A total of 87.17% of all respondents stated that training was mandatory and 96.85% said they did not need to apply for multiskilling. An amount of 95.54% reported that multiskilling training was conducted in-house and 93.19% were multiskilled by existing hotel employees at supervisory levels or higher. Some 99.21% stated that training was important to them and that they felt empowered by it and were also motivated to perform even better in the workplace. This was especially true for food and Beverage department employees in the

sample group studied. Multiskilling was found to cover, although in varying degree, aspects such as basic language skills, technical skills, conflict resolution, interpersonal skills, IT skills, self-initiative, motivation, marketing, geography and appropriate industry grooming and product knowledge. There are clearly many gaps that are not covered by higher education providers that require attention. Hospitality businesses as well as higher education providers have failed to teach students the appropriate values of professionalism and discipline in the workplace.

The responses to satisfaction with multiskilling in the workplace were varied considerably as indicated in table 1 below.

Table 1. Levels of satisfaction with multiskilling in the workplace

Item:	Response % n=382
I am very satisfied with multiskilling training	12.56%
Multiskilling training is okay	40.57%
No response (neutral)	15.96%
Not satisfied with multiskilling training	19.10%
Other eg. Intend to leave anyway	11.78%

The questions as to how multiskilling can be improved and the employees personal opinions as well as which skills were deemed necessary by them yielded interesting results as per table 2 below (a sample of the most representative answers were used). The importance of employee motivation is thus also a consideration as identified in both the literature and in the respondents replies in this study.

Table 2. How can multiskilling be improved?

Multiskilling training must be made longer	52.44%
The trainer is not adept at imparting knowledge although he/she has the skills-they should thus be trained to train	47.98%
Employees should be asked if they wish to	18.55%

obtain skills in other department areas of operation and not be forced to attend	
There is too much theory in the training	37.23%
Employees in higher level positions get more training than me	18.80%
Management has high expectations of training	33.28%
There should be repeat training to help employees master skills	41.09%
Management needs to communicate more with employees on skills needs	22.45%
I believe I already have the skill so the multiskilling training is a waste of time	08.66%
It can help managers to better evaluate my performance and I can be promoted	19.06%
The training reduces the likelihood of accidents	09.78%
The training has improved my ability to offer quality customer service	16.46%
Multiskilling helps the organisation more than me	30.85%
It is not important at all to me- I am just being 'used' by the company	35.90%
IT skills are what I need the most	18.88%
I need more customer service skills	31.50%
I need language skills in English	20.17%

Employees should be guided to a realization that improving themselves is the main aim of multiskilling while it also solves staffing problems that may arise and ultimately leads to greater guest satisfaction and thus higher profits for the company. A carefully designed multiskilling training programme, enough relevant communication and appropriate and effective multiskills facilitation training are important if hotels are to minimise the possible negative effects of multiskilling as perceived by numerous employees. It was clear that Front-Line Managers were more the most pleased with multiskilling raining provision and were the

most satisfied in their jobs. Employees who felt that they were multiskilled were more job satisfied than those who believed they were not multiskilled. This shows that effective multiskilling training should increase job satisfaction by providing employees with meaningful challenges and highly monotonous and repetitive work is limited (Kelliher & Riley, 2003). Job satisfaction can be increased through the use of multiskilling training as it enhances the employees' need for development and this can be a critical moderating factor when it comes to deciding on whether or not to stay at the same company.

Almost 20% of multi-skilled employees felt that they were more likely to be promoted than the non-multi-skilled employees. Promotion opportunities for employees are undoubtedly enhanced through multiskilling and it also to an extent, provides a career path for employees who acquire new knowledge and skills which provides them with greater opportunities (Armstrong, 2006). Organizational efficiency appears to be better supported by multiskilled employees when compared to non-multiskilled employees (Ottenbacher, Gnoth, & Jones, 2006).

12. RECOMMENDATIONS

There are a number of vital interventions that hospitality enterprises can employ to transform the industry to become more multi-skilled and thus more effective and efficient. A major challenge for the hospitality sector is getting hotels to change from being overly labour-intensive. They will need to have employees who can not only perform single job functions, but who can assume cross-functional roles. Essentially, they will need to be multi-skilled. Once employees have gaining greater competency from multiskilling training, it is conceivable that they could obtain higher salaries. Manpower must in any event be optimized and a drive must be made to introduce a range of labour-saving IT systems and other relevant technology and innovation that will free employees to assist with other tasks. Job functions and roles will need to be re-designed so that employees can be multi-skilled and be deployed where they are needed the most at short notice. For example, front-desk employees could thus be trained to serve in restaurant operations. A doorman could double as a security officer. An HR manager could take care of VIPs on Executive Floors. Valet parkers and reservation agents can collaborate to prepare a banqueting hall after a function with 500 guests at lunchtime, for an international function with over 1000 guests for dinner. Waiters can assist in the laundry and a restaurant manager of a restaurant operating only at night can

assist with reservations in the morning. A valet service can be done by housekeeping employees. Food and beverage staff can serve as registrars for a conference. All maintenance employees can be cross-skilled in plumbing, electrical work and general carpentry.

Multiskilling of employees is a great way to curtail costs and increasing guest satisfaction with service provision. Where a company has huge budgets, it would be wiser to stick with the idea of specialisation but in the current global economic meltdown this is less and less an option for the foreseeable future. Such labour flexibility can augment organizational productivity in response to a tentative service setting. Multiskilling training makes the retention of hospitality employees more likely. The literature suggests that job enrichment and alternating in functions leads to greater employee retention and minimizes their turnover (Brotherton, 2004). Multiskilling indicates to employees that they can develop their career in their current place of employment and this tends to attract them to remain at their work longer thus increasing labour retention. *“The introduction of multiskilling and/or generic working can give an organization greater efficiency and also provide job enrichment for its workers”* (Akhlaghi & Mahony, 1997). Multiskilling also leads to improved level of interdepartmental communication and greater empathy between employees and thus promotes solidarity in the workforce.

13. CONCLUSIONS

The basis of this research was the principle of confidentiality and anonymity. It was ascertained that in each hotel investigated, there were problems relating to multiskilling training per se. Multiskilling is invaluable in the hotel industry since it is a very cost-effective method to assist businesses to face the many employment challenges that are posed in the current global industry. Multiskilling does away with departmental boundaries and promotes and fosters a spirit of teamwork, which leads to better levels of service quality provision. The research provides a set of guidelines about the benefits of multiskilling training of hospitality industry employees. Multiskilling is likely to be the most cost-effective tool to aid hotels to come to grips with the issues of insufficiently qualified and unskilled employees. It is suggested that multiskilling can make employees more flexible and efficient and able to cope with the variety of functions relating to hotel operations. Employees are empowered with additional skills and capabilities which allow them to cope within what is

often a volatile environment. It will also to an extent, serve as a shield given the inordinately high employee turnover rates that are exhibited in the industry. This exploratory study has identified that most 4-star and 5-star hotels in Gauteng and some of those in other countries involved in the study, have adopted multiskilling for their employees. Hotels will undoubtedly benefit from multiskilling as service quality provision, organizational productivity and efficiency, and especially retention of employees are more likely as a result of it. The maximum effect of multiskilling is improved service quality provision and this is critical since better levels of service quality usually lead to greater profits. Critically, organizational performance in this essential service sector is greatly enhanced. Multiskilling training when used as a cost-reduction strategy, has the potential to facilitate and lead all employees to enhanced productivity and efficiency (Kelliher, et al., 2000; Pan, Nickson, & Baum, 2005).

Appropriate employee training in multiskilling initiatives are the critical factors which promote the provision of service quality consequently, hotels that multi-skill employees should provide training which focuses on employees' professional attitudes and behaviours in the workplace, especially relating to guests (see figure 2). In this way, a strategic competitive advantage is obtainable as guests will experience the differences, advantages and benefits of opting to stay at a particular hotel. Multiskilling offers hotels a major benefit, in that it empowers employees to handle what are often unpredictable service situations. This is especially true for front-line managers who supervise employees in daily operations. Organizational productivity is generally improved and staff-turnover is reduced due to multiskilling as it is likely to increase job satisfaction and offers some direction in an employee's career path. Thus employee training and skill development in a number of departments is critical for hotels' wishing to enhance service quality, reduce the cost of labour, and increase general productivity. Multiskilling, if carried out effectively will empower employees and motivate them to offer superior quality service provision. More importantly, it will reduce absenteeism and minimize employee turnover. Line managers play a vital role in delivering and developing a service-oriented culture in their area of operation and beyond, on a day-to-day basis.

When designing a multiskilling programme, hotel managers in the southern African region should draw on the varied experiences of other hoteliers and this will increase the potential for success. Where possible, modules should be developed which are in line with the National

Qualifications Framework (NQF) and which are in line with the CATHSSETA needs. This will make any training transferable to other employers and also encourage employees to be more positive about undergoing multiskilling training.

This research which was essentially a mixed methods approach, has hopefully provided some data against which similar and more detailed quantitative studies can be compared for a more meaningful analysis of multiskilling in the hospitality industry. Further studies could involve the interviewing of all employees and even guests and would undoubtedly enhance our knowledge on the issues at hand. The findings of this research will be reported to industry so as to stimulate the development of the practice of effective and sustainable multiskilling training.

Appendix 1

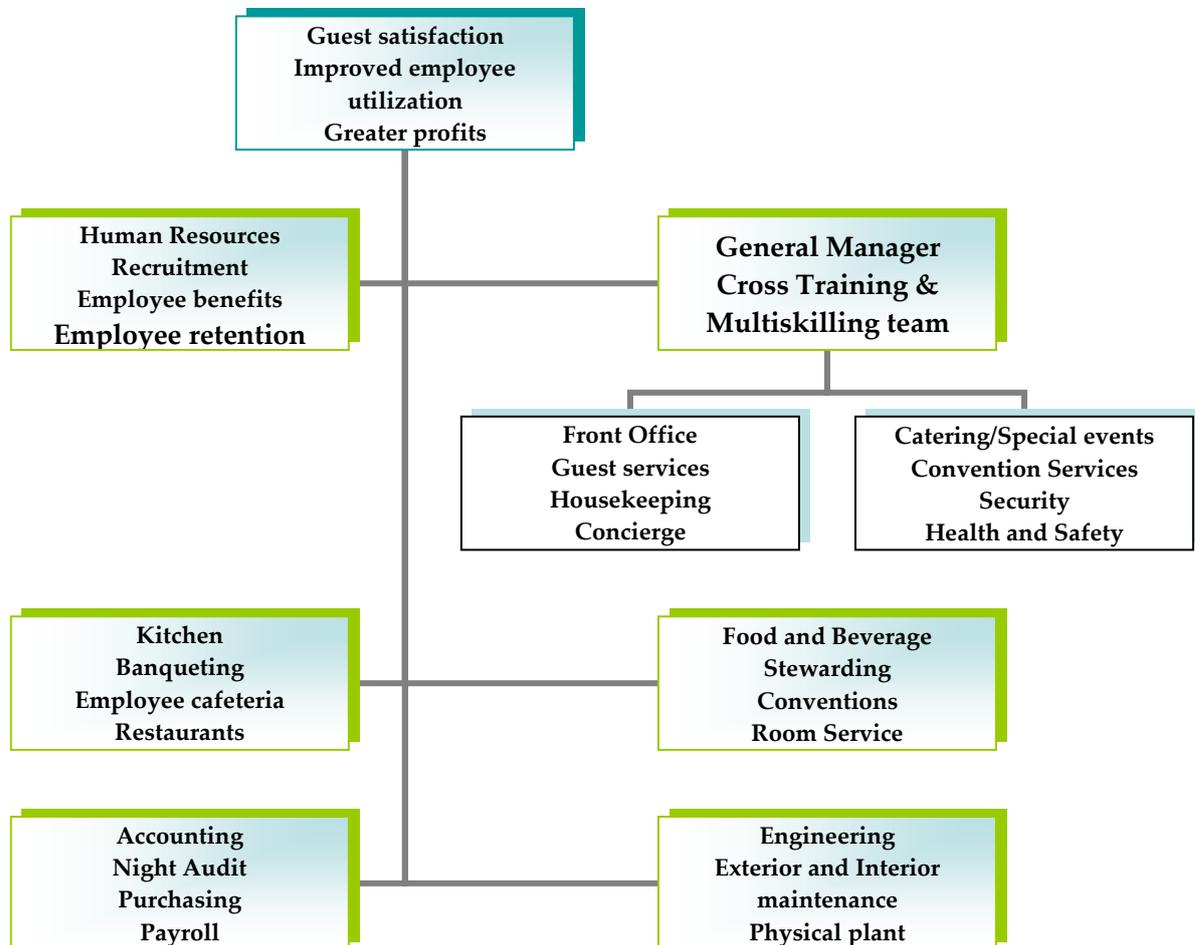

14. QUESTIONS FOR HOTEL MANAGERS TO CONSIDER RELATING TO MULTISKILLING TRAINING

1. What are the main human resource issues that plague your hotel ?
2. Why is there a problem?
3. What strategy can you adopt to minimize the risk associated with the problem/s you face?
4. What should you focus on in managing your employees training?
5. Is your current multiskilling training truly effective?
6. What can you do in training to create and sustain a strategic competitive advantage?
7. Do you have the right employees in each department?
8. Are there policies in place for the multiskilling of employees?
9. Do employees have attainable career paths?
10. Are you abusing or empowering employees?
11. Are you recruiting suitable employees?
12. Do you offer orientation programmes for new employees?
13. Are training plans in place which include training needs, goals, and objectives?
14. Do you request staff to attend or force them to attend multiskilling training?
15. Do you evaluate the acquired knowledge and skills that multiskilling provides and is it part of your performance appraisal for employees?
16. Do all employees' competences depend on skills acquired during training?
17. Does quality of service depend on the competencies developed in multiskilling training?
18. Do newly appointed graduates from Universities of Technology and other higher education institutions have the requisite skills for your business?
19. Do you actively assist Higher Education providers to provide students for industry with the required skills by taking part in advisory panels on curriculum design?
20. Are graduates adequately skilled?
21. Do you plan and conduct regular multiskilling training programmes?
22. Do you pay a fair wage for the job?
23. Is multiskilling training for front-line managers only?
24. Do you believe that multiskilling training should increase organizational productivity in the hotel industry
25. Is multiskilling training needed but seen as a threat as it is associated with increased promotion in an industry with limited upward mobility?

26. Will multiskilling training lead to increased organizational efficiency?
27. Do you think that only upmarket hotels should emphasize multiskills competence?
28. Is your service aligned with the expected guest and industry standards?
29. Do you provide incentives to employees who undergo multiskilling training?
30. Do you effectively identify employees' strengths and weaknesses?
31. Have you ever tested employee attitudes towards the notion of multiskilling?
32. If you have a high employee turnover rate, why is this so according to exit interviews, assuming that the latter are in place?

APPENDIX 2

Figure 1. Hotel organizational structure incorporating multiskilling

Appendix 3

Figure 2.

EXPLORATORY RESEARCH SURVEY QUESTIONNAIRE

Multiskilling in the hospitality industry

Dear Sir/Madam

This is a questionnaire for an exploratory study on multiskilling in hotels, which considers various aspects of the employee training especially multiskilling.

Definition of multiskilling: This is obtaining additional task-related skills and knowledge, which empower you to carry out a broader range of tasks and functions within your organization.

You are not in any way obligated to do this survey however your participation will be greatly appreciated.

Your responses will remain anonymous and you will in no way be compromised.

Kindly complete the questionnaire as truthfully as possible.

Thank you for your understanding and time and effort.

Please download, complete then scan the completed document and email back to the sender.

1. Gender: Male _____ Female _____ (place an X where appropriate)

2. Age: 18-25, 26-45, 46-64, >65 (circle which applies to you)

3. Have you had prior hospitality education: (e.g. at school, college, FET, University, other.)

Please specify, _____

4. Previous hotel working experience: 0-2 year, 2-6 years, 7-10 years, >10 years (circle which applies to you)

5. How long have you been employed in this hotel? Less than 1 year, More than 1 year, more than 5 years, more than 10 years (circle which applies to you)

6. Your current position: _____ (e.g. front desk manager, chef, housekeeper)

7. Did you have company training when you were first employed? Yes No (circle which applies to you)

If yes, what was the duration? _____

If no, you can skip question 8.

8. What was the nature of the training you received?

9. How was the first training you attended? Important, Necessary, Just routine, Not really important Why? _____

10. How often do you undergo training held in the hotel?

Just once in the beginning when work started, Once a year, Twice a year, Once a month Daily basis (circle which applies to you) and for how long? or...

Other, _____

11. Have you been multi-skilled in any way? Yes No (circle which applies to you)

12. If _____ yes,
elaborate: _____

12. Is the training in the hotel mandatory or optional (circle which applies to you)

13. Do you have to apply for the trainings? Yes No (circle which applies to you)

14. Where was the training held?

15. Who conducted the training (You may select multiple choices by underlining them)?

Lecturer hired from outside , Senior Manager, Supervisor, Trainers, line manager, Other,

16. Is such trainings important in the industry?

(Please number them in the order of most important to the least important.

e.g. 1=most important, 2=second important, 3= third important etc.)

Motivates employees and helps them perform better

Empowers employees

Encourages self-development & self-confidence

Management team can evaluate employees' performance

Sustains a positive attitude towards customer service

Shows commitment to skill employees

Improves communication between management and employees

Reduces accidents and safety violations

Helps organizational development Introducing new technologies in time

Unimportant

17. Are you satisfied with the multiskilling training in the hotel? Very satisfied, It's okay,

Neutral, Not satisfied at all, other,

18. How can the multiskilling training be improved if at all?

19. What is your personal opinion concerning multiskilling

20. Which skills would you like to be taught that you are deficient in? (list up to three)

Thank you very much for your co-operation!

PPP AND CULTURAL SPONSORSHIP LAW AND MANAGEMENT

Nikolopoulou, Marina¹; Maniatis, Antonios²

¹Hellenic Open University, Greece, mnicolopoulou@gmail.com

²Higher Technological Educational Institute of Patras, Greece, maniatis@dikaio.gr

ABSTRACT

The School of Thought of New Public Management puts the stress on contracting-out. If contracting-out, exemplified by the traditional-type public works and services contracts and by concession and its variant, Public - Private Partnership (PPP), is the principal methodology for public constructions and services, it may be backed up by supporting contracts, such as donations and sponsorships. As a result, a legal and managerial approach to this operational whole consisting in a double synergy (PPP and its catalyst in form of a funding “partnership”) is recommendable. Non-reciprocal scopes of public policy related to social fundamental rights fit in with corporate social responsibility, so PPP to sponsorship respectively.

Keywords: Contracting-out, PPP contracts, Concession, Cultural Sponsorship, New Public Management, Market economy, Cultural Heritage, Excavations, Antiquities looting, Coverage with earth.

INTRODUCTION: FUNDING MECHANISMS FOR PUBLIC PROJECTS

The state is in need of resources to accomplish its mission, so it has tested both obligatory ways and optional ones of fundraising. Obligatory ways consist mainly in imposing taxes and levy of money but the so-called “Conservative Revolution”, inaugurated by Thatcher in 1979 and by Reagan in 1980 in the United Kingdom and in the USA respectively had other priorities. This neoliberal recipe for public economy *inter alia* put the stress on privatization of public companies as well as on reduction of income taxes and public fees (Cañagueral, 2011). In this context, the New Public Management is a contemporary theoretical approach to the way of change of Public Administration. It started in the United Kingdom, expanded initially in the United States of America and Australia and then in Scandinavia and elsewhere in

Western Europe. It refers to the tendency of adopting the principles and values of the private sector in order to meet financial objectives and goals (Kalogirou and Maniatis, 2012).

Another way of fundraising, in ancient times obligatory and then merely optional, is sponsorship.

The state has diachronically made use of the concession of technical works and services to the private sector, let alone the fact that the similar mechanism of Public - Private Partnership (PPP) has recently constituted a worldwide trend (Patrikios, 2009).

On account of this methodology of private-centered optional fundraising for public activities, *we suppose that PPP needs enhancement through the sponsorship mechanism, exemplified by the cultural sponsorship contracts.*

PPP LAW

PPPs are not regulated by specific EU law but by national legislations. In fact, any contract in which a public entity entrusts the provision of an economic activity to a private contractor, should be subjected to rules and principles, such as transparency, equal treatment, proportionality and mutual recognition. It is recognized that the methodology for implementation of PPPs can vary, depending on the nature of a given project and local concerns. (Nikolopoulou, 2012).

In general, PPPs are agreements between the public sector and the private one on providing public infrastructure, community facilities and relevant services, through allocation of various risks. The motivation of the use of this model varies but generally it involves financing, designing, construction, operation and maintenance of public infrastructure and services. (Ministry of Municipal Affairs Canadian, 1999)

Some common features of PPPs according to the Green Book of the European Commission are the following:

- Long-term relationship between parties.
- Risk-allocation between the public sector and the private one.
- The private sector financing (the project in some cases may be substantially completed by public funds)

- The public services and ultimate regulatory responsibility remain in the public sector.
- Project distinction based on the way of the repayment of the private sector.

Upon the way of the private contractor's repayment, the PPP scopes may be reciprocal or not. Reciprocal projects implicate the full or partial repayment through the reciprocal charges of end-users and, as a result, the correspondent risk of the private entity ("sponsored PPPs"). They are exemplified by transport projects (ports, airports, railways etc), environmental ones (water supply, sewerage, waste management) etc.

Non - reciprocal projects are repaid directly by the public sector ("administrative PPPs") and are usually related to social fundamental rights of citizens and social policy for schools, hospitals, museums, cultural activities etc.

Although cooperation between the state and the private companies may offer micro-economic benefits permitting execution of a project that provides value for money and meets public interest objectives, the recourse to PPP cannot be considered as a miracle solution for the state facing budget constraints. Empirical research has demonstrated that, for each project, it is necessary to assess whether partnership offers real value added against the rest contracting-out alternatives, such as outsourcing and mainly traditional-type public technical works and services contracts as well as concessions.

NEW PUBLIC MANAGEMENT

Governance is the administration of public affairs conducted by a central directing institution, the government. There is no uniform model of governance, particularly on account of the fact that the movement of New Public Management seems rather apprehensive as for the reformative methodology to adopt. The principal movements of this preeminent School of Thought are the currents of the economy of the market and of participation and reinforcement (Maniatis, 2006).

The first current, which prevailed in the United Kingdom and in Australia, has caused decentralization through the creation of specialized services. These services function on the basis of productivity targets under the direction of managers frequently coming from the

private sector. Furthermore, certain systems of attachment, going from the reciprocation to the productivity of public servants have been institutionalized. As far as possible, administrative processes are replaced by the market mechanisms. For instance, coupons are in use for the participation in various programs while internal markets have been generated in the public sector of health.

A considerable alternative, more popular in Northern America and in certain states of Europe, is less related to the market economy, to which it is in opposition as long as it turns down the universal primary role of markets mechanisms for the delivery services. On the one hand, it encourages the active participation and the contribution of the working population to the bureaucratic processes and, on the other hand, it put the stress on active participation and the reinforcement of the citizen in his relations with the executive power. This current recommends the reduction in the number of levels of hierarchy in the interior of services, the elimination of certain intermediary echelons of administration and the systematic encouragement of initiatives of lower grade public servants. Besides, it implicates the creation of institutions specialized in the aid of public services users and of citizens in total, gives advice to the public and familiarizes it with the aims and the procedures of various services. In the United States, the reinforcement of the lowest echelons of bureaucracy has been realized since the beginning of the 21th century (Spanou, 2001). An interesting aspect of this current has to do with the European integration. It is about the application of directives as sources of the European Union Law. This intrinsic to the European integration legal tool needs its transcription in each legal order of the states involved. The pressure of the directives on the political and administrative system of the states makes the competent public employees more conscious of the insufficiency of the executive power and consequently they supply them with a notable argument to reinforce their own institutional position against the politicians and perhaps to counterbalance the pressures of meritocracy.

Anyway, severe criticism has been raised against the New Public Management for various reasons. For instance, as for the market economy current, the use of methods and technologies by the public servants, whose the attention was diverted from the rules and the processes towards the results and the performance should not be disconnected from values that the creation of these rules aimed at safeguarding. The technological and economic automation of the state should not be duplicated in the form of normative autonomy as for the social needs and the rights of public services users. The participation and reinforcement model should not imitate the anachronistic cases of socialization of the management of the

public enterprises on account of the fact that the workers' approach is usually far away from the one of private individuals. The model of "Citizen – Client" of public services, particularly of public enterprises, is in principle recommendable, so a kind of combination of the two currents of New Public Management emerges.

PPP AND NEW PUBLIC MANAGEMENT

As for the relationship between PPP and New Public Management, it is to pay special attention to the fact that PPP is above all an institutional case of Management serving legally consecrated public purposes. Indeed, the institutionalization of PPP is not merely a way of cooperation between the state and the private companies but it may be considered as the inversion of the bad practices of both state and society, well exemplified by earthed-up monuments. Coverage with earth constitutes a controversial issue, particularly widespread in the archeological practice (Maniatis, 2013). First of all, sites under legal archaeological excavation, unguarded due to the lack of resources, are proved to be the field of antiquities looting, as it happened in the site of Archontikon in Greece in 2011. As states make use of the coverage with earth as a "mortgage" for an on-the-field research, to be accomplished by the future generations of archaeologists, some private individuals take benefit from it as a "mortgage" for illicit excavations of the current era. As a result, a finding emerges, consisting in the counterbalancing dynamic of criminality against the controversial practice of Public Administration. So, administrative and private practices result in a homogeneous total, particularly in the countryside. Besides, states set the bad example to citizens as in the urban fabric they frequently do not authorize the unearthing of localized monuments and so they deny the citizens' right to monuments according to the principle of sustainable development, in virtue of par. 1 and 6 of art. 24 of the Greek Constitution. This practice has recently exemplified by the antiquities under the Ypapanti square of Kalamata, accidentally discovered and unearthed in 1960, earthed-up about six months later on the usual pretext that there are no resources for the necessary programmed excavation and still kept in the earth in spite of the recent decision for the square!

What has not been realized is that the dynamic of private individuals' criminality against the State that is the owner of the ancient monuments corresponds to controversial practices of the Public Administration like this. Concretely, owners of immobile things, particularly in the urban fabric, have the tendency of deciding to earth up the findings of cultural interest. This is confirmed mainly when they desire to proceed to building works, a case in which

complicity of the building contractors may occur. A town or a city may include even unknown, by the State and the public, underground tunnels including eventual monuments, admittance that does not constitute merely an “urban legend”.

To sum up, coverage of monuments with earth serves various state purposes, such as facilitating and acceleration the execution of public constructions, fundraising and protection of monuments from of looting while private individuals also make use of it illegally, for instance to go on with their own constructions or by committing antiquities looting. So, there is an informal “Public – Private Practice” (or “Partnership” by improper use of the term), with a negative impact for heritage, instead of the potential use of the PPP legal tool for the protection of heritage and the promotion of culture. So, the PPP institution is symmetric to the informal and criminal phenomenon of bad Public – Private Practice in combination, namely of ... Public – Private Partnership. As a result, it may be considered as an example of the principle of proportionality, let alone in its perfect development because not simply a proportional (symmetrical) institution but a homologous one (in the form of synergy between the public sector and the private one) has emerged against the comparable tradition of bad practices.

Furthermore, PPP contract model is historically connected with the Conservative Revolution, particularly in the United Kingdom, and exemplifies the tendency of contracting out for state activities. In this sense, PPP corresponds to one of the major dimensions of New Public Management and, according to some experts, even to its essence (Lane, 2000). Contracting out has become, since the beginning of the 1980s, a part of the big program of the New Public Management. More concretely, in the first phase of this School of Thought, the priority consisted in privatising public activities whilst since the second part of the 1990s contracting out has been the preferable solution for various reasons. The institutionalization and the application of the PPP contract model is incorporated into this historical development.

So, PPP exemplifies the current of market economy, given that neoliberal policy is inspired by the private sector way of constructing and operating, although it implies also some elements of the other current, such as the simplification or even the inversion of the hierarchical pyramid.

CULTURAL SPONSORSHIP LAW

Definitions of sponsorship, like the ones of PPP, vary and the practice has been described as *“an investment in cash or in kind activity, in return for access to the exploitable commercial potential associated with that activity”*. Sponsorship of sport is now very big business and as the value of rights fees inflates, companies are increasingly eager to achieve a return on their investment particularly in the economic downturn. Companies have to ensure that the sponsorship is a congruent fit with the sponsee, that objectives are realistic and clear, and that the sponsorship is re-evaluated over its life span. Finally, it is more important than ever to evaluate and manage risk and to ensure that legal protection is in place from the outset (Fabien, 2010).

The cultural heritage in a wide sense comprises the cultural heritage itself, having to do with ancient monuments and archaeological sites, and the architectural one, consisting in listed buildings and uses of buildings as well as in traditional residential complexes. It constitutes a relatively modern scope in the field of the public law, worldwide. For instance, it is explicitly protected by the ad hoc paragraph 6 of article 24 of the Greek Constitution, besides the general protection of the environment, the cultural one included, in paragraph 1. Although the Constitution makes no explicit reference to sponsorship, L. 3525/2007 regulates this autochthonous ‘function’ according to the ancient Greek term meaning a financial duty imposed by the state, of financing cultural activities. It is to pay special attention to the fact that several countries have recently adopted a law relevant to these contracts, just like they did almost simultaneously for PPP contracts. This is the case of Greece that in the aforementioned law defines cultural sponsorship as a pecuniary or non-pecuniary economic benefit consisting in kind, immaterial goods or services, for the enhancement of concrete cultural activities or purposes of the sponsee (Maniatis and Kapralou, 2012).

Sponsors’ motive is to strengthen their corporate image through the identity of social responsibility. Besides, they may also take a profit from the consequent tax exemption that is in use in most countries of the European Union and of North America and allows to big carriers of cultural goods and activities to back up their mission just as their own sponsors are facilitated to accomplish their commercial mission in a competitive way, so in conformity with the New Public Management current of market economy.

The underlying motivation of cultural sponsorship combines the two opposite poles: interests, on the one hand, and ideals, on the other hand. The tough interests for a sponsorship are often colored by softer reasons, such as personal fondness, attachment to and familiarity with culture on behalf of people in business. Some of these intentions are benign and legitimate, others not so spotless. One reason for mapping and analyzing types and

motivation of private involvement in culture is that this practice helps make successful policies vis-à-vis private partnership.

Anyway, in the Greek legal order sponsors are defined as physical or legal persons, regulated by private law, proceeding to cultural sponsorship. Sponsorship has been institutionalized as a formal contract, namely in form of private contract document, producing mutual obligations for the parties. Indeed, the sponsor is supposed to offer money, services, materials or immaterial goods to the recipient in order to back up a concrete cultural purpose or activity while the sponsee is supposed to notify publicly the sponsor's offer. Anyway, the sponsor acquires no right to interfere into the form or the content of the activity on the matter, in virtue of the principle of the independence of the sponsee. Thanks to this incompatibility, the recipient remains the unique responsible for his policy, like the public partner that is the master of the PPP project from scratch.

L. 3525/2007 classifies sponsors in the following categories, on the basis of financial criteria:
a. Great Sponsor, b. Sponsor, c. Supporter, d. Friend.

THE QUESTION OF CORRELATION OF CULTURAL SPONSORSHIP WITH PPP

Literature on PPPs sometimes makes use of the term "sponsored PPP" against "administrative PPP" but in a sense quite different from the legal sense of sponsorship. In this context, sponsored PPP declares the PPP case, in which the cost of providing the service is jointly borne by the users of the services and the government through a capital subsidy, not wholly borne by the Public Administration (administrative PPP). On the contrary, the question of correlation between sponsorship, in the proper use of the term, and PPP is not only legally unregulated but also almost fully original in the level of scientific research. Indeed, just a recent research has proposed this idea on account of the French successful paradigm of cultural sponsorship (Vassilakou and Maniatis, 2012). Cultural sponsorships in France have been particularly successful, consisting even in rewards for information to the authorities investigating crimes related to heritage and artistic treasures. However, this approach may be enriched by the datum that the French system of funding culture consists in a strong public intervention, reinforced by the tax-policy, and in a relatively mediocre sponsorship. So, it appears to be strictly the opposite to the USA system, in which funding is based on a variety of private initiatives.

The aforementioned research considered, in this context, the correlation, in law as well as in practice, of sponsorship contracts to the PPP ones as highly recommendable. So, it concluded that national PPP legislations, such as the French law and the Greek one, could include a detailed reference to sponsorship or the interested states could adopt a single law including PPP contracts and sponsorship ones.

The proposal of that research is reinforced by a historical argument related to public infrastructure and to cultural goods. Indeed, both contractual types are not only new in the legislative level but also comparable within the following scheme of the history of management of the public infrastructure and the cultural goods (particularly heritage), from 18th century on, in the western world, mainly in France:

PHASE OF THE PERIOD 18 th C. -21 st C.	PUBLIC INFRASTRUCTURE MANAGEMENT (PROGRESS TO OPERATIONAL PRIVATIZATION)	(PUBLIC) CULTURAL HERITAGE AND ARTS MANAGEMENT (CREATION AND GROWTH OF THE MUSEUMS BRANCH OF THE PUBLIC SECTOR)
1	STATE MONOPOLIES	ROYAL COLLECTIONS & BUILDINGS (PALACES)
2	CONCESSIONS	CULTURAL HERITAGE AND ARTS PUBLIC MUSEUMS ENDOWED WITH FORMER ROYAL COLLECTIONS AND BUILDINGS (PALACES)
3	CONCESSIONS AND THEIR NEW VARIATION: PPP CONTRACTS	CULTURAL SPONSORSHIP CONTRACTS AND CONCESSION CONTRACTS AND PPP CONTRACTS FOR CULTURAL ACTIVITIES AND MUSEUMS

Table 1: Phases of public infrastructure and cultural heritage management (18th c.–21st c.)

Anyway, correlation of sponsorship and PPP is also supported by the argument of their joint potential spiritual character. Sponsorship may be proved to be quite beneficial for PPP contracts, even in the PPP pre-contract procedure, consisting in the conception of the idea and the preliminary assessment of the PPP scope. In other words, sponsors could back up the crucial preliminary stage, mainly by non-pecuniary sponsorship.

CONCLUSION: THE SPONSORSHIP AS A POTENTIAL CATALYST FOR PPP

To sum up, the sponsorship in general, as exemplified by the cultural sponsorship version, is not incompatible with the comparable innovation of the PPP model. On the contrary, in principle it is worth correlating in law as well as in practice these two modern types of financing the state scopes, particularly in the sensitive domain of culture. If contracting-out is the principal methodology for public constructions and services, it may be backed up by supporting contracts, such as donations and sponsorships. As a result, a legal and managerial approach to this operational whole consisting in a double synergy (PPP and its catalyst in form of a funding “partnership”) is recommendable. Last but not least, non-reciprocal scopes of public policy related to social fundamental rights fit in with corporate social responsibility, so PPP to sponsorship respectively.

GREEN WOODEN FURNITURE. DETERMINATION OF MARKET TRENDS AND TENDENCIES IN GREECE AND CYPRUS DURING ECONOMIC CRISIS

Papadopoulos, Ioannis ¹; Karagouni, Glykeria ²; Trigkas, Marios ³; Beltsiou, Zoi ⁴

Department of Wood & Furniture Design and Technology, Technological & Educational Institute of Larissa, Karditsa, Greece, papad@teilar.gr¹; karagg@teilar.gr²; mtrigkas@cereteth.gr³; zoibelt@hotmail.com⁴

ABSTRACT

The present paper explores the tendencies of Greek and Cypriot furniture manufacturers to produce and/or dispose eco-friendly furniture in relation to relevant market trends based on consumers' intentions, production costs and prices. The study seeks to draw attention to the critical factors which will impact decision making on such products development within the severe crisis. 85 specially constructed questionnaires were selected in 2012, which were further elaborated and statistically analyzed with SPSS ver 17.0.

