeed, as emerges from our investigation, 84.2% of the Italian respondents did not know of treatment processes of food products with ionizing radiation and 83.2% of them is not aware that in Italy are sold food products previously irradiated. Even as a result of the acquisition of information on the technology and its benefits in terms of food safety and food security, most consumers continue to express doubts about the impact that the treatment of agro-food products with ionizing radiation can have on health in the long period. A concern that is mainly linked to the expression "food irradiation" that is perceived in its most negative association. Indeed, the replacement of the expression "food irradiation" with "cold pasteurization" for food products, being the same

technology, could change the attitude of consumers towards the treated products, increasing the propensity to buy irradiated foods.

The results highlight, on the whole, the need to start an effective communication campaign aimed at making known the benefits of technology, taking into account the impact that the same can have both on the food safety and on the food security.

This study provides some both political and managerial implications. From a political point of view, this study, could reinvigorate the interest of the European and National governments towards the irradiation technology, taking into consideration that this technology contributes as a whole to the wellbeing of society, but which requires several investments in communication campaigns. On the managerial point of view, our findings can support the decision making process as they provide indications on the main perceived risks for food products, contributing to satisfy the consumers expectations. In addition, the use of this technology could contribute to solve an ethical issue related to the food waste caused by many pests and contaminants that can be eliminated through ionizing radiation treatment.

ABSTRACT

The wine sector is one of the most remarkable industries in Portugal exhibited by the several and important demarcated regions. This paper intends to predict the wine industry farm sustainability of two of the most relevant Portuguese regions, North and Alentejo. The available data on the Portuguese Farm Accountancy Data Network (PTFADN 2001-2012) which compiles social, economic and environmental parameters from 2001 until 2012, allowed us to perform the function fitting with MATLAB and gather information about each variable's behaviour. That information was then blended into our selected methodology, an ABM that emulates the current North and Alentejo wine-production reality and simulates their further development. Considering the current status of both regions and our model parameters, the 100 years simulation showed that only 38% and 68.2% of the North and Alentejo farms respectively would subsist by the end of the timeframe. By changing the model initial conditions, alternative scenarios were tested and governmental policies were evaluated. The grape selling benefits generally outperform the direct governmental subsidies, to the point that a simple governmental grape selling benefit of 0.054(€/kg) on the Northern region may avoid the extinction of 15.6% of the farms in the next 100 years. The results also showed that the Alentejo region is generally better prepared to deal with increasing labour and environmental costs opposed to the North region, which saw a severe depletion of the farm survival rates during this experiment.

Keywords: Agent-Based Model, Wine Sector, Performance, Sustainability.

INTRODUCTION

The wine sector presents itself as one of the most important economical and historical Portuguese endeavours. In fact, this sector relevance goes way beyond the pragmatic profit-oriented approach

since the extensive Demarcated Regions such as the Douro and the Green Wine Demarcated Regions in the North of Portugal own an uncapped non-tangible value. The extensive vineyards in the Northern region bundle quality wine production (the worldwide known Port Wine is one of the region most cherished treats) with a mesmerizing set of wine landscapes perceived as a potential resource for the development of the tourism (Rachão and Joukes, 2017). Alongside the Northern Region which is characterized by the prominent steep mountain viticulture, Alentejo shows up as the other most relevant wine producing region from Portugal. Alentejo drifts away from the North's entrepreneurial layout since it's based on plain field viticulture welcoming the high mechanization of vine related tasks. Since the viticulture activity relies on natural scarce resources and there is a major concern with the trade-off between intensive production and the activity environmental impact (Marta-Costa *et al.*, 2012), this premise falls purely into the sustainability notion which is usually defined as a three-dimensional concept (Marta-Costa *et al.*, 2012; Mencarelli and De Propris, 2014). This article follows up this assumption acquainting three core variables (social, economic and environmental) which may describe the long-term sustainability of the featured regions (Alentejo and North). To reach the inner Alentejo/North dynamics MATLAB R2017a software was used to interpolate the data of those two regions into trendy but periodical functions. Afterwards the ABM software (NETLOGO) was selected to simulate the following 100 years acquainting the real data-based dynamics previously found. This article is divided into 5 sections. After the brief introduction about our working concept and major goals, Section 2 presents the methodological literature review. Section 3 explicitly presents the ABM formulation while Section 4 dives into the numerical simulation with shifting initial conditions. The overall conclusions are finally presented on Section 5.

LITERATURE REVIEW

Agent-based models have become an increasingly important tool. They are particularly valuable for systems that are not understood well enough to build an equation-based model. Those models also display an inherent simplicity that eases the output presentation to people without intensive knowledge about the scientific facts. An *et al.* (2017) considers ABM's as "middle-ware" investigatory objects that can select abstracted representations of real-life that seem too complex for formal traditional mathematical analysis. ABM building allows the researcher to settle arbitrary deterministic events or relationships between agents that underpins the complexity levels and computational expense. On the other hand, the event bundle created by the author may generate unforeseen results and aware him about patterns and relationships that he wasn't aware before (emergence).

The ABM's inner simplicity and absence of evaluation mathematical tools was criticized right way by Lorek and Sonnenschein (1999), so, in order to counter that statement, Grimm *et al.* (2006, 2010)

proposed a set of ABM generic format rules that intend to create a standard basis for those models. Called frequently “Overview, Design Concepts, Details” (ODD) the main purpose of this protocol is to make ABMs writing and reading easier and therefore more suitable for replication. It is also worthier to point out that the application of the ODD protocol may be extended to other large and complex models in general.

The properties of individual organisms how they grow or develop (reproduction, death, hunting, gathering food) and how they interact with each other can be represented quite well by using an ABM. Alongside the inner individual features the environment can also be configured fact that allows the researcher to collect information about the interaction between the individual agents and the environment. The way as the individuals respond to external circumstances in a mapped landscape can be modelled in detail with the ABM approach (e.g. DeAngelis and Mooij, 2005; Grimm *et al.*, 2005; Railsback and Grimm, 2012). Considering that range of possibilities, the ABM methodology presents itself as a perfect contender for Ecology or Biology studies. For example, Santos *et al.* (2017) models an ABM framework that intends to predict bat activity and mortality on wind farms. Sibly *et al.* (2012) presents the energy acquisition by individuals in ABM, emulating the dynamics within an animal population, while DeAngelis (2005) formulates the systematic of ecological and evolutionary processes. Nonetheless, ABM's features also reveal themselves very useful in the social sciences such as Economics or Psychology (Smith, 2007). A few authors such as Kohler (2000), Bonabeau (2002) and Conte (1997) describe the dynamics in human societies and also ABM methods and suggestions to simulate those systems. An (2012) modelled a coupled human decision and natural system (environment) ABM. In fact, those human based dynamics, heterogeneity, decision making process coupled together in this methodology not only present a deliberate invitation to Economic modelling but also as main tool to solve latent economics problems (Farmer, 2009). Regarding more specific Economics applications, ABM methodology has been used to describe Keynesian model of income distribution alongside credit and fiscal policies (Dosi *et al.*, 2010, 2013), financial incentives in market-oriented policies (Sierzechula *et al.*, 2014; and Shafiei, 2012), or analyse threats to the financial stability (Bookstaber, 2012).

MATERIAL AND METHODS

To attain a simulation-wise environment and further apply our featured methodology (ABM) the data available on PTFADN (2001-2012) was considered to model deterministic functions that describe the behaviour of the North and Alentejo farms.

Since we want to evaluate the overall sustainability of the wine farms considering their own heterogeneity, each farm should acquaint a set of variables that display their current entrepreneurial

status. As referred on Section 1, the goal is to avoid farm bankruptcy and allow the subsistence of such an important Portuguese sector. The model premise is quite simple. Each farm has a set of inner characteristics such as their own area, bank balance, overall management quality, productivity (size-dependant) and location (Alentejo or North). At each period the farm produces and sells their grapes (for wine production) considering their own productive capacity and foreign market prices: grape selling value, labour, intermediate consumption among others. Afterwards the bank balance is updated and a trigger is settled to evaluate if the farm is sustainable and can proceed their activity or it closes.

Considering the available data on PTFADN (2001-2012) from 2001 until 2012 (for North and Alentejo regions), we collected the values of the subsidies (euro per ha), investment (euro per ha), production (ton per ha), labour costs (euro per ha) and finally an environmental bundle variable which compiles the sum of: electricity, fuel and lubricant, fertilizers, crop protection and water (all specified in euro per ha). Each variable compiles a short-term time series from 2001 until 2012 furtherly interpolated with the MATLAB fitting tool (see Appendix 1 - Figure 4 and 5 for graphical results). It is also important to consider that the farm productivity generally improves with larger areas due to the increasing returns to scale (Sellers and Alampì-Sottini, 2016). To obtain a function that relates the farm size and productivity (Appendix 1 - Figure 6), we used the Galindro *et al.* (2018) results which delivers a productivity coefficient per farm size (nine area intervals) in the Douro Region (three sub-regions). To perform the MATLAB fitting we gathered average values from Galindro *et al.* (2018) bundling the three sub-regions productivity into one and considering the average value of the authors. The size productivity function $V(s)$ is now obtained (Equation 11) for the model variables start from the 2012 values (initial conditions) and evolve according to the individually obtained function.

$$P_a(t) = 2169 + 514.7 \cdot \cos(w_1 t) + 1475 \cdot \sin(w_1 t) - 926.7 \cdot \cos(2w_1 t) + 627.6 \cdot \sin(2w_1 t) \quad (1)$$

$$P_n(t) = 3193 + 328.1 \cdot \cos(w_2 t) + 204.9 \cdot \sin(w_2 t) + 168.9 \cdot \cos(2w_2 t) + 170.9 \cdot \sin(2w_2 t) \quad (2)$$

$$L_a(t) = 149.4 + 7.006 \cdot \cos(w_3 t) + 132.9 \cdot \sin(w_3 t) - 116.5 \cdot \cos(2w_3 t) - 3.045 \cdot \sin(2w_3 t) \quad (3)$$

$$L_n(t) = 664.6 + 95.17 \cdot \cos(w_4 t) + 111.4 \cdot \sin(w_4 t) - 36.62 \cdot \cos(2w_4 t) + 50.39 \cdot \sin(2w_4 t) \quad (4)$$

$$E_a(t) = 140.7 + 30.16 \cdot \cos(w_5 t) + 31.61 \cdot \sin(w_5 t) - 29.1 \cdot \cos(2w_5 t) - 22.43 \cdot \sin(2w_5 t) \quad (5)$$

$$E_n(t) = 293 - 5.764 \cdot \cos(w_6 t) + 17.01 \cdot \sin(w_6 t) - 14.02 \cdot \cos(2w_6 t) - 16.21 \cdot \sin(2w_6 t) \quad (6)$$

$$I_a(t) = 623.5 + 516 \cdot \cos(w_7 t) - 303.4 \cdot \sin(w_7 t) \quad (7)$$

$$I_n(t) = 603.2 + 30.02 \cdot \cos(w_8 t) + 150.4 \cdot \sin(w_8 t) + 69.05 \cdot \cos(2w_8 t) + 126.6 \cdot \sin(2w_8 t) + 112.6 \cdot \cos(3w_8 t) - 109.2 \cdot \sin(3w_8 t) \quad (8)$$

$$S_a(t) = 1715 - 1529 \cdot \cos(w_9 t) - 598.7 \cdot \sin(w_9 t) \quad (9)$$

$$S_n(t) = 5.918e08 - 5.918e08 \cdot \cos(w_{10} t) + 1.299e05 \cdot \sin(w_{10} t) \quad (10)$$

$$V(s) = 0.2558 - 0.000145s + 0.008062s^2 \quad (11)$$

Where variables t and s represent, respectively, the simulation time-period, with $t \in \{1, 2, \dots, 100\}$ and the farm size. Equations (1) and (2) represent the Production (Y); Equations (3) and (4) are the Labour (L);

Equations (5) and (6) represent the Environment (E); Equations (7) and (8) are the Investment (I); Equations (9) and (10) represent the Subsidies (S); and Equation (11) are the size productivity (S) (see Table 1). The constant values are given by:

$$\begin{aligned} w_1 &= 0.5023, & w_2 &= 0.6365, & w_3 &= 0.5459, & w_4 &= 0.4698, & w_5 &= 0.7204, \\ w_6 &= 1.067, & w_7 &= 0.312, & w_8 &= 0.6585, & w_9 &= 0.07364, & w_{10} &= -0.0001127 \end{aligned}$$

Modelling Procedure

The description of the model follows up the suggested specifications of the standard protocol ODD (when applicable) to describe ABMs, proposed by Grimm *et al.* (2010). NETLOGO 6.0.3 software (Wilensky, 1999) was used to perform the simulations and to calculate the several model outcomes. For simplicity both Alentejo and North farms will be simply referred as “wine-farms” since most of the concepts are analogous between them.

Virtual site description

The model simulates the subsistence of Alentejo and Douro farms and emulates two separated landscapes (one per each region) overshadowed by distinctive global variables, since the problem formulation doesn't acquaint spatial interactions among the agents their location on the 1024 patched grids is arbitrary.

Overview

Entities, state variables and scales

The model contains three types of conceptual variables (Table 1): the patches (unit cells) which form the virtual landscape and splits the studied area into two different regions (North and Alentejo), the generated wine-farms which are able to produce at each period, own a certain initial area (in ha) normally distributed with parameters approximately equal to the average values of the real data PTFADN (2001-2012), a management quality status, an initial bank balance and a Size Productivity value, both acquainting the farm size. Finally, the global variables surround the agent's production function supplying the market values of the several available features stated on Table 1.

Variable	Alentejo (IC)	North (IC)	Brief Description
Grape selling price (P)	0,82€	0,82€	Grape selling price (€/kg) given by the external market.
Area (A)	$\sim N(19.92, 5)$	$\sim N(8.23, 5)$	Individual farm area (ha).
Bank Balance (B)	$A^* \sim N(20000, 1000)$	$A^* \sim N(20000, 1000)$	Initial bank balance from each Douro and Alentejo farm (€).
Quality (Q)	Random number (0.5-1.5)	Random number (0.5-1.5)	Inner farm conditions (management, terrain, vineyard structure) that can overvalue or undervalue the production. (-50% to +50%).
Subsidies (S)	Equation (9)	Equation (10)	Subsidies value that each farm receives from the government per each period (€/ha).
Investment (I)	Equation (7)	Equation (8)	Yearly investment value by the producer (€/ha).
Environment (E)	Equation (5)	Equation (6)	Bundle of intermediate consumption that each farm expends in order to produce (€/ha).
Labour (L)	Equation (3)	Equation (4)	Labour costs that the farm needs to support in order to produce (€/ha).
Production (Y)	Equation (1)	Equation (2)	Individual grape production (kg/ha) of each farm.
Size Productivity (V)	Equation (11)	Equation (11)	Based on Equation 11, V displays the productivity of the farm considering its size.

Table 1. *ABM variables formulation, description and Initial conditions(IC)**Produce*

The farm production is the core procedure of this model, at each period the farms perform their activity and gain or lose money according to the production function $R_i(t)$, given by Equation (12), where i represents the farm i from the set of 500 farms $F = \{1, \dots, 500\}$. The final result updates each farm bank balance and evaluates if the farm is sustainable and able to proceed their activity (*bankruptcy* procedure).

$$R_i(t) = P(t) \cdot A_i \cdot Q_i \cdot a_i + S \cdot A_i - E \cdot L \cdot I \quad (12)$$

Bankruptcy

Since our goal is to evaluate the sustainability of Alentejo and North wine farms, the bankruptcy procedure checks each farm bank balance and perform an “if” condition, where farms with bank balance below 0€ disappear from the model.

SIMULATION AND RESULTS

The initial model tries to attain information about the evolution of 1000 farms (500 from Alentejo and 500 from the Northern region). It contains a settled seed to entangle the initial stochastic generation of each farm size (A), quality (Q) and bank balance (B). Since the global variables evolution is previously given by the interpolated functions, the initial model outcome is purely deterministic. The grape price

is settled to start at 0.82€ and increment by 0.005€ (to acquaint the price inflation). The graphical interface of our model (before running the simulation on NETLOGO 6.0.3 can be seen on Figures 1A and 1B. The layout is divided into two distinctive areas separated by a neutral black horizontal line. The green area represents the North region and the yellow is the Alentejo region. The houses represent each individual farm (Alentejo-red and North-blue) and their size are directly correlated with their area. It is quite noticeable that Alentejo owns substantially larger farms than North. The Figure 1B shows the graphical interface at the end of the simulation ($t=100$) where 310 farms (62%) from North went out of business, the Alentejo scenario is mildly better with only 159 vanished farms (31.8%). In both regions overall costs increased during the simulation (see Figures 2A and 2B), especially during the latter 50 years.

Figure 1. Initial A)($t=0$) and final B)($t=100$) ABM graphical interface for the North and Alentejo regions

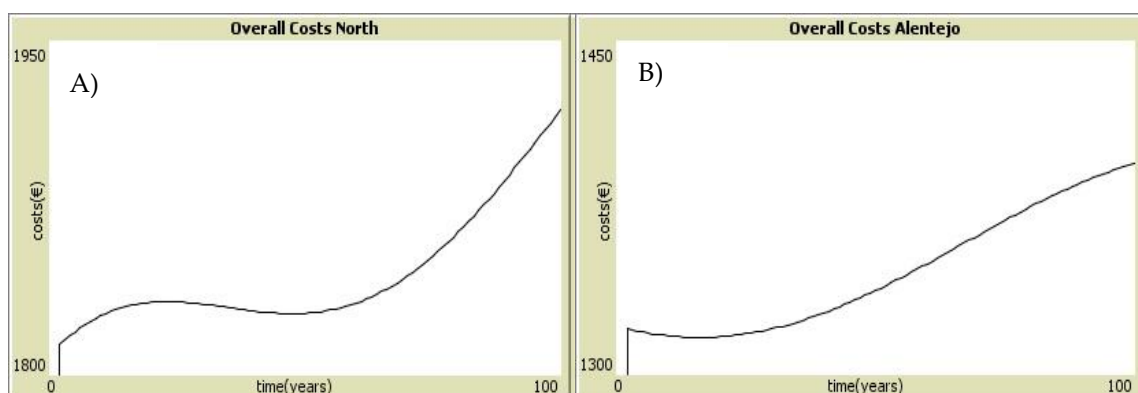

Figure 2. ABM simulation results for overall costs in North region (A) and Alentejo region (B)

The main goal is to avoid this sad fate with such many bankrupted farms in the next 100 years. The subsidies appear in the model with a direct influence into each farm bank balance, we then assume that the government is able to increase this direct aid. Figure 3 provides the impact rate per incremental subsidy level on the farm survival rate at the end of the 100-year simulation. Even though it is possible to improve our benchmark scenario, and almost ensure the complete survival of the whole Alentejo's farms for a 3000 (€/ha) incremental subsidy per period, such measure discloses heavy governmental expenditure.

Figure 3. *Survival rate of Alentejo (ASR) and North (NSR) farms per governmental subsidy level*

Fortunately, the government owns alternative tools, other option (which is currently active in Portugal) is to provide a beneficial grape selling price (€/kg) to the producer. Starting again from the initial model, we add a certain value (benefit) to the yearly farmers grape selling price. In order to establish some comparison against the previous government support, we calculate the government expenditure per benefit level accounting the overall production per hectare from both regions. The results on Table 3 display the farm survival rate (SR) upon the two different supports with matched governmental expenditure.

Government Expenditure (€/ha)	Beneficial grape price (€) Alentejo	Beneficial grape price (€) North	Alentejo SR Subsidies	North SR Subsidies	Alentejo SR Benefit	North SR Benefit
0	0.000	0	67.2%	38.0%	67.2%	38.0%
100	0.027	0.033	69.4%	39.4%	72.8%	44.2%
200	0.054	0.067	71.2%	40.4%	77.8%	53.6%
300	0.079	0.100	72.8%	40.6%	80.4%	54.8%
400	0.105	0.133	73.8%	42.2%	83.6%	56.4%
500	0.131	0.167	75.8%	42.2%	88.4%	57.4%

Table 2. *Comparison of governmental subsidies and grape selling benefits in the survival rate of Alentejo and North farms*

It is easy to see that the beneficial grape price measure overshadows the subsidies impact on both regions. The main reason may lay on the fact that this incentive benefits directly the production function outcome allowing roughly productive farms to withstand. While the subsidies are not related to the farm production, the selling price benefit directly shifts up the operational capabilities introducing a multiplicative income effect to the farm that increases the SR substantially. The results on the North are quite impressive, according to our model's conditions and assumptions, it is possible to save 15.6% of this region farms with a 0.067€ benefit and an additional government expenditure of 200 (€/ha). On the other hand, with the same amount of expenditure, 10.6% of Alentejo's farm would also be preserved.

Environmental and labour based impacts

As stated previously during this article the environmental and social variables represent two of the three core concepts that define the firm sustainability. Labour shortages and subsequent wage overpricing can be a consequence of unfavourable demographic dynamics such population aging (Fuchs *et al.*, 2017) and migration towards urban areas (Jan van der Laan, 2016). On the other hand, activities such as the viticulture rely on scarce natural resources. The depletion of those natural resources and the overall environment may trigger increasing prices and governmental taxes in order to discourage excessive demand and preserve the environment. To emulate such scenario alongside the uncertainty concerning Social and Environmental variables, we apply a percentage increase into the labour (L) and environmental (E) cost variables per year. To consider the volatility surrounding such variable we will also apply a random deviation upon that increment level. For this simulation we abandon the fixed seed at the beginning of the model, therefore, to perform this stochastic model we run each simulation 30 times. Table 3 compiles the results, displaying both region survival rates upon different levels of cost increments and randomness.

Social and Environmental percentage increment per year	Random deviation	Alentejo		North	
		Average SR	SR Standard Deviation	Average SR	SR Standard Deviation
0%	0%	68.20%	0.0000	38.00%	0.0000
5%	-3% to 3%	68.14%	8.8474	32.90%	9.5768
10%	-6% to 6%	67.60%	8.9659	31.17%	12.8185
20%	-12% to 12%	67.14%	11.3171	26.75%	17.8581

Table 3. *Alentejo and North survival rates with incremental Environmental and Labour costs.*

The first remark from our results it is the almost innocuous effect from the increasing costs in the Alentejo region farm SR. On the other hand, the Northern region suffers substantially with the introduced randomness and increasing costs, losing about 11.25% more farms than our initial simulation in the worst-case scenario. There are two possible explanations for this phenomenon: the

first is that the North requires more labour intensive than Alentejo and subsequently the impact should be greater. The second explanation lays on the higher productivity levels from the Alentejo farms underpinned by their larger areas. Such advantage may lead those farms to deal better upon negative and unexpected (random) scenarios.

CONCLUSIONS

In this article two distinctive wine producing Portuguese regions, Alentejo and North, were presented. After a brief presentation about this sector relevance on the Portuguese economy the sustainability analysis of the studied regions was selected as the major goal of this article. To emulate the wine farm activity from the Alentejo and North regions and furtherly simulate alternative scenarios, the ABM methodology was selected. The model relies on a few assumptions, random generation and interpolated time-dependent functions based on real data accounting also productivity per farm size variable. The initial simulation compiling 500 generated farms per each region displayed an alarming scenario at the end of our timeframe (after 100 years) with the survival of only 38% and 68.2% of the North and Alentejo farms respectively. Governmental policies such as the subsidies and the grape selling benefits were analysed and compared, the results showed that the latter may overperform the subsidies measure on both regions. Considering our model formulation and assumptions a simple governmental grape selling benefit 0.054€ on the Northern region may avoid the extinction of 15.6% of the farms. Finally, some threats were also considered such as rising labour and environmental costs alongside with model stochasticity. The results showed that the Alentejo region is generally well prepared to deal with such negative scenarios opposed to the North region, which saw a severe depletion of the farm survival rates during this experiment. The reason beyond the strength upon negative scenarios of the Alentejo farms in comparison with the North might be explained by their less intensive labour approach (more mechanization) and better productivity levels derived by their larger areas. This article with the chosen methodology (ABM) showed that Alentejo and North farms sustainability on the forthcoming future (specially the North region) are under threat but governmental measures such as the grape selling benefit may play an important role to ensure the sustainability of both regions. For further work, it is possible to get into more detail and include more variables such as the weather conditions or add the real data of individual farms to make the model more accurate.

INNOVATION AND TRADITION IN THE WINE BUSINESS: AN ENQUIRY INTO FAMILY BUSINESSES' APPROACH TO THE DILEMMA

Giacosa, Elisa; Stupino, Margherita

Department of Management, University of Turin, Turin, Italy

ABSTRACT

In the last twenty years the winemaking sector has witnessed considerable change due to an increase in competition and in the competence of wine consumers, who now look for quality rather than quantity. Some firms decide not to focus on the product or the brand, but rather on the moment of consumption and the philosophy underlying such moment. Such an approach might be considered as an example of the combination of tradition and innovation: the history and the uniqueness of the territory are not affected by dramatic changes; in fact, they benefit from innovation in the meaning of the product.

Most firms try to pursue strategies seeking to take advantage of both tradition and innovation. Even though the opposition between innovation and tradition has not been solved yet, meaning-driven innovation definitely opens a window on a series of issues that deserve to be taken into consideration for further research.

Keywords: Wine Business, Innovation Management, Tradition, Family Business

INTRODUCTION

Nowadays innovation is definitely one of the most important drivers for the success and growth of companies (Christensen et al., 1999 and 2003; Kim and Mauborgne, 2005; Verganti, 2008).

The wine industry has become an increasingly important factor for the growth of a lot of countries, with a relevant contribution both in terms of employment and revenues (Avermaete, 2002; Menrad, 2004; Bigliardi and Galati, 2013; FoodDrinkEurope, 2016). Within this context, which is characterized by an increasing competition and globalization, innovation is recognized as a key strategy for sustaining competitiveness and meeting current and future consumer's needs, also in terms of health and safety (Bigliardi and Galati, 2013).

Italy has had a long history as a wine producing and consuming country and it is then no surprise that today it ranks first in the world for the volume of total wine production, with nearly 45 million hectolitres produced in 2013 (OIV, 2013).

New competitive patterns and changes have emerged in the industry placing Italy, along with other wine making countries, in a challenging and competitive environment, where tradition and an

internationally recognized fame are no longer sufficient to maintain a leading position on the global market, where the “New-World countries” have been increasing their market share: while in the 2000-2012 period the most traditional wine producing countries witnessed a decrease in the level of wine production (i.e. France -28,4%, Italy -15,15%, Spain -22%), in the same period countries such as China, Chile, Australia and South Africa increased their production of over 40% (OIV, 2013). Such rapid considerable growth undoubtedly represents a critical factor which should not be underestimated.

Furthermore, significant changes in consumption patterns, have contributed to making the competitive arena more challenging: while in Europe the recent recession has led to a sharp decrease in consumption, in New-World countries wine has become more and more popular.

What is more, the increasing internationalization of the sector has forced companies to face a larger number of consumers on the one side – which represents a considerable opportunity – and to deal with different consuming behaviours on the other – which has resulted in a more and more uncertain market.

A number of studies (such as Cohen et al., 2009; Balestrini et al., 2006; Norman et al., 2014) have showed that the buying process and consumption patterns of wine consumers change depending on national culture.

Moreover, differences in quality perception should also be taken into consideration. Broadly speaking, two schools of thought might be identified when it comes to the organoleptic characteristics of a wine. The first considers the quality of the product as strictly related to the *terroir*¹, thus a prerogative of the winemaker, considered as an “expert” because of his considerable knowledge of climate, grape variety, soil and the environment from which the wine derives its origin. According to this perspective, human intervention, for instance the adding of aromas, should be kept to a minimum, as the final product should fully express the characteristics of the land. This approach is known as the “French method” (Cohen et al., 2009), which dominated the worldwide market for several decades, but which is currently struggling to maintain its position in countries where such culture and are not long-established. Old-World countries have tried to protect themselves by emphasising the importance of the *terroir* and introducing stricter national laws on the Denomination of Origin².

However, such laws did not produce a decisive advantage for French and Italian wine producers, as

¹ Although the term stands for “territory” in French, in the wine sector *terroir* represents a broader concept. The term does not only represent the natural and physical characteristics of the soil, the climate and the geology of the land, but it also includes the knowledge and expertise necessarily related to the history and culture of the population of that territory, which all contribute to the intrinsic and unique qualities of a specific wine (Cusmano et al., 2010).

² In Italy, the Denomination of Origin is an official recognition of the quality of a wine, certifying that it has been produced in a specific territory according to specific standards. The Denomination of Origin law originally distinguished DOC (*Denominazione di Origine Controllata*) from DOCG (*Denominazione di Origine Controllata e Garantita*) wines (Corrado et al., 2009).

they did not provide effective guidance for production and generally ended up confusing consumers, especially international non-expert ones (Corrado et al., 2009). As a result, an opposite, more recent market-oriented trend has emerged, one according to which the consumer is the main player (Cusmano et al., 2010).

All of these factors have resulted in another big challenge for wine producers, especially for Italian ones: the increasing importance of marketing activities.

WINE BUSINESS: LITERATURE REVIEW

The literature about the wine industry is rich. Focusing on innovation, the presence of different types of innovation has been investigated (Vrontis et al., 2016) along with different available business models. Considering the paradigm of open innovation (Chesbrough, 2003), external and internal configurations have emphasized the relevance of external sources within innovation development processes (Sarkar and Costa, 2008). In particular, the crucial stage of acquiring external knowledge and building strategic networks (Giacosa et al., 2017) has been analysed, as it increases competition and growth (Bower, 2001).

In a current scenario characterized by both hyper-competition and globalization, on the one side, and new technologies on the other (Bjor et al., 2010), innovation is the key strategy for achieving competitiveness (Bresciani, 2009 and 2010; Cooper and Kleinschmidt, 1993). Thanks to innovative strategies (Bresciani et al., 2015), companies build and maintain competitive advantage by developing products and services in order to achieve a sustainable position in the market (Santoro et al., 2016).

In such a context, innovation in the wine sector is deemed particularly relevant. Although the wine sector is characterized by a low R&D intensity and a certain mature degree (Galizzi and Venturini, 1996; Costa and Jongen, 2006), product and process innovation may help companies to deal with competitors and satisfy consumer's needs (Menrad, 2004), while allowing to satisfy the demand in terms of product variety (Costa et al., 2007).

Process innovation generally focuses on both production and marketing strategies (Dries et al., 2014) along with productive, logistic and packaging innovation aimed at generating or modifying customer's needs (Toops, 2009). Effective innovation strategies generate different kinds of benefits, such as lower costs, higher product quality, higher productivity levels, as well as customer satisfaction (Clarke et al., 2012).

Several innovation approaches have been analysed in the wine sector, taking into account both internal and external sources for achieving innovation (Chesbrough, 2003; Sarkar and Costa, 2008).

Different configurations of innovation (internal, external and mixed) (Schilling, 2009), along with product and process innovation (Bresciani et al., 2015; Giacosa, 2011) have been applied to the wine

sector (Adner and Levinthal, 2001; Bresciani, 2009 and 2010; Sood and Tellis, 2009). Within this context, it has frequently emerged that only a combination between traditional and innovative strategies allows companies to achieve and maintain the competitive advantage which ensures the company's survival (Carrasco-Hernandez and Jimenez-Jimenez, 2012; Greenwood and Miller, 2010).

Where does innovation lie? Or, in other words, what are the most innovative sectors? It is a fact that industries seem to be more innovative than others or, at least, they seem to promote and favour innovation more than others. Every year Thomson Reuters publishes *The 100 Global Innovators* report, which aims to rank the 100 most innovative firms of the year by considering a number of parameters such as the number of patent applications granted, how often such patents are cited by other companies, whether such patents improve existing ones. Considering the limits of this approach (for instance, there cannot be a patent for innovation concerning change in the meaning of a product), the results of the last three years give useful insights. Some industries recur more than once while others are not present at all. The wine and beverage industry is not on the list but, as already pointed out, this may be due to the fact that in this industry patents are not as frequent as in the other sectors. What is more, most of the patents filed in the wine industry concern the suppliers of a wine company, as they may be related to the bottle, the closure or the label of the product. Results differ when we consider Forbes. Its section on the Most Innovative Companies in 2013 does list some firms from the beverage industry and that is due to the fact that Forbes evaluates firms by considering their *innovation premium*, i.e. the difference between their market capitalization and the current net value of the cash flow of companies in the same business 11, which is a good indicator of how much the investors expect the company to be innovative now and in the future. What is noticeable in Forbes's list is that none of the companies is Italian. Although Italy is globally recognized as one of the major and best reputed producers of wine, spirits and other alcoholic beverages, it still suffers in the competitive arena before international competitors. Most Italian wine companies are family-owned or cooperatives, which demonstrates how crucial tradition is in this sector.

If, on the one hand, the literature offers an analysis of the innovative processes conducted by enterprises, on the other hand the issue is whether such studies may find an application in a sector which does not share the characteristics considered in the study of innovation.

In some large companies, the combination of tradition and innovation is managed with a strategy of diversification of the portfolio: on the one hand, some wines are representative of tradition, i.e. they are made from indigenous grape varieties with a constant research aimed at produce the best wine possible. When it comes to this kind of wines, history, quality and expertise are highly valued; wines, even though they target different segments, are promoted in a way that one might consider "conventional", i.e. it is emphasized that they represent a territory at its finest expression. When it

comes to this kind of wines, there is little place for innovation, which tends not to be considered essential, as the history and poetry surrounding the wines get all the attention.

On the other hand, the company also owns a brand (i.e. a set or range of wines) which has a global appeal and generates considerable volumes of sales. Although still related to the family, the wines are not related to a specific territory or a single estate, they are promoted as any mainstream brand (for instance, they are distributed in supermarkets). For this kind of wines, innovative strategies play a more prominent role than for the previous one; strategies are usually more flexible and aimed at promoting the products that best suit a specific segment, without harming the identity of the company. In order to ensure this, market research must be extremely accurate and it becomes the main driver for innovation: salesmen and export manager(s) are to study the market and identify emerging trends.

As the family generally wants to preserve the identity of the company and its coherence with the Italian winemaking tradition. That is precisely why some (large) wine companies do own a large portfolio with tens of products created for different specific markets. Doloreux *et al.* (2013) have highlighted that clients are the most frequently cited type of source of information and new ideas, the other sources used being trade fairs, exhibitions and suppliers along with competitors and industry associations.

In wine companies, the main innovation drivers are often the area managers and other operators in the sales department), when they act as market researchers: they can play such a role because they are closer to the market and can get ideas and suggestions in an easier, more immediate way. This is in line with what Dyer *et al.* (2011) have theorised, i.e. observing is one of the key skills of innovators, who should first understand the market in order to come up with new ideas.

Given the fact that their size does not allow for a complex organisation, often in family businesses there is no formal distinction between the marketing and sales departments.

In terms of innovation, the most relevant differences seem to be related to the kind of market targeted by the company: in the most traditional markets, such as Italy and France, different marketing strategies are required as innovation seems somehow to be associated with trivialization. This is due to the fact that in the most traditional markets people are used to drink wine daily, and the consumption of wine is related to diet and tradition (Bernetti *et al.*, 2006). What is more, a sort of sacred value is conferred to wine, considered as a product deeply related to the territory and the history of people; wine has always been distinguished from other beverages and perceived as more sophisticated, in that it is the only beverage whose uniqueness is closely related to the uniqueness of a territory.

On the other hand, countries which do not have an ancient tradition of wine making and wine

consumption, the value of wine does not only depend on the *terroir d'origine* but also on other immaterial factors, such as the brand. In such markets there is definitely more space for marketing and communication activities aimed at creating and associating new values to the product (Balestrini *et al.*, 2006).

Another aspect to take into account is the openness of a market to new, innovative products. In traditional countries, consumers are acquainted with drinking wine but generally they drink wine(s) from their own territory. Although they might have experience and knowledge of other products from their country, this does not necessarily mean that they know about international wines. Italy is an example of such kind of countries, along with Australia, France, Spain, Belgium, Chile and Argentina. On the other hand, some countries seem to be more open to different types of wine; typically, the United Kingdom, whose wine consumers are usually aware of a broader range of varieties and brands. It is a fact that British consumers tend to experiment rather than stick to a range of labels. Also the United States and Canada share several of the characteristics of the British market (Campbell *et al.*, 2006), as well as Northern European countries (Norway, Sweden, the Netherlands, the Baltic states). Wine Intelligence (2013) has defined the most traditional countries as “mature markets”, which do not offer big opportunities of growth; on the contrary, “modern countries”, i.e. emerging markets, appear to be more attractive and more open to new products and new meanings.

In conclusion, in Italy innovating tends to be seen as unprofitable, and not only because of the individual perception of wine –which might be considered sacred and stereotyped at the same time: the wine sector tends to conform; in other words, doing things differently does not always work. For instance, in traditional countries such as Italy, Germany and Spain using screw caps gives the wine a detrimental “low-cost/low-quality” aura: this is the reason why some (large) companies sell screw capped bottles only in some markets, while in others they use natural cork.

Another reason why it is hard to innovate in Italy lies in the stagnation of the market. Wine Intelligence has classified the Italian market as mature, i.e. characterised by little or no growth (Wine Intelligence, 2013).

As innovation often requires considerable investments that need to be paid back, the current state of the Italian market does not seem to allow for investments on innovation.

However, companies who can afford it create a marketing department for the domestic market and a marketing department for foreign markets, a strategy which is in line with the “export imperative” that has forced wine companies to focus on more promising markets (Wine Intelligence, 2013; Anderson *et al.*, 2011).

Finally, another aspect to consider is that new, non-traditional consumers are approaching wine, i.e. young people and women, which might contribute to the success of initiatives promoting wines in

unconventional ways. Although young consumers might consider wine as a product for “old people” (Mora, 2006) or might feel insecure because they do not know much about the considerable number of labels and denominations available (Brunner *et al.*, 2011), companies should invest on marketing activities targeted at young people, with the aim of creating a core of wine-drinking customers that will pay back the investments in the long run.

Product innovation

When talking about product innovation in the wine industry, it is essential to consider the fact that the product can be thought of in different ways. In other words, “wine” does not refer only to the liquid contained in the bottle. Packaging matters too, i.e. bottle, cork, label and other accessories. As Mueller *et al.* (2008, p.1) have pointed out, “the first taste is with the eye”. The packaging might also affect consumers’ expectations about the sensory experience they are about to enjoy (*Id.*, 2008). In addition, it has been shown that 48% of purchases in a point of sale are based on packaging (De Luca *et al.*, 2006). Packaging is also the product component that is more subject to change and innovation, especially when one considers the stopper and the bottle: elements that are changed in order to improve the manageability of the product and that represent an important communication tool (Balestrini *et al.*, 2006; De Luca *et al.*, 2006). De Luca *et al.* (2006) has reported on a qualitative research carried out on the English market, where consumers said that, when buying a bottle of wine, they actually choose on the basis of the label design and the aesthetic characteristics of the bottle, as they do not know much about the product.

Innovating marketing strategies

As each market reacts to marketing activities in a different way, wine producers tend to adopt the closest possible approach to the consumer. If, in the past, making good wine was enough to sell the product, nowadays wineries have to find strategies to make the product and the brand recognized and considered in the sector.

Communication tends to emphasize the quality of products, the respect for the unique characteristics of the territory, the peculiarities of the vineyard, the history and the “poetry” surrounding wine.

As already suggested, it might be easier and more effective to innovate the ways of communicating the product, i.e. packaging, label, bottle, rather than the product itself (Balestrini *et al.*, 2006). An example is the sleeve label, which is a transparent plastic cover that adheres onto the bottle, thus letting the producer “dress” its product with whatever colour or pattern he wants. Sleeve labels have been used for beverages for decades, but they have been recently used successfully also in the wine business as a way of communicating.

Meaning-driven innovation

Innovation does not concern solely the product but also the social meaning of it as well as its use. As

Verganti (2008) has pointed out, meaning-driven innovation is related to products which satisfy subtle, unspoken needs of the market, by creating new habits and contexts of consumption. Meaning-driven innovation is not aimed at radically changing the product, but its meaning in the consumers' perception.

Process innovation

Innovation may also concern internal processes (Schilling, 2008). Innovating processes does not only mean considering the productive point of view but also improving sales and organizational procedures. It is related to thinking about business in a different way. It often represents an important improvement in the process of building brand awareness and loyalty: two crucial factors in the wine industry.

CONCLUSION

In the last twenty years the winemaking sector has witnessed considerable change due to an increase in competition and in the competence of wine consumers, who now look for quality rather than quantity. Although more intense competition has led to innovation, wine makers have not abandoned local traditions.

The most recent challenge lies in the attempt to make wine in a more and more environmental-friendly way while at the same time meeting the needs of a more and more demanding audience who gives assiduous attention to health and environmental issues. To this regard, a lot has to be done to harmonize international regulations as well as to make stricter national laws to regulate the use of toxic chemicals. The regulations on the use of sulphites and other additives in organic wines clearly need to be revised – innovation might be crucial in reducing the use of such substances, with an impact not only on winemaking but also on food production in general.

Being thoroughly regulated as well as based on a complex appellation system, the winemaking sector has limited possibilities to introduce radical innovations. On the other hand, innovation plays a major role also in the countries where traditions are more deep-rooted – such countries, successfully combining tradition and innovation, have made it possible for the sector to keep abreast of the times and be up-to-dated.

As for product innovation, of course wineries can introduce new products but these cannot – at least for some time – be classified at the top of the quality pyramid as appellations are given only to typical products which have been classified as IGT for some years. Furthermore, it is extremely difficult – if not impossible – to introduce product innovation within the existing appellations as the regulations governing production are quite strict about the way in which the various wines must be made. Those who wish to work with fewer rules, might opt out of the appellation, as a number of wineries have

done over the years – in a few cases, their new products have had a huge success.

At least in theory, wineries have endless possibilities to carry out product innovation, for instance by blending different grapes. In actual fact, though, a successful wine is the result of years of studies and research carried out by qualified wine makers. Any wine should be created bearing in mind the consumer's tastes and needs. Following strategies defined "market pull", wineries gather loads of information on such tastes and needs. Very often, they use international varieties not traditionally associated to the area of production such as Chardonnay, Merlot and Sauvignon, which tend to be more easily recognized even by novices.

Last but not least, organic, natural and biodynamic wines may well be considered a result of product innovation.

Focussing on family wineries, it is a fact that they tend to follow strategies based on the combination of tradition and innovation – their efforts to innovate result in both a wider range of products (i.e. new wines) and in the continuous improvement of the quality of the existing ones thanks to the use of technology. The production of local wines is based on traditional practices, while innovation is more related to attempts at appealing to the consumer.

When consumers are captivated (Quester and Lim, 2003), they are more likely to get involved in a buying experience (Flynn and Goldsmith, 1993). Across generations, a multi-sensorial strategy (Clarke et al., 2012) highlights its specificity in relation to corporate values, family reputation, and cultural identity. This in turn contributes to long-term authenticity and prestige, brand awareness, together with a sense of exclusivity of the goods offered (Kapferer, 2002), thus also promoting regional identity in a rather effective way.

Undoubtedly, the combination of innovation and tradition has a positive impact on the consumer's perception of the image of the winery, provided that product innovation is managed in an appropriate way, i.e. combining extensive research into product quality with a focus on the consumer's perception of the winery's image.

In order to support their innovation strategy, some family wineries might adopt a flexible, flat organisational structure, which improves vertical and horizontal coordination and communication, making it possible for the family to take timely decisions and readily adapt to the market.

ABSTRACT

During the last decade the exposure of institutional investors to FOHFs has increased strongly, inside the hedge funds industry because of diversification opportunities despite the poor value they deliver.

Among the diversification choices at the heart of portfolio construction, there is the geographical focus: despite a high diversification by asset, FOHFs managers prefer to invest in nearby hedge funds because information availability. Nonetheless, little is known on geographical diversification without US focus and on the contribution of the single country.

By looking at hedge funds from United Kingdom, Ireland and Cyprus, results show that geographical diversification matters for FOHFs. In particular, funds based in Cyprus do not outperform with respect to other market independently with respect to the RAP measure selected, but they are useful for constructing FOHF especially if investors aim to reduce the systemic risk, tracking error or downside risk exposure.

Keywords: hedge funds, performance, FOHF, portfolio diversification, Sharpe ratio, Treynor index, Jensen's alpha, Modigliani's square, Information ratio, Sortion index.

1. INTRODUCTION

Funds of Hedge Funds (hereinafter, FOHF) are diversified investment vehicles that provide investors with diversification either across managers but within a single hedge fund strategy, such as long/short, or across a wide range of hedge fund strategies (Dai and Shawky, 2012).