The results indicate an increasing interest of both Greek and Cypriot consumers for eco-friendly furniture, defining certain target-groups. Eco-furniture production will increase production costs at a rate of 11-15%. On the other hand, consumers are willing to pay a higher price of no more than 7-11% for eco-furniture.

Factors which constitute major concerns for enterprises in order to decide the turn to eco-furniture can be categorized into three groups: economic and investing, firm resources and marketing.

Keywords: *Green Wooden Furniture, Furniture Markets, Greece and Cyprus Furniture enterprises, Market research, economic crisis*

1. INTRODUCTION

1.1 *Green wooden products*

Nowadays, environmental and ecology issues constitute an imperative concern for a major part of the global population and entrepreneurs (Allen and Malin 2008; Schaper 2002; Larson 2000; Adeoti 2000). There is a relatively growing trend towards both production and purchase of “green” products and services even during the economic recession (Nidumolu et al 2009; Chamorro et al 2009; Bleischwitz et al 2009).

For the purposes of the present study, we define as “eco-furniture” or “green” furniture, a product of furniture designed to minimize the environmental impact during its whole life-cycle (Albino et al 2009; Baumann *et al.*, 2002) and thus furniture with characteristics of environmental compatibility, taking into consideration all the stages in furniture life-cycle (Alhola 2008; Progetto Life, 2005).

The number of companies interesting on environmental performance which address their environmental effort early in the supply chain is increasing (Frondelet al 2007; Epstein and Roy 2006). Concepts such as design for environment, eco-design, extended producer responsibility and product stewardship are becoming more and more common in corporate culture (Santolaria et al 2011). Design for environment has been defined as the systematic process through which products are designed in an environmentally conscious way (Fiksel, 1996), while for eco-design the environment becomes a co-pilot in product development (Brezet and van Hemel, 1997).

1.2 *Goal and scope definition*

The practical motivation for this study arises from the continuously intensified competition on international markets and the question of ways for wood products industry to maintain its competitiveness in these markets. The core aim of the present research is to explore the viability of the ecological furniture niche markets in Greece and Cyprus. More specifically, we investigate the current demand on ecological furniture, manufacturers’ estimates on the increase of production costs and the prices relevant customers are willing to pay. Finally, particular emphasis lays on the analysis of the factors that will support decision-making of Greek and Cypriot enterprises in order to incorporate ecological furniture into their current activities.

2. LITERATURE REVIEW

2.1 Eco-furniture market. Creating value for customers through innovation

Many observers claim that pressures of global competition, the fragmentation of markets into smaller segments, and the rapid pace of change in many industries indicate that companies' product development capabilities are crucial determinants of business success (Brown & Eisenhardt, 1995; Schilling & Hill, 1998).

The European Union is one of the largest producers, traders and consumers of wood products in the world (European Commission, 2012). The furniture industry is basically an assembling industry which employs different raw materials (wood as well as metals, plastics, leather etc) to manufacture different products. At present, the European furniture industry has a strong image worldwide thanks to its high level of quality, not only at a technical level, but also at an aesthetical one. However, there is a growing concern about the environmental effects derived from goods production and use as well as on how they are disposed of at the end of their life cycle (Humphrey and Schmitz, 2001). Several eco-labels have developed criteria for furniture. The demands in eco-labeling arise on the basis of a lifecycle perspective (Swedish EPA, 2002). Eco-design or Design for Environment (DfE) refers to the systematic incorporation of environmental factors into product design and development and may play an essential role (Tukker et al., 2000).

The decision in new products development, such as eco-furniture constitutes one of the basic issues of the company's business strategy in order to gain a significant market share. Nowadays, the furniture sector is paying special attention on environmental and innovative concerns due to the aim of distinguishing its products from other competitors as well as its entrance into the emerging market of green products (González-García et al. 2012).

On the other hand, marketing scholars and practitioners alike highlight the central role of customer perceived value, or customers' overall assessment of the utility or worthiness of an offering in impacting their purchase decisions (Anderson, 1995; Gao, Sirgy, & Bird, 2005; Woodruff, 1997). For the enterprises, being able to provide high product quality and value for customers has been considered a key element for improving competitiveness (Lindgreen and Fynstra, 2005; Sweeney and Soutar, 2001). Several studies conclude that "environmental friendliness" has a major influence on furniture purchase decision and customers are willing to pay an extra 2 - 16% for eco-labeled furniture (Papadopoulos et al. 2010; Veisten 2007). Thus they give the opportunity to manufacturers to capitalize on their ready access to

sustainable, commercially cultivated timber sources to strengthen their position (Morris and Dunne 2004).

Starting from this premise of the importance of environmental issues as strong drivers for innovation along with unexpected changes in markets (such as markets during crises), new product development and innovation projects are facing obstacles of several kinds (Damanpour, and Gopalakrishnan 1998). This limitation is especially salient in adoption contexts involving expensive, discontinuous, and technologically complex innovations, where the stakes, costs, and risks are particularly high. In such decision contexts, manufacturers' innovation value assessments naturally take place in high risk situations (Gao et al. 2012). Awareness of the competitive advantage of an eco-furniture product, which encompass not only the environmental aspects but also other aspects such as product quality and consumer satisfaction, could temper any hesitations in related investments (Park and Tahara 2008; Penttinen 2005).

2. RESEARCH METHOD

The primary data collection and elaboration followed the methodology of gathering, processing and editing according to the basic principles of marketing research (Gordon and Langmaid, 1988; Tull and Hawkins, 1990; Doyle, 1998; Aaker et al. 2004; Siomkos and Mavros 2008). Questionnaires were specially constructed for the purpose of the study with short and precise questions. The research was conducted by skilled researchers who addressed directly the entrepreneurs or executive members of the firms by personal face-to-face interviews.

The questionnaire was divided in three groups of 34 questions in total. The first group contained 9 about the profile of each firm. The second group contained 19 questions about the production and marketing of ecological furniture. The third group entailed 6 close-end questions about general aspects regarding consumers' ecological sensitivities such as protection of the environment, green marketing and question on production and marketing difficulties in Greece and Cyprus.

The study was conducted during 2012. We collected data from a random sample of 85 questionnaires; 36 Greek furniture enterprises, 25 Cypriot ones and 24 sectoral experts and relevant institutes in Greece and Cyprus. 91 questionnaires were collected representing approximately the 10% of the total sectoral population. A pilot questionnaire was applied in

five enterprises in Greece and Cyprus. The pilot research enabled the reformation and improvement of the questionnaire according to Dillman (2000).

Data were processed and analyzed using the statistic package SPSSWIN ver 17.0 and all the related tests of Frequencies, Descriptives, Crosstabs, Analysis of Variables Independency using chi-square criterion, Correlation analysis and Analysis of variance - T-test were made (Norusis, 2007; Howitt and Cramer, 2003).

The construct validity was based on the test of unidimensionality of the elements constituting each factor, as well as the content validity of each factor separately. We used Factor analysis according to the method of Principal Component Analysis. Regarding the content validity of the research variables, the statistical factor of Cronbach's Alpha was used (Siomkos and Vasilikopoulou 2005, Chantzoudis *et al* 2009, Sarigiannidis *et al* 2009).

3. RESULTS

It is rather interesting that although most firms (73.5%) know the benefits of adopting the EU ecolabel, only a 16.4% has adopted some kind of eco-labeling and only recently. In fact retailers are more related to eco-labeling and tend more to use it for their products than furniture manufacturers (Pearson $X^2 = 5.153$, Cramer's $V = 0.306$ at a significance level $> 90\%$ Approx. Sig= 0.076).

In spite of the severe economic crisis in Greece and Cyprus, the sampled firms admit that consumers in their majority are moderately or very little interested in ecological furniture or woodworking in general (54.0% and 60.9% respectively, Figure 1). A percentage of 18.9% and 17.3% respectively are conscious consumers of the above product categories and can constitute the ideal target groups.

The X^2 control revealed that this interest is statistically significantly related to the number of company employees (Pearson $X^2 = 25.808$, Cramer's $V = 0.392$ at a significance level $> 95\%$ Approx. Sig= 0.011). This indicates that bigger companies have customers who are more sensitive to ecological issues and, by way of consequence they are more interested in buying eco-furniture.

Besides the rather negative current attitude, firms estimate that ecological furniture will increase prices at about 15% in average in relation to conventional furniture in Greece and at

about 11% in Cyprus with a significant statistical relation of price increase percentage and country of sales (Pearson $X^2 = 12.700$, Cramer's $V = 0.389$ at a significance level $> 95\%$ Approx. Sig= 0.013). A further analysis showed that manufacturers estimate a price increase of 15.5% and retailers of 12%.

Interestingly enough statistical analysis indicated that the smaller the employees number, the bigger the price increase as estimated by company managers (Pearson $X^2 = 32.677$, Cramer's $V = 0.437$ at a significance level $> 99\%$ Approx. Sig= 0.001).

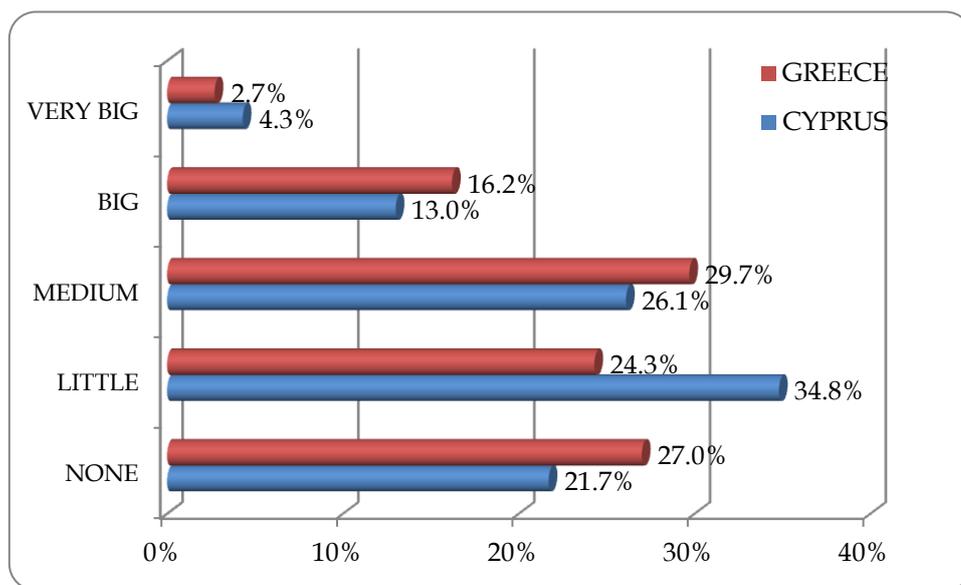

Figure 1. Tendency of sampled firms' customers to buy ecological furniture or other ecological wooden products

An important question of the research referred to the intention of consumers to buy ecological furniture by paying an additional amount of money compare to conventional furniture. Cypriot entrepreneurs believe that their customers would be willing to pay an average of 11% more money in order to buy eco-furniture. Therefore, it seems that entrepreneurs and consumers' estimations converge regarding the added value of eco-furniture. On the contrary, Greek consumers seem reluctant to pay an additional amount of more than 9%. This results to a difference of 6% between suggested prices of suppliers and customers. A relevant research of Papadopoulos et al. (2010) denoted that Greek consumers are willing to buy eco-furniture at prices of only 6% higher than the ones of traditional furniture. A significant percentage of 21.7% has declared that they will not pay more to buy any type of ecological furniture. This was rather expected due to the severe financial and public debt crisis in Greece (Figure, 2).

Crosstabs analysis confirmed further that bigger companies have customers who are more sensitive to ecological issues and are more interested in buying eco-furniture. This customers' percentage is significantly related to a) the firms' turnover (Pearson $X^2 = 33.066$, Cramer's $V = 0.395$ at a significance level $>95\%$ Approx. Sig= 0.033) and b) the number of employees (Pearson $X^2 = 17.592$, Cramer's $V = 0.318$ at a significance level $>95\%$ Approx. Sig= 0.040).

Greek and Cypriot target groups present some differences. Greek potential consumers of eco-furniture are mostly women (86.8%), between 25-34 years old (63.2%), married with one or two children (68.4%) and academic background (68.4%). They are freelancers (52.6%) with a monthly income of 2-3,000 € (47.4%). They usually have a house of 100-150 sq.m. (39.5%). Cypriot potential consumers of eco-furniture are women (60.0%), between 25-34 years old (40.9%), married with one or two children (41.2%) with a monthly income of 2-3,000 € (36.4%). Yet, they are high school graduates (47.6%), work in private sector (33.3%), and they have bigger houses than Greeks (150-200 sq.m., 44.4%).

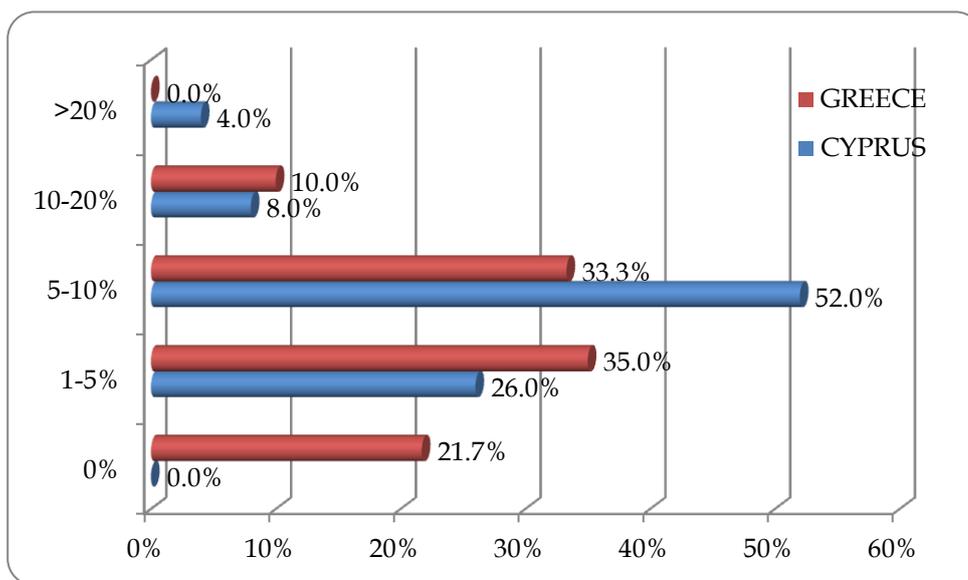

Figure 2. Percentage of additional charge of eco-furniture that sampled firms' customers are willing to pay.

3. 1. Issues of concern

Table 1 presents insights and speculations provided by the entrepreneurs who participated in this research regarding eco-furniture production or retail investments and relevant decision-making. More specifically, they question issues on preconditions and information needed to eliminate risks regarding green marketing and certified sustainable wood promotion.

Greek wood and furniture entrepreneurs' major concerns refer to the business risk and the size of uncertainty that the company encounters in case of choosing a green marketing strategy as well as the size of the new investment. These two factors were ranked first and second (4.29 and 4.11 respectively with 5 to be the most important). In the mid of severe economic crisis and lack of liquidity it is rather normal for Greek companies to be very conscious on the type of new investments. On the contrary Cypriot firms (*we remind that the research was contacted before the severe crisis in Cyprus*) did not show any anxiety against new investments. Current developments verify our former assumption that there would be a 1.5 -2 year time lag of the consequences of the economic and fiscal recession in Cyprus (see Papadopoulos et al., 2012). At the time of the research, Cypriot firms were more concerned on a) Prospective price, guarantees, potential discounts, and economic supplies of the products (3.76) and b) raw materials, trademarks, packaging, size, colors and product view in general (3.71).

<i>a/α</i>	Questions regarding certified wood	Importance	
		Greece	Cyprus
1	business risk and size of uncertainty	4.29	3.50
2	Investment size	4.11	3.68
3	Prospective price, guarantees, potential discounts, economic supplies of the products	4.00	3.73
4	Questions on raw materials, trademarks, packaging, size, colors and product view in general	3.95	3.76
5	Best ways for fund sourcing: own funding, borrowing, leasing etc	3.84	3.71
6	What will be the variable cost and how will fix cost be charged? What about promotion and production costs?	3.68	3.68
7	What will be the process and the time needed to replace conventional wood with certified wood?	3.62	3.26
8	Do consumers, market conditions and competition allow for such changes?	3.45	3.22
9	Can existing production facilities, know-how etc support this new business concept?	3.45	3.23
10	Can existing resources (sales, channels, human capital etc) support this new business concept?	3.34	3.17
11	What is the optimum production quantity?	3.30	3.62
12	Which are the specific distribution channels and the relevant intermediaries' networks?	2.81	3.14

Table 1. Concerns on production and launching of certified wood (importance rating from 5 to 1 with 5 to be the most important)

Since all the 12 above factors of Table 1 seem to relate to each other, a Pearson correlation analysis was conducted. The results are presented in Table 2. Some factors which present a positive relation to each other at a significance level of 0.01 when a firm turns to production or sales of eco-furniture are:

- a) The bigger the business risk and the size of uncertainty, the bigger is the concern on a) the investment size (Pearson correlation coefficient = 0.617) and b) the source of the capital needed (Pearson correlation coefficient = 0.581).
- b) The more consumers, market conditions and competition allow for the ec-furniture development, the more willing firms are to invest on production capacity, process equipment, know-how etc and produce eco-furniture (Pearson correlation coefficient = 0.599).
- c) The more the market pressure for changing from traditional to certified wood as a raw material to eco-furniture, the bigger the price of final products. In parallel, guarantees and economic supplies will also increase (Pearson correlation coefficient = 0.523).
- d) The higher the new investment size a) the sooner the firm will decide and replace traditional with certified wood (Pearson correlation coefficient = 0.611) and b) the higher the price of the final products. In parallel, guarantees and economic supplies will also increase (Pearson correlation coefficient = 0.567).
- e) The higher the variable and fixed costs as well as the costs of production and promotion of eco-furniture, the higher the product price, guarantees and economic supplies will also increase (Pearson correlation coefficient = 0.517).

Additionally, at a significance level of 0.05, raw material, trademarks, packaging, size, color and product view in general will impact the distribution channels and more specifically the intermediaries networks (Pearson correlation coefficient = 0.464). This results was also evident in our former research (Papadopoulos et al., 2011).

The reliability test (Cronbach's Alpha = 0.815) of the above concerns' importance and the relevant decision making indicates that the deterministic variables (responses) are concrete and reliable structures, capable to contribute to the measurement of the factor they belong to. Factor analysis after the factor matrix rotation showed three major factors: financial and investment factor (variables 10, 11, 9, 12, 4, 8 of Table 1), company resources according to the market demand (variables 2, 1, 3 of Table 1), marketing (variables 5, 6, 7 of Table 2). These 3 factors have quite high eigenvalues which reach the 63.2% of the total variation.

Cronbach a (Alpha) are 0.858 for the first factor, 0.584 for the second and 0.719 for the third one. Besides the relatively low reliability of the second factor, the total reliability is quite high and significant (Siomkos and Vasilokopoulou 2005).

4. CONCLUSIONS - PROPOSALS

Besides the rather severe consequences of the crisis on the Greek and Cypriot companies, eco-labeling and the related social responsibility are considered by them as very important. There is an increasing trend towards eco-labels for furniture and harmonization with the statutory ones by EU. However we should mention that none of them is totally suitable for all market sub-sectors and market criteria (European Commission 2008).

On the other side the analysis indicate a moderate to minor trend towards eco-furniture both in Greece and Cyprus. This is due to the severe economic crisis which caused a significant fall of the buying power (mainly in Greece for the time being). Customers of big companies seem to be more interested in eco-furniture; they are mostly women over 35 years old with high educational level and a monthly income of 2 to 3,000 €.

Price is a major determinant of the buying decision. Consumers report willing to spend an additional amount of 6 and 11% in Greece and Cyprus respectively on eco-furniture (compared to conventional furniture).

However, eco-furniture can constitute a significant competitive advantage for both Greek and Cypriot firms, especially after the recovery of the long-lasting recession. This is due to their focus on sensitive environmental issues and the arising markets of green products. Nedmark (1998) had even then indicated that firms which use environmental friendly raw-materials are able to improve their products and facilitate entrance in relevant markets. "Green Entrepreneurship" is according to recent literature (Trigkas et al 2011; Nikolaou et al. 2011; Rodgers, 2010; Zisis 2003) among the most important contemporary types of entrepreneurship. It regards the environmental dimension as an opportunity instead of a threat offering differentiation and affecting performances in positive ways.

The main obstacle that seems to exist is the business risk that such a turn to eco-furniture production and/or selling can cause. Yet, existing relevant cases indicate that this risk can be eliminated by a proper market research and a thorough analysis of certain factors which according to the present research are a) financial and investing factors, b) existing resources according market demand and c) effective marketing of the relevant firms. Considering that risk is inevitable in any type of investment, decision making is quite important and should be based on strictly organized methods and practices in order to be effective. Quoting Jim Rohn (2011) «*You cannot make progress without making decisions*», especially in difficult market conditions as the existing ones.

A major contribution of the present research is that it can constitute a useful basis for policy makers at governmental and institutional level in both Greece and Cyprus to encourage close collaborations of companies to academia, design and research centers for the sustainable development of the sectors through the eco-friendly practices and relevant innovations. In 2004 such an action took place in Finland (Finnish Furniture Panel, 2005; Nissinen and Parikka, 2007). A significant result of that project was the development of extensive networking which assisted the diffusion of information as well as of a pertinent culture on eco-products. There are many other actions which show the growing importance of the issue (Ecosmes, 2005; Nordic Eco-labeling, 2003; GRIP, 1998). A similar Greek research project, named e-furniture develops e-collaborations among non-competitive wood and furniture companies (<http://inflab.kard.teilar.gr/e-Furniture/index.php/en/>).

The present research is the first at Greek national level to question the significance of eco-wood and furniture products. It seems that it has indirectly contributed to eco-furniture culture development, since it has caused a fruitful brainstorming among sectoral entrepreneurs and offers solutions to the existing "cul-de-sac". We consider the changing of the entrepreneurial culture as the most important issue in order to achieve the turn to green entrepreneurship. According to the known Indian writer Pantatzali of the 3rd century B.C. *"When you are inspired by high aims and exciting plans, then your thoughts cast off, your brain transcends limitations, your consciousness is widened at all directions and you find yourself in an new, bright world full of miracles. The sleeping powers, your abilities and talents come to life and you find out that you are somebody greater than what you could ever imagine to be"*.

The present research has its certain limitations. Further research could extend to the exploration of the preferences, trends and specific buying attitudes of eco-furniture at certain sub-sectors as well as the strategic positioning of the relevant firms (a relevant study of AUEB, Avlonitis 2011).

MARKETING PUBLIC RELATIONS: A CASE STUDY IN THE ADVERTISING SECTOR IN CYPRUS

Papasolomou, Ioanna¹; Melanthiou, Yioula²; Sabova, Majka

¹Marketing Department, School of Business, University of Nicosia, Nicosia, Cyprus, Papasolomou.i@unic.ac.cy

²Marketing Department, School of Business, University of Nicosia, Nicosia, Cyprus, Melanthiou.y@unic.ac.cy

ABSTRACT

This article responds to the lack of sufficient data related to Marketing Public Relations (hereinafter MPR). A literature review revealed that there is very limited published evidence regarding MPR despite its growing importance primarily due to the heightened power of word-of-mouth communication and consumer-generated marketing. Through in-depth personal interviews, an empirical investigation within the Advertising and Public Relations agencies sector in Cyprus, shows that practitioners have started to place emphasis on the use of MPR as they see it as being equally effective but less expensive than advertising in achieving primarily marketing objectives such as launching new products in the market, re-positioning brands, building brand reputation and increasing sales.

Keywords: Marketing Public Relations, Promotional Mix, Advertising, Cyprus, Case Study.

INTRODUCTION

The paper sheds light onto the underlying principles and practice of MPR based on the perceptions and experiences of managers and practitioners of advertising and PR agencies in Cyprus. The overarching goal of the study was to generate knowledge and enhance understanding related to the MPR concept. Specifically, the research study aimed to explore the following objectives:

The study aimed at achieving the following objectives:

1. Identify the key ideas of MPR as perceived by the practitioners studied
2. Determine the factors that led to the growth of MPR
3. Identify the relationship between MPR and Integrated Marketing Communications
4. Identify the relationship between MPR and advertising
5. Uncover the tools used by the agencies studied to implement MPR
6. Find examples of local MPR campaigns
7. Identify whether there is a 'debate' between marketing and PR regarding the concept of MPR
8. Determine the relationship between MPR and CPR

In order to study the concept of MPR the researchers used a qualitative research approach since the aim was to build knowledge by being based on the perceptions, attitudes, preferences and experience of practitioners working in the advertising and PR sector in Cyprus. Data was collected from thirteen advertising and PR agencies based in Nicosia, the capital of Cyprus, from a total of thirty seven agencies that were members of Cyprus Advertising Agencies Association. The researchers interviewed practitioners working in executive positions ranging from general managers, managing directors, client service directors, strategic marketing planners and heads of PR departments. The study revealed that the local agencies studied integrate MPR in their promotional mix in an effort to enhance and complement their advertising strategy. The study's findings revealed that the majority of practitioners interviewed do not use the 'MPR' term per se in practice, although they implement the concept. Although the literature reviewed revealed that there is a debate between marketing and public relations, in practice the practitioners integrate these disciplines in the various campaigns that they undertake. In the practitioners' view the separation of marketing and PR could lead to misunderstanding, confusion and ineffectiveness. The agencies studied often integrate MPR in their promotional strategies in an effort to complement the other promotional tools especially advertising. The study revealed some examples of local MPR campaigns which showed that MPR tools can be used in creative and unique ways to enable the agencies to create a 'buzz' and favorable publicity for the brand.

LITERATURE REVIEW

The term *marketing public relations* was coined in the 1980s in an effort to distinguish the use of public relations techniques in achieving marketing objectives from the general practice of

public relations (Harris and Whalen 2006). It is an 'all encompassing' term integrating concepts and tools from public relations, marketing, advertising and research. Harris stipulates that its growth was supported by the recognition of its intrinsic value by business executives and the ability of PR professionals to develop PR campaigns in support of marketing strategies. MPR is a late 20th century phenomenon with a wide coverage in the public relations, advertising and marketing press. It is a tool often used to complement and extend the reach of advertising in reaching niche markets where it may be expensive to advertise. It is also used at certain periods in the product's lifecycle in order to generate interest and excitement. MPR can also enhance the impact of personal selling by instilling trust and long-term relationships with the customers. It can provide that linkage with the customer that nourishes loyalty and continued usage. When the concept emerged, it was considered to be product publicity, integrated in the public relations effort has evolved into a package of techniques and tools that aim at increasing a company's sales of its products a services. Armstrong and Kotler (2009) stipulate that a number of marketing tools classified as consumer-generated marketing (CGM) have evolved over time, one of which is MPR, in which consumers voluntarily create and share messages and other brand exchanges themselves. The literature reviewed refers to these messages and exchanges as word-of-mouth and buzz. The essence of MPR is that it requires the marketer to hand over his or her promotional message to an intermediary in order to reach the ultimate customer. The intermediary will then voluntarily pass a message about the firm and its products to their audience of businesses or consumers.

Today nearly a billion people use the Internet and subsequently communicate instantly with others. They are able to retrieve and analyse information about people and organisations instantly with a desire to share the information with others. Enabled by internet-driven new media consumers have become 'intermediaries' and have the power to filter the message (Papasolomou and Melanthiou 2012). This 'new' trend has forced businesses to widen their promotional mix and incorporate new as well as social media alongside traditional media. Businesses are realising the importance for adopting more interactive ways to develop a two-way brand relationship with their customers and prospects. They cannot afford to ignore the power of social media that puts the user in a new role – that of a connector. The user has the power to share information with others, influence others and even take the role of an "opinion leader" who can potentially enhance or destroy the reputation of a brand. The 'new' emerging environment has led to marketing strategies that use the fundamental ideas and tools of public relations in innovative approaches, fostering interactions between

organisations, products, consumers and the media. MPR is in the spotlight due to the recent 'explosion' of the use of social media. According to Kitchen (2010), MPR has a potential to be a leading tool in integrated marketing communication due to the general ability of public relations (PR) to contribute in achieving marketing objectives.

Henry (1995, p. 3) defined MPR as: "a comprehensive, all-encompassing public awareness and information program or campaign directed to mass or specialized audiences to influence sales or use of a company's products or services." Harris and Whalen (2006, p. 7) postulate that MPR refers to "the use of public relations strategies and tactics to achieve marketing objectives." According to Kotler (2003), MPR plays a significant role in the process of launching a new product as well as in the repositioning of a mature product; it can build interest in a product category, influence specific target groups, defend a product which experiences public problems and build the corporate image in a way that reflects favourably on its products/services. Kitchen and Pappasolomou (1997) emphasized the effectiveness of MPR in winning consumers' trust, celebrating special occasions and sponsoring special events and programs. Giannini (2010) posits that MPR has the potential to enhance the visibility of products and organizations, inform stakeholders in relation to issues that are critical to the organization, influence public opinion favorably towards the organization as well as encourage trial of products and increased usage.

Giannini (2010, p. 4) defines MPR as: "any program or effort designed to improve, maintain, or protect the sales or image of a product by encouraging intermediaries, such as traditional mass media, the electronic media, or individuals, to voluntarily pass a message about the firm or product to their audience of businesses or consumers." A few studies have been carried out in order to identify the degree of awareness of the business sector regarding MPR. One of these is the study carried out by Duncan (1985) according to which MPR is especially effective in building brand awareness and brand knowledge whilst it breaks through clutter and complements advertising by increasing the credibility of messages.

The literature reviewed also revealed that there is a debate between the PR and marketing discipline. From the marketing point of view, PR is often viewed as a part of the marketing communication mix (Kotler, 2003). Kitchen (1997) on the other hand argues that PR has the ability to create a favourable environment for organizations which cannot be created by marketing management tools. Kitchen and Pappasolomou (1997) also state that while marketing ensures the creation of exchange between the organizations and their target

markets, PR tries to influence the various publics of the organisation that have an impact on its success.

LITERATURE REVIEWED CONCLUSIONS- THEORETICAL GAPS

The theoretical part of this research has shown that the MPR concept is under researched despite its growing popularity. The literature reviewed revealed that there is a very limited literature on the MPR topic (Kitchen and Papasolomou 1997; Papasolomou and Melanthiou 2012). There appears to be a number of matters regarding the concept that demand further research. Firstly, identify the key ideas underpinning the concept as perceived by the practitioners. The literature revealed that there is a lack of consistency in the way MPR is viewed and defined by researchers (practitioners and academics). Secondly, there is a need to enhance understanding in relation to the factors that contribute to the growth of MPR. Thirdly, there is limited evidence regarding the way in which MPR is practised, the tools used and how these are implemented. Finally, there is not adequate knowledge in relation to how MPR is interrelated and integrated with advertising and the other promotional tools in an integrated marketing communication program.

METHODOLOGICAL ISSUES

Daymon and Holloway (2002) explored the suitability of qualitative research in the public relations and marketing communications field. Qualitative research enables a researcher to be mindful and to understand the lived experience of a phenomenon (Fill, 1999). Since the aim of the present study was to shed light onto the practice of MPR in the specific sector the adoption of a qualitative research approach rather than a quantitative research method was justified. The qualitative research approach enabled the researchers to uncover and study perceptions, attitudes and experiences of practitioners in relation to the MPR concept since the existent literature revealed that the knowledge and understanding regarding MPR is limited. According to Daymon and Holoway (2002), qualitative research is mostly associated with an *interpretive* paradigm which enables the researchers to understand social reality from the point of view of the research participants. The interpretive paradigm guided the present research study since the aim was to understand MPR through the interpretations and experiences of practitioners.

The researchers adopted a case study approach to exploring the experiences and perceptions of practitioners in relation to MPR as is implemented by advertising and PR agencies in Cyprus.

According to Daymon and Holloway (2002 p. 105), "case study is an intensive examination, using multiple sources of evidence, of a single entity which is bounded by time and place".

Yin (2003) claims that the importance of case studies has rapidly grown along with the need to understand complex social phenomena since it enables a researcher to investigate in depth the characteristics of real-life situations such as organizational and managerial processes, individual life cycles, and international relations. According to Daymon and Holloway (2002, p.105), the purpose of the case study is "to increase knowledge about real, contemporary communication events in their context". This was in fact the case with the current study; understanding the way the advertising agencies sector implements MPR.

For this research study, the researchers studied 13 advertising and PR agencies in Cyprus. This number represented approximately 40% of the total 37 advertising and PR agencies registered with the Cyprus Advertising Agencies Association. Daymon and Holloway (2002) emphasized that it is unusual to study more than four cases since with every additional one the advantages of multiple case design tend to diminish. However, because the present study was the first to explore how a specific sector implements MPR it was perceived as essential to incorporate more agencies in the study to ensure an in-depth and detailed exploration. The initial aim was to gain the access to at least 4 agencies, however, during the actual data collection process the researchers realised that there was a need for more agencies in order to collect the necessary data. The idea of not specifying the final number of cases in the beginning of the research is supported by Yin (2003) who claimed that the choice of the units of analysis could be revisited and adapted during the data collection process.

In the data analysis the researchers used *cross-sectional indexing* or *coding* by which the researcher applied a set of indexing categories systematically to the data collected (Mason, 2002). The main rationale behind the cross-sectional indexing was to get a systematic overview of the scope of data collected. Moreover, through categorizing and indexing, the data became easily retrievable for further purposes and, more importantly, this processes also enabled the researcher to assess whether the data collected addressed the research questions.

In the following table, the codes which were generated from the data collected by the researcher are summarized.

Table 1: Codes generated from data analysis

MPR definition	MPR objectives	Successful MPR campaign
MPR vs. CPR	MPR & other tools & IMC	Unsuccessful MPR campaign
Importance of MPR	MPR vs. Advertising	New trends in MPR
Ideas behind MPR	MPR within organization	Future of MPR
MPR tools	MPR terminology	MPR vs. Cyprus typical factors

By comparing the codes to the research questions, it is clear that the codes reflect the thematic areas of the research questions. This demonstrates that the data collected lead to the solution of the research problem, thus answering the research questions.

EMPIRICAL RESEARCH FINDINGS

According to a study by media monitoring company Matrixmedia, advertising revenues in Cyprus have seen a year-on-year decrease. The study revealed that there has been a 25 per cent drop in advertising last year. Television's advertising revenues have also seen a year-on-year drop. TV revenues dropped from € 325m to € 293m. Advertising revenues for print media dropped from € 76m in 2011 to € 58m last year (Matrixmedia, Cyprus Mail, 2013). According to Matrixmedia, the media advertising pie is traditionally divided between TV, press and radio with 70 per cent going to TV, 20 to print and 10 to radio. The result of falling revenues for TV and print has seen media owners carry out a series of layoffs and salary cuts to delay closure. The negative developments in the media sector have had a direct impact on the marketing communication strategies adopted by advertising agencies. AA have started to redesign their marketing communication by shifting some of the emphasis placed on advertising on MPR.

1. Key MPR ideas

The study's findings revealed that the majority of practitioners interviewed do not use the 'MPR' term in practice, although they implement the concept.

"The understanding and interpretation of various terms depends greatly on each organisational culture and the terminology used in each organisation. We do not use the term MPR. We recognise the tactics that relate to MPR by designing a specific strategy or activity. However, if we used the term MPR it would be confusing."
(Executive Director)

"It is not important what terms you use as long as you use the correct words. I think PR is common sense. A client wants to generate awareness, change perceptions, create knowledge and you need to work with these objectives. Whether you say MPR or CPR... Especially in a place like Cyprus, you are still going to use similar tools in different ways that would make your 'words' come true." (PR Agency Director)

The practitioners interviewed identified the following ideas as the ones that underpin the MPR concept:

- MPR directly or indirectly contributes to the achievement of marketing and sales objectives
- MPR enables companies to promote the products/services in a trustworthy way
- MPR makes the media and the public interested in a cause, product or service
- MPR prepares the public for news
- MPR has the ability to create favourable perceptions towards brands
- MPR encourages favourable word-of-mouth communication

Table 2: MPR definitions given by practitioners

Job Title of interviewees	Verbatim Quotations
1 Digital and PR Manager of a communications agency	"MPR is a PR activity which helps the company to achieve its marketing and/or sales objectives either directly or indirectly, through the projection of the company's image and key messages via the mass

	media.”
2 Executive Director of an advertising agency	“MPR includes tools for achieving the marketing objectives.”
3 Head of a PR department of a communications agency	“MPR is a way of promoting a client without using above-the-line promotion.”
4 Managing Director of an advertising agency	“MPR is an activity organized and planned to cultivate the grounds for a product/service. In other words, to make consumers interested in a product/service and to prepare the market for them. MPR is the effort to create inventions to attract the audience.”
5 Client Service Director of a communications agency	“The whole PR is about having relations with different publics. It is a unique communication tool when you identify your target groups and how your strategy will reach these target groups all the time. Then, when talking about MPR, the target group is mostly customers.”
6 Executive Director of a brand building agency	“MPR is a way, function, of a company that aims at increasing the social capital of a brand by creating favourable perception.”

2. The factors that led to the growth of MPR

The practitioners interviewed believe that today’s consumers are more informed, educated, sophisticated and even critical of the promotional techniques used by companies. This highlights the importance of using MPR that has the potential to instil trust and create a favourable environment for the communication process to take place. The study revealed the following as the key factors that have enhanced the importance of the MPR concept in the local market:

- a. Advanced technology and telecommunications that enable customers to be more informed about brands and share word-of-mouth communication faster
- b. Smaller promotional budgets
- c. Fragmentation of media which makes it more difficult to reach target audiences
- d. Increasing competition in the advertising and PR sector in Cyprus which forces local agencies to adopt more efficient and unique marketing communication techniques and approaches

Some of these factors corroborate the current MPR literature (Kitchen and Pappasolomou, 1997; Zyman, 1999; Seitel, 2001; Kitchen, 2010; Kotler, 2003; Broom, 2008; Giannini, 2010).

The interviewees claimed that MPR is an important marketing communication tool due to its ability to effectively achieve the following goals:

- Building the relationships with customers on the basis of a face-to-face interaction and two-way dialogue
- Generating awareness and brand recognition
- Making media interested in the promotional campaigns thus creating credibility for the products/services and brands
- Communicating a key message about the products/services to target audiences in a way which does not always appear as a promotion
- Differentiation from the competition

3. MPR and Integrated Marketing Communication

The local practitioners often integrate MPR in IMC campaigns in order to achieve maximum exposure and effectiveness. The practitioners interviewed share the view that MPR should be incorporated in all the promotional campaigns. Currently MPR is given a secondary role and not a leading role which is usually given to advertising. There is a wide recognition and appreciation of the importance of combining and integrating promotional tools to achieve maximum exposure. None of the promotional tools alone can achieve the desired outcome. Instead, the tools need to be combined in order to strengthen each other. The combination of the tools depends always on the client's requirements, preferences and the objectives of a campaign according to which the communication strategies are designed.

MPR's growing popularity in the local advertising and PR sectors is due to its ability to create media and market receptivity. This popularity is due to the fact that MPR allows practitioners to integrate marketing and PR tools in innovative and creative ways to foster interactions between organisations, brands, media and publics. MPR manifests itself as a recommendation from a friend, or an enthusiastic claim about a brand from a happy and satisfied customer. This results in higher credibility than other promotional messages or tools like advertising and direct selling, and makes the message more

trustworthy and believable. In many instances MPR messages are spread voluntarily and consumers perceive them differently than other types of promotion. Both the media and consumers become 'partners' in the firm's efforts to create a buzz about brands. The study revealed that MPR is often integrated in IMC programs that focus on launching a new product or service with the aim of preparing the market, creating awareness and giving information. It is also used in brand building campaigns in order to achieve brand awareness and create brand loyalty.

"MPR is a very important tool and it has an important place in integrated marketing communications. Advertising campaigns should have a preceding MPR campaign which prepares the public for news, creates awareness, and informs the public about the brand. MPR should complement and support the advertising function." (Director of an advertising agency)

"Advertising is decreasing in importance since it does not encourage interaction with potential customers...the target customers are not passive receivers. They want interaction with the sellers. MPR creates two-way communication - a dialogue which is crucial for the success of the communication process." (Executive director of a brand building agency)

4. MPR and Advertising

MPR appears to have a complementary and supportive role to traditional promotional tools, especially advertising. Although the practitioners interviewed believe that advertising is still perceived as the most important promotional tool by local clients, they are recognising the fact that the impact of advertising can be strengthened if it is supported by MPR. A number of factors were put forward by practitioners:

- Advertising alone does not guarantee the success of the communication process
- MPR enhances two-way communication
- MPR is more credible and trustworthy than advertising
- MPR can create a buzz about the brand and hence, pave the way for advertising
- MPR does not require extensive promotional budgets

“Advertising is decreasing in importance since it does not encourage interaction with potential customers...the target customers are not passive receivers. They want interaction with the sellers. MPR creates two-way communication - a dialogue which is crucial for the success of the communication process.” (Executive director of a brand building agency)

“MPR is a very important tool and it has an important place in integrated marketing communications. Advertising campaigns should have a precedent MPR campaign which prepares the public for news and then the advertising is more effective in combination with MPR. But still, MPR is a complementary function...Advertising itself is still growing in Cyprus, not declining. Even though PR discipline grows too, it will never reach the growth rate of advertising.” (Director of an advertising agency)

“Advertising is decreasing in importance as it is a process that communicates a message to prospective clients whilst the consumers remain passive. Advertising interrupts the natural social environment where a dialogue is crucial.” (Executive director of a brand building agency)

5. MPR tools

The local advertising and PR sector combines and implements various MPR tools in order to achieve a number of MPR objectives primarily to generate media coverage and word-of-mouth communication. MPR is practised in the local market through the following tools in order to achieve specific objectives

Table 3: MPR tools used by local agencies

MPR tools	MPR Objectives
Press release	<ul style="list-style-type: none"> • To get media coverage • To create awareness for the product/service/brand • To reach large audiences
Press conference	<ul style="list-style-type: none"> • To create media interest in a specific cause/event • To enhance publicity
Events, presentations, exhibitions, road shows	<ul style="list-style-type: none"> • To generate publicity • To build relationships with customers • To strengthen awareness through entertainment and education

Seminars	<ul style="list-style-type: none"> • To educate the public in relation to a product/service • To generate publicity • To reach narrower market segments
Anniversaries	<ul style="list-style-type: none"> • To remind target publics about the product/service/brand • To generate publicity • To maintain interest
Extraordinary events (Guerrilla MPR)	<ul style="list-style-type: none"> • To create strong awareness about a product/service/brand
Social Media	<ul style="list-style-type: none"> • To share information • To engage customers and others with the brand • To create a 'buzz' about the brand
Newsletters, publications	<ul style="list-style-type: none"> • To promote the image of companies and their expertise • To build awareness regarding companies and their activities
Competition	<ul style="list-style-type: none"> • To build interaction with publics • To create awareness
Sampling	<ul style="list-style-type: none"> • To encourage trial • To build demand
Spokespersons, brand ambassadors, interviews	<ul style="list-style-type: none"> • To influence public opinion • To generate trust and aspiration

The study revealed that the practitioners interviewed combine different MPR tools in order to reach their target audiences as well as generate media coverage, publicity and word-of-mouth communication. Some of the tools are used on a regular basis, for example, press releases, publications, and articles while other tools such as events, seminars and competitions are implemented on an ad hoc basis.

6. Local MPR campaigns

The present study showed that the local agencies use MPR when they launch new products/services in the market, reposition existing ones, and in B2B marketing. The study revealed that MPR campaigns have been in use in the local market since 1999. Harris and Whalen (1995) referred in their work to MPR campaigns that were launched to introduce new products such as Gillette Mach 3, Pfizer Viagra, Toyota Prius and the Harry Potter books and movies. The agencies studied gave the following examples of local successful MPR campaigns:

- *Launching the Lay's Sensations crisps*
- *Re-launching of Galaxy chocolate*

- *Introducing McDonald's Fruit Cup*
- *Promoting the services of a local law firm*
- *Launching a national distribution centre*
- *Mini Cooper Art campaign*
- *Launching the Nissan X Trail*
- *Introducing Pfizer Viagra in the local market*

To illustrate the MPR campaigns above, let us provide more detail information regarding the "Lay's Sensations" campaign where the key objectives were to introduce the new product range, to build awareness and to support sales. The MPR campaign for launching the new product range of Lay's had one challenging characteristic, namely targeting only adults who were interested in the strong flavours of the product. In order to emphasize this well-defined target group and to communicate the key message to the target audience, the agency designed a series of provocative posters which were not appropriate for a younger audience. There was a need to structure the message in a careful way and ensure that the audience will not accuse the company of using inappropriate promotional techniques. The solution was found in the use of MPR. The agency sponsored a Jazz night where only adults and media were invited. The posters were placed at the venue. The entertainment was guaranteed by the street artists who were creating the replicas of the posters' images on the spot with the use of the product's ingredients (salt and pepper). The interaction with the audience and media was achieved by encouraging them to create their own designs with the product's ingredients. Moreover, the media were given a press kit with information about the brand, the new product range and copies of the posters. The original and creative idea of combining the MPR tools generated a widespread publicity and product awareness.

7. The debate between marketing and PR regarding MPR

The research study's findings revealed that the majority of interviewees perceive PR and MPR to belong to the marketing discipline. What was highlighted was that the two functions should be complementary to each other and integrated in order to achieve organizational objectives. This finding corroborates with some of the literature review findings (Kitchen and Papasolomou, 1997; Broom, 2009). However is in contrast to the perception postulated by some academics such as Hart (1995), Cameron et al., (2008), and

Harris and Whalen (2006) according to which marketing and PR are perceived as distinct disciplines.

The majority of practitioners placed MPR under the marketing umbrella.

“The entire PR activity belongs under marketing so consequently MPR should be placed under the marketing umbrella too. Even when you design your PR strategy, it has to be guided by marketing. Despite this, I believe that marketing alone is not sufficient any more to get your product or service out to clients. You need PR.” (Head of the PR department of a communication agency)

8. MPR versus Corporate Public Relations (CPR)

The study showed that the agencies studied appear to use both MPR and CPR. MPR aims at achieving marketing objectives through building relationships with customers and media while CPR is used to support the corporate image by forming relationships with different stakeholders. In contrast to the literature review findings (Kotler, 1986; Harris, 1993; Harris and Whalen, 2006), the majority of practitioners interviewed pinpoint to the fact that these functions are in theory distinct but in practice they are often combined into an integrated marketing communications campaign. MPR and CPR are viewed and treated as complementary to each other. This finding supports the findings that emerged from an earlier study carried out in the UK PR consultancy sector according to which practitioners integrate both CPR and MPR in their campaigns (Kitchen and Papasolomou, 1997).

CONCLUSION

MPR is one of the concepts which have emerged and have enhanced the marketing communications mix. Its potential lies in the credibility which is created through media endorsement and word-of-mouth communications which subsequently build trust and strong relationships with an organization's audiences. It encompasses a variety of tools which can be integrated in different creative ways without any limitation. The inclusion of social media in the portfolio of MPR tools adds greater potential and flexibility to the concept and makes it even more popular and critical in integrated marketing communication campaigns.

The present study shed light onto how local advertising and PR agencies implement the concept. Even though the term *marketing public relations* is not used by the practitioners interviewed, the key ideas of the concept are implemented and form an integral part of many marketing communication campaigns. In practice, local professionals do not differentiate between MPR and CPR, the two terms are treated as synonymous and play a complementary role to each other. MPR has the potential to complement advertising and enhance the marketing communication efforts of businesses by using social media, stimulating word-of-mouth communication, getting media endorsements and creating a 'buzz' about products and services. It incorporates and combines many tools one of which is social media that enhance its potential, flexibility and creativity.

HUMAN RESOURCE MANAGEMENT: 'CONTENT', 'PROCESSES', OR 'PERCEPTIONS'?

Pavlou, Fotis

Cyprus Institute of Marketing, fotis@cima.ac.cy

ABSTRACT:

This paper introduces a comprehensive conceptual framework as a means to compensate for the failure to recognise the complexities in capturing a complete picture of how an HRM system may add value to employees and organisations. This is achieved by highlighting the immense differences that exist when examining HRM as 'content', as 'processes' and as 'perceptions'. The paper reviews relevant - key studies and debates on their approach towards HRM (in regards to the three key elements mentioned in the title). In essence, this review indicates that while studies examining HRM as 'content', 'processes' and 'perceptions' independently proliferate, attempts to bring these three interrelated areas together are limited. Also, by reviewing particular case studies, it becomes obvious that while HRM policies may be in place, this does not imply that they are effectively enacted by line managers or that they are interpreted by employees in the desired way.

Keywords: Strategic HRM, Analytical HRM, Content, Processes, Perceptions

INTRODUCTION

Endless publications analysing the different perspectives on SHRM and the way that these are associated with organisational performance dominate libraries' bookshelves. In essence, chasing the 'big research' concept, many in this field have strived to identify and justify the way that HR policies and practices influence organisational performance; as if this is the ultimate and only aim of HRM. Throughout these endeavors however, vital aspects are downgraded and critical links are often bypassed.

In fact, many mostly concentrate on the way that the HRM 'content' (i.e. the policies and practices) operates. Others, alongside this focus, suggest that it is equally important to examine the 'processes' organisations employ for operationalising managerial initiatives and policy intentions. Yet, for another group of researchers, exploring HRM both from the

'content' and 'process' angles is not enough. For them, it is equally important to explore managerial actions from the standpoint of those they are meant to influence. Within this spectrum of literature, attention is given to the degree to which managerial rhetoric is converted into workplace reality.

The aim of this paper is to introduce a conceptual framework as a means to compensate for the failure to recognise the complexities and difficulties in capturing a comprehensive picture of how a complete HRM system may add value to employees and organisations. This is achieved by drawing attention to three distinct, but at the same time related notions: the 'content'; the 'processes' and the 'perceptions' of HRM.

THE 'CONTENT' OF HRM

The term 'content' in the field of HRM is regularly used to denote the various HR policies and practices that are designed to support employees' efforts for accomplishing their responsibilities (Bowen and Ostroff, 2004). These are built based on a particular strategic focus and are guided by organisational goals and values. Discussion regarding the 'content' of HRM fits well with the Strategic HRM (SHRM) literature since, by definition, one of the most important aims of SHRM is to achieve strategic fit, an orientation mainly expressed through the 'matching concepts' – horizontal integrations and vertical alignments. The former terms is used to denote the efforts to pursue 'best practices' and fit these into coherent bundles (i.e. universal models); whereas the latter discuss the importance of matching HRM strategies with business plans (i.e. 'best fit' – contingency models) and designing HR practices according to the unique characteristics of organisations' workforce (resource-based views – 'HR architecture').

In more detail, the 'universal' model is based on the assumption that there is a universal way of managing and one 'best' way for practicing HRM. The basic belief is that 'the more organisations adopt and implement these practices the clearer the payoff will be in terms of performance improvements' (Bach, 2005: p8) and that all firms (no matter their size; structure; type of industry; country etc.) experience performance improvements and enjoy important benefits by only investing in 'best practices'. These positive outcomes are reinforced by formatting these 'best' HR practices into coherent bundles that have the potentials to produce better results rather than if these were implemented individually.

Yet, these claims are not accepted without criticisms (see Truss et al., 2012). For the 'contingency' supporters, 'to claim that a bundle of best practice HRM is universally applicable leads us into a utopian cul-de-sac' by ignoring momentous forces both internal and external the organisation (Purcell, 1999: p36). According to this 'best fit' model, HRM varies between organisations and it should be designed to manage people 'across different jobs, workplaces, companies, industries, societies and cultures' (Boxall et al., 2008: p4). Mainly, this model assumes that HRM is a particular field of study rather than a distinct style of management and there is no 'ideal' set of universal practices. On the contrary, numerous contextual forces influence management's decisions regarding HRM.

However, the limitations of this orientation (i.e. deterministic assumptions; neglecting the importance of dynamics and the process of change etc.), and particularly the fact that it mainly follows an 'outside-in' orientation has led researchers to an alternative approach to HRM. Following an 'inside-out' perspective, the 'HR Architecture' idea mostly concentrates on organisations' internal resources and more particularly draws attention to the 'human capital' factor and their competencies and intellectual capabilities (Allen and Wright, 2008).

Briefly, the core implicit assumption of this resource-based view is that investments on HRM should be done according to the different types of workers employed within organisations. This emphasises the importance of having an 'HR architecture' (Lepak and Snell, 1999), whereby different HR policies and practices are targeted to different occupational groups (always according to their distinct needs, responsibilities and roles). As Hutchinson & Purcell (2007: p9) nicely summarises, 'different types of employees have different needs and respond in different ways to HR policies, with the obvious logic of the need for different type of HR systems, including rewards and training, learning and development for different types of employees'.

Of course, beyond the above models, new and updated ways for analysing HRM appear in the literature, offering a unifying framework and resolving the tensions between the three dominant models. For example, adding on the ideas proposed by some dominant authors in the field, Pavlou (2012) articulates his thoughts for a 'Core Plus Context' (CPC) specific approach to HRM. This proposition builds on Boxall's & Purcell's (2011) suggestions to consider 'best fit' elements to be at the 'surface level' and 'best practice' components at the

'underpinning layer' of SHRM. Similarly, through the lenses of CPC, Pavlou (2012: p1279) builds on the RBV notion and adds to the 'table stakes' argument by stressing the necessity 'for developing HRM systems 'tailored-to-the-organisational reality' and for establishing a particular strategic focus that will differentiate the organisation from competition'.

THE 'PROCESSES' OF HRM

As useful as the above discussion may be, it lacks some essential 'ingredients'. One of the most important shortcomings is that 'much writing about HRM at the strategic level has tended to assume that the vertical and horizontal dimensions are sufficient' (Gratton and Truss, 2003: p76). Apart from the work done by a handful of researchers; a limitation of many previous investigations is that they are mostly concentrated on the 'content' of HRM. But, beyond the content, there are also those who give more weight to 'processes' aspect of HRM. Within this spectrum, focus falls on the 'how'; thus investigating the actual procedures adopted in order to put HR strategies and managerial plans into operation.

Using the term 'process', Bowen and Ostroff (2004) emphasise how the prescriptive HRM models (i.e. the 'content' of HRM) can be designed and administered effectively. In order for this to be achieved, the authors introduce the notion of a 'strong situation' which can be achieved when the HRM system is perceived as high in distinctiveness, consistency, and consensus (p208). By enriching these three key constructs, the authors elucidate nine metafeatures of an overall HRM system that, if met, have the potentials to foster a shared meaning and develop consistency in employees' understanding (since the HRM content will unambiguously communicate the intended messages).

One way for better appreciating 'how' this consistency may be achieved, is to investigate the way that seniors' intended HR policies are put into effect mostly by line managers. Actually, the distinction between the intended and implemented HR practices draws attention to the gap between the espoused HR policies and their enactment; a gap that may create discrepancies in the workplace, both horizontally and vertically. Among others, this brings line managers at the forefront, who have the power to influence, deliberately or not, the process of converting HRM policies into practice.

For ensuring that HRM policies are implemented consistently throughout different levels, it is vital to realise the importance of integrating line managers in this process. This issue is considered by Armstrong (2006), who recognises that the success of the policies initiated by the HR specialists lies with line managers. For the author, while the 'HR proposes, the line disposes' (p97), meaning that eventually, line managers are those who will determine the degree to which HR practices will be effective or not. The same belief is also expressed by Hutchinson & Purcell (2003: pvii), who state that 'the way in which they interpret and use the policies and practices designed by HR professionals has become an important determinant of the success or failure of those practices'.

In handling HR issues, line managers unavoidably exercise a certain degree of discretion. If they decide to use their own discretion and initiative not to convert seniors' intentions into actions, the consequence is that promoted policies will remain only in theory. Of course, beyond line managers' discretion, there are also other factors that may influence the way that line managers carry out their HR responsibilities. Although there are many aspects that may restrain organisations to operationalise their intended plans, for this paper of particular importance is how line managers may inhibit this process.

Rejecting the assumption that all managers, at all levels and departments will uniformly follow a given strategy without any variations, the suggestion is that line managers, due to several reasons, may 'block' this process. Many research endeavours have reached the conclusion that line managers may act as a barrier for the successful realisation of the desired HRM policies (e.g. Harris, 2001, Redman, 2001) and have also considered the several forces that may hinder line managers' effectiveness (see Hall and Torrington, 1998, Hutchinson and Purcell, 2007, Hutchinson and Purcell, 2010, Larsen and Brewster, 2003, Marchington, 2001, McGovern et al., 1997, Whittaker and Marchington, 2003).

Among these studies, perhaps the one done by Hutchinson & Purcell (2010) within the NHS best summarises the main point related to line managers' role. Concerning with line managers' effectiveness in delivering HRM, the authors focused on identifying their role, their own reality and experiences. They established and explained the main factors inhibiting line managers' ability to successfully deliver HRM. Heavy workload; role conflict; poor background HR skills and knowledge; inadequate training; pressures for focusing on short-term priorities; divided loyalties; competing priorities and lack of commitment to HR

objectives combined with the lack of management's support comprised a mix of factors suppressing their effectiveness in carrying out their HR role.

THE PERCEPTIONS OF HRM

The profound interest for allocating greater HR responsibilities to line managers call for reevaluating and measuring how effectively HRM is being delivered. One way to achieve this is by exploring how employees experience and perceive these HR-related activities. Thus, beyond looking at the 'content' and the 'process' of HRM, attention should also be given to the way that seniors' intentions and line managers' implementations are ultimately perceived by non-managerial employees. In essence, the aim within this spectrum is to explore 'how well' HR practices are delivered to the workforce. The main argument is that simply having in place high commitment HR practices does not guarantee they are implemented effectively. For gaining a complete picture, it is essential to also account the views of those at the 'receiving-end' - the recipients of any HRM-related effort.

Concerning with this issue and in order to examine the degree to which 'practices were practiced', Edgar & Geare (2005) measured the effectiveness of HRM from employees' perspective. By emphasizing the importance of allowing employee voice to be heard, one of the authors' conclusions is that it is necessary for researcher to evaluate HR practices by their perceived quality and not only by their quantity. Similarly, by focusing at the ward level, Veld et al. (2010) examined the way employees perceived the intended HRM strategic goals and if their perceptions generated the desired effects. Their outcomes are of course interesting, as they show deviations between intended HRM (i.e. policies and declared strategies) and perceived HRM as conveyed by the ward level.

Without a doubt, examining the way by which employees perceive HRM activities, discrepancies emerge. This is because most of the time they will not perceive managerial attempts as the organisation initially planned. These indications are reinforced by the study of Khilji & Wang (2006) which offers great insights regarding this point. The authors' paper makes a clear distinction between the HR practices intended by the organisations and those actually implemented. Credence to these findings is also provided by other studies, such as the one of Liao et al. (2009) who examined the disconnection between what organisations in general say they do as formal practices and what employees actually experience at the

workplace. By differentiating these two levels (i.e. management's versus employees' perspectives) the authors revealed substantial differences.

The case seems to be that 'employees may not always perceive the objective existence of certain practices as the organisation intends' (Allen et al., 2003: p103) and their perceptions may not be in line with organisational objectives. Actually, the concerns raised long ago by Brewster et al. (1983) for a distinction between 'espoused' and 'operational' policies; and more recently by Legge (2005) for differentiating between rhetoric and reality are of great importance here. Of course, the management may dictate investment on high levels of EIP and communication practices, but in reality, the focus given on schemes facilitating related practices may be marginal. Similarly, organisations most of the times declare that they are strong supporter of quality training and development practices. Yet, by evaluating employees' views, it is possible that training provided is judged to be irrelevant or not supportive for improving their competencies. Undoubtedly, such cases generate the belief that management's declarations are just rhetoric, rarely converted into reality, something that negatively impacts on employees' perceptions.

Summarizing, the preceding review reveals the importance of evaluating both managerial members' opinions and beliefs regarding HR policies and practices, but also the necessity to investigate how workers, from their own perspective, experience and perceive the HR practices offered to them. Accordingly, there is the need to investigate the degree to which managers' and workers' views regarding HRM coincide or differ.

CONCLUDING REMARKS: HRM 'CONTENT'; 'PROCESS' & 'PERCEPTIONS': AN 'ANALYTICAL' APPROACH TO HRM

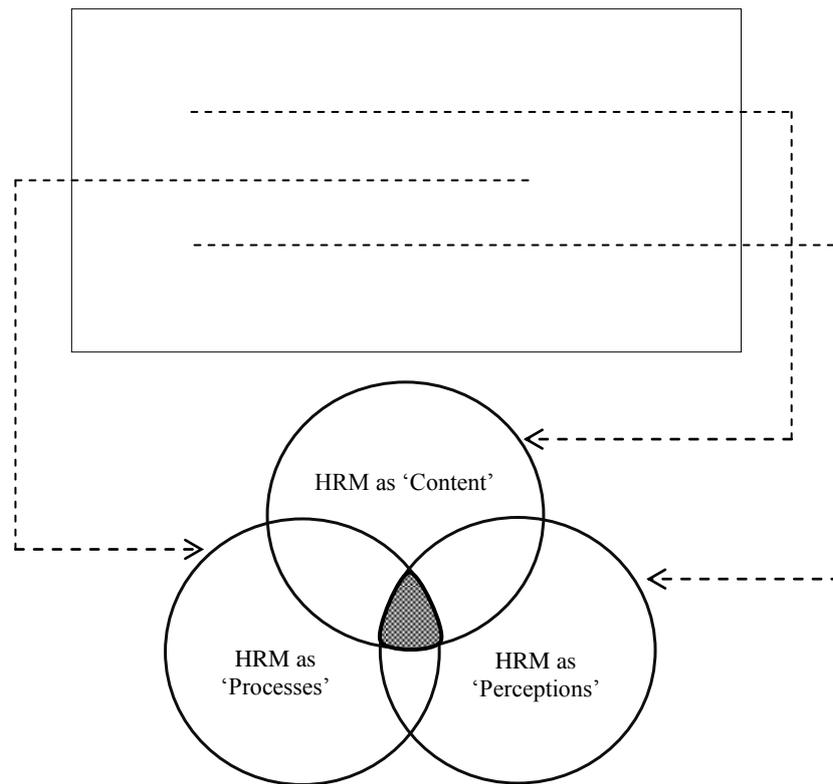

This paper briefly explored HRM from the 'content', 'processes' and 'perceptions' perspectives. The main objective was to assess the pragmatic nature of HR practices rather than only the stated policies. The conclusion reached is that when evaluating the value of HRM, it is not enough to remain at surface measures, which capture at best the quantity and frequency of schemes operated by the organisations. This implies the need to distinguish between espoused policies (intentions) and actual practices (implementations). Moreover, to gain a real feeling of the impact that HRM has, essential are also the perceptions of non-managerial employees who are considered to be the 'consumers' of the different practices.

The basic belief is that the truth about HRM lies beyond the senior managerial members and can be found closer to those who are really affected by the implementation of these policies.

This paper articulates the necessity for a multilevel conceptual framework and calls HRM researchers to equally explore what organisations do and why (i.e. the content); how they do it (i.e. the process); and for whom and how well (i.e. the perceptions). According to Boxall and colleagues, this conceptual framework represents an Analytical approach to HRM (AHRM). Accepting the fundamentals of AHRM, researchers are able 'to identify and explain what happens in practice' (Boxall et al., 2008: p4). This is because this approach to HRM has a triple focus. Beyond trying to understand the nature of the various HRM policies / strategies and the way these can develop invaluable capabilities to the workforce, it also highlights the key role of line managers for their successful implementation. Moreover, this concept draws attention to the actual impact of HRM, not only as sought by the organisation and managers, but by also integrating the voice of non-managerial employees into the argument.

As seen in Figure 1 below, concerning with 'what the management does and why', this paper has investigated the 'content' of HRM and the forces shaping its operation at the workplace. Concerning with 'how HRM process work', the focus was on line managers' role in bringing HR policies into life and the barriers that may inhibit their efforts. Lastly, investigating the 'for whom and how well' aspect, focus has shifted to non-managerial employees, thus concentrating on the way they experience and perceive HRM.

In the literature, there are studies with several focus areas / objectives which base their conclusions on senior members' suggestions (i.e. CEOs, HR directors, senior managers) and official / formal organisational documents; others focusing exclusively on line managers and others downplaying the role of the line and exploring HRM from employees' viewpoint. Of course, there are also studies which incorporate these levels of analyses and provide a more comprehensive picture of how HRM may have an impact on employees and organisations. It is within this spectrum of research that this paper rests.

Figure 1: A Comprehensive / Multilevel Conceptual Framework

The originality and value of this paper lies in the fact that it builds on the idea of 'Analytical HRM' and advocates the necessity for a multilevel conceptual framework, stressing the importance for HRM researchers to equally explore the 'content'; the 'process' and the 'perceptions' of HRM. Collecting information only for one of these aspects is insufficient, offering a partial understanding. The key message is that HRM should not be evaluated only as policies; as processes, or as perceptions. None of these on their own are sufficient. For this particular paper; it is all about how these are linked together.

LIMITATIONS & FUTURE RESEARCH

This paper should be taken as an effort to introduce a more critical approach and to develop an analytical conceptual framework. As such, it solely focused on bringing forward key theoretical debates by drawing on existing studies in the related fields. Consequently, the preceding discussion is based on literature review and does not integrate any empirical information or data derived from fieldwork research. The aim was to build a multilevel conceptual framework and highlight the need for future researchers to account for the 'multivocality' within organisations and the necessity to accommodate the views of everyone affected by and involved in the operation of HRM. Nonetheless, these ideas and propositions

were applied by the author through a case study methodology and the fruitful outcomes that will be presented in a forthcoming publication / research-based paper.

Future research efforts pursuing this 'multiple –lenses' approach have the potentials to add to our existing knowledge by not only remaining on the 'content'; 'process' and 'perceptions'; but also seeking to identify how these perceptions may influence their outcomes (i.e. in terms of attitudes; behaviours and eventually their performance). Connoisseurs of this field can immediately realise the call for future research endeavor related to the widely debated issue of 'Black Box' or 'Holy Grail' regarding the relationship between HRM and organisational performance. In essence, this proposition relates to the causal chain of HRM, aiming to draw attention to the critical steps that are necessary to be achieved if HRM is to have an understood and 'tangible' performance outcome (see the models offered by Marchington and Wilkinson, 2012, Purcell and Kinnie, 2008, Purcell et al., 2009).

ABSTRACT

Mobile Commerce has already begun to have applications in for trade of fashion brands. Collections of Fashion Design were developed for this new trading platform. The materials, profiles and product categories impact the success of sales through Smartphones and Tablets.

The purpose of this study is to examine the collections of fashion design apps of brands and retail chains (available on iPhone and iPad) from the point of view of materials, style and product categories. It is concluded that elastic materials such as knitwear, dresses and t-shirt are privileged,. Pants have the lowest incidence in consumers. The preference attributes associated with mobile commerce depends upon piece variety, multiplicity of style and possibility to coordinate. There are differences in gender that are due to easiness of accessibility, piece personalization, professional advice, videos collections and social networks links and share. Female consumers give more importance to fashion attributes such as satisfaction and comfort, followed by function, while men prefer comfort, followed by satisfaction and, after that, quality. This study concludes that mobile marketing allows customer interaction with brand in a fun way, which in creases customer loyalty.

Keywords: Mobile Commerce; E-commerce; Fashion Business; Fashion attributes; consumer preferences; Iphone; Ipad

INTRODUCTION

An increasing number of consumers are making every year purchases online of clothes and sports goods. From 2006 to 2009, the number of Internet users who ordered goods or services in the previous year grew from 47 to 54 per cent and in Europe27 increased 10 percent (European Commission report, 2010).

The purchase categories preferred by around 140 million Europeans ordering online every year are changing over time. Travel and accommodation remain the most popular category among services, and clothes and sports among goods. In Europe27 the fifth category to online purchasing, in 2010, consisted of films/music or books/magazines/e-learning material or computer software (24%), followed by holidays (21%). Clothes and sports goods (19%) occupy the third category. Figure 1 and figure 2 show the percentage of individuals that make online purchases of clothes and sports goods for the most important countries and for different age consumers in e-commerce (Eurostat, 2012).

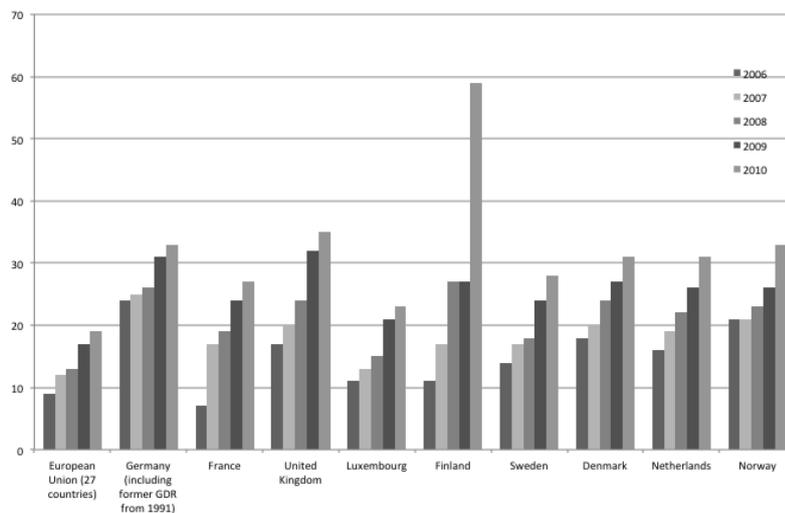

Figure 1 - Percentage of individuals that make online purchases of clothes and sports goods by country (Source: Eurostat, 2012)

A survey that used a sample of 1,500 people, in United States (November of 2011) concluded that smartphone and tablet apps are not consumers' preferred channel for browsing or shopping: just 4 percent of connected consumers like to use branded apps, whereas 87 percent prefer to use websites (including mobile web sites). The purchase is primarily done

with the objective to find the best price, using either the smartphone or tablet. The consumer also considers more fun and exciting to purchase using the tablet platform than smartphone or PC platforms.