During the last decade the exposure of institutional investors to FOHFs has increased strongly, inside the hedge funds industry: such success of FOHFs among investors is determined by the positive contribution to diversification of equity portfolios, both during bull and bear phases (Denvir and Hutson, 2006), that increases with the extension of investment opportunities to international assets

(Kooli, 2007), therefore despite the poor value they deliver they are appreciated by risk adverse investors (Ang et al., 2005). The advent of the global financial crisis reversed somewhat this trend, with assets under management (AUM) of the industry taking a sharp turn for the worse after steep losses and heavy redemption pressure from investors (Dai and Shawky, 2013) that was mainly ascribed to an excessive risk taking and the lack of diversification of the portfolio under management (Iannuzzi and Berardi, 2010).

Among the diversification choices at the heart of portfolio construction, there is the geographical focus that in other areas and in other industries it represents the best solution in order to reduce the overall risk exposure (e.g. Ferraris, Bresciani e Del Giudice, 2016). Despite a high diversification by asset, FOHFs managers prefer to invest in nearby hedge funds because information is scarce and costly to obtain. In fact geographical diversification is found negatively impacting both returns for not global strategies and risk overall. Nonetheless, available empirical evidences address the topic of the impact of international diversification by geographical areas always considering the US, while little is known on geographical diversification without US focus and on the contribution of the single country.

In light of the contagion risk that concentrated FOHFs can pose at system level (Sialm et al., 2013), the paper addresses international diversification of FOHFs investing in European hedge funds, that are featured by a higher frequency of biggest funds and a lower intensity of home bias (Eurekahedge, 2018). Selected hedge funds are domiciled in United Kingdom, Ireland and Cyprus: such funds share the common regulation framework under the Directive on Alternative Investment Fund Managers fostering transparency, but they still differ. United Kingdom is the first country in Europe by manager location (and it found fundamental in attracting capital when implementing international diversification out of United States (Teo, 2009), while Ireland is the domicile of the vast majority of European hedge funds since last decade (PWC, 2015). A fast growing country in the hedge fund industry is Cyprus, with the number of entities doubling and the total assets tripling over the last decade, especially after the 2013 financial crisis which hit the island and its banking system with deposits bail in, even though several fluctuations are noticed in the last 4 years (Eurosystem, 2018).

The paper presents an empirical analysis on a portfolio of hedge funds internationally diversified in order to evaluate if the Cypriot market may be an interesting opportunity for maximizing the return/risk profile for a FOHF. The paper presents a detailed analysis of the literature review (section 2) about the FOHF diversification strategy and the impact of geographical diversification on the performance and risk of the portfolio. The empirical analysis (section 3) presents the sample selection criteria, the RAP (risk adjusted performance) measures selected for the analysis and the results on the relevance of the Cypriot market in a diversification strategy. Results show that hedge funds based in

Cyprus do not outperform with respect to other market independently with respect to the RAP measure selected but they are useful for constructing FOHF especially if investors aim to reduce the systemic risk, tracking error or downside risk exposure.

2. LITERATURE REVIEW

During the last decade the exposure of institutional investors to alternative investments has increased strongly, particularly through FOHFs, inside the hedge funds industry: such success of FOHFs among investors is determined by the positive contribution to diversification of equity portfolios, both during bull and bear phases (Denvir and Hutson, 2006), that increases with the extension of investment opportunities to international assets (Kooli, 2007), therefore despite the poor value they deliver they are appreciated by risk adverse investors (Ang et al., 2005).

Diversification is a key difference between FOHF and single strategy hedge funds: while the first ones can be diversified in terms of assets classes, sectors, styles and geographies, FOHF's are diversified investment vehicles that provide investors with diversification either across managers but within a single hedge fund strategy, such as long/short, or across a wide range of hedge fund strategies (Dai and Shawky, 2012).

Moreover, hedge funds information is scarce and costly due to restrictions in advertising publicly and the limited disclosure requirements (Agarwal et al., 2013), thus frequently institutional investors delegate due diligence and monitoring activities to FOHF at the cost of fees' duplication (Brown et al., 2005). Van Nieuwerburgh and Veldkamp (2010) show that the investor will specialize in their investment portfolios because they prefer to hold assets they are informed about, FOHF should be relatively undiversified due to the preference of investing funds close to them.

A lot of studies have addressed the topic of the number of hedge funds a FOHF should invest to reach a sufficient diversification level: a small number of funds, between 10 and 25, is found sufficient to diversify risk away, also under more recent analytical frameworks to assess the risk/return profile (Amo et al., 2007). Nonetheless, empirical evidences show that the FOHF industry is well diversified by number of funds, even though diversification does not appear to drive to meaningful risk reduction, but it can determine the death of the fund under extreme conditions (Brown et al., 2011).

At the heart of portfolio construction, there are the diversification choices on the exposure to take toward different strategies, sectors, geographies determining empirical evidences show that strategic asset allocation counts for more than the 70% of the performance (Suppal and Garza, 2012): in the geographic allocation of the portfolio, that is found affecting the capital raising capacity (Teo, 2009) as

geographical concentration is associated with smaller size (Gregoriou and Pascalau, 2009), FOHF appear to concentrate on hedge funds in the nearby because fund of hedge funds' managers are not capable to overcome institutional investors information limitations and, therefore, a negative relationship is observed between geographical diversification and FOHF return, even though a significant reduction of idiosyncratic risk is observed (Shawky et al., 2012). In particular, the global macro strategy, based on geographical diversification with the aim at profiting from major economic trends and events in the global economy, like currency and interest rates shift (Fung et al., 2006), allows to mitigate risk, coherently with the violation of the normality properties of returns (Morton et al., 2006) to enhance positive skewness of the market risk exposure (Davies et al., 2016) coherently with the violation of the normality properties of returns (Morton et al., 2006).

Among the risk factors, funding liquidity risk is extremely relevant for FOHFs because, in first place, they are liquidity providers. Secondly, FOHFs' investments show that funds with high loadings on the funding liquidity factor underperform low-loading funds and market liquidity and funding liquidity interact with each other, potentially leading to negative liquidity spirals, while hedge fund managers are not entirely successful in timing shifts in market liquidity, and lockup provisions are only effective during high liquidity states (Ilerisoy et al, 2017). Under the macro perspective, the geographical diversification of FOHFs can mitigate disruptive implications of liquidity crises due to contagion they create within the area (Sialm et al., 2013), particularly during bear market conditions (Agarwal and Naik, 2000).

3. EMPIRICAL ANALYSIS

3.1 Sample

Our research sample consists of two of the main European markets for the hedge funds industry (United Kingdom and Ireland) and Cyprus. The choice to consider Cyprus is justified by the high increase in the investment funds in Cyprus in the past 10 years, with the number of entities doubling and the total assets tripling, especially after the 2013 financial crisis which severely affected the island and its banking system with deposits bail in. Several fluctuations are noticed in the past four years (Figure 1).

Figure 1 – Evolution of total assets and number of reporting entities in Cyprus

Source: Central Bank of Cyprus data processed by the author

Information for all the main players on the basis of the asset under management (AUM) for the time period 2010-2015 (monthly data) are collected. In order to have comparable size of samples for the three countries considered and due to the lack of data available for the Cypriot market, the number of hedge funds included is 10 for each country (Table 1).

The analysis of data by country show that some interesting differences in the performance achieved by hedge funds that may create an incentive for an international diversification strategy for maximizing the return/risk trade-off (Table 2).

Table 2. Summary statistics

Country	Statistics	2010	2011	2012	2013	2014	2015	Overall

Cypriot hedge funds are on average the riskier investment opportunity and also the less performing one while the best market for both performance and risk is United Kingdom. The correlation analysis show, as expected, that the performance achieved by hedge funds in different geographical areas is correlated but interesting the correlation between the Cypriot market and the other markets is the lowest independently with respect to the benchmark used (Ireland and UK) and even if it is higher than 50% it is not statistical significant.

3.2 Methodology

The performance analysis of each hedge funds investment is performed by considering the following risk adjusted performance measures (hereinafter RAP):

$$\alpha_{it} = r_{it} - r_{ft} - \beta_{it}(r_{Mt} - r_{ft}) \quad (1)$$

$$SR_{it} = \frac{r_{it} - r_{ft}}{\sigma_{r_{it}}} \quad (2)$$

$$M_{it}^2 = r_{ft} + \frac{r_{it} - r_{ft}}{\sigma_{r_{it}}} \times \sigma_{r_{Mt}} \quad (3)$$

$$TR_{it} = \frac{r_{it} - r_{ft}}{\beta_{it}} \quad (4)$$

$$IR_{it} = \frac{r_{it} - r_{Mt}}{\sqrt{\frac{1}{n} \sum_{i=1}^n (r_{it} - r_{Mt})^2}} \quad (5)$$

$$SI_{it} = \frac{r_{it} - r_{Mt}}{\sqrt{\frac{1}{n} \sum_{i=1}^n \text{Min}(r_{it} - r_{Mt}, 0)^2}} \quad (6)$$

where r_{it} is the return of hedge fund i in the year t , r_{ft} is the return of a risk free rate bond for the year t proxied by a the ten year German government bond, r_{Mt} is the average value weighted return for all the hedge funds in the sample, β_{it} is the beta of the return of the hedge fund i with respect to the market index, $\sigma_{r_{it}}$ and $\sigma_{r_{Mt}}$ are the standard deviation of returns for each fund and for the market benchmark, an n is the number of periods in the one year time horizon.

Formula (1) is the Jensen's alpha and it represents the excess return at time t of the hedge funds with respect to its expected return computed by using the standard CAPM model (Jensen, 1968). Formula (2) is the Sharpe ratio (Sharpe, 1994) and measures the extra return at time t with respect to the risk free for each unit of risk of the each fund (defined by the standard deviation of returns). Formula (3) is the Modigliani's square (Modigliani and Modigliani, 1997) that computes the return achieved by the hedge fund at year t if the risk assumed by the hedge fund is exactly equal to the market risk. Formula (4) is the Treynor index (Treynor 1965) that measures the excess return of the hedge fund with respect to the risk free rate divided for its Beta. Formula (5) is the Information Ratio (Goodwin, 1998) and it computes the extra-return with respect to a benchmark (the average value weighted index) with respect to a tracking error. Formula (6) is the Sortino Index (Sortino and Forsey, 1996) that measures the extra return with respect to a benchmark (the average value weighted index) with respect of a downside risk proxy. Similar tools are used in the literature for other funds' (ETFs) performance analysis (Mihai-Yiannaki, 2015).

A preliminary comparison analysis of the risk adjusted performance measures by country is performed in order to identify differences between in the risk and return profile for hedge funds base in Cyprus and other markets. The comparison considers standard summary statistics, correlations analysis and t-test for differences in the average values.

The role of Cypriot hedge fund industry in a portfolio of hedge funds is analysed by considering the yearly return of a portfolio of hedge fund internationally diversified, in formulas:

$$r_{Pt} = \sum_{i=1}^z w_i^* r_{it} \quad (7)$$

where the weights * that has to be assigned to each hedge fund are computed in order to achieve a RAP value equal to $\frac{1}{9} [O - ()]$ with ϵ and $0 \leq \epsilon \leq 9$. The analysis is performed by considering all different RAP measures presented in formulas (1) to (6).

3.3 Results

A preliminary analysis of returns achieved by hedge funds domiciled in Cyprus with respect to other European markets does not allow to find interesting and statistically significant differences in the performance achieved (Table 3).

Table 3. Summary statistics on RAP measures for Hedge Funds in Europe and Cyprus

		2010	2011	2012	2013	2014	2015	Overall
α_{it}	Overall	-0.96%	0.23%	1.08%	2.43%	1.71%	1.70%	1.03%

	Δ Cyprus	-0.16%	-1.13%	-3.52%	-6.89%	-5.24%	-3.64%	-3.42%
$M2_{it}$	Overall	8.88%	1.87%	5.92%	8.50%	7.65%	3.94%	6.13%
	Δ Cyprus	-0.27%	-1.76%	-4.24%	-7.82%	-0.71%	-5.58%	-4.46%
TI_{it}	Overall	-0.43%	-0.10%	1.52%	0.16%	-0.07%	0.10%	0.20%
	Δ Cyprus	-0.28%	0.05%	-1.6%	-0.16%	+1.32%	-0.36%	-0.17%
IR_{it}	Overall	-1.52%	1.13%	0.89%	2.17%	0.09%	1.53%	0.71%
	Δ Cyprus	1.30%	-1.26%	2.46%	-6.26%	-2.25%	-3.45%	-2.39%
SI_{it}	Overall	-1.55%	3.78%	10.10%	14.35%	1.23%	5.10%	5.50%
	Δ Cyprus	2.06%	-3.89%	-10.32%	-18.95	-1.42%	-7.33%	-6.64%

Source: Bloomberg data processed by the authors

Cypriot hedge funds almost never outperform with respect to the market average and only in one case (Jensen's alpha) the difference is positive and statistically significant. The worst average performances are related to the Sortino index because in the period analyzed all hedge funds based in Cyprus perform significantly less than the average market and so the index identifies them as not performing investments. The performance more similar to the hedge fund market is related to the average Treynor index because Cypriot hedge funds are on average characterized by a beta lower than other

markets and so even if the gross performance is not high the performance for unit of systemic risk is higher.

There is no clear time trend over time that can be identified in the data and the differences of the Cypriot market with respect to the rest of the industry seems to be persistent over the time horizon analysed.

The analysis of the role of Cypriot market for an hedge fund diversification strategy allow to identify some interesting differences on the basis of the type of RAP considered for the analysis (Table 4).

Table 4. The role of the Cypriot market in a diversification strategy

	2010	2011	2012	2013	2014	2015	Overall
α_{it}	81.99%	6.34%	44.29%	21.19%	50.20%	40.65%	40.78%
SR_{it}	26.86%	55.59%	41.77%	49.59%	55.96%	16.47%	41.04%
$M2_{it}$	15.77%	15.39%	26.82%	49.65%	40.61%	38.74%	31.16%
TI_{it}	19.83%	0.35%	13.84%	61.92%	12.82%	86.64%	32.57%
IR_{it}	12.44%	24.25%	16.41%	60.57%	23.50%	54.97%	32.02%
SI_{it}	15.58%	18.57%	9.98%	43.57%	9.30%	44.39%	23.56%

Source: Bloomberg data processed by the authors

On average RAPs that benefit the most from the investment also in the Cypriot market are the Jensen's Alpha (40.78%) and the Sharpe Ratio (41.04%) with a Sortino Index consider the investment in Cyprus as a marginal and residual strategy (23.56%). Results support the hypothesis that the benefits related to investing in that market allow to achieve better average results for RAPs based on mean and variance proxies while those based the tracking error, the beta and the downside risk do not take a clear advantage by investing in Cyprus.

In the 2011 portfolios, independently with respect to the RAP and the risk/return of the portfolio considered is the one in which the benefits related to invest in Cyprus are at the minimum. These evidences are consistent with the summary statistics analysis that identified the 2011 in Cyprus as the less performing and the riskier year in the sample. For analysing the contribution of Cyprus for different return/risk ratios, an additional analysis is performed by considering the average exposure portfolio on Cypriot funds for portfolio ranked in to deciles on the basis of the RAPs' values (Table 5).

Table 5. The role of the Cypriot market for diversified portfolios with different levels of RAP values

	α_{it}	SR_{it}	$M2_{it}$	TI_{it}	IR_{it}	SI_{it}
1st decile – Min	63.43%	87.66%	52.81%	37.93%	37.28%	23.94%
2nd decile	57.14%	77.43%	48.57%	36.72%	36.94%	26.89%

Source: Bloomberg data processed by the authors

The role of the investment in Cyprus or the Jensen Alpha, the Sharpe Ratio and Modigliani Square is higher for low performing portfolios and lower for portfolios characterized by higher values of the RAPs. The usefulness of investing in Cyprus is so higher for investor cannot invest in a portfolio that maximize the RAP values while others will consider it as a residual market for investing their capital.

The analysis of the Treynor Index, the Information Ratio and Sortino index show that Cyprus is not the main market for investing independently with respect to the RAP values, but all investors have benefit from having exposure in this market independently with respect to their target RAP value. Results show that investors that are worried about the systemic risk, the tracking error and downside risk have to consider always to have at least a minimum exposure in the Cypriot market for maximizing their return-risk trade-off.

Hedge funds industry is an heterogenous market that may offer significant advantages related to the implementation of a diversification strategy even if is still not clear if there could and advantage related to investing in different countries. The existence of significant differences in the regulation, size and performance among countries could be exploited for diversification purposes in the hedge fund industry.

4. CONCLUSION

The analysis of the Cypriot market has shown that it behaves differently with respect to other European markets (Ireland and UK) and even if its performance is worse than the average market it could be useful for diversification purpose. The analysis show that investors that wants to maximize their return-risk profile could benefit from investing in Cyprus especially for reducing the systemic, tracking error and downside risk exposure. Results obtained support the hypothesis that, even if the hedge fund market is significantly integrated worldwide and there is a high risk of contagion in the industry (e.g. Edwards, 1999), a FOHFs may benefit from international diversification strategies. An

efficient diversification strategy in the hedge industry cannot increase too much the number of hedge funds in the portfolio due to the cost of diversification and the lack of disclosure (Brown, Gregoriou, and Pascalau, 2011) but an international diversified one can allow to maximize the benefits related to the strategy implemented. Further development of the study has to consider longer time series and more complete set of hedge funds markets in order to evaluate if results provided are robust with respect to sample selection and moreover an interesting development could be to exploit if the advantage of investing in the Cypriot market holds even in a FOHF that is able to invest also outside Europe.

CHINESE INNOVATION AND GLOBAL INTEGRATION - THEORETICAL FRAMEWORK OF PERCEIVED INSECURITIES IN UNIVERSITY TECHNOLOGY TRANSFER

Hamilton, Clovia Ann

Department of Management and Marketing, Winthrop University College of Business Administration,
Rock Hill South Carolina, USA

ABSTRACT

University technology transfer is growing in China and is vital to China's innovation and intellectual property program. This paper provides a literature review used to create a theoretical framework for explaining conflicts between university technology transfer participants. Economic development and business competitiveness relies on innovation and intellectual property generation. Given increased investments in university research and Chinese universities, it is important to be aware of conflicts between university technology transfer office staff and faculty within academic exchanges. University technology transfer is growing in China and is vital to China's innovation and intellectual property program. Conflicts between university technology transfer participants can thwart efforts to create thriving, successful university technology innovation and commercialization programs. This paper provides a literature review which defines insecurity as perceived threats felt by both the faculty researchers and TTO staff. From this literature review, a theoretical conceptual framework and hypotheses were developed to explain this phenomenon.

Keywords: intellectual property, job insecurity, technology commercialization, culture in research, research and development, technology development, Chinese intellectual property piracy, IP piracy

INTRODUCTION

This research is motivated by recent concerns over Chinese piracy of intellectual property. This research identifies conflicts between participants in university technology transfer which can harm academic exchanges between American and Chinese researchers. Universities have increased contributions to China's national innovation systems (Singh, 2015). In the late 1990s, a number of regulations were adopted by central and provincial Chinese governments to increase technological innovation and university-industry partnerships (Nezu, 2007). This is evidenced by the fact that since 2000, China has been the largest producer of science and engineering doctoral degrees; and the growth has been at a rapid rate. There were 4,000 awarded in 1996 and 31,000 by 2010 (NSF, 2014). Also, in

the early twenty-first century, there were about 2,000 scientific university ran businesses employing 238,000 employees including 78,000 researchers resulting in an increase of university technology transfer (Nezu, 2007).

Like the American universities, the details of managing intellectual property (IP) rights in collaborations are decided by the Chinese universities. Many Chinese universities have University IP Management Offices with publicly stated IP rules and require that their researchers file IP disclosure forms (Nezu, 2007). Thus, there is increasing transparency. With the increase of university managed business enterprises, there is growth in international collaborations. For example, the Japanese Kyoto University set up a technology licensing office in China. Although many Chinese universities have publicly stated their IP rules, there is a need for more consistency in IP rights management and more transparency given the increase in international collaborations (Nezu, 2007).

Academic interest in China's tech transfer has increased in both China and in America (Chen, 2016). University technology transfer offices (TTOs) have been around in America since the passage of the Bayh Dole Act in 1980. TTOs emerged in China nearly 20 years later in 1999 at the Xi'an Jiotong University and East China University of Science and Technology (Nezu, 2007). There are at least 30 TTOs in operation in China. Faculty are critical to university-industry licensing because if the research faculty did not participate in university tech commercialization, there would be a lack of university owned intellectual property (IP) to license and potential licensees to license patented inventions to (Thursby, 2004). Although the TTO staff is also critical, faculty researchers' attitudes about university tech transfer and their participation have more influence on the success of university tech licensing than the assistance provided by university TTOs (Wu, 2014). There are potential conflicts between the American faculty researchers and their university TTO staff persons. Herein, it is argued that in multicultural academic exchanges between American and Chinese researchers, there are also potential conflicts due to perceived threats. These threats are largely influenced by American's focused attention on IP piracy problems in China.

This research begins with a literature review of felt insecurities from both the faculty researchers' and TTO staff's perspectives. This is followed with a discussion of IP piracy violations and the work of cross-cultural teams. Based on these findings, a conceptual theoretical framework which explains this phenomenon is described.

LITERATURE REVIEW

Defining Insecurity as a Perceived Threat

Faculty Researchers' Insecurities

Counterfeits and IP piracy. When Chinese university researchers seek to work collaboratively with American university researchers, there are likely to be perceived insecurities. Legal researchers have noted that as America's legal regime is aimed to protect American intellectual property, it thwarts the optimal foster of innovation (Dreyfuss, 2016). The lack of clarity over IP ownership rights can make American universities unattractive to Chinese students, visiting faculty and other collaborators given the litigious nature of the 1996 Economic Espionage Act (EEA) involving harm to academic exchanges (Dreyfuss, 2016). Academic exchanges between American and Chinese faculty can also be harmed by perceived insecurities about IP piracy and current concerns about counterfeit product markets. It is estimated that 5 to 10% of world trade is counterfeit goods valued at an estimated \$500 billion in lost sales to companies with legal rights to those products (Amine, 2007). There is evidence that IP owners have to raise their prices and quality; and reduce sales in order to attract product demand and compete against Chinese counterfeit products. This evidence may lead to insecurities and distrust at the R&D phase of product innovation and academic exchanges between American and Chinese researchers. At the production phase of tech commercialization, there is evidence that when Chinese multinationals fear losing tech advantages to counterfeits, they fragment their production among multiple local plants to diminish information flow and deter IP infringement; or they may limit the range of technologies that they offer (Sun, 2010, Maskus, 2000, Fink, 2016). This leads to inefficiencies and a reduction in the ultimate technology transfer into the commercial marketplace.

The high incidents of counterfeiting and IP Piracy in the East (China and India) in comparison to the West (America) is likely the result of cultural differences. Owning and protecting IP rights is a Western concept and infringing on IP rights is not viewed as morally wrong in China (Chaudhry, 2009). In fact, although the World Intellectual Property Organization (WIPO) was created in 1967 (WIPO, 2017), IP laws were not adopted in China until the late 1970s and China was not admitted into WIPO until 1980 (Amine, 2007). China did not have patent laws until 1984. Whereas, the American patent protection is included in the US Constitution legislative powers given to Congress signed in 1787 to promote science and the arts (History.com, 2009). Thus, there is nearly 200-year time span between the birth of the American and Chinese IP legal systems.

This cultural difference has presented conflicts between American university researchers and Chinese national researchers in the United States. It has also resulted in race- based hate and discrimination directed toward Chinese students and faculty on university campuses. For example, the racists flyers were posted at the University of Texas at Austin School of Engineering accusing

Chinese students of plagiarizing and in need of special ethics lessons (Herreria, 2017). Yet, the reality is that there is a widespread global problem with consumer complicity to purchase counterfeits, to ignore IP owner legal rights and protections, and to support counterfeit sellers in order to express anti-big business sentiments (Chaudhry, 2009, Tom, 1998). Yet, there are serious concerns in China. The Office of the US Trade Representative (USTR) has China on Section 306 monitoring due to its serious problems with regard to IP rights protection in trade (Piquero, 2005). This does not help American Chinese research relationships. For example, in the software industry, by the year 2001, China had piracy rates of over 90 percent (Ronkainen, 2001). Using cultural value dimensions (Hofstede, 1980), Ronkainen (2001) found that countries with high power distance displayed higher levels of piracy than more equalitarian societies. These types of countries display concerns of interpersonal distrust and feelings of unfair deals. Further, the higher the avoidance of uncertain and ambiguous situations, the higher the rate of piracy (Ronkainen, 2001).

Forty-nine (49) American firms formed an anti-counterfeiting coalition in China. The coalition's purpose was to implement resistance strategies against deceptive product designs, labeling and packaging. However, they are losing the battle (Amine, 2007). Arguably, the American/China IP piracy war increases perceptions of perceived threats to IP rights and in turn to job security for research faculty who rely on the creation and protection of the results of their R&D. It can lead to distrust.

Besides IP rights issues, other problem areas with cultural differences in multicultural research teams include communication issues with accents, fluency, differing attitudes toward authority and hierarchy, indirect versus direct communication, and conflicting decision-making norms. The key to rectifying these communication problems is to acknowledge and discuss the cultural gaps and establish norms (Brett, 2006). Trust is essential to high functioning multi-cultural teams. Having team leaders that understand cultural and language differences and multi-cultural perspectives; and the ability to establish clear norms is essential to building trust in cross-cultural teams (Molinsky, 2016).

American faculty researchers' conflicts with their university TTO staff. To further fuel insecurities, there are issues among the American university technology transfer players. In America, non-tenured faculty have less independence than tenured faculty and considerable voice in influencing university choices (McPherson, 1999). In addition, what is produced in the academy is highly specialized and advances the need for long-term job security (McPherson, 1999). In research universities that offer tenure, non-tenured faculty researchers strive to earn tenure and guard themselves in the process of achieving this goal. A fundamental question that arises is whether the American faculty researcher's participation in university tech commercialization will count toward tenure.

American faculty researchers are evaluated on the basis of their research, teaching and service. Faculty members may choose not to participate in technology commercialization and not to work with their TTO because scholarly work is advocated more so in university policies than commercialization activity which is typically ranked as a service and does not weigh as much in TNP decisions (Markman, 2005, Link, 2008). Since, in research universities, faculty research findings count the most toward tenure, faculty members are very guarded and protective about their research. Getting involved with TTO staff has been deemed an act of delegation on the part of faculty (Jain, 2009). This occurs only after the faculty researcher perceives the TTO staff as trustworthy.

When it comes to TTO staff's insecurity, there are perceived threats to positive performance evaluation outcomes. TTO staff competency is evidenced by their actual educational backgrounds, prior work experience and years of work experience in the TTO. As aforementioned, the faculty researchers have concerns about the TTO staff's competence and their ability to manage the disclosed inventions, gain patent protection, and communicate effectively with industry representations regarding licensing opportunities. Tech transfer is a social knowledge-making action for which professional communication is central to the transfer of the technology transfer (Perkins, 1993). Well, the TTO staff may be equally insecure about these responsibilities. They will gain more confidence and feel less perceived insecurity as they gain more experience and education.

Technology transfer is typically a research administration service located in the research offices of universities. In America, the TTO directors often report to the Vice Presidents of Research. TTO performance is measured by the number of startups and licenses formed. With respect to research administration, some of the challenges include faculty fear of the unknown in that they do not know how their engagement in research and tech transfer will turn. More importantly, they question what is in it for them (Miner, 2003). Problems include not understanding why any new focus on tech commercialization is needed, lack of confidence in leaders and general mistrust. Faculty researchers question why leaders want them to do more when their workload may already be too heavy (Miner, 2003).

One issue is the TTO staff's perception of faculty researchers' motivation to engage in university tech commercialization. TTO directors have listed faculty indifference and ideological resistance as impediments to securing discoveries from faculty inventors (Markman, 2005). While applied researchers care little about increases in university patenting, there is fear among some basic researchers that patenting might get in the way of their research choices (Davis, 2011).

In addition, the time demanded by faculty researchers and university administrators can be problematic. At many researcher universities, TTOs are very demanding, high stress work

environments (Abrams, 2009). These offices operate in crisis mode with deadlines, mounds of paperwork, pressure, budget restrictions and bureaucracy (Hesselton-Mangan, 2003). This is particularly true of universities with larger research volumes. In general, with respect to time management, research administrators like the TTO staff are responsible for inspiring faculty to submit invention disclosures, bolstering the university's research culture, and gaining buy-in to research activities, and training faculty and other personnel about research policies and procedures (Miner, 2003). The time demanded of the TTO staff by their customers depend on their customers' ever changing expectations which need to be managed (Weeks, 2006).

Potential conflicts in American-Chinese research exchanges

PROPOSED THEORETICAL FRAMEWORK

Based on the literature review, a theoretical framework for Chinese American academic tech transfer exchanges was developed. The study of perceived insecurity is complicated. Figure 1 depicts conceptually independent variables that can be and in fact, have been measured to assess individual insecurity distress and how that distress correlates to TTO staff performance, the dependent variable. TTO performance is a measure of licensing revenues and start-up companies formed by the TTOs.

Propositions

Faculty researchers' job insecurity

As per the findings in the literature review, faculty researchers' perceived threats to tenure and promotion are impacted by the following six (6) measures:

1. Whether the research university has policies that allow participation in the university technology commercialization process to count toward tenure and promotion

Proposition 1.1 – The presence of university policies that allow participation in the university technology commercialization process reduce affected distress caused by faculty researcher job insecurity.

2. How the faculty researchers perceive the TTO staff's reputation

Perceptions of TTO staff's reputation are influenced by the faculty researcher's and their peers' previous experience with the TTO staff. Perceptions of TTO staff lack of competence to successfully carry out technology commercialization functions also influences perceptions of TTO staff reputation. These perceptions may be related to evidence about the TTO staff's educational background, size of the organization measured by full time equivalent staff hires

(FTEs), and TTO staff years and quality of prior work experience in technology intellectual property protection, marketing, and licensing negotiations.

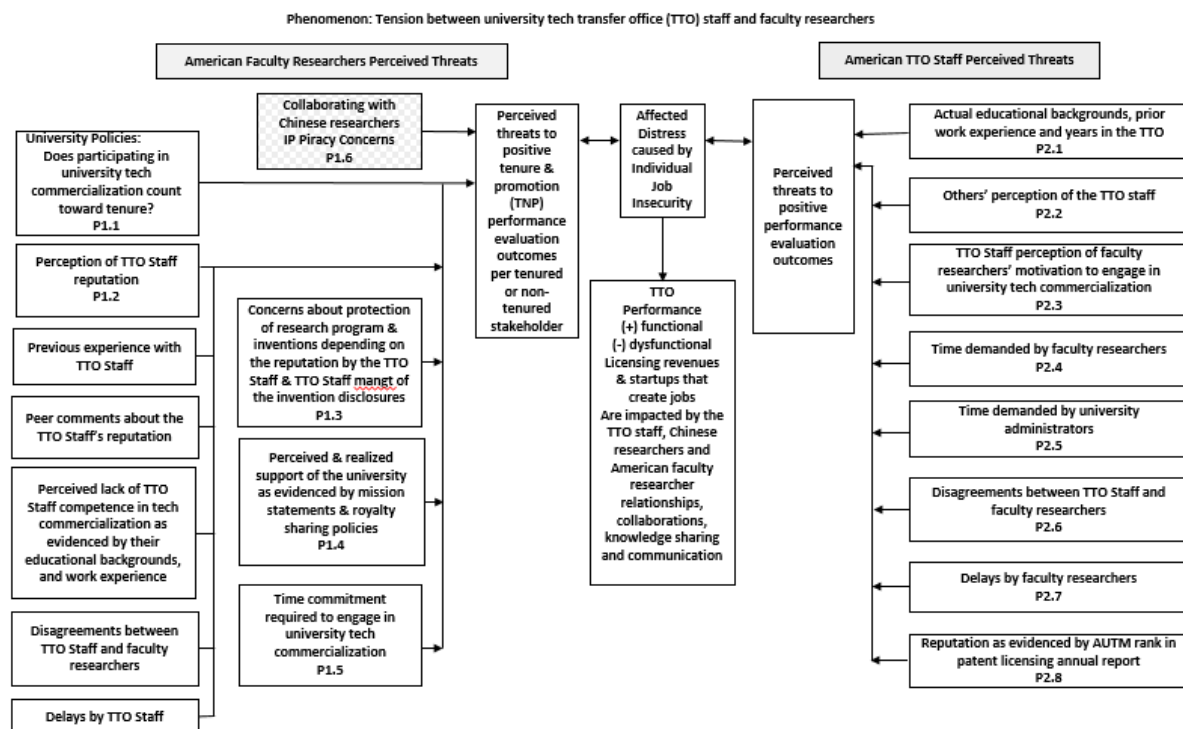

Figure 5: Concept Model for University Tech Transfer Insecurities in Chinese American Academic research exchanges

Proposition 1.2 – Positive faculty researcher perceptions of TTO staff reputation reduce affected distress caused by faculty researcher job insecurity.

- How concerned the faculty researchers are about protecting their research programs and inventions from potential mismanagement by TTO staff

Proposition 1.3 – Positive faculty researcher perceptions of TTO management of faculty researcher inventions and established industry social network relationships reduce affected distress caused by faculty researcher job insecurity.

- Perceived and realized support from the university as evidenced by university mission statements and policies related to funding, royalty sharing, and other incentives and rewards for participating in technology commercialization

Proposition 1.4 – Positive perceptions and realizations of support from the university as evidenced by university mission statements and policies related to funding, royalty sharing, and other incentives and rewards for participating in technology commercialization, reduce affected distress caused by faculty researcher job insecurity.

- Time commitment required to engage in university technology commercialization

Proposition 1.5 – Perceived and realized high amounts of time commitment required to engage in university technology commercialization will reduce affected distress caused by faculty researcher job insecurity.

6. The added layer of complexity with perceived threats of Chinese IP piracy which looms as a concern when American faculty researchers collaborate with Chinese researchers

Proposition 1.6 – Perceived threat of Chinese IP piracy will increase affected distress caused by faculty researcher job insecurity.

TTO Staff's Job Insecurity

TTO staff perceived threats to job security, evidenced by performance evaluations, are impacted by the following eight (8) measures:

1. Actual educational backgrounds, technology commercialization work experience, and years in the TTO

Proposition 2.1 – The presence of actual technology commercialization educational backgrounds, technology commercialization work experience, and years of work in the TTO reduce affected distress caused by TTO staff job insecurity.

2. Other's perceptions of TTO staff competence

Proposition 2.2 –Positive perceptions by others of TTO staff competence reduce affected distress caused by TTO staff job insecurity.

3. TTO staff perception of faculty researchers' motivation to engage in university technology commercialization

Proposition 2.3 – Positive perceptions by TTO staff of faculty researchers' motivation to engage in university technology commercialization reduce affected distress caused by TTO staff job insecurity.

4. Time demanded of the TTO staff by faculty researchers

Proposition 2.4 - Perceived and realized low amounts of time commitment required to work with faculty researchers engaged in university technology commercialization reduce affected distress caused by TTO staff job insecurity.

5. Time demanded of the TTO staff by university administrators

Proposition 2.5 - Perceived and realized low amounts of time commitment required to work with university administrators engaged in university technology commercialization reduce affected distress caused by TTO staff job insecurity.

6. Disagreement between TTO staff and faculty researchers

Proposition 2.6 – Low amounts of disagreements between TTO staff and faculty researchers reduce affected distress caused by TTO staff job insecurity.

7. Delays by faculty researchers

Proposition 2.7 – Low instances of delays by faculty researchers reduce affected distress caused by TTO staff job insecurity.

8. Reputation as evidenced by the Association of University Technology Managers' (AUTM) rank in patent licensing annual report

Proposition 2.8 – Working for a research university that is highly ranked by AUTM's annual licensing survey reduces affected distress caused by TTO staff job insecurity.

Any added threats of intellectual property piracy exacerbates an already tenuous area of conflict.

CONCLUSION

This research is motivated by recent concerns over Chinese piracy of intellectual property. The goal of this research is to provide a conceptual theoretical framework for researching conflicts in academic exchanges between faculty researchers and university TTO staff. In particular, this framework includes the added complexity of potential conflicts due to cultural differences between American and Chinese faculty researchers. Ultimately, with use of this theoretical framework for research, this body of research can reveal guidelines to alleviate conflicts for use by technology managers and academic researchers who are responsible for engaging in university technology commercialization. Tech transfer can be viewed as a process that draws out stressors and result in felt job insecurity. Job insecurity is proposed to be felt by both the TTO staff and the faculty inventors. This research aims to provide a better understanding of what can reduce affected distress and result in subsequent improved university tech transfer performance.

The significance of the university tech transfer process for intellectual property managers is the emphasis tech transfer paces on collaboration and knowledge sharing. It is proposed that any lack of communication, social exchanges, motivation, engagement, streamlined processes, supportive organizational cultures, or competencies on the part of the TTO staff or faculty researchers can result in felt job insecurity and distress. Also, people who lack personality characteristics that give them an aversion to job insecurity can experience the stress. It is advocated that all of these factors need to be examined further in a holistic way.

This study will help universities hone in on the causes of faculty researcher and TTO staff perceived job insecurity. This paper provides a review of the top perceived impediments to faculty researcher participation in the university technology transfer process. It is theorized that job insecurity may cause both the faculty researchers and TTO staff to experience perceived distress that hinders their

ability to build stronger working relationships in the technology commercialization arena. Job insecurity is a perceptual phenomenon (Sverke, 2002, Greenhalgh, 1984) and is defined as an affected distress in alignment with stress theory which teaches that the anticipation of a fundamental and unwanted event leads to strain (Sverke, 2002). This study is very important to the field of university technology transfer because job insecurity can lead to reduced work effort, propensity to leave, and resistance to change (Greenhalgh, 1984). This research focuses on job insecurity among university faculty researchers and technology transfer office (TTO) staff. Many research universities have TTOs to support technology commercialization activities. These activities include soliciting invention disclosures from academic inventors, evaluating the disclosures for marketability, patenting inventions, and licensing intellectual property (IP). IP might be licensed to start-up businesses or established firms big and small.

This paper examines the top impediment to faculty researchers engagement in the process: faculty indifference, ideological resistance, poor discoveries, limited TTO budget, bad TTO reputation, and university bureaucracy (Markman, 2005). Other impediments examined are lack of trust in the process, delays, building and guarding research collaboration funding relationships, and non-tenured faculty researcher concerns. In addition, this paper also examines the theoretical framework for the study of job insecurity related to university technology transfer. Personality, motivation, social exchange, social network, power dominance, worker resistance, and communication theories are discussed. A theoretical conceptual model of the phenomenon is also provided and discussed. Fourteen (14) related propositions are presented as groundwork for a future empirical study to test this theoretical concept.

BLACK AMERICANS PAST AND PRESENT CREATED FRUGAL INNOVATIONS AND EMBRACED CIRCULAR ECONOMY PRINCIPLES: THE MARKETING DILEMMA

Hamilton, Clovia Ann

Department of Management and Marketing, Winthrop University College of Business Administration,
Rock Hill South Carolina, USA

ABSTRACT

Frugal innovation is the practice whereby the rich learns from innovations developed in poor countries, and there is purportedly a current rivalry between India and China in the frugal innovation arena. This research advocates that the concept of frugal innovation did not originate in Asia or India. The practice of the rich taking the poor's innovations is not new. In particular, Black American slaves and freed slaves developed a number of inventions in poverty conditions. It is imperative that frugal innovation research be more historically accurate so as to reduce the marginalization of contributions developed by poor innovators and to increase the more widespread embrace of circular economy principles. If a poor innovator resides in a rich country, then that innovator should not be excluded from the frugal innovator category if frugality was indeed used to innovate.

Keywords: intellectual property, black inventors, African American inventors, frugal innovations, circular economy, technology commercialization, research and development, technology development, entrepreneurship

INTRODUCTION

"And when one considers the enormous part played by American inventors in the economic, industrial and financial development of our country, it became a matter of importance to ascertain what share in this great work is done by the American Negro. The average American seems not to know - Not knowing it, he does not believe it, and not believing it he easily advances to the mental attitude of being ready to assert that the Negro has done absolutely nothing worthwhile in the field of invention."

- Henry E. Baker

Assistant Examiner, US Patent and Trademark Office (Baker, 1917)

Several definitions of frugal innovation have been published. Such definitions include the use of local resources to develop and deliver affordable, functional technological products that provide value

(Chakrabarti, 2014, Prabhu, 2017). Frugal innovation involves innovating cost effectively and quickly under severe resource constraints with local resources in an affordable way (Chakrabarti, 2014, McNicoll, 2014, Radjou, 2012). Frugal innovation is not merely a representation of the Indian concept of Jugaad which is focused on makeshift, short term problem solutions. Instead, it is focused on innovating with efficiency, low cost, safety standards and quality standards (Chakrabarti, 2014). Add to this the tall order of sustainability which includes profitability, the support of environmental aims, and the social benefits such as affordability (Rao, 2013, Chakrabarti, 2014, Wohlfart, 2016).

Frugal innovations strip away complexity, are simple changes that improve stakeholders' experiences, deliver great value at low costs, and can help companies generate new revenues (Hemsley, 2016). Frugal innovations make use of reduced amounts of materials, repurpose, reuse and are cheaper (McNicoll, 2014). Frugal innovations are products and services created by local innovators adopted to the needs of their local population (Lehner, 2016). Further, frugal innovations apply human ingenuity, create faster solutions, create better solutions, create cheaper solutions, and are scalable (Prabhu, 2017). Frugal innovations require little financial investments (Prabhu, 2017, Hemsley, 2016). Researchers have acknowledged that while frugal innovations are usually associated with emerging countries including India and China, it is not a new phenomenon because companies in Silicon Valley and Santa Clara University's Frugal Engineering Innovation Lab has been innovating frugally as well (Wohlfart, 2016). Yet, these researchers do not go far enough back in American history. To Other researchers have recognized that in times of craftsmanship and hand production before the industrial revolution, material waste was unknown (Strasser, 2000, Lieder, 2016). This research study provides examples of frugal innovations found in India and in Kenya. It compares these innovations to innovations developed by Black American inventors. It is argued that Black inventors during slavery and the reconstruction period post-slavery were indeed frugal innovators. Further, these frugal innovators also embraced circular economy principles. The current scholarly emphasis on frugal innovations originating in India and Asia is harmful because perhaps much can be gained in achieving the mainstream implementation of circular economy principles if more diverse populations were studied.

EXAMPLES OF FRUGAL INNOVATIONS IN DEVELOPING COUNTRIES

There are numerous examples of frugal innovations in India and China. Ways to improve the efficiency of the frugal innovation product development process have been published. The goal is to find ways to transfer and accelerate the development of frugal innovations perhaps in a cookie cutter manner (Lehner, 2016, Rao, 2013). For instance, a systematic problem solution pattern approach has

been developed (Lehner, 2016). The goal is to find ways to transfer and accelerate the development of frugal innovations perhaps in a cookie cutter manner.

Examples of frugal innovations in India are provided in Table 1. While some of these innovations have improved the lives of their frugal innovators, some have not. For example, Mohamed Saidullah, the inventor of a floating bicycle still lives in poverty (McNicoll, 2014). Looking to frugal innovations to eradicate rural poverty is being researched. In fact, since one percent of the world's population holds more than 35% of the wealth, it has been advocated that frugal innovations may be the key to eradicating economic inequality (Prabhu, 2017).

Frugal Innovator	Frugal Innovation	Source
Tata Chemical	No power drinking water filter Low cost of \$0.65 for a family of five	(Caploe, 2010)
India Institute of Technology	Laptop Low cost of \$35	
Ayas Shilpa	Suspension bridge Low cost of 1/10 conventional price	
Muruganatham	Sanitary napkins Low cost	
	Waterwheel carries 50 liters of water; low cost \$25-30 at 1/3 conventional price	
Prajapati	Miticool Fridge made of clay that cools food up to 5 days with no electricity	(McNicoll, 2014)
Bharti Airtel	Mobile phone calls; low cost	
Mohammad Saidullah	Award winning floating bike	
M-Pesa	Service enables unbanked people to send and receive money through mobile phones	(Prabhu, 2017)

HISTORY OF BLACK FRUGAL INNOVATIONS IN NORTHERN AMERICA

Although American history lessons teach that Eli Whitney invented the cotton gin, some historians believe that a slave named Sam invented this combing device to alleviate the harsh laborious conditions associated with removing seeds from picked cotton. In addition, the slave named Ned of inventor Oscar J.E. Stuart developed the innovative double plow (Aoki, 2007, Yancy, 1984). In 1858, the United States Attorney General confirmed a court decision refusing to grant patents to slaves' inventions to the slaves or their slave owners. Yet, when the slaves Isaiah and Ben Montgomery invented a boat propeller, their slave owner recommended to the United States Congress an amendment to the patent law to allow the slave owner to receive patents for inventions by slaves

(Baker, 1917). Although America's poor Black slaves were not allowed to file for patent protection, many poor white inventors between 1739 and 1819 were able to achieve wealth and recognition with patented inventions (Aoki, 2007).