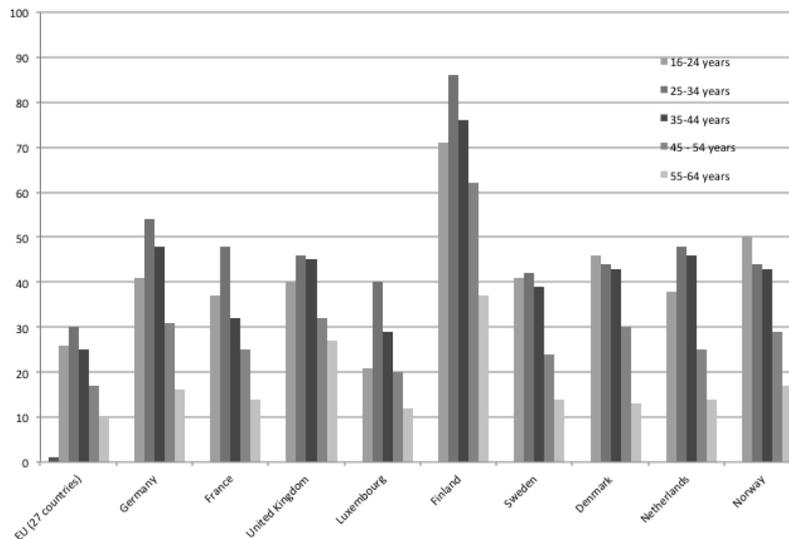

Figure 2 - Percentage of individuals that make online purchase of clothes and sports goods by age (Source: Eurostat, 2012)

This type of consumer is expected to increase by 49%, next year, the volume of purchasing through tablet platform in contrast with only 19% through smartphone. The motivations for shopping with iPad are convenience, browsing and ease of transaction. The year 2011 is focused in apps of brands, but the research by Zmag/Equation Research projects that in 2012, Facebook will be the preferred shopping platform. In accordance with eMarketer reports, it is envisaged that mobile commerce sales will grow over four-fold in the next years, from about \$7 billion in 2011 to \$31 billion in 2015.

In 2010 the business transaction volume of purchases of textiles and clothing on the Internet were estimated in 2.9 billion in France, representing about 9% of total apparel sales. The clothing purchase occupy third position in mobile commerce and the total consumer in mobile commerce represents 0,005% of the total of consumer retail, being e-commerce 2,8% (Journal du Textile, 2011).

Ko *et al.* (2009) explored the potential of consumer technology adoption model in examining structural relationships among mobile commerce characteristics, perceived value and intention to adopt mobile shopping for fashion products in Korea.

Kim, Chan, and Gupta, (2007) concluded that the consumer perception of value is a significant variable to determine actual behavior intentions, rather than their attitude toward the act of using technology in the mobile commerce context.

The results of study of Kim *et al.* (2009) showed that the consumers' shopping intentions via mobile technology are positively influenced by attitude toward mobile commerce, subjective norm, and perceived enjoyment. Retailers may target fashion leaders or early adopters in mobile commerce to promote their new applications.

Design Attributes of Fashion Products

There are several individual and collective factors that interfere on the purchasing decision, such as the brand of a given fashion product as many consumers make purchases by influence of a designer or company brand. Brands are perceived in differences ways, but cost, uniqueness, utilitarian or fashion image are important factors (Salomon and Rabolt, 2009).

Quality is another factor to which consumers pay more attention (Acharya and Elliot, 2003; Hanf and Wersebe, 1994). The design is an important motivation for purchasing and consumption of fashion. In a garment, consumers give more and more relevance to aesthetical appearance, like the line, look, among many others. The characteristics or attributes of fashion products also influence purchasing, since they interfere on the value, style and quality of product (Hong *et al.*, 2002; Wickliffe and Psysarchik, 2001).

Of the visual attributes, aestheticians believe silhouette to be the most important, because it "frames" an object in its surroundings. Line also interacts with color, to emphasize or deemphasize silhouette and shape (DeLong 1987, Eckman and Wagner, 1994).

Product comfort is also an important attribute as consumers wish comfortable products to satisfy specific needs. The usefulness is also a factor that consumers have in mind when buying garments, because, for example, they buy a garment that combines with their existent wardrobes, and they make their choices also considering aspects such as durability and easy care. The product novelty is a factor that fashion followers have into consideration, in each season they renew their wardrobes, and they look for innovation in their wearing way.

Price is a rational factor that much influences the purchase of a product since consumers consider a better product the one with better price (Hanf and Wersebe, 1994). The acceptance

of a product is reached when there is equilibrium between value and price that the consumer is willing to pay for it. In general, the consumer considers a low price product the one that is outdated or with low quality.

May-Plumlee (2006) pointed out thirteen universal evaluative criteria in clothing products. Dutton (2006) shows that the products' attributes of styling, brand, price, place, production and fiber content have a significant effect on the buyer intention of the consumers in a range of age between 15 to 25 year-old. Pereira et al. (2009) used the same attributes to study the valorization of the apparel attributes according to the influence of the advertising level on the buying behavior.

The Fashion Designer of the future

Clothes are not divorced from social context (culture, group association, social situation, immediate body space, person characteristics (i.e, age and gender), kinetic interaction, garment/body interaction and the garment itself (Damhorst, 1985). The last one is subdivided by garment pieces (skirts, pants, jackets, dress, etc...); the finishing and the condition of material. The perceptual elements within the design of a garment can vastly create different images and impressions. The visual image resulting from the manipulation of design elements (line, space or area, shape or form, color, pattern, texture of material, apparent weight, fiber and odor). Principles of design, that is the arrangement of the design elements, to create harmony, unity, rhythm, balance, emphasis and proportion (Davis, 1996; Jones, 2005, Salomon and Rabolt, 2009). Nowadays, the best fashion design has a need for arrangement of the design elements that are appealing to the consumer of the digital era.

The work of Fashion Designer for 21st century need to reevaluate the requirements of product use and consumption that include problems focused on environment, sustainability, and societal concerns (Palomo-Lovinski and Faerm, 2009); the new designer needs to consider the internet platform, find the way to connect the designer's and brand values to the social and environment challenges (moving toward a sustainable lifestyle and economy) facing our civilization (Benson and Fine, 2011). Eundeok and Kim (2009) conclude that the design and product development processes would rely heavily on computer and digital technology. As a result, the role of technical design would be increasingly important. This heavy reliance on computers was predicted to lead to increased production of relatively simple designs that could be efficiently executed by computer. This is one way for reducing the consumption of

raw material and to achieve sustainable processes. Black (2007) also, in his work with a research cluster, concluded that the potential for emerging technologies and digital fashion contribute to a more sustainable future. Today the fashion designers need to create Fashion based is those principles, and to adapt to new ways of business, that include digital platforms and global aesthetics diversity.

The Attributes in E-Commerce and Mobile commerce

The success of the e-commerce and mobile commerce depends on the type of goods and services to acquire. Thus, for sensorial products such as clothing, jewelry or accessories, which are experienced through one or more of the five senses (e.g. touch, sight, smell), the consumers' ability to examine merchandise before purchasing is substantially limited, even when an online shopping site has video or audio capacities. Online retailers of fashion sites have attempted to capitalize on the advanced unique virtual shopping environment using 3D Flash sites, electronic dressing rooms and fashion-conscious virtual personal shoppers to guide users (Stockport et al., 2001). Other attributes and factors such as transaction/cost and incentive programs, along with demographic variables (gender, income and number of children) were important predictors in determining the intention to purchase clothing, jewelry, or accessories via the Internet. Incentive program mediated the relationship between education level and online purchase intention, concluded Kim and Kim (2004) in their work. Mobile commerce marketers should progress toward a "customer-centric" strategy by focusing on instrumental personalization of mobile shopping sites design and implementation (Fan and Poole, 2006; Lee and Park, 2006; Kim and Lee, 2009) in order to delight profitable customers. Ha and Stoel (2009) concluded that the web site quality plays a significant role in consumers' adoption of e-shopping and has four dimensions: (1) web site design, (2) customer service, (3) privacy/security, and (4) atmospheric/experiential and shopping enjoyment and trust. Ha and Stoel (2009) say that the customers are not only web users with trust/safety and information needs, but also shoppers with service and experiential needs. The key points suggested by Gatford (2010) are consistency and flexibility; mobile commerce makes it possible for customers to get what they want wherever they are, not relying on proximity to a real life store or their computer or internet connection. They want familiarity with the store/website they already know and the option to customize their purchasing experience. Providing stock details and reservation ability, SMS reports about delivery status, are all ways to give the customer full control and to in turn encourage them to

put their full trust in mobile commerce. Butcher (2010) suggests that the mobile commerce platform addresses merchants' need for a new channel that will broaden their loyalty through gift programs, mobilization of sales and marketing to reach customers anytime, encourage purchases and build a stronger brand affinity. According to Butcher (2010), there is much consumer interest in using mobile for tasks such as discount vouchers, finding stores and checking stock levels before they go to the store. Now that most luxury brands have accepted that the internet is a powerful tool for commerce and that social media provides an opportunity for a new kind of brand engagement, along comes another technological wave that will feed the ongoing digital revolution in fashion, and take it mobile. Some brands in the Luxury Fashion Market at mobile commerce refer that good smartphone apps offer an intuitive User Interface (UI) where design is critical. Useful features that address the mobile use cases and don't simply replicate what a website might do in a stationary computing environment. Other feature is to be fun either as utility or a game. Also they incorporate mobile metrics and an analytics package into the app to make informed decisions around app improvements and future releases. An application must be more than a product shop window and this may include using the device's camera/video capture, location-detection capabilities, accelerometer or mobile screen itself. The app is used as an engagement channel with social media tools, location-based search and commerce, if appropriate, to expand the market and build a digital dialogue with consumers (Amed, 2010).

The iPhone and iPad

The launch of the iPhone revolutionized the mobile phone market (Kim *et al.*, 2005). According to eBay, one item is purchased every two seconds using eBay mobile app, with apparel, auto parts, cell phones/accessories, sporting goods and collectibles ranking as the top five categories of purchased items. A new era of commerce is arriving and, with it, a need for several studies. Thus, the main objective of this paper is to study the attributes apps for iPhone and iPad fashion products, study the consumer buying behavior according to the gender and to understand the apps attributes most valued by consumers in mobile commerce. To attain this objective three research questions were presented:

- 1) What are the best apps for iPhone and iPad in fashion products?
- 2) According to gender, what is the type of goods and services that are bought by the consumer using mobile commerce, taking into account his experience in e-commerce?

3) According to gender, what is the importance given by the consumer to attributes when consulting fashion products using smartphones?

The subsequent hypotheses are set out:

H₁: There are significant differences in the type of goods and services bought by the consumer in mobile commerce according to gender.

H₂: There are significant differences in the attributes valued by consumers that use smartphone platform to purchase fashion products according to gender.

This paper is organized as follows: After the introduction to the topics, the methodological aspects are described in the second section. In the third section the main results are presented and in the fourth one the main conclusions are drawn.

METHODOLOGY

These studies focus on two particular platforms, Apple's iPhone and iPad. This particularization was made due to four reasons: the market size, the number of applications developed for mobile commerce of fashion products included in the Lifestyle group, the portability of equipment and the motivation to fashion products are considered (Katz and Sugiyama, 2006). Users of the iPhone can draw applications to their devices via the iTunes store. The offer is divided into 20 categories. This work focuses on the applications included in the Lifestyle category, because there is no sub-category of retail for clothes or fashion. Only in US was created, in September 2011 to celebrate the Fashion Week and promote fashion-related apps, a new App Store section named "Fashion: Apps for the Clothes -Minded".

Thus we select a set of applications associated with the following categories in fashion retail industry. The consulting took place from November 2011 and throughout 2012. From the total apps found in the iTunes store using the search "Bestsellers in Lifestyle" a set of 12 apps were obtained from 8 countries. An analysis table was constructed. In the second part of the work we developed a survey to obtain results on some aspects of mobile commerce in Portugal (Portuguese fashion industry has for many years been known for its quality and low-cost production, but designers face a larger challenge when it comes to being recognized as a fashion center (Soares, 2011).

The nonrandom sampling technique was used, i.e. the population selected to constitute the sample depends, partly, on the researcher's judgment. Beyond this sampling technique it was also deployed the snowball sampling process. A questionnaire was sent by e-mail to all the contacts on the researcher's mailing list living in the country (Portugal). Next, was disseminated it by the snowball technique for successive contacts of first respondents. The study sample comprises 570 respondents for smartphone and internet platforms. Concerning the answers obtained from the surveys, they were measured according to the Lickert scale (1 to 7). Data were exported to the SPSS 17.0 software in order to develop a statistical analysis. To obtain the answers to the research questions, descriptive and multivariate statistics were used.

RESULTS: MOBILE COMMERCE APPS FOR BUYING AND KNOW ABOUT FASHION

In this work we choose the top apps based in the classification of iTunes store in category of lifestyle for 8 countries. The obtained results from the research done are presented in Table 1 and Table 2. The leader in multichannel apps is eBay, followed by the Amazon mobile. In brand apps, the leader is H&M, followed by Danish Trendsales. In fashion magazines, the leader is Cosmopolitan UK. From this analysis, the fast fashion brands are the most preferred in the top 10 Best Sellers.

Results: Consumer's inquiry results

In order to put in context this analysis, the consumer profile of respondents was analyzed. Beginning with age, the majority of respondents were between 23 and 29 years old (60 %), followed by the age group ranging from 18 to 22 (18,8 %), then from 40 to 55 (9,4 %) and

finally the 30-40 (7,1 %). In terms of gender, the research sample is by majority represented by women (65 %), with males accounting for only 35 % of respondents.

Regarding the intention to buy fashion items, using the smartphone platform, the following answers were obtained; in the last two years the consumer did not use that platform to purchase fashion products; presently very rarely think in it; in the near future, will do it a few times only, albeit with a slight increase in the average value (see Table 3).

The survey included open questions to obtain some explanations for the answers that are summarized next. Some consumers indicate as main reason for not making purchases using smartphones the lack of confidence in the transaction process as compared to e-commerce. The applications available for the smartphone also exist in e-commerce, prices do not differ, privacy and the screen size is limiting. The low number of consumers who choose to buy via smartphones, identified as the main reason the fun of the transaction in their leisure time with friends, when need a last-minute shopping and to be the quickest way to do it, because there exist apps of brands to which the consumer is sure. Other reasons were after entering a physical store easily they compare prices and products via smartphone and if it is advantageous, they perform the purchase through the smartphone.

When consumers were asked to compare traditional shopping with mobile shopping the answers were; preference to buy expensive fabrics with traditional shopping because of need to touch. Traditional shopping was also preferred for purchasing of jeans and slim trousers. The consumer prefers to buy easy elastic fabrics and knitwear using mobile commerce platforms.

Table 3. Intension to Buy Fashion products using smartphones

To answer the second research question, according to gender, what is the type of goods and services bought by the consumer using the mobile commerce, considering his experience about e-commerce? According to gender, regarding the consumer buying behavior of goods and services using the mobile commerce as a function of his experience with e-commerce, the data analysis reveals that men's buying is different in hotels, games, fashion accessories, perfumes/beauty and shoes. In this way, the H1 is not rejected for this type of goods (Table 4 and Table 5).

As purchase intention, men prefer to perform purchases using smartphones primarily for services such as hotel booking, travel, books, music /concerts and only secondarily then to buy fashion accessories. In what concerns the women's intention to purchase with smartphone platform is inferior to that of men in most goods and services and the preferences fall in travel, books, hotels booking, music /concerts, apparel and fashion accessories.

To answer the third research question, according to gender, what is the importance given by the consumer to attributes when consulting fashion products via smartphones? Regards the importance given by the consumer to attributes associated with fashion products in mobile commerce, it appears that there are differences between men and women are: the easy

accessibility to the various application areas /site, ability to coordinate the different pieces, customizing pieces, professional advice, link and share with social networking and video collections. Thus hypothesis 2 is not rejected (Table 6).

Table 6. Differences of attributes when consulting fashion products through the smartphone: iPhone according to gender (t-test)

		Results of t-test

CONCLUSIONS

The use of smartphones will continue to grow. Forecasts indicate that they will represent 23 % of mobile phone sales in 2013, with about 300 million units sold each year. The addition of 3G and the low price of Internet access from mobile phones, preview that this type of equipment will occupy the first position in the ways of accessing the Internet in 2020. After the development of e-commerce in retailing and fashion products, it is also expected that mobile commerce will start to escalate.

From the analysis of a set of apps for the iPhone and iPad it is concluded that retail companies and brands of fashion products are aware of this new way to conduct business. Nevertheless, fashion category apps are not yet worldwide available in iTunes. An example of the importance of this category is the apps fashion.ebay.com only used for sales of fashion products, offering fashion products with discounts of 70 % on luxury goods at the beginning of each week.

Thus we conclude that from the analysis of this application group there are differences between the portals of e-commerce and mobile commerce, the entertainment is here seen as an asset to the consumer. The success cases in e-commerce are not necessarily the ones that will succeed in mobile commerce. Retail chains and brands have to be alert to cases of success in other areas and to the good practices that are developed by other chains. This study may thus help in a modest way small businesses whose investment needs to expand their network of physical stores would be impossible, to bet on new ways of marketing their products, taking into account all aspects mentioned here. However, we are in the early stage of mobile commerce, particularly in Portugal. The areas of security and privacy need to be improved for the success of mobile commerce. The differences between male and female respecting the preference of attributes for apps are evident, leading to the conclusion that brands should develop different menus and apps for men and women in fashion business. These conclusions can only be validated on a global level after the completion of such studies in other countries. The forecast for the increase of female consumers that use mobile commerce is expected in the short term, observed by the trend obtained in the survey and by the growth in smartphone sales recorded last year. Luxury brands are the first to invest in apps other than their own e-commerce sites and thereby gain market share with mobile commerce, having already complete awareness of the importance of the location factor for the brands, conclusion also obtained by Ghose and Han (2009). According to the study, the location (mobile vs. PC) influences the consumer behavior. A brand has stronger primary effect in

mobile versus PC (18.7 %), and also a stronger local interest for branding in mobile versus PC (more 30 %).

Mobile commerce has many advantages. Mobile marketing allows immediate action, it is very appropriate especially for launching time-limited campaigns, offers or coupons. Instantaneousness of the interaction between consumer and the brand expedites the purchasing process. Not only the brands but also the 21 century Fashion Designer should take advantage of the emerging mobile platforms to reach consumers in a more sustainable manner, more quickly, with a better management of resources and higher interaction and participation of fashion goods consumers.

PATTERN-FINDING IN QUALITATIVE DATA - A 17 STEPS PROCEDURE OF MAKING DATA ANALYSABLE

Philipson, Sarah

University of Gävle, Sweden

ABSTRACT

I have examined or tutored some 500 bachelors theses and some 100 masters theses at several Swedish universities.

Over the past 20 years Swedish secondary school graduates has become less and less apt in mathematics, Mullis, et al. (2009). Due to this development university students mostly chose to make qualitative studies, irrespective if this is the best choice to study the research question or not. Most of them don't even make good qualitative studies. After analysis of the requirements of what is needed, Prahalad's (2006) 'sandbox of innovation', I have developed an abductive method for analysing qualitative data to help the students to get good use of their empirical material, a well-grounded theory, in contrast to the inherent deductive nature of grounded theory. It is suitable for studies based on interviews, focus groups and observations.

As the dataset grows, the method becomes cumbersome, which I don not consider is a big problem, as big qualitative datasets would preferably be analysed by non-parametric statistics, rather than the iterative interpreting qualitative method I suggest here. The method has so far been used to advantage by students in some 15 bachelor and master theses. I also discuss the limitations of the method.

Keywords: Presentation and analysis of qualitative information, interviews, focus groups, observations.

ACKNOWLEDGEMENTS

I am indebted to B.Sc. Godwill Dvuwala Jam and B.Sc. Manuel Mbinda Tah for allowing me to use their thesis to exemplify my method, and professors Sven-Olof Collin and Aihie Osarenkhoe, Associate Professor Arne Fagerström, Assistant Professor Ernst Hollander, and Lecturer Tomas Källquist for invaluable feedback.

REQUIREMENTS ON A NEW METHOD

Understanding the world – What is it all about?

Science, whether natural or social science, is about discovering the essence of a phenomenon, "das wesen", (Dietzgen, 1973), (Marx, 1968; 1975), or the "Dasein", (Heidegger, 1954). This means that we have to search for the generalised being of the phenomenon, not individual beings, (Heidegger, 1954:19). "Being does not become accessible like a [my emphasis] being." (Heidegger, 1954:19). "The fundamental subject of research in ontology, as determination of the meaning of being by way of time, is Temporality." (Heidegger, 1954:14). This quest for generalizability makes post-modern claims of the importance of the individual story invalid as a means for scientific devoir, however interesting it might be. But it could of course it could be inspirational in an early stage of the scientific process.

Deduction, induction and abduction

Deductive reasoning means that we view reality through the lenses of our pre-understanding, which means that we do not see anything other than what we already know. The interview guideline is provoking the answer and the observation guideline makes us see what we are looking for, not what we are not looking for.

But the very idea of a tabula rasa approach to science, that we can do inductive research without having a luggage of pre-understanding is absurd.- even with an open "tell me...", the interviewee will respond to whom is questioning. In reality all research must be abductive; must proceed with a conscious awareness of the researchers' own world-view, or views, but still be open for finding the unexpected. We are not only looking at data through the lenses of existing theories, but we are actually also reaping data from subjects that are interesting according to existing theories. However valid the reason for theoretical sampling – research efficiency is such a valid reason – it means that we are looking for the lost key under streetlight, rather than where we lost it. The challenge is not to question existing theories, but to identify *what needs to be explained*. If then existing theories does not explain the identified problem or pattern, it eventually forces a Copernican revolution, Kuhn (1970).

Finding patterns vs. fragmentation, outliers and the absence of patterns

Science is about finding patterns: "Summarize the general pattern you see, retaining only an illustration or two." (Walcott, 1990:67-68). To others it is to refrain from pattern finding (Alvesson & Källström, 2011:40). They even mean that it is really the fragmentation that is

interesting: "The interest in finding (constructing) deviations from patterns implies a search for (opportunities to come up with) fragmentations." (Alvesson & Källström, 2011:42).

A bizarre presentation of the empirical material is to present the integrity of each interview: But scientists are neither storytellers (fiction writers), nor conduits for the interviewee to tell her story. We are supposed to look for an understanding of phenomena, its Dasein; not that of an individual being. We are hence not interested in descriptive statistics of the answers to the individual question. Some researchers describe the answers to the individual questions with descriptive statistics: "7 of the 12 interviewees said..." (As if such description has any significance!); when making the operationalization (or whatever word you prefer) of the theories that you would like to get the perspective on, one would normally have to use several questions to get an understanding of one single concept. So why would one interest oneself for the answer on the individual questions?

The social construction of reality

Researchers "...construct rather than collect data. We don't discover knowledge or theory, and we do not believe that data can be used as reliable informants for what is true or false." according to (Alvesson & Källström, 2011:24-25). Post-modernism do not understand that reality as being a social construction, as (Berger & Luckmann, 1966), but as self-constructed by the individuals. It is evident in much management literature; perhaps most pertinently in branding, where authors regularly seem to think that customers "dress up" their identities with brands. This is the American dream gone wild; supposing that some customers have chosen to be poor, ugly and sick, drinking Coca-Cola and eating McDonald's hamburgers, while we others are beautiful, healthy, partying with Britney Spears and drive a Lamborghini. And presumably the former are as happy as us! And consequently advertisers depict the persons engaging in these unhealthy lifestyles – smoking, drinking beer and colas, eating fast food and ice cream – as extremely fit and healthy.

Grounded theory

"Grounded theory... has become by far the most widely used framework for analyzing qualitative data." (Bryman & Bell, 2011:577). In grounded theory "...data collection analysis, and eventual 'theory stand in close relationship to one another (Strauss and Corbin, 1998:12). Thus two central features of grounded theory are that it is concerned with the development of theory out of data and the approach is iterative, or recursive, as it is sometimes called, meaning that data collection and analysis proceed in tandem, repeatedly referring back to each other." (Bryman & Bell, 2011:576). It derives its theoretical underpinnings from Pragmatism and Symbolic Interactionism, (Corbin & Strauss, 1990:5).

The critique of this approach has emphasised an over-reliance on pure "data" and a neglect of the constructed nature of empirical material, (Alvesson & Sköldbberg, 2009), (Charmaz, 2000), and (Lincoln & Guba, 2000).

"Coding is the fundamental analytic process used by the researcher. In grounded theory research there are three basic types of coding: open, axial, and selective." (Corbin & Strauss, 1990:12). It has been criticised for this theoretically motivated codification of data giving it a deductive character (Alvesson & Källström, 2011:105).

"Grounded theory is very much associated with an approach to data analysis that invites researchers to fragment their data by coding the data into discrete chunks. However, in the eyes of some writers, this kind of activity results in a loss of sense of context and narrative flow (Coffrey and Atkinson, 1996)..." (Bryman & Bell, 2011:583).

"By plucking chunks of text out of context within which they appeared, such as a particular interview transcript, the social setting can be lost." (Bryman & Bell, 2011:588).

In her critic of grounded theory, Charmaz (2000:523), cited after Glaser (2002:8), says: "The constructivist approach also fosters our self consciousness about what we attribute to our subjects and how, when, and why researcher portray these definitions as real. Thus the research products do not constitute the reality of the respondents' reality."

But this idea of science as respecting the respondents' meaning(s) of their reality will only discover their ideology, not the nature of the reality they theorise about.

Grounded theory is in my view mainly *deductive*, as the data is interpreted with *index' operationalized from theory*, hence data is interpreted by previous understanding.

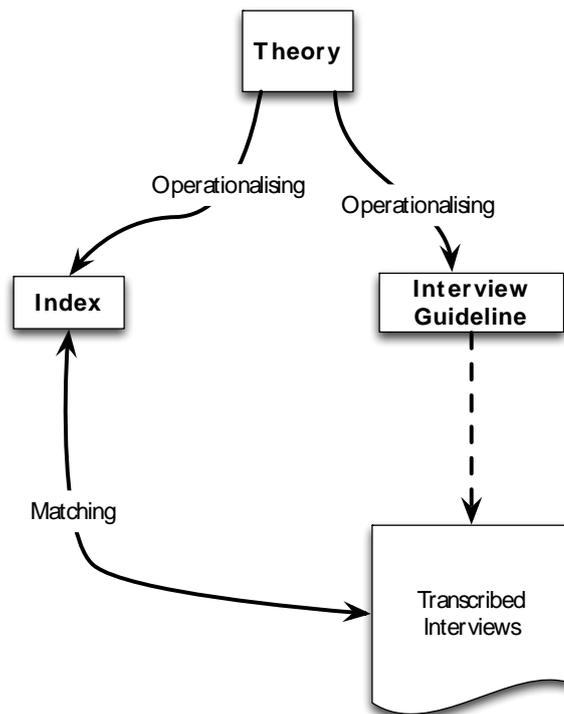

Image 1 Grounded theory, own

Research ethics and documentation

We don't know if research falsification has become more common, or just more detected. But especially in medicine and physics a large number of falsifications have been identified the last decades. There is reason to believe that it is even more common in social science, only that it is more difficult to uncover because it is usually not experimental research and hence not possible to independently verify.

The process information should be put in a public depository, normally at the university to which the researcher is affiliated, for verification of the analysis made and for the possible re-interpretation of the data. It is highly unethical that this is not generally made – even without an assumption that some researchers are likely to cheat if they can get away with it. The transcripts of the interviews should be included as attachments to a thesis. For a journal article it should be available as a pdf on demand. I am of the definite opinion that to diminish the risk of research fraud, journals should be obliged to keep primary data for at least 10 years. "...they should display enough evidence for each construct to allow readers to make their own assessment of the fit with theory.", (Eisenhardt, 1989:548). "...although most published qualitative reports provide detailed descriptions of the settings, people, events, and processes that were studied, they say little about how the researcher got the information, and almost nothing about the specific analysis procedures used." (Miles & Huberman, 1984:22).

Summary of the requirements on the proposed Method

The method should allow for

- Generalising, finding similarities and differences between cluster of respondents or observed subjects.
- Primarily findings patterns, not outliers
- Social, not individual construction
- Abduction, neither deduction, nor induction
- Interpretation of data rather than coding data from a theoretical/inductive perspective.
- The transparency of the interpretation

A WELL GROUNDED THEORY

Outline of the method

Research has to be presented in an abbreviated form, but the absence of standardized procedures for this abbreviation makes it necessary to document the very *procedure* for abbreviation.

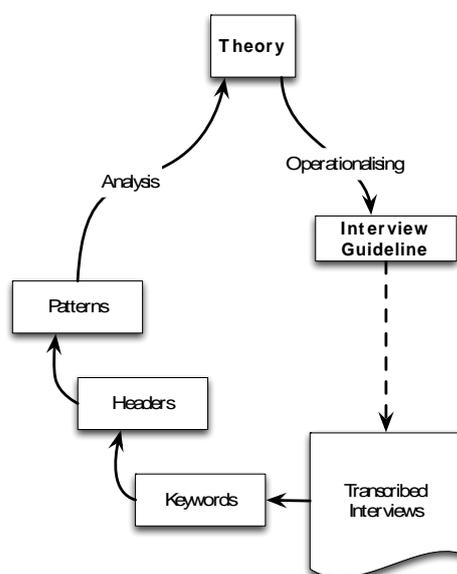

Image 2. The abductive nature of the proposed method, own.

The two methods are compared below for clarity.

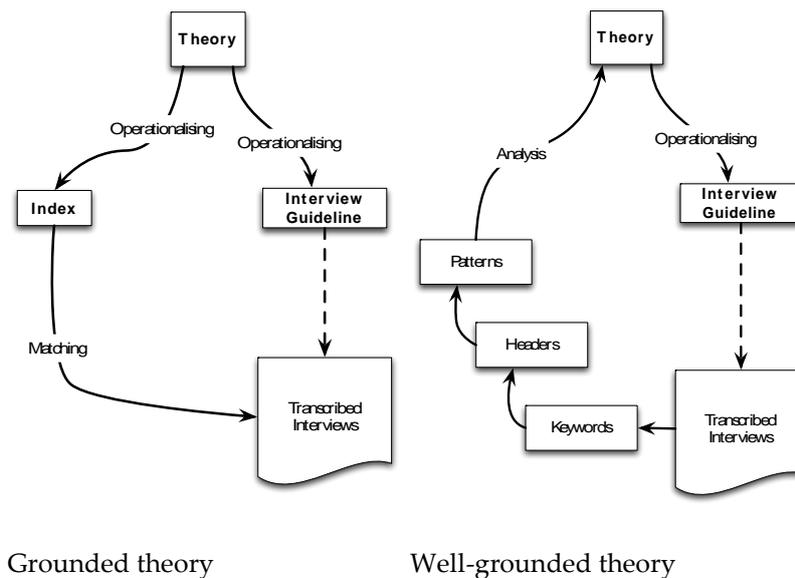

Image 3. Comparison between Grounded theory and our proposed theory

There is no fundamental or qualitative difference between presentation of empirical data and analysis, as the very documentation is an abstraction of reality, based on explicit and tacit processes in the head of the researcher. Noting observations, transcribing interviews, or other such documentation, includes analytical elements. To control this process, it should be made as stepwise and explicit as possible. "Data reduction is not something separate from analysis. It is a part of analysis that sharpens, sorts, focuses, discards, and organizes data in such a way that final conclusions can be drawn and verified." (Miles & Huberman, 1984:23-24). "The trick is to discover essences and then to reveal those essences with sufficient context, yet not become mired trying to include everything that might possibly be described." (Walcott, 1990: 35). "As with data reduction, the creation and use of displays is not something separate from analysis; it is a part of analysis." (Miles & Huberman, 1984:24).

Research has to be presented in an abbreviated form, but the absence of standardised procedures for this abbreviation makes it necessary to document the very procedure for abbreviation.

1. Transcribe the interviews, observations, or focus group Interviews, etc. (hereafter interviews) vary in length between 20 minutes and several hours. The researcher must transcribe the interviews, focus groups or observations. If interviews are conducted in another language than that of the paper, they should be

transcribed in the language they were conducted in and then be translated to the language of the paper.

2. Organise the empirical data

Construct a matrix in MS Excel, Numbers, Open Office, etc., with the interviewees as column heads and the questions (observations, etc.) as rows. Then paste the whole answer on each question into the cells. "We have found systematic matrix displays for words to be uncommonly fruitful." (Miles & Huberman, 1984:26). See table 1.

	Respondent	1	2	3	Etc.
Q 1 View of innovation		Yes! If we must grow the relationship between our existing customer and us, we must continue to provide outstanding services and value someone will do it better. Continues improvement important for future growth in our company, we must face the challenge! If we must be seen different in the market we will have offer something different from our competitors.	In this business, innovation is a key to your position in the market. As one of the market leaders in 3PL a continuous innovation is a relationship with our responsibility of UPS. As the tough as the competition is today, almost everyone offers the same core product. The only way for UPS to be unique has been through its innovative strength that has given it a strong brand name.	Yes! We are very innovative That's right, innovation is the only way for us to come out of commoditisation. We need to grow a strong relationship with our existing customer through the delivering of outstanding services that will make us unique.	

Table 1. Answers from transcribed interviews

3. Mark keywords

Go through each answer and mark keywords – only keywords, not whole sentences! The keywords should be understood stand-alone from the whole answer. The more unstructured the interview, the more information must be contained in the keywords. It is important not to choose to simple keywords or value statements (important, good, etc.), as that will tend to eliminate differences between the interviewees. If there are several authors of the paper, they should preferably do this independently and then negotiate the choice of keywords. When the keywords are decided, one goes back to the transcripts and

marks the keywords, so that they can be seen contextualised. Hence, the reader can see if the keywords convey the meaning of the transcribed interviews, observation, etc.

4. Reduce to the keywords

Exclude everything that is not in fat italics [here underlined]. Separate each set of keywords with a slash, "/", so that you can identify the keywords that are related to each other. See table 2.

	Respondent	1	2	3	Etc.
Q 1 View of innovation		Yes! If we must grow the relationship between our existing customer and us, we must continue to provide outstanding services and value else someone will do it better. <u>Continues improvement</u> very important for future growth in our company, we must face the challenge! If we must be seen different in the market we will have offer something different from our competitors.	In this business, innovation is a key to your company position in the market. As one of the market leaders in 3PL a continuous innovation is a responsibility of UPS. As the tough as the competition is today, almost everyone offers the same core product. The only way for UPS to be unique has been through its innovative strength that has given it a strong brand name.	Yes! We are very innovative That's right, <u>innovation is the only way for us to come out of commoditisation.</u> We need to grow a strong relationship with our existing customer through the delivering of outstanding services that will make us unique.	

Table 2. Keywords in transcribed interviews

5. Ascribe generic keywords – headers

Go through the answers of all interviewees on each question and try to find a structure of the keywords, by generic keywords. This step is a first pattern finding. The generic keywords identify similarities between the answers, observations, etc. The generic keywords should be in colloquial language of the same type as the keywords, not theoretical concepts (which would make them indexes). What we suggest here are not theoretical or conceptual codes, but common-language headers, preferably fetched from the interviewees. It is yet not time to detach oneself from "data". It is very important to consider these keywords critically; formulating and re-formulating headers until they are irrefutable,

6. Separate the generic keywords

Create sub-rows on each question for the generic keywords. It is usually necessary to leave a last row for odd comments. See table 3 below where the answers on question 1, 'View of innovation' has been separated under two headings, 'Differentiation through innovation' and 'Innovation necessary to stay competitive'.

7. Describe the keywords

Write a short description of the substructure of each question, the headings.

8. Move the keywords

Leave the original keywords in the cells, but move them around so that they are in the cell corresponding to the appropriate keyword. See table 3.

9. Colour the cells

Colour the cells with keywords with a light colour, to make a visual identifier [here grey, but on the computer I prefer yellow]. See table 3.