Blacks were impoverished during slavery and during the reconstruction period when slaves were emancipated. They had no choice but to be frugal when engineering and inventing solutions to problems that they faced in harsh work conditions. The Black American southern Norbert Rillieux invented a way to refine sugar by developing a vacuum pan in 1846 in Louisiana. James Forten invented a better way to handle sails on sail boats in 1842.

In 1853, Jan Matzeliger developed a way to hold shoes on their lasts, grip and pull the leather down to the heel of the shoe, and drive in nails (Kaplan, 1955, Baker, 1917). This invention was bought by the United Shoe Machinery Company and reduced the cost of making shoes by more than fifty percent. This certainly meets the definition of frugal innovation. It resulted in increased worker wages, decreased worker hours, improved factory conditions and made the President of the United Shoe Machinery Company a multi-millionaire (Baker, 1917).

American slavery persisted between 1619-1865. The American Civil War over whether or not to continue the institution of slavery in American was from 1861-1865 (Williams, 2004). From the beginning, the titans of industry looked to Black ex-slaves for a source of labor and assistance. Interestingly, when slavery ended, 4.4 Million freed slaves needed to be educated. The titans of industry provided charity to Historically Black Colleges and Universities because they wanted a say in how the former slave laborers would be educated since they had a continued need for this labor force (Hamilton, 2016). The industrial titans included, but were not limited to:

- ⊙ Investor George Peabody (1867 Peabody Fund),
- ⊙ Textile tycoon John Slater (1882 Slater Fund),
- ⊙ John D. Rockefeller (1902-1964 General Education Board (GEB) for rural schools and the modernization of farming),
- ⊙ Sewing machine tycoon Thomas White, and
- ⊙ Sears Roebuck's Julius Rosenwald (Williams, 2004).

Elijah McCoy invented a way to hold lubricant for locomotive trains with a novel cup in 1872. Granville T. Woods invented the steam boiler furnace and air brakes in 1884 and 1902. Purvis invented a method of making paper bags; A.P. Albert invented a cotton picking machine; Andrew Hilyer invented the hot air register; Andrew Washington invented the shoe horn; and Joseph Lee invented a dough kneading machine (Baker, 1917).

In an 1894 speech before Congress, the United State House of Representative member George Washington Murray read the names of 92 southern American Black inventors who contributed to

America's southern economic and technological progress. The list of 92 inventors came from a Black man, the United States Patent and Trademark Office's Assistant Patent Examiner Henry E. Baker's research (Sinclair, 2004). All of these innovations were developed under resource constraints. There were common instances of financial hardships as part of the hard challenge Black Americans faced to earn livings. It was particularly hard given the amount of time it takes to secure patents. Many of the Black inventors did not get any reward for their inventive genius (Baker, 1917).

Given that the contributions of Black inventors has been well researched and documented (Ives, 1987, Jenkins, 1996, Sullivan, 1998, Williams, 1978); and the claims that frugal innovations were newly discovered in 2006 by Ghosn with observations of frugal engineering in India (Chakrabarti, 2014) is historically problematic. Frugal innovations clearly go back to the period of slavery and reconstruction in America and perhaps even earlier in history.

Renault-Nissan has developed electronic cars and low cost vehicles using frugal engineering observed among India's frugal innovators (Radjou, 2012, Radjou, 2015). General Electric and Tata Sons are also multi-national companies producing low cost products by harnessing frugal innovations. For 12 years, Professor Anil Gupta's Honey Bee Network has searched rural India for frugal innovators and inventions to commercialize (McNicoll, 2014). During slavery and the post-slavery period of reconstruction, American slave owners and factory owners did the same. As aforementioned, an example is the use and commercialization of the Black inventor Jan Matzelinger's frugal shoe lasting device.

Although many of the Black frugal innovators were not called entrepreneurs or known for having so-called startups, through necessity they worked to exploit limited resources and create new market opportunities. They did so in a manner which is closely aligned with the proposed *Autotelic Capabilities Framework* (Karagouni, 2013). This framework has the three (3) dimensions of bricolage, improvisational and transcendental capabilities. The bricolage capability helped the Black American frugal innovators to successfully tap their competence and knowledge, re-employ, reframe and recombine creatively. The improvisational capability is the ability to repeatedly rework initial concepts until a venture was launched. The transcendental capability of Black American frugal innovators helped them recognize and analyze their limited material resources; and tap into their knowledge and technical abilities. In some instances, entrepreneurial results were achieved. But often, the Black American frugal innovators were merely striving to make their strenuous workloads lighter.

BLACK AMERICAN FRUGAL INNOVATORS EMBRACE CIRCULAR ECONOMY PRINCIPLES

A circular economy embraces material and product reduced use, reuse, recycling, redesign, remanufacture, and the repair of old goods. There are three (3) specific principles advocated in the Ellen MacArthur Foundation's Outline of a Circular Economy which include:

1. Preserving and enhancing natural resources by controlling and balancing the stocks of renewable resource flows through regeneration, virtualization and exchange;
2. Optimizing resource yields by circulating and optimizing the use of products, components and materials to regenerate, share, and creating a close loop economy; and
3. Revealing and designing-out negative externalities to foster system effectiveness (Ellen MacArthur Foundation)

These practices close the loop in industrial ecosystems and minimize waste (Stahel, 2016, Winans, 2017). Certain features of the circular economy principles such as the more efficient use of resources, combined with waste prevention and regional job creation were introduced by Stahel and Reday in 1976 (Stahel, 1981, Geissdoerfer, 2017). These principles were popularized in China in the 1990s (Winans, 2017). Over the past 12 years, the United States, China and South Korea have been researching reuse and remanufacturing. In addition, since 2010, the Ellen MacArthur Foundation has researched and advocated for the implementation of a circular economy. Further, since 2015, the European Parliament has been researching the topic.

Although there has been a lot of activity in recent years, again, Black American frugal innovators have embraced material and product reduced use, reuse, recycling, redesign, remanufacture, and the repair of old goods for hundreds of years. They had limited resources that they coveted and saved. They strived to save energy and their contributions created jobs. While some believe that the implementation of the circular economy idea is purportedly 'slow to gain traction' (Stahel, 2016), others believe that at least the term *circular economy* is gaining traction among academia, industry, and policymakers (Geissdoerfer, 2017). Most authors that have researched the circular economy principles focus on environmental performance related to resource inputs, waste and emission outputs, rather than a holistic view of sustainability (Geissdoerfer, 2017). Yet, perhaps researchers are not looking in the right places to find frugal innovators like those among Black Americans that have embraced circular economy principles for hundreds of years out of poverty conditions, necessity, scarcity and as part of their cultural identity.

The purported slow widespread, mainstream embrace of the circular economy idea is due to fear and unfamiliarity of embracing product reduced use, reuse, recycling, redesign, remanufacture, and the repair through socialization (Stahel, 2016). This is because the American economy is incredibly

focused on the linear supply chains and economies of product manufacturer, use and disposal. This is an imperfect economic framework which fosters a lack of corporate accountability. With regard to sustainability, the lack of corporate accountability does not adequately respond to societal ecological issues and economic issues such as poverty (Mohammed, 2013). In our resource constrained world, accountability needs to be to all stakeholders, not just shareholders. Corporations need to become more like truly 'social businesses' that recognize their important role in providing potential solutions for sustainability (Mohammed, 2013). Herein, it is argued that researchers of frugal innovations and advocates of the circular economy idea need to broaden their search for examples well beyond India and China. The study of Black American and other culturally diverse frugal innovators past and present can be a way to find potential solutions.

This more inclusive approach is related to the notion of *inclusive development* which advocates going beyond applications of the social pro-poor theory, and embracing social, ecological and relational theories that inclusive development can build on (Gupta, 2017). The pro-poor theory advocates that enhanced human wellbeing can be achieved if poor people are empowered to establish their own priorities with a human rights-based approach. Circular economy principles and frugal innovation practices are examples of ecological theories and approaches supportive of inclusive development (Gupta, 2017).

Reused, recycled, redesigned, remanufactured, and repaired goods are viewed as lacking quality. New, brand products are viewed as having better quality. Mainstream Americans are inordinately comfortable with materialism, status symbols and therefore are squeamish when considered circular economy principles (Hood, 2016). Yet, arguably, there is more to this circular economy image problem. In order to make the embrace of circular economy principles mainstream, there needs to be improved green marketing to improve the aforementioned image problem. Moreover, this green marketing will require a closer study of the ecologically conscious consumers (ECCs) market segment (Tilikidou, 2013). The Black American frugal innovators seem to be marginalized and not included in studies of this market segment. There is a limited understanding and incomplete profile of ECCs. This is a problem that needs to be addressed in order for the most appropriate marketing and business communication strategies to be chosen (Tilikidou, 2013).

DISCUSSION OF FINDING

First, there is a need for a closer study of frugal innovators and ways to make frugal innovations more appealing to consumers in a more widespread manner. There has been advocacy toward increasing academic research for ways to implement a circular economy more widespread (Stahel, 2016). Herein, it is recommended that instead of studying large industrial corporations and small to medium size

enterprises, the focus should be on the study of individual consumers' cultural identities. For example, it is hypothesized that individuals such as Black American frugal innovators, both past and present, are frugal and embrace circular economy principles because these principles have been embraced and valued in the Black American culture since slave days and perhaps earlier in Africa. The examples of Black American slaves and freed slaves that were frugal innovators has been provided herein. Examples of present day Black American frugal innovators can be found through grassroots searches and a concentration in academia can be found among emerging research institutions that were established once slaves were freed. There are approximately 100 of these Historically Black Colleges and Universities that are still in existence today. Although many are focused on teaching rather than research and development, there is a growing number of Black inventors that serve as faculty in these institutions (Hamilton, 2016, Hamilton, 2017a, Hamilton, 2017b). In addition, there are other examples among other diverse groups such as Hispanics and American Indians.

Second, there is a need for more widespread marketing of frugal innovations and circular economy principles that showcase a diverse population of frugal innovators. This research advocates that frugal innovators who live in poverty conditions are not limited to just people from India and Asia. The way Black Americans, past and present, and other diverse populations innovate under frugal conditions should be studied much more closely and marketed more readily. The identification, marketing and promotion of diverse populations of frugal innovators and innovations need to be added to the Outline of a Circular Economy promoted by the Ellen MacArthur Foundation as noted in the amended Outline of a Circular Economy System in Figure 1.

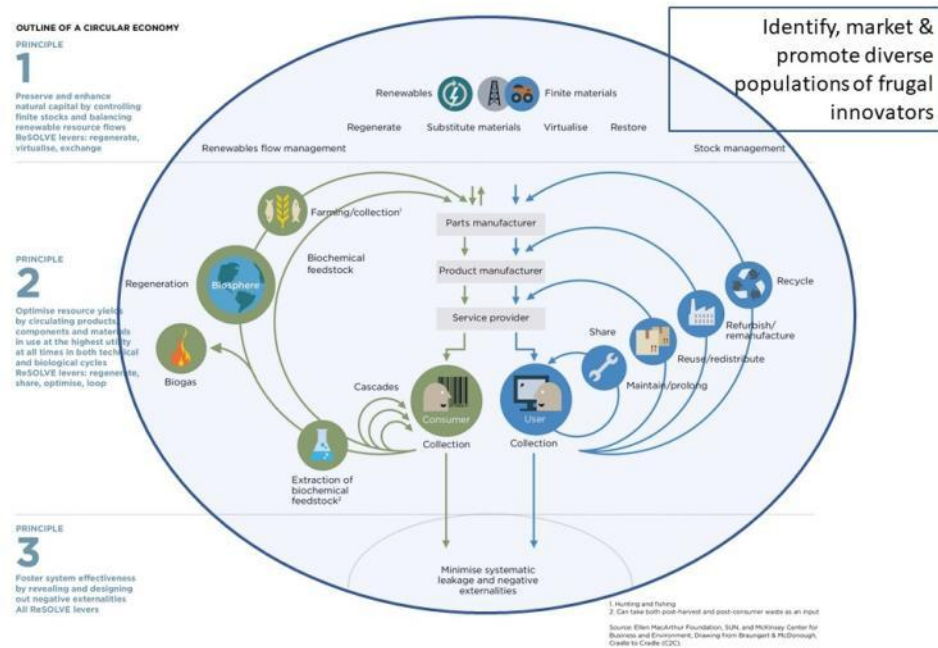

Figure 1. Outline of a Circular Economy System Amended

It is hypothesized herein that improved research and marketing will help these innovations become more popular and more widely embraced. For example, transformational marketing which drives organizational, social and environmental changes can have a more strategic role as an interface between organizations and consumers in sustainability and environmental protection since it requires a study of human behavior and consumption (Baker, 2013). With regard to children's socialization in consumption, it is particularly important to market circular economy principles and examples of these principles in practice. Since it is established that children can identify brands while watching television and surfing the internet (Carlos Estrela, 2014), circular economy principles and examples of these principles in practice like the Black American frugal innovations should appear in television and internet marketing advertisements.

Further, as these examples of specific value chains, material flows, and frugal product development are identified and aligned with circular economy principles, they need to be introduced into environmental policy. An example of an environmental policy would be to certified frugal innovative products and practices. The certification of sustainably managed timber products in Greece was studied and the capture of green consumers through green marketing was advocated (Papadopoulos, 2010).

CONCLUSION

Frugal innovation is the practice whereby the rich learns from innovations developed in poor countries and there is purportedly a current rivalry between India and China in the frugal innovation

arena. This research advocates that the concept of frugal innovation did not originate in Asia or India. The practice of the rich taking the poor's innovations is not new. In particular, Black American slaves and freed slaves developed a number of frugal inventions in harsh poverty conditions with limited resources. It is imperative that frugal innovation research be more historically accurate so as to reduce the marginalization of contributions developed by poor innovators. If a poor innovator resides in a rich country, then that innovator should not be excluded from the frugal innovator category if frugality was indeed used to innovate.

Further, it is argued that Black American inventors during slavery and the reconstruction period post-slavery were indeed frugal innovators. Further, these frugal innovators also embraced circular economy principles. The current scholarly emphasis on frugal innovations originating in India and Asia is harmful because perhaps much can be gained in achieving the mainstream implementation of circular economy principles if more diverse populations of frugal innovators were identified, studied, marketed and promoted. In addition to recognizing the frugal innovations that are being developed in rural developing countries, it is important to recognize the contributions of Black frugal innovators because doing so may help inspire young people to follow this path. Carrying this torch from generation to generation may bolster the sustainability of the frugal innovation movement.

ABSTRACT

The study demonstrated that small businesses in the industry and craft sectors that seek to promote innovation must implement processes for developing an innovation culture. Interestingly, these processes contribute mainly to product and process innovation and less to marketing and organizational innovation. The empirical study was conducted in Israel in 2016 on a sample of 202 businesses in face-to-face interviews.

This research expands the body of knowledge on cultural processes for promoting innovation in this group of businesses, which has rarely been the focus of studies on innovation.

The study may contribute in a practical manner to assisting small businesses in the development and implementation of appropriate cultural processes for promoting innovation, and as a result, contribute to overall regional economic growth.

Keywords: Small businesses, innovation, cultural processes.

1. INTRODUCTION

This study addresses the contribution of innovation cultural processes to the promotion of innovation in small businesses. This group of businesses, despite its unique characteristics, has received little attention in the literature regarding innovation. In a rapidly changing global world, innovation is vital to all businesses (Marques & Ferreira, 2009; Porter, 1996; Teece, Pisano, & Shuen, 1997), but the innovation process carries risks and its management is complex (Chesbrouge, 2003), making it particularly difficult to promote innovation in small businesses, in view of their resource constraints and size disadvantages.

Small businesses must cope with various hardships that hinder their innovation, such as difficulty in obtaining suitable talent, lack of appropriate information and infrastructure, and lack of funding (Harel & Kaufmann, 2016; Kleiknecht, 1989; Lee, Park, Yoon, & Park, 2010; Van der Vrande, De Jong, Vanhaverbeke, & De Rochemont, 2009; Wu et al, 2016).

Previous studies have indicated the relationship between the size of the business and its innovation activity, so that in larger businesses employing a greater number of employees, the innovation activity is greater (CBS, 2015; CIS, 2017). Most studies regarding business innovation view small and medium-sized enterprises (SME) as one cohesive group. Many of these studies focused on product and process innovation (Oke, Burke, & Myers, 2007), as well as on businesses in technological fields and early stages of the business lifecycle (Lee et al., 2010). The current study focuses on small businesses, distinguishing between four types of innovation (product, process, marketing, and organizational), and explores the innovation at different life stages of the business. The study does not include businesses in the high-tech sector, whose activities are by nature concerned with innovation.

The purpose of this study was to examine the contribution of innovation cultural processes (hereinafter **cultural processes**) aimed at promoting innovation in small businesses in the industry and craft sectors. The study empirically examines a theoretical model that presents the relationship between these processes and the level of innovation in the business.

2. LITERATURE REVIEW

2.1 Addressing Innovation in Small Businesses

Previous studies compared the innovation dynamic in different business groups and have indicated the relationship between the business size and its innovation activity (CBS, 2015; CIS, 2017). Most of the studies refer to small and medium-sized enterprises as a single business group, despite considerable differences in their size and definitions in different countries. One contribution of this study is its approach to the uniqueness of cultural processes that are applied in small businesses.

2.2 Characteristics of Small Businesses

According to the EU Commission, small businesses are defined as businesses that employ up to 50 employees (European Commission, 2003). Small businesses are often characterized by limited regional activity and relatively small market share, and their employees are frequently located in one building. Moreover, these businesses are characterized by autonomy, as they are not part of a corporate group, and thus the owner has unrestricted authority and effective control over all business activity (Carson, 1990; Schollhammer & Kuriloff, 1997). Nonetheless, the most important distinguishing characteristic of small businesses is their unique management style. Management in small businesses is personal, as the manager personally knows each employee, is involved in every aspect of managing the business, and often does not include others in decision-making processes (Carson, 1990; Miller, 1983; Schollhammer & Kuriloff, 1997).

A large segment of small businesses is family-owned and operated by the primary shareholder (Coleman & Carsky, 1999). In such cases, the business manager often views the business

both as a means of achieving personal goals and as a source of familial income (Stewart, Watson, Carland, & Carland, 1999).

2.3 The Importance of Small Business to the Economy

Small businesses are perceived as an important growth engine for the economy, responsible for creating a significant portion of new jobs (Henrekson & Johansson, 2010, OECD, 2009). In the ever-changing economic environment, the advantages of small businesses are expressed in flexibility, dynamism, rapid response, and adaptability to change in this environment (Tzadik, 2007). The creativity of these businesses fuels entrepreneurial spirit and economic growth (Savlovski & Robu, 2011).

At the same time, according to Henrekson and Johansson (2010), only a small group of small businesses that grow rapidly because they are innovative is responsible for economic growth. Therefore, it is crucially important to understand processes for promoting innovation in small businesses, in order to expand this limited group of businesses and thereby contribute to the growth of the economy.

2.4 Cultural Processes

According to Nonaka (2007), successful businesses consistently generate new knowledge, disseminate it throughout the organization, and rapidly incorporate it into new technology and products. Nonaka claims that it should be recognized that the creation of new knowledge is not simply a matter of processing objective information. Rather, it depends on personal tacit knowledge as well as subjective insights, intuitions, and hunches of individual employees at all levels of the organization. Only the creation of a suitable organizational culture that encourages innovation will make these available for use by the entire organization. Nonaka also argues that new knowledge begins with individuals, and to make the personal knowledge available to others is the central activity involved in creating knowledge in the business.

Tacit knowledge consists in part of beliefs, technical expertise, and skills, which cannot always be accurately expressed. Therefore, an organizational culture that encourages communication and knowledge sharing assists in translating hidden knowledge into explicit and clear knowledge that can be used. The internalization of explicit knowledge by all the individuals in the organization will enrich their personal knowledge, thus contributing to the continued development of a “spiral of knowledge” of increasingly higher levels through which the knowledge that has been internalized and accumulated will serve other innovative ideas. According to Miron, Erez, and Naveh (2004), organizational culture that supports innovation encourages employees to find new ways to deal with problems while taking risks and explore new ideas even when the result is unclear. A culture that supports innovation makes it possible to translate creative ideas into actual innovation.

Dobni (2008) defines organizational culture as a framework of shared values and beliefs for employees at all levels of the organization that are reflected in its characteristics. Organizational culture that supports innovation includes behavior that demonstrates an appreciation of creativity, risk taking, freedom, teamwork, value seeking, communication, trust, and respect.

Tellis (2012) and Tellis, Prabhu, and Chandy (2009) also argue that organizational culture is one of the principal factors that affect innovation in organizations, despite the difficulty in measuring it. The researchers define organizational culture as a basic set of approaches and practices shared by members of the organization, and claim that a culture that fosters innovation will assist the business to stay ahead in the long term. Organizational culture is a unique product that develops slowly within the organization, cannot be determined or dictated by management, is not easily defined, and is difficult to transfer between organizations.

According to Skarzynski and Gibson (2013), there is no one way to organize business innovation. Each organization has elements of leadership, skills, infrastructure, values, culture, and organizational processes, and the challenge is to adapt these components to an innovation framework that is compatible with the organization and its objectives. According to the researchers, every individual in the organization can become an innovator by receiving encouragement and assistance with tools that the organization provides, for example training for creative thinking, allowing employees to take breaks in accordance with their own judgement, encouraging the proposal of new ideas, and so on. In addition, the organization should encourage dialogue and communication around the subject of innovation and integrate considerations regarding innovation capabilities into the hiring process of new employees and the employee remuneration system. In order for innovation to be accepted as a value in the organization, it must be clear and concrete to the employees. In addition, internal adjustment is required in the organization between structure, processes, the remuneration system, and the management's commitment and behavior, so that the employees will be convinced over a long period of time that their ideas are accepted and implemented in the organization, that initiative and risk-taking are rewarded, and that it is permissible to fail in the implementation of an idea and not be punished (Skarzynski, & Gibson, 2013).

Terziovski (2010) reinforces the claim that developing an organizational culture that encourages innovation is an integral part of the innovation process. This culture can be measured by examining the business's reward system for creativity, focusing on teamwork, encouraging informal employee meetings and interactions, encouraging employees to monitor their own performance, continuously experiment with new ways of doing things, and share knowledge.

In previous studies, the contribution of cultural processes to innovation was examined primarily in large businesses. The current study seeks to examine the extent to which cultural

processes are carried out in small businesses and explore their contribution to levels of different types of business innovation.

3. RESEARCH MODEL AND HYPOTHESES

Based on the literature review, we formulated a theoretical model that presents the relationship between cultural processes and levels of innovation in small businesses in the industry and craft sectors.

The model relates to the business characteristics and to the characteristics of the business manager, which may affect the level of innovation in these businesses. The model relates to four types of innovation: product, process, marketing, and organizational. Figure 1 below shows the model for promoting innovation in small businesses in the industry and craft sectors.

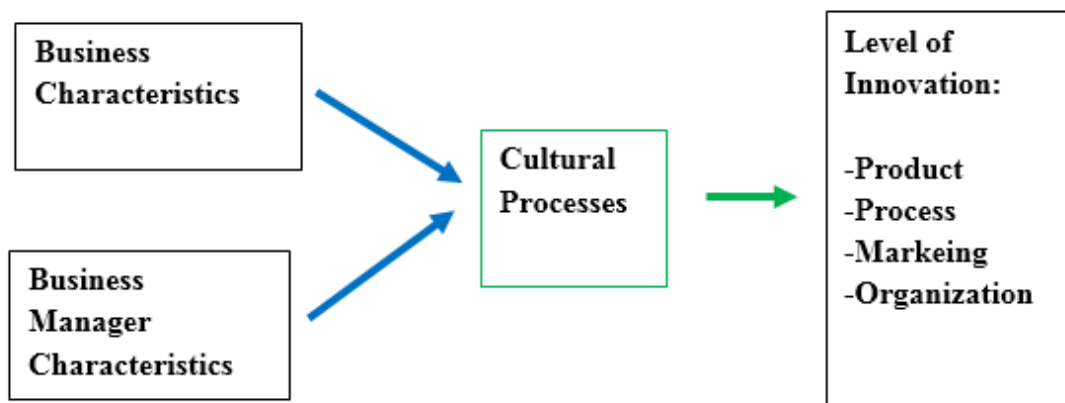

Figure 1: Model for promoting innovation in small businesses in the industry and craft sectors.

Model variables

Dependent variables

The dependent variables relate to the level of innovation in the four types of innovation in the business.

Independent variables

The Cultural processes

Control variables

A. Business characteristics: size, age, level of human capital, level of export sales, and rate of sales from subcontracted work

B. Characteristics of the business manager: managerial experience, number of businesses he has managed, and being the owner of the business

Research hypothesis

The research hypothesis has been formulated for simplicity in general, but will be examined in relation to the level of each type innovation separately.

Previous studies have shown that organizational culture encourages innovation, enables creative ideas to be translated into innovation performance, and facilitates the translation of tacit knowledge into knowledge that is explicit and available to the business. Organizational culture that encourages innovation is an integral part of the business innovation process.

The contribution of cultural processes to business innovation has been examined mainly among large businesses. The current study examines whether these processes are also implemented in small businesses, and if so, in what manner and to what extent. Moreover, the study examines the contribution of these processes to the level of different types of innovations. Thus, our research question is: Does the degree of implementation of cultural processes in the business have a positive impact on the level of innovation in small businesses in the industry and craft sectors?

This question will be examined using the following hypothesis:

The greater the extent of cultural processes in the business, the higher the level of innovation.

4. RESEARCH METHODOLOGY

The sample

The sample included 202 small businesses in the industry and craft sectors in Israel that employ between 10 and 50 employees. The data was based on the Israeli Industry and Craft Association, which includes the details of all small businesses in these sectors, which by law are incorporated into this organization.

Data collection

Data collection took place over the course of three months in 2016 and was conducted using a questionnaire divided into three parts: innovation in the business, cultural processes, and characteristics of the business and the business manager.

Innovation in the business

This section addresses the level of each of the four types of innovation in the business (CBS, 2012). For each type of innovation, the level of innovation was measured according to four degrees of innovation related to market presence (Oke et al., 2007). First-degree innovation indicates a significant improvement on an existing product, process, or method. Second-degree innovation indicates products, processes, or methods that are new to the business, but exist in the local market. Third-degree innovation indicates products, processes, or methods that are new both to the business and to the local market. Fourth-degree innovation indicates products, processes, or methods that are new to both the business and the global market.

The business managers were asked to indicate the amount and degree of each type of innovation implemented in the business in the past three years. The level of each type of innovation was calculated based on a weighted index of the number of innovations and the degree of innovation (Bobko, Roth, & Buster, 2007; Miron-Spektor et al., 2011).

Cultural processes

The cultural processes include ten managerial practices. The first six are based on a validated index from a study by Terziovsky (2010), while the other four are based on Skarzynski and Gibson (2013). The practices are: encouraging employees to engage in informal meetings, monitor their own performance, and share knowledge, focus on teamwork, continuously experiment with new ways of doing things, including a component of creativity in employee remuneration (Terziovsky, 2010), discussing innovation in meetings with employees, encouraging employees to propose new ideas, implementing employees' new ideas, and incorporating the consideration of creativity and innovation capabilities into the hiring process of new employees (Skarzynski, & Gibson, 2013). The examination of internal reliability using Cronbach's alpha, obtained indicated high internal reliability of the index that included the ten items. The managers were asked to assess the extent to which each of the ten cultural processes exists in the business on a Likert scale (1–5). The index used to examine the contribution of cultural processes to the innovation in the business is presented in Table 1, below.

Table 1: Measures for examining the contribution of cultural processes to the innovation in the business

The Processes in the Measure	
a.	Encouraging employees to hold informal meetings
b.	Encouraging employees to monitor their own performance
c.	Encouraging employees to share knowledge
d.	Focusing on team work
e.	Encouraging initiatives for examining new ways to carry out tasks
f.	Including creativity as an element of employee's remuneration
g.	Discussing innovation in meetings with employees
h.	Encouraging employees to propose new ideas
i.	Implementing employee's new ideas
j.	Incorporating the consideration of creativity and innovation capabilities into hiring process of new employees

Characteristics of the business and the business manager

The characteristics of the business are: size (the number of employees), age, level of human capital (the proportion of employees with engineering or scientific backgrounds), level of sales for export, and rate of sales from subcontracting. The characteristics of the business manager are: managerial experience, number of businesses he has managed, and being the owner of the business.

5. FINDINGS

The findings are presented in three parts. The first part presents the characteristics of the businesses and the business managers. The second part presents the correlations between all the research variables and the level of innovation in the business. The third part presents the regression analyses that examine the contribution of cultural processes to the level of each type of innovation.

5.1 Characteristics of the Businesses and the Business Managers

Businesses characteristics

Half of the businesses have between 10 and 19 employees, while one quarter have between 20 and 29 employees and another quarter have between 30 and 50 employees. The average number of employees is $M=22.7$ ($SD=13.1$) and the average age of businesses in the sample is $M=28.3$ ($SD=14.2$).

Thirty-seven percent (37%) of the businesses have no employees with an engineering or scientific background, and in only 13% of the businesses more than 20% of their employees have such backgrounds. Seventy percent (70%) of the businesses in the sample do not export their products and in less than 9% of them exports comprise over 50% of their sales. Furthermore, 40% of the businesses work as subcontractors.

Characteristics of the business managers

The average number of years of management experience was $M=26.9$ ($SD=10.7$). More than 75% of the business managers had managed only one or two businesses, indicating that despite many years of experience, their management experience is not diverse. This finding can be explained by the fact that in 90% of the businesses in the sample, the manager of the business was also its owner.

5.2 The relationships between the research variables and the level of innovation

Cultural processes and the level of innovation

The distribution of businesses in the sample according to the extent to which cultural processes are implemented is presented in Figure 2, below.

Figure 2: The distributions of businesses in the sample according to the extent to which cultural processes are implemented

Figure 2 shows that in all businesses there was a cultural process of some kind, and that in about 60% of the businesses, these processes took place to a moderate extent or higher. The correlation between the extent to which these processes took place and the level of innovation in the business are presented in Table 2, below.

Table 2: The correlation between the extent to which cultural processes took place and the level of innovation in the business

	Product Innovation	Process Innovation	Marketing Innovation	Organizational Innovation	M	SD
Culture processes	0.48**	0.37**	0.29**	0.36**	2.35	0.74

* $p < 0.01$ ** $p < 0.001$

Table 2 shows high positive correlations between cultural processes and the level of innovation in all types of innovation. The highest correlations were found with product innovation.

Business characteristics and the level of innovation

The correlations between the business characteristics and the level of innovation are presented in Table 3, below.

Table 3: The correlations between the business characteristics and the level of innovation in the business

Businesses Characteristics	Product Innovation	Process Innovation	Marketing Innovation	Organizational Innovation
Business Size	0.20*	0.15	0.04	0.23*
Business Age	0.04 -	0.05	0.09 -	0.10 -
Engineers	0.36**	0.15	0.19*	0.28**
Export sales	0.36**	0.09	0.21*	0.19*
Subcontractors	0.21* -	0.08	0.21* -	-0.06

* $p < 0.01$ ** $p < 0.001$

Table 3 shows high positive correlations between the number of employees with engineering or scientific backgrounds, the level of export sales, and the level of product innovation. In addition, positive but relatively low correlations were found between the business size and the level of organizational innovation. Low negative correlations were found between subcontractor sales and the level of product and marketing innovation.

Characteristics of the business managers and levels of innovation

The examination of the correlations between the manager's experience, number of businesses he had managed, and levels of innovation revealed that except low negative correlation between the manager's experience and the level of organizational innovation

($r = -.22, p < .01$), no significant correlations were found (see Appendix A1).

The differences in levels of innovation as a function of the manager being the business's owner were examined by means of one-way MANOVA analysis, which showed a significant effect of the manager being the owner:

$F(5,196)=7.33, p<.001, \text{wilks' } \eta^2=0.16$.

In the analysis by types of innovation, being a manager-owner was found to have a significant effect on all types of innovation, except of process innovation, where the average score of a manager who is not the owner is higher than that of a manager-owner (see Appendix A2).

5.3 Regression analyses

The contribution of cultural processes to levels of innovation in the business was examined using hierarchical regression analyses in three steps. The variables that were significantly correlated in a Pearson's correlation test with at least one type of innovation were introduced into the regression.

The analysis was conducted using four separate regressions for each type of innovation separately, with identical identity and order of the variables.

The regression coefficients are presented in Table 4, below.

Table 4: The regression coefficients

Variable	Product β	Process β	Marketing β	Organization β
Step 1				
Manager's experience	-0.07	0.10	0.00	-0.17*
Manager- Owner	0.17*	0.00	0.30**	0.23**
Step 2				
Export sales	0.34**	0.10	0.14	0.14
Business size	0.20*	0.18*	0.01	0.24**
Prop. Of engineers	0.30**	0.21*	0.13	0.29**
Subcontractors	-0.19*	0.05	-0.18*	-0.04

Business age	0.03	0.13	-0.08	-0.06
Step 3				
Cultural processes	0.37**	0.42**	0.21*	0.25*
R2	0.34	0.20	0.18	0.24

* $p < 0.01$ ** $p < 0.001$

In the first step, the characteristics of the business manager were introduced into the regression. Being a manager-owner significantly contributed to the levels of marketing and organizational innovation such that in businesses where the manager is not the owner, the level of marketing and organizational innovation is higher.

The manager's experience was found to contribute significantly only to the organizational level of innovation such that the greater the experience, the lower the level of organizational innovation. These variables are used as control variables in the study.

In the second step, the business characteristics were introduced. Export sales were found to contribute significantly only to the level of product innovation such that the higher the rate of export sales, the higher the level of product innovation.

The size of the business and the number of employees with engineering or scientific backgrounds were found to contribute significantly to the level of innovation of all types, except for marketing innovation. The larger the business and the greater the number of employees with engineering or scientific backgrounds, the higher the levels of product, process and organizational innovation. These variables served as control variables in the study.

In the third step, the cultural processes were introduced into the regression. These processes significantly contributed to the levels of product and process innovation, but less to the levels of marketing and organizational innovation.

6. DISCUSSION

The current study empirically examined a theoretical model that presents the relationship between cultural processes and levels of business innovation.

In the examination of the relationship between cultural processes and level of innovation through Pearson's correlation, high positive correlations were found with all types of innovation. In the examination of the contribution of cultural processes to levels of innovation by means of regression analysis, it was found that they had a significant contribution mainly to the levels of product and process innovation.

These findings confirm the research hypothesis regarding the levels of product and process innovation such that the greater the extent of cultural processes in the business, the higher the levels of product and process innovation. These findings may be explained by the fact that innovations in product and process are based on the knowledge, personal experience, insights, and intuitions of employees at all levels of the business. The implementation of cultural processes assists in translating tacit knowledge into explicit and available knowledge for wide use in the business, thereby contributing to its innovation (Nonaka, 2007). On the other hand, in small businesses, marketing innovations such as setting up a website or changing means of distribution, and organizational innovations, including changes in responsibility and authority, may be made solely by the manager, without the participation of additional employees.

Dobni (2008), Nonaka (2007), Miron et al. (2004), and Tellis et al. (2009) support the findings of the current study, although these studies examined the contribution of cultural processes to innovation in large businesses only and did not relate to the various types of innovation.

7. CONCLUSION

The research findings confirmed the study hypothesis and demonstrated that the implementation of innovation cultural processes, such as encouraging employees to examine new ways of performing tasks, is crucial for promoting innovation in small businesses. Nonetheless, it is interesting to note that cultural processes affect differently according to the innovation type: product, process, marketing or organization. The impact is higher to the levels of product and process innovation and lower to marketing and organizational innovation.

The theoretical contribution of the research is expressed in its focus on small businesses in the industry and craft sector, in distinguishing between different types of innovation, and in expanding knowledge on cultural processes implemented in these group of businesses, which has rarely been the focus of studies on innovation. The use of face-to-face interviews as a research tool facilitated the attainment of knowledge that is generally less accessible. In addition, the study findings may be instrumental in assisting small businesses in implementing appropriate processes for promoting innovation.

8. LIMITATION OF THE STUDY AND FUTURE RESEARCH

The findings were based on data provided by the business managers. However, in accordance to ensure the study's validity, a structured questionnaire was filled out by the author during face-to-face meetings and verified by means of additional questions intended to clarify the answers.

Future research should expand the parameters to include small businesses in other sectors. This expansion will facilitate a broader understanding of all small businesses in the market.

NON-STOCHASTIC PREDICTION SPAN AS A PREDICTING TOOL IN ECONOMIC TIME SERIES

Hindls, Richard¹; Hronová, Stanislava²; Marek Luboš¹

¹Department of Statistics and Probability, University of Economics, Prague, Czech Republic

²Department of Economic Statistics, University of Economics, Prague, Czech Republic

ABSTRACT

This paper describes an original method suitable for constructing a non-stochastic prediction span in seasonally adjusted economic time series. Such a technique is capable of providing a rather narrow interval that can be used for short-term predictions in the time series evolution. We first analyse the properties of the presented method, in particular with respect to variability in the values of the underlying time series. Using simulations, we then compare the prediction potential of the model depending on low/high variability. In the end, we illustrate our findings about the model properties on time series data taken from the national accounts of the Czech Republic.

Keywords: combinations of polynomial trend curves, non-stochastic prediction span, variability of seasonally adjusted time series, final consumption expenditure.

INTRODUCTION

Analysis of time series is currently a dynamically developing field, particularly in connection with large data sets and possibilities of stochastic modelling. This fact is caused by the growing need to use the results of statistical analysis in economic decision-making. The availability of input data and the growing lengths of the economic-index time series to be analysed bring about a challenge to look for novel approaches to analysing and predicting in time series, as well as making the predictions more accurate. All prognosis methods in time series stem from looking into the future on the basis of studying the past. Predictions in time series of any economic indices should always comply with demanding requirements on accuracy and reliability, on which the quality of the subsequent decision-making heavily depends.

The quality of predictions in economic time series depends, to a variable extent, not only on the particular prediction span technique utilised but primarily on the variability of the past values of the underlying time series. When extrapolating the observed evolution, we must always take into consideration the factual and formal properties of the series as well as the criterion of the predictions to be meaningful. A wide prediction span is virtually worthless for the user, despite the high

reliability of such predictions; on the other hand, a narrow interval of predicted values brings a higher risk of prediction errors. The method presented in this paper is aimed at finding an acceptable compromise between those two extremes.

VARIANTS OF PREDICTION SPANS

The methods of statistical prognostics are among the most widely used prediction models. They include extrapolation techniques for one- and multi-dimensional time series, as well as different modifications of regression analysis. The substance of the traditional extrapolation methods studies the time series of a selected phenomenon and transfers the established regularities from the past and present to the future. This principle (called *ceteris paribus*) can, more or less smoothly, be applied to phenomena that are stable in time. If, however, substantial qualitative changes have been taking place in the analysed time period (and similar changes are to be expected in the future), the use of the traditional extrapolation methods is disputable. The point is that in the present economic practice we encounter a number of unstable phenomena. In such instances, point-estimate predictions lose their usefulness and we have to make use of prediction methods based on prediction intervals and methods of regression analysis. Such predictions may take on the form of traditional stochastic confidence intervals (cf., e.g., Fox, 2012 or Holger and Schreiber, 2004) or non-stochastic prediction spans (cf., e.g., Rogoza, 2017 or Kozák et al., 1999).

First of all, we are going to briefly describe the traditional stochastic prediction span, followed by a non-stochastic "fin-shaped" prediction span (which is partly based on our work Hindls, Hronová and Marek, 2016). We will now further develop this technique by testing its ability to comply with the requirements for prediction quality depending on the variability (as measured by the variation coefficient) of a particular time series. Finally, we will make predictions in time series of aggregate indices from the national accounts of the Czech Republic, accompanied by the corresponding factual analysis of the related issues.

Traditional stochastic interval predictions

The traditional interval predictions are two-sided prediction intervals with pre-set confidence levels. They are based on point estimates created by extrapolation of the trend curve, around which the stochastic is constructed. Let us denote by y_t the time series value at time $t = 1, 2, \dots, n$ (where n is a positive integer).

Within this concept, a predictor π is created for the given prediction horizon $h > 0$ (where h is a positive integer as well) for the time moments between n and $(n + h)$, viewed as an estimate of the unknown variable y_{n+h} to be predicted, together with two more predictors $\underline{\pi}$ and $\overline{\pi}$ such that $\underline{\pi} < \pi < \overline{\pi}$; π is the

so-called mid-predictor (which is, in substance, a point estimate of the future evolution); π_l and π_u are the lower and upper predictors; and the (π_l, π_u) interval is the prediction span. A traditional two-sided symmetric confidence interval for the mid-predictor π is used, with the end predictors $[\pi - D(\otimes), \pi + D(\otimes)]$; here $D(\otimes)$ is a random variable such that, for a given value of Δ , with $0 < \otimes < 1$, probability inequalities $P[|\pi - y^{(m)}| \leq D(\otimes)] \geq 1 - \otimes$ and $P[|\pi - y^{(m)}| \leq D(\otimes)] \geq 1 - \otimes$ are true. By $y^{(m)}$ we have denoted the applied prognostic model for the variable to be predicted (cf. in more detail, e.g., Stulajter, 2002 or Woodward, Gray and Elliott, 2012).

In order to describe the process being monitored, we can use a two-parameter linear regression function with positive, non-decreasing monotonous values of the independent variable. The prediction problem is resolved in a traditional way: the mid-predictor is obtained by extrapolating the deterministic component from the past to the future, and the prediction span by utilisation of a traditional symmetric two-sided confidence interval (Granger and Newbold, 1986 or Wei, 1990).

We begin with the fact that the dependent variable can be described as

$$y_t = \alpha + \beta x_t + \varepsilon_t, \quad t = 1, 2, \dots, n, \quad (1)$$

where

$$x_t > 0, \quad t = 1, 2, \dots, n, \quad (2)$$

stands for the known decreasing values of the independent variable, β and α for unknown non-stochastic parameters, and ε_t for random perturbations characterized by

$$E(\varepsilon_t) = 0 \quad \text{for } t = 1, 2, \dots, n, \quad (3)$$

$$\begin{aligned} E(\varepsilon_t \varepsilon_s) &= \sigma^2 \quad \text{pro } t = s, & t, s &= 1, 2, \dots, \\ &= 0 \quad \text{for } t \neq s. \end{aligned} \quad (4)$$

The estimates a and b of the parameters β and α respectively are identified with the aid of the least squares method, i.e., using the formulas below:

$$a = y - bx, \quad (5)$$

$$b = \text{cov}(x, y) / \text{var } x = r (\text{var } y / \text{var } x)^{1/2}, \quad (6)$$

where r is the correlation coefficient between y and x .