10. Reduce the matrix to keywords

Reduce the matrix to keywords. In a separate column you count the number of answers under each header. See table 3.

	Respondent	1	2	3	Etc.
Q 1 View of innovation	Differentiation through innovation	To provide outstanding services and value	Everyone offers the same core product. The only way for UPS to be unique	Innovation is the only way for us to come out of commoditisation	
	Innovation necessary to stay competitive	Offer something different from our competitors	Continuous innovation is a responsibility – innovation is a key to position your company		

Table 3. Answers reduced to keywords and sorted under headers

11. Eliminate odd comments

We would come back to these, the fragments or outliers; they could of course be interesting in themselves, but we now try to identify patterns, worthwhile to analyse.

12. Eliminate the keywords

Eliminate the keywords, but keep the headers and the colours in the cells that previously had keywords in them. Re-arrange the sub-rows, so that the header rows with most answers under, each question comes first.

13. Move around the columns

Move around the columns (the interviewees, etc.), so that those with similar answers all over are close to each other. The purpose of rearranging the columns (the order in which the respondents are portrayed) is to bring the respondents that are most similar in their global answers next to each other in the matrix. One of my group of master students, (Xu et al., 2011) suggested a rank order analysis to find the second patterns, when due to many interviewees this step became too complicated,

14. Finding patterns

Try to find global patterns – groups of interviewees, observed subjects, etc. that over the whole interview, etc., answers in a similar way. The visual identifier helps to identify these similarities. The similarities raises questions as to what might explain these similarities and hence the differences between the groups, constituting the second pattern finding. These patterns are underlying commonalities in common basic assumptions, values, (Schein, 2010), character masks, (Marx, 1976:1064, 1981:956), etc. These patterns are Eisenhardt's (1989:540) cross-case patterns: "This process allows the unique patterns of each case to emerge before investigators push to generalise patterns across cases."

This matrix is put in the empirical chapter of the thesis, with a discussion of every stage of the pattern finding. See table 4.

	Respondent	6	1	2	etc.
Q 1 View of innovation	Innovation necessary to stay competitive				
	Differentiation through innovation				
	To provide value				
Q 2 Working with NSD	Company improvement (product oriented)				
	NSD is equal to innovation				

	Respondent	6	1	2	etc.
	New market Demands (Market oriented)				

Table 4. Keywords replaced with visual identifier

15. Describe the patterns in words

What do you see? Are there similarities or differences between the respondents, observations, etc.?

	Name of Company	DB SCHENKER	UPS	DS V	GEODIES WILSON	Nils Hansson	VSN Åkeri AB	DHL	Åkeri AB Nils Olof Nilsson	Halléns Transport AB	C. G. ERIKSSON AB	Gunnar Karlsson Spedition AB	Brunskog AB	LIEF AB

	To provide value														2
Q 2 Working NSD	Company improvement (product oriented)														7
	NSD is equal to innovation														6
	New market Demands (Market oriented)														2
Q3 Major sources of innovation	All sources of innovation are important														4
	To listen to customers is necessary														7
Q4 Involving the customer in innovation and NSD	Customers consultation														5
	Interaction														4
Q5 Benefits of customers involvement	Observation														3
	Quality														9
	Loyalty/relationship														8
	Understanding customers														7
	Cost														6
Q6 Experience market share as result of customers involvement	Facilitates sales														3
	Lead-time														8
	After sales support														2
	Company learning														2
Q6 Experience market share as result of customers involvement	the theory is similar to our understanding														6
	To satisfy Customers														4

Table 5. Identifying patterns

16. Analysis

In the analysis chapter you work with the patterns and relate them to the theory, by "going backwards" through the operationalization or you induce a proposed theory from the patterns.

17. Do it again!

Throughout the process each step is made in a new sheet. The last sheet is copied to a new sheet and then one continues to work in the next step in the copy. See table 6. This gives the researcher the possibility to go back and revise each step and it makes it possible to reflect on the implicit tacit analysis that is done in each step, because in reality the analysis starts already in the transcription of the interviews. In traditional ways of conducting qualitative research this process is most often unconscious, undocumented, and hardly reflected upon! "One may, however, work with coding in different ways; perhaps do multiple codings, based on re-readings and re-framings of one's position; take incoherences and contradictions seriously; and generally try to open oneself up to experiences of productive breakdowns. But a strict and ambitious codification project, where the faithful representation of data is the key virtue, is very different from the research ideal suggested here." (Alvesson & Källström, 2011:60). "Through multiple readings we increase the chance of encountering/producing unexpected constructions – opening up rather than letting common sense (as in grounded theory) determine 'reality' – and also the chance of establishing that the unexpected is not just the outcome of a specific and narrow way of seeing." (Alvesson & Källström, 2011:34).

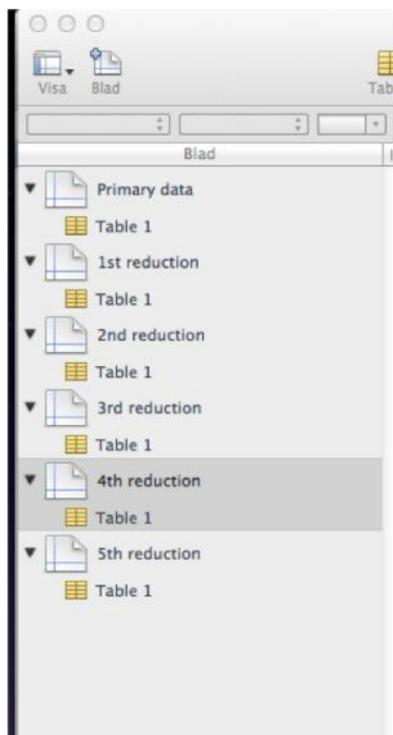

Table 6: The gradual process

LIMITS OF THE PROPOSED METHOD – TACIT KNOWLEDGE, LANGUAGE AND SKETCHING

The method proposed here involves a major effort. You will encounter hurdles as the number of interviewees or observational units grew above 10. Even if you have a big screen you might have to leave the computer and paste it all on the wall. Restructure, reprint, and then again... This method is not an easy road to scientific stardom, but work, hard work. But we believe that this is the road to go – until it is developed further or revolutionised. But for the time being this is what we propose.

One of the major problems in scientific research is that most, human knowledge is tacit. Informants – and researchers – not only (1) do not know, (2) or lie. But they also (3) don not know how to express their knowledge. Vocabularies simply do not simply mirror the world – they produce and conceal as much as they reveal, (Alvesson & Källström, 2011:32). This is not an individual act of production, but an institutional social process. Language does not produce and conceal; it re-produces and even if it conceals, its inherent pretence always includes not only what is "false" understanding, even if fragmented of reality; to be discovered, or uncovered, cf. (Alvesson & Källström, 2011:34).

But tacit knowledge often cannot be accessed by language metaphors. Creativity is the result of associative synopsis in the brain, built on internalization of past experiences and how these have been interpreted and given meaning. The child is essentially born autistic, with an information overload, overwhelming the small capacity of the brain. By experience the associations are built into a grid of pre-understanding that filters sensory information considered as redundant. Not until the grid is fine enough, can the brain start higher mental functions, built on the child's meta-understanding of itself, (Vygotsky, 1934; 1962).

Human experience is diverse and individual. Hence, associations are not the same from one individual to another. Tacit knowledge could be said to be the mass of these associations. And with a rich network of unusual loose link associations, the individual is considered creative by those that do not have the same associations. Even explicit knowledge is also harboured in the brain, where it is embedded in the tacit knowledge, making even the explicit knowledge intrinsically tacit!

Tacit knowledge can be transformed to explicit knowledge through externalisation.

Externalisation is made in written or oral language, visualisation and behaviour. Even with odour, fragrance, scent, and aroma. The externalisation, the objectifying of the subject, makes it possible for the subject to "look at" her tacit knowledge and reflect on it. The "looking at" aspect is evident. Visualisation is a very powerful instrument for the designer, architect, and product developer. The externalised knowledge is however not necessarily immediately understandable to others. It might need interpretation, a transformation into more explicit knowledge, based on a - more - common frame of reference, a more explicit knowledge.

To access tacit knowledge we use the origins of language metaphors – images. These preceded language in human development and seem to be closer to tacit knowledge. "...design know-how, is considered to be tacit and is highly, if not totally, inarticulable." (Wong & Radcliffe, 2000:494) "The fact that drawings are usually accompanied by verbalisations (in the case of the individual designer this would just be unspoken thought) supports the idea that sketches only partially represent ideas in mind. Generally, a drawing act in sketching is not an attempt to represent a solution as such; rather it is a notational device that helps its creator to reason with complex and labile mental structures. (Scrivener & Clark, (1994:114), in (Van Der Lugt (2005:106). These mental images are also called a gestalt.

Our proposed method has its limits. It is occupied with the methodological study of language, whether in a direct or metaphorical form. Pictures (photos, art, etc.) could be interpreted with the help of the method, but the researcher should complement this with using social network analysis, such as e.g. Valdis Krebs InFlow, www.orgnet.com, or brain-sketching with the interviewee, as suggested by (Van Der Lugt, 2005), and many other methods.

CONCLUSION

After a discussion of the requirements of a good qualitative method, this paper proposes a 17 steps method as a solution to make qualitative data interpretation transparent and as conscious as possible.

It has limitations; the most important are discussed here, but it also considerable advantages. Some 20 of my bachelors and masters students have used it and made substantially better qualitative theses than previous students. I intend to use it in upcoming research.

ABSTRACT

Importance – The concept of patient satisfaction has received significant attention internationally since 1990s (Hamilton et al. 2013; Schoenfelder, T.; Klewer, J. and Kugler, J. 2011; Thomas, et al. 2006; Speigth, 2005; Bredart, 2001; Rahmqvis, 2001; Williams, 1994) mainly in three key areas of research: a) expectations of the services, b) personal preferences, and finally c) realities of the care received.

The purpose of this study is based on a funded project conducted by the Department of Health Economics of the Technological Institute of Athens funded European Social Fund (E.S.F) Ministry of Education, Lifelong Learning and Religious Affairs 2012-2015. It is to identify key determinants of patient satisfaction in Greece. The primary health care in Greece (Noula , et al. 2007), is still lacking behind targets and expectations. Issues like long waiting lists, poor medical and nursing service, and high expectations of patients are consider to be ones of the most important factors that result in negative influence on satisfaction (Tountas et al. 2005; Niakas and Mylonakis, 2005; Papagianopoulou et al. 2008; Pierrakos and Tomaras, 2009).

By taking the above issues into consideration, the scope of this study is to develop a comprehensive conceptual method for measuring the satisfaction experienced of the offered Primary Health Care (PHC) services in Greece.

Design/methodology/approach – The aim of this study was to develop a comprehensive conceptual method for measuring the satisfaction experienced of the offered Primary Health Care (PHC) services in Greece, based on a survey of 500 self-administered questionnaires by random sampling distributed in five hospitals throughout the Attica region during the period of April 2013 to July 2013.

Findings – There are some preliminary results of a pilot research. Many factors have been suggested to influence patient's satisfaction; however there is little consensus at

to which areas of care actually influences overall satisfaction response. Patients stated satisfied with medical care and nursing care. However, the level of satisfaction was found quite low in administrative services as also in facilities. The non-parametric test by Kruskal Wallis, showed that the improvement in the patient's health was statistically significant in the overall satisfaction of health care ($p \leq 0.001$), as was also the satisfaction with medical ($p \leq 0.004$) and nursing care ($p \leq 0.014$).

Practical implications – Results of the present study have implications for health providers aiming at improving the service quality and quality of care.

Keywords: Primary Health Care, Services, healthcare quality, public health, Greece.

1.0 INTRODUCTION

The purpose of this study is based on a funded project conducted by the Department of Health Economics of the Technological Institute of Athens funded European Social Fund (E.S.F) Ministry of Education, Lifelong Learning and Religious Affairs 2012-2015. It is aimed to identify key determinants of patient satisfaction in Greece. The primary health care in Greece (Noula , et al. 2007), is still lacking behind targets and expectations. Issues like long waiting lists, poor medical and nursing service, and high expectations of patients are consider to be ones of the most important factors that result in negative influence on satisfaction (Tountas et al. 2005; Niakas and Mylonakis, 2005; Papagianopoulou et al. 2008; Pierrakos and Tomaras, 2009).

By taking the above issues into consideration, the scope of this study is to develop a comprehensive conceptual method for measuring the satisfaction experienced of the offered Primary Health Care (PHC) services in Greece. As such, the first session of this paper in progress is dual: first, to provide an historical review of research conducted in the area of patient satisfaction and specifically on patients' evaluation of the health services and secondly to outline and further discuss some key dimensions of patient satisfaction. The remaining of the paper, focuses on patient satisfaction of primary health care in Greece, its main aims and objectives of the project, as well as preliminary findings of the project.

2.0 PATIENT SATISFACTION: AN HISTORICAL REVIEW OF THE CONCEPT

The concept of patient satisfaction has been under investigation since 1900. In the beginning of medical science, interest was focused mainly on the treatment of the patient or the relief of their pain. However, in the early 20th century a new concept was introduced to the scientific community concerning the evaluation of not only of the outcome of the illness but also of the care provided. This evaluation resulted in the recognition of the patients rights (Williams, 1994) and the introduction of the evaluation of the provided services by the patient also described as patients satisfaction (Thomas, *et al.* 2006). However, as Gilber and Velloutsou argue (2006), the subjective affective component of the patient satisfaction construct makes its measurement “probably a hopeless quest” and its study is largely flawed as it has lacked precision, at the expense of exact science, with many researchers having undertaken studies of a purely exploratory nature.

Indeed, according to Donabedian (1988), the quality of the provided services has a complex impact on patients care provided and is determined by the following organizational parameters: structure, processes and outcome. According to the study:

- *Structure*: concerns two main levels: a) the individual level which regards the quality of health professionals and b) the hospital level which regards the quality of facilities and medical equipment. In general, structure concerns the features and provision of health services; low structure, nevertheless, does not necessarily mean low quality of health services.
- *Procedures*: refer mainly to information to the patient during, before and after care. It concerns all actions carried out for the provision of services to the patient.
- *Results*: concern the final subjective evaluation of the patient for the services provided regardless of the clinical outcome. It is also a key means of evaluation of health service.

Regarding the historical development of the evaluation of health services, in 1982 Linder-Pelz found out that patient satisfaction was based on the *positive evaluations of distinct dimensions of the health care*. The researcher set five key dimensions in order to determine satisfaction: a) Expectations, b) Value c) Entitlements, d) Occurrences, e) Interpersonal comparisons.

In addition, Ware *et al.* (1983: 254) research identified that: “*estimates of satisfaction are intentionally subjective and attempt to conceive a more personal evaluation, which cannot be formed*”

through a simple observation of care. Subjectivity is the only power of the satisfaction measurement tools."

Further research by Meterko et al (1990) argue that the dimensions based on which satisfaction should be assessed are the reception of patients, care by medical and nursing staff on a daily basis, hospital environment and administrative issues relating to hospital cost and discharge procedures. Greeneich *et al*, (1992), have also explored the determinant on patients satisfaction and concluded on the following factors: a) nursing personality characteristics, b) nursing caring, c) nursing proficiency, d) environment and e) expectations.

Speigth (2005) also reported that patient satisfaction is the result of the comparison between the provided care and patients' expectations. Similar is the definition by Bredart (2001) who states that patient satisfaction is the personal perception of the patients of the care provided to them. Indeed, research conducted by the Picker Institute Europe (2002) reveals that the degree of patient satisfaction from health care services depends primarily on the expectations of the services, the patient's personal preferences, and finally the actual care received. To add value to the above concepts and results- despite the fact that they are a good measure of health services evaluation- some quality standards for measuring health services have been developed such as:

- a) The minimum level under which the quality of health services should meet in order to achieve required standards,
- b) The average level; it is the acceptable level of services provided. Although the majority of organizations fall in this level, it requires improvements, and
- c) The ideal level which is the primary objective of any health system and organization.

2.1. Dimensions of Patient Satisfaction

The hierarchical model of satisfaction (Dagger *et al.*, 2007) argues that patients perceive quality in 4 dimensions: *interpersonal quality* through interpersonal relationships between the patient and the provider of health services, *technical quality* where the effect referred to in perceived by the patient outcome, *environmental quality* of the facilities and the atmosphere in the space and *administrative quality* on waiting time functions etc.

More contemporary studies (i.e. Chang et al., 2013; Hamilton *et al.* 2013; Schoenfelder, T.; Klewer, J. and Kugler, J. 2011;) argue that patient satisfaction, patient participation in the process of diagnosis, and patient participation in treatment decision-making may have a significant impact on hospital loyalty.

Parasuraman et al., (1988), have shown that users of health services use almost the same assessment criteria regardless of the type of health care provided. As a result, it is worth mentioning the criteria by which patients evaluate the quality of health services. As there is a large number of criteria we will identify the most important ones:

Socio-economic status: According to Henschke, *et al.*, 2013), cultural, demographic, and psychological factors influence on satisfaction (With regards to patients' income, current literature argues that higher income is associated with greater satisfaction and better communication with doctors (Bertakis, *et al.* 1991) while people with lower incomes have stated more problems during their stay in hospitals (Rogut *et al.* 1996).

Health condition of the patient: Satisfaction is irrelevant to people with chronic illnesses, although the preferences of these patients vary according to their health status. The study of Crow *et al.* (2002) showed that the patients who are more satisfied are those with good health than those suffering from a chronic illness.

Selection of the service provider: According to a survey by Crow (2003) the choice of the service provider by the patient is associated with high satisfaction with the health system. Patients who receive health services from a provider they have chosen and pay after the visit are more satisfied than those who are forced to visit a particular entity without having a choice.

3.0 PATIENT SATISFACTION WITHIN THE PRIMARY HEALTH CARE (PHC) IN GREECE

Primary Health Care in Greece (Noula et al., 2007), is still underperforming despite the efforts that have been made over the last decade. It is important to support research efforts towards the formulation of proposals for the development of policies which will upgrade the offered services, especially in the regional level. The demand for public, free health services, particularly primary health Care Services in Greece increases exponentially, following the reduction of income and loss of insurance coverage of households (Benos, 2012). In Greece,

Public Hospitals and Outpatient Departments are the main provider of primary health services especially in urban areas.

More contemporary studies indicate that access to the secretariat services creates negative patient satisfaction. The waiting list, often encountered in urban public hospitals in Greece, has negative influence on satisfaction and hence creates dissatisfaction (Tountas *et al.* 2005). However, the majority of outpatients show understanding about the waiting list when they know the reason about the delays (Niakas and Mylonakis, 2005). The attitude and interest of the nursing staff about the prediction of a disease and the reassurance of the patient plays an important role in outpatients satisfaction. Research measuring satisfaction with health care services in an Athens paediatric hospital showed that improvement in infrastructure is the most important for health services users (Papagianopoulou *et al.* 2008). Another research concerning the Role of Patient Satisfaction in the Development of Health Care Services Marketing showed that people in Athens hospitals for outpatients services had high expectations of health services (Pierrakos and Tomaras, 2009).

3.1. Aims and Objectives of the study

In line with the prevailing theories this research project (Archimedes) also argues that members of local communities should be co-shapers of services in primary care. Therefore, it is very important to produce a health need assessment methodology for the appropriate services and secondly to established a methodology of patient satisfaction evaluation for those services (Pierrakos G., 2008).

Therefore, the main objective of this research is to produce methodological tools to:

- Firstly, evaluate patient satisfaction (users from the Outpatient Department of Public Hospitals) via patient satisfaction rates, in order to assess the clinical care and services provided to patients.
- Secondly, identify the needs of the population with regards to primary health care provided by the local community. As result, Municipalities will be able to develop and offer those health services that will be of value to citizens.

The contribution of this study is to develop a conceptual framework to evaluate patient satisfaction relating to health care services. The ultimate goal is to develop a methodology of evaluating / measuring patient satisfaction and a Standard Operating Procedure document to be used by managers of local health authorities. This study is also aimed at Primary Health

Care Units staff as it will provide valuable know-how on patient satisfaction in relation to the quality of services provided.

The assessment of satisfaction with health services is dynamic, multidisciplinary and based on the hierarchical model of satisfaction (Dagger et al 2007). The research hypothesis problems seeking this research are:

- a) How do patients evaluate the Primary health service users in Outpatient Departments?
- b) What extent these services would improve their health status
- c) What extent the different patients would pay more money in order to get a better health the specific question is “would you be willing to pay ten Euros per visit in order in an anticipation of better health?”

4.0 RESEARCH METHODOLOGY

This working paper presents the first strand of its research strategy: evaluation of patient satisfaction. In this survey closed-ended questionnaires are used primarily based on following key areas:

- Medical Care evaluation
- Nursing Care evaluation
- Administrative Services evaluation
- Facilities of Outpatients evaluation
- Time and Attendance Service
- Cost of Service
- Overview outpatient services
- Future Use of Services

The approach of the research field in the sense of the localization of the reference population provides the opportunity to identify the differences / peculiarities of local socio-economic and socio-cultural characteristics, also using a structured methodology that ensures the reliability and validity of the measurements during the process of collecting, processing and analysis of data.

4.1. Design of the Sampling Method in quantitative research

In order to assess the patient satisfaction from the outpatients services in Athens Greece the research focus on the group of patients who visited the outpatient departments of public hospitals demand for primary health care.

Since, however, the available time and cost of the investigation, it was necessary to add a further criterion of accessibility for the researchers. Therefore, population research is a group of patients, users of primary health care public hospitals in Attica. 22% of public hospitals located in the capital region. (NSSG, 2009).

The research team had to decide which hospitals in Attica (accessible population) would constitute the research sample. Conducting research in all 25 public hospitals in Attica was impossible in the time you place the sub-project. For this reason, proceeded to the sample of hospitals with the creation of the sampling frame.

The sampling method used was the stratified random sampling. The sample of the study are outpatients from 8 Hospitals. Four of them are specific disease hospitals and other are general hospitals. The sampling ratio was 1:5 and the response rate was 60% (497 out of 800 questionnaires distributed).

5.0 PRELIMINARY RESULTS AND DISCUSSION

This section discussed the pilot study (40 questionnaires) for the purpose of this working paper and on behalf of the Division of Quality Assurance Health of the Ministry of Greece. A Cronbach analysis to assess the internal consistency of the questions showed reliability Medical Care evaluation 0.901, Nursing Care evaluation 0.960, administrative 0.924 and the facilities of Outpatients 0.933 facilities.

It was conducted a correlation analysis between 4 dimensions of satisfaction using the coefficient Spearman. According to the results all the dimensions correlated positively with each other in significant level 0.01 (table 1).

Table 1 : Correlation between 4 dimensions of patient satisfaction.

	Medical Care	Nursing Care	Administrative services	Facilities of hospital
Medical Care	1,000			

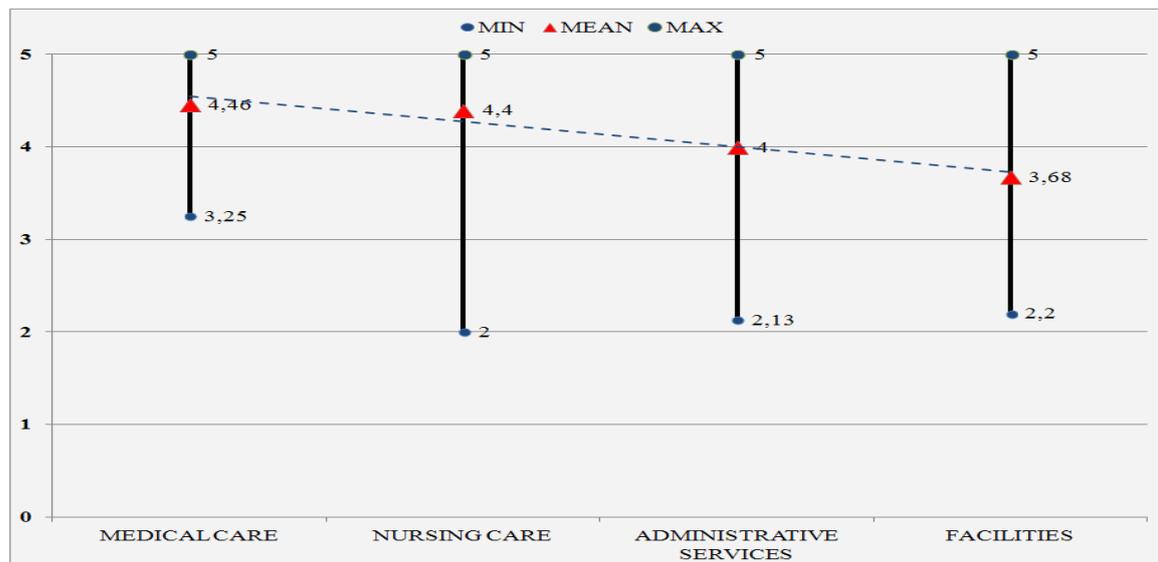

Nursing Care	0,745**	1,000		
Administrative services	0,631**	0,729**	1,000	
Facilities of hospital	0,554**	0,623**	0,771**	1,000

** . Correlation is significant at the 0.01 level (2-tailed).

In addition, the patients were satisfied with health care both before the test (4.3 ± 0.7) and after that (4.5 ± 0.7). Specifically, the patients stated very satisfied with medical care and nursing care (4.5 ± 0.5 and 4.4 ± 0.7 respectively). Low decrease in satisfaction found in administrative services as also in facilities of hospital (4 ± 0.7 and $3.7 \pm 0,7$ respectively).

We investigated the differences between improving health of patients and the overall satisfaction and the four dimensions of satisfaction. Specifically, the non parametric test Kruskal Wallis H, showed that the improve the patient's health influence statistically significant the overall satisfaction of health care ($p \leq 0,001$), as also the satisfaction from medical ($p \leq 0,004$) and nursing care ($p \leq 0,014$).

The majority of patients (40,6%) stated that the general health was *moderate*, while in question «*evaluation of care from outpatient basis to improve your health*» the majority (45,7%) answered *very good*. There was a difference between these means ($p \leq 0.001$), $t = - 4.773$ C.I. $-1.58 - -0.63$, using the t-test.

There was a need to establish the communalities of each question of four factors, so the multi factor analysis was used. Four models of factor analysis were undertaken for the final result

concerning medical care (overall KMO= 0,827), nursing care (overall KMO= 0,890), administrative services (overall KMO= 0,756) and facilities of hospital (overall KMO= 0,754).

From the fourth models the most important factors are:

- Concerning medical care: Quality healthcare outcomes depend upon patients' adherence to recommended treatment regimens and communication they have with physician.
- Concerning nursing care: According to patients' responses, a professional nurse should demonstrate a caring attitude by expressing warmth, interest and empathy toward the patient-client and his/her immediate family and deal with the course of treatment with professional and ethical manner.
- Concerning administrative services: Patients wish to exercise effectively their right to access certain services commissioned by health bodies and professionals with the minimum waiting times and also benefit from fast admittance procedures.
- Concerning facilities of the outpatient department: Good physical environment (i.e. room temperature, waiting rooms and cleanliness) is associated with outpatient satisfaction.

6.0 CONCLUSION

According to the above results patient satisfaction is a complex concept that is related to patient's needs and it seems that it is associated with the effectiveness of services provided to the patient (ie administrative services, facilities, organisational support) as well as the physical environment (cleanliness of the premises and room temperature). Moreover, patient satisfaction is related with the health professionals' competence and the interpersonal relationships between the health care staff and the patient. As it clearly comes from the results quality healthcare outcomes depend upon patients' adherence to recommended treatment regimens and communication they have with physician, professional nurse and the behaviour, professional manner and ethical approach of the latter to their patients.

Direct use of Primary Health Care services

- **Evaluate the services of Medical Care:**

- The time available for physicians to examine
- The accuracy of the information which the doctor gives you about your illness
- Instructions for medications you should take
- Instructions on the kind of lifestyle you should follow
- Behaviour of physicians
- Communication you have had with their doctors
- The confidence your doctor gives you (about your life)
- ✓ The interest of physicians in addressing your health problems

- **Evaluate the facilities of Outpatients**

- ✓ The cleanliness of the premises
- ✓ Cleanliness in toilets
- ✓ Comfort in waiting rooms
- ✓ Adequacy of premises
- ✓ Room temperature
- ✓ The ambient spaces
- ✓ Facilitate access for people with disabilities

- **Evaluate the services of Nursing Care**

- Willingness of nurses to address your health problems
- Nurses' support to your family and your environment
- Behaviour of nurses
- Communication you had with the nurses
- The confidence Nurse gives you (about your life)
- Support provided by nurses to help you deal with your problems
- The speed with which they performed their duties
- The interest of nurses in addressing your health problems

- **Time and Attendance Service**

- ✓ Time between telephone contact and the date of appointment
- ✓ Time you took from your home to get to the hospital
- ✓ Standby time of the scheduled appointment time until you saw your doctor

- **Evaluate Administrative Services**

- Admittance procedures
- Discharge procedures
- The speed with which the administrative staff perform their duties
- The conduct of the administrative staff
- Ability to keep your waiting time to a minimum
- Consistency in compliance with the appointment for your examination
- The interest of the administrative staff in the smooth implementation of procedure
- Communication you had with the administrative staff
- **Cost of Service**
- ✓ Outpatient ticket examination is high
- ✓ Participation in the cost of the tests is high
- ✓ would you be willing to pay ten Euros per visit if you believed that you would have better health?
-

- ✓ Ease of your orientation (signs, direction lines, signalling)
- ✓ Responsiveness of opening hours to your needs

- **Overview outpatient services**

- ✓ The financial costs paid
- ✓ Improve your health
- ✓ Your satisfaction with the services after your examination
- ✓ Your satisfaction you expect to have before your examination

- **Future Use of Services**

- ✓ Would you like to re-visit the same outpatient?
- ✓ Would you recommend the same to other outpatient clinics visited?
- ✓ Would you prefer to visit private outpatients?

-

A STUDY ON ANTECEDENTS AND IMPACTS OF ENGAGEMENT AND PARTICIPATION IN BRAND COMMUNITIES IN PORTUGAL

Pires, Ana Regina¹; Loureiro, Sandra Maria Correia²

¹University of Aveiro, Portugal, ana.reg.pires@gmail.com

²Instituto Universitario de Lisboa (ISCTE-IUL) Business Research Unit (BRU/UNIDE), Portugal, sandramloureiro@netcabo.pt

ABSTRACT

The phenomenon of be engaged and participate in brand communities is not yet well-known. This study carries out a systematic literature review to get the major construct that could explain the mentioned phenomenon and the consequences to the brand. Therefore, the aim of this study is to contribute for a better understanding of antecedents and impacts of engagement and participation in brand communities. Data was collected using an online survey. The link of the questionnaire was sent through the community websites to all registered members of brand communities in study. The major findings reveal that brand relationship quality is an important initiator of the process, together with the brand identification, the presence of other members and satisfaction. Being engaged a member tend to be more active in participating in the community, which in turn improve the brand knowledge, the brand loyalty and word-of-mouth. In future we suggest testing the same model in other contexts, such as other products, countries and comparing between genders.

Keywords: brand relationship quality, satisfaction, participation, engagement, identification, brand community, brand knowledge, brand loyalty, word-of-mouth

INTRODUCTION

Fournier (1998) demonstrates the critical importance of understand the mechanism behind consumer-brand relationships. Indeed, her study proposes a “new theoretical conception of brand personality in a framework that recognizes reciprocal exchange between active and interdependent relationship partners” (Fournier 1998, p. 368). The personality of a brand is a

set of human traits proposed by the consumer based on repeated observation of the behaviours of a brand, thinking as a partner in the relationship dyad (Fournier 1998).

In the relationships built between the brand and the consumer positive outcomes can emerge for both relationship partners. In other words, the consumer can achieve self and social satisfaction when they build and maintain relationships and the brand takes advantages from their loyalty, advocacy and recommendations to others (e.g., Algesheimer, Dholakia & Herrmann 2005; Fournier 1998; McAlexander, Schouten & Koenig 2002; Stokburger-Sauer 2010).

According to McAlexander, Schouten & Koenig (2002, p. 38) "a brand community from a costumer-experiential perspective is a fabric of relationships in which the costumer is situated". In addition brand communities can help in strengthening consumer-brand relationships (Muniz & O'Guinn 2001). So, the study of brand communities falls within the context of marketing relationship. Consumers with similar norms, values and habits tend to congregate in groups called communities of consumption. A special kind of community of consumption is the brand community, which Muniz & O'Guinn (2001, p. 412) defined as "a specialized, non-geographically bound community, based on a structured set of social relationships among admirers of a brand". A brand community "is a friendship group of consumers with a shared enthusiasm for the brand and a well-developed social identity, whose members engage jointly in group actions to accomplish collective goals and/or to express mutual sentiments and commitments" (Bagozzi & Dholakia, 2006, p. 45).

Muniz & O'Guinn (2001, p. 413) has proposed three main characteristics of brand communities. First, we have the consciousness of kind, which is "the intrinsic connection that members feel toward one another, and the collective sense of difference from others not in the community". Second, we have the presence of shared rituals and traditions, which "perpetuate the community's shared history, culture, and consciousness". The third indicator of community is a sense of moral responsibility, "which is a felt of sense of duty or obligation to the community as a whole, and to its individual members".

Several studies around brand communities have been conducted in international context, mainly of those focus the virtual brand communities (e.g. Algesheimer, Dholakia & Herrmann 2005; Stokburger-Sauer 2010). However, studies regarding communities with offline and online existence, particularly in countries such as Portugal, are missed or very few. Our study aims to address this gap. So, we intend to study the Portuguese online brand

communities build around three brands and understand what leads the members to engage and participate in these communities, that is, understand the mechanism that lead consumers to participate in collective activities within the brand communities and what could be the outcomes for brands.

The remainder of this paper is structured as follows. The next sections present the systematic literature review process and conceptual framework and hypothesis. Thereafter, the methodology of the empirical study is described and the results are presented. Finally, the conclusions, limitations and suggestions for further research are drawn.

SYSTEMATIC LITERATURE REVIEW PROCESS

In order to achieve the goal of this research, first we took out a systematic literature review with the intention of building the proposed theoretical model, which was subsequently tested. Therefore, the systematic literature review process uses an automated search to collect information and increase knowledge about the antecedents of participation, engagement and identification in brand communities.

The goal is an identification, documentation and conceptualization for all key analyses in those themes. The EBSCO system accessed through University of Aveiro, containing electronic databases, such as Business Source Complete, Academic Search Complete and EconLit with Full Text, is used to search for information. The main search terms are the following: Identification AND Participation AND Engagement AND Brand Community. The choice of the above mentioned search terms lies on the fact that they are sensitive for the present research topic.

The period considered was from 2006 to 2013. After a broad screen of titles and abstracts and a strict screen of the remaining articles, 9 of them were selected as the most appropriate and relevant to our research topic. The articles analysed are written in English and we included articles with qualitative and quantitative methodology.

Selection Criteria

The selection criteria of the remaining 9 articles from the screening process are analysed according the following criteria:

- Time frame: We used the time frame from 2006-2013 in order to obtain the more recent investigation in area;
- Language: The paper language must be English due to the language limitations of the researchers;
- Study key-words: We excluded studies that were irrelevant with the research question, through the most relevant keywords;
- Quality assessment: The selected studies will pass the Quality assessment only if they are published within journals that are included at the Harzing quality list of journals. The reason for selecting Harzing quality list of journals relays on the fact that is based on the analysis and ranking of 19 business and management official journal rankings (Mingers & Harzing, 2007). By applying Harzing quality list of journals as a credibility measure, the quality of this paper will raise because it will include studies published within the best journals worldwide. Furthermore, apart from the articles, this study also included grey literature that met all the Quality criteria except their inclusion in the Harzing quality list of journals.

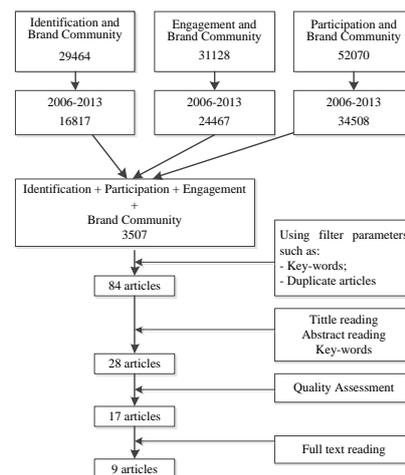

Figure 25: Selection Process

Data Extraction

In this systematic review, a developed data extraction form was used in order to extract the data from the selected studies and to document the data extraction process. Regarding the elements that have been extracted from the studies concern: General details (Title of the paper, author's name and publication details); Features of the study: (Methodological approach and Central Approaches); and Final Insights. In addition, Annex 14 shows the developed data extraction form along with the data extracted from each of the selected studies. These 9 core articles allow us to find other articles in order to develop the conceptual framework.

HYPOTHESIS DEVELOPMENT

Based on previous research, our proposed conceptual framework (see figure 2) explores the inter-relationship of antecedents of engagement and participation and explicates the bases and consequences of the brand community's influence on consumers.

As shown in *Σφάλμα! Το αρχείο προέλευσης της αναφοράς δεν βρέθηκε.*, the model depicts brand relationship quality, brand identification, the relationship with other members, satisfaction and degree of influence as the strengths of engage and participate in community. Identification is influenced by the consumer's relationship with the brand which in turn leads to engagement and perceptions of normative pressure. The model also present the consequences of participation, that is, brand loyalty, brand knowledge and word-of mouth.

Brand identification and brand relationship quality

According to Algesheimer, Dholakia & Herrmann (2005) the identification is related with the strength of the consumer's relationship with the brand community, whereby the person recognizes in common in the brand and in himself/herself to be a member, that is, to make sense to "belonging" to the brand community. The common elements involve cognitive and affective components. In what concerns to the cognitive component, identification with brand community includes categorization processes, whereby formulates and maintains a self-awareness of his/her membership within the community, focusing the perceived similarities with other community members and differences with non-members (Algesheimer, Dholakia & Herrmann 2005; Dimitriadis & Papista 2010) Regarding the affective component, identification includes a sense of emotional involvement with the group.

Brand relationship quality is the degree to which consumer views the brand as a satisfactory partner in an on-going relationship, according Algesheimer, Dholakia & Herrmann (2005). A "harmonious relationship with the brand can lead consumers to seek out and interact with like-minded consumers who share their enthusiasm" (Algesheimer, Dholakia & Herrmann 2005, p. 23). Therefore, we propose the following:

H1: Higher levels of brand relationship quality lead to a stronger brand community identification.

Engagement antecedents

Brodie, Ilic, Juric & Hollebeek (2013) in their study developed a working definition to the concept of consumer engagement in a context of virtual brand communities. They point out

that consumer engagement involves interactive experiences between the brand and the consumers and also experiences among the members of the community. Consumer engagement is a context-dependent, psychological state characterized by fluctuating intensity levels that occur within dynamic, iterative engagement processes and plays a central role in the process of relational exchange (Brodie, Ilic, Juric & Hollebeek, 2013)

Algesheimer, Dholakia & Herrmann (2005) highlight that engagement means the positive influences of be identified with the brand community, which is the consumer's intrinsic motivation to interact and cooperate with community members. Community engagement suggests that "members are interested in helping other members, participating in joint activities, and otherwise acting volitionally in ways that community endorses and that enhance its value for themselves and others" (Algesheimer, Dholakia & Herrmann 2005, p. 21).

Due the overlap between the self-identity of a member and the identity of the group, it is reasonable to consider that this interconnection leads to engagement (Algesheimer, Dholakia & Herrmann 2005; Lee, Kim & Kim 2011; Pai Cheng, Hsin-Yun & Cheng-Kiang 2010). So, we propose:

H2: Stronger brand community identification leads to greater community engagement.

Regarding other members, this construct means a brand community as social aggregation of brand users and their relationships to the brand. Thus, other members represent a repository of meanings which supply brand community members with their mutual and cultural capital (McAlexander, Schouten & Koenig 2002). Consumers also value their relationships with brand owners and managers. As mentioned before engagement reflects motivation to participate and cooperate with others in a way that creates value for themselves and for others (Porter, Donthu, MacElroy & Wydra 2011). Thereby, we propose:

H3: Stronger relationship with other members in the brand community, stronger the community engagement.

Satisfaction is an overall evaluation of the performance, and it is based on prior experiences and is associated with meeting expectations (e.g. Anderson, Fornell & Lehmann 1994; Loureiro & Miranda 2008). Therefore, the consumer engagement process generates satisfaction, but the opposite could also be regarded, this means, a satisfied member is more

willingness to be more deeply engaged (Brodie, Ilic, Juric & Hollebeek 2013). So, the following hypothesis is proposed:

H4: Community satisfaction has a positive influence on community engagement.

Normative pressure antecedents

Normative pressure means the consumer's perceptions of the brand community's extrinsic demands on a person to interact and cooperate within the community (Algesheimer, Dholakia & Herrmann 2005). The influence of normative pressure from group members is an important element of attitude-theoretic formulations of behaviour (Ajzen 1991; Pai Cheng, Hsin-Yun & Cheng-Kiang 2010). So, we propose that greater identification with the brand community reduces the consumer's perceptions of normative pressure by increasing the overlap between the community's and the individual's norms, values and goals (Pai Cheng, Hsin-Yun & Cheng-Kiang 2010). Thus:

H5: Stronger brand community identification leads to reduce normative community pressure.

According to Algesheimer, Dholakia & Herrmann (2005) community engagement and normative pressure are not mutually exclusive. Indeed, higher levels of engagement, though stemming from positive self-endorsed motives, are likely to be connected to greater degrees of conspicuous participation within the community (Algesheimer, Dholakia & Herrmann 2005). Highly engaged members may take on leadership roles, become active and vocal recruiters, advocate positively for the community, and avoid other brand communities (Algesheimer, Dholakia & Herrmann 2005). Such actions are likely to influence the normative pressure. So:

H6: Stronger brand community engagement leads to reduce normative community pressure.

Participation antecedents

According to Obst, Smith & Zinkiewicz (2002), degree of influence is defined as an individual's need to have some control and influence. The concept of degree of influence is closely related to the concept of self-efficacy; therefore, people that exercise a high degree of influence should be more willingness to engage in the community (Bandura, 1986). As Woisetschläger, Hartleb & Blut (2008) study, we propose that the degree of influence with a group leads to an active community participation and so we hypothesize the following:

H7: The degree of influence in the community has a positive influence on consumer participation.

Consider the impact of normative community pressure on the behavioural intentions, the greater the pressure on members to behave according to the brand community's norms and objectives, the more burdensome are the association with and the participation in the brand community (Pai Cheng, Hsin-Yun & Cheng-Kiang 2010). As a result, consumers are less inclined to engage in community-related activities (Algesheimer, Dholakia & Herrmann 2005). So:

H8: Stronger normative community pressure leads to reduce the brand community participation.

Community engagement represents the positive and self-instigated aspects of the brand community's influence, so it is likely to be positive to participation (Algesheimer, Dholakia & Herrmann 2005; Pai Cheng, Hsin-Yun & Cheng-Kiang 2010).

H9: Stronger community engagement leads to stronger community participation.

Participation Consequents

Over the years, marketers and firms pay great attentions to involve their consumers in order to be loyal (Bao, Su & Hou 2011). Loyalty can be regarded as an overall attachment or deep commitment to a good, service, brand or organization (Oliver 1999). Muniz & O'Guinn (2001) pointed out that consumers will have more difficulty to leave the brand when are engaged and involved in the community of that brand. Algesheimer, Dholakia & Herrmann (2005) show that a strong involvement in the community leads to a long-term relationship. So, the following hypothesis is proposed:

H10: Consumer participation has a positive influence on community loyalty.

According to Woisetschläger, Hartleb & Blut (2008), a favourable word-of-mouth is the likelihood of a consumer positively recommends the product/brand to another potential consumer. Dimitriadis & Papista (2010) argue that several studies have supported the positive path from relational benefits to word-of-mouth. Algesheimer, Dholakia & Herrmann (2005) postulate that the involvement and the participation in a brand community help members to be more willing to say positive words about the product /brand. Thereby:

H11: Consumer participation has a positive influence on community word-of-mouth behaviour.

Brand knowledge captures the aspects of interest in the brand and the consumer's previous experience lived with it, suggesting that knowledgeable consumers are those more engaged with the brand and the community (Algesheimer, Dholakia & Herrmann 2005).

H12: Consumer participation has a positive influence on brand knowledge.

Finally, Algesheimer, Dholakia & Herrmann (2005) also found a positive impact of brand relationship quality on brand loyalty. So, we also regard:

H13: Brand relationship quality has a positive impact on brand loyalty.

METHODOLOGY

First the questionnaire containing the items of the constructs and the socio-demographic variables was built. Then, the questionnaire was pre-tested by ten managers and some members of three communities contacted. The brand communities have an offline existence, times to times they organize meetings offline, but they also share thoughts and concerns about the brand online. The communities are managed by Portuguese members but are associated to Renault Clio, Toyota Land Cruiser and VéloSolex bicycles. After the pre-test the questionnaire was prepared online using the tool Google Docs and the link of the questionnaire was sent (through the community websites) to all registered members of brand communities in study. Data was collected during the period of February to April of the year 2011. At the time when the survey started, a total of 5440 users were registered. We collected 342 completed online fulfilled questionnaires, representing a response rate of 6,3%. Of the participants, 11% were female and 89% were male. The sample error is 5,1%.

Measures

The constructs were measured with multi-item scales. Identification was measured by using a scale from Algesheimer, Dholakia & Herrmann (2005). Satisfaction and the degree of influence were measured by using an established scale from Woisetschläger, Hartleb & Blut (2008). Norms and community engagement was measured with a scale from Algesheimer, Dholakia & Herrmann (2005). The construct other members came from the studies of McAlexander, Schouten & Koenig (2002). Participation was measured by using a scale from

Algesheimer, Dholakia & Herrmann (2005). In what concerns to the outcomes of participation, loyalty was measured by using a scale from Algesheimer, Dholakia & Herrmann (2005), word-of-mouth were adapted from a scale proposed by McAlexander, Schouten & Koenig (2002) and the brand knowledge came from Algesheimer, Dholakia & Herrmann (2005) study. All items were measured by using a 5-Point Likert-type scale and the questionnaire was constructed with 33 items representing the constructs (see Table1).

Construct		Measurement scale	Source
Community Engagement	E1	I benefit from following the brand community's rules.	Algesheimer, Dholakia & Herrmann 2005
	E2	I am motivated to participate in the brand community's activities because I feel better afterwards.	
	E3	I am motivated to participate in the brand community's activities because I am able to support other members.	
	E4	I am motivated to participate in the brand community's activities because I am able to reach personal goals.	
Degree of Influence	GI1	As a member of community, I can influence the community as a whole.	Woisetschläger, Hartleb & Blut 2008
	GI2	I am satisfied with the degree of influence to shape the community.	
	GI3	A single member has the chance to be an active part in the community	
Community Identification	I1	I am very attached to the community.	Algesheimer, Dholakia & Herrmann 2005
	I2	I identify myself with other brand community members and I share the same objectives.	
	I3	The friendships I have with other brand community members mean a lot to me.	
	I4	If brand community members planned something, I'd think of it as something "we" would do rather than something "they" would do.	
	I5	I see myself as a part of the brand community	
Brand Knowledge	K1	When compared to other people, I know a lot about this brand.	Algesheimer, Dholakia & Herrmann 2005
	K2	My friends consider me an expert regarding this brand.	
	K3	I consider myself very experienced with this brand.	
Community Loyalty	L1	It would be very difficult for me to leave this brand community.	Algesheimer, Dholakia & Herrmann 2005
	L2	I intend to stay on as a brand community member.	
	L3	If I am invited to another community brand, I will definitely stay in this brand community	
Brand Word-of-mouth	M1	I would recommend this brand to my friends.	McAlexander, Schouten & Koenig 2002
	M2	If my friends are looking for a brand to buy a product x, I would definitely recommend this brand.	
	M3	I have encouraged other people to buy this brand	
Normative	N1	In order to be accepted, I feel like I must behave as other brand community members expect me to behave.	Algesheimer, Dholakia & Herrmann 2005
	N2	My actions are often influenced by how other brand community members want me to behave.	
Other Members	OM1	I know interesting people because of the brand community.	McAlexander, Schouten & Koenig 2002
	OM2	I feel a certain kinship with other members of the community.	
	OM3	I have interest in contacts with other members of the community	
Community Participation	PA1	I actively participate in the brand community's activities	Algesheimer, Dholakia & Herrmann 2005
Brand Relationship Quality	Q1	This brand says a lot of the kind of person I am.	Algesheimer, Dholakia & Herrmann 2005
	Q2	This brand image and the image I have of myself are similar in many respects.	
	Q3	This brand plays an important role in my life.	
Satisfaction	S1	Overall, this community meets my expectations.	Woisetschläger, Hartleb & Blut 2008
	S2	The content of this community matches exactly with my interests.	
	S3	This community fulfils my need	

Table 1: The questionnaire's construct, items, and sources

RESULTS

Measurement Results

A PLS model should be analysed and interpreted in two stages. First, the measurement model or the adequacy of the measures is assessed by evaluating the reliability of the individual measures, the convergent validity, and the discriminant validity of the constructs. Then, the structural model is evaluated. In order to evaluate the adequacy of the measures item reliability is assessed by examining the loadings of the measures on their corresponding construct. Item loadings of scales measuring reflective constructs should be 0,707 or more, which indicates that over 50% of the variance in the observed variable is explained by the construct (Wetzels, Odekerken-Schröder & van Oppen 2009). We analyzed the item loading of each item and all of them exceed the value of 0,707.

All Cronbach's alpha values are above 0,7, except for Normative, and all composite reliability values in **Σφάλμα! Το αρχείο προέλευσης της αναφοράς δεν βρέθηκε.** are above 0.8. All constructs are reliable since the composite reliability values exceed the threshold value 0,7. The measures demonstrate convergent validity as the average variance of manifest variables extracted by constructs (AVE) are above 0,5, indicating that more variance of each indicators are explained by their own construct. In order to analyze the discriminant validity, the square root of AVE should be greater than the correlation between the construct and other constructs in the model (Fornell & Larcker, 1981). Table 2 shows that this criterion has been met.

Construct	Mean	C.R	Alpha	AVE	1	2	3	4	5	6	7	8	9	10	11
1.B Knowledge	3,3	0,895	0,829	0,741	0,861										
2.B Loyalty	3,8	0,885	0,808	0,721	0,403	0,849									
3.B identification	3,7	0,906	0,870	0,660	0,320	0,656	0,821								
4.Brelationship quality	3,7	0,883	0,801	0,715	0,606	0,578	0,385	0,846							
5.D of influence	3,3	0,853	0,744	0,660	0,390	0,617	0,659	0,474	0,813						
6.Engage	3,	0,8	0,8	0,6	0,3	0,6	0,7	0,4	0,7	0,8					

ment	5	98	47	88	75	85	52	72	08	30					
7.Normative	2,8	0,830	0,600	0,710	0,191	0,330	0,371	0,256	0,437	0,431	0,843				
8.O Members	3,3	0,869	0,773	0,688	0,293	0,662	0,749	0,371	0,677	0,707	0,389	0,830			
9.Participation	2,7	1,000	1,000	1,000	0,285	0,548	0,657	0,308	0,560	0,696	0,240	0,684	1,000		
10.Satisfaction	3,6	0,887	0,809	0,724	0,415	0,687	0,686	0,554	0,653	0,634	0,395	0,642	0,518	0,851	
11.WofM	4,1	0,949	0,921	0,862	0,455	0,537	0,298	0,730	0,352	0,374	0,167	0,286	0,218	0,480	0,929

Notes:

- C.R. – composite reliability: AVE – average variance extracted
- Diagonal elements in the ‘correlation of constructs’ matrix are the square root of AVE. For adequate discriminant validity, diagonal elements should be greater than corresponding off-diagonal elements.

- Table 2: Measurement model and test for discriminant validity

Structural results

The overall structural results are presented in Figure 2. All path coefficients are found to be significant at the 0,001, 0,01 or 0,05 levels, except for following relationships: Brand identification->Normative, Normative->Participation and Degree of Influence-> Participation. Thereby, all hypotheses are supported except H2, H5 and H8.

All values of Q^2 are positive, so the relations in the model have predictive relevance. The model also demonstrated a good level of predictive power (R^2), especially for the Engagement (77,6%) and Participation (50,1%). Overall, the values of GoF statistics reveal that the model has a good fit to the data collected.

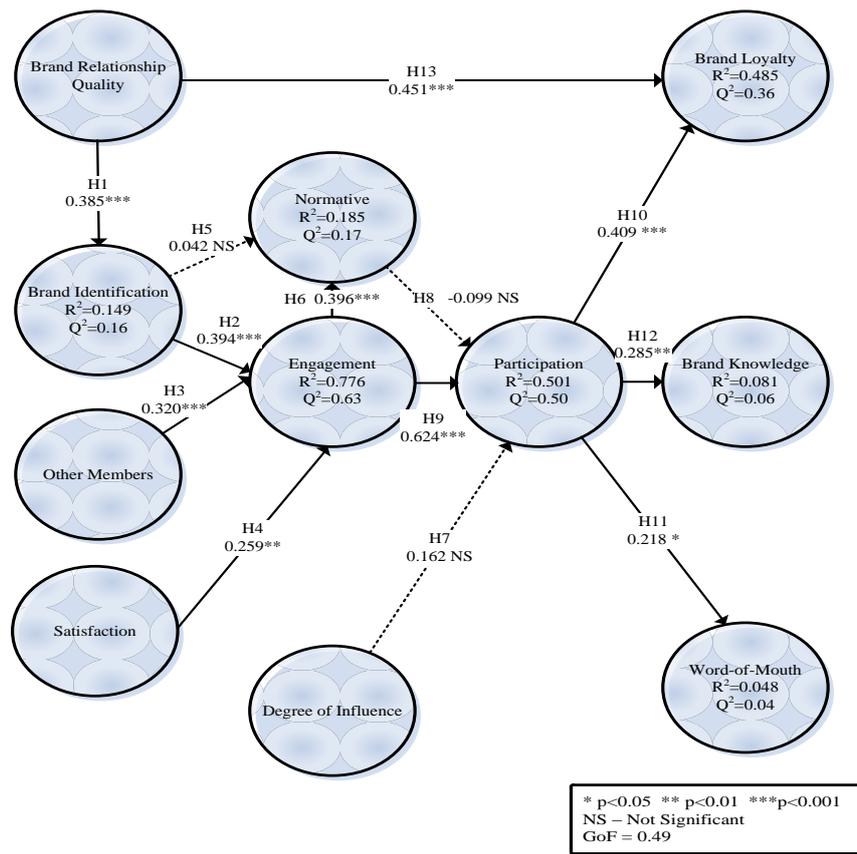

Figure 2: Structural results

CONCLUSIONS AND IMPLICATIONS

In Portuguese brand communities, as in other countries and as we have seen in other studies (e.g. Algesheimer, Dholakia & Herrmann 2005; Woisetschläger Hartleb & Blut 2008), the participation in the community leads to loyalty, brand knowledge and word-of-mouth. Therefore, participation tends to increase the tendency to stay within the community, to stay positive recommendations about the brand and to improve the knowledge about the brand.

In what concerns of the antecedents of participation, community engagement is the most important motivator to participate in Portuguese communities. The brand relationship quality is important to influence brand identification. Norms has a negative but not significant effect on participation, as expected. The Portuguese members of communities tend to dislike the normative, they don't like behave as other members expected and they don't like to feel that their actions are influenced by other members (through restrictions to act in certain ways), because they understand it as coercive. Brand communities should not have a

set of norms very restrictive and extensive because it can inhibit members to participation in the community. In order to motivate the Portuguese members to participate it is important that they feel motivated to participate in the activities because they feel better afterwards, more able to support other members and reach personal goals. In addition, to engage and involve all members in activities it is also important that the members share the same objectives, they feel friendship, they see themselves as a part of community and that the plans are group plans and not individual plan. In this vein, a brand community should create an environment that allows the interaction among members in order to share plans and goals among all members. By contrast to the Woisetschläger, Hartleb & Blut (2008) study, in the current study the group well-being is more important than the individual satisfaction, or even the degree of individual influence inside the community. To the managers of brand communities we suggest to improve the number of activities that involve the members with one or few objectives shared among them.

Table 3 allow us to compare and better analyse the results of the current study and those of previous studies.

Hypotheses	Relationship	The current study results	Previous studies results
H1	Brand Relationship Quality → Brand Identification	Supported	Algesheimer, Dholakia & Herrmann 2005 – Supported
H2	Brand Identification → Engagement	Supported	Algesheimer, Dholakia & Herrmann 2005 – Supported Lee, Kim & Kim 2011 - Supported Pai Cheng, Hsin-Yun & Cheng-Kiang 2010 – Supported

Table 3: Comparison between the results of the current study and previous studies

Limitations and further research

Our study focuses in Portuguese brand communities, so careful must be taken when extrapolating our findings to other types of brand communities. As we have seen, the cultural dimension has a relevant importance when we analyse the results. Careful must also be taken when we want to extrapolate the results to virtual or online brand communities, because the communities studied have a physical existence and only uses the online environment to facilitate the some communications with members. We should also refer that we only study brand communities associated with vehicles brands.

Future research should integrate variables that can moderate the suggested relationships between the constructs, such as customer profile, especially the gender. As we have seen, our sample is mainly constituted by males, and we propose to know in future if that fact influences the results. We suggest the application of this questionnaire in other contexts, such as, different products, different countries, to investigate the divergences between the products and to make a cross-cultural study about the participation in brand communities around the world.

1	Porter, Constance Elise; Donthu, Naveen; MacElroy, William H.; Wydra, Donna (2011)	California Management Review	Qualitative Approach	Three-stage process that managers can follow to successfully foster and sustain engagement through virtual communities.
2	Schau, Hope Jensen; Muñiz, Albert M; Arnould, Eric J. (2009)	Journal of Marketing	Qualitative Approach	Practices have an “anatomy” consisting of: <ul style="list-style-type: none"> - (1) general procedural understandings and rules (explicit, discursive knowledge); - (2) skills, abilities, and culturally appropriate consumption projects (tacit, embedded knowledge or how-to); and - (3) Emotional commitments expressed through actions and representations. The authors find that there are 12 common practices across brand communities.
3	Hassay, Derek N.; Peloza, John. (2009)	Journal of No-profit & Public Sector Marketing	Qualitative Approach	A discussion of current marketing practices revealed that while charitable organizations exhibit some aspects of brand community they are not cultivating the sense of community amongst supporters that is necessary to fully realize the benefits witnessed in a true brand community. However, the need to increase overall support and a desire to develop greater loyalty amongst current supporters, demonstrates the relevance of brand community to this sector. Charities have an opportunity to leverage brand communities to enjoy benefits similar to the increased loyalty and sales enjoyed by their for-profit counterparts. Charities looking to gain greater commitment amongst their supporters.
4	Laing, Angus; Keeling, Debbie; Newholm, Terry. (2011)	Journal of Marketing Management	Netnographic methodology	Within the broadening of the health care encounter To include the virtual parallel encounter, the patient in informational terms shifts from being positioned primarily as a recipient to being a provider and recipient. Given the weight attached by patients to information regarding the experience of living with conditions, such provision represents a significant and influential role.
5	Bagozzi, Richard P.; Dholakia, Utpal M. (2006)	Management Science	Quantitative methodology	In this study of LUGs, where negative, but not positive, anticipated emotions predicted intentions, the findings are similar to those found for online interactions of low-intensity venues reported by Bagozzi et al. (2006). It appears that members of LUGs are motivated by the fear of not gaining the benefits of participating in their LUG rather than the anticipated gain, per se. It may be that it is not so much the expected joy of LUG participation that drives choices as it is that joy and satisfaction are outcomes of participation, much as research in organization behaviour has shown that satisfaction results from performance rather than causes it.
6	Olbrich, Rainer; Holsing, Christian	International Journal of	Quantitative	Social shopping features exert a significant impact, both positive and negative. Tags and high ratings have a positive impact on a click-out. In contrast, the more lists and styles used, the less likely the user

	(2011-2012)	Electronic Commerce	methodology	is to make a click-out. Yet, lists and styles seem to enhance site stickiness and browsing. Moreover, the more direct shopping features that are used, the less likely the user is to conduct a click-out. Increasing transaction costs and information overload could be potential reasons. We also found that community members are more likely to make a click-out than ordinary users. This implies that community members are more profitable.

ABSTRACT

The current literature review tries to shed some light on consumers' interest and attitude towards sustainable wine, examining the real chances that sustainability will become a relevant competitive advantage in the international competitive arena. The study explores and critically discusses the main findings of over 20 scientific and professional articles (and reports) on consumers' attitude and behavior towards sustainable wines, analyzing both organic and environmental-friendly products. Our review confirms that the motives which trigger sustainable wine buying behavior have not yet been deeply analyzed by academics and professionals. Indeed, consumer awareness of sustainable winegrowing and winemaking is currently quite low and sustainable wine is a rather confusing and vague term. However, as consumer awareness grows, the market should see growing acceptance and demand for certified sustainable wines, therefore the industry should develop appropriate marketing programs that guide consumers in identifying and distinguishing these products on the market shelves. Moreover sustainable production enriches and strengthens the relations with political institutions, with consumer associations and social groups sensitive to ethical problems.

Keywords: Sustainable wine consumer; Literature review; Organic wines; Environmental friendly wines

INTRODUCTION

Nowadays, as put by McDonald and colleagues (2006), every time someone makes a decision about whether to purchase a product or service there is the potential for that decision to contribute to a more or less sustainable pattern of consumption. While academic literature is increasingly discussing the core advices to alter consumption patterns to foster sustainable consumption (e.g. Hinton and Goodman, 2010; Jackson and Michaelis, 2003; Mebratu, 1998) a wide consensus has been reached on the fact that food is a prior area in which improvements

are needed (Tukker and Jansen, 2006; Gilg *et al.*, 2005; Seyfang, 2005). In this framework, like other food industries, the wine business has been increasingly impelled by market and regulatory drivers to assess, reduce and communicate environmental and social performances. At the same time there has been growing concern regarding environmental and social problems related to the wine industry, particularly in certain countries with a shorter tradition in winemaking (Australia, New Zealand, U.S.A. and South-Africa). In addition wine companies have realized that sustainability constitutes a means of differentiation, which is crucial for increasing productivity and competitiveness. Consequently, sustainability has developed into a priority in the wine supply chain (Forbes *et al.*, 2009; Gabzdylova *et al.*, 2009).

Despite the above described scenario, the reasons behind consumers' adoption of sustainable practices, attitudes, and intention to purchase sustainable wines remain largely unexplored (Barber, 2010). Or in other words, there appears to be a general interest in sustainability and sustainably produced wines but a lack of clarity on what exactly this means (Berghoef and Dodds, 2011). Alongside whether consumer interests, attitudes and perceptions towards sustainability in general impact buying decisions is still highly disputed (Vermeir and Verbeke, 2006). In addition, the essential concept of sustainable development has many different meanings and interpretations that can even vary robustly (for a detailed review and discussion see Hopwood *et al.*, 2005). Not surprisingly, as demonstrated by the cross-cultural study conducted by Szolnoki and colleagues (2011), it is still very difficult to define the term "sustainability" because not only each country but also each entrepreneur has a different understanding of sustainability in the wine industry. Even today, the term is mainly (or only) associated with the environmental aspects of wine production, neglecting other important issues (i.e. workers rights, community development, etc.). In the same research these authors also reveal that wineries generally agree that consumers are not informed well enough to appreciate sustainable wines. Similarly, other scholars (Gabzdylova *et al.*, 2009) have found that customers' demand was not among the most important drivers of sustainable practices adoption by wineries. Despite this, the wine industry has witnessed a proliferation of numerous voluntary certification standards aimed at insuring sustainable practices (i.e. certified California sustainable winegrowing, Oregon certified sustainable wine, Integrity and sustainability certified in South Africa, Sustainable winegrowing in New Zealand).

The current review tries to shed some light on consumers' interest and attitude towards sustainable wine, exploring the main findings of recent literature and discussing core implications and possible future research avenues. In particular, since no study has

investigated all features of sustainability (social, environmental and economic) we have focused our attention on the most significant academic and professional articles and conference proceedings that have dealt with singular aspects of sustainability (such as organic and environmental-friendly).

The remainder of the paper is structured as follows: the next section presents the background of the study; then a section on organic wine consumers studies is presented; followed by a review of researches on environmental-friendly wine. The subsequent section critically discusses the major findings of the analyzed studies. Finally, the paper concludes with a summary of the managerial and policy implications of these studies and outlines future research avenues.

BACKGROUND

Due to the large amount of different cues that may influence consumer choice, purchase decision for wine is more complex than the choice for many other products (Mueller *et al.*, 2010). In addition, as powerfully stated by Laroche *et al.* (2001), efforts to understand environmentally friendly consumers date back at least 30 years. In general, while consumers are highly concerned of the effects of food production practices on the health of the environment, they are less concerned about the effects of wine production practices (Forbes *et al.*, 2011). Academic and professional studies on the consumer perspective of sustainability in the wine sector are quite recent and have mainly focused on two different streams of research: consumers' behaviors towards organic wines and consumer attitudes/purchasing intentions towards wines that have some sustainable characteristics (as environmental friendly or carbon neutral). The first avenue of research has mainly investigated the core reasons that induced consumers to purchase organic wines instead of conventional ones, as these wines are perceived to be less harmful to the environment mainly due to the non use (or rules of use) of chemical inputs. Whereas the latter researches have more deeply observed the propensity of individuals to participate in the "sustainable" market. In both cases, the bottom line is that sustainable practices are valuable for businesses only if consumers are willing to pay a price premium for these wines. Thus most of the studies available have investigated willingness to pay (WTP) through diverse methodologies – ranging from open-ended WTP studies to choice experiments and experimental auctions – and with very heterogeneous samples (mostly convenience samples). Finally it is important to remark that while a large amount of the articles concerning organic wines are developed in Europe, nearly all the

studies that have focused on other sustainable features of wines have been performed in the new world.

LITERATURE REVIEW

Organic wines

In general, it is assumed that organic wines constitutes a relatively small share compared to other organic farming products like fruits, vegetables and eggs (consider that the European organic market is the biggest in the world, valued around 14 billion Euros, see among others Willer et al., 2008). This due to the fact that many consumers perceive wine to be a natural product and do not necessarily see a need for wine to be organic (Sirieix and Remaud, 2010). In addition, the wine industry has in recent years been untroubled by scandals and food scares that have strongly hit other food industries (as meat). Indeed the latest important sanitary outbreaks concerning wine occurred in Italy (methanol added to wine) and in Austria (frost protection used to sweeten wines) in the early and mid eighties. Furthermore, while organic food products constitute an independent premium category, organic wines find themselves in the middle of the wine assortment, being present in different categories (e.g. red or white wines), within different grape varieties as well as within different price segments. Finally, some authors have suggested (Olsen *et al.*, 2006) that consumers' resistance to purchasing organic wine is related with bad taste and therefore less pleasure. As a consequence market response to organic wines is not uniformly positive and there are several contradictions in consumer attitudes to organic wines. Nevertheless organic wines are a good example of how the environmental concerns addressed by eco-labeling meet with other normative demands in consumption. In their socio-demographic profile of the organic wine buyer in Greece Fotopoulos et al. (2003) showed that these people more often purchase food at specialty shops, are more concerned about their healthy dietary patterns and use more media compared to non-organic buyers. Brugarolas et al. (2005), investigating Spanish consumers' willingness to pay (WTP) for organic wines, found that the average price premium was around 17%. Barreiro-Hurlé et al. (2008), investigating consumers' interest for functional wines, indicated that the additional WTP for an organic wine on average was 15% of the maximum price that respondents declared they usually pay for a bottle of wine. Remaud and colleagues (2008) showed that, overall, a minority of Australian wine consumers (14%) valued organic wines. However, this group of consumers are willing to pay a 22% premium for a special occasion. Nevertheless, the average Australian wine consumer would only pay a 1% premium for an organic wine. In a replication of this study the same authors

(Mueller and Remaud, 2010) found that the environmental claim had the same importance (5%) for choice over all consumers, while its influence strongly increased for one environmental sensitive segment. Additionally, they revealed also that a segment of consumers seemed to be 'eco-allergic', deriving a considerable negative utility from environmental claims. Another Spanish study (Brugarolas *et al.*, 2010) revealed that consumers from regions where wine production shares a larger proportion of the regional economy are willing to pay more for organic wine. Delmas and Grant (2010), exploring over 13.000 wines of California, have estimated and revealed that the organic production method has a positive impact on the price of the bottle but this effect lasts only as long as it remains undisclosed, in fact bottles with organic labels dragged down prices. Specifically, Delmas and Grant (2010) found that an environmental certification increases the price by a 13%, but the inclusion of an eco-label reduces it by 20%. Mann *et al.* (2012) exposed that for Swiss consumers the organic attribute was more important than the color of the wine, but less important than the price and the country of origin. In addition, urban and female consumers were relatively likely to consume organic wine, as consumers who perceived organic wine as being healthy. At last the research by Olsen and colleagues (2012), in the U.S.A., demonstrated that hedonistic and environmental protection values and beliefs can partially explain the propensity to purchase organic wines.

Environmental friendly wines

Prominent scholars have settled on the assumption that ethical-political consumers are not insensible to price or quality, and what counts as 'ethical' or 'political' is neither simple nor uncontested with multiple motivations establishing an extremely complex space (Herman, 2012). Wine, obviously, makes no exception.

Loureiro (2003) found that American consumers in some cases were not willing to pay more for the environmentally friendly wine when quality was a perceived difference, while D'Souza *et al.* (2006) found in their study of Australian consumers, that nearly 70% of the sample indicated they would purchase these products even if they were more expensive than the alternatives.

Furthermore, Bazoche *et al.* (2008) found, in their study in France, that the environmental signal (on the wine label) is valued differently depending on who conveyed the information and that dissemination of information about the environmental repercussions of farming methods does not significantly affect willingness-to-pay. Similarly, In Australia, Remaud and colleagues (2008) forcing consumers to trade-off different attributes, through a discrete wine

choice experiment, found sustainable attributes to be overall irrelevant. Barber et al. (2009) conducted a study on the influence that knowledge and attitudes about environmentally friendly practices have on US consumers when choosing a wine, revealing that the choice of these products is made because consumers are more interested in helping producers. Similar findings can be retrieved in Forbes et al. (2009), who found that nearly 73 percent of respondents (in New Zealand) stated that, although sustainable wines may cost more than traditional alternatives, they will be willing to pay that extra. In sound with previous mentioned research Zucca and colleagues (2009), in their study on Californian consumers, revealed that respondents liked the concept of sustainable winemaking (around 90% of positive responses) but they really did not have a clear idea of what sustainability meant in practice or what processes the wineries did to achieve it. Barber (2010), exploring green wine packaging, revealed that consumers' environmentally friendly behavior can be motivated by emphasizing the importance of environmental issues. Nowak and colleagues (2010), exploring Californian Millennials, find evidences that consumers who believe that the winery's pro-environmental business practices make a difference have increased purchase intentions. Loveless et al. (2010) research, on an international consumer panel, shows that sustainability is less important to consumers than other credence characteristics like quality control. Berghoef and Dodds study in Ontario (2011) revealed that consumers are interested in purchasing eco-labeled wines but their other expectations must also be met, in addition the majority of respondents was willing to pay a premium for eco-labeled wine. The empirical results of Schmit and colleagues (2012), in New York state (USA), revealed that sensory effects dominate extrinsic environmental attributes; indeed once consumer willingness-to-pay was conditioned on a wine's sensory attributes, the addition of environmentally friendly information did not affect their WTP. Finally the forthcoming paper by Mueller and Remaud (2013) shows that corporate social responsibility (CSR) claims relating to social and environmental issues have similar awareness and penetration in UK, France, Germany, USA and Canada. However their impact on consumer choice is different, as environmental corporate responsibility claims have higher marginal WTP. In addition, consumer valuation of CSR claims significantly differs across different markets.