Estimates of the random perturbations (residuals)

$$e_t = y_t - a - bx_t, \quad t = 1, 2, \dots, n, \quad (7)$$

have, with respect to Formulas (5) and (6), residual variance

$$\text{var } e = (1 - r^2) \text{var } y. \quad (8)$$

The usual coefficient of determination $R^2 = 1 - \text{var } e / \text{var } y$ is here reduced to $R^2 = r^2$ (9)

and an unbiased estimate for the variance of random perturbations σ^2 has the form

$$s^2 = n(n-2)^{-1} (1 - r^2) \text{var } y. \quad (10)$$

The prediction problem is solved on the basis of the fact that the independent variable's value,

$$x_{n+h} > 0 \text{ for } h = 1, 2, \dots, m, \quad m < n, \quad (11)$$

is known between points n and $(n+h)$. The mean predictor is then

$$\hat{I}(h) = a + bx_{n+h} \quad (12)$$

where a and b stand for the estimates (5) and (6). With respect to the unknown variable y_{n+h} to be predicted, the error amounts to

$$d(h) = \pi(h) \otimes y_{n+h} \quad (13)$$

If the *ceteris paribus* principle is valid for the variable to be predicted, i.e., if the $y_{n+h} = y^{(m)}$ prognostic model is considered in relation with the model specified by Formula (1), which describes the past with the following properties:

$$y^{(m)} = \alpha + \beta x_{n+h} + \varepsilon^{(m)}, \quad (14)$$

$$E(\varepsilon^{(m)}) = 0, \quad E[(\varepsilon^{(m)})^2] = \sigma^2, \quad (15)$$

$$E(\varepsilon^{(m)} \varepsilon_t) = 0, \quad t = 1, 2, \dots, n, \quad (16)$$

then the variable under consideration is *ex ante* unbiased,

$$B_m[\pi(h)] = E[d(h)] = 0, \quad (17)$$

and its *ex ante* quadratic risk equals

$$R_m[\pi(h)] = E\{[d(h)]^2\}, \text{ which in its turn equals}$$

$$R_m[\pi(h)] = \sigma^2 C_n(h) \quad (18)$$

while there is

$$C_n = \frac{(n+1)}{n} + \frac{(x_{n+h} - x)^2}{n \cdot \text{var } x}, \quad h = 1, 2, \dots, m. \quad (19)$$

The traditional span of predictions will be determined as follows: when the coefficient of reliability is given as

$$1 \otimes \Delta, \quad 0 < \Delta < 1, \quad (20)$$

the lower variant $\pi_L(h)$, and the upper one $\pi_U(h)$ are calculated:

$$\pi_L(h) = \pi(h) \otimes D(\Delta, h), \quad \pi_U(h) = \pi(h) + D(\Delta, h), \quad (21)$$

where

$$D(\Delta, h) = \mu(\Delta) \{s^2[C_n(h)]\}^{1/2} \quad (22)$$

stands for an admissible error value, and $\mu(\Delta)$ is a $(1 \otimes \Delta/2).100\%$ quantile for the Student t -distribution with $(n \otimes 2)$ degrees of freedom. The resulting construction admits the following interpretation: if all the hypotheses on the model are valid (especially, the assumption that the random perturbations have normal distributions and the variable to be predicted complies with its *ceteris paribus* prognostic

model), then the variable to be predicted will lie inside the interval $[\pi_l(h), \pi_u(h)]$ with the probability value equal to $(1 \otimes \Delta)$, and outside this interval with the complementary probability value of Δ .

"Fin-shaped" prediction intervals

The traditional solution of stochastic predictions (21) presented above can be extended to alternatives based on non-stochastic approaches (cf. Kozák and Hindls, 1997). We will consider two such alternatives here; both of them are related to two additional models of the dependent variable

$$y_t = \alpha_p + \beta_p(x_t)^p + \varepsilon_{p,t}, \quad 0 < p < 1, t = 1, 2, \dots, n, \quad (23p)$$

$$y_t = \alpha_{1+q} + \beta_{1+q}(x_t)^{1+q} + \varepsilon_{1+q,t}, \quad 0 < q < 1, t = 1, 2, \dots, n. \quad (23q)$$

Regarding their interpretation with respect to model (1), it is useful to require that all of these three models should have the same deterministic components both at the beginning of the prediction, $t = n$, and at the beginning of series, $t = 1$. With respect to Formulas (1), (23p), and (23q), it seems reasonable to require that the following boundary conditions should be met:

$$\alpha_p + \beta_p(x_i)^p = \alpha + \beta x_i, \quad 0 < p < 1, \quad i = 1, 2, \dots, n, \quad (24p)$$

$$\alpha_{1+q} + \beta_{1+q}(x_i)^{1+q} = \alpha + \beta x_i, \quad 0 < q < 1, \quad i = 1, 2, \dots, n. \quad (24q)$$

We have estimates (5) and (6) for α and β ; hence, denoting by a_p, a_{1+q}, b_p and b_{1+q} the estimates for $\alpha_p, \alpha_{1+q}, \beta_p$ and β_{1+q} (respectively), we can calculate them with the aid of the following Formulas

$$a_p + b_p(x_1)^p = K_1, \quad a_p + b_p(x_n)^p = K_n, \quad (25p)$$

$$a_{1+q} + b_{1+q}(x_1)^{1+q} = K_1, \quad a_{1+q} + b_{1+q}(x_n)^{1+q} = K_n \quad (25q)$$

where

$$K_1 = a + b x_1, \quad K_n = a + b x_n. \quad (26)$$

In other words, the equality

$$a_p = a + b [x_1(x_n)^p \otimes x_n(x_1)^p] / [(x_n)^p \otimes (x_1)^p] \quad (27p)$$

is valid and there is

$$b_p = b (x_n \otimes x_1) / [(x_n)^p \otimes (x_1)^p]. \quad (28p)$$

Analogically,

$$a_{1+q} = a + b [x_1(x_n)^{1+q} \otimes x_n(x_1)^{1+q}] / [(x_n)^{1+q} \otimes (x_1)^{1+q}] \quad (27q)$$

and there is

$$b_{1+q} = b (x_n \otimes x_1) / [(x_n)^{1+q} \otimes (x_1)^{1+q}]. \quad (28p)$$

Models (23p) and (23q) provide alternative predictions

$$\pi_p(h) = a_p + b_p(x_{n+h})^p, \quad 0 < p < 1, \quad (29p)$$

$$\pi_{1+q}(h) = a_{1+q} + b_{1+q}(x_{n+h})^{1+q}, \quad 0 < q < 1, \quad (29q)$$

and the goal is to compare those with the mean variant (12), related to the original model (1). It can be proven that they fulfil the following inequalities:

$$\pi_p(h) < \pi(h) < \pi_{1+q}(h) \text{ or } \pi_{1+q}(h) < \pi(h) < \pi_p(h); \quad (30)$$

hence the lower and upper predictions

$$\pi_p(h) \text{ at } 0 < p < 1, \text{ and } \pi_{1+q}(h) \text{ at } 0 < q < 1 \quad (31)$$

can, as related to the mean variant $\pi(h)$, be viewed as the limits of a non-traditional span of predictions, called a "fin-shaped" span. Of course, selection of the constants p and q is decisive for this construction.

QUALITY OF "FIN-SHAPED" PREDICTIONS DEPENDING ON THE VARIABILITY OF THE TIME SERIES DATA

The variability of the time series data (for purposes of the "fin-shaped" predictions, the time series must always be seasonally adjusted if the seasonal component is present) is a key factor for the size, and therefore the quality of the prediction span. That is why, prior to applying our approach to real data, we carry out comparative analysis on simulated data to study the effects of variability. To this end, we will utilise a standard generator of random numbers available online. Let us generate two different time series of types (1) and (2); each of them with random perturbations according to (3) and (4). They differ in their variability, i.e., the values of their variation coefficients. For the first series, the variation coefficient value of the generated series is $0.042 = 4.2\%$; for the second one, this value is about ten times higher, i.e., $0.459 = 45.9\%$. We have generated $n = 60$ observations in both instances. The visual outcome is shown in Figures 1 and 2 (y_t = generated data; Y_t = trend line values; Y_t^H = the fin's upper contour; Y_t^D = the fin's lower contour).

Figure 1. "Fin-shaped" model for a low-variability series

However, the "fin-shaped" model will only be made up based on 56 observations, and the remaining four will be set aside for future use. That is, we set up two "fin-shaped" models, each from its respective 56 observations, according to Equations (29) through (31) derived above. Finally, we construct the non-stochastic prediction spans with emphasis on our studying the ability of each such span to reflect the future evolution, or rather, the effects of variability on this ability. Figure 1 sums up our results for the time series with the value of the variation coefficient equal to 0.042.

In a fully analogous way, we have created the second "fin-shaped" model (again for 56 observations and setting aside four observations for later use). The only difference is the higher variability of the second series. Figure 2 sums up our results for the time series with the value of the variation coefficient equal to 0.459.

Figure 2. "Fin-shaped" model for a high-variability series

The visual comparison clearly indicates that the "prediction fin" made from the lower-variability data (Table 1 and Figure 1) is able to envelop the real data. The observation we originally set aside, i.e., y_t for $t = 57, \dots, 60$ fit inside of the prediction fin – cf. Figure 1. This prediction fin, however, does not envelop the "last year" data, i.e., y_t for $t = 57, \dots, 60$. In other words, the variability of the data to be interpolated is a primary, even if not sufficient, condition for reliable non-stochastic predictions.

We will now carry out a more detailed analysis of real time-series data, namely, the quarterly values of final consumption expenditure in the Czech Republic in the period 2003-2017 (source: Czech Statistical Office; www.czso.cz). Four values of this index from 2017 are again set aside, and we will try to use the "fin-shaped" model from the years 2003-2016 for the prediction of the four quarterly values of 2017 and compare those predictions with the actual 2017 data.

The final consumption expenditure value is one of the key macroeconomic indices in the area of the quarterly national accounts; it is based on the expenditure incurred by households, general government, and non-profit institutions serving households on the final consumption goods and services. The households' final consumption expenditure includes the value of the purchased goods and services, imputed rents, domestic services, etc. The general government's final consumption expenditure includes the individual and collective consumption expenditure values. The general government's final individual consumption expenditure corresponds to the social transfers in kind for households; the general government's final collective consumption expenditure includes all the remaining non-individualised expenditure (on administration, defence, security, science and research, etc.). The latter equals the general government's actual final consumption. For the non-profit institutions serving households, the final consumption expenditure always includes individualised expenditure; it corresponds to the social transfers in kind in favour of households.

This index also sensitively reflects the economic development in the monitored time period, which is a truly varied sample of different stages of the Czech economic cycles. Its beginning years, 2003-2007, were times of economic conjuncture, followed by the worldwide mortgage crisis, approximately from 2008 to 2010, which severely affected the Czech economy as well, including the final consumption expenditure values. After a short recovery in the years 2010 and 2011, a new wave of troubles with the economic growth came (not only in the Czech Republic), mainly caused by the fiscal problems of developed economies. In the remaining years of this period, a recovery again occurred, also prevailing in 2017. It is the evolution of the final consumption index in this year we will try to estimate and then compare with the actual values, already known now.

"FIN-SHAPED" PREDICTION INTERVAL FOR THE TIME SERIES OF THE FINAL CONSUMPTION EXPENDITURE

The procedure of constructing a non-stochastic prediction span will be now illustrated on a time series comprising the final consumption expenditure values. Our predictions will be based on a sequence of quarterly values of this index beginning in the 1st quarter of 2003 until the 4th quarter of 2016. It means $t = 1, 2, \dots, 56$, where $t = 1$ corresponds to the 1st quarter of 2003, and $t = 56$ to the 4th quarter of 2016. This time series (its original data are written below in Table 1) is characterised by a lower level of variability (namely, $v_x = 0.125 = 12.5\%$), even though, in the Czech economy, time series from the same time period occur whose variability levels are even lower. The value of the variation coefficient v_x we refer to can be viewed as a good precondition for applying the "fin-shaped" non-stochastic prediction span.

After deriving the "fin-shape-based" predictions for all four quarters in 2017, we compare those predicted values with the actual ones, which are now officially known. The data from the period 2003–2016 are given as current prices in million CZK, and they have been seasonally adjusted; such adjustment is a condition necessary for the application of the presented method.

Table 1. The "fin-shaped" model for the time series of the expenditure on final consumption (in million CZK, current prices)

Note: the following notation is used in this Table: y_t = generated data; Y_t = trend line values; Y_t^H = the fin's upper contour; Y_t^D = the fin's lower contour; and $\delta_D^H \rightsquigarrow Y_t^H \rightsquigarrow Y_t^D$.

Our primary task is now to establish the values of the p and q parameters. We have to choose them so that the curves interconnecting the Y_t^H values (corresponding to the p parameter), and Y_t^D values (corresponding to the q parameter), visually make up a "fin" into which a substantial part of the Y_t real values fall. We have chosen $p = 0.20$ and $q = 0.75$ to meet this requirement. Some other choices close to this one would be possible; we can verify this statement experimentally. The following parameter values of our model are calculated with the aid of Equations (5), (6), (27p), (27q), (28p), and (28q):

$a = 520,275.65$; $b = 4,942.677$; $a_p = 305,429.026$; $b_p = 219,789.301$; $a_{1+q} = 525,216.779$; and $b_{1+q} = 1.5488$.

The four "set-aside" values are shown in the bottom of Table 1, highlighted in grey, together with the prediction span values between the limits, which equal Y_t^H and Y_t^D . A chart showing the achieved results, including the fin shape, is given in Figure 3 below (y_t = generated data; Y_t = trend line values; Y_t^H = the fin's upper contour; Y_t^D = the fin's lower contour).

Figure 3. The chart of the "fin-shaped" model for the time series of the expenditure on final consumption

We can see in Figure 3 that we have been able to estimate quite exactly the evolution of the final consumption expenditure in the Czech Republic for the four calendar quarters in 2017 (that is, $t = 57, \dots, 60$). The real values are indicated by bold print in Table 1; the model values of the upper and lower limits of the fin are next to them in normal print.

The percentage error of our non-stochastic prediction span is not higher than about 0.5%, which can, by and large, be considered an exact prediction of the future evolution of the expenditure on final consumption in 2017. This result is all the more valuable concerning the fact that this time series covers times of rather turbulent developments in the (not only) Czech economy, in which recession and recovery periods quickly took turns. Despite those complications, the selected "fin-shaped" prediction

method has been capable of describing the process satisfactorily, and successfully predicting the evolution in all four quarters in 2017.

CONCLUSIONS

The goal of the present paper is to explain a novel method for constructing a non-stochastic prediction span in a time series. The original feature of this method is the way in which the past behaviour of the time series is projected to the future, namely, with the aid of a specific combination of two parameters, p and q , of the polynomial trend. This approach thus interconnects two aspects of the trend modelling: the concept of models with constant parameters on the one hand, and with variable ones on the other hand. This method is in particular suitable to be applied to processes that are not subject to sudden external interventions into their development, not seasonally affected (if they are, the seasonal effects have to be filtered away), and whose character is not overly explosive. An advantage is that we do not have to achieve stationarity, which is a usual prerequisite in many other time series models.

The above-mentioned results of the comparison analysis on simulated series with low/high variability level seem to indicate that the higher the variability in the past evolution, the wider the span between the limit trends (which are the "fin" contours, as all our Figures show), and vice versa. A similar phenomenon can be observed in the "fin-shaped" Project Documentation spans. A high level of variability (approximately, with the values of the variation coefficients above 0.25) provides virtually no certainty about the quality of our predictions. On the other hand, even a low value of the variation coefficient is not a reliable condition sufficient for a good quality of predictions (if it were, the *ceteris paribus* principle would be contradicted).

Certain open questions remain in the concept of the non-stochastic fin-shaped prediction. The choice of the p and q parameters plays a key role. We have two basic options here.

The first option is to choose these values so that a vast majority of the observed values fall between the limit polynomial trend curves. Let us once again recall that seasonal adjustment of the underlying series is a *sine qua non* prerequisite. If it is not met, the "fin" is unable to envelop the time series values (because the seasonal fluctuations quickly run away, that is, do not remain within the fin limits).

The other option for choosing the p and q parameter values is using a classical pseudo-prediction method. It means reducing the time series length by several values (in our example, we set aside four values), derive the fin-shape-based predictions, and finally compare the predicted values with those set aside before. From the viewpoint of computations, this approach requires that we investigate all possible combinations of the p and q parameters. There are infinitely many such combinations, which means that we have to reduce this task with the aid of the first-mentioned approach, based on the visualisation of the fin shape. After identifying the admissible combinations of the p and q parameter

values (and the number of such combinations will have been substantially reduced), we will calculate the values of the Theil coefficients and determine the best variant for the parameters based on those coefficient values.

THE INFLUENCE OF CONSUMER ETHNOCENTRISM, CONSUMER ANIMOSITY AND DOMESTIC COUNTRY BIAS IN PRODUCT PREFERENCE

Hungara, Ana Paula¹; Meneses, Raquel¹; Nobre, Helena²

ABSTRACT

This paper aims to study the influence of consumer ethnocentrism, consumer animosity and domestic country bias in product preference. Previous studies focused on a specific country and the connection between consumer ethnocentrism, consumer animosity and product perception bias in product preference is not yet clear. This study hopefully contributes to fill in these gaps. Since the use of a single country as a test was one of the main limitations of former studies, an experiment was performed in two different European countries, scoring high and low in ethnocentrism, Austria and Portugal respectively. Consumers over 18 years of age were randomly selected to participate in the study. The experience consisted of the tasting of a product with a domestic label and the same product with a foreign label from a country with a low level of animosity versus a country with a high level of animosity, followed by the completion of a questionnaire. Results have made it possible to compare the impact of different levels of ethnocentrism and animosity in consumer preference of domestic versus foreign products. Findings confirmed the country of origin effect with the influence of consumer ethnocentrism on product judgments for certain categories of products. The influence of animosity did not find significant results.

Keywords: Domestic Country Bias, Consumer Ethnocentrism, Consumer Animosity, Product Preference, Country of Origin.

INTRODUCTION

According to Feurer, Baumbach and Woodside (2016, p.352), consumer ethnocentrism can be seen as “[...] a form of protectionism at the consumer level”, that will threaten the entry of international firms in foreign markets, affecting trade and generating consumer perception bias. Specific events may also generate negative attitudes and adversely influence the purchase behaviour through consumer animosity, which refers to the effect of tensions between different countries.

Until now, studies focused on a specific country and it is not yet clear the connection between consumer ethnocentrism, consumer animosity and the subsequent development of negative product judgments, leading to a bias in consumption (Feurer et al., 2016). This paper tests the influences of consumer ethnocentrism, consumer animosity and domestic country bias in product preference in two different European countries, scoring high and low in ethnocentrism, Austria and Portugal respectively. Studying consumer preference of domestic versus foreign products in two different countries offers more possibilities to answer our main research question: what is the influence of consumer ethnocentrism, consumer animosity and domestic country bias in consumer preference of domestic versus foreign products?

The most relevant literature related to consumer ethnocentrism, consumer animosity and domestic country bias is analysed, followed by the empirical analysis of data for the two countries considered in the study. Conclusions about product preferences in two different contexts are drawn from the results obtained.

THEORETICAL BACKGROUND

According to Keller (1993), brand knowledge is “[...] a brand node in memory to which a variety of associations are linked” (Keller, 1993, p. 3). One of these associations can be the country of origin of a product, in what is known as Country of Origin effect (or COO effect) (Koschate-Fischer, Diamantopoulos and Oldenkotte, 2012). COO effect will effect product preference by generating “[...] a bias against foreign products and in favour of domestic ones” (Balabanis and Diamantopoulos, 2004, p. 80). This bias can be influenced by consumer ethnocentrism and consumer animosity.

Fernández-Ferrín, Bande-Villela, Klein and del-Rio Araújo (2015) relate product preferences to ethnocentrism through the social identity theory. According to which ethnocentric consumers will distinguish themselves from out-groups by choosing products from their own group (Fernández-Ferrín et al., 2015). Social influences, such as those of their friends or family, will enhance these choices, as predicted by the theory of planned behaviour (Fernández-Ferrín et al., 2015).

In terms of judgments, according to Fernández-Ferrín et al. (2015), consumers can choose national products to support their country's economy (rational judgment), or they can see it as their obligation (moral judgment).

Consumer animosity refers to consumers' perceptions of disagreements between the home country and a foreign country (Riefler and Diamantopoulos, 2007) and it is based on feelings of anger (Fernández-Ferrín et. al., 2015). Most animosities stem either from economic or war-based reasons. However, animosities can also be related with, for example, religion or mentality (Riefler and Diamantopoulos, 2007).

Shoham, Davidow, Klein and Ruvio (2006) use the cognitive dissonance theory to explain the relationship of consumers' animosity with their purchase behaviour and product judgement. According to this theory, people may have a negative attitude towards a country, but positive towards some aspects of its culture, like food or clothing. However, this dissonance may diminish through negative campaigns and information on the products and services from the other country, thus affecting product judgment (Shoham et al., 2006).

The connection of animosity, ethnocentrism and the domestic country bias with product preference has been demonstrated by some authors. Morey (2016) and Balabanis and Diamantopoulos (2004) studied this phenomenon from the demand side. Balabanis and Diamantopoulos (2004) only established the connection between consumer ethnocentrism and a domestic country bias for domestic products of certain categories. Animosity is not mentioned in these two referred studies, which measure only one country. The studies however indicate that country bias varies according to product category and country. Hence, two main limitations in the literature can be referred: too much attention has not been paid to the roles of consumer ethnocentrism, consumer animosity and domestic country bias altogether in consumer behaviour; and the focus on one single country to obtain results limits the ability to generalise the studies (Balabanis and Diamantopoulos, 2004). Moreover, according to Urbonavicius, Dikcius, Gineikienė and Degutis (2010), the relationship between consumer ethnocentrism and animosity remains yet unclear and deserves to be further studied.

The impact of ethnocentrism, consumer animosity and the existence of a domestic country bias on product preferences are not consensual. For example, De Nisco, Mainolfi, Marino and Napolitano (2015) suggest that economic animosity effects product receptivity, thus product preference. Fernandez-Ferrín et.al (2016) refer that consumer ethnocentrism has a bigger influence on product judgment than consumer animosity. For Morey (2016) and Siamagka and Balabanis (2015), ethnocentric consumers will always prefer domestic products, even if the quality is lower and the price is higher.

METHODOLOGY

This study compares an ethnocentric country, Austria, with another low scoring country in ethnocentrism, Portugal. The ethnocentrism of Austria can be seen in the supermarkets, for example, where the grocery receipts of the supermarket chain MPREIS offer information on the amount of money spent on regional products. Moreover, in the 2016 Austrian Parliamentary elections, the right wing party FPÖ obtained 35 percent of the votes (Aisch and Rousseau, 2016). This contrasts with 0.5 percent of the votes in 2015 obtained by the Portuguese right wing party, PNR (RTP Notícias, 2015), indicating a lower level of ethnocentrism.

This paper not only studied the relationships between these two countries, but also the relationship between each one and their main economic partner. Spain is the main partner of Portugal, contributing with about 32.9% of the total Portuguese imports in 2015 (CIA, 2016). In the case of Austria, 41,5% of the imports in 2015 came from Germany (CIA, 2016). However, animosity can also exist between these partner countries. Portugal and Spain, for instance, share a “sibling rivalry” from the time of the Discoveries, during which these two countries fought to forge their empire (Berdichevsky, 2012). Austria and Germany also have differences, mostly mentality and culture-related, such as the Austrians’ perception of Germans’ rigidity and lack of humour and the differences between the German spoken in Austria and the official version of the language. Historically, the defeat of Nazi Germany during World War II and the discovery of the German atrocities were a breaking point in the relationship between these two countries (The Local, 2014).

Research design and data collection

An experiment was performed in Austria and Portugal. Consumers over 18 years of age were randomly selected to participate in the study, in events in these two countries. The experience consisted of the tasting of a product with a domestic label and the same product with a foreign label from a country with a low level of animosity versus a country with a high level of animosity, followed by the completion of a questionnaire. The different questionnaires tested the relations between: Austria-Portugal and Portugal-Austria; Austria-Germany and Portugal-Spain. The control group for Portugal and Austria tested a non-specified country A against a non-specified country B. This was performed to verify if, by not specifying the countries of origin of two products, consumers would still perceive any differences.

Consumers were asked to taste two different jams and two different waters and to rate them in terms of quality. Although products were similar (from the same brand and from the same country), they were offered in similar recipients and marked differently as “domestic” and “foreign”.

Water was selected because it is a product consumed by everyone, which presents differences across countries: for example, if it is water from a river or from the mountains. The choice of jam is related with the fact that it is a product that is consumed at breakfast in both Austria and Portugal, and so most of the consumers are familiar with it. According to Marchi, Martinelli and Balboni (2014), the study of consumer ethnocentrism should always focus on products that have an available domestic alternative.

The objective of the questionnaire was to measure the impact of ethnocentrism, animosity and the domestic country bias in product preferences and choices.

The quality of the products tasted was evaluated through a Likert-Type scale of seven points. The quality of the water was evaluated based on the flavour, smell and transparency. The characteristics of

the jam appealed to consumer's senses, with questions related to the flavour, the colour, the texture, the sourness and the sweetness.

The last part of the questionnaire consisted of a Consumer Ethnocentric Tendencies Scale, or CETSCALE, from Shimp and Sharma (1987), of 12 elements, adapted to fit the purposes of the study. This scale is the one normally accepted to measure consumer ethnocentrism across different countries (Zeugner-Roth, Diamantopoulos and Montesinos, 2008).

Sample and Reliability Tests

The sample was heterogeneous in terms of ages and gender. The sample of Austria consisted of 138 observations and the Portuguese sample of 145 observations. To ensure the fit of every item and the reliability of the model as a whole, an Average Variance Extracted (AVE) analysis was performed and Composite Reliability (CR) was also measured using the software SMART PLS for a Confirmatory Factor Analysis. The results then ensured the fit of the scales used and it was possible to remove the elements with outer loadings above the recommended minimum value of 0.5.

RESULTS

The first analysis consisted in comparing the means of consumer evaluations of domestic versus foreign products to check for inconsistencies, since recipients with the labels of domestic and foreign contained exactly the same product (water/jam). The hypothesis tested was:

H1: The means of the evaluations of domestic and foreign products are different.

The differences in product judgment were analysed in pairs, using boxplot graphs. The results of the different characteristics of the products of a home country were analysed in comparison with those of the foreign country. The analysis was further complemented with a T-Student hypothesis test, since the samples presented a normal distribution and they were paired. The result of the T-test was significant, confirming H1. Hence, a country of origin effect exists for both countries.

In order to ascertain the influence of ethnocentrism in product preferences when comparing domestic and foreign products, two extra SMART PLS analyses were performed. These analyses allowed to test the following hypothesis:

H2: Ethnocentrism influences positively the overall quality perceptions of domestic products (water/jam).

The results indicate strong evidence for the confirmation of H2 in the case of water, at a p-value of .025. Loureiro and Kaufman (2017) also offer evidence that, for some product categories, the country

of origin influences perceived quality and, therefore, a bias is introduced in preferences towards domestic products. This study extends the findings of Loureiro and Kaufman (2017) by, simultaneously, applying the research to two different countries and accessing animosity contexts.

Since the test was performed in different countries, there is interest in knowing if consumer ethnocentrism will vary among countries. Therefore, a third hypothesis was formulated:

H3: Nationality (Portuguese or Austrian) impacts ethnocentrism.

A significant difference was found for Austrian and Portuguese people regarding the relationship between nationality and ethnocentrism, providing evidence for the rejection of H0. This extends the findings of Balabanis and Diamantopoulos (2004) that indicate that ethnocentrism studies needed to be replicated in different countries. Results show that Austrian consumers, whose country context is more favourable to the preference for domestic products, are more ethnocentric than Portuguese consumers.

Assuming animosity as the factor (independent variable), two types of trade contexts were built involving four pairs of countries. Animosity-free contexts (i.e. Portugal-Austria and Austria-Portugal) were compared with contexts with the presence of animosity (i.e. Austria-Germany and Portugal-Spain). Results indicated that ethnocentrism impacts product judgments for both animosity (Portugal – Spain and Austria-Germany) and animosity-free contexts (Austria-Portugal and vice-versa), in the case of the quality of the water. To check if the effects of these relationships were different between different country groups, that is animosity and animosity-free contexts, a two-sample z-test was run, in a sample of 89 questionnaires for Austrians and 99 for Portuguese people. Two distinct analyses were performed to understand the causes of differences in product perceptions and if these differences were related to consumer animosity. The z-value was .000140098, indicating that animosity did not show a significant influence over the impact of ethnocentrism on the general perceived quality of water. This means, in other words, that animosity does not seem to influence ethnocentrism.

More research is needed to better clarify the relationship between consumer animosity and consumer ethnocentrism. Since animosity is a phenomenon that occurs in different ways for different contexts (Urbonavicius et al., 2010), it is difficult to find a pattern to analyse its antecedents and establish a connection with particular cases.

CONCLUSIONS

This paper aims to test for the effects of consumer animosity, consumer ethnocentrism and domestic country bias in product preferences in two different country contexts. Several tests of hypotheses were performed to check the significance of relationships between variables. Results indicate major

differences in product evaluations between countries, suggesting the existence of country of origin effect. The role of consumer ethnocentrism on general quality perceptions was also confirmed in the case of water, revealing differences in product categories. The differences on this impact generated by consumer animosity were not significant, meaning that the impact of an animosity context on product preferences needs to be further studied.

One of the main limitations of this work was precisely the lack of a consistent scale to evaluate animosity. Animosity varies among different countries, unlike what happens with the CETSCALE that can be applied to many different countries (Urbonavicius et al., 2010).

The main conclusion of the study is that ethnocentrism seems to vary across countries. This result extends the findings of Balabanis and Diamantopoulos (2004) by testing ethnocentrism in two different countries.

This paper brings some contributions to the research in product perception bias and preference. It first provides an insight on the effects of the “country” label in consumers’ senses and preferences. The impact of domestic country bias and consumer ethnocentrism appears to vary across countries and product categories. Managers should measure the degree of consumer ethnocentrism when introducing their products in a new market. By evaluating the impacts of the constructs of animosity, consumer ethnocentrism and domestic country bias in product preferences, this paper offers important contributions for the field.

PAIN MANAGEMENT TO IMPROVE THE PATIENTS' PERCEIVED QUALITY OF HEALTH CARE SERVICES: A THEORETICAL FRAMEWORK

Iaffaldano, Nicolaia

Ionic Department in Legal and Economic System of Mediterranean: Society, Environment, Culture
University of Bari Aldo Moro, Taranto, Italy

ABSTRACT

In Italy the pain management culture is not widely spread. In order to promote a significant socio-cultural shift, in 2010 a palliative care and pain therapy law was passed. It requires a compulsory registration of the pain and treatment relief in medical records.

The research objective is to monitor the quality of services, as perceived by patients, provided by the Pain Management structures at the University Hospital "Ospedali Riuniti" and at the A.S.L. Hospital in Foggia.

The questionnaire developed considers aspects of pain therapy service related to the booking service, waiting time and medical examination, kindness and openness to communication of staff, respect for privacy, relief from pain.

The methodology develops through several phases: definition of the investigation field, design of tools, method of administration, data processing, presentation of results, improvements on hospital performances.

The research has developed a theoretical framework as the empirical survey is underway. It will show a certain level of perceived satisfaction of the services by the users. Overall, the use of *customer satisfaction* tools in healthcare informs the supply and planning of services in relevant organizations. They have important managerial implications to improve health care performance.

Keywords: pain therapy, service management, questionnaire, customer satisfaction, network, hospital structures, outpatient structures, "pain free hospital-territory", SERQUAL model, law 38/2010

INTRODUCTION

The quality that a patient perceives and searches for within a Health Care Institute is the key element which determines the patients' level of satisfaction. An aspect which Health Care workers have recently drawn their attention to (Bowers et al., 1994, pp. 49-55; Bowers and Kiefe, 2002; Yasin et al., 2011; D'Souza and Sequeira, 2012; Kaldenberg and Becker, 2001; Mallarini, 2003; Dagger et al., 2007).

Patients are generally unable to judge the quality of the therapy and the medical treatment received from a strictly technical and professional point of view; but they are extremely able to evaluate the quality of interpersonal interaction experienced with the medical and paramedical staff (Mohammed et al., 2016, pp. 12-21; Yavas et al., 2016, pp. 49-69; Westbrook et al., 2014; Sofaer and Firminger, 2005; Saviano, 2012, pp. 78-101; Nigro et al., 2007, pp. 182-210; Ugolini, 2004).

Undoubtedly a correlation exists between the level of perceived quality and the final outcome of the service offered, or rather how the patients satisfaction can enhance the co-operation which in turn increases the probability of therapeutic success.

For a Health Care structure, the quality of service can be evaluated by the patient using his/her level of satisfaction as an indicator of the quality of service provided by the Health Care structure. In the course of the research that we will carried out, the above statement will show how an appropriate management of the patients' pain, can considerably improve the therapeutic outcome together with the co-operation and satisfaction of the patient.

The World Health Organization (WHO) considers pain treatment, in particular within hospitals as an indicator of the quality of the Health Care services provided. However, in a large number of cases the pain treatment of hospitalized patients is unsatisfactory in Italy (Costantini, 2011, pp. 6-9; Mediati, 2011, pp. 30-35). The reasons why pain and suffering in general are no longer openly treated can be due to the general opinion that pain is a component of the illness that has to carry out its natural course, to the fact that the attention on such subjective and personal symptoms centralize the patient attention rather than the doctor in the traditional doctor-patient relationship, to the many doctors' unbelief on creating a new equilibrium which allows the patients' experience of pain relief to play a vital role when providing Health Care assistance.

The "Towards a Pain Free Hospital" Project was introduced in 1992 in Canada. Other Pain Free Hospital Initiatives followed and were adopted in France, Switzerland, Belgium, Spain and in the United States of America (Ferrari S. et al., 2005, p.193).

In Italy, a document with guidelines related to the "Pain Free Hospital" Project was approved by the State - Regions Conference in 2001, which encouraged this culture combined with starting up the "Pain Free Hospital" Project throughout the National territory (www.salute.gov.it).

One of the salient points of the document was the establishment of appropriate "Hospital Surveillance Committees" and the introduction of Descriptor Scales to measure the intensity of pain. Apart from isolated cases, the document remained unapplied, despite the fact that pain is recognised as a symptom that is more likely to threaten the psychophysical equilibrium and the patient's quality of life.

In Italy there still is not an adequate diffusion of pain culture, so much that the opinion that pain is in

some way a fellow companion to the illness prevails. Pain Therapy, however has yet to become a common patrimony for the medical and paramedical class (Costantini, 2011, pp. 6-9).

On the 15th of March 2010, the Italian Parliament passed the following law N.38: "Dispositions to guarantee access to Palliative Care and Pain Therapy" as a way to encourage a substantial social-cultural change. This law is highly innovative because for the first time it protects and guarantees, as part of the essential levels of assistance, the access to palliative care and to pain therapy on behalf of the patient regardless of the type of illness or age he/she may have.

From the "Pain Free Hospital" Project to "Pain Free Hospital-Territory" Project, as indicated in the article 6 of Law 38/2010, the focus of pain care on the territory is shifted, leaving the pain management of complex cases to the Hospital and involving the figure of the general practitioner in the care process, and also introduces the concept of pain care network extended over a wide territory (www.salute.gov.it).

The law interests a much large number of patients affected by chronic pain (not by cancer), who are about 25-30% of the population (Ministero della Salute, 2010, p. XI).

Furthermore, the law concerns about 265,000 adults (140,000 males and 125,000 females) affected each year by cancer diseases. The incidence of tumors in the Italian population is increasing, for a real increase in some types of tumors, for the most accurate diagnosis, due to the increasing aging of the population. According to some estimates, the over 65s in Europe were 87 million in 2010 and will be 148 million in 2060 (Ministero della Salute, 2010, p. 60 e ss.).

This Law 38/2010 imposes on medical staff the compulsoriness to record on the patients' medical chart the intensity of pain, the analgesics administered, the degree of relief and the simplification of prescribing analgesics and in particular prescription of opiates. Therefore, the most innovative aspect of this law is introducing the obligation on doctors to monitor their patients pain levels on the patients' medical chart. An obligation that needs to be applied to all patients, regardless of their pathology and should be carried out taking note of personal observations, method of care provided and outcome of treatment.

Seven years after the entry into force of the law, however, almost 65% of patients do not know that there is a law that guarantees access to therapy to alleviate suffering and that hospitals are obliged to measure the level and write down everything on the patient's medical chart. Almost one in two Italians does not know the pain medicines. Two out of three general practitioners have not prescribed a visit to a specialist pain center (Fondazione Gigi Ghirotti, 2017).

Therefore, the paper aims to monitor the quality of the services provided as perceived by patients, exactly provided by the A.O. University Hospital "Ospedali Riuniti" in Foggia, that provides more specialized services of pain medicine, and provided by the A.S.L Hospital in the same Foggia

province, that provides services that interpret the needs of the inhabitants of the territory, both to monitor the quality and the appropriateness of the services provided according to the needs of the patient by comparing the different structures (A.O. and A.S.L. Hospitals) of pain management in a network and collaboration logic as required by law.

OBJECTIVES

The research intends to support the transfer of the managerial culture within the Health Care ambit in order to build a bridge between two worlds which are too often in conflict; that is between the clinical and managerial world.

The person in charge of managing hospital and outpatient structures of pain medicine at the A.O. Hospital and A.S.L. Hospital of Foggia has an extremely challenging role which is that of creating appropriate organizational conditions so that the hospital and outpatient structures are organised in a way which focuses entirely on the patient, and at the same time creates a positive environment where the entire personnel is motivated and willing to co-operate. For this role, the managerial responsibility can only be entrusted to a doctor; a person that can maintain a clinical contact with his/her patients and at the same time obtain a technical *leadership* acknowledgement from his/her colleagues, which derives from ability and practical experience (Bowers and Kiefe, 2002; Weiner et al., 1997; Adinolfi and Borgonovi, 2018).

Therefore, the research has the objective to monitor the quality of services provided by the hospital and outpatient structures at the A.O. and A.S.L. of Foggia as perceived by the patients. It's a survey extended to the province of Foggia as it will result from the sample of patients that will be interviewed.

The *customer satisfaction* surveys can represent the starting point to a broader approach to *Service Management* within the Health Care ambit. This research aims firstly to work out the notion that "one must put him/herself in the patient's shoes". Therefore, it seemed useful and appropriate, without claiming to be exhaustive or complete, to come to define the features of a managerial model for hospital and outpatient structures that helps to implement the quality of service, starting from the patient and his/her point of view.

One needs therefore to listen to what the patient has to say in a systematic way (Ugolini, 2004), placing the patient within a model that looks specifically at the quality of the Health Care services, which considers the peculiarity of the productive processes, the active role of the patient, the co-operation between the people that work within the organization. All this with the belief that the patient can be capable of generating an innovative Health Care service, on the same level as technology and clinical practice.

This way, one can be successful, by referring to consolidated models that focus on the quality of service, and that is of the *confirmation/disconfirmation* of the expectations (Parasuraman et al., 1988), breaking away from the typical self-referential logic of the Health Care professions. Parasuraman et al.'s (1988) SERVQUAL model and its improved version are still widely used all over the world for measuring service quality in various sectors including health care (Shemwell et al., 1998; Choi et al., 2005; D'Souza and Sequeira, 2012; Padma et al., 2009; Taner and Antony, 2006; Mostafa, 2005; Al-Borie and Damanhour, 2013).

The *customer satisfaction* surveys should help the doctor-manager, responsible for pain management structure, to assimilate the patient's standpoint, to implement the correct measures of service and to ensure that the areas of excellent service are more fully appreciated. Finally, the doctor-manager will be able to explain the reasons for an unsatisfactory service.

According to the new regulation, the law 38/2010, which focuses on the "quality" of pain therapy service, has become all of a sudden a point of institutional reference which must be followed in clinical practice; and a survey on *customer satisfaction* can contribute and enhance the importance of this law. A *customer satisfaction* survey focuses on understanding the degree of patient satisfaction related to the Health Care service provided. These measures are finalised to keep on improving the service offered (D'Souza and Sequeira, 2012; Otani et al., 2010).

Such surveys allow the assessment of the users' perception, which should exceed or at least equal expectations, as regards relational aspects (health care workers' kindness, attention, availability to communicate), humanization aspects (respect for privacy and visiting hours), aspects of physical accessibility (booking procedures, methods of access), aspects of time-related accessibility (waiting time when making a booking for a medical appointment and when the medical appointment actually takes place), comfort aspects (suitability and cleanliness of the Health Care environment) and pain relief (Sofaer and Firminger, 2005, pp. 513-559; Saviano, 2012, pp. 78-101; Yavas et al., 2016, pp. 49-69; Westbrook et al., 2014; Rothman et al., 2008; Mohammed et al., 2016, pp. 12-21; Studnek et al., 2013).

A questionnaire was created to carry out the *customer satisfaction* survey. The questionnaire varied from questions of a general nature to more specific and detailed questions, but in any case, all aspects need to return to the patients' logic and point of view. However, in order to measure *customer satisfaction*, one needs to use a questionnaire that includes all those aspects falling within the patient's criteria of evaluation and choice.

From a managerial perspective, it is important to listen, or better still to question the patient in order to know the variables he/she considers a priority. By doing so, service expectations can be outlined in function to the different variables which are considered to be a priority: not all the variables will have the same importance in determining the overall opinion of a patient's satisfaction. The knowledge of

such variables will allow to improve Health Care performance. It allows to intervene on those aspects of service which the patient believes to be a priority, and at the same time spreading amongst the hospital personnel the knowledge of these variables which the patient considers to be important. All this corresponds to a belief that what the “customer” wants must be known.

METHODOLOGY

For the *on desk* analysis, the research of theoretical models and managerial tools useful to the Heads of the Hospital and Outpatient Units will be carried out within the theoretical framework represented by *service management* studies.

Service Management is a rather new area of business disciplines, that however represents a series of concepts and “tools of the trade” of which Health Care literature has experimented its applicability. The tools on the whole are linked to a consolidated model on the quality of service, that is of the *confirmation/disconfirmation* of the expectations, according to which the consumer perceives an adequate level of service; at least adequate compared to his/her expectations (Parasuraman et al., 1988).

The *on field* analysis however will be carried out using a questionnaire which will be allowed to carry out the *customer satisfaction* survey. In particular, the survey methodology was divided into several phases: definition of the survey area; selection and design of tools (questionnaire); method of administration; data processing; presentation of results; actions on business processes.

When defining the survey area, some patients will be questioned at random (a sample statistically representative of the entire number of patients within the pain care unit per year) who are turned to the pain care units of the A.O. Hospital and A.S.L. Hospital in Foggia. Patients on their first visit with therapy treatment yet to be imposed will be excluded.

The method of administering and gathering data will take place by conducting a face to face interview. The data will be collected directly by the interviewer. Face to face interviews are often used because they are considered as the most effective and reliable method where the identity of the interviewee is known and at the same time you have a low percentage of refusals although many other methods are preferred in healthcare (Delvecchio, 2002, pp. 30-31).

In the next months, the patients will be given in an anonymous way, a questionnaire in a multiple choice format relating to the various aspects of the pain therapy service. The questionnaire gathers the socio-demographic characteristics of the patient; the booking procedures and accessibility to the Pain Care Structure; the type of pain presented at the time of entering the structure and the previous method of treatment; the type of service provided by the Structure; the overall level of the patients' satisfaction of the pain therapy service; the specific satisfaction felt for each aspect of the service

provided; possible patient criticisms and suggestions on how to improve the service.

More specifically, the questions within the questionnaire consider the aspects of the pain therapy service related to the booking procedure; waiting time when making a booking for a medical appointment and when the medical appointment actually takes place; kindness, attention, availability to communicate with the health care workers, respect for privacy; and pain relief (Saviano, 2012, pp. 78-101; Yavas et al., 2016, pp. 49-69; Westbrook et al., 2014, pp. 97-114; Mohammed et al., 2016, pp. 12-21; Studnek et al., 2013; Sofaer and Firminger, 2005).

In order to interpret the data related to the satisfaction perceived, not having been asked the question on how much each aspect of the service is considered important (or the expectation questions about each aspect) within the global service, this was done to facilitate the administration of the questionnaire, we will proceed the search by looking at the existence of a correlation between the results gathered in the general question on satisfaction "Overall how much do you consider yourself satisfied with the pain service?" and the single results of the other questions on satisfaction, in particular, on every aspect of the service provided. This means to ask oneself how much the satisfaction of every aspect of the service can be important and have repercussions on the satisfaction of the service as a whole.

This analysis is finalized to look into the intensity of the existing connection between two quantitative phenomena. The linear correlation coefficient takes on values that are always included in the interval between -1 and +1. If the value of the correlation coefficient tends get closer to a zero, the connection between the two phenomena is quite weak and if this equals zero the connection between the two phenomena is non-existent. If the value of the correlation coefficient tends to move towards a +1, this means that a positive correlation exists. That is, as the satisfaction increases for each single item; so does the opinion on the overall satisfaction of the service. This means that this item is not only considered positively but it is also important when analysing the overall opinion of the service in terms of satisfaction. However, if the value of the correlation coefficient tends to move towards a -1, this means that a negative correlation exists. That is, as the satisfaction for each single item increases, the opinion on the overall satisfaction of the service received decreases (Delvecchio, 2015, p. 343 e ss.). By using the values of the correlation coefficient it will be possible to draw up a map of positioning (Figure No.1), where the various aspects that constitute the service will place themselves in specific strategic areas functioning with the qualitative component that these aspects are capable of bringing.

Figure 1. Positioning Map

In the graph the horizontal axis represents the level of importance attributed to the different aspects of the service, while the vertical axis represents the level of satisfaction declared by the interviewees for the same aspects. In this way, the map is divided into four quadrants that define the strategic areas of intervention, as described below.

A – Strengths: in this quadrant you will find the aspects of the service in which a high standard in terms of requisites considered to be of the utmost importance by the patient (value of the correlation coefficient +1); here you will find the aspects of the service that have a high level of importance and a high level of satisfaction.