DISCUSSION

A major outcome revealed by the current literature review is the existence of a hierarchy of consumer concerns: as clear signs of concern can be retrieved inherent to the negative environmental effects of food production while individuals appear unconcerned of wine

production environmental externalities. Our review points out that consumer knowledge of the concepts of sustainable viticulture and wine-making is rather limited and the expression sustainable wine is still perceived as extremely confusing. In addition, strong differences remain on academic and professional outlooks of the amount of wine drinkers willing to purchase these types of wines in the next future and consumers' willingness to pay a premium price for wines with sustainable features. Most authors believe that consumers will not be willing to trade-off the quality of a wine for environmental/social features (Lockshin and Corsi, in press), thus sustainable wines should be sold at the same price as regular wines. Whereas many scholars remark that sustainability will most likely become a relevant competitive advantage in the international arena (Pullman *et al.*, 2010; Forbes *et al.*, 2009; Bison *et al.*, 2002). These findings are not particularly surprising if we look at sustainable wine consumption in the wider perspective of current debates on the relations between consumption and sustainable development. Indeed, activists and several academics are arguing that much of Northern consumer behavior is unethical and immoral because it frequently impacts negatively on the next generation, those living elsewhere, those not yet born, and the environment (e.g. Sanne, 2002). Since ultimately, all the environmental impacts caused by man can be related to human consumption patterns (Carlsson-Kanyama *et al.*, 2003) and waste production (Urry, 2010). Thus individuals, through their more conscious purchases, are called to act as citizens working towards a more sustainable future (Hinton and Goodman, 2010). Even if the exact scope and definition of sustainable consumption remains quite ambiguous, the current institutional consensus has tended to settle for a position which implies consuming differently rather than consuming less, and in which this is to be achieved primarily by the production and sale of more sustainable products (Jackson and Michaelis, 2003). As a consequence, in the last twenty years or so developed countries markets have witnessed the growing popularity of goods that seek to embody sustainable consumption practices that do not jeopardize the needs of future generations. Tough consumers' understanding of sustainability has, so far, received little research attention (Hanss and Böhm, 2012) and studies on how relatively important the different dimensions of sustainability are and which purchase decisions consumers consider sustainable would provide valuable input for the promotion of sustainable consumption. Nevertheless, general consensus has been reached on the fact that socio-demographic variables alone are not sufficient for explaining sustainable food consumers behavior (Verain *et al.*, 2012). Personality characteristics, lifestyle variables and behavioral variables should all be considered in future studies on sustainable consumption. Not surprising, as this review has highlighted, studies

on consumer's attitude and WTP for sustainable wines are very recent, dating not more than 12-15 years. Scholars' interest is clearly growing in the wake of the overwhelming popularity of sustainability in society and public policies.

CONCLUSION

Although the general public has become increasingly interested in sustainable development this interest has failed to engender an effective political response, or to bring about significant changes in the everyday behaviors of consumers (Soron, 2010). Therefore, today new types of policy approaches are needed to create opportunities for making consumption more sustainable and to change unsustainable activities. Alongside, it appears that there is currently a positive momentum to develop new sustainable consumption policies, but such policies should overcome existing skepticism and uncertainties. The current literature review of consumer attitudes and behaviors towards sustainable wines reveals the complex and sometimes contradictory feelings and interests that shape consumers' practices. In summary, available studies seem to show that the adoption of organizational models for sustainable production do not allow directly to obtain higher prices or to compensate for poor quality. However, this should not lead to the conclusion that sustainability is not an important factor for marketing, or for the development of strong relationships between firms and markets. Several elements need to be considered in the light of the principles of market orientation and relationship marketing (Arnould and Thompson, 2005; Gummesson, 2002; Narver and Slater, 1990; Kohli and Jaworski, 1990). These principles taken together indicate that the development of competitiveness is based on the ability of the company to focus not only and not so much on the individual transaction (as in the perspective of transactional marketing) and the trading price, but in the development of a wide network of relationships certainly with customers but also with numerous other individuals who directly or indirectly may affect the performance of the company and company's human resources. In this perspective, and given the institutional importance of the issue, sustainable production enriches and strengthens the relations with political institutions, with consumer associations and social groups sensitive to ethical problems. Inside the firm, then consistency with the principles of sustainable development determines enhancing the capacity of individuals, in terms of specific skills, but also, the attention and sensitivity towards the context in which the company operates which is reflected in greater enterprise's ability to understand and possibly anticipate market needs. In sound with other scholars we could sum up our review stating that the motives which trigger sustainable wine buying behavior have not yet been deeply

analyzed by academics and professionals. Indeed, consumer awareness of sustainable winegrowing and winemaking is currently quite low and sustainable wine is a rather confusing and vague term (Zucca *et al.*, 2009). Furthermore these studies have to be well weighted since the linkages between attitudes and behavior are complex and that the precise nature of the relationship is contingent on many contextual factors (Selfa *et al.*, 2008). However, as consumer awareness grows, the market should see growing acceptance and demand for certified sustainable wines, therefore the industry should develop appropriate marketing programs that guide consumers in identifying and distinguishing these products on the market shelves. The simple solution of launching labels (e.g. eco or carbon neutral labels) can facilitate the identification of sustainable products and may guide purchase decisions (Gallastegui, 2002). With the caveat that the proliferation of various types of labeling may confound consumer understanding of sustainable wine, both if it's a private (made by firms that make unverified claims about their products) or public certification. Indeed, it is important to keep into mind that competing certification schemes can create potentially negative effects and that lately Northern consumer demand has required sustainability to encompass both social and environmental sustainability (Browne *et al.*, 2000). Notwithstanding that different certification schemes within the wine industry face significant pressure from interests located in state agencies, dominant market players, and social and environmental interest groups (Mutersbaugh *et al.*, 2005). In addition, wineries can be frustrated by the fact that the world of sustainable agriculture is one where the horizon is always receding (Ohmart, 2008). Available studies have focused on the price premium that consumers are willing to pay for organic or broadly environment-friendly wines, further research should analyze WTP for wine that carry more comprehensive and specific sustainability features. Additional studies should directly compare consumers' attitude and behavior towards these wines across different countries to confirm (or disprove) the previously described results. Furthermore a major drawback of most of the articles here review is the use of contingent valuation techniques that do not capture actual behavior due to strong hypothetical bias. New studies should try to simulate real shopping environments, that reduce or eliminate hypothetical bias, to provide more reliable and precise information. Some limitations of the current work are related to the non exhaustiveness of the review and the rapidly changing scenario that complicates the goal of framing exactly the current market situation. In addition, the lower environmental impact of organic food is contested and undercut by uncertainty and paradoxes (Mondelaers *et al.*, 2009; Foster *et al.*, 2006). In

conclusion, we also recognize that the meanings of sustainable wine are very complex and still heavily debated.

ABSTRACT:

Purpose – The aim of the paper is to analyze the growing trend of craft beer consumption from a customer point of view. The paper benchmarks the profile of traditional beer consumers with those of craft beer drinkers, thanks to an exploratory study, and seeks to identify which traditional beer consumer characteristics could be important in pushing them towards craft beer consumption.

Design/methodology/approach – A sample survey enabled us to empirically assess research questions by identifying differences between traditional and craft beer consumers. A probit model was specified to capture factors enhancing switching attitudes towards craft beer.

Findings – Craft beer drinkers can be distinguished from traditional beer consumers by their different habits and frequency of consumption, which are also crucial elements favouring switching.

Research limitations/implications – The main limitation can be found in the non-probabilistic sample design.

Practical implications – Craft beer consumption is increasing despite a higher price compared with traditional beer prices, highlighting the importance of quality in determining consumer beverage choices, opening new opportunities for business in this sector, in Italy, but also in Europe.

Originality/value – To the best of our knowledge no studies have as yet been conducted in Europe in this particular beverage segment, above all from this

perspective, so this is a first exploratory study which considers consumer preferences and their possible switch from traditional beer to craft beer consumption.

Keywords: traditional beer, craft beer, consumer preferences, consumer characteristics, consumer switching features.

ACKNOWLEDGMENTS:

This paper is the shared work of Stefano Poponi who wrote § 2 and § 3, Luca Secondi who wrote § 4 and § 5, and Barbara Aquilani who wrote § 1 and § 6.

1. INTRODUCTION

Craft beer is one of the growing beverage segments, despite the important economic crisis in Europe and above all in Italy, where business struggles to find new opportunities and profitable activities mainly due to the decrease of disposable income.

The beer sector is particularly interesting because today only the top of the range beers have increased consumption (i.e. special and premium beers), despite the decreasing consumption trend of other types of traditional beers with lower prices (AssoBirra, 2011).

This growing trend also affects craft beer consumption which is becoming more and more popular among customers, making its weight felt in the entire sector, also worrying firms which traditionally operate in this industry and whose incomes and profits could be negatively affected by the growing consumption rate of craft beer. However, this same trend could also represent an important opportunity for business, especially for small start-ups, if craft beer is perceived as quality beer, as the USA market shows. Therefore, the first research question which supports this paper concerns factors affecting consumer choices for beer purchase and consumption, also studying whether there are links between some important choice characteristics such as price and quality.

The second one concerns the profile of beer consumers, benchmarking the most important characteristics of traditional beer consumers with those of craft beer drinkers.

The third concerns factors which could eventually enhance a switching attitude between traditional and craft beer consumption, enhancing, on the one hand, new businesses in understanding which characteristics consumers desire and expect from a craft beer and, on the other, managers of established firms in better supporting their products, possibly partially changing their characteristics or communication and distribution strategy in order to meet changing consumer desires, expectations and preferences.

In order to answer the above research questions the paper includes the relevant data on European and Italian beer manufacturing and consumption, where the exploratory study has been carried out, and a benchmark with the USA market where some studies concerning craft beer consumption have already been conducted. It also presents a section devoted to factors affecting beer choice and consumption in the past and present, taking into account new emerging attitudes and preferences in this particular segment of the beer industry.

In the next section the paper explains the methodology used to conduct the exploratory study, their results and elaboration. The paper concludes with some insights, including managerial implications, limitations of this study and possible steps for future research.

2. THE BEER MARKET IN NUMBERS

2.1 A benchmark between Europe and Italy

Since 2007 the European beer market has grown continually, both in production levels which peaked over the last 10 years, 409 million hectoliters produced, and in the 80.3 liter per capita consumption (AssoBirra, 2011; Brink et al., 2011; Datamonitor, 2010a). The effects of the economic crisis have been felt since 2008 and have determined a 1.47% drop in production compared with the previous year, but the greatest drop was registered in 2010 when the differential with 2007 showed a loss of 6.21%. A slight sign of economic recovery was observed in 2011 with a positive variation of 0.33%, even though the 2011 production and per capita consumption are quite different from the values observed in the pre-crisis years.

For European governments, the beer industry is an important source of revenue from the application of VAT, workers' income tax and from tax paid by the production companies. In 2010 this income was approximately 50.6 billion euro, which was decidedly inferior to 2008, when the public income amounted to 54 billion euro.

Since 2008, a series of economic maneuvers have been introduced by various countries in the euro zone to modify increasing or decreasing of VAT rates. The average UE27 tax rate went from 19.4% in 2008 to 20.7% in 2011, even though tax levels are destined to rise because of additional maneuvers Member States must introduce to comply with constraints between balance and GDP deficit, as is the case with Italy where in all probability the rate will go from 21 to 22% by the end of September/December 2013 (AssoBirra, 2011; Brink et al., 2011; European Commission, 2013).

Table 1. U.S.A., Europe with 27 memberstates and Italy: production and consumption

Production (000 hl)	U.S.A.*	Variation	EU 27**	Variation	ITALY**	Variation
2007	230,618.00	-0.52%	409,353.00	0.11%	13,462	5.02%
2008	231,772.00	0.50%	403,327.00	-1.47%	13,343	-0.88%
2009	230,937.00	-0.36%	385,535.00	-4.41%	12,776	-4.25%
2010	228,982.00	-0.85%	383,914.00	-0.42%	12,814	0.30%
2011	225,337.00	-1.59%	385,179.00	0.33%	13,410	4.65%

Per capita consumption (litres)	U.S.A.*	Variation	EU 27**	Variation	ITALY**	Variation
2007	21.79	0.09%	80.30	1.52%	31.10	2.64%
2008	21.72	-0.35%	78.30	-2.49%	29.60	-4.82%
2009	21.08	-2.94%	74.80	-4.47%	28.00	-5.41%
2010	20.70	-1.78%	72.20	-3.48%	28.60	2.14%
2011	20.31	-1.92%	74.70	3.46%	29.00	1.40%

Source : our elaboration of AssoBirra** and Beer Institute* data (2012).

Production and consumption levels are countered by the increase in the number of beer factories, whose number grew by 18% in Europe between 2008 and 2010, encouraged by the opening of microbreweries and the changing tastes and preferences of consumers whose purchasing preferences are increasingly directed at quality beers and not only on-trade acquisitions (outside the home, in restaurants, in brewery, pubs, etc.) but above all in off-trade (through modern and/or traditional distribution) (AssoBirra, 2011). There have been no specific studies on market trends and purchasing motivation for craft beers in Europe, although Brink et al. (2011) estimate that over 70% of breweries within Europe are microbreweries producing high quality beers with special characteristics.

From the economic-income point of view the beer market makes an important contribution to the European Union through production and sales services. The sector provided work to over 2 million people in 2010, representing 1% of the Union workforce, even though there was a negative trend in 2009 with the loss of approximately 264,000 jobs compared with the previous year.

Per capita consumption of beer in Europe shows a decreasing trend; from 2007 to 2011 per capita consumption dropped by 7%, even though in 2011 consumption began to increase again (+3.46% compared to 2010). The country with the highest per capita consumption rate is the Czech Republic with 154 liters of beer, followed by Belgium with 145 liters, Ireland with 108.3 liters and Germany with 107.2 liters. Italy holds the last position in the per capita consumption classification (l. 29.0). Part of the drop in beer consumption in the entire European Union can certainly be due to the general increase in taxes, but without doubt is also due to increased VAT which impinges directly on the price paid by the consumer (AssoBirra, 2011). Given beer demand is elastic compared with its price and in the presence of low switching costs to alternative products like wine and spirits, the price increase has had direct consequences on the profitability of the entire chain, causing a loss of jobs, above all in the hospitality and retail sectors (European Commission, 2013; Rojas and Shi, 2011; Global Insight and The Parthenon Group, 2005).

Looking at some European countries in detail Germany, the country which traditionally has been the major producer, 24.43% of European production, even though there has been a drop of -0.1% since the previous year. In the United Kingdom there has been a 1.56% increase in production, compared with the European production level of 11.69%.

Italy has shown a production increase of 4.65%, placing it in ninth position in terms of market quota; however, the consumer approach in Italy is changing, paying more attention to quality and on-trade and off-trade consumption. In fact consumption increased in 2011 compared to 2010 in two top beer ranges, respectively by 4.4% for the specialty segment and 2.6% for the premium (AssoBirra, 2011). Today these two segments represent overall a market quota of 44%, quota within which it is possible to include the typicality and quality of craft beer which is becoming increasingly important in Italy. If one looks at the number of beer producing companies, the number increases from 266 in 2008 to 347 in 2011, the number of microbreweries is estimated to be 339 (Brink et al, 2011).

2.2 Comparative data: Europe vs U.S.A.

European production has a position of leadership in the world market, second only to Chinese production (489 million hectoliters in 2011), while in the United States beer production reached a quota of approximately 225 million hectoliters in 2011, but the economic development is totally different from the European one (Beer Institute, 2013; AssoBirra, 2011).

Production and diffusion of this drink in the United States underwent a drastic interruption during the period of prohibition in 1919. Only in 1933 with the introduction of the XXI Amendment did beer production resume; while in 1976 with the legalization of home/domestic production introduced by President Jimmy Carter, small breweries and brew pubs were able to enter the market. Interest in craft beer and the perception of high quality was initially a strong point for the food and beverage markets, which subsequently became the only brewing segment to enjoy an increase in consumption that has since been consolidated.

Since 1999 the growth in the number of small beer producers has increased and consolidated compared with big commercial beer producers (Carroll and Swaminathan, 2000; Tremblay and Tremblay, 2005) until such a point that the widespread distribution of small breweries has overcome the advantages connected to the economies of scale of the big producers.

In the United States production is highly concentrated and connected to 23 big breweries and above all to custom distribution which has reached 2,751 breweries among brewpubs, microbreweries and regional craft breweries (Beer Institute, 2013).

Anyway the small market share of craft breweries is causing concern in big multinational companies because of the increased interest in specialty brews. This particular segment has high profitability since it is associated with the so-called “millennium generation”, that is to the high income consumer group between the ages of 21 and 30 (approximately 70 million consumers in the USA), interested in exploring new tastes in beer and willing to pay higher prices (Ascher, 2012).

Having outlined the economic situation of the beer sector and above all the development dynamics both at a production and consumption level, it would appear interesting to carefully examine consumer purchasing motivation to better understand the reason for their interest in craft beers.

3. FACTORS AFFECTING BEER CHOICE AND CONSUMPTION: A LITERATURE REVIEW

The study of the literature has enabled the underlining of critical success factors which directly affect beer consumption (see Table 2).

Table 2. Critical success factor for beer

The aspects which occur most frequently and are present in most studies are quality, differentiation and price.

Quality has been studied in literature under different aspects; Ascher (2012), Brink et al. (2011), Donoghue et al. (2012), Kim and Chintagunta (2012), Kleban and Nickerson (2012) study quality in function of the characteristics of the primary materials used, malted barley, hops, yeast and water and of the special ingredients added to the product to create different

styles and flavors, Jackson (1988) uses a different approach and studies quality in relation to the control of the production process and of the high standard of production used in the sector, while others focus their attention on quality perceived by the consumer who chooses the product based on brand preference and consumption habits (AssoBirra, 2011; Kim and Chintagunta, 2012).

The second factor, differentiation, refers to the diverse varieties of beer, like ales, stouts, low/no alcohol, standard, premium, specialty beer and the brands to which they can be traced. Clemons et al. (2006) and Ascher (2012) analyze differentiation regarding the concentration and consolidation of the main brand properties over time. Other authors instead analyze the effects that differentiation has on brand preference, in relation to all the choice mechanisms which come into play in different consumption situations and which so determine consumer behavior and brand switching (Eckert, A. E. and Douglas, W., 2013; Douglas and O'Neill, 2012; Nelson, 2005;).

Price is one of the main elements of many analyses because it can seriously affect the choice of the beer consumer, not only because it is influenced by a wide flexibility of demand but also because it reflects the value the consumer gives to the product (Datamonitor, 2011; Ascher, 2012). Research into the changes in consumer preferences following price variation due to increased taxation, as well as the effect such price modifications have on the quality of the product carried out by Rojas and Shi (2011) is relevant here.

The above concepts have undergone a radical revision in recent years whilst still remaining the key factors which influence and condition consumer choice.

The consumption of craft beer and attention to taste which were previously insignificant have become new important characteristics in determining consumer behavior.

Craft beers use traditional styles combined with their own unique formulas by adding non-traditional ingredients.

There are a series of contributions which analyze different aspects of this new segment of the beer market. Kleban and Nickerson (2012) for example, have studied the competitive forces of craft beer connected to increased characteristics of the product, product consistency, freshness, social responsibility, for customer satisfaction.

Clemons et al., (2006) on the other hand analyze the force of hyperdifferentiation in the craft beer industry and the value of resonance marketing for the positioning strategy.

The other factor present in literature is taste perception and its influence on consumer preference (Allison and Uhl, 1964; AssoBirra, 2011; Choi and Stack, 2005) and how the product differs from the high economic perception connected to craft products, which generates a “taste revolution” (Kleban and Nickerson, 2012). To date the elements which seem to motivate consumer choice in beer seem to be firmly connected to the discovery of taste, the search for quality and the product craftsmanship. Growing attention towards this form of consumption is modifying the habits and purchasing behavior, favoring off-trade consumption compared to places traditionally connected to consumption habits like brewpubs, restaurants, etc.

An exploratory study to empirically verify the changes in consumer preferences and identify the relevant factors which encourage traditional beer consumers to change to craft beers has thus been conducted using the following methodology.

4. METHODOLOGY

4.1 Research design and data collection

With the aim of evaluating the popularity and level of consumption of craft beer, as well as understand the differences (if any) in consumer perceptions and habits of this type of beer compared to traditional beer consumers, a sample survey was drawn up and carried out. Data were collected in July 2012 by means of standardized personal interviews. On the basis of a judgmental sampling design, a total of 444 individuals of a minimum age of 18 were selected at random among people participating in a cultural literary festival in the city of Viterbo (Italy). The respondents were asked to complete a questionnaire regarding their habits, attitudes and behaviour towards drinking traditional and craft beers.

4.2 The questionnaire

The questionnaire was composed of 24 questions divided into two sections. The first section focused on traditional beer consumption.

The first set of questions in this section referred to consumer preferences concerning *i)* favourite beer colour beer and packaging *ii)* frequency with which beer is consumed *iii)* where they drink it and *iv)* with whom.

The second set of questions referred to the moment of purchase of the beer, requiring a judgement of importance (on a numeric scale from 1 to 6 where 1 was the lowest level of importance and 6 the maximum) concerning various characteristics of the beers (aroma, froth, fizziness, quality, etc...) as well as the factors that influence the purchase (brand, price, availability in stores, etc...).

The second section of the questionnaire focused on craft beer. Participants were asked about the same aspects (presented in Section 1) referring to craft beer, in order to carry out a comparison between the two types of beer consumers.

Lastly, the questionnaire included questions concerning personal socio-demographic information such as gender, age, residence and professional status.

4.3 Identifying craft beer consumers: a comparative analysis and a segmentation approach

The information gathered enabled us to perform two different types of analyses, whose results will be discussed in the following section. Firstly, through the identification of the profile of both traditional and craft beer consumers we carried out a comparative analysis both from a socio-demographic standpoint and according to consumer attitudes and habits. Secondly, by focusing on the sample of consumers, we were able to identify factors that can enhance a switching attitude of traditional consumers towards craft beer. On the basis of a segmentation approach, we considered the binary variable indicating whether the respondents consume craft beer or not as the dependent variable of a probit regression model which can be described as:

$$y_i = \mathbf{x}_i' \boldsymbol{\beta} + \varepsilon_i \quad (1)$$

where y_i is the dependent variable indicating whether the craft beer was consumed ($y_i=1$) or not ($y_i=0$) by the i -th respondent. x_i is a k -dimensional vector of exogenous variables representing the respondents' personal characteristics and factors related to habits and consumption towards traditional beer. β is the vector of parameters to be estimated and ε_i is the error term.

The estimation results, obtained by using STATA software, are presented referring to marginal effects (MEs) showing how a one unit change in one of the explicative variables affects the predicted probabilities, leaving the other variables constant at their mean value (Greene, 2012). It is worth noting that for dummy independent variables the ME was calculated as a discrete change (from 0 to 1) holding other variables constant (Long and Freese, 2006).

5. FINDINGS

5.1 *Who are the consumers of traditional beer and what are their habits and preferences?*

About 76% of participants declared they generally drink beer (337 respondents out of 444 participants). As shown in Table 3, about 6 out of 10 beer consumers were male. Moreover, over 60% were aged between 18 and 33.

Table 3. Socio-demographic characteristics of beer consumers

Variable	%
<i>Gender</i>	
Female	41.05
Male	58.95
<i>Age</i>	
18-25	38.27
26-33	26.54
34-41	15.74
42-49	12.04
50+	7.41
<i>Professional status</i>	
Employee	36.80
Self-employed	18.69
Searching for a job	7.12

Variable	%
Housewives	5.04
Retired (Pensioners)	2.67
Students	25.52
Professional status not declared	4.15

Concerning the moment of purchase, the participants were asked to indicate how much importance was given to the aspects reported in Table 4.

Table 4. Factors influencing the purchase of traditional beer

Factor	Mean	Standard Deviation (SD)
Brand	4.10	1.62
Price	3.61	1.73
Availability in bars, restaurants, etc...	3.55	1.70
Availability in stores	3.50	1.62
Packaging	2.66	1.60

Brand is the most important factor influencing purchase (average value 4.10), followed by price (average value 3.61).

Table 5. Importance of the various characteristics of traditional beer

Characteristics of the beer	Mean	SD
Quality	4.61	1.54
Aroma	4.52	1.53
Fizziness	3.85	1.58
Alcoholic grade	3.72	1.62
Colour	3.54	1.58
Froth	3.46	1.62
Organic raw materials	3.32	1.79
Calories	2.77	1.71

Quality plays the most important role when choosing a beer, followed by aroma and grade of fizziness (Table 5). Given the importance of price and quality when choosing a beer, we distinguished consumers according to the degree of importance they attributed to quality, and whether the different levels of importance given to quality also corresponded to those of price. We found that the higher the importance given to quality, the lower the importance given to price. For example, consumers who gave little importance (equal to 2) to quality expressed average importance to price equal to 4.71 while consumers who gave a lot of importance to quality (equal to 6) expressed average importance to price equal to 3.84. An ANOVA (Analysis of Variance) test was applied to evaluate the significance of the differences among the groups. The obtained F statistics enabled us to strongly reject the null hypothesis of equal means between the different groups ($F\text{-statistic}=6.26$ ($p\text{value}: 0.000$)).

Concerning the type of beer preferred, about 57 consumers out of 100 declared that they prefer light (lager) beer. Amber-coloured beer was preferred by about 18% of consumers while few participants preferred dark and red beer.

A high percentage of consumers prefer to drink draft beer (49%) and bottled beer (43.4%) while only a small percentage of consumers declared they preferred canned beer.

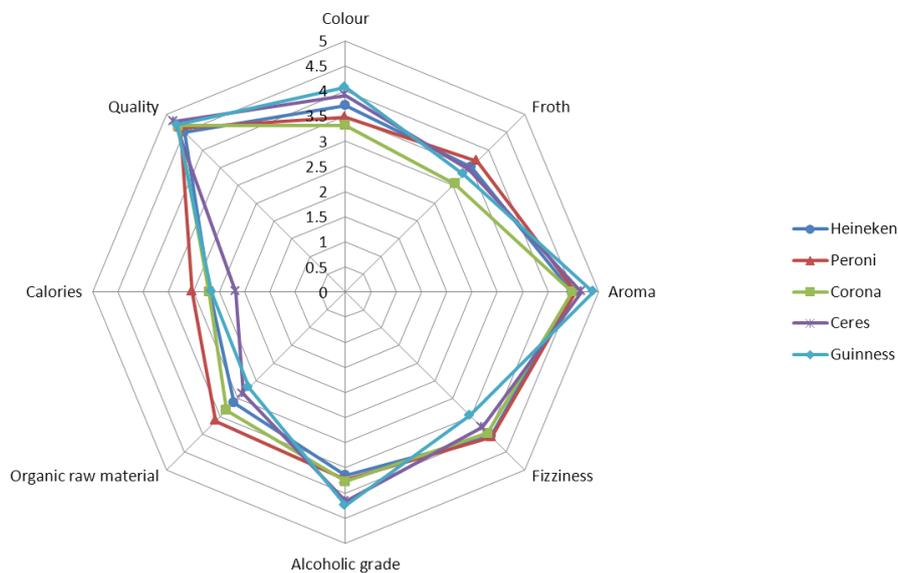

Participants were also asked which brands they purchased regularly and about a third mainly consumed Heineken beer. One participant out of five preferred Peroni beer followed by Corona, Ceres and Guinness. The consumers who consider themselves beer experts are those whose declared consumption was Tennent's and Tuborg, as shown in Table 6, whilst, the less knowledgeable consumers are Corona drinkers.

Table 6. Preferred brand of traditional beer and consumers' self-evaluation as beer experts

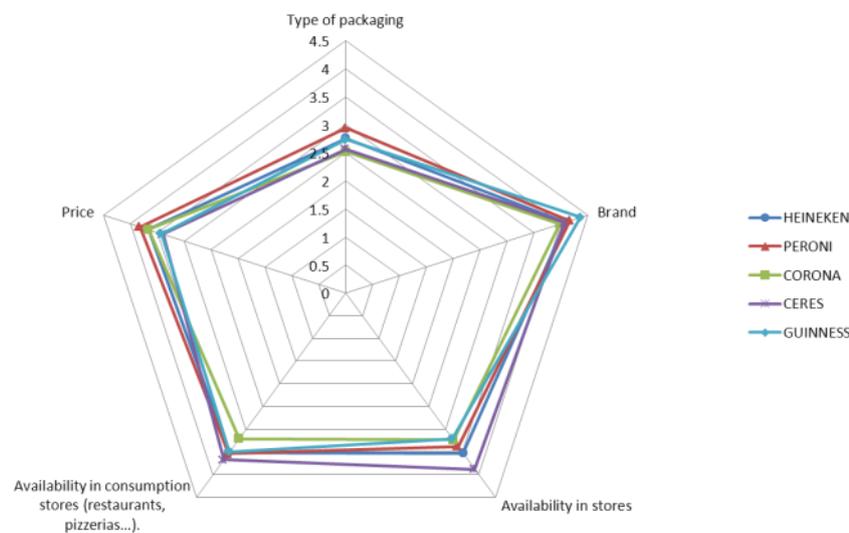

Brand of beer	%	Self-evaluation of the consumers as beer experts (scale 1-6)
Heineken	32.64	3.26
Peroni	19.88	3.27
Corona	18.10	2.72
Ceres	13.95	3.23
Guinness	13.06	2.80
Nastro azzurro	12.76	2.91
Beck's	12.46	3.21
Moretti	12.46	3.10
Budweiser	9.50	3.22
Tuborg	7.42	3.60
Tennent's	7.12	3.75
Foster's	4.15	3.36
Carlsberg	3.86	3.23

Notes: Percentages do not sum to 100 because respondents can choose more than one beer brand.

Figure 1 shows the distribution of the average values of importance relative to the characteristics of the favourite five beer brands.

Figure 1. Importance of the various characteristics for the favourite five brands

Heineken drinkers give more importance to the amount of fizziness compared to the other four brands. Peroni drinkers also give a lot of importance to the fizziness and presence of froth. The most exigent consumers in terms of alcoholic level, taste, colour and quality are Guinness drinkers.

Figure 2. Factors influencing the purchase of the five most favourite brands

Consumers who choose Peroni beer give more importance to price, brand popularity and packaging when purchasing beer and therefore it seems that they seek product which lies within their shopping budget and whose brand and packaging are well-known (Figure 2).

Those who purchase Ceres are less influenced by price, but are very influenced by brand availability in traditional stores as well as restaurants, pizzerias and pubs.

In terms of distribution channels, an aspect already found in literature (Assobirra, 2011) and confirmed by our sample survey is the remarkable proportion of beer consumption that takes place off-trade. In fact, about 25% of respondents declared they generally drink beer at home while pubs, pizzerias and bars are respectively the favourite places of consumption outside the home (on-trade).

Regarding the occasions of beer consumption, respondents declared that beer is mainly drunk at parties (45.99%) and at home with meals (33.53%). Over 70% of respondents stated they usually drink beer at least once a week, 12% once a month and 18% only on special occasions. The existence of a relationship between the frequency of consumption and

importance given to price was investigated by the ANOVA test (Table 7) indicating there are no significant differences among the mean values of the different groups.

Table 7. Frequency with which traditional beer is consumed and importance given to price

Frequency of beer consumption	%	Average Importance given to price
Everyday	11.41	3.50
Five/six times a week	9.91	3.69
Three/four times a week	19.22	3.48
Once/twice a week	30.03	3.54
Once a month	11.71	3.89
Only on special occasions	17.72	3.69
Total	100.00	3.70

Notes: ANOVA test: F-statistic=0.37 (pvalue: 0.87) Bartlett's test for equal variances: $\chi^2 (5) = 3.9398$ Prob> $\chi^2 = 0.558$

Regarding the social aspect of beer consumption, beer is considered a beverage which is mainly consumed in a social context: “drinking beer with friends” seems to be the slogan for about 70% of the respondents followed by the partner (equal to 20% of the respondents) and lastly drinking beer in the family and alone.

5.2 Who are the consumers of craft beer and what are their habits and preferences?

About 79% of traditional beer drinkers stated they have drunk craft beer at least once. Moreover, those who declared themselves craft beer drinkers are those who on average considered themselves expert beer drinkers (average value equal to 3.2 versus 2.6 for those who have never drunk craft beer).

As shown in Table 8, no significant differences were found from a socio-demographic point of view between craft and traditional beer drinkers

Table 8. Socio-demographic characteristics of craft beer consumers

	%
<i>Gender</i>	
Female	39.68
Male	60.32
<i>Age</i>	
18-25	37.15
26-33	28.06
34-41	15.81
42-49	13.44
50+	5.53
<i>Professional status</i>	
Employee	38.40
Self-employed	19.39
Searching for a job	7.98
Housewives	3.04
Retired (pensioners)	2.28
Students	24.71
Professional status not declared	4.18

The most important factor influencing the choice of craft beer is the availability of this product in bars, restaurants and pizzerias (average value 3.78).

Table 9. Factors influencing the purchase of craft beer

Factors	Mean	SD
Availability in bars, restaurants and pizzerias	3.78	1.59
Price	3.47	1.69
Availability in stores	3.43	1.56
Brand	3.34	1.65
Packaging	2.59	1.61

As Table 10 shows, the characteristic of the craft beers deemed to be most important is quality followed by aroma.

Table 10. Importance given to the various characteristics of craft beer

Characteristics	Mean	SD
Quality	4.72	1.58
Aroma	4.52	1.53
Colour	3.92	1.79
Fizziness	3.91	1.65
Organic raw material	3.87	1.82
Alcoholic grade	3.86	1.53
Froth	3.77	1.60
Calories	2.87	1.70

Lager is also the favourite type of craft beer (46% of the respondents), followed by amber-coloured beer (27.38%), dark and lastly red beer.

Craft beer is mainly consumed in pubs (60% of the respondents) while home consumption is less frequent (15.21%) than traditional beer consumption. The profile of the people with which craft beer consumption is preferable is similar to that for traditional beer drinkers, a large percentage prefer to drink it with friends (69.58%) followed by in company of the partner (18.63%) and the family (11.41%).

The main difference between craft beer drinkers and traditional beer drinkers is the frequency of consumption. In fact, about 45% of craft beer drinkers declared they only drink this type of beer on special occasions (Table 11). This percentage is about three times higher than that of traditional beer drinkers.