B – Maintenance: this quadrant expresses the level of satisfaction which is already quite high, where possible improvements would not have significant repercussions on the overall opinion concerning service satisfaction (value of the correlation coefficient -1); here you will find the aspects of the service that have a low level of importance but a high level of satisfaction.

C – Indifference: in this quadrant you will find all the aspects of the service that do not have significant importance when looking at service satisfaction on the whole (value of the correlation coefficient -1); here you will find the aspects of the service that have a low level of importance and a low level of satisfaction.

D – Improvement: in this quadrant aspects of the service that need improvement are represented because these aspects have been considered unsatisfactory and considered determining to the overall opinion on the satisfaction of the service offered to the patient (value of the correlation coefficient +1); here you will find the aspects of the service that have a high level of importance but a low level of satisfaction.

Every item surveyed on will find its position in one of the four quadrants in the map and providing information on the perceived quality of the specific aspect of service provided. Therefore, in order to highlight the strengths and weaknesses of the service provided, a map of positioning will be created and elaborated on, where the various aspects that make up a service will fall into specific strategic areas on the basis of the qualitative component that these aspects are able to bring.

As one can see from the map (Figure No.1), the users judgments of both satisfaction and importance are very high regarding all the aspects of the pain therapy treatment received with a typical distribution “cloud” of a positive correlation, obviously this happens in the excellence structures of pain therapy. The elaboration of the answers of the questionnaire will allow to place on the map the pain therapy services of the two hospitals, commenting on the positioning itself.

By placing the various items in each quadrant will allow an immediate analysis of the areas to keep, improve and develop on adopting a program in which the essential elements of service offered to a citizen can be improved on.

CONCLUSION

The *customer satisfaction* survey, which will be carried out, will demonstrate a certain level of patient satisfaction for the services provided by the Structures of Pain Medicine as experienced at the A.O. Hospital and A.S.L Hospital of Foggia and the survey itself will make comparisons between different hospital and outpatient structures in the same province, placing them in a network logic from the patient’s point of view.

The questionnaire used for our research will be easily administered and the analysis of the results, described graphically in the positioning map, will allow a simple and an immediate interpretation, providing useful information for the hospital administration’s strategic planning relating to the requisites that the Structures of Pain Therapy must have as observed individually than together to build a network. Thus, the managerial model for the hospital and outpatient structures which help to implement the quality of service starting from the patients’ point of view, not only measures the perceived quality of the treatment supplied but can also represent a suitable support in the definition of the requisites that these types of structures should possess, all matters that assist the hospital administrators.

In particular, we believe that the investigation of *customer satisfaction* in health care service will lead to a more incisive contribution on the part of patients who, when providing a qualitative assessment of health care services, will indicate what is “really” important and “really” satisfying. In so doing, patients give information which is essential when planning levels of treatments to be provided. Treatments which an organizational structure should be able to guarantee.

Furthermore, the results of the *patient satisfaction* survey have significant managerial implications for the management of the Pain Care Structures in Hospital as they can supply strategic guidelines for administrators in order to improve health care performance.

HOW ITALIAN AGRIFOOD PRODUCTS COMMUNICATE THEIR AUTHENTICITY? THE BRAND-LAND LINK INVESTIGATED ON THE WEB

Iaia, Lea¹; Fait, Monica²; Maizza, Amedeo²; Cavallo, Federica²; Scorrano, Paola²

¹Dept. of Business Administration at 'Gabriele d'Annunzio' University, Chieti-Pescara, Italy

²Department of Management, Economics, Mathematics and Statistics, University of Salento, Lecce, Italy

ABSTRACT

Company websites plays an important role in communicating information, but it is still unknown their potential for stirring emotions, i.e. creating involvement and, if possible, a stable relationship with the consumer.

This paper seeks to analyse the experiential dimension of websites that are exemplary of best practices in the Italian context and best represent the brand-land relationship of agrofood products with high-level of cognitive value, trying to understand as the success of certain regions in becoming famous "brands" thanks in part to the value of their products (e.g. Champagne, Gorgonzola, Montalcino, etc.)

The research was conducted by designing and testing an ad hoc model (called SOber) and by means of the focus group technique, which made it possible to identify and assess the essential variables for promoting and publicising the brand-land relationship via the Web.

Keywords: Web 2.0, agrifood products, brand-land relationship, company's website, experiential website, experiential evaluation model

1. PREMISE

Authentic agro-food products play an important role in food-and-wine heritage, particularly in Italy. Indeed, they have an *identity* – which in strategic terms can be called "unique" – arising from various factors, tangible and otherwise (Maizza & Iazzi, 2011; Scorrano *et al.*, 2013; Maizza *et al.*, 2013), such as traditions, habits, customs, history and culture, as well as climate, landscape and production methods that have become consolidated over time.

Although authentic agro-food products are enjoying consistent and growing sales, they still account for a only a small part of spending on food as a whole, which is why there may be interesting potential for growth that requires forms of promotion based on precise marketing measures. These measures must seek to enable authentic products to fulfil their potential, making them recognisable

and raising their profile, thereby creating value for the companies that make them and for their regions of origin (Ribeiro & Santos, 2008). Indeed, as Keller points out (1998, 1993; Keller *et al.*, 2005), the concepts of *brand recognition* and *brand recall* are at the heart of the broader concept of *brand image*.

The cognitive values possessed by *origin-based products* (otherwise known as *brand-land products*, whose characteristics will be explained in greater detail in paragraph 3.1) mean that they are “information intensive” (Watson *et al.*, 1999), and are thus likely to benefit from the implementation of so-called *experiential marketing* strategies (Schmitt, 1999; Pine & Gilmore, 1999).

For these products, the role of the experiential dimension appears to be particularly significant because it enables the consumer to remember the region, its history and its culture. The product thus becomes a cognitive element that can transfer experiences (actual or imagined) to different moments and places. Seen from this perspective, the Web (Cleff & Thomas, 2017) represents a particularly useful means of channelling the experiential value of the *brand-land* association. This can take place however only if the elements (texts, images, sounds, etc.) are properly harmonised and coordinated.

Aligned to the above-mentioned reasons, the scope of the paper is to improve the online communication of the agrofood products by means their link with the own region of origin in order to recall experiential aspects and emphasise the brand-land connection. In other words, assuming that the implementation of marketing communication strategies based on “experience-providing” websites (Ferraresi & Schmitt, 2006) can enable the *local dimension* to enter the *global context*, through the study of the experiential dimension (*Customer Experience Management*, Schmitt, 2003) of the websites of brand-land products and an adequate focus on those perceived as more specific/authentic (Pine & Gilmore, 2009) by the consumer, the research tries to define the *drivers of online experiential communication* for the authentic agrofood products. This could enable for these products also, to create a virtuous circle between virtual and real worlds in which brand notoriety is consolidated and becomes self-sustaining, enabling the region itself (the *land*) to become a *brand*.

2. THE THEORETICAL FRAMEWORK

The geographical, cultural, historic and social components of authentic products mean that they are categorised as “hedonistic” (Holbrook, 1980; Hirschman & Holbrook, 1982; Chaudhuri & Holbrook, 2001). Indeed, they tend to occupy – in the dynamics of consumption – a space that is not definable as the mere satisfaction of a need. They are also – and above all – characterised by the full involvement of the consumer, which transcends the product and has complementary effects, linked to the sensations and emotions targeted by experiential marketing. The customers thus become the protagonists of their own experience of consumption, expressed in a curiosity to learn about and visit the places of production, to participate in “memorable” events and to enjoy unique and unrepeatable experiences

(Pencarelli & Forlani, 2006; Pine & Gilmore, 1999; Schmitt, 1999).

For this to happen, consumers must fully perceive the value of such products: in addition to the concept of *authenticity* there must also be that of *brand fame/notoriety* which, as we know, requires a suitable process of communication. The latter can be achieved by means of interactive and experiential approaches, both online (e.g. the so-called Web 2.0 formula) and offline, in accordance with the *integrated marketing communication* approach (Schultz *et al.*, 1993; Kitchen *et al.*, 2004; Duncan & Mulhern, 2004).

In Italy, an example of the safeguard and promotion of authentic products, as well as of their deep connection to their places of origin, is the producers' associations (Consorti di Tutela). In the best cases, they have shown that organised cooperation can transform the traditional activities of a region into an *identity*, which it can then raise into a fully-fledged *brand*.

The formulation of the theoretical hypotheses was based on two theoretical macro-areas in marketing studies (summarised in the following paragraphs), which appear to be closely linked, especially in reference to the products we are dealing with here. As we have said, these products are strongly rooted in their context of origin and possess a combination of values and emotions that can be usefully employed in experiential marketing strategies.

2.1 The Brand-Land concept

Authentic products, in French known as *produits du terroir* (Arfini *et al.*, 2010), are products characterised by a close and indissoluble link with a specific *terroir*, i.e. with the geographical and human identity of their region of origin. The meaning of the word *terroir* developed in the mid 19th century in France, although it should be regarded as a concept in continuous evolution (Vaudour, 2005; Barham, 2003; Dedeire, 1995; Dubois, 1994).

A more extensive analysis of the aspects of authentic agro-food products leads to the identification of four dimensions: *geographical*, regarding the pedoclimatic conditions that affect the product, making it unique (from the raw materials to the production process); *historical*, understood as the sum of the knowledge and know-how accumulating over time within the place of reference, i.e. the human factor; *cultural*, resulting from the values, beliefs, knowledge and traditions that are consolidated in the region and determine the principles that guide the inhabitants' way of life and thought; *social*, as an effect of the relational and behavioural rules that characterise given contexts.

On all of this depends the deep-seated link (here called the *brand-land* relationship) that such products have with their respective place of production in the wider sense, since the features that make them authentic are not replicable or "exportable" beyond that specific context (Mastroberardino, 2004; Maizza *et al.*, 2003). The identity of a region (the so-called *place-identity*; see Siano, 2001 and Siano *et al.*, 2008), from which the specific character of the products arises, is the direct consequence of its

traditional economic activities (the so-called *place-personality*), which determine the *place-image* (Peterson & Jolibert, 1995; Roth & Romeo, 1992; Usunier & Cestre, 2007; Maizza & Iazzi, 2011).

When the land (region, *terroir*), the “primary economic resource” in which “the experience of production” takes shape (Rullani, 2000) and guarantor of the product’s *authenticity* (Gilmore & Pine, 2009), becomes widely known, it becomes synonymous with these features. From this perspective, the brand-land combination is linked to the concept of the common good, i.e. an intangible asset that encapsulates the values and behavioural models of a socio-geographical area in which the cultural traditions expressed by the products discussed here are consolidated. This asset generates and transfers value (including economic value) to a plurality of subjects, who, in order to preserve it and increase it, must respect its underlying essential conditions and behavioural rules. In Italy, as we have said, these criteria appear to be met particularly well by the producers’ associations of the authentic products, which, in the best cases (such as those analysed here), have managed to safeguard and promote a combination of elements and traditions, even in the global context. In this way *land* is *brand* and thus, via consumer loyalty it is able to create *equity* for a plurality of subjects.

3.2 The experiential content of authentic products

The considerations set out above resonate with the principles of *experiential marketing* (Pine and Gilmore, 1999; Schmitt, 1999), since they enable a change of perspective: it is no longer a question of promoting just the company product / service, but the experience that can enhance its value, which then becomes “unique and unrepeatable” for the consumer (Pine & Gilmore, 1999; Schmitt, 1999). This approach is the fruit of two main trends (Codeluppi, 2001; Knutson *et al.*, 2006; Schmitt 1999; Pine & Gilmore, 1999): the behaviour of the modern (or post-modern) consumer, who, thanks to today’s technology, has become more informed and interactive (as much with other consumers as with companies), and therefore more demanding and anxious to assert his/her personality via “emotive” purchasing choices. The increasingly companies’ marketing strategies that are based not on the use value of their products/services, but on the company’s values, in which the brand itself becomes an archetype of an experience, i.e. a dynamo of many experiences, via atmospheres that arouse emotions, sensations and the holistic involvement of the consumer.

By adopting this approach, which falls within the scope of so-called *Customer Experience Management* (Ferraresi & Schmitt, 2006), companies therefore create and implement a strategy for managing the consumer’s experience with the product, in which contexts of use and consumption are analysed, designed and proposed.

Even when it is transmitted via advertising – the experiential dimension enables: a) the consumer to perceive the product (and the region of origin) differently, attributing a higher value to it on the basis

of his/her personal experience, making it thus not comparable with other brands; b) the company to apply a premium price by virtue of its differentiated competitive positioning.

Starting from these assumptions, and consistent with the experiential grid proposed by Schmitt (1999; Ferraresi & Schmitt, 2006)¹, it was considered useful to focus the analysis on so-called *Experience Providers (ExPro)*² – in this specific case, *company websites* – and on the types of experience to be enjoyed by the consumer, the so-called *Strategic Experiential Modules (SEM)*. In order to observe the value attributed to brand-land products by web users, the SEMs were arranged as follows (Table 1).

Table 1. The Strategic Experiential Modules (SEM) for the brand-land products

Sense	Referring to the sensory dimension, the minimum level for creating involvement via the five senses. <i>Brand-Land perspective: The sensory dimension (sight, hearing, touch, taste and smell), through which the perception of the product is stimulated, recalling its region of origin in particular.</i>
Feel	Pertaining to the consumer's affective involvement with the brand, in the phases of both purchase and consumption, with the aim of establishing a relationship with the consumer and increasing his/her loyalty. <i>Brand-Land perspective: The affective dimension, i.e. sentiments, which arouses positive emotions towards the brand, for example suggesting occasions for use of the products.</i>
Think	Regarding the cognitive/creative and problem-solving dimensions that prompt the individual to engage in a rational activity. <i>Brand-Land perspective: The cognitive/creative and problem-solving dimensions, by which companies seek to draw the consumers' attention via initiatives that involve the sphere of intellectual activities linked to the product and/or region of origin, as well as the connection through them.</i>
Act	Offering the consumer physical experiences, as well as new ways of acting and interacting with other consumers in a framework of change. <i>Brand-Land perspective: The dimension of acting (and interacting), in which the company promotes initiatives (which also involve the region of origin) with the aim of inducing consumers to modify their lifestyles, involving them in "physical" experiences that cause them to reflect.</i>
Relate	It aims to involve the consumer in initiatives that enable him/her to meet others who are enthusiastic about the company brand (birth of a <i>brand community</i>). <i>Brand-Land perspective: The dimension of personal and inter-personal relations, based on the creation of experiences that enable consumers to get in touch with their ideal selves or with a group of people that share the same interest in the product in question and its region of origin.</i>

3. RESEARCH HYPOTHESIS AND METHODOLOGY

This paper is based on the following logical construct: *in order to become well-known, authentic agro-food products must express their link with their region of origin by means of forms of online communication that recall experiential aspects and emphasise the brand-land connection.*

This study therefore aims to analyse the experiential dimension (*Customer Experience Management*, Schmitt, 2003) of the websites of brand-land products, to see how they can be perceived as specific/authentic (Pine & Gilmore, 2009) by the consumer. It is assumed that the implementation of

¹ The experiential grid proposed by Schmitt (Schmitt, 1999ab; Ferraresi & Schmitt, 2006) makes it possible to strategically plan the experience to be enjoyed by the consumer on the basis of two dimensions: i) *Strategic Experiential Modules (SEM)* which can be broken down into five different aspects (in which the degree of involvement grows sequentially from one module to the next; see Table 1); ii) the *Experience Providers (ExPro)*, which determine/provide/stimulate the various experiences; they activate the experiential modules (SEMs) and are associated with activities connected with the following elements.

² The *ExPros* are: *communication, visual/verbal identity, product presence, co-branding, Websites and media, people.*

marketing communication strategies based on “experience-providing” websites (Ferraresi & Schmitt, 2006) can enable the *local dimension* to enter the *global context*, making it possible to create a virtuous circle between virtual and real worlds in which brand notoriety is consolidated and becomes self-sustaining, enabling the region itself (the *land*) to become a *brand* (Iaia *et al.*, 2016, 2017).

The company website represents a means of communication between the consumer and the company, which must also be able to create consumer involvement (measurable by means of specific factors such as the duration of the visit, return visits, etc.). The recourse to an experiential logic in web communication can facilitate/emphasise the brand-land connection, increasing the brand notoriety (a pre-condition for competitive success) and the competitive capacity of authentic (brand-land) agro-food products. This logic also takes account of a) the factors that prompt the consumer to visit a website, b) the formation of their perceptions (Rodgers & Thorson, 2000; Rodgers *et al.*, 2007) and c) the potential significance of the *emotional dimension* for products *with a high cognitive content*.

In this perspective, an answer was sought to the following question:

What are the key elements for transmitting the experiential dimension and the brand-land connection of authentic agro-food products in online communication?

To answer this question, we analysed the communication strategies of certain brands considered to reflect best practices in advertising based on the link between the product and its region of origin. These cases of excellence were identified with reference to previous research that studied in detail the salient aspects of web communication. Specifically, this study looked at the Consorzi (producers' associations) responsible for (see also Maizza *et al.*, 2013, Scorrano, 2013; Fait *et al.*, 2013; Scorrano *et al.*, 2013, Fait & Trio, 2011a, 2011b):

- i. *wine sector*, Consorzio Vino Chianti Classico, Consorzio dell'Asti D.O.C.G., Consorzio del Vino Brunello di Montalcino (for further details see: www.chianticlassico.com, www.astidocg.it, www.consorziobrunellodimontalcino.it);
- ii. *cheese sector*, Consorzio per la Tutela del Formaggio Gorgonzola, Consorzio di Tutela del Formaggio Grana Padano, Consorzio del Formaggio Parmigiano Reggiano (for further details see: www.gorgonzola.com, www.granapadano.it, www.parmigianoreggiano.com);
- iii. *meat product sector*, Consorzio del Prosciutto di San Daniele, Consorzio del Prosciutto di Parma (for further details see: www.prosciuttosandaniele.it, www.prosciuttodiparma.com).

The model used to assess the experiential content (i.e. the overall importance of the experiential aspects) of the websites exemplifying the above-mentioned best practices is founded on *strategic experiential modules* (SEMs – *sense, feel, think, act and relate*) (Schmitt, 1999; Ferraresi & Schmitt, 2006), which were contextualised and categorised as elements for assessing the websites.

For this to succeed, a suitable method (dubbed *SOber*) was conceived and tested for determining and assessing a website's experiential dimension, applying it to the sector in consideration. The method is divided into the following steps:

- (1) Identification and selection of the key elements with which to assess a website's experiential dimension (*Selection*), on the basis of each *strategic experiential module* with reference to the organisation of the information (textual and visual content). To this end, recourse was made to n. 3 focus group of the "inspection" type (Mich, 2007), one for each sector, composed usually of 9-10 experts in communication and marketing in the sectors, as: n. 3 sommeliers; n. 3 oil tasters; n. 3 sociologists; n. 5 communication managers; n. 3 copywriters; n. 4 marketing researchers; n. 2 CEO; n. 4 business communication experts. Discussions were conducted in July 2015 at University of Salento, by a moderator and his assistant (who played a key role in data analysis) and generally lasted ninety minutes.
- (2) Observation of the behaviour of consumers, web marketing experts and people with knowledge of the agro-food sector (*Observation*), via n. 3 *user-based focus groups* (Mich, 2007), in order to analyse:
 - the use of content, via navigation in the website;
 - the perception of the experiential aspects, via comparative assessment of the key elements identified with the help of the experts cited in point 1;
 - the degree of involvement that follows from these elements.

This led to a final evaluation of the experiential dimension, which expressed the interviewees' summary verdict. The *user based focus groups*, conducted with the same modalities of the precedents, involved: n. 4 consumers, n. 4 web marketing experts, n. 3 food sector experts; n. 5 communication managers; n. 3 sommeliers; n. 2 oil tasters; n. 1 sociologist; n. 3 marketing researchers; n. 3 CEO. Each focus group was made by 9/10 people, lasted one hour and forty-five minutes circa, and they abled participants to fill an evaluation grid (*experiential degree*) in order to express their impressions and feelings about the examined website.

- (3) Processing of the opinions expressed by the interviewees (*Evaluation and Ranking*), useful for ranking the experiential content of the websites considered.

The *SOber* model, the fruit of detailed studies based on the theme of experiential marketing (Schmitt, 1999), highlighted the existence of certain more intensively perceived aspects, which were thus considered to be the *drivers of online experiential communication*.

This paper thus belongs to a field of enquiry that has yet to be extensively tackled in the marketing literature, despite universal recognition of the importance of the web in advertising and users' purchasing decisions. It makes particular reference to those types of product whose presence on the market is limited to a place-based niche.

4. WEB COMMUNICATION, EXPERIENTIAL CONTENTS AND THE BEST CASES OF THE BRAND-LAND COMBINATION: AN EMPIRICAL INVESTIGATION

RQ: What are the key elements for transmitting, in online communication, the experiential dimension and the brand-land connection of authentic agro-food products?

The following paragraph shows the main results of the investigation of the case studies considered here, conducted by means of the two kind of focus groups described above (inspection and user-based), for a total of six focus groups. So, the description below can be considered as a summary representation of the assessments, considerations and suggestions that emerged during the meetings. The interviewees' assessments on a five-point Likert scale (in which 1 is poor and 5 is excellent) will be discussed in the next paragraphs. This assessment is useful since it enables comparisons and thus comparative analysis of:

- (1) the various competitors;
- (2) the most strongly perceived SEMs;
- (3) the emotional communication expressed by the website and perceived by users (in this specific case, the space available in this paper did not allow for gap analysis).

4.1 The origin-based products: the "sense" SEM

The analysis conducted shows that *sense* is the "module" that is most intensely perceived by users – as argued by Pine & Gilmore (1999), "*the more sensory an experience, the more memorable it will be*". This is achieved above all by recourse to visual cues, but also to smells and flavours. Indeed, textual, visual and audio-visual content focusing on:

- the region of origin, the product and the link between the two are emphasised by means of the description and images of the *terroir* (*sight sense*), its history and its *comuni* (districts) of production (see *Chianti Classico*, *Brunello di Montalcino*: vines, hills, woods, fields in bloom, traditional rural buildings; cfr. Fig. 1); the structural and visual characteristics of the product and its production processes, highlighting its authenticity and uniqueness and educating consumers (*smell/taste senses*) as to how they can

- recognise it (see *Chianti Classico*, *Brunello di Montalcino*: vintage, bunch of grapes, colour of the product); explanatory images and captions that link the specifics of the product to the pedoclimatic and historical-cultural conditions of the product's places of origin (see *Prosciutto di Parma*: characteristics of the raw materials, climate and authentic techniques used in the region; colour and black-and-white images of the valleys of Parma through history showing the conservation of a natural and uncontaminated environment, in which traditions, innovated and modernised, are handed down from generation to generation);
- the sounds of the production process (*hearing sense*), especially regarding the transformation of the product therefore linked to both the region of origin (see *Chianti Classico*: sounds of nature, conversations of farmers busy harvesting the grapes) and the product (see *Chianti Classico*: bottle of wine being opened, serving the wine, clinking of bottles during the production process; images of the winery that evoke the silence and tranquillity of the locations; auditory analysis of the maturity of the cheeses of *Parmigiano Reggiano*); sounds of tradition (traditional feasts, special events, etc. – see *Chianti Classico*, *Parmigiano Reggiano*); sounds of tradition (traditional feasts, special events, etc. – see *Chianti Classico*, *Parmigiano Reggiano*); the silence of the places of production, with a strong appeal to the concept of time, the seasons, the naturalness of the product, i.e. *slow food* and a healthy and balanced lifestyle (see *Chianti Classico*, *Parmigiano Reggiano*, *Prosciutto di Parma*);
 - the main “tangible” components (*touch sense*) that distinguish the product and make it immediately recognisable are recalled for experts and ordinary consumers alike (see *Chianti Classico*, *Brunello di Montalcino*: consistency of the soil and bunches of grapes; *Prosciutto di Parma*: delicacy of the slice; *Parmigiano Reggiano*: master cheese-makers processing the raw material in order to transform it into the finished product in accordance with traditional rules);
 - the description of the product's aromas and fragrances (*smell/taste sense*), which are associated with the place of production understood in terms of its physical characteristics, i.e. the soil, climate, history and culture (see *Chianti Classico*: authenticity and uniqueness of the wine's bouquet – the floral fragrance of irises and violets, of spices and forest fruits; *Parmigiano Reggiano*, *Prosciutto di Parma*: processing and fire branding; olfactory analysis of the maturity of the product; appeal to the cool and natural state of the places where the product is matured). The sense of taste is invoked by reference to tasting alone or with other foods, often-available in the region (see *Chianti Classico*, *Brunello di Montalcino*, *Parmigiano Reggiano*, *Prosciutto di Parma*).

4.2 The origin-based products: the “feel” SEM

Although the smell and taste senses are hard to convey via the web they are communicated by videos which (for example) show the consumer the product's associations and the distinctive features of the region of origin in a wider sense, or teach the basic notions for correctly performing a sensory analysis of the product, both in an educational framework (SEM: *feel*).

In fact, the involvement of users is centred on:

- 1) suggestions as to when the product could be used, with reference to:
 - a) the food-and-wine heritage of regional cuisine (Tuscany for *Chianti Classico*, Emilia Romagna for *Parmigiano Reggiano* and *Prosciutto di Parma*, the North of Italy for *Grana Padano* and Friuli Venezia Giulia for *Prosciutto San Daniele*) and, more generally, Italian cuisine and the Mediterranean diet;
 - b) the Italian tradition of dining with the family (see *Parmigiano Reggiano*) or with friends (see *Chianti Classico*);
 - c) the product's versatility of use, depending on the consumer's needs, given its capacity to adapt to the tastes of all age groups and its nutritional properties (target clientele considered: children, women, the elderly and sports players; see *Parmigiano Reggiano*, *Grana Padano* and *Prosciutto di Parma*);
- 2) *online education* (textual and/or audio-visual), aimed at helping the public to learn the steps into which the sensory analysis of the product is divided, including the preparation of dishes that envisage the use of the products in question (see *Parmigiano Reggiano*, *Grana Padano*, *Prosciutto di Parma* and *Prosciutto San Daniele*);
- 3) cookery courses and tasting courses to be held at the *Academies* of the Consorzio (see *Parmigiano Reggiano* and *Chianti Classico*).

In this sense, all three case studies analysed effectively implement the above-mentioned stimuli, although the Chianti Classico website is held to be the most engaging (with a score of 4/5; Parmigiano Reggiano, 5/5; Prosciutto di Parma, 4/5).

4.3 The origin-based products: the “think and act” SEM

With reference to the last modules to be examined, i.e. *think* and *act* (which were considered together given the substantial similarity of the two modules in the present case), it is seen that thanks to the appeal to the product's health properties, naturalness and quality of the products and the Mediterranean diet, together with the promotion of a healthy lifestyle by means of events and the involvement of sports personalities, Parmigiano Reggiano again scores highly (5/5). In addition, the site provides the user with numerous angles from which to approach the “storytelling” of the product, which, together with the other SEMs cited above, creates engagement for the user.

However, each brand focus on the healthy and balanced lifestyle that every individual should enjoy (see *Parmigiano Reggiano*: “Never manufactured, always hand-made”, “The King of cheeses”; *Chianti Classico*: “the true heart of Chianti is the land”, “Not all wine made in Chianti is Chianti Classico”; *Prosciutto San Daniele*: “Naturale, Italiano, Unico”; *Prosciutto di Parma*: publication of the brochure entitled “diet and well-being” and advertising “100% natural”).

4.4 The origin-based products: the “relate” SEM

The *relate* sphere is made up by organisation of events, demonstrations and courses (for recreation, presentation and promotion) which bring together enthusiasts of the products being studied, with the intention of enhancing their loyalty by awareness-raising and acculturation to a healthy lifestyle and a balanced diet (see *Parmigiano Reggiano*: “*I am what I eat: dietary education project*” (organised by the *Consorzio*), involving 20,000 young people and 1,000 school teachers in Piedmont, Lombardy, Emilia-Romagna, Veneto, Tuscany and Rome; *Parmigiano Reggiano Academy* “*The taste of knowledge*”; *Chianti Classico*: *Chianti Classico Academy, in the Gallo Nero wine school*”).

5. CONCLUDING SUMMARY AND MANAGERIAL IMPLICATIONS

The study sought to verify the experiential dimension of the communication used by websites by means of a model of analysis created for the task (*SObER*), tested using the focus group technique (*inspection and user-based*).

Given the results of the test conducted, the application of the chosen methodology, created and verified in order to *understand and assess the experiential content of websites*, is argued to be replicable in contexts other than the one investigated here, since it makes it possible to first identify the basic elements of the experiential dimension and then assess them by means of user-based focus groups. Indeed, it was noted that in online advertising, experiential content represents a new frontier, whose opportunities (enhanced by the evolution of computer technology) appear to be numerous and fruitful for both marketing studies and managerial applications.

It is easy to see that the internet can play a fundamental role in the marketing of these products via the sharing of experiential content by i) the producing companies, on the “experience of production” (Rullani, 2006); ii) the users, on the experience gained in the physical place (whether this be the store or the production site). By adopting this approach in advertising it is thus possible to involve other potential consumers via online and offline word-of-mouth communication (Prendergast *et al.*, 2010; Solima, 2010; Riva, 2010), increasing the visibility of the products and their regions of origin in the international arena. This can have a positive impact on the behaviours and purchasing decisions of consumers and tourists alike (Lau & Ng, 2001).

To summarise, the study made it possible to verify that the emotional element can be communicated

and perceived (even unconsciously), thereby enabling products with a high cognitive and experiential content (as in the case of place-based products) to gain a high profile and thus greater competitiveness in the international context.

PROFITABILITY DYNAMICS OF TOURISM COMPANIES DURING THE CRISIS PERIOD 2007-2015*

Iovino, Felicetta; Migliaccio, Guido

University of Sannio, Department of Law, Economics, Management and Quantitative Methods, DEMM,
Benevento, Italy.

ABSTRACT

The global financial crisis has affected all countries during the period 2007-2014. Tourist companies, especially in Italy, play a significant role in the economy of a country. The performance of tourism companies, and in particular hotels and travel agencies and tour operators, will be analysed in this paper, relative to the period of the crisis.

The aim of this paper is to analyze profitability dynamics of the aforementioned tourist companies, to check whether they have suffered the effects of the global crisis.

To this end, data from AIDA database relating to Italian companies in the sector were used. The profitability of these companies has been analyzed using the main profitability ratios, ROI and ROS ratios. An analysis of the trends and ANOVA of these ratios was carried out for the period 2007-2015. In this way, it has been verified whether the global crisis has affected profitability dynamics of hotels and travel agencies and tour operators in Italy.

There is a parallelism in the trends of the main operators' indices in the three Italian macro-regions. The best performance is in the South, in a less developed economic context.

The crisis has reduced the income indices in the first three years, even if the figure remains positive. Since 2012 there is a clear recovery, especially for hotels; intermediaries, on the other hand, suffer from competition from websites. However, the indices confirm the close relationship between travel agencies, tour operators and hotels. ROI mainly rewards first, while ROS intermediaries.

Keywords: Tourism, Crisis, Profitability, Performance, Ratio

INTRODUCTION

The economic crisis that has recently hit many capitalist nations has developed a rich literature with respect to its effects on tourism.

* The paper is the result of a collaborative work. However it is possible to attribute to Felicetta Iovino: research methodology, results and discussion. The other sections are of Guido Migliaccio.

There are numerous studies that have measured the fluctuations in the stock prices of the main operators (Zopiatis *et al.*, 2018; Angel *et al.*, 2018; Grechi *et al.*, 2017), the effects on the psychology of tourists (Batle and Robledo, 2018) and residents of the host cities (Garau-Vadell *et al.*, 2018), as well as the management of intermediaries (Blázquez-Resino *et al.*, 2018; Bremser *et al.*, 2017; Perles-Ribes *et al.*, 2016).

In relation to these studies and those subsequently cited, this paper highlights the situation in Italy with specific reference to tourist companies, hotels and travel agencies and tour operators. In particular, its objective is to analyze the profitability situation of Italian tourist companies, during and after the 2008 crisis, about various geographic areas and the two tourist markets, hotels and travel agencies and tour operators.

The hypotheses are that:

(H₁) the financial crisis did not significantly affect the profitability structure of tourist companies, by virtue of their resilience;

(H₂) there are differences between groups belonging to different markets or geographic areas;

(H₃) these differences are statistically significant.

To this end, we asked ourselves three basic questions:

RQ1: What is the actual situation and what has been the trend in the last decade in the various Italian geographic areas and business markets?

RQ2: Are there differences between the two markets or geographic areas?

RQ3: Are these differences significant?

For this aim, the profitability structure is evaluated using two ratios: the ROI (Return on investments) and ROS (Return on sales); the period considered is the eight years from 2007 to 2015; trend analysis and ANOVA has been used.

In the future, the research must be extended to other operators in the tourism sector and, furthermore, it will be necessary to investigate the main indices and asset margins to link them to the income surveyed here.

Our research approach is quantitative.

In the following sections, a review of literature on tourist companies is presented. Thereafter the methodology, results and implications, conclusions are discussed.

LITERATURE REVIEW

The theme of tourism is faced by a vast international bibliography. The sector, in fact, lends itself to multidisciplinary and interdisciplinary reflections. However, the economic aspects of the company enjoy significant, but certainly lower, attention, especially considering the balance sheet and balance sheet analysis that derive from quantitative empirical research. In fact, they need a laborious and articulated study of the quantitative results of the company and of statistical elaborations.

A first bibliographic reference, therefore, must address precisely these last aspects of a mathematical-quantitative type using, for example, the study of Ye *et al.* (2017) which offers useful reflections on the relationship between the core competition and the surplus value of listed tourism companies. Focusing on a series of research on the problem of the profitability of listed tourism companies, even if referring to the Chinese reality, this article is the closest to the object of our study.

An even more complex mathematical-statistical modeling applied to the tourism sector is presented by Yang *et al.* (2017) describing curvilinear effects of e-loyalty in China's online tourism industry. An empirical study was conducted in China. Structural equation modeling used to test the models, and pair-wise nested. Results show that the curvilinear model has greater explanatory power of loyalty than traditional linear models. This finding means that businesses should link online user-generated reviews to business performance in tourism. Finding incentives for users to become a part of the website.

The proposal by Wang and Fang (2010) is also worthy of a serious discriminant analysis and its application on the profitability of the whitening weight function easily. However, it presupposes specialized knowledge of statistical quantitative elaborations.

Econometric models that involve the profitability of tourism companies are also proposed in what will presumably be the tourist trip par excellence in the coming decades: that of sub-orbital space tourism. Already in 2006, in fact, Charania *et al.*, using the data then available, of the market demand and the forecasts on the most probable future vehicle suppliers, tried to examine the economic profitability of the companies that wanted to present themselves in this particular and particular segment of the tourist market.

As part of this brief review of econometric modeling applied to tourism, it is also necessary to mention the work of Boz *et al.* (2015) about the systematic-risk determinants of the European accommodation and food services industry in the period 2003-2011.

Many other international scientific productions refer, instead, exclusively to accommodation companies (hotels) or to tourism intermediaries such as travel agencies or tour operators, sometimes

avoiding complex quantitative elaborations, without however diminishing the intuitions useful for scientific progress and for the concrete improvement of company management. There is no comparative analysis between the two operators who, although offering obviously different services, are closely related because the former rely mainly on the action of the latter.

With prevalent attention to hotels, the study by Alvarez-Ferrer *et al.* (2018) who tried to focus on the key factors for success of these companies. It is a mainly bibliographic study, referring exclusively to the Spanish reality, which nevertheless manages to identify some factors that guarantee hotels durability and therefore also the ability to respond to crisis situations. Among these factors, the location certainly emerges, in Spain as elsewhere. A focus on this theme is proposed by Segarra-Oña *et al.* (2012). The identification of the successful elements of the Spanish tourism realities favor the entry of new companies as specified by Andreu *et al.* (2010). The Spanish study also refers to the quantitative study by Camisón *et al.* (2016) which focuses on the return on capital in tourism businesses. It has the merit of highlighting the role of family businesses spread in that country, as well as in Italy where this paper is located. Financial analyzes logically connected to the income ones of the Spanish reality are also in Such Devesa *et al.* (2009).

With reference to Tunisia, on the other hand, a similar analysis was carried out by Ben Aissa and Goaid in 2016, using data derived from 27 hotel companies. The study considered two fundamental information: Data Envelopment Analysis (DEA) and the Return On Assets (ROA).

The recent study by Xu (2017), which critically analyzes the operating and profitability efficiencies of the US listed hotel companies in the recent five years through a data envelopment analysis (DEA) approach, focuses on hotels. Findings suggest that they are highly efficient and profitable. His results are quite close to the income analysis for indices that is proposed in this work.

The profitability of hotels is influenced by several factors. Among these it seems important degree of commercial agglomeration in the tourist districts. Using the multiple linear regression method to a sample of Spanish companies located in a particular region, Marco-Lajara *et al.* (2014) have shown that hotels located in destinations with a higher degree of agglomeration are less profitable, probably due to the greater rivalry that exists between neighboring competitors. This conclusion, although in need of adequate interpretations with respect to the methodology and the data processed, is useful not only for the management of individual companies but above all because it adequately directs tourism development policies and related sectors.

The profitability of hotels also depends, of course, on the price policies adopted by each company, considering that different prices can be used in the different channels of communication with potential customers. This is what emerges from the study by Kim *et al.* (2014) entirely focused on the effect of

price dispersion on hotel performance. Dispersion and hotel performance. It is suggested that customization and bundling strategies for offline channels enhance the overall profitability of hotels.

Furthermore, the profitability of hotels as well as any other tourist company, and also related to the qualities of governance as emerged from the empirical research of Al-Najjar (2014) even referred exclusively to companies in the Middle Eastern countries.

Another factor that directly influences the profit of all tourism companies, and therefore hotels, is customer satisfaction. Among others, see the contribution of Sun and Kim (2013).

The food and drink industry is linked to tourism and, of course, to all accommodation facilities. The analysis of the profitability of this specific segment, in Croatia, is proposed by Pervan and Mlikota (2013). In this regard, the interconnections between hotels and restaurants are well described in Skalpe (2003) which focuses mainly on risk profiles.

The most recent developments relating to tourism focus attention on the sustainability of the sector and its operators. The theme makes use of ethical and social considerations and considers the respect of the environment and people as a priority, as well as the protection of local cultures and traditions. Profitability, therefore, should be subordinated to sustainability. The bibliography is extended. We limit ourselves to mentioning Mihalič *et al* (2012), Lim *et al.* (2012), Pérez-Calderón *et al.* (2011), Inoue and Lee (2011), Beriatos and Papageorgiou (2009), Kasim *et al.* (2008).

It is more difficult to find adequate bibliographic sources on the profitability of other tourism intermediaries, also considering that the diffusion of the Internet network favors the customers who autonomously plan their travels, avoiding the traditional intermediaries. However, even new intermediation web operators need adequate strategies to maintain at least sufficient profitability. The topic is discussed in the recent study by Zhu and Li (2017) which proposes a theoretical reference for the development of online tourism enterprises. Carrying out interesting reflections on a company that manages a site for tourist trips, he concludes that the evaluation model of the Internet is a business model that is made up of value groups, product and service, resource allocation and profit patterns. On the basis of this, the internal and external resources of the enterprise are integrated, ultimately the development strategy of the online tourism profit. Considering the trends in progress, this attempt to interpret the management dynamics of online intermediaries is certainly to be considered as a reference for areas to be investigated in more detail, even considering that the number of information obtainable online can generate confusion, as outlined in article by Ranjbarian *et al.* (2016). This study is aimed at investigating the risk of confusion for the firms or service organizations in the tourism industry. Of these possible confusions must therefore take into account all the times that e-commerce is also applied to the tourism sector. Liu *et al.* (2009) has already dealt with its diffusion in two large

countries such as the USA and China. In 2009, directing companies by enriching their websites' contents, establishing individual brands and enhancing cooperation with traditional tourism companies. These strategic lines are still valid.

In conclusion it is necessary to mention the work of Feng *et al.* (2014) about strategic restructuring for turnaround. It has the advantage of analytically describing the entire restructuring process as a response to a corporate crisis in the hotel industry. An indirect correlation with this paper that wants to focus on the economic performance of some tourism companies in the years of the global crisis. It also highlights the need for integrations between companies in the same tourism sector, as also feared by Pansiri (2008).

RESEARCH METHODOLOGY

Data collection and sample characteristics

To our objectives, secondary data on AIDA database has been used. To analyse the profitability situation, two ratios, ROI (return on investments) and ROS (return on sales) have been chosen. The nine years during and after the crisis, i.e. 2007-2015 had been considered. The sample was made up of hotels and tour operators and travel agencies, that is 6465 tourist companies. This is the maximum number of companies available. Then we verified the number of such companies for which data are available for the indexes considered by us in the 9 years under investigation. The sample consists of 794 companies. Successively, different groups have been identified using two discriminating factors, the geographic area and the business market. About the first one three clusters have been identified: north, centre and south according to conventional classification of Italian regions. The geographic distribution of the sample was the next: 51,55% in the North group, 30,67 % in the Centre and 17,78 % in the South ones. To identify the belonging market a specific section was assigned to each tourist firms according to the statistical classification of economic activities in Italy (*NACE rev.2 codes*), and they were grouped in two groups: hotel market and tour operator and travel agency market (Iovino and Migliaccio, 2018).

According to the second discriminating factor, the sample consisted of 87,15% hotel firms and 12,85% tour operator and travel agency firms.

Fig. 1 – Source: our elaboration - geographic distribution of Italian tourist companies

Fig. 2 – Source: our elaboration - market distribution of Italian tourist companies

Method

First of all we analysed data's trend in the period 2007/2015 for each ratio and group. Then by the analysis of variance (ANOVA) we assessed the differences of means between groups and the response variable means at the different factor levels.

The null hypothesis states that all population means (factor level means) are equal while the alternative hypothesis states that at least one is different. In our case, the independent variables were the geographic localization and the business market while the dependent variables were the ratios. We chose ANOVA one-way type, because two variables were analysed e separately.

RESULTS AND DISCUSSION

Trend analysis

ROI (return on investments) indicates the profitability of the typical management of the company and therefore of the core business. It is given by the ratio between operating income and operating net invested capital. Its value should therefore be as high as possible. Within the sample the nine year's ratio between 1.84 and 6.65, if we consider the geographic localization as discriminating factor, and between 1.87 and 9.25, if we consider the belonging market. Figures 3 and 4 show that the mean over the nine years decrease considerably between 2007 and 2009 with the beginning of the crisis and then

go back to starting from 2012. The trend of ROI in the nine years is the same in all geographical areas. With respect to geographical areas, ROI has the lowest values in 2009 and 2012 respectively 1.84 and 1.9, while the highest values are in 2007 before the crisis, with 6.65 and in 2015 after the crisis with a value of 4.9. Market-based ROI trend also looks similar in the nine years. ROI values of travel agents and tour operators are higher than those of hotels, due to several factors including the greater weight of property, plant and equipment. Also according to the market of belonging, the values of ROI fell considerably between 2007 and 2009, the years of the crisis, going from a maximum of 9.25 to a minimum of 1.87. Subsequently, the values of ROI increase with the exit from the crisis, although recording a new decrease in 2012.

Figure 3: Trend of ROI according to geographic localization (our elaboration).

Figure 4: Trend of ROI according to market (our elaboration)

ROS measures the profitability of sales. It therefore relates operating income to sales. ROS should take as high a value as possible. Trend analysis highlights a situation of good profitability (Figure 5-6) both according to geographic localization and according to market. ROS throughout the nine years has always been between 7.58, 2007, and 1.61, in 2012, according to geographical location, and 7.58, in 2007, and 0.64, in 2012, according to the market. The trend of ROS in the nine years is substantially the

same in all geographical areas. In fact, there has been a reduction in ROS from 2007 to 2009, at the beginning of the crisis, with a slight increase in the following years and a new minimum in 2012. In the following years the ROS increases progressively reaching pre-crisis values, with the exception of the center.

Figure 5: Trend of ROS according to geographic localization (our elaboration).

Figure 6: Trend of ROS according to market (our elaboration)

While we consider the classification by business market (Figure 6), the trend is overall stable for travel agencies and tour operators, while it is strongly negative for hotels. In fact, between 2007 and 2015 the ratio decreased from 7.58 to 2.43, with a reduction of 67.94%. Ratio values range between 1.72 and 0.64 in the travel agency. The values of the hotels ROS remain steadily higher throughout the period considered. The trend according to the relevant market shows that ROS of travel agencies and tour operators suffered less the effects of the crisis than hotels, for which ROS recorded the lowest values in 2009, with 2.49 and in 2012, with 2.48. These values tend to increase with the exit from the crisis, although at 5.81 in 2015. This value is similar to that at the beginning of the crisis. In general, we can verify that there are no significant deviations from 2008 values, when the crisis started. However, in the course of the crisis hotels have a ROS trend with greater fluctuations than travel agencies and tour operators. Different conclusions are for ROI. In fact, it is a more drifting trend. Therefore the

hypothesis H1 is partially validated. About the hypothesis H2, we are related to geographic areas. Thus the crisis seems to be on the profitability, especially on the sales, differently for the hotels.

Analysis of variance

About ROI, Table 1 shows the results of the analysis, assuming the geographic area as independent variable. There is no a statistically significant difference between groups ($F(2,24) = 0.529897$, $p = 0.595394635$), in fact $F < F_{crit}$ ($p \text{ value} > 0.05$).

Table 1: ROI - Analysis of variance with geographical localization as independent variable						
Source of variation	SQ	gdl	MQ	F	Sig.	F crit
Between groups	1,482289	2	0,741144	0,529897057	0,595394635	3,402826
Within groups	33,56778	24	1,398657			
Total	35,05007	26				
Significant level at 0,05						

The null hypothesis must not be reject and the alternative ones must not be accept. While if the business market is considered as independent variable the results, set out in Table 2, indicate a statistically significant difference between groups ($F(1,14) = 4,773$, $p = 0,000456543$), in fact $F > F_{crit}$ ($p \text{ value} < 0.05$).

Table 2: ROI - Analysis of variance with belonging sector as independent variable						
Source of variation	SQ	gdl	MQ	F	Sig.	F crit
Between groups	38,39800556	1	38,39801	19,27287	0,000456543	4,493998
Within groups	31,87735556	16	1,992335			
Total	70,27536111	17				
Significant level at 0,05						

The results of ANOVA applied to ROS show that we have to accept the null hypothesis if it is considered geographic localization as independent variable, while we have to reject the null hypothesis if we consider the market as independent variable. Therefore, only, in this last case, there is a statically significant difference between groups (see tables 3 and 4), which is already highlighted by the trend analysis.

Table 3: ROS - Analysis of variance with geographical localization as independent variable						
Source of variation	SQ	gdl	MQ	F	Sig.	F crit
Between groups	10,79832	2	5,399159	2,435587842	0,108883298	3,402826
Within groups	53,20269	24	2,216779			
Total	64,00101	26				
Significant level at 0,05						

Table 4: ROS - Analysis of variance with belonging market as independent variable						
Source of n variation	SQ	gdl	MQ	F	Sig.	F crit
Between grups	43,64894	1	43,64894	30,52557166	4,61447E-05	4,493998
Within grups	22,87862	16	1,429914			
Total	66,52756	17				
Significant level at 0,05						

The results of statistic analysis show that the hypothesis H3 of this research, previously described, is partially tested with regard to ROI and ROS if we consider both geographic localization and business market, while it is fully tested if we consider only business market. In fact, there is a relevant difference between hotel business and travel agencies and tour operators business regard to infrastructural factors which have a considerable role in the profitability of hotels.

CONCLUSIONS

The tourism offer evolves all over the globe, especially because developing countries offer increasingly popular destinations because they are innovative and low-cost.

The Italian tourist offer remains, however, unique in the world considering the wonderful mix of natural, historical and artistic beauties. It also has a long tradition and therefore benefits from a positive reputation.

However, the accommodation facilities are often obsolete, sometimes of modest size, family-run and therefore in need of restructuring and modernization, similar to infrastructures and regulations on a rather complex regional basis.

This study wanted to focus the ability of the main operators in the tourism sector to resist the stimulus of the crisis, measuring their profitability over time, comparing it also with reference to the different areas of the country. It is well known, in fact, that Italy has notable territorial imbalances due also to previous historical events: North is notoriously richer than Southern regions.

The distribution of tour operators highlights these differences, considering their greater concentration in the northern regions and their progressive reduction going from North to South. Nevertheless, the parallelism that is won in the trends of the main income indices among the operators present in the three macro-regions of the Nation is impressive. Both the ROI and the ROS, in fact, follow similar trends throughout the broad period of time considered, with differences in absolute value not high. Wonder, however, the best income performance achieved by the southern companies, considering the less developed economic context: the motivations may be different and should be subject to a more careful and thorough analysis that matches the budget results to other statistical indicators such as, for example, the type of tourist present in the different areas, the place of origin and above all its potential spending capacity. It is probable, in fact, that the south enjoys a flow of customers more wealthy and more willing to spend, considering even the lowest prices.

These outcomes could also be justified by the higher running costs of the northern companies and also by the widespread presence of family-run businesses in South of Italy, which often rely on the

indomitable action of family members that increases the efficiency of the workforce without a simultaneous increase in personnel costs.

We should also analyze the beneficial effects of possible interventions by public authorities in support of southern tourism, considering that over time hotels have also been able to take advantage of operating capital grants that have naturally made the investment more profitable. The crisis has also had its effects on hotels and tourism intermediaries, as is evident from the gradual reduction in income indices in the first three years. However, we must also underline that overall the average figure remains positive, even in the years in which other sectors have recorded almost disastrous results. Clumsy situations followed, however, since 2012 have assumed the clear symptoms of a decisive recovery, with a decidedly increasing trend.

The indicators considered confirm the close relationship between tourism intermediaries (travel agencies and tour operators) and hotels. Profitability follows very similar trends, even if we note an antithetical position considering ROI and ROS: the former, in fact, rewards mainly the tourist intermediaries, contrary to the second.

Also for these trends it would be necessary a deepening combining the income indices with the equity ones. However, some hypotheses could be formulated mainly linked to the composition of the elements measured by the first index which mainly focuses on the profitability of operations. It is evident that tour operators and travel agencies can enjoy lower fixed costs, instead much higher in hotels that are characterized by significantly larger invested capital. These conclusions have elements common to those of the Blázquez-Resino *et al.*'s study, (2018). The management of intermediaries is much more agile, even considering the beneficial effects of the Web that facilitate the relationship with customers avoiding massive uses in structures, however, necessary especially for traditional customers less accustomed to the use of the Internet.

It is, however, necessary to underline that the evident recovery in the profitability of the hotels is followed by a decidedly lower growth in the profitability of the intermediaries who presumably suffer from a reduced demand for their services due to the development of telematics which allows many tourists to design independently their travels avoiding the higher costs of traditional intermediaries.

The setting of the study is original and has no immediate similarity to facilitate a comparative analysis with previous studies.

Some quantitative publications have been mentioned, but they are mainly made up of advanced statistical and econometric tools that are not always relevant to accounting results and are often referred to environmental situations that are very different from Italian ones (Ye *et al.*, 2017; Yang *et al.*, 2017; Wang and Fang, 2010).

The proposals by Camisón *et al.* (2016), Such Devesa *et al.* (2009) and Andreu *et al.*, 2010 have a preferable managerial approach, although limited to the Spanish reality more similar to the Italian one. With exclusive reference to hotels, our results could in some way be compared to the intuitions of Alvarez-Ferrer *et al.* (2018) and especially those of Ben Aissa and Goaid (2016), Marco-Lajara *et al.* (2014), by Al-Najjar (2014) and Xu (2017).

The tourism offer evolves all over the globe. The Italian tourist offer remains, however, unique in the world with her long tradition and a positive reputation: the trends in force oblige, therefore, tour operators and travel agencies to a “strategic revolution”, considering a demand that is progressively decreasing, while maintaining instead a steady steadiness of the hotels. This “strategic revolution” must also consider positive experiences of similar states for tourism culture such as Spain (Bremser *et al.*, 2017; Perles-Ribes *et al.*, 2016).

SPECIAL ECONOMIC ZONES: AN OVERVIEW*

Iovino, Felicetta; Paolo, Esposito

Department of Law, Economics, Management and Quantitative Methods, University of Sannio,
Benevento, Italy

ABSTRACT

There are numerous confusions generated by the semantic ambiguities on the special economic zones which, on the other hand, do not find a robust explanation of the economic literature of the company. There are also numerous definitions and acronyms at the international level of the Special Economic Zone, more than three thousand according to some scholars (Klugmann, 2013), susceptible to variation from country to country; ZED in Cuba, ZEDE in Ecuador, SEZ in China, India, Africa; Free zones in the United Arab Emirates, LEAP Zones in U.S .. The paper try to provide an overview of SEZ's concept and its characteristics and a literature review of principal effects of them.

Keywords: Special Economic Zones, Urban Free Zones, Tax, development, fiscal advantages, finance

INTRODUCTION

There are numerous confusions generated by the semantic ambiguities on the special economic zones which, on the other hand, do not find a robust explanation of the economic literature of the company. There are also numerous definitions and acronyms at the international level of the Special Economic Zone, more than three thousand according to some scholars (Klugmann, 2013), susceptible to variation from country to country; ZED in Cuba, ZEDE in Ecuador, SEZ in China, India, Africa; Free zones in the United Arab Emirates, LEAP Zones in U.S. All, however, respond to interventions with reduced taxation or advantage and zero bureaucracy or developed according to models of great operational simplification. The most frequent and recurring notion is that of Special Economic Zones (SEZ), or Special Economic Zone (ZES), in Italian, however, corresponding to an area within a country in which specific financial and economic laws are adopted. with the aim of attracting foreign investors who might be interested in doing business in an area where they receive favourable tax, economic and financial treatments.

Some of the largest ZES are located in China, where the government has started creating such areas

* The paper is a result of a collaborative work. Nevertheless, it's possible to attribute to Felicetta Iovino: methodology of the research; benefits arising from SEZs and disadvantages arising from SEZs; the other sections are of Paolo Esposito.

since 1980, but there are examples also in Europe (Madeira, Latvia) although many free trade zones actually have similar characteristics of the SEZs.

Within the ZES zone, taxes are reduced and can be completely zeroed, companies pay lower rates. The idea behind a special economic zone is that it can be able to stimulate rapid economic growth. By attracting foreign investors, nations can draw on wealth from other countries to improve their economies and living conditions. These areas can develop very quickly, attracting workers from the entire area of reference. Many nations have experienced an economic boom due to special economic zones.

The paper sets several objectives aimed at analyzing the SEZ concept.

The paper, in particular, aims to provide an overview of the concept of SEZs. This will be achieved by presenting the main definitions of SEZ present at international level and the relative characteristics. Furthermore, a further objective will be the clarification of the main benefits, but also disadvantages deriving from the establishment of SEZs. To this end, a brief analysis will be carried out of the main international literature which has highlighted these peculiar aspects over time.

In this sense the main research questions of the paper are:

Q1: What are the main definitions of SEZs?

Q2: What are the main characteristics of the SEZs at an international level?

Q3: What are the main advantages and disadvantages of the SEZs highlighted in the international literature?

In order to answer these questions, the paper follows the main definitions of SEZ, and then there are the words about the advantages and disadvantages of the SEZs and the main conclusions.

SEZS: AN OVERVIEW

Most quoted is the SEZ's definition by Grubel (1984): "a geographically defined area within which certain types of economic activity take place without some of the government taxation and regulation that applies to them in the rest of the economy".

Wei Ge (1999) has defined special economic zones as "characterized in general terms as a geographic area within the territory of a country where economic activities of certain kinds are promoted by a set of policy instruments that are not generally applicable to the rest of the country."

A Special Economic Zone (ZES) is an area, area, portion or geographic region with its own tax-related economic legislation (Mises, 1998, Romer, 2009) and different (Lavoie, 1982), with respect to current legislation in the country of origin and affiliation (Moburg, 2013), as a tax instrument for the benefit of free entrepreneurial initiatives (Ricci, 2011), policy or reformist intervention or fiscal reform (Ricci, 2010). Special economic zones are therefore usually created to attract more foreign investments (Mises,

1998, Bauer, 2000, Moburg, 2013, Boettke and Moburg, 2013), to increase technology transfer and in general supply different benefits, such as tax incentives, lower tariffs and higher tax exemption (Tao, Y., Yuan, Y. and Li, M., 2016). Particular types of SEZ, are realized with the priority purpose of urban and social regeneration, the so-called Urban Free Zones (UFZ) (Esposito, P., Ricci, P., Iovino, F., 2017). Thus now the term Special Economy Zones ("SEZ") covers a broad range of zones, such as free trade zones, export-processing zones, industrial parks, economic and technology development zones, high-tech zones, science and innovation parks, free ports, enterprise zones, and others (Shukoor, A., 2016). Economic activities in SEZs are mainly lead by market forces and have the following characteristics (FIAS, 2008): products are primarily export oriented, creation lies on attracting and utilizing foreign capital, joint ventures with foreign capital, partnerships, and wholly foreign-owned enterprises are the main types of companies and government-led infrastructure development is fairly supported (Tao, Y., Yuan, Y. and Li, M., 2016).

The main characteristics of Special Economic Zones are:

- geographically limited area also in general, with physical security;
- administrated by an unique authority;
- receiving financial and procedural advantages;
- simplified procedures;
- having delimited custom area;
- governed by more liberal economic laws (FIAS, 2008; Shukoor, A., 2016).

According Zeng (2015), SEZs have two main types of objectives, which in part explain their diffusion- "static" economic objectives such as employment generation, export growth, government revenues, and foreign exchange earnings; and the more "dynamic" economic objectives such as skills upgrading, technology transfer and innovation, economic diversification, productivity enhancement of local firms, and also urban and social redevelopment of degraded areas or areas affected by natural disasters (Esposito, P., Ricci, P., Iovino, F., 2017; Scrofani, L., Leone, M., 2016).

The various types of SEZs have been identified by the World Bank through a series of distinctive criteria and are summarized in the following table (tab. 1).

Type of Zone	Development Objective	Physical Configuration	Typical Location	Eligible Activities	Markets	Examples
Free Trade Zone (Commercial Free Zone)	Support trade	Size < 50 hectares	Ports of entry	Entrepôt and trade-related activities	Domestic, re-export	Colon Free Zone, Panama
Traditional EPZ	Export manufacturing	Size < 100 hectares; total area is designated as an EPZ	None	Manufacturing, other processing	Mostly export	Karachi EPZ, Pakistan
Hybrid EPZ	Export manufacturing	Size < 100 hectares; only part of the area is designated as an EPZ	None	Manufacturing, other processing	Export and domestic market	Lat Krabang Industrial Estate, Thailand
Freeport	Integrated development	Size > 100 km ²	None	Multi-use	Domestic, internal and export markets	Aqaba Special Economic Zone, Jordan
Enterprise Zone, Empowerment, Urban Free Zones	Urban revitalization	Size < 50 hectares	Distressed urban or rural areas	Multi-use	Domestic	Empowerment Zone, Chicago
Single Factory EPZ	Export manufacturing	Designation for individual enterprises	Countrywide	Manufacturing, other processing	Export market	Mauritius Mexico Madagascar

METHODOLOGY OF THE RESEARCH

The methodology adopted to answer research questions is mainly an analysis of the most widespread international literature on SEZs. It has been identified through the use of keywords such as "SEZ" or "special economic zone" in some search engines including Google Scholar, but also databases including Scopus and WOS. In this way, a series of papers were identified that were the subject of an in-depth analysis conducted on-site by the authors. It was flanked by the snowball technique that allowed us to identify further papers. So the identified papers were selected considering those that best responded to the research questions. In fact, the papers that identified the main characteristics of the SEZs, the benefits and disadvantages of their constitution were taken into consideration. A synthesis of the main propositions present in these papers was then made with regard to the investigated aspects.

BENEFITS ARISING FROM SEZS

Different authors have suggested the benefits arising from the establishment of SEZs in a specific area. Most Chinese authors highlight several advantages for China such as gateways for the openness of Chinese markets, clusters of innovative manufacturing and locomotive for area economic growth (FIAS, Foreign Advisory Service, 2008; Zheng and Wang, 2005). Zheng (2016) shows as SEZs promote the development in industrialised regions.

Yeung's study (2009) discusses as the contribution of SEZs in China is promote the economic growth by new policies, capital flows and wide spreading new policies and practices.

Wang (2009) finds three different types of advantages from SEZs. There are: 1) rising of foreign direct investment; 2) increasing of productive growth rate; 3) delivering of innovative technology.

Korhonen and Sankin (2005) find that a particular type of SEZs, EIPs, contributes to raise production capabilities, increase technical efficiencies and synergies.

Jensen's study (2017) finds as Polish SEZs have a positive impacts on employment of about 60%.

Ge (1999) argues that Chinese SEZs may contribute for enhancing financial and economic liberalisation, improving resource use, stimulate economic and structural changes.

Curran, Cook, Hampton, Clark, Yorgey and Anderson's study (2009) lists the key success elements in South Africa.

Chen's study (1993) finds positive effects from Shenzhen SEZ. The main benefits are related to employment, tax revenue, foreign-exchange earnings and technical transfer.

Brautingham (2014) suggests as China invested in Africa for establishment of SEZs. This isn't the main concern of the African government, but SEZs have reached the minimum results of provide infrastructures such as electricity, water and sanitation.

Ambroziak and Hartwell (2017) show that Polish SEZs located in poor areas have had positive impacts. These benefits are reduction of unemployment and a higher gross value of fixed assets (GVFA) per company.

FIAS's study (2008) describes the main long-term benefits arising from SEZs. They are: indirect employment, skills improvement, female employment, technology moving, best practises and development of the area.

Davies and Mazhikeyev (2016) find that SEZs development has beneficial effects on exports of countries with open economy and on value exports of countries with barriers to import.

DISADVANTAGES ARISING FROM SEZS

Literature have suggested several negative effects arising from SEZs. Yang (2008) and Zhang and Li (2007) describe as the local governments subsidise the hosted companies in SEZs with low-price land. In

this way real-estate speculation raise and the SEZs often become isolated island instead of engines of growth (Li, Yang, 2010; Zheng, Zhang, 2014).

Tudor, Adam and Bates' study (2007) describes a range of limitations of a specific type of SEZs, EIPs. They are the potential fragility of the system and challenges due to material fluctuations, that is resources, communication, information, changes in political, economic and environmental policies.

Rawat, Bhushan and Surepally (2011) highlight many controversial effects of SEZs referring to the Indian case. The main concerns are related to environmental negative impacts, if SEZs make real economic positive effects or only a displacement of places and employment. Other negative suggested effects are the community resistance for the way of acquisition of land.

Gopalakrishnan (2007) analyses two main negative effects of SEZs in China, that is real estate speculation and loss of agricultural land and several labour abuse.

Aggarwal (2004) describes as Indian SEZs haven't achieved the positive expected performances because of inadequate policies and regulations, scarce behaviour of the officials, centralised governance, an excess of labour laws an insufficient physical and financial infrastructures.

Ambroziak and Hartwell (2017) collect data, which prove as SEZs in rich Poland areas have had weak or negative effects, such disturbance of competition and distort local market.

FIAS (2008) reports as SEZs have had negative impacts in some countries. They are among others, exploitation of women, lower labour standards and decreasing of labour conditions.

CONCLUSIONS

The present contribution attempts to offer a unitary and comprehensive yet synthetic representation of the distinctive elements of the SEZs.

In this sense, the main characteristics of the SEZs and the different types are presented. Finally, it is clarified through a brief analysis of the literature that the SEZs certainly have undoubted advantages, as evidenced by the majority of the selected studies, but also by the disadvantages. In this way, it is clear that the phenomenon of SEZs can be observed in a critical way, but at the same time the elements on the one hand to be exploited and on the other on which to intervene are revealed.

All this will allow the different actors in the system directly or indirectly involved to obtain the best results from the creation of the SEZs, also promoting further paths for improvement. Some research questions, however, are still open and unexplored to scholars and practioners, especially in multi-disciplinary and multi-professional terms, such as the issues of overcoming the rules, the suspension of rules and conventional legality; the influences and impacts on democracy and the costs of democracy and damage to this; along with the perception that zero-cost measures in the short term, then end up determining further and not well-defined costs in the medium and long term -

produced and generated by institutional disequacy against citizens and businesses, in addition to costs of controls to avoid reputational damage and / or fraud, all in the context of the absolute absence of inter-institutional task forces to identify predictive models against damage and / or risk prevention to which are subjected the already so delicate scaffolding on which the democratic systems of the countries are governed.

SPECIAL ECONOMIC ZONES: A BRIEF COMPARATIVE EXCURSUS*

Iovino, Felicetta; Paolo, Esposito

Department of Law, Economics, Management and Quantitative Methods, University of Sannio, Benevento, Italy

ABSTRACT

The SEZ concept is a very variegated notion that has not a specific clarification in the economic literature. There are also numerous definitions and acronyms at the international level of the Special Economic Zone, more than three thousand according to some scholars (Klugmann, 2013), being different from country to country; ZED in Cuba, ZEDE in Ecuador, SEZ in China, India, Africa; Free zones in the United Arab Emirates, LEAP Zones in U.S. The paper tries to provide an overview of SEZ's concept and some different cases of them.

Keywords: Special Economic Zones, Urban Free Zones, Tax, development, fiscal advantages, finance, Emergent countries.

INTRODUCTION

The creation of special economic zones has affected several countries around the world including: the People's Republic of China, India, Jordan, Poland, Kazakhstan, the Philippines, North Korea and Russia.

SEZs are forms of "tax advantages", which have been established for a long time in order to ensure particular places - a district, a port, a production area - benefits of a fiscal and regulatory nature. These tools allow us to determine real conditions of commercial and productive advantage. Among them the Urban Free Zones (set up for the first time in France in 1996), are an effective tool for local development. It is one of the tools aimed at pursuing more solidaristic and economic goals.

In fact, the ultimate goal of the Urban Free Zones (ZFU) is "to favor the economic and social development of neighborhoods and urban areas characterized by social, economic and occupational disadvantages, with potential for development with unexpressed development potential" by means of tax concessions, contributions and social security contributions. The experience of SEZs began in China in 1980 with the creation in Shenzhen of the first and most important SEZ close to Hong Kong. Over time it has grown exponentially becoming one of the main financial and business centers globally. In this way, the creation of further SEZs throughout China

* The paper is the result of a collaborative work. However, it's possible to attribute to Felicetta Iovino: SEZs in India and SEZs in MENA countries; the other sections are of Paolo Esposito.

began. The positive Chinese experience has led many emerging countries in the years following the creation of similar SEZs. Many of them are aimed at guaranteeing tax benefits of various kinds in favor of companies, particularly in the most technologically advanced sectors and also at startups.

Here, multiply similar experiences, using existing legal tools and proceeding to the widespread establishment of the SEZ often in strategic places, but also widespread in the country. This creation was often made by differentiating, depending on the characteristics of the settlement territory, the productive sector subject to incentive. In this sense, the goal is to create productive districts that become crucial in the economy of each country, allowing companies to network and, in this way, attract high quality foreign investments.

The paper aims to explore the concept of SEZ in some emerging countries. In particular, we want to highlight the main characteristics, the reasons for the success, but also the negative aspects of the establishment of the SEZ in China, India and in the MENA countries.

- What are the main characteristics of SEZs in emerging countries?
- What are the reasons for their success?
- What are the main negative impacts caused by their establishment?

The paper then, after a brief introduction to the SEZ concept, proceeds with specific paragraphs on the SEZs in China, India and in the MENA countries. Finally, the main conclusions of the aforementioned analysis are summarized.

ZESS IN THE CHINESE POPULAR REPUBLIC

The adjective “special” in the People's Republic of China refers mainly to indicates special policies and flexible interventions aimed at managing the economic system. The main policies and interventions include the following:

- special tax benefits for investments made by foreigners in the SEZ;
- extensive autonomy aimed at managing activities related to international trade.

The activities of the Chinese special economic zones are characterized by some fundamental principles:

- the structures created primarily for the purpose of attracting and using foreign capital;
- the economic activities are organized through the creation of joint-ventures between Chinese companies and foreign companies and also through companies with entirely foreign capital;
- the products are basically made for export to foreign markets;
- economic activities are governed by the principles of the liberal market system.

National planning and financial planning indicate the special economic zones of the People's Republic of China separately. The provincial authority has the competence of the economic administration of

the SEZs. The legislative authority in relation to the SEZs is attributed to the congress and local governments.

Box 1 - The special economic zones of the People's Republic of China

In the Guangdong Province: Shenzhen, Zhuhai and Shantou

In Fujian Province: Xiamen

Entire province of Hainan

The SEZs were created with the aim of creating a model of growth and modernization for the whole of China, forming innovation centers and production best practices. In this way, they are able to confront and compete with the most advanced industrial districts of the world's largest economies. The term Chinese SEZ calls to mind therefore words like progress, development, investments, GDP growth and employment (Mack, 2017). However, the Chinese SEZs are also carriers of pollution, degradation of local ecosystems and environmental devastation. The Zes, the Special Economic Zones, were born in the late seventies and have since formed the main engine of the Chinese locomotive. By virtue of the special subsidized tax regimes they benefit from and the ad hoc regulation that regulates the activities that focus on them, aimed at attracting foreign companies and investments, these areas are one of the crucial growth tools used by China in the last decades .

However, the environmental problems associated with this hypertrophic growth are of great weight. The plant, animal and ecological heritage that is included in the Zes is in fact particularly at risk. In fact, the high production rates of the SEZ and the increasing amount of waste and harmful emissions generated by them expose the environment of the SEZ and the surrounding environment, in particular, to serious risks and to significant and constant damage. However, the Chinese SEZs have been very successful with employment growth, GDP and exports above the national average.

The reasons for the success of the Chinese SEZs are due to a number of key factors, in particular:

- a wide legislative delegation in the commercial and administrative areas coordinated in compliance with the national planning for the areas outside the SEZs;
 - availability of high quality infrastructures, such as ports, roads, airports, various lines of communication and services;
 - flexible and numerous financial services;
 - a highly efficient local government system capable of creating the best environment for SEZs;
 - the variety of the population of the SEZs, in particular Shenzhen, consisting mainly of immigrants.
- This favors the exchange and the fusion of different ideas and cultures;
- the favorable geographical location of all the Chinese SEZs, close to strategic infrastructures, mainly

ports, but also important financial centers. The latter is the case of Shenzhen very close to Hong Kong, the international financial center of Asia (Tao, Y., Yuan, Y. and Li, M., 2016).

ZESS IN INDIA

The creation of the Indian special economic zones was initiated by the central government in April 2000 in order to make them as foreign territory in relation to the main business, ie commercial, tax and customs aspects. The Indian government has essentially replicated the Chinese model for its special economic zones. The declared objectives of the Indian SEZs are, among others, the increase in foreign investments, the increase in the level of national exports and the realization of the conditions in order to ensure that Indian companies are competitive in the global market. In fact, even the Indian SEZs are indicated separately in national and financial planning and have a provincial level authority on economic administration, which has legislative authority (Agarwal, 2006). The Indian government has also allowed the transformation of the "Export Processing Zones" (economic zones characterized by the production of products for export) into special economic zones (Soundarapandran, 2012).

Box 2: Indian SEZs

Kandla e Surat (Gujarat)

Cochin (Kerala)

Santa Cruz (Mumbai–Maharashtra)

Falta (West Bengala)

Chennai (Tamil Nadu)

Visakhapatnam (Andhra Pradesh)

Noida (Uttar Pradesh)

In 2005, the Indian Government issued the SEZ Act. The primary objective of this provision is to promote the industrialization process (Naresh Reddy, G., 2009), through increased exports, infrastructure development and upgrading, the level of technological innovations. Indian SEZs offer several benefits including:

- tax benefits;
- long-term low rents;
- provision of services and infrastructures;
- provision of a single administrative desk;
- simplified procedures;
- exemptions from various restrictions typical of the internal market.

The Indian SEZs were able to set up some real clusters specialized in products such as jewelry,

software and electronic products.

The reasons for the success of the Indian SEZs are:

- special tax incentives for foreign investments;
- greater independence in international trade activities;
- production aimed primarily at export;
- no import license required;
- full freedom of sub-supply;
- no verification by the authorities of imports and exports.

The Indian SEZs, like the Chinese ones, have also brought about important issues related to environmental degradation and the resulting effects on human health and the environment, on the rights of workers and women and other negative social impacts.

The impact of the Indian SEZs after the implementation of the SEZ Act is summarized in the following table (Figure 1).

Number of Formal approvals (As on 04.06.2018)	419		
Number of notified SEZs (As on 04.06.2018)	355 + (7 Central Govt. + 11 State/Pvt. SEZs)		
Number of In-Principle Approvals (As on 04.06.2018)	32		
Operational SEZs (As on 31 st March, 2018)	223		
Units approved in SEZs (As on 31 st March, 2018)	5,146		
INVESTMENT	Investment (As on February, 2006)	Incremental Investment	Total Investment (As on 31 st March, 2018)
Central Government SEZs	Rs.2,279.20 cr.	Rs.16,599.12 cr.	Rs.18,878.32 cr.
State/Pvt. SEZs set up before 2006	Rs.1,756.31 cr.	Rs.11,259 cr.	Rs.13,015.31 cr.
SEZs Notified under the Act	-	Rs.4,43,023.74 cr.	Rs.4,43,023.74 cr.
Total	Rs.4,035.51 cr.	Rs.4,70,881.86 cr.	Rs.4,74,917.37 cr.
EMPLOYMENT	Employment (As on February, 2006)	Incremental Employment	Total Employment (As on 31 st March, 2018)
Central Government SEZs	1,22,236 persons	1,14,035 persons	2,36,271 persons
State/Pvt. SEZs set up before 2006	12,468 persons	86,571 persons	99,039 persons
SEZs Notified under the Act	0 persons	16,41,906 persons	16,41,906 persons
Total	1,34,704 persons	18,42,512 persons	19,77,216 persons
Exports in 2015-16	Rs. 4,67,337 Crore		
Exports in 2016-17	Rs. 5,23,637 Crore		
Exports in 2017-18 (As on 31 st March, 2018)	Rs. 5,81,033 Crore

SEZs IN MENA COUNTRIES

MENA countries (Dassel, Eckermann, 2013) have been created over the past 30 years principally both trade free zones and special economic zones (Del Federico, 2009). They are therefore characterized by the prevailing economic aspect that distinguishes them. These SEZs are derived from Free port zones, which were just simple storage areas and without customs duties. They were then transformed into export processing zones for re-export and special economic zones with numerous exemptions from the regulations of the host country. The SEZs of MENA's countries have different characteristics in each country in the area, as well as its investment environment. However, it is possible to identify common elements. In fact, SEZs have strong and different regulatory benefits, with significant administrative simplifications of the procedures for firms established in the areas. There are authorities in the one-stop shops that deal with all necessary licenses and permissions and carry out a check of regularity on SEZ companies.

Another principle benefit from foreigners who often characterize the host country. In fact, other incentives are supplied by many SEZs in the Mena countries are always different from national legislation, which may be bought by foreigners or for long or different periods, even with state aid. These countries have many trade restrictions, but they have been operating in the SEZs. The areas of SEZs of the MENA countries are usually close to ports and airports and with better physical infrastructures than those of the other zones of country. Thus, SEZs are established in these countries for the purpose of implementing investment attractiveness strategies through state interventionist policies whose objective is to achieve economic and industrial development (Bohmer, Christiansen, OECD, 2004).

The number of SEZs in the MENA countries has grown exponentially over the years, as well as in the rest of the world, as shown in the following graph (Figure 2).

Fig. n. 2: source: Economist (2015)

The results achieved by SEZ countries in the MENA countries, as shown previously for the Indian SEZs (Figure 1), are positive relative to the main indicators. As shown in the figure below (Figure 3), the extent of trade, and the increase in time over time as it is assumed to be higher values not only globally but also in same state.

Fig. 3: source: (Dassel, K., Eckermann, 2013)

The main factors of success of MENA's SEZs are different and some may be useful to improve the experience of the other countries.

The below table show the main characteristics (Figure 4):

Characteristics	MENA's countries
Government Goal	Diversification Economy and Free Market Opening
Primary recipients	Foreign Investments (FDI)
Types of firm	Large and Small Businesses
Nature Action	Commercial
Types of zones	Exporting processing / trade zone Industrial zone

Fig. 4 – source: our elaboration from: Esposito, P. Ricci, P. Iovino, F. (2017).

CONCLUSIONS

In spite of the economic advantages of the international experiences of the SEZs, it is not possible to analyze and observe the different elements of critical and institutional and democratic weakness that the SEZ mark and determine by influencing the economic policies of the promoting countries, linked to the fact that tax reliefs are directed only to certain categories of companies, and that, moreover, the increase in the employment of subsidized companies is mostly offset by the reduction in non-subsidized ones. Secondly, more than favoring new employment, tax relief incentives the shift of production activities from the neighboring non-incentivized areas to the EZ (De Blasio, Accetturo,

2007). If you want to encourage the creation of an enterprise with the Zfu, you must be sure that these will remain in place for a sufficient number of years. The current nine-year exemption period appears reasonable. However, the appropriations do not keep their promises. The criteria for identifying Zfu must be transparent and based on objective indicators of urban degradation. It would be desirable for the Ministry of Economic Development to provide an indication of the eligible urban areas, together with those already identified as Zfu. Based on objective indicators it allows to limit the distortions induced by local political interests; facilitating and facilitating, it also submits the evaluation activity. The Zfu represent smaller portions of the municipalities of which they are part, but the evaluation activity - necessary to understand whether the intervention works or not - is currently limited by the availability of data to a level of aggregation finer than the municipal . It would be desirable for the start of the experimentation to take place at the same time as a commitment to collect information, without which we will never know if these interventions have been served or not. The collected data should not refer only to the areas that will be identified as Zfu, but it would be advisable to have information also on the candidate areas to become Zfu, and then excluded, and which represent the natural control sample (De Blasio, Accetturo, 2007).

FROM THE UFZS TO THE SEZS: THE ITALIAN CASE¹

Iovino, Felicetta; Paolo, Esposito

Department of Law, Economics, Management and Quantitative Methods, University of Sannio, Benevento, Italy

ABSTRACT

The economic crisis, but also specific territorial conditions, have led many countries to adopt measures aimed at attracting national investments, but also international ones. In this context, the UFZs were introduced in Italy. However, this intervention showed some critical issues that led to the establishment of the SEZs. This paper, after the presentation of the UFZ phenomenon in Italy, illustrates its main negative aspects. In order to overcome these, the creation of the Italian SEZs takes place.

Keywords: Urban Free Zones (UFZ), Special Economic Zones (SEZ). Advantage Taxation,

1. INTRODUCTION

The concept of special economic zone presents many ambiguities due mainly to different semantic specifications. There are also many definitions and international acronyms of the Special Economic Zone, more than three thousand according to some scholars (Klugmann, 2013), which vary from country to country; ZED in Cuba, ZEDE in Ecuador, SEZ in China, India, Africa (ICE, 2010), Australia; Free zone in the United Arab Emirates, LEAP or EZ Zones in the United States (Hodge, Komarek, 2016). However, all the definitions refer to the granting of tax concessions, regulations and even administrative ones, allowing a notable simplification of operations. The most widespread notion is the Special Economic Zone (SEZ), or Special Economic Zone (ZES), in Italian. This area is special precisely because it is an area within a country to which legislation is applied, particularly tax and administrative, which provides numerous exemptions and simplifications, such as to attract the interest of foreign investors. In fact, they are attracted by the possibility of receiving substantial tax, financial and financial benefits. A Special Economic Zone (SEZ) is an area, portion or geographical area with its own (Mises, 1998; Romer, 2009; Esposito, 2012, 2014, 2015) and different (Lavoie, 1982; McLauren, 2017) tax legislation compared with the legislation in force in the SEZ settlement country (Moburg, 2013) as a tax lever for free business activities (Ricci, 2011), policy or reform or tax reform (Ricci, 2010) and also for ecological purposes (Monagham, Nort, Southern, 2016; IGBC, 2015). The

* The paper is the result of a collaborative work. However, it's possible to attribute to Felicetta Iovino: the results of Italian UFZs and SEZs in Italy; the other sections are of Paolo Esposito.

attraction of foreign investments, particularly multinationals, is the main reason for the creation of SEZs (Mises, 1998, Bauer, 2000, Moberg, 2013, Boettke and Moberg, 2013). The first and largest SEZs have been created in China since the 1980s (Zhao, Kuo, Wang, 2016), but there are also many in Europe (Madeira, Poland, Latvia) and Africa (ILO, 2012) also if many free zones have similar characteristics. The primary objective of the SEZs is to allow rapid economic growth through the attraction of investors, including foreign ones. The improvement of the conditions of life and economy of the country thus passes through the inflow of wealth from other states. The SEZs become catalysts of the workforce, determining a strong demand for human resources, coming from the whole area of reference. Many countries have experienced experiencing a real economic boom following the creation of special economic zones.

The aim of the paper is to highlight, through an analysis of the literature and other secondary sources, the phenomenon of UFZs in Italy and the main reasons that led to the creation of the SEZs. In fact, the main research questions are:

Q1: What are the characteristics of UFZ in Italy?

Q2: What are the main reasons for their creation?

Q3: What are their greatest critical issues?

Q4: What are the peculiarities of the SEZs in Italy?

The paper is first and foremost articulated in a section that identifies the main characteristics of the UFZ in Italy and the process that led to their creation. Then follows a paragraph that outlines the main results of the experience of the UFZs, then a further paragraph describing the introduction of the SEZs in Italy and finally the final considerations.

2. THE ITALIAN URBAN FREE ZONES (UFZ): A DEVELOPMENT TOOL FOR LOCAL FINANCE

The urban free zone (UFZ) is a subject of considerable appreciation for the development of the territory in Italy. In fact, the Italian Ministry of Economic Development - Department for Economic Development and Cohesion has identified 22 UFZs in the national territory (MEF, 2009). The tax lever, a distinctive feature of the UFZ, is indisputably the most effective means of promoting and sustaining the growth and attractiveness of investments.

The Urban Free Zone (identified for the first time in France in 1996) (Di Risio, 2011) is a fundamental means to concretely intervene in the realization of local development. It is one of the different ways of "taxation of advantage", which arose from the outset precisely to ensure certain areas - a district, a port, an area of production - those tax and regulatory facilities that determine real commercial and

productive spaces. The UFZs are among the tools that are more oriented towards solidarity rather than economic objectives (Scrofani, Leone, 2016).

The creation of the UFZs was established by the 2007 Finance Law, then amended by the 2008 Finance Law. These areas were to arise in those urban areas and districts characterized by high social and economic disadvantages quantified by the socio-economic disadvantage index calculated through the combination of four indicators of socio-economic exclusion, each identified for the areas concerned: unemployment rate, employment rate, youth concentration rate, schooling rate (Luchena, 2016).

The tax benefits deriving from the creation of the UFZ are embodied in a series of fiscal and social benefits for small and micro enterprises that start new activities in the area and specifically (MISE, 2015):

- total tax exemption from income tax for individuals and natural persons (IRES and IRPEF) for the first five years of tax;
- exemption from the regional tax on production activities (IRAP);
- exemption from the municipal property tax;
- total exemption from the payment of social security contributions to employees (Barabino, 2017).

These exemptions are progressively reduced starting from the sixth year of the activity (60% from the sixth to the tenth, 40% for the eleventh and twelfth, 20% for two consecutive years).

These exemptions and simplifications are contained in the Interministerial Decree 10/04/2013 as well as in further measures (Legislative Decree 179/2012, Interministerial Decree of 21/01/2014, Decree No. 78/2015, Decree No. 244/2016; MISE 10/03/2016, Decree No. 50/2017).

By means of these benefits (tax, regulatory, administrative and social security), the FOM mainly aims to stimulate, incentivize and root the business activity locally in areas with significant social and economic disadvantages. The measures implemented for this purpose are of a social-welfare nature and aim at reducing the hardship of the resident population and increasing the dynamism of the area. To all this is added also the fight against delinquent phenomena, unemployment and undeclared work.

The implementation of the UFZs, however, is not new. In fact, other countries have spread this tool on their territory in order to promote their business fabric. For example, the United Kingdom has created the Enterprise Zones (24 only in England). They are generally focused on a specific sector and offer different incentives and tax breaks for startups in the first five years of life. In this way, they promote the registration in the country of patents and intellectual property deriving from industrial research. Furthermore, the recognition of a tax credit on R & D is envisaged which makes it possible to make the country attractive even in times of economic crisis and possible tax losses for companies.

The administrative procedure on the UFZ

The definitive document establishing the UFZs provides that particular benefits are to be assured to the urban areas of 22 Italian cities with significant social disadvantages.

The DPS has been responsible for coordinating the process between the institutions concerning the presentation and evaluation of the proposed projects. The objective indicators were used to identify the areas. They were based on the infra-municipal data of the 2001 census.

After obtaining the favorable opinion of the National Conference on March 25, 2009, the technical proposal drafted by the DPS was approved by the CIPE at its session on May 8, 2009. These forecasts were merged into a "Dissemination and award resolution to 22 Urban Free. Areas for fiscal and social benefits in favor of new production sites".

The approval of the CIPE was the central step for the implementation of the prepared final document. On 11 June 2009 the DPS initiated the notification procedure for the aid scheme, registered under no. 346/2009, to the competent services of the Competition DG of the European Commission. The obtainment of the European authorization allowed the effective entry into force of the benefits envisaged by the operating rules indicated by the Ministry of Economy and Finance.

UFZ policy

22 Italian cities include the areas identified by the CIPE in 2009 for the first experimentation of the UFZ instrument.

The areas in which the first UFZs are present are located at:

Andria, Cagliari, Campobasso, Catania, Crotone, Erce, Gela, Iglesias, Massa-Carrara, Lamezia Terme, Lecce, Matera, Mondragone, Naples, Pescara, Quartu Sant'Elena, Rossano, Sora, Taranto, Torre Annunziata, Velletri, Ventimiglia

Over time, the number of UFZ has increased significantly, prompting the Italian Government with the two-measure 2016 Stability Law. First of all, the territory of the UFZ has been limited to that identified by the CIPE resolution no. 14 of 08/05/2009 (Law 208/2015; Luchena, Rinaldi, 2016; Chamber of Deputies, 2017). Furthermore, the creation of new areas in Lombardy was planned and subsequently by Decree no. 50/2017 also in the municipalities of the province of Rieti affected by the earthquake.

Municipalities have been the central actor in the process of identifying urban free zones. In fact, the municipalities had to identify the areas, formulate the proposed projects, identify the management methods and plan other and possible investments to be carried out on the same territory in order to maximize the overall results of the interventions.

The Circular of the DPS of 26 June 2008 specified that the project proposals were sent to the structure responsible for the single Region in the terms indicated in the CIPE Resolution no. 5 of 30 January 2008, published in the Official Gazette of 6 June 2008.

The municipal administrations have formulated their project proposals by preparing a specific document, which has indicated in detail:

- the presence of eligibility requirements for the municipal territory;
- the presence of eligibility requirements for the identified UFZs and their goals;
- the calculation and extent of the socio-economic disadvantage index (IDS);
- the reasons for the UFZ proposal;
- the management methods of the project;
- the indication of further and possible programs and projects for the upgrading of the areas indicated.

In order to facilitate the technical investigation of the administrations involved, IL DPS attached to its circular a type of index that indicated in a structured way the information required in order to adequately prepare the project proposals. The introduction and effective functioning of the UFZs guarantees a real growth and development promotion potential, especially in addition to additional incentives aimed at encouraging small and medium-sized enterprises. In fact, these measures can create positive conditions capable of attracting investments. This can promote the growth of the Italian economy through the opening of new companies and production facilities, the reorganization of existing companies and their financial capitalization. In this way a virtuous circle will be created, capable of creating new jobs and the emergence of an economy of knowledge.

3. RESULTS OF ITALIAN UFZS

The general economic crisis has forced most governments in different countries to adopt integrated measures that would combine the search for economic competitiveness along with social cohesion and the enhancement of territories. In this context, the UFZs in Italy were introduced. Significant progress has been achieved in granting the benefits in January 2015 compared to L'Aquila's first experience, by virtue of the use of digital procedures (De Angelis, Pagliarini, 2016).

Nevertheless, the MISE (2015) data specify that at 31/01/2015 the average national indemnity benefit rate is only 31%. This data highlights how, in reality, the objective of economic and social development of the territories included in the UFZs is achieved only modestly. Furthermore, it should be noted that among companies excluded from benefits there are "companies in difficulty", ie all those companies that lost $\frac{1}{4}$ of their subscribed capital or those involved in insolvency proceedings in the previous year. Among these companies, there are many of the s.r.l. with a share capital of 1 euro, whose establishment took place with the aim of promoting economic and

social development (Esposito, P., 2015).

It must be considered that from the initial 22 initial UFZs, 46 have been reached, plus another 10 out of the convergence target called UFZ of the second generation. The 2nd generation UFZs have been created to tackle emerging events such as earthquakes and floods. However, they have substantially changed the original objective of the social and urban recovery of the areas concerned (Scrofani, Leone, 2016, MISE, 2015). In addition, an "enveloping effect" is added which can cause more difficulties than advantages. In fact, initially a maximum of 2 UFZ were foreseen per region, but this limit has long been overcome by dispersing the sense of the interventions. Faced with inert legislation, politics has often intervened without adequate tools to understand and tackle risk, but by creating mixtures with opportunistic political bets "(Ricci, 2015) .This way, the excessive spread of free zones has This has certainly led to exaggerated inequalities between areas outside the area often characterized by tax evasion and the free zones that instead benefit from tax incentives without them becoming a real factor in The tax advantage for some areas could therefore result in a disadvantageous taxation for the neighboring territories excluded from the free zones (Esposito, Ricci, 2015) .The urban free zones are certainly at least an intention to develop, but they also have considerable risks that are often unavoidable. These risks include the transfer of operational sites, the constraint of development in an area, the abandonment of neighboring communities by families and businesses, and the risk of not respecting the identity and vocation of a given territory (Esposito, Ricci, 2015) beyond that probable phenomena of clientelism. A further critical element is also the temporary nature of the interventions, in particular for the areas in which emergencies have arisen due to natural disasters (Buccico, 2008). In fact, the time forecast may seem reasonable, but the lack of funds does not allow the intervention to be lasting and effective (MISE, 2015; Luchena, Rinaldi, 2016; Scrofani, Leone, 2016; De Blasio, Accetturo, 2007) also in terms of perception (De Leo, 2011).

Therefore it is first of all necessary to increase the funds available for these instruments. Furthermore, an increase in coordination between Municipalities and the central government, as well as greater responsibility of the former in identifying the SFVO (Svimez, 2016), will reasonably allow the FUT instrument to become more effective by bringing it back to the original project. Greater control over the benefits granted and the measurement of the real impact on the area will allow a more accurate selection by the UFZ of the companies to be financed.

Finally, the performance of the UFZs can be isolated from those of other economic forces, and this makes it possible to consider these bankruptcy areas, precisely because they do not meet the development objectives of the territory that they had set themselves with their creation.

4. SEZS IN ITALY

To meet the critical issues that emerged from the experience of the UFZ in Italy, the Government has planned the establishment of SEZs in the south of the country. Their creation constitutes a partial overcoming of the UFZ in Italy, but also and above all a greater focus on the more strictly economic aspects.

In fact, also on the basis of similar experiences in other European and non-European countries (Esposito, P., Ricci, P., Iovino, F., 2017), in particular those on the shores of the Mediterranean, art. 4 co. 3 of the law decree n. 91 of 2017, converted by law n. 123/2017, envisaged the establishment of the SEZs.

Subsequently the Decree of the President of the Council of Ministers n. 12 of 25/01/2018 approved the regulation for the creation of SEZs in Southern Italy.

The purpose of these SEZs is to offer favorable tax, regulatory and administrative conditions in order to relaunch the port areas and those connected to them. They have some characteristics. First of all, SEZs may arise in the southern regions (Abruzzo, Basilicata, Calabria, Campania, Molise, Puglia, Sardinia and Sicily) for a maximum extension provided for by the regulation with which their creation was approved (Villani, M. Attanasi, F., 2018).

Furthermore, they must be created in port areas and also economically linked to them with three characteristics:

- must arise within the confines of the State, in a clearly delimited and identified geographical area;
- may also consist of areas that are not necessarily contiguous, provided they have an economically functional link;
- include a port area connected to the trans-European transport network (Article 3).

The SEZs can also be interregional if a region does not have port areas. In fact, they will be able to associate with another region that has at least one port area and present proposals of interregional SEZs (Article 4).

The establishment of the SEZs takes place with a specific procedure.

First of all, each region concerned must submit a strategic development plan of the SEZ that identifies all the characteristics of the SEZs and the relevant areas concerned, together with the SEZ's proposal (Article 5-6).

The President of the region, after hearing the mayors of the areas concerned, presents, in compliance with the state aid regulations, the development plan to the President of the Council of Ministers. The actual institution of the SEZ will take place through a special decree of the President of the Council of Ministers, on the proposal of the Minister of Territorial Cohesion and the Mezzogiorno (Article 7).

The advantages deriving from the establishment in the SEZ area are foreseen in the same regulation as the institution of the President of the Council of Ministers, however the individual regions can foresee further advantages for what they are responsible for. In fact, the investments made in the SEZs will enjoy a tax credit proportional to the cost of the purchased goods, by 31/12/2020, within the maximum limit, for each investment project, of 50 million euros. This measure was specifically introduced with the aim of encouraging the establishment of large international companies, also in order to make South Italian ports more and further open to transactions on a global scale.

In order to achieve real economic development of the SEZ areas, the regulation (article 7) provided for the revocation of benefits for those companies that will not keep their companies for at least 7 years in the areas covered by the intervention or that the company is in a state of liquidation or dissolution. Similarly to what is already happening in other countries, a special management and administration authority has been set up by the SEZ, ie a Steering Committee (Article 8), consisting of a representative of the region, the Presidency of the Council of Ministers, the Ministry Infrastructures and the President of the Port Authority.

At present, the SEZs of the Campania Region and Calabria (Lamboglia, A., 2018) are constituted by specific decrees of the President of the Council of Ministers of 11.05.2018. The establishment of an inter-regional SEZ between Puglia and Basilicata (USB, 2018) is being defined. The main distinctive features of the two interventions promoted in Italy are summarized in the following figure (Fig. 1):

Differences	Italian SEZs	Italian UFZs
Government Goal	Development of Southern economy	Development and recovery of local communities
Primary recipients	Foreign Investments (FDI) and Italian investments	Italian Investments
Types of firm	Large and Small Businesses	Small and Micro Businesses
Nature Action	Commercial	Economic-Social
Types of zones	Exporting processing / trade zone Industrial zone	Urban free zone Rural Development Areas

Fig. 1 – source: our elaboration from: Esposito, P., Ricci, P., Iovino, F., (2017).

5. CONCLUSIONS

From the Law n. 296/2006 (art.1, code 341/341 / ter) which established the Urban Free Zones to the circular of the Inland Revenue no. 39 / E of 24/12/2013 and the subsequent measures that respond to application problems, years of long travails have passed in order to favor a process of recovery and development of micro and small Italian companies. The disturbing data that emerges from the first

surveys of the experiential results of the Urban Free Zones in Italy, is linked to the uncertainty and uncertainty according to which the tax exemption may have favored or helped to foster an increase in development and which are the limits of these measures.

Admitted to the tax benefit in Italy, of such facilities, were and are micro enterprises (which have less than 10 employees and have a total annual budget that does not exceed 2 million euros), small businesses (with less than 50 employees and a budget total annual amount not exceeding 10 million euros) in full of their activity and regularly registered in the Register of Companies on the date of submission of the application (whose deadline expires on 28 April next), but also professional firms that carry out their own activities in the form of an enterprise within the ZFU area and regularly registered in the same register.

Among the excluded, "companies in difficulty", ie those companies that lost $\frac{1}{4}$ of their subscribed capital in the previous year or those companies involved in insolvency proceedings. The paradox is that this category also includes srls, simplified companies that, born with a minimum capital of 1 euro, under-capitalized, not solving meta-cultural and then business economic issues, such as the dimensional between ownership and control, and the size of capital and investments in a tax liability regime. From the first experiences in Italy, in fact, many perplexities emerge regarding the inorganicity between the original design of the legislators and the subsequent directives implementing the law. One of the oddities is that if at the central level there is a tendency to encourage continuity of development in the ZFU, at local level, for example in some municipal administrations, a process of discontinuity and exclusion of some roads with commercial realities has been carried out. very respectable. Thus, while opportunities are offered to nearby local businesses, the boundaries of the free zone have been set in order to secure tax revenues. In fact, the absolute lack of a participatory concertation and horizontal subsidiarity is recorded in an alarming manner. A further limit can be found in the quantitative dimension of the free zones. For a total of 22 ZFU on a national scale, it was emphasized that only the four regions of the "Convergence Objective", ie Campania, Calabria, Sicily and Puglia, had according to the latest available data of the Italian Ministry respectively 9, 7, 17 and 11 ZFU. The Italian Italian legislator has moved between empty political and regulatory, without having the appropriate tools to interpret and tackle the risk, confusing the latter with opportunistic political bets (Ricci, 2014). Therefore the excessive diffusion of the free zones has generated action spans that are too close together that risk creating excessive inequalities between areas excluded from the area in which the process of tax exemptions and free zones are active, which benefit from tax concessions without being at the same time as a development factor for those who are not exempt. Taxes of "advantage" for some areas therefore risk translating into "disadvantaged" taxation for adjacent territories excluded from free zones.

Ultimately, the urban free zones, in addition to being a driving force for development, also entail unequivocal risks, including the relocation of the operational headquarters, the development constraint in a single area (given the five-year residency requirement in the ZFU for 30 % of employees of non-sedentary companies), the abandonment of neighboring communities by families and businesses and the risk of not respecting the identity and vocation of a given territory.

A CONCEPTUAL FRAMEWORK AND RESEARCH PROPOSITIONS ON RESOURCE SEEKING CHINESE FIRMS MODE OF MARKET ENTRY IN EMERGING MARKET

Iwaloye, Ojo Olukayode

Macau University of Science and Technology, School of Business, Avenida Wai Long, Taipa, Macau

ABSTRACT

In the past three decades there have being an increase in the number of Trade Agreements (BTAs) globally. These agreements involve huge human and financial movements and are essentially based on trade and investment. This phenomenon has brought new dimension to global business environment by changing the landscape in which firms from emerging markets operate in another emerging market. In the light of this, this study conceptualizes how trade agreements provisions influence choice of foreign market entry mode of resource seeking Chinese Multinational Enterprises operating in Nigeria. Model that integrates Dunning's OLI theory, Resources Dependency Theory, and Institution theory was developed to investigate eight research issues.

Keywords: Bilateral Trade Agreement, Chinese Resources Seeking Firms, Mode Of Entry, Oli Theory

I. INTRODUCTION

Nigeria and China have signed a number of bilateral trade and investment agreements. It is important to know how Nigeria –China relation pattern merges trade and investment to resolve issues of ownership and location disadvantages. This study fills this gap by developing a model to investigate bilateral trade agreements influences on Chinese firm's specific advantages and location advantages in Nigeria. The joint effects of ownership advantages (firm's specific advantage) and location advantages are examined to determine the Choice of foreign entry mode of Chinese MNEs in Nigeria. This study bridges the gap and supports the need for theory building and empirical efforts within the global marketing research community

The model developed in this study makes a contribution to theory for the study of market entry modes of MNEs from developing countries entering another developing country. In this case, Chinese resources seeking multinational firms entering Nigeria. Elements of Dunning's OLI theory, Resources Dependency Theory, and Institution theory extended for the purpose for the theory development process. It also provides important information to assist state policy actors in their development of

trade agreements between China and Nigeria. Implications for firms and their involvement in developing countries and with framework where trade agreements exist are also provided.

II. RESEARCH BACKGROUND

The rise of China as an economic and political power has stimulated research interest into FDI in China and the FDI activities of Chinese multinational enterprises. For example, Pan and Tse (2000) recognized the important drivers of over 10,000 Chinese firm's foreign direct investments. Also, Jiang (2005) considered open policy of government and other location variables as important entry factors for foreign firm investment in China (March, 2004). Rajan and Pargarkar (2000) applied Dunning's eclectic paradigm to identify that strategic motivation is a critical factor in deciding the foreign entry mode decision of Chinese firms.

Choice of entry mode is therefore a critical strategic decision for firms wishing to operate in emerging markets. It is also a significant decision for multinational enterprises from emerging markets pursuing cross border expansion in emerging or developing markets. Apart from the fact that there is a paucity of empirical study on the effects of bilateral trade agreements on choice of market entry mode, there has also been limited research focusing on the activities of resources seeking firms in developing countries. These are important gaps in empirical literature. In particular, the issue of how 'State sponsored' resources seeking multinational enterprises from emerging markets in general, and China in particular, behave across their borders demands more attention (Yamakawa, Peng and Deeds, 2008, Xu, Hu and Fan, (2011); Peng, 2012).

Drawing from above discussion, three main theories form the basis of the model development for this research work. Dunning's OLI Theory is the main theory from what the current framework is developed. The other two theories are the Institution Based View (IBV), and Resource Dependency Theory (RDT) with a branch of Resource Based View. The theories are widely used in business and marketing literature to explain the cross border activities in term of choice of location of multinationals firms. Unlike other theories on multinationals activities, according to Dunning (2006) and Demirbag, Tatoglu and Glaister, (2009), OLI paradigm is based on the systematic relationship between the determinants of foreign direct investment flows of ownership, location and internalization and the stage and structure of economic development of a country. While a new generation of researchers (Peng, 2012; Meyer, 2009) suggested that institutions are much more than a background condition in emerging markets.

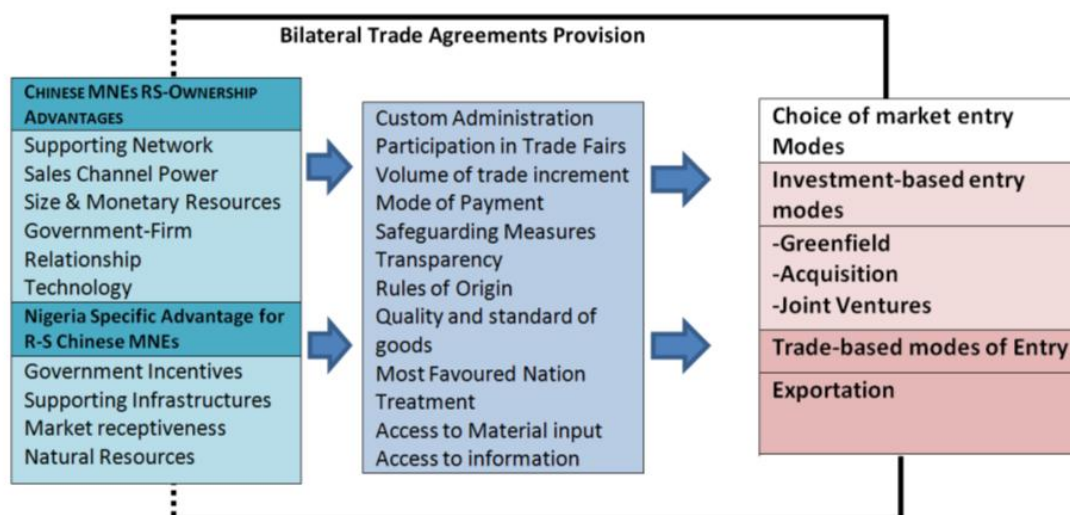

The differences in the institutions framework between the advanced markets and emerging markets call for new entry mode models. Therefore, as the reader will become aware, the incorporation of the three theories is essential for this model development. Indeed, the use of institution theories and

Dunning's OLI framework are complementary in recent research works by Dunning, (2006) and Demirbag, et. al. (2009). It is also in response to the work of Guisinger, (2001) and Demirbag, et. al., (2009) who suggested that institution variables such as country legal and regulatory framework have been relatively unexplored. Therefore, this model is assembled to study Nigeria-China bilateral trade agreements provisions and their influence on resources seeking Chinese MNEs Ownership advantages and Nigeria location specific advantages and the resulting choice of entry mode of Chinese resources seeking MNEs.

III. FRAMEWORK FOR RESOURCES SEEKING CHINESE FIRM'S CHOICE OF MARKET MODE OF ENTRY

The focus of this conceptual paper is to investigate how bilateral trade agreements (BTA) provisions between China and Nigeria influence market entry mode choice of resource seeking Chinese firms operating in Nigeria. In this present research, we propose a framework (Figure1) for understanding the interactions among institutions, resources and OLI variables, for the purpose of studying the research problem. When combined, institution and resources variables on one hand help to identify BTA provisions that facilitate and direct interactions between firms and markets, in this case Chinese firms operating in Nigeria. The OLI variables are in right and left boxes on Figure 1 below. The box on the right accommodates the O and L variables while the right box brought together the L variables in OLI theory. The BTA provisions, the middle box are institution and resources dependency theory variables. The connections among the elements that underpin the study are discussed next

Figure 1

Source: Dunning, 1977, 1988...2013; Agarwal and Ramaswami, 1992; Ahuja, 2000; Eden, Thomas and Olibe, 2003; Stoian and Filippaios, 2008; Meyer, Estrin, Bhaumik, and Peng 2000, 2009, 2012; Davis and Cobb, 2009; Crotti, Cavoli and Wilson, 2010; Demirbag, Tatoglu and Glaister, 2009; Obiwuru, Oluwalaiye and Okwu, 2011;.....

The concepts of institution based views of global business and resources dependency theory are combined to complement John Dunning OLI theory to arrive at the development of the model. The model provides the framework to assemble the elements that underpin the study of how BTAs provisions influence choice of market entry of resources seeking Chinese MNEs operating in Nigeria. Expanding OLI theory by incorporating institution and resources based theories is in accordance with Dunning's propositions (Dunning, 2006) that the institution determinants can also be firm as well as location specific. Examining the influence of institution variables in the realm of BTA provisions is also in tune with Dunning's propositions because it is described as another form of ownership advantages build by a firm to gradually use to interact with their home and host institution environment (Stoian and Filippaios, 2008). BTA provisions that are institution-constraining devices govern the relationship between the firms and the country to minimize uncertainty and dependence as well as maximize resources autonomy for the firms in the host country (Davis and Cobb, 2009).

Taking the discussion from this point of view, Meyer, et. al., (2009) considered the interaction of institution based view of global business and resources dependency theory to determine selection of entry modes into emerging markets. They combined these two theories that provide theoretical pillars to develop this model. The situation becomes complementary when BTA provisions which are institutional factors directly or indirectly combined with a firm's and a country factors to influence management decision of a firm on choice of market entry mode. Also, the combinations of a firm's (ownership advantages) and a country's (location advantages) factors were found by Agarwal, et. al.,(1992) and Meyer et al.,(2009) as necessary requirements that guide firms to select an appropriate market entry mode into a foreign markets. The reason is that strong ownership advantages gain additional rent on location advantage and vice versa, and influence mode of entry into foreign markets (Eden, Thomas, and Olibe, 2003)

The framework in figure1 is reassembled to include five resources seeking Chinese firms' advantages (O) and four Nigeria location specific advantages (L), and the relevant BTA provisions for firms to operate in Nigeria. The O and L factors navigate and sieve through the BTA provisions to determine choice of market entry mode decision (L) of resources seeking Chinese firms in Nigeria. The five constructs of resources seeking Chinese firms' advantages and four Nigeria specific location advantages are selected using Dunning's work as a guide. The eleven BTA provisions identified in the model/framework are legal and regulatory institution variables associated with the two concepts of institution base view and resources dependency theory (Meyer, et al. 2009). They are brought together to consider the influence BTA provisions on firm's and country's specific factors in determination of foreign firms level of involvement to access local resources.

IV. RELATIONSHIP BETWEEN BTA PROVISIONS AND RESOURCES SEEKING CHINESE FIRM'S OWNERSHIP ADVANTAGES

As identified earlier the Chinese firm's Ownership advantages are different from most of firms from advanced countries. What Chinese companies lack in terms of established brand, experience, know-how capabilities are substituted with the following factors. These include supporting network, sale channel power, size and monetary resources, government relationship and Chinese technology (Iwaloye, 2014). Ownership advantages are measure of risk inherent in the products, services and process possessed by the firm. These Ownership specific factors affect directly the perception of the need to control the international operation (Brouther et al. 1996). According to these authors, management of firms with tacit firm's specific factors will be more likely to choose high degree of entry modes (investment-based modes). Management will like to control its specific assets. This research explores the influences that BTA provisions have on four resources seeking Ownership advantages listed above.

Also, from earlier discussion, BTA provisions are institutional variables. How do they influence the firm's Ownership advantages of Chinese firms at market level The first primary step to know the level of influence of BTA provisions is to determine how these institutional variables reduce the cost and perceived risk. When these variables are unable to reduce the risk associated with internalizing firm's specific factors, the firm may not commit its resources and invariably choose a lower degree of entry mode. In like manner, when both provisions and firm's Ownership advantages possess high tendency to limit the perceived risk, the firm is likely to embrace high degree of entry mode.

BTA provisions are institutional arrangements that aid trade and investment relationship between China and Nigeria. The provisions perform two important functions. It helps the government to achieve macro level marketing activities like what firm does at micro level. Also, it influences firm's ownership and location advantages to achieve micro level objectives of the firm. For example, institutional arrangement as in the case of BTA provision is a strategic tool to achieve firm's objectives of internalization. These provisions influence firm's ownership advantages to support the voluntary exchange of what underpinning an effective market mechanism. Provision such as *access to natural resources* on availability of resources possesses economic and strategic reasons for resources seeking Chinese firm to internalize its ownership advantages. Also, preferential treatment in the form of most favoured nation treatment can go a long way to assist firm in its cross border activities to get favour and attract consideration in policy formulation. *Access to information* BTA provision on the other hand embraces the culture of openness and accountability in every business transaction. A good example is a situation where the firm does not need to spend more resources searching for information about business partner.

The *administration of customs* duties is another major provision. It is a vital tool which assists government in the allocation of investment incentives to representatives of parties involved in bilateral trade agreements. Besides custom administration, there is a BTA provision to increase volume of trade between each other. Other bilateral trade agreements provisions are mode of payment and safeguarding measures provisions to secure assets and properties. From these few indications, BTA provisions are measures capable of reducing costs of engaging production and marketing activities in foreign markets (Sharma, et. al. (2004). When institutional framework of BTAs strengthens a firm's specific factors, it possesses the tendency to lower the cost of doing business in the market. In addition, it reduces perceived risk and increases the likelihood of firms committing resources in such markets also too. Also, MNEs prefer high degree of entry mode (Wholly Owned) when there are positive relationships between host and home countries (Demirbag, McGuinness, and Altay, (2010). On the other hand, BTA provisions may influence Ownership advantages indirectly. We consider a situation in which BTA provision are unable to ensure effective use of firm's Ownership advantages to support the voluntary exchange underpinning an effective market mechanism. For example, BTA provisions such as *custom administration* may be undermined by corrupt practices of the officials and preferential treatment to local firms. Also, the realization of trade volume increment advantage to firms from the involving countries may be hindered by legal restrictions emanating from host country. All these increase the costs and perceive risks associated with dealing within weak institutions (Meyer, et. al. 2009). At this junction, it is imperative to briefly examine each firm's Ownership advantages as identified in the model to generate the research issues.

V. RELATIONSHIP BETWEEN BTA PROVISIONS AND NIGERIA LOCATION ADVANTAGES

Location advantages are the measures of risk perceived in the marketplace which may be brought about by institution factors such as legal and political dimensions in the country. Therefore, market conditions due to institutional factors affect the commitment of resources by management of MNEs firms. A location with high location advantages make firms willing to commit resources and likely to enter with high degree of entry mode than a market where location advantage is low (Meyer, et al. 2009). To understand these two combinations of high location advantages and high degree of entry mode, we need to integrate both formal and informal institution and resources as integral part of country's specific advantage (Dunning et. al., 2008). In this case, BTA provisions, which are institutional factors, are able to influence a country's location advantages to create favourable condition for internalization of Ownership advantages of a firm.

Resources seeking MNEs in emerging economies need host market favourable institutions and country specific factors that will favour firms to internalize their ownership advantages. The availability of supporting infrastructures and good government policies in a politically stable environment is important to firms that are resources seekers these factors provide access to acquire the resources. When the BTA provisions support location specific variables, and access to them, they make the market to be highly attractive to foreign investors. For example, custom administration BTA provision can reduce cost of mining operations of raw materials by foreign resource seeking firms. In this situation, MNEs would probably use contracts to arrange most transactions and select high degree of entry mode (Meyer, et al. 2009).

On the other hand, when institution variables in the realm of BTA provisions are not influencing the location factors, MNEs may not be able to rely on its various ownership factors to access their resources. For example, High degree of entry mode may not be the best option if financial market is inefficient, legal framework ineffective and infrastructural facilities are not available. Where this is the case, foreign MNEs may prefer low level of control in order to minimize risk. In this situation, the foreign firm in need of local resources will form partnerships with local firms; the tendency of contributing resources together and sharing control will be an option (Meyer, et. al. 2009). In this present research, there are four specific advantages that distinguish Nigeria location from another country because they enhance the use of ownership advantages to make it attractive investment destination for resources seeking Chinese firms. Some of these location factors specific to Nigeria include availability of natural, supporting infrastructures, government incentives and market receptiveness. The four location specific attributes are relevant for this analysis. The influence of BTA provisions on each of these variables will help us to generate research issues needed to investigate the research problem. The next session provide us the opportunity to develop the eight research issues designed to investigate how bilateral trade agreements provisions between Nigeria and China influence the choice of market entry mode of resource seeking Chinese firms operations in Nigeria.

VI. DEVELOPMENT OF RESEARCH ISSUES

The development of research issues for this study commenced with the formulation of the framework and the establishment of the relationship between ownership advantages of resources seeking Chinese firms, Nigeria location advantages for resources seeking Chinese firms and the influence of BTAs provisions. This provides the bases for the generation of eight research issues formed to explore the influence of BTAs provisions on choice of market entry of resources seeking Chinese firms operation in Nigeria. The four research issues that guide the development of four research issues related to ownership advantages of Chinese firms operating in Nigeria were formulated.

A. Development of Research Issues on BTA Provisions Influences on Resources Seeking Chinese Ownership advantages

China and Nigeria BTA provisions influence firm's Ownership advantages to create an added value that can give Chinese firms a competitive edge. For example, BTA provision such as *access to natural resources* influences resources seeking Chinese firm's core competence of government relationship, supporting network, technology and size and monetary resources for sustainability and profitability. We now establish the relationship between BTA provisions and ownership advantages to form research issues guiding in the exploration into how BTA provisions influence choice of market entry mode of resources seeking Chinese MNEs in Nigeria.

Chinese Government Relationship

Chinese government plays positive role by supporting their MNEs in series of preferential arrangements at domestic and international levels (Rui and Yip 2008; Buckley, Peter, Adam, Hui, Liu, and Hinrich, 2008 and Liu, and Scott-Kannel, 2011). The support is spread across many areas such as provision of financial support, management autonomy, profit retention, low-interest financing, favourable use of home currency for exchange and reduced taxation (Wu, 2005). Access to huge investment funds from the government make resources seeking Chinese firms to be flexible in economic related matters. The influence of BTA may play a major role in the provision of financial supports to resources seeking Chinese firms in Nigeria. In the first instance, *access to natural resources* BTA provision which is directly related to *volume of trade increment* BTA provisions is directly related to government relationship factor of Chinese MNEs. The relationship at government to government level (G2G) encourages the firms to increase production and marketing activities (Sharma, et. Al. 2004) in Nigeria. For example, Chinese government financially supports resources seeking firms from China to fulfill the objective to sources for material inputs in emerging markets in order to provide for the growing manufacturing sector in China. (Gilroy, Gries, and Naude, 2005; Alden and Davies, 2006; Broadman, 2007 and Luo and Han, 2010)

To enhance resources seeking Chinese firms achieving the goal of sourcing for material input necessary for growth in China. Chinese government provided financial support (Morck and Zhao, 2008, pre-arranged preferential treatment (Chen, Lee and Li, 2003) and also less interfering in resources seeking Chinese firm's decision making exercise (Schüler-Zhou, 2012). McDonald, Warhurst, and Allen, (2008) provided the evidence that increasing operational **decision-making autonomy** is associated with enhanced performance. Also, Takeuchi, Shay, and Li, (2008) supported this empirical finding when they found that decision autonomy of resources seeking Chinese firms is significantly and positively related to foreign managers adjustment to institutional pressure. The

freedom assisted Chinese firm to use the similar experience from China to reduce delay in strategic decision making in Nigeria (Warhurst, and Allen, 2008).

Chinese government involvement in their firms' activities in Nigeria would be highly influenced by BTA provision such as access to natural resources and volume of trade increment. There is high tendency that Chinese firm will take the advantage of raw materials available in Nigeria, coupled with the provision to increase the volume of trade between the two countries. The provision of financial support to resources seeking Chinese firms is to support unhindered access to raw materials (Li, et al. 2003) and export of raw material from Nigeria to China. The support also helps to match importation of goods and services from China to exportation of raw resources from Nigeria in order to avoid trade deficit. Increasing trade involves Chinese MNEs to conduct activities in the host country such as outright foreign investment or exportation of raw materials. Therefore, we may explore how Chinese government-firm relationship is influenced by BTA provisions to determine firm's choice of entry modes, and leads us to the development of the first research issue:

Research issue 1: *How do BTA provisions influence home government relationship factor in the choice of resources seeking Chinese firm's market entry mode into Nigeria.*

Chinese Firm's Supporting Networks

Chinese firms are widely known to engage in extensive networking in search of opportunities and performance (Peng and Luo, 2000 and Mathew 2006). Supporting networks as a factor of Chinese MNEs has direct relationship with sales channel power because Chinese firms earn support through the linking of individuals and institutions in a knowledge and experience sharing type of framework (Ajayi, 2006). The relationship within the network and actors in distribution channel is positively linked to the concept of guanxi (Dickson 1996; Shapiro, et. al. 2009; Liu and Scott-Kannel, 2011). They do most of the distribution within their network and the source of their power is based on the value for respective relationship with members within the network in China. Therefore, the two constructs in figure 4.1 are combined together because they are interrelated because firms with these advantages may be influenced by a number of similar BTA provisions.

Access to natural resources and volume of trade increment BTA provisions help to increase trade and investment activities in both countries. There a good number of BTA provisions that serve as catalyst to the increment of trade and investment volumes. Transparency BTA provision, mode of payment, and safeguarding measures are BTA provisions with tendency to reduce risk associated with firm internalization. BTA provisions such as information sharing and participation in international trade fair have the ability to reduce the liability of foreignness. For example, relevant information gathered during the fair and business fora help Chinese firms to favourably dispose in making use of the

opportunities provided by sales channel power and support from different Chinese networks in Nigeria and China.

Deviating from above scenario, supporting networks that always benefit from preferential treatments from their home country may be forced to adhere to rules and regulations in the host country. Enforcement of legal obligations and conformity with state rules and regulations such as quality and standard of goods, for example, will invariably affect the internalization of these factors. Also, rules of origin provision in exportation and importation of goods and services may indirectly influence internalization decision of resources seeking Chinese firms in Nigeria. For example, rule of origin allow made in China mining equipment in Nigeria. The influence of BTA provision is fundamental consideration to the determination of Chinese firm's entry mode in Nigeria. It is important to investigate how Chinese supporting network and sales power channel are further influence by BTA provisions. The above issues lead us to the development of the second research issue:

Research Issue 2: *How do BTA provisions influence supporting networks factors of resources seeking Chinese firm's choice of market entry mode into Nigeria?*

Technology

Technology is a specific factor to Chinese MNEs in emerging markets (Gao, Woetzel and Wu (2003). Technological products and their spare parts from China are known to be cheap and available compare to those from advanced countries (Wai-sum and Chan, 1997; Giovannetti and Sanfilippo, 2009; Shi, 2010 and Rangasamy and Swanepoel 2011). In the same vein, emerging countries preference for giving tax holiday to investing firms may also provide opportunities for Chinese firms to bring their technology for production purposes to Nigeria (Nasrin, Baskaran, and Muchie, (2010).

On the other hand, Nigerian business and individual consumers may perceive risk in using Chinese brands of technology, like in US, for example, where the 19.1% of Chinese made products are regarded as substandard (Kiley, 2007). Such a situation could prevent Chinese firms to adopt investment modes of entry (Shige, Beamish and Zhao, 2004) no matter the level of influence gained from most favoured nation treatment and favourable custom preferential treatments. Chinese technology may not be seen as the best option to compete in the foreign market with competitors (Von Zedtwitz, Ikeda, Li, Carpenter and Hämäläinen, 2007), because BTA provisions may not be able to influence reduction of risk or increase economic gains. The quality of Chinese technology does not ensure long term stability of acquiring required natural resources in Nigeria. Shige, Beamish and Zhao, (2004) indicated that the management of any firm facing this type of conditions where its technology is substandard will likely select low degree of control of its resources in another country and embrace less commitment entry modes strategy (Kiley, 2007 and Grande, et. al. 2011). Also, firms with sophisticated **technologies** prefer high degree of mode entry (Javorcik and Saggi, 2010). We

would like to investigate if the influences of BTA provisions such as *volume of trade increment, custom administration and most favor nation treatment* on Chinese technologies may reduce or increase their commitment in internalization of their specific advantages in emerging markets. The above discussions lead to the development of third research issue.

Research Issue 3: *How do the influences of BTA provisions on technology support resources seeking Chinese firm's choice of market entry mode into Nigeria?*

Chinese MNEs Size and Monetary Resources

It has been noted that large firms with huge resources such as skilled labour and abundant monetary resources, together with suitable investment opportunities have greater tendency to move abroad (Dunning, 1988). From the resource-based theory viewpoint, Ahuja, (2000) found that firm with enormous size is a reflection of availability of sufficient resources and therefore lowers the inducement to enter into alliances. Larger firms with sufficient resources also prefer to fully own and control their investment than JV (Xie, (2013). The enormous monetary resources at the disposal of Chinese firms are being used to achieve wholly owned investment in emerging markets (Cheng and Lo, 2004, Morck and Zhao, 2008). For example, within Nigeria, *mode of payment* provision encourages parties to settle business transaction using their local currency, which is in direct support of Chinese government internalization of Remimbi (Yuan) (Wu, 2005) also¹. The problem associated with conversion to another accepted international currency such as USD, pound sterling and Euro will therefore be eliminated.

Also, the security of Chinese MNEs assets in Nigeria is guaranteed to some extent based on the *safeguarding measures* BTA provision put in place by the bilateral trade agreement between Nigeria and China. The provision allows the firm to enjoy 100% profit repatriation. It also provides for host government inability to create any fiat law in a bid to take over their firm. The firm will make use of its specific factors when the influences of these BTA provisions give resources seeking Chinese firms a competitive edge in term of cost advantage and economic rent. The BTA provision may further influence Chinese government to financially support Chinese firm's investment plan once it is in line to achieve the economic objectives of sourcing for material input in Nigeria. In this regards and since resources seeking Chinese firm's specific factors will enjoy cost advantages in economic terms in Nigeria, there is tendency that Chinese MNEs will favour investment modes choice of entry. The discussion leads in to the next research issue on the influence of BTA provision on resources seeking Chinese firm's size and monetary resources.

Research Issue 4: *How do BTA provisions influence the use of resources seeking Chinese firm's size and monetary resources in its choice of market entry mode into Nigeria?*

¹ The Nigeria Central Bank Governor, LamidoSanusi, today, Tuesday 6th September 2011, announced plans to invest between 5-10% of our foreign exchange reserves in China's currency – the Renminbi (RMB) or Yuan

A. Development of Research Issues on BTA Provisions Influences on Nigeria Specific Advantages for Chinese Resources seeking MNEs

There are certain specific location advantages in Nigeria that make it an attractive investment destination for resources seeking Chinese firms. They include natural resources, supporting infrastructures, government incentives and market receptiveness. We establish the relationship between BTA provisions and Nigeria location specific advantages to form research issues to guide the study on how BTA provisions influence choice of market entry mode of resources seeking Chinese firms in Nigeria.

Government Incentives

Previous studies have shown that government initiatives in term of incentives, assistance in registration, tax reduction, grants, and allowances in cost of investment, and banking, tax and tariff reforms can play a vital role in attracting FDI (Nasrin, Baskaran, and Muchie, (2010). The overarching incentives are also packaged to help revive the economy, accelerate growth and development and reduce poverty (Osbonebo (2011). It has also been developed to assist growth and development of local industries through the stimulation of domestic investment and to attract inflow of foreign investments (Larsson, and Venkatesh, (2010) and Kaggwa, Steyn, and Pouris, (2012)

According to Braioniac, (2010) The Federal Government of Nigeria develop many incentive packages to stimulate expansion of domestic production capacity and to shield both new and existing investments from unfair competition. Gilroy et al., (2005) noted that measures such as tax break and trade incentives, like duty free for export of material input are given to reduce cost and making investment profitable. Other categories of incentives adopted by the Nigerian government to attract and make the country to benefit from FDI are financial incentives, fiscal incentives and other general incentives (Ogunkola and Jerome, 2006). The present government in its *fiscal policy offers incentives to extractors of natural resources* to attract investors in extractive industries (Oshonebo, 2011). While general incentives provided by government include the subsidization of infrastructure and services market preference and regulatory concession to reduce cost of doing business in Nigeria solid and mineral sector (Ogunkola and Jerome, 2006 and Cheney, 2011).

Location advantages available to Chinese MNEs in Nigeria are also influenced by BTA provisions. Most favoured nation treatment, rule of origin¹, and custom administration measures are directly influence by government incentives. For instance, the rule of origin provision support that products meant for trades should originate from each of the countries; either grown or manufactured in one or both of the BTA countries. The Nigerian Custom Service administers and manages incentives for the government as directed by the Federal Executive members headed by the President. Nigeria Custom

¹ Rule of Origin (RoO) is part of bilateral trade agreements provisions which determine what products from which countries can benefit from the incentives such as tariff concession and other preference.

Services is directly involved in carry out destination inspection which is emphasizes by the *rule of origin* BTA provision reference to cover the last two sentences. In the same manner, firms from these two countries enjoy preferential treatment as stipulated in the BTA provision. For example, The two countries grant each other the most favoured nation's treatment (MFN) or status in all matters relating to customs duties and foreign trade formalities in connection with importation and/or exportation of goods and services products. The influences of BTA on incentives provided by host and home countries include measures to reduce costs and enhance the flow of goods, services, and capital. They further enhance location advantages and may facilitate Chinese firms adopting higher or lower entry modes. In this regards, it is pertinent to see if BTA provisions influence government incentives in the determination of Chines MNEs internalization strategy in Nigeria. This revelation leads to the development of fifth research issue.

Research Issue 5: *How do BTA provisions influence home government incentives to facilitate resources seeking Chinese firm's internalization decision in Nigeria?*

Supporting Infrastructures

Recent studies have shown that availability of infrastructures such as power, water, transportation and technology (particularly, in the realm of telecommunications and mobile phones services) are significant FDI determinants in developing countries (Dunning, 1993; Kirkpatrick et al. 2006; Nwankwo, 2006; Lydon, and Williams, 2005; and Luiz, et. al., 2001). Dunning (2002) specifically listed infrastructures services such as transportation and telecommunications as needed services to sustain resources seeking firms day to day operations in resource endowed countries. While Khadaroo and Seetanah, (2010) also agreed that improved infrastructure facilities help to aid the investment climate and also in determining the attractiveness of the country towards FDI.

Measures in the BTA provision relating to the use, access and supply of transportation and telecommunication facilities can provide added advantages to the location and the firm's ability to use its specific advantages (Dunning, 1993, 2002; Lydon, and Williams, 2005; Demirbag, Tatoglu, and Glaister, 2009). Availability of supporting infrastructures or actual generation of these important infrastructures will reduce the cost of MNEs operations in Nigeria. These supporting infrastructures provide the Chinese firms unhindered access to the natural resources in Nigeria due to access to natural resources BTA provisions. The motivation from provision of supporting infrastructures enhances the attractiveness of Nigeria location and as well increase the possibility of resources seeking Chinese firm's investment in Nigeria. In this regard, it is important to investigate the influences of BTA provisions such as access to natural resources support supporting infrastructures in Nigeria to facilitate Chinese mode of entry in Nigeria. The above issues lead us to the development of the sixth research issue:

Research Issue 6: *How do BTA provisions influence supporting infrastructures to assist resources seeking Chinese firms in choice of mode of entry into Nigeria?*

Market Receptiveness

Market's or consumers' receptiveness to foreign products specific to a country of origin for emerging markets have not been considered in traditional frameworks for market selection Sakarya, Eckman, Hyllegard, (2007). Bodur, (1994) considered customers' receptiveness among the indicators of the business environment affecting export performance and found that consumer's receptiveness is an important determinant export activities in foreign markets. On the other hand, Cavusgil, (1997) used trade figures to measure market receptivity and does not provide micro level input on customers. Sakarya, et. al., (2007) assessed the potentials for market selection in emerging markets and found that there positive customer receptiveness is an advantage for foreign products and business in emerging markets. Bodur, (1994) and Cavusgil's (1997) studies were partially involved in expanding the two concepts of market's and consumer's receptiveness. However, they were unable to incorporate important institutional components into their studies such as pressure from competitors, competitiveness of the product, attitude toward foreign products and level of market positioning and acceptance. Therefore, in this present research,

Sakarya, et. al., (2007) idea of customers' receptiveness is embraced as similar to market receptiveness for this study because the researchers deviated from reliance on aggregate, general country indicators of go-no-go traditional method to incorporated country's heterogeneity through the assessment of the competitive strength of the specific industry. In this present study, Nigerian firms' acceptance of Chinese companies and general perceptions of Chinese products with respect to competitor pressures are adapted to measure market or customers' receptiveness.

Foreign direct investment and market receptiveness also are known to be deeply interconnected because uncertainty associated with unstable market reduces inflow of foreign direct investments (Sakarya, Eckman and Hyllegard, 2007). MNEs invest in a location where the market is available and stable (Agarwal and Rarnaswami, 1992; Root, 1994; and Russow and Okoroafo, 1996). Nigeria with a population of over 160 million as well as its influence in West African regional markets (MarketingWorld, 2010) provides advantages that support foreign investment. Nigeria market is also highly receptiveness to Chinese products, and the competition from both local and foreign brands is very low (Mthembu-Salter, 2009). Moreover, the middle class is growing (ADB, 2011 and Obuh, 2012) and there is further ability to accept the Chinese's products. Chinese products in Nigeria are increasingly popular because of the following reasons:

- Most of the imported Chinese products are relatively less expensive compared to few Nigeria made products and those from other countries.

- Low cost maintaining of Chinese technology is very low because of availability of spare parts at minimal cost.
- Consumer spending in Nigeria is growing due to emergence of educated and wealthy middle class.
- There are growing numbers of Chinese and Nigerian business men importing products from China
- Chinese product has helped to alleviate poverty and increase standard of living in Nigeria.

Marketing and political stability also directly influence each other because traditional market analysis relies purely on macroeconomic and political factors (Sakarya, Eckman and Hyllegard, 2007). Marketing receptiveness is possible due to Nigeria transiting from unstable political situation to a moderately stronger political environment. There is stability in the political arena which also herald stability in market place (Musonera, 2008). Nigeria has been able to stabilize politically recently due to its ability to successfully transfer power among three presidents using constitutional means (Holiday, 2013). This has also helped to underpin her growth because these three presidents came to power through the same political party.¹ Other factors that have made Nigeria to be market and political stable are higher level of literacy and rich talent among the youths. Others are availability of natural resources (Asiedu, 2006, Broadman, 2007 and TradeInvest, 2010). and implementation of reform programs which is positively related to sustainable economic development² (Okonjo-Iweala and Osafo-Kwaako, 2007 and McKern, et al., 2010) Nigeria has significantly improved in rule of law, transparency of rule of law and corruption categories (Ige and Lawal, 2005). Other notable areas of modest improvement are human rights, civil rights, judiciary, safety and security.

Participation in international trade fair has inevitably influenced location factors/advantages of Nigeria because it provided resources seeking Chinese first hand privilege to observe the situation in Nigeria and to identify their needs. The low pressure from competing brands in Nigeria and the establishment of China town in Lagos, Kano and Port Harcourt are contributing factors that have enhanced Nigeria location. Also, preferential treatments accord to Chinese MNEs and their products in Nigeria due to most favoured nation BTA provision and influence acceptance of Chinese products. Nigerian market may be dominated by Chinese products because of the agreement to increase the volume of trade between the two countries. Nigeria raw materials such as cassava, crude oil and gas are high demand by Chinese firms. In the same manner, Chinese machineries clothing, automobiles and mobile phones are demanded in Nigeria (Omeh, 2013). Combining these factors with market attitudes toward Chinese goods and services in Nigeria, it is important to investigate the influence of BTA provisions in choice of Chinese firms' entry mode into Nigeria. The discussion leads to development of the seventh research issue.

¹ President Olusegun Obasanjo, President Umaru Yar'dua and President Ebewe Goodluck Jonathan emerged through the platform of People's Democratic Party of Nigeria from 1997 to date

² Mo Ibrahim index 2008.

Research Issue 7: *How do BTA provisions influence market receptiveness of resources seeking Chinese firms and its choice of entry mode in Nigeria?*

Natural Resources

One of the keys to take the full advantages of foreign direct investment in developing countries is the availability of natural resources. The common perception is that FDI is largely driven by natural resources in Africa (Asiedu, 2006). Availability and access to natural resources is an important determinant of Chinese MNEs investment in Nigeria (Dunning, 2002 and Kinishita, et. al. 2002). The benefits of access to natural resources are of great importance to both Nigeria and Chinese MNEs. This is a platform for trade volume increment between the two countries. The exportation of natural resources as input material for industries in China contributes to gross domestic products and economic growth of the host country – Nigeria (Stefanovic, 2008). In the same manner, Chinese MNEs buy low cost raw materials from Nigeria and also return finished products to Nigeria in order to benefit from its large market.

BTA measures such as most favoured nations and access to natural resources provide the legal backing for Chinese MNEs to invest in Nigeria. Access to abundant and relatively untapped natural resources in Nigeria (Broadman, 2007) such as natural gas, petroleum, iron ore, tin, coal, limestone, zinc, lead, columbite, niobium and arable land (Asiedu, 2006) enhance the location and facilitate the use of resources seeking Chinese firms ownership advantages in Nigeria. Other BTAs provisions that will enhance Nigeria location are method of payment, rule of origin, custom administration, safeguarding measures and transparency. It is necessary at this point to investigate how these provisions influence the behavior of Chinese investments in Nigeria. This leads to the development of research issue eight.

Research Issue 8: *How do BTA provisions influence availability and access to natural resources to facilitate resources seeking Chinese firm's mode of entry into Nigeria?*

VII. CONCLUDING REMARKS

We developed a model and 8 research issues to guide the study into the research problem to investigate how bilateral trade agreements provisions between Nigeria and China influence the choice of market entry mode of resource seeking Chinese firms operating in Nigeria. The eclectic paradigm by John Dunning, institution-based view and resources dependency theory are the three theories used to develop resources seeking firm's choice of market entry model for a developing or emerging market, in this case Nigeria. The model is convenient utilized to assemble eleven institutions and resources variables in the form of BTA Provisions (legal and regulatory factors), and five resource seeking Chinese firm's ownership advantages and four Nigerian location specific advantages for

resources seeking Chinese firms. Finally, eight research issues were developed from the nine constructs of resources seeking Chinese ownership advantages and Nigeria location specific advantages for Chinese resource seeking firms to guide the study.

CONFLICT OF INTEREST

There is no conflict of interest

ACKNOWLEDGEMENT

This research project wouldn't have been completed without MUST Foundation financial support through the management of Research and Technology Administration Office (RTAO). The result and discussion in this research article were from Entry mode of resources seeking Chinese MNCs in emerging market. Your support, encouragement and tenacity are acknowledged.

CIRCULAR BIOECONOMY: DO WE REALLY NEED ANOTHER CONCEPT?

Karagouni, Glykeria¹; Tsoukatos, Evangelos²

¹WFDT Department, University of Applied Sciences of Thessaly, Larissa, Greece

²Department of Accounting and Finance, University of Applied Sciences Crete, Greece

ABSTRACT

The Circular Bioeconomy (CB) concept emerged around 2015 and starts becoming a common buzzword mostly within the policy and biosciences groups. According to generally accepted views, it is a combination of the circular economy and bioeconomy concepts. The rather uncritical way of using the CB notion raises a number of issues on the topic, starting from the essential question if we really need another new concept, taking into consideration the already confusing landscape of bio-concepts.

This paper purports to answer this question by exploring the popularity, robustness and evolution of the term and the ways it is used. An extensive literature review was conducted using the Scholar and Scopus databases for that purpose. It appears that though CB is not yet an established discipline, the current literature recognizes scope for its development. The analysis shows that the existing CB work is international and transdisciplinary but it is mainly done on the practical and technical level and mostly in Europe. Besides its growing significance, the results highlight the considerable challenge for deeper analysis of the CB concept and construct digging into the theoretical underpinnings and its comprehensive connection to business, organizational and management study research.

It is the first paper to draw on the very concept and phenomenon of the circular bioeconomy evolution and reveal its weaknesses regarding issues of management, economics and entrepreneurship research. Perhaps the major contribution of the paper is that it makes clear that the circular bioeconomy should be treated by scholars as a novel conceptual framework.

Keywords: circular bioeconomy, management, economics, entrepreneurship, social sciences, review, evolution, circular economy, bioeconomy

INTRODUCTION

Circular Bioeconomy (CB) appeared as a term in policy and research work around 2015 as a buzzword rather instead of a structured concept. It was used mostly in order to describe research efforts that

combined bioeconomy issues to principles of circular economy such as the use of existing bio-resources in efficient novel ways. Quite soon it was adapted by policy makers who started talking about the role of the bioeconomy in spurring the circularity of the economy.

In general, the nascent field of the circular bioeconomy (CB) appears to gain in popularity, attracting attention from many sectors. The term itself shows up more and more in the media, academia and the policy cycles and starts forming the strategy of several research centres (e.g. CBIO in Aarhus University). The reasons behind the CB popularity are many; perhaps the most important one is that CB has struck a responsive chord providing answers to multiple grand challenges of our planet and society.

However, the circular bioeconomy seems to be a rhetorical term that is used in rather superficial ways interchangeably with the terms of circular economy and bioeconomy, as it is commonly accepted that the circular economy and the bioeconomy constitute the two sides of the circular bioeconomy. Discussions on their merge under the umbrella called “circular bioeconomy” raise the essential question if we really need another new concept, taking into consideration the already confusing landscape of bio-concepts.

Against this background, this paper tries to answer this question starting with a review of existing CB literature so far, since concepts are often given rise with the aid of statistics. More precisely, a bibliometric analysis of academic publications, reports and working papers was initially engaged to explore the evolution of the concept and its rate of growth since its birth. At a second stage, a deeper look at the ways and fields of evolution and the nature of the construct allows for the discussion of revealed weaknesses and gaps and some suggestions on further research and policy making.

THE BUILDING BLOCKS OF THE CIRCULAR BIOECONOMY

Bioeconomy

The bioeconomy has emerged as a significant alternative that targets “the production of renewable biological resources and the conversion of these resources and waste streams into value added products, such as food, feed, biobased products and bioenergy” EC (2012, p9), promising to meet societal needs in environmentally sustainable manners. The term spread quickly between 2010 and 2013, as a result of actions of various European Union bodies as “the part of the economy which generates growth through development and creates jobs in the process of using and processing bioresources in an environment-friendly manner” (Adamovicz, 2017) or “as the knowledge-based production and utilization of biological resources, innovative biological processes and principles to

sustainably provide goods and services across all economic sectors” (Global Bioeconomy Summit, 2015).

The term has been used to cover a wide variety of products and industrial sectors (and services), such as construction, food, bioplastics and bioenergy as well as R&D, marketing, tourism, water supply and sales becoming a changing concept to fit many purposes and sectors. Due to the number of interconnections embodied, bioeconomy has been developing driven by policy action and relevant strategies and in relation with a number of “bio-concepts” such as sustainability, green economy and ecology.

In general, bioeconomy covers closed-loop recycling strategies, the development of environmental standards for secondary raw materials to increase potential of their use, scientific trends on waste reduction (especially food and water) and similar. According to Bugge et al. (2016) there are three ideal categories of what a bioeconomy constitutes of three categories: (1) one that emphasises the importance of bio-technology research, application and commercialisation; (2) one related to biological raw materials in sectors such as agriculture, marine, forestry, and bioenergy and the establishment of new value chains; (3) one towards bio-ecology and thus, the optimization of the use of energy and nutrients by biodiversity. More specific aspects of the bioeconomy are also the subject of a growing research effort, such as bioenergy, biorefinery, and biotechnologies. Searching “bioeconomy” in the Scopus database in 1st February 2018 yields 1142 papers. Comparing it to Viaggi’s (2016) review (479 papers) indicates the significant growing trend of the issue.

Circular Economy

A circular economy (CE) as defined by the Ellen MacArthur Foundation is “an industrial system that is restorative and regenerative by design, and which aims to keep products, components and materials at their highest utility and value at all times, distinguishing between technical and biological cycles”. CE contemplates that, in opposition to take-make-dispose linear pattern of production and consumption, a circular system for achieving net reductions at the organizational supply chain and industrial levels would achieve minimal input and minimal production of system ‘waste’.

The concept dates back to the beginning of industrialization and the 19th century (Boulding, 1966), draws from the ideas of industrial ecology and industrial metabolism of the 1970's and 1980's and becomes popular during the '90s (D’Amato et al., 2017). Today, the CE approach emphasizes product, component and material reuse, remanufacturing, refurbishment, repair, cascading and upgrading as well as the potential of sustainable energy sources using a cradle-to-cradle life cycle approach (Korhonen et al., 2018). According to several reviews (e.g. Merli et al. 2017; Korhonen et al, 2018), the definition of CE is evolving, indicating its undefined boundaries so far. Besides definitions, these

studies review concepts, principles, and conceptual relationships mainly with sustainability and bioeconomy. There are also a plethora of articles with specific attention on several areas such as closed loop value and supply chains, circular business models and circular product design (Geissdoerfer et al., 2017). Empirical work concentrates mainly on cleaner production, environmental impact and waste production along the life cycle of a product.

According to Merli et al. (2017), CE studies follow three main lines of action: a) papers on change of the socio-economic dynamics at macro and administrative level; b) firm-level support in circular processes implementation, and c) at meso-level, discusses on industrial symbiosis. According to the reviews, the majority of CE papers are published in journals in the category of green, sustainable and environmental sciences with the Journal of Cleaner Production to take the lion's share. However, it is commonly accepted that CE conceptualization is still in its infancy and the literature is only emerging. A research in Scopus led to around 1000 results on circular economy with more of the half in 2017.

The Circular Economy (CE) as an approach to combat environmental challenges and promote sustainable development is currently a very popular notion within the policy and business advocacy groups. Such discussions are primarily led by policy makers (e.g. the European Commission) influencing governments and intergovernmental agencies at the local, regional, national, and international level.

The debate on linking the bioeconomy with the CE principles

According to the evolving theoretical and empirical literature on CE and bioeconomy, the former aims to eliminate urban and industrial waste and design products for a cycle of disassembly with the adoption of closing-the-loop production patterns, while the later offers the possibility to produce renewable and biodegradable solutions for societal needs. Therefore, CE is respectively narrower in scope than bioeconomy but bioeconomy alone cannot safeguard sustainability (Birner, 2018).

A first approach towards the linking of the principles of the two emerging systems is tracked in the Global Bioeconomy Summit in 2015, in order to “involve systemic approaches across sectors (i.e. nexus thinking), particularly innovation policy measures that aim at optimizing bioeconomy value networks and minimizing waste and losses” (Bioeconomy Summit 2015, p. 5). Yet, it is only in 2017 that the combination of the two concepts can create synergies (Antikainen et al. 2017). Bioeconomy can support the successful and efficient implementation of the CE principles with its focus on biotechnological innovation taking into account the ‘cascading use’, re-use and recycling of resources (including waste) which can further lead to an interlinkage of different value chains.

METHODS

Things are moving fast on the bioeconomy highway. In just a decade, it appears that bioeconomy and circular economy have attracted increasing attention by researchers and managers and have gained significant political interest. D' Amato et al. (2017) presented a significant study on the diversity between the concepts of Circular Economy, Green Economy and Bioeconomy based on a bibliometric review of almost two thousand scientific articles and coupled with a conceptual analysis. They conclude that both CE and bioeconomy are resource-focused, joined by the common ideal to reconcile environmental and social goals but the achievement of economic growth is rather questionable. On the other hand, according to many researchers and politicians, circular bioeconomy is more than bioeconomy or circular economy alone. According to existing literature there is a need to merge the two systems in a fruitful way and therefore, streamlining the research agenda, examine the nature and conceptualize the circular bioeconomy concept, develop measurement constructs and explore and examine several factors such as its antecedents and consequences at firm-level and in an integrated framework.

However, before attempting to extend our understanding on the nature of CB, it is essential to question if we really need another new concept, taking into consideration the already confusing landscape of bio-concepts. Therefore, the core research question addressed by this article is:

Is there a notable shift to Circular Bioeconomy? How appealing is the CB construct today (in the beginning of 2018)?

In order to trace the academic interest on the circular bioeconomy issue a bibliometric review was conducted to identify all relevant articles. Data were collected from Scholar and Scopus in February 2018. Terms searched were "circular bioeconomy" or "circular bio-economy" in title, abstract or keywords (Scopus) and in full-text (Scholar) in regard of all available sources (books, articles, reviews, reports, conference papers) written in English (generally considered as the international academic language (Genç and Bada, 2010)). No chronological restriction was employed. It is important to stress that, besides peer-reviewed scientific journal articles in English which ensures the quality of the research, the inclusion of other literature was rather imperative since CB is literally in its infancy and actually these studies are the very first to pose core research questions and initiate discussion on the CB concept and strategy

The research on Scopus returned 18 results and on Scholar returned 292 results. After manual control to filter out irrelevant publications, 30 of the Scholar results were found to have the terms in title, abstract or keywords. All Scopus (18) and the 30 Scholar results were manually checked; i.e. the full content was examined. Only 15 of them were found to discuss the concept of circular bioeconomy

(Table 1). The rest of them would have only one reference in the CB term, mostly within a sentence such as “It is a key-enabling technology for a circular bioeconomy’ (Velea et al., 2018), or “To reduce the landfill of waste to safeguard the environment and enabling the shift toward a circular bioeconomy” (Ronda et al., 2017). These records fall mostly into the Process Engineering category. They are all technical scientific studies of specific areas, such as biological sciences and chemical engineering; e.g. the first phrase above belonged to an article on heterotrophic and mixotrophic microalgae cultivation, in *Microalgae-Based Biofuels and Bioproducts* Journal and the second one to a novel methodology to valorise waste in *Process Safety and Environmental Protection* journal. The summary of the publications is given in Tables 1 and 2.

TOTAL	15	TOTAL	292

Table 2: *Publications on CB / by year of publication*

According to the database analysis it appears that CB is a brand new and a rapidly growing research topic. Following the Scholar Database, in 2014 the term appeared only once in an article on biomass and biorefineries in Netherlands (Van Dael et al., 2014) and again once in a chapter of Guillou and Matheron (2014), under the rather strange title “Producing Other Goods”. In 2015, the first effort to delineate CD is found in a project report of Leinonen et al. (2015), although the authors did not intend to put extra weight on the issue: “... This development opens a trajectory towards a circular

bioeconomy, based on the design of closed cycles for materials use. In these cycles, nothing is defined as “waste” anymore, but every material is perceived as a raw material for producing something” (p63).

The number of documents increased steeply in 2016-2017; in 2016, 53 articles appear in scholar to entail the CB term; in seven of them the term is found in title, abstract or keywords and devote at least one paragraph in the issue. However, once again most records are technical articles which underline the contribution of the novelty in the CB development. In 2017 the number of records is more than tripled while the results of the first month of 2018 almost equal the total number of 2016 indicating the rapid growth of the research topic.

Most of the journals studied have technical - environmental issues as their main topic. The *Journal of Cleaner Production* has pride of place, with 3 out of the 15 articles to include the term in title, abstract and keywords and with 2 out of the 15 papers to discuss the CB issue. It is followed by 3 papers of conferences on environmental issues and three scientific project reports while all other journals have published one paper each (Table 1). It is quite interesting to note that these 15 papers indicate a transnational and multi-, inter-and transdisciplinary approach. In more detail:

- only three (3) out of the 15 studies are written by only one author affiliated with one University and these are one from England, one from Greece and one from Poland. However all three authors are affiliated with Faculties of different disciplines and namely, the Department of Chemical Engineering, an Institute of Environmental Sciences and a Faculty of Agriculture.
- eight (8) are written by authors affiliated with Universities mainly of the Scandinavian countries and more precisely by a) Schools and Departments that are related to environmental issues such as Industrial Environmental Economics and the Department of Forest Science or Departments of Food and Resource Economics; b) relevant environment Institutes (e.g. the European Forest Institute in Finland, NIBIO in Norway); c) other Centres for Technology and Innovation (e.g. NIFU in Norway, VTT in Finland and CIRCLE in Sweden); d) other Faculties and Departments with a focus on business such as Business Schools, and Departments of Economics and Management.
- three (3) are work of Universities of the former Eastern countries and more precisely Romania, Slovakia-Ukraine and Poland. Once again authors represent a variety of disciplines such as Veterinary Medicine, agriculture, Life and Environmental Sciences, Faculty of Economics and Management, Engineering and even Geography.
- one (1) comes from India. The authors are affiliated with Bioengineering and Environmental Sciences, an Institute of Chemical Technology and the Academy of Scientific and Innovative

Research. The authors have published a significant number of relevant papers on biorefineries and bioeconomy.

- One (1) paper was the combined work of two researchers of a Greek and an English Department of Food and Nutritional Sciences
- In four (4) of the above mentioned “Scandinavian” papers there was a contribution of Universities and Institutes from Australia, Germany, Belgium, Denmark, UK and Spain. The majority were related to environment such as Forest Management and Sustainability, but there was also a Department of Management Engineering.

Interestingly, it appears that CB is mainly a European issue so far. Besides the significant work of Mohan et al. (2016) in India and the Australian contribution in one of the papers, all other research work belongs to Europe. A closer look indicates that Scandinavians and former Eastern countries are the major contributors to this extremely new but emergent stream of research. Furthermore, all 15 results refer to macro-level of analysis, since they all regard policy, production and consumption activities encouraging the CB development at national, European and global level.

A closer study of the content and the aims of the 15 papers leads to five groups:

- a) Four (4) articles discuss the CB issue as their core theme and approach it through the lens of innovation. Interestingly, they are all reports and working papers of specific European research projects on CB. More precisely, Antikainen et al., (2017) discuss the CB concept referring to the efficiency and reuse of bio-based resources, and explore the implications of the circular bioeconomy for the renewal of manufacturing (RECIBI project). The Reime et al’s (2016) report on the CB in Scandinavia is a deliverable of the first work package of the SusValueWaste project on *circular* bioeconomy. The authors are the first to pose significant questions on CB and try to define the concept. The authors map the circular bioeconomy in Sweden, refer to the EU policies and claim that knowledge-based innovation, research and innovation strategies are important to achieve CB in Sweden. Hetemäki et al’s (2017) 50-page report, a work of a multi-European country research teams, focuses on ways to a European CB strategy (FORBIO project). The authors propose potential policies for CB but actually they build on the concepts of circular economy and bioeconomy and mainly investigate CE national and international policies effectiveness. However, they *do* try to answer some core question on CB at strategic level. They argue on the need to link the bioeconomy and circular economy strategies, instead of advancing them separately. Finally, Coenen et al’s (2017) working paper approaches CB through the lens of innovation. According to the authors, CB is an important policy priority in many countries, identified as one of the EU’s Horizon 2020 societal challenges. The development towards a

- circular bioeconomy can be characterised as a system innovation as it requires fundamental changes in both production and consumption (Vinnova project).
- b) Two (2) articles develop specific models for specific areas through the CB lens. Matiuti et al. (2017) put forth a pilot project that will allow the development of the Rural Circular Bioeconomy. Ryabchenko et al (2017) proposed a CB model which provides the approach of agricultural production decision optimization towards sustainability based on a case study in Ukraine.
 - c) Six (6) articles comment on CB discussing specific issues of circular economy or bioeconomy but without any effort to define or delineate the CB concept, taking it for granted. Mohan et al (2016) propose a futuristic biorefinery platform with a holistic biorefinery CB approach. Velendurf (2016) considers biowaste-to-resource innovation as part of the circular bioeconomy. In her study, the bio-based economy was interpreted as the usage of biomass for materials, chemicals, fuels and power. Zabaniotou (2017) discusses the role of bioenergy in the context of the Circular waste-based Bioeconomy and concludes that the global bioenergy sector may face challenges, due to the new demand for biomaterials from the same sources. Egelyng et al. (2016) and Egelyng et al. (2018) explore cascading and upcycling for a circular bioeconomy in Norway focusing on the food system. These two articles are the very first to mention the role of ecological economics in bioeconomic research. Maina et al. (2017) argue that the core CE principles are complementary to the bio-economy and should lead to the establishment of integrated sustainable approaches elaborating holistic resource utilization. The authors presented alternative innovative technologies for the utilization of waste as a CB resource.
 - d) Two papers review the concepts of bioeconomy (Adamovicz, 2017) and analyse the diversity within and between the bioeconomy, green economy and circular economy concepts (D' Amato et al., 2017). In both papers, a first approach of the CB issue is attempted.
 - e) The paper of Scordato et al. (2017) announces their purpose to study the ways of policies' formulation towards a systematic transition to a circular bioeconomy.

The rapidly emerging concept of circular bioeconomy

Even though the circular bioeconomy has been appearing in scientific work and policy making for less than four years, it has become quite popular at least as a concept. This tendency indicates that both researchers and policy makers admit the inadequacy of the CE and bioeconomy concepts towards the new socio-economic environment and that they also embrace and welcome the new CB construct. The analysis showed a steep growth of CB literature in 2016-2017 while the results of the first month of 2018 are greatly encouraging and inspire high expectations for the future of the CB system.

Actually, it appears that in policy-making, there is more and more talk about the sustainable circular bioeconomy which resonates well with the current shift towards Grand Challenge driven research and

innovation policy. Neither CE nor bioeconomy seem to be able alone to address the challenges. Moreover, the simplistic assumption, that one of the concepts may be just a part of the other (no matter which) does not satisfy either the scientific or the policy-making world. Moreover, there is much debate on the role and scope of CB, too. According to Antikainen et al. (2017) the umbrella use of CB cannot pursue effective solutions; CB should imply a transition to a fundamentally different system in regard of “new technologies and infrastructures, co-evolving shifts in markets, practices, policy and culture”.

The geographical distribution of the records, so far, indicates that CB has been born and is growing particularly in Europe. This is quite expected since according to D’ Amato et al. (2017), both CE and BE are particularly popular in the EU, mainly due to the quite strong promotion of both systems by EU policy makers as core aspects of sustainability and growth. However, it is expected to grow in the rest of the world, since China shows strong research and political interest while USA appears to adopt relevant policies (D’ Amato et al., 2017).

Therefore, the answer to the research question is definitely positive: the circular bioeconomy phenomenon is becoming popular since there is a well-organized and strongly supported campaign towards its establishment at least in Europe. Furthermore, this approach touches upon the whole ecosystem and namely business, citizens and the environment and therefore it will be embraced by all scientific, research and business fields. Accordingly, it appears that the circular bioeconomy will be soon well established in policy cycles and a fruitful area of research, regarding many disciplines and scientific fields.

As expected, the CB review indicates significant weaknesses. There are clear differences and different approaches among the research communities so far engaged in research that touches upon the circular bioeconomy, in addition to the dependence on either the bioeconomy or the circular economy views and, consequently, the lack of a holistic approach (e.g. Korhonen et al., 2018). For instance, Reime et al. (2016) take circularity for granted in the bioeconomy without considering the dynamic sense of recycling, refurbishing or remanufacturing, which constitute essential elements. Discussing on the around 300 records which name once or twice the CB concept, it appears that CB is well accepted and addressed by environmental, engineering, biotechnology and natural sciences-orientated research communities by the development of novel physical materials and processes, or even energy flow-based models, but research has not managed so far to orient findings towards a comprehensive perspective on competitiveness and positive economic development.

A significant weakness is the fact that the circular bioeconomy concept is used without having being defined. Besides one or two efforts to give a definition (e.g. Reime et al., 2016; figure in Antikainen et

al., 2017), all existing relevant work takes the CB construct for granted or confuses it either with bioeconomy or the CE concepts. While, CB has been established to redefine the entire socio-economic system in dynamic ways, most scholars adopt the concept under an environmental view focusing on the combination of waste elimination and biotechnology which they consider as the essence of the circular bioeconomy. However, this tendency rather supports the traditional linear path of management hindering the benefits and value added by the emerging technological and organizational CB innovations. On the other hand, the basic assumptions concerning the structures, values, culture and the paradigmatic potential of CB remain still unexplored. The CB research needs urgently categorization, classification and organization.

Interestingly, according to the review, the issue has not yet attracted the interest of scholars in management, economics or social sciences; this is quite normal, since such studies tend to appear later in general. However, the CB notion is gaining significant interest in a notable number of sciences and businesses and it is high time for scholars to raise discussions on the CB construct in a holistic approach and explore broad socio-economic and environmental factors, constraints and benefits of the emergent CB theory. Therefore, it is important for scholars in social, economic and management sciences to consider the infant stage of CB and its multiple roots in different disciplines and schools and work towards CB definition, conceptualization and even parameterization in order to establish the emergent but highly appealing socio-economic CB paradigm.

The circular bioeconomy should acquire its independent role in academic research as a new dynamic construct that moves forward and is not simply the umbrella of CE and bioeconomy. Scholars are called to study the phenomenon as a necessary mechanism and an agent of change mediating between its building blocks, knowledge and its transformation into sustained economic activities. The CB system has been established to shape and be shaped by the social and environmental context which is comprised of culture, people, sustainability issues and environmental aspects as well as institutions; thus pointing at its necessary linkage to entrepreneurship, tools and methods for modelling processes, and the interactions between CE, bioeconomy, knowledge, innovation, economic growth and social well-being.

Focusing on the specific need to study the phenomenon under the lens of entrepreneurship, economics and management, we call for research work at micro- and macro-level: scholars are called to study in depth the very act of CB-based entrepreneurship, in order to delineate its characteristics, scope and boundaries at micro-level. On the other hand, at the macro level, which is quite critical for policy makers, researchers should explore the links between CB, economic growth and environmental and social wellbeing. Such studies would support policy makers approach the issues systematically

aiming at an organic integration of diverse sets of policies that influence the fruitful application of CB policies and norms.

CONCLUSIONS

The present study explored the robustness of the circular bioeconomy concept within the existing literature. It is the first paper to draw on the very concept and phenomenon of the CB evolution and reveal its weaknesses regarding issues of management, economics and entrepreneurship research. Despite its rapid growth and its popularity, CB seems to mean different things to different fields, disciplines, sectors and even nations. This is quite confusing especially if combined with the fact that there is actually little consensus concerning what its building blocks - circular economy and bioeconomy - actually imply.

The analysis indicates that the CB is a brand new and a rapidly growing research topic with a transnational and multi-, inter-and transdisciplinary approach. It is mainly a European issue, so far, and it builds mainly on the synergies of the circular economy and bioeconomy concepts. Yet, the limited but growing literature on the CB phenomenon itself indicates that both researchers and policy makers admit the inadequacy of these two concepts towards the new socio-economic environment and that they also embrace and welcome the new CB construct.

Therefore, it is clear that the development of the circular bioeconomy phenomenon is rapid; however, the concept is still in an embryonic stage lacking theoretical content and construct legitimacy and therefore it requires multiple-scale and scope research. Besides focused studies in specific sectors, holistic approaches are needed to link technology assessment and business and production models to efficiency, consumer attitudes and impacts of the eco-systemic environmental and social CB dimensions. The emerging literature, as indicated by the present study, underlines the significance of the circular bioeconomy, but the results highlight further the considerable challenge and need for deeper analysis of the CB concept and construct digging into the theoretical underpinnings and its comprehensive connection to business, organizational and management study research.

A limitation of the study is that the data collection was purposefully limited in English, in searching for the terms of "circular bioeconomy" and "circular bio-economy" and only in academic publications, working papers and project reports excluding other grey literature. Nevertheless, the analysis highlighted the importance of the CB concept, the rapidly emerging academic, socio-economic and political interest, as well as a number of weaknesses. It is evident that the circular bioeconomy needs a managerial approach and advancements in theory building and testing. Perhaps the major contribution of the paper is that it makes clear that the circular bioeconomy is an exciting reality, a

novel conceptual framework which needs the attention of strategists and economic scholars. Failure to incorporate such scholarly advancements will place research in the circular bioeconomy in a questionable state of legitimacy and academic merit.

ABSTRACT

The topic of sustainability has come into vogue trying to help reverse the unbridled search for growth and profit through the extensive exploration of nature. Regarding the fashion market (especially the luxury sector), they carry with them the burden of one of the biggest pollutants of the environment. Osklen, a Brazilian luxury fashion brand, take its first steps towards becoming one of the pioneers of sustainability in the fashion world. Thus, the main goal of the current study is to analyse the perception of customers of Osklen about how the luxury brand deals with corporate social responsibility. A qualitative approach is employed using in-depth interviews. Data are encoded and treated using ATLAS TI software. Findings reveal that customers are aware of the social-environmental concerns of the brand without losing the identity of the country-of-origin.

Keywords: Sustainability; Corporate Social Responsibility; Fashion; Luxury market.

1 INTRODUCTION

According to Cortes (2012), since the Palaeolithic humans already have some behaviour connected to luxury: ornaments, parties, unconcerned consumption of non-renewable goods, among others. At this time there is no material splendour, just the impulse of spending everything for the present pleasure not worrying about the future consequences. This is a revelation of a luxury mentality even before the existence of luxurious objects. The universe of Luxury -as it known now- arose from the need for a distinct social class, in particular for the top class of the pyramid. The intention is to stand out from the others, using products that would provide them grandiosity. Examples of these are crowns, coats, rings, ornaments and noble fabrics. These artefacts are considered exclusivity of the wealthiest class and served as a mean to show their superiority. They are also taken as measurement of the wealth of a nation since the manufacture and sale of these luxury goods occurred only where there is the possibility of commercialization.

As Michael Rae claim, *“something that is beautifully made, finely crafted, made out of rare materials and well designed, will account for nothing if it is also equated in the public mind with human rights and environmental destruction”* (De Beers Group 2008, p. 26). In this era of increased consumerism and activism, luxury brands are forced to become more transparent and socially responsible.

The notion of responsible luxury has received wide attention these days, especially after the news of Gucci maltreating its employees in its stores and Prada and Dolce & Gabbana exploiting illegal Chinese immigrants in their Tuscan factories (Caixiong, 2011; Wilkinson, 2008). In responding to such situations, many luxury brands, namely, Armani and Chanel have initiated corporate social responsibility (CSR) practices. Consumers may respond positively to environmental claims made by these firms when those claims emphasize status-related benefits (Steinhart et al., 2013).

The main propose of this study is to get a thorough understanding of the new slope of luxury that no longer focus on the values of the old luxury - status, distinction, power - but instead, has some principles of Corporate Social Responsibility embedded on it. In order to get a better insight on this new concept and how it has been communicated, the Brazilian luxury fashion brand Osklen is chosen as object of this study, once it has been one of the pioneers on the establishment and dissemination of the concept of New Luxury.

Particularly, the main goal of the current study is to analyse the perception of customers of Osklen about how the luxury brand deals with corporate social responsibility.

After the introduction, the literature review presents foundations on luxury concepts and consumption, as well as an overview about the sustainable luxury consumption issues. The third part of the article is devoted to de description of the methodology and the analysis of the findings. Lastly, in the conclusion, managerial implications, limitations and recommendations for further research are presented.

2 THEORETICAL BACKGROUND

2.1 *Luxury consumption*

Beckham and Voyer (2014), suggest that consumers use luxury to enhance status and power and that might also result in being more likely to violate social norms related to responsible and sustainable consumption rather than actively engaging with them. Yet, luxury is no longer determined only by it luxuriousness (or even only the price) of its products (Heine, 2012). Now consumers want to be emotionally touched by their experience' also aligning sustainable and ethical values and beliefs (Thomas, 2014).

Starting from the principle that products launched within the fashion world are expressions carried with values and beliefs (Valente, 2008), they can communicate their message to consumers at

the moment they are shown on the runway, replicated on social media and then displayed on the stores. Luxury brands can influence consumer behaviour through product design and example setting (Bendell and Kleanthous, 2007) and can be considered as one of the greatest responsible for setting the new trends either for goods or for services that will be launch in the market (Iloureiro and Bilro, 2016).

With many of the luxury companies operating globally, this sector can play a significant role in the dissemination and awareness of green values. They could contribute towards more responsible supply chains by developing sustainable sourcing policies; by ensuring apparel factories operate under fair working conditions; by investing in the education and development of the communities in which they manufacture their goods; by communicating these mechanisms in a transparent way to consumers; and by partnering with NGOs for long-term change (Hughes, 2001; Yu, 2008; Carrigan, Moraes and McEachern, 2013). Thus, luxury industry may contribute to helpful bringing to life this new definition of what is luxury, where greener values are expressed through social and environmental. Another of the benefits that can be seen in having luxury brands promoting sustainable behaviour is that they have the ability to make sustainable behaviour a mainstream lifestyle choice (Petersen and Muratovski, 2014; Bresciani, Bertoldi, Giachino, and Ferraris, 2015). In sum, all the brands of this industry that want to be successful should bring together aspects of the old and new luxury, enhancing brand heritage, differentiation, creativity, relationship management, as well as all the aspects of Corporate Social Responsibility.

In the fashion industry, value can be conceptualized not only in terms of the positive value generated throughout value chains, but also in terms of the harms that are co-created by stakeholders at different stages of the fashion supply chain (Carrigan, Moraes, and McEachern, 2013) and the same can be applied to the luxury industry. As firms are widely held responsible for the entirety of their supply chain. Indeed, Palazzo (2010) claim the need to examine the consequences of a company's actions, as the emphasis is no longer just for 'doing good' but also of 'doing no harm'(Carrigan, Moraes, and McEachern, 2013).

2.2 Sustainable luxury consumption

2.2.1 Corporate social responsibility

We are living in the era of 'eco-consciousness, ' and it is characterized by an increasing number of companies engaged in Corporate Social Responsibility (CSR) (Achabou and Dekhili, 2013). According to Villagra, Cárdaa and Ruiz San Roman (2016), the term CSR has its origin 60 years ago, and since then it has grown in relevance and served as the focus of numerous studies. Even not existing a consensus on the definition of this term (Achabou and Dekhili, 2013), commonly it is defined as the necessity of reconciling corporate development with ethical, social, and environmental aspects. For the European Commission, Corporate Social Responsibility (CSR) is defined as "A concept whereby

companies integrate social and environmental concerns in their business operations and their interaction with their stakeholders on a voluntary basis." In other words, it refers to companies taking responsibility for their impact on society. They believe that CSR is important for sustainability, competitiveness and innovation (European Commission).

According to Villagra et al. (2016), companies that effectively implement CSR do not measure their success based on a purely financial bottom-line; instead, they hold themselves accountable to the triple-bottom-line of finances, social impact, and environmental impacts. Organizations may examine CSR issues from a corporate perspective, but they also need to consider how other stakeholders view those issues (Carrigan et al., 2013) because, according to Loureiro et al. (2012), studies point out that CSR has a positive effect on companies once it maintains or improve both consumer and society's well-being.

2.2.2 Sustainable luxury

According to Solomon (2015), consumer behaviour can be recognized as an ongoing process, not merely what happens at the moment a consumer hands over money or credit card and in turn receives some goods or services. It means that, as said by Kotler and Keller (2012), cultural, social, personal and psychological factors influence the consumer behaviour. In this case, talking specifically about the consumers of luxury goods, it is possible to say that, according to Strehlau (2008), a product is more than the result of the sum of raw-materials, quality and producing costs once it represents any dissatisfaction: social, emotional or economical. This means that the value of the product is not only related to the monetary price spent on it, but also to the value perceived by the customer (Hasan, 2016).

Regarding the luxury-fashion market, aggregating 'high-net-worth' consumers: well-travelled, cosmopolitan individuals who use luxury products as a conspicuous code that signifies wealth and success (Chadha and Husband, 2006). All over the history, in societies have been known for wasting, squandering, spending and consuming more than what is absolutely necessary; by the simple reason that is through the excessive consumerism of the superfluous that not only the individual but also the society feels that do not exist, but they are alive (Baudrillard, 2008). However, now consumers are changing their behaviour and becoming more demanding. The acquisition of these premium products is no longer and social differentiator, seeking for much more at satisfying intimal pleasures, of a personal nature. (Valente, 2008).

Due to this changing in the luxury consumers behaviour, Cervellon (2013) points out that sustainability issues are raising and starting to be perceived as a complementary model to luxury, in particular among the wealthy (Cervello and Shammass, 2013). For consumers, ethical concerns can help to improve opinion and self-perception; they constitute an increasingly decisive factor in the

psychological satisfaction afforded by luxury goods (Achabou and Dekhili, 2013; Olorenshaw, 2011). Regarding new markets, as they mature, their more affluent citizens increasingly follow international trends, including awareness and concern over social and environmental issues, and a desire for their purchases to provide meaningful experiences (Bendell and Kleanthous, 2007).

Another relevant aspect to be considered related to new luxury is the quality over exclusivity. According to Albatross Global Solutions and the Numberly's fourth annual 'The Journey of a Luxury Consumer' report, mentioned on Tessera's article for Marketing Week (2015), 86% of the global luxury consumers are citing quality as the most important attribute for them. In conclusion, luxury consumer goods are now more aware and more demanding regarding products and services purchased by them. The history, tradition, exclusivity and high prices are no longer indicators of luxury. Environmental and social causes are real concerns, and brands have to take into consideration these new aspects to adapt to this new business era. Besides this information, there is a lack of the academic literature, where authors pay little attention to the relevance of adopting responsible practices in the case of luxury goods and do not examine the propensity of consumers to consider recycled materials in luxury purchases (Achabou and Dekhili, 2013).

2.2.3 Communicating sustainability

Kleanthous and Peck (2006), in order to decide what to communicate to consumers, one question is crucial: is your message an accurate reflection of your corporate/brand values and about your products and services? In case of a positive answer, it is considered worthwhile communicating to your consumers about environmental and social aspects of your products, services and performance once the value of the brand is directly related to the banners that they rise. It is not only regarding what they say but also, and foremost, to what they do and how they care about the environment and social well-being (Valente, 2008). Otherwise, the company can be accused of 'greenwash' and only damage the brand's reputation.

Overall, the lack of transparency and disclosure by luxury-fashion businesses makes it difficult for consumers, investors, activists, and policymakers to assess who the ethical and unethical brands really are (Carrigan, Moraes, and McEachern, 2013). Based on that, it is possible to say that marketing and brand communications can make a major contribution to meeting the biggest challenges of our age (Kleanthous and Peck, 2006) and helps on the awareness and transparency demanding by consumers, especially those concerned about sustainability issues.

In sum, luxury brands should care about their communication and marketing once they are strong tools to disseminate their greener values. What must be taken into consideration is the fact that brands tell consumers what to care about all the time, both directly and by implication or demonstration (Bendell and Kleanthous, 2007) and an effective communication help to build the

image among their target. The message has to be integrated into the most appropriate channel and if it is the case, even create an own channel for it. In the end, the credibility of luxury products will be linked to the ability of the brand to advance in well-being rather than harm (Carrigan, Moraes and McEachern, 2013).

3 METHODOLOGY

3.1 Procedures for collecting data: qualitative research

In order to achieve the goals of the study, primary and secondary data are collected. The primary data is gathered through an online questionnaire and visiting some shops of the brand. As a complementary research, secondary data are collected from the information provided by the brand and posting online.

In the current study, we conducted 30 in-depth interviews face-to-face with customers of Osklen, lasting between 60 to 120 minutes each. (questionnaire interview script in Appendix A). The saturation had been achieved with this number of interviews. No additional efforts are carried out to continue collecting data because interviewees began to reinforce the previous information without adding any further novel information (Glaser and Strauss, 1967).

Following Zikmund and Babin (2010), this exploratory research started with an open mind without any intention to achieve a particular result. First, the interviewer invites those being interviewed to think about the partner with which his/her firm has a closer, more frequent professional relationship (at least 3 years of relationship). Next, we started to ask to describe the relationship that participants (representing his/her firm) has with the partner with similar position in the other firm.

3.2 Customer sample profile

As the brand has female and male merchandise, men and women took part on the questionnaire, being men 45% of the interviewees and women the others 55%. The age and the occupation are not directly answered but, personally knowing the respondents, the researcher categorized them in some age range - going from 20 years old, up to 55 years old - and all of them are currently active on their field of work. Lastly, all the interviewees belong to a medium-high to high social class (we cross their income with their profession to get their social class).

3.5 Content analysis and data classification

All interviews are audio-recorded, with the permission of the participants. The interview results are analysed using the software ATLAS TI. All this information is subject to a careful content analysis process. A detailed analysis of the responses from each interview is carried out, and through a semiotic clustering process (Feldman, 1995).

The process of category creation is based on the Grounded Theory requiring the researcher to actively interpret the raw data and code components that emerge from the interview data as signifiers, parts, properties, or instances of other coded components (Batra et al., 2012). Each researcher individually used the same methodological to coding and subsequently the results are compared to avoid bias. The discrepancies found are discussed and agreed upon (Olesen, Droes, Hatton, Chico, and Schatzman, 2002). No significant differences are found between participants with regards to gender, or types of organization (supplier or distributor).

4 RESULTS

4.1 Overview Osklen brand

The history of the brand Osklen starts before the idea of building a fashion brand. Back in 1986, Oskar Metsavaht – founder and creative director of Osklen- worked as a physician and due to his knowledge of biophysics and ergonomic, he is invited to be part of an expedition to Mount Aconcagua, in the Andes. One of his functions is to search for clothes that would keep them warm and prepared for the adversities they would face during the trip. However, at that time, Oskar did not find the most suitable clothes and equipment, deciding then to develop the fabric to make the clothes designed by him.

According to Metsavaht, the brand works under five main pillars: universal aesthetical language, the originality, the meaning, the intrinsic quality and the sustainability. For their Mission, they aim to enchant the customers with their products, services and attendance, do not forgetting their social-environmental commitment. Their Vision is determined through their style, creativity and authenticity - a global brand, original from Rio de Janeiro. For last, their Values are based on the creativity, balance, sophistication, detachment, technical quality, contemporaneity and sustainability (Boechat, 2016).

The concept of 'New Luxury' consists of deeper and greener values and is fully embodied in the sourcing, manufacture, marketing and distribution of products and services (Bendell and Kleanthous, 2007). Oskar Metsavaht claim that New Luxury is based on one simples equation: $\text{ETHICS} + \text{AESTHETICS} = \text{NEW LUXURY}$.: *"the representation of a lifestyle compatible with the sustainable values. It is a way of being and dress that opposes to the exhibitionism. It is a combination of simplicity and elegance, despoliation and sophistication"* (Osklen, 2015). Specifically, inside the fashion world, New Luxury consists in developing refined design to sustainable materials. In other words, it is the combination of the two factors already mentioned: Aesthetics and Ethics.

The communication of a brand evolves several aspects. Official Website; Social Medias; Advertisement in magazines (especially in fashion magazines like Vogue and Elle Brazil); Personal Selling; Physical

Store; Products; Symbols; the perfume 'Vento'; Lectures given around the world by Oskar Metsavaht; among others.

Brands are now creating online platforms and social networks pages devoted "to the conception of new offers and ideas and are open to feedbacks" (Benmiled-Cherif, Kaufmann and Manarioti, 2016, p.3). The Osklen's website is an important communication and promotion vehicle for the brand. It contains information about the history of the brand as well as its founder and creative director, Oskar Metsavaht; all the collections already presented and the one being sold at that season. They are present on Facebook, Instagram and Twitter and have separate accounts for some of their lines of products. Like the website, their Social Media can be found in different languages.

4.2 Osklen social-environmental responsibility partnerships

The social-environmental movement of Osklen regards the partnership with Instituto- E (a non-profit organization run in Brazil that believes that the sharing of information is the first step towards the promotion of a sustainable human development), E-fabrics (a permanent project that works on the identification of sustainable raw materials, aiming the textile production and the fashion market), E-brigade (the movement Save your Lifestyle. Act Now."), E-Ayiti (a project started from Haiti) and Ashaninka (an indigenous tribe settled in Amazon).

Osklen works directly with the Instituto- E as the main partner in the fashion industry and as an experiential laboratory' for them. By producing clothing and accessories using sustainable materials developed and recognized by the institute's tag 'e-fabrics,' Osklen's products introduce innovation on the fashion market.

The goal of the E-fabrics project is to promote studies about the environmental impacts on the productive process, the preservation of the biodiversity and also the social relationship with the producing communities. Osklen worked as the incubator for this project, beginning to use the sustainable materials in 2001. Among the materials employed by the brand, stands out the Pirarucu and salmon leather; the recycled pet fabric composed of cotton and polyester fibres, result of the recycling of Pet packaging; the organic cotton, cultivated without using any harmful substances to the environment; the recycled tricot, made of defibrillated cotton yarn prevent of the leftovers of textile industry; and the organic silk, produced with cocoons discarded by the traditional silk makers for being out of standards.

The E-brigade is a movement started at the end of the 90's, by the hands of Oskar Metsavaht, under the slogan "Save your Lifestyle. Act Now." The main goal is to reunite ecologists, sports people, journalists, professors, environmental preservation organizations, community action organizations, companies and research and teaching institutions to fight against the environmental misinformation. This project is the seed to the foundation of Instituto-E, and the movement still keeps on going.