Table 11. Frequency with which craft beer is consumed and importance given to price

Frequency of craft beer consumption	%	Average importance given to price
Everyday	10.12	3.28
Five/six times a week	4.67	3.42
Three/four times a week	7.78	3.10
Once/twice a week	16.73	2.93
Once a month	14.79	3.61
Only on special occasions	45.91	3.74
<i>Total</i>	<i>100.00</i>	<i>3.47</i>

Notes: ANOVA test: F-statistics=1.73 (p-value 0.1288); Bartlett's test for equal variances: $\chi^2(5)=5.4161 - \text{Prob}>\chi^2=0.367$

Regarding craft beer, we found that the average level of importance given to price is not significantly different according to the frequency of consumption. This result strongly confirms that price does not represent a limit concerning the frequency of consumption of

craft beer which is believed to be a quality product for which consumers are willing to pay a higher price.

5.3 A segmentation analysis: probit estimation results

Bearing in mind the third research question of our paper, Table 12 shows the estimation results of the probit model specified by [1].

Table 12. Probit model for the probability of becoming a craft beer consumer

Variable	M.E.	Std. Err.	Sign.
<i>Characteristics of (traditional) beer</i>			
Aroma	0.032	0.017	*
Quality	0.042	0.018	**
Organic Product	0.007	0.015

Bottled	-0.162	0.052	***
Canned	-0.174	0.133	
<i>Habits towards (traditional) beer consumption</i>			
<i>Frequency of consumption (ref: at least once a week)</i>			
Once a month	-0.157	0.077	*
Only on special occasions	-0.262	0.127	**
<i>People with which beer is consumed:</i>			
Family-partner	0.009	0.061	
Alone	0.173	0.039	**
Friend-colleagues	0.077	0.087	
<i>Occasions:</i>			
Free time	-0.025	0.071	

Variable	M.E.	Std. Err.	Sign.
Meals	-0.065	0.077	
<i>Socio-economic characteristics</i>			
Gender	0.022	0.051	
<i>Age (ref. 18-25)</i>			
26-33	0.09	0.057	
34-41	0.065	0.066	
42-49	0.129	0.053	*
50+	-0.23	0.163	*
<i>Professional status (ref. salaried employed)</i>			
Self-employed	0.002	0.070	
Searching for a job	0.123	0.053	
Housewives	-0.304	0.160	**
Retired (pensioners)	0.111	0.071	
Students	0.02	0.070	
Professional status not specified	0.092	0.101	

NOTES: * Significant at the 10% level. **Significant at the 5% level *** Significant at the 1% level.

[LR Test: $\chi^2(24) = 67.52$ ***; Pseudo Adjus.R²: 0.2632; Hosmer-Lemeshow *Goodness-of-Fit Test*: HL $\chi^2(8) = 7.53$ Prob> $\chi^2 = 0.4807$]

People aged between 42 and 49 are more likely to drink craft beer while people aged 50 or over are less likely to drink it, compared to young people aged between 18-25. Housewives are also less likely to drink craft beer.

Giving more importance to the quality and aroma when purchasing traditional beer means having a higher probability of switching to craft beer. This result also shows that people are more inclined to switch to craft beer when they pay attention to the whole production process.

People who prefer drinking traditional bottled-beer have a lower probability of switching to craft beer, compared to people who prefer traditional draft beer.

In a different specification of the probit model we also introduced the various brands of beer as explicative variables: however none of the brands considered has a significant effect on the likelihood of becoming craft beer consumers.

The frequency of consumption plays a fundamental role in determining the probability of consuming craft beer: in fact it is interesting to note that those who consume traditional beer less frequently have a lower probability of consuming craft beer. This probably means that those who drink craft beer are not occasional beer drinkers but habitual drinkers and thus experts of taste.

Finally, people who drink traditional beer alone are more likely to switch to craft beer: this stresses the fact that craft beer is deemed to be a quality product which one drinks for enjoyment and not just for social drinking.

6. CONCLUSION

Two main contributions distinguish this paper.

Firstly, a benchmark between profiles, habits and preferences of traditional and craft beer consumers, highlighting that craft beer drinkers are distinguishable from traditional beer consumers not for socio-demographic characteristics but rather for their different views concerning beer production and their consumption habits and frequency.

Secondly, factors which could perhaps enhance a switching attitude between traditional and craft beer consumption. We found that craft beer consumers pay great attention to quality, production process and aroma, but also frequency of consumption becomes a crucial element favouring the switch from traditional to craft beer.

From a managerial point of view this paper helps, on one hand, new firms in the craft beer segment to clearly identify which factors are considered the most important in beer choice and purchase and highlights which distribution channels could eventually be preferred by consumers who consider themselves experts and so more easily choose a craft beer. On the other hand, this paper explains in some way, why beer drinkers who consider quality important and not price so crucial prefer top of the range traditional beers or switch to

craft beers if they have this choice, helping managers of established firms in better supporting their products, eventually partially changing their characteristics or communication and distribution features and choices, in order to meet consumers changing desires, expectations and preferences.

Some limitation of this study can be found in the non-probabilistic sample used, but also in the number of interviews conducted, and in the restricted area in which they were carried out.

Further research could be represented by a national study in Italy, or a benchmarking study in different European countries to identify consumer profiles and differences and eventually map this growing trend in craft beer production and consumption in Europe to better understand its characteristics and future developments.

ROLE OF TAXATION IN INVESTMENTS ALLOCATION DECISIONS: USING A GRAVITY APPROACH FOR EXPLORING BILATERAL FDI INTO THE EU

Raudonen, Svetlana

Tallinn School of Economics and Business Administration, Tallinn University of Technology,
svetlana.raudonen@mail.ee

ABSTRACT

The article analyses the impact of taxation on the FDI flow to European Union countries using a gravity approach. The aim of the research is to examine the applicability of the gravity model to FDI between EU countries and their main investor partners and measure the importance of tax variables to bilateral flows. We found a negative relationship between the tax burden and the amount of FDI for EU countries over the period from 1998 to 2011. The variable of double taxation treaty is nonsignificant; therefore, the treaty does not affect EU FDI. The results provide strong evidence of the importance of corporate taxation and total tax burden for inward FDI in EU countries.

Keywords: gravity model, foreign direct investments, corporate tax, European Union countries

1. INTRODUCTION

The study contributes to the discussion about the fundamental role of gravitation force in the financial flows into EU countries and the importance of taxation in these flows. Inward foreign direct investments (FDI) to EU economies have included considerable flows from the EU countries, mainly from the United Kingdom, the Netherlands, Germany and Luxembourg, and from third countries, mainly from the United States. The European Union has become one of the most important economic regions due to its favourable location, high economic development and high level of economic freedom, including free

movement of capital, goods and labour. The relation between foreign investment flows and economic, social, political and other factors has been an object of interest of economists for many years. The literature on FDI emphasizes the impact of tax treaties, investment and free trade agreements. The general purpose of these treaties and agreements is to ensure that the investments will be promoted and protected and that the profit earned will be exempted from double taxation. However, the actual effect of tax treaties on FDI flows is questionable. As the effect of low tax rate policy, which may enhance, stimulate or damage investments, is examined in numerous studies, we investigate the relationship between inward FDI and EU taxation because these announcements may influence FDI flows into the EU countries both from other EU economies and from third countries.

However, the investment decisions mainly depend on the perspectives of the host country's economy, its openness, degree of growth, institutional quality and many other political, economic and social factors. The differences in economic conditions, political climate and legislation of countries have a significant impact on the decision-making process concerning the allocation of investments. For example, let us have a look at the neighbouring EU countries the Republic of Lithuania and the Republic of Poland, which have almost the same geographical advantages, but different economic conditions. From the point of view of economic geography, their position is very good: the Russian Federation is on one side and old Europe on the other. This has enhanced economic growth in both countries. At the same time, Poland has more natural resources and a cheaper labour force. Lithuania has more qualified specialists and from the perspective of tax policy, allocation of capital into Lithuanian companies is more beneficial because the income tax rate is lower. Hence, the Lithuanian government competes with Poland by offering lower tax rates instead of natural resources. The dilemma is how much the flows are influenced by the level and mechanism of taxation. The single European market offers companies located in any EU country the opportunity to relocate production to countries with lower tax rates. Moreover, the regulations concerning corporate taxation, which are different in EU countries, may be observed as a potential advantage because the regulations concerning indirect taxation are harmonized in the EU countries. Third countries' investors may be interested in investing in a EU country and relocating the production from third countries because this provides the opportunity to avoid customs duties on goods imported to the EU. Moreover, the possibility of deducting expenses, especially payable taxes as part of corporate income, may be viewed as a potential

preference of a particular host country because the customs union²⁹ provides identical rules for all EU countries in matters concerning tariffs and customs duties. Therefore, besides various types of taxation policy that may affect investors the particular object of our interest is corporate taxation because of its variations in EU countries.

The concept of the gravitation force has been used by economists to explain the volume of trade, capital flows and migration issues. The gravity model was introduced in 1962 by Tinbergen (1962), who showed the importance of the gravitation force in trade theory. The first authors who applied the gravity equation to FDI flows were Brainard (1997) and Frenkel et al. (2004).

During the last decade the gravity model has been widely used in empirical researches concerning changes in foreign investments flows in order to find the main factors influencing bilateral FDI (Stone and Jeon, 1999; Buch et al., 2003; Kumar and Zajc, 2003; Bevan and Estring, 2004; Roberto, 2004; Portes and Rey, 2005). In addition to the standard variables used in the gravity model, such as the GDPs of the host and investor countries and geographical distance between the two countries, economists are interested in the independent variables that affect the FDI. Substantial changes in legal systems and tax competition between countries are also objects of remarkable studies and have been widely discussed and developed (Egger and Pfaffermayr, 2004; Milner et al., 2004).

The aim of the paper is to check the applicability of the gravity model to foreign direct investments between EU countries and their main investor partners and to evaluate the importance of corporate taxation and tax treaty for the investment allocation decisions in EU countries.

In section two we review the existing theoretical and empirical literature and draw some conclusions about how to use the gravity approach. In section three we describe the data set, explain the empirical examination and present the main results of the estimations. Section four is dedicated to the robustness test. The last section presents conclusions.

2. THEORETICAL CONSIDERATIONS

²⁹ EU countries form a customs union, whose regulations are harmonized according to the Customs Code.

According to the classical gravity model, which will be the base for our theoretical approach, the gravity force (GF_{ij}) between two objects i and j is expressed as the proportion of their respective masses M_i and M_j to the distance D_{ij} between these objects. In terms of natural logarithms the gravity model is expressed as:

$$\ln GF_{ij} = \ln M_i + \ln M_j - \ln D_{ij} + \varepsilon_{ij} \quad (1)$$

Gravity theory has been used for describing social phenomena in population migration, tourist travel, trade and information flows and traffic movements. The gravity model has been broadly used for the estimation of FDI. During the last decade economists³⁰ have paid great attention to the flows from Japan and China, to the flows between NAFTA countries, between China and Europe and between Central and Eastern European countries as well as to China and Asian countries and to the countries in transition.

According to the model, the investment flows from one country to another are explained by the economic development of the countries, their market size, direct geographical distances between the investor and host countries and other variables determining common economic development. In case of the capital flow from country i to country j , Equation 1 of the gravity model changes into:

$$\ln FDI_{ij} = \alpha + \beta_1 \ln GDP_i + \beta_2 \ln GDP_j + \beta_3 \ln D_{ij} + \varepsilon_{ij} \quad (2)$$

The gross domestic product (GDP) of the countries is expressed as the mass and the geographical distance (D), which is a factor that indicates transportation costs, cultural differences and historical relationships between the countries, is expressed as the distance between the two objects in accordance to the classical gravity model.

Similarly to the formulation applied by Frenkel (1997), the flow of capital is estimated as a function of countries' population, income per capital and distance. This approach was used by Choi (2003) in the estimation of FDI flows specified as:

$$\ln FDI_{ij} = \alpha + \beta_1 \ln POP_i + \beta_2 \ln POP_j + \beta_3 \ln GDP_i + \beta_4 \ln GDP_j + \beta_5 \ln D_{ij} + \varepsilon_{ij} \quad (3)$$

³⁰ Cieřlik and Ryan (2004), Roger and Noel (2004), Keiko and Kyoji (2005), Demekas et al. (2007), Raymend (2007), Hidemi and Yasuyuki (2010), Resmini and Siedschlag (2013), Tatsui (2013)

In recent years special attention was paid to effective corporate tax rates (Mutti and Grubert, 2004) and corporate taxation policy (Folfas, 2011). Using the gravity approach Folfas (2011) focused on tax differences between host and investor countries. One problem that such approach does not take into consideration is the taxation differences between host countries that describe tax competition. Still Mutti and Grubert (2004) concentrated on differences in taxation in host countries. However earlier research generally indicates that host country taxes play a greater role (Hines, 1997).

As for taxation, we look at the tax burden in host countries. According to Root and Ahmed (1979), taxes do not have a significant effect on FDI. Contrary to them Swenson (1994) reports a positive effect of taxation on foreign investments. Considering the suggestion that higher taxes reduce investment a negative effect of a high tax burden on FDI is expected. The expectation will be investigated by the empirical evidence for EU countries. Similarly to the previous research (Raudonen and Freytag, 2013), this analysis cannot be used to distinguish pull effects from push effects, i.e. we are not able to give evidence of whether EU countries attract foreign capital because they have so attractive tax regimes or because the investor countries deter investment and drive capital out of their countries because their location is rather unattractive. In the course of our analysis we assume that pull effects dominate the decisions on average and do not consider this distinction further; our assumption is connected with the manifold motives of FDI and the rather small size of the EU countries.

Based on the theoretical considerations and the existing empirical research, we test the hypothesis that the bilateral FDI flows of EU countries are influenced by preferences conditioned by tax policy. Bearing in mind the formulated aim and the gravity approach, the following hypotheses will be tested:

1) Incentives and low tax rates influence the level of FDI flows positively. The European Union has harmonized tax policy in the field of indirect taxation and the member states have independent tax policy in the field of corporate taxation. According to the results of the European Commission's study (Ruding Committee, 1992) and Paying Taxes Report (World Bank, 2011) concerning the convergence of corporate taxes in the European community and tax burdens, the taxation aspects are important in the allocation and profit repatriation decisions.

2) Increasing the FDI inflow into the EU depends on the investor country. The signing of the Convention for Avoidance of Double Taxation between the investor country and the host country affects positively the FDI inflows into the EU countries.

3) The size and level of growth of an investor country's economy affect the FDI flow to the country. A country with a high GDP is preferable as a partner country in the investment into the EU economy to a country with a small economy. Long distances between the investor and host countries impact FDI negatively due to high transportation costs, differences in culture, lack of information concerning local market and other factors.

Several studies show that investors are sensitive to tax rates. The study conducted by Bénassy-Quéré et al. (2000), which also applied the gravity approach, shows that the size of the country has a major impact on the share of investments because larger states have a greater economic potential. The influence of taxation on FDI with the focus on the impact of corporate tax variables was examined by Bénassy-Quéré et al. (2005), who found a negative relationship between the taxation burden and FDI flows to OECD countries. Similarly, Boskin and Gale (1987), Grubert and Mutti (1991), Hartman (1994) and Hines and Rice (1994) found that a high corporate income tax rate has a significant negative effect on attracting FDI flows.

As a consequence of the theoretical thoughts and in relation to the set hypotheses the suggested gravity equation is as follows:

$$\ln FDI_{ijt} = \alpha + \beta_1 \ln GDP_{it} + \beta_2 \ln GDP_{jt} + \beta_3 \ln D_{ij} + \beta_4 TAX_{jt} + \mu_{ij} + \lambda_t + u_{ijt} \quad (4)$$

Tax variables in our equation include those variables linked with taxation aspects in the host country, in particular corporate income tax rate, tax burden and tax treaty.

In our model the distance that is one fundamental variable for the gravity model does not change over time. We used the Hausmann-Taylor (1981) estimation method for solving the problem for the data concerning time-invariant variables. According to this method, a few of the variables can be endogenous in the sense of correlation with individual effects but still be exogenous with respect to the error term as it was done in the study of Czarny et al. (2010). This approach allows us for the use of both time-varying and time-invariant variables.

3. MODELLING BILATERAL FDI FLOWS OF EU COUNTRIES

3.1. Data set

FDI flows of EU countries are coming mainly from developed economies, mostly from the United States and the European Union countries (UNCTAD, 2011). According to the World Investment Report 2012, the index measuring FDI potential includes market attractiveness, availability of low-cost labour, presence of natural resources and infrastructure. Therefore, the prospective spending power and the growth potential of the market are expected to be important factors for attracting FDI. Policy measures such as corporate taxation changes, concluded double-taxation treaty and cultural proximity between the investor countries and the host region may be important determinants of FDI.

The empirical part testing the taxation variables of FDI is based on a panel of bilateral inward FDI flows of EU countries. We use data on FDI flows from 40 economies to 27 recipient economies from 1998 to 2011. Each observation point determines a FDI flow in euros between an investor country i , i.e., EU-27 and other selected countries, and host country j . In our sample the host countries are EU countries. The selected investor countries are the major suppliers of the FDI flows (see Table 1 of Annex). This group accounted for more than 90 per cent of the FDI inflows to the EU during the time span covered. Figure 1 of Annex provides a regional breakdown of EU FDI, by the reporting countries for which data are available. The data show that in 2011 the United States, Germany, the United Kingdom, the Netherlands and Luxembourg made almost 60 per cent of the EU FDI. In contrast, Ukraine with its share of less than 0.01 per cent in the EU FDI has been relatively unimportant for the European Union.

Literature supports the use of the following variables to explore bilateral FDI: country size, economic potential of the country, distance factor and tax determinants. The choice of the method measuring country size usually raises many questions and economists are widely discussing this (Paas, 2002; Folfas, 2011). Many economists use GDP as the variable of economic size of host and investor countries (Buch et al., 2003; MacDermott, 2007; Hidemi, 2010). Some prefer to measure country size by population (Portes and Rey, 1999; Choi, 2002).

Initially we use GDP to represent market size because we assume that a larger host country has a greater potential for attracting FDI. The coefficient of the market size variable is expected to be positive. The positive sign is also expected for the estimated investor market size. Similarly to Egger et al. (2008) we use real GDP in euros. The distance between the host and the investor country is expected to be important in bilateral FDI flows. Longer distance reduces FDI due to high transportation costs, discrepancy in culture, lack of information

concerning local legislation and investor climate and other factors. This variable is thus expected to have a negative relationship with FDI.

In accordance with Choi (2003), we expect a negative coefficient of tax rate variable. However, in contrast to Porcano and Price (1996) but in line with our reasoning in Introduction and Paying Taxes study (World Bank, 2012), the total tax rate was additionally included to the model. Central government corporate income tax rate as the basic central government statutory corporate income tax rate is expected to have a negative relationship with the FDI. Tax burden measured as percentage of all taxes to the commercial profit of a company is also expected to have a negative relationship with foreign investments. Comparison of the total tax rates in EU economies shows that the average is 28.3 per cent of the commercial profit, the lowest total tax rate, 20.8 per cent, is in Luxembourg and the highest rate, 68.5 per cent, is in Italy. The larger burden causes damage to the companies and affects negatively investor location decisions.

Using the data set, we estimate the impact of the Double Taxation Treaty on bilateral inward FDI. Moreover we investigate whether signing the Double Taxation Treaty affect FDI. We use a dummy variable to explore the significance of the treaty (see Table 1 of Annex). In accordance with Barthel et al. (2009), Double Taxation Treaties are expected to affect bilateral foreign investments positively. Politicians' main goal in concluding a Double Taxation Treaty with a partner country is to ensure investors that double taxation shall be avoided. Table 1 gives an overview of the expected signs of variables.

Table 1. Expected signs of variables

Variable	Expected sign
Corporate income tax rate	-
Total tax rate	-
Double taxation treaty	+
Gross Domestic Product	+
GDP growth	+
Distance	-

Data on bilateral flows of FDI were obtained from the database of the Eurostat. Data concerning taxation were extracted from the World Bank database. Data on GDP came from the Eurostat and UNCTAD statistical databases, corporate income tax rates mainly from the

OECD database and other variables from the database of the World Bank. Table 1 of Annex provides the descriptive statistics of all variables used in the empirical analysis.

Among the FDI data extracted from the Eurostat numerous values are missing. According to the sample the number of observations reduced to 11 881 in comparison with the preliminary sample of 15 498 observations. Despite the missing values, the sample is large enough because it contains many observation points.

3.2. Empirical analysis

We focused on the impact of tax burden on investment inflows. The empirical analysis proceeded in two steps. First we evaluated the significance of tax variables on inward FDI flows. The influence of three tax variables, corporate tax rate, total tax rate and tax treaty, on FDI was estimated separately. Secondly we explored how sensitive particular investor countries were to the taxation in the EU, For this purpose we estimate the model for various samples of countries.

In the basic version of the model, we used a gravity specification of the bilateral FDI inflow, where we included tax variables (CORPTAX, TOTALTAX and DTA). We analysed different models including the basic model (4) described previously. Models estimated within fixed country-pair and fixed time effects. The variable of geographical distance is time-invariant and this variable is affected only by fixed country-pair effect. We applied a test on a sample with a fixed effects panel data estimator (Wooldridge, 1995). We ran fixed-effect regression with GDP, GDP growth and tax variables. Similarly to the study of Bevan and Estrin (2004), the results were very poor, indeed $R^2 = 0.36$. After the inspection of the data we added population variable. A similar approach was used by Portes and Rey (1999), who estimated a gravity model of equity flow including population variables that represent the openness of the country. The coefficients they received for population in their regression are very close to ours. The goodness of this equation rises: from initial $R^2 = 0.36$ to $R^2 = 0.49$. We therefore used model (3) as our baseline for further examination.

Table 2. Model. Different tax variables. Regression results for the foreign direct investments (log FDI)

	Model 1 (corporate income tax)	Model 2 (total tax)	Model 3 (double taxation treaty)
--	--------------------------------------	------------------------	--

Corporate income tax rate (CORPTAX)	-0.0208*** (-5.1310)	-	-
Total tax rate (% of commercial profits) (TOTALTAX)	-	-0.0196*** (-6.6157)	-

Constant	3.9313*** (10.8546)	3.2921*** (6.3581)	3.6121*** (10.0739)
R-squared	0.4935	0.4527	0.4916
Number of observations	7010	3830	7010

Note: t-statistic in brackets. ***- significant at the 1% level, **- significant at the 5% level, *- significant at the 10% level.

The estimated parameters of the variables derived from the basic version of the gravity equation are statistically significant and have the expected signs (see Table 2). The positive sign before the variable of investor country GDP shows that the FDI flows from larger countries are bigger. It also indicates that a larger investor country has more potential to invest to the host country and its FDI flows will become larger. Similarly to the previous research by Folfas (2011), the sign before the host country GDP is also positive, which shows that countries with greater spending power are more attractive for investors. The positive sign of the host country GDP is most likely connected also with greater interest of the investor in the countries with high economic growth. The above-mentioned allowed us to conclude that FDI flows are bigger between countries with larger GDPs. The distance as a factor expressing cultural differences and transportation costs has a significant effect on bilateral FDI inflows. As we expected, a long distance between the investor and the host countries influences negatively the attractiveness of a country for investors. This is proved by the sign of the coefficient before the distance variable.

Next the impact of GDP growth was examined. As a country with a great potential is more attractive for investors, the sign was expected to be positive. Higher expected growth should attract more FDI inflows. The results presented in Table 2 show that GDP growth affects the amount of the FDI flow. The positive sign before the variable of GDP growth shows that FDI flows from countries with higher level of economic growth are bigger.

Finally, tax rate appears to be an important factor in the investment decisions. Low tax rates of host countries attract more investments, particularly into EU countries.

To sum up: the basic model describes the relationship between the inflow of foreign direct investments into the EU member states, the host and investor countries' GDP, geographical distance between the countries, level of economic growth and tax rate in the host country. The inflow of FDI from the investor country to the host country depends on the tax rate in the host country. A high tax rate has a negative impact on the FDI flow. Also a long distance and a high level of the total tax burden have negative impacts on bilateral FDI.

As the estimation results in Table 2 indicate, we cannot reject the first hypothesis: the taxation policy in the host country, incl. the corporate income tax rate and the total tax burden, is statistically significant. A large total tax burden and high corporate income tax rate have negative impacts. Similarly to Choi (2003), who added to the basic gravity equation the corporate tax rate variable of the host country, we found the coefficient for corporate tax rate to be negative and its size is 0.02. In general, the study suggests that an increase of the tax rate in host countries by one per cent will decrease FDI flows by 0.02 per cent, which is broadly in line with previous research. The size of the coefficient of the total tax burden variable comes next after income tax rate, and its impact on FDI is similar. However, as concerns our second hypothesis, empirical calculations show that the Double Taxation Treaty signed between the investor and the host country governments does not impact on the inflow of FDI into the EU. One explanation of the result may be that double taxation is regulated by the saving directive and other legislation acts in the EU additionally to the Tax Treaty. Besides, almost all countries under examination belong to the OECD and have the same regulations concerning double taxation according to the OECD model agreement. As hypothesised, the host country's GDP, the investor country's GDP and geographical distance between the countries are statistically significant at the 1 per cent level.

The above-mentioned results suggest that FDI flows into EU countries respond to the changes in taxation differently or that differences in the details that our measure did not cover cause

the differing effects. One could imagine that a tax break on reinvested profits would contribute to FDI inflows. Further research is necessary to identify the drivers of these differences.

3.3. Results and discussion

Empirical examination was done on the basis of panel data of bilateral FDI of the EU countries. The impact of the tax rate variables on bilateral EU FDI is high and the coefficients of the tax rates are indeed negative. There is a strong correlation between the corporate income tax rate and investment flow from the countries in the sample. To explore how sensitive particular investor countries are to the corporate taxation in the EU we performed additional tests with various samples. We formed the samples by the regions to which the investor countries belong and excluded other investor countries for the purpose of testing the sensitivity of investors from the various regions to the tax variables in the EU host countries. Table 3 shows that there is a significant correlation between investor country groups FDI and corporate tax in the host country. Generally speaking, in the EU the FDI flows from North America, the former Soviet Union and Balkan countries are sensitive to the corporate tax rate. However, it appears that investors from Norway, Iceland and Asian countries are not sensitive to corporate taxes in the EU countries.

Table 3. Impact of taxation for investor countries. Estimation results of tax variables

Region of Investor country	Model 1 (corporate income tax)	Model 2 (total tax)	Model 3 (double taxation treaty)
North America	-0.0325**	-0.0401***	-0.7951**
Asian countries	insignificant	-0.0262**	2.0978***
former Soviet Union	-0.0566***	insignificant	0.8114**
Switzerland/Lichtenstein	-0.0299**	-0.0325***	Insignificant
Norway/Iceland	Insignificant	-0.0243**	Insignificant
Balkans countries	-0.0443*	insignificant	Insignificant
EU-15	-0.0221***	-0.0153***	Insignificant
EU-12	-0.0188**	insignificant	Insignificant

Notes: The Table presents the sensitivity analysis of FDI on changes in taxation. The EU-15 includes old EU member countries. The EU-12 includes new EU member countries. North

America includes Canada and United States. Balkans countries include Bosnia-Herzegovina and Croatia. Asia includes China, Hong Kong. Former Soviet Union includes Ukraine, Russia and Belarus.

Source: Authors' calculations.

In addition to investors from North America, Balkan countries and the former Soviet Union the influence of corporate taxation on the investments flow is greater also for investors from Switzerland and Lichtenstein than from the other countries under examination. The FDI inflows to the EU from Norway, Iceland and Asian countries are not responsive to changes in corporate taxation.

The following hypotheses were proved in the course of the estimation of the gravity equation:

- 1) Being countries with taxation incentives the EU countries have great potential for the attraction of investors from partner countries; a low tax burden has a positive impact on FDI. The Double Taxation Treaty is nonsignificant for FDI flows.
- 2) The EU countries have preferred to achieve good relations with investors from large countries with a high level of economic growth. The economic potential of the investor country, measured by GDP, has a positive influence on the bilateral FDI flows to the EU.
- 3) The distance between investor and host countries impacts on bilateral FDI flows. The shorter distance increases FDI flows and a longer distance decreases FDI flows into EU countries. Cultural differences, transportation costs and historical relationships between countries measured as the geographic distance between the countries influence the foreign investments flows.

The above-presented modelling showed that the use of the gravity approach in the examination of FDI flows explains changes in FDI flows considerably well.

4. ROBUSTNESS AND STABILITY ANALYSIS

In this section we perform several robustness tests. The goal of this section is to check the stability of the results received in the gravity estimation, in particular the impact of tax rate on FDI flows. Differently from Folfas (2011), who checked the importance of the usage of offshore financial centres in investment location decision, we exclude tax haven regions from the sample in checking the stability of results, especially the impact of taxation variables. For

testing the sensitivity of the results, firstly we perform a robustness experiment for Model 1, which excludes the offshore financial centres such as Cyprus, Luxembourg and Malta from the estimation, and Model 2, which excludes all non-European economies from the sample as investor country. As a result of these changes not all the countries are included in the sample tested. Due to the above-mentioned changes the number of observations in corporate income tax rate estimations falls from 7010 to 6316 according to Model 1 and from 7010 to 4747 for Model 2. The results of the experiment are presented in Table 4.

Next we check the robustness of the estimations and the impact of control variables. Firstly, the level of inflation in the host country is checked via annual change of the consumer price inflation (*INF*).

Table 4. Robustness experiment

Note: t-statistic in brackets. ***- significant at the 1% level, **- significant at the 5% level, *- significant at the 10% level.

Low inflation as a determinant of macroeconomic stability matters positively affects FDI. However, most empirical studies ignore this variable. The study performed by Akinkugbe (2003) shows that inflation rate is a nonsignificant variable for the estimation of FDI inflows in developing countries. Udoh and Egwaikhide (2008) report that the effect of inflation rate uncertainty on FDI is negative. According to the gravity model of Lada and Tchorek (2008), inflation has a significant impact on FDI. Our results are presented in Model 1 of Table 5. The positive sign before the inflation coefficient is an unexpected result. One explanation of the result may be that the inflation in investor countries has the same tendency as in host countries. Inflation is probably related to the consumer spending power and therefore the variable has a positive effect on FDI.

Secondly, the impact of the unemployment level as a control variable is assessed via the percentage of unemployed persons in the host country (UNEMP). According to Roberto (2004), investors avoid in their location decisions distressed regions with high unemployment rates, according to his study the unemployment rate has a negative sign and it affects negatively foreign acquisitions. Therefore unemployment is expected to have a significant impact on FDI flows. The results presented in Model 2 of Table 5 show that the impact of unemployment on the FDI flow did not show persistence and is mainly not significant. This may suggest that other variables are more important for bilateral FDI into EU countries as well as that the governmental expenditures on labour development are not sufficient for the attraction of foreign investments and that this variable does not reflect the real situation of the labour market, because the quality of employment is more important than quantity. The impact of the tax variables remains unchanged.

Note: t-statistic in brackets. ***- significant at the 1% level, **- significant at the 5% level, *- significant at the 10% level.

The stability of the coefficients of tax rate is checked by combining the independent variables with additional control variables. The checks show that the tax rate is not significantly different from the basic model and in comparison with the basic model the gravity model is also appropriate.

5. CONCLUSIONS

The results of the study show that the gravity approach could be used for the estimation of FDI flows in EU countries. The gravity approach for analysing the flows of foreign direct investments between EU countries and their main investor partners reveals that the indicator of distance between two countries, based on the transportation costs and cultural differences, has considerable influence on the bilateral flows. The results of the study support the

principle that the gravitation force plays the main role in the attraction of foreign investments, accordingly, the FDI of EU countries are influenced by the spending power, the size of the economy and its growth potential, which are expressed by the GDP of the investor country. FDI flows are bigger between larger economies. Further testing showed that additionally to the size of the economy and distance between the countries the level of the tax rate in the host country, especially in the field of corporate taxation, has an important role in the FDI between the investor and host countries. Nonetheless, the FDI gravity model faces a number of additional obstacles. Firstly the data of bilateral FDI flows are available only for selected countries and a limited period. Certain countries under examination have also limited availability of other data, but missing data do not damage the final result because the sample consists of many observation points. No data concerning the total tax rate variable are available for 1998-2004. Over time, however, the sample will become longer, which may resolve the problem concerning the sample.

In this paper we have investigated the effect of taxation policy on bilateral FDI of EU countries using a gravity model. Foreign investors tend to be attracted by host countries that have tax incentives and liberal legislation. The results suggest that EU countries are effective in attracting FDI due to low tax rates in host countries. The study shows that increasing the corporate income tax rate by 1 per cent will decrease the FDI inflow into a country by 0.02 per cent. Inward FDI reflect the changes in tax policy, in particular in the corporate income tax rate, but we did not examine the principles of taxation and exemption rules. With almost 7000 observations on bilateral inward FDI, we consider that these results are robust. Combining the various control variables confirms the stability of results. These findings are similar to the results of Demekas et al. (2007), according to whose estimation the coefficient of statutory corporate income tax rate is equal to -0.02. In line with the results of Blonigen and Davies (2002) we found that a tax treaty does not influence foreign investments flows. Our empirical work is strong evidence that international investment location decisions are affected by corporate taxation in force in the potential investment region. The result agrees with most previous empirical studies. However, our specific focus on EU tax rates and on tax treaties leads to additional conclusions. The study suggests that politicians should look for new regulations of common corporate tax policy in the European Union and to improve the incentives of tax treaties. Apart from other advantages of tax competition such as that it forces governments to search for efficiency and welfare, tax policy can be instrumental to attract investment from abroad. This paper does not pay attention on the specific deduction schemes

and does not simulate a model in order to decrease the tax base. Such analysis has to be left for further research.

APPENDIX

THE IMPACT OF CHINESE FOREIGN DIRECT INVESTMENT IN SWITZERLAND

Rios-Morales, Ruth; Brennan, Louis; Schweizer, Max

Centre of Foreign Affairs and Applied Diplomacy, Zurich University of Applied Sciences (ZHAW), Switzerland, ruthriosmorales@bluewin.ch

ABSTRACT

China has surged as an important contributor of outward foreign direct investment. Recent trends reveal that investment from China to Switzerland is growing faster than that from other markets; a number of Chinese firms have invested in long-established Swiss sectors such as the energy technology and the watch-making industry. The latter is a new economic phenomenon worthy of reflective assessment from both the theoretical and international business perspective. These new trends have been driven by a combination of intense competitive pressure, favourable policies for foreign investment and the need to secure long-term economic development. This paper focuses on Chinese investment into Switzerland given particular consideration to the assessment of these new entrants, aspects related to drivers and motivators, elements of difference, and considerations of resources and capabilities. Likewise, the challenges and opportunities facing incumbents in responding to the increasing presence of Chinese firms are offered.

Keywords: Foreign Direct Investment, Chinese Outward Foreign Direct Investment, Chinese Foreign Affairs, Switzerland.

1. INTRODUCTION

During the last decades, there has been an extraordinary transformation in the economy of China. The economic reforms of the late 1970s and the incorporation of China as a member of the World Trade Organisation in 2001 have led to the emergence of an economy based on greater openness and competition. A notable aspect of China's international openness has been its attractiveness for foreign direct investment (FDI); in 2012, China became the largest recipient of foreign direct investment (FDI) (UNCTAD, 2013). Another important aspect of the Chinese economy is its economic competitiveness expressed in the outsized surplus of its

balance of payments due to its export sector. The contribution of FDI and the remarkable performance of its exports are reflected in the impressive growth of the Chinese GDP in the last decades (World Bank, 2013). This extraordinary economic growth has led China to emerge as an important source of outward foreign direct investment (OFDI).

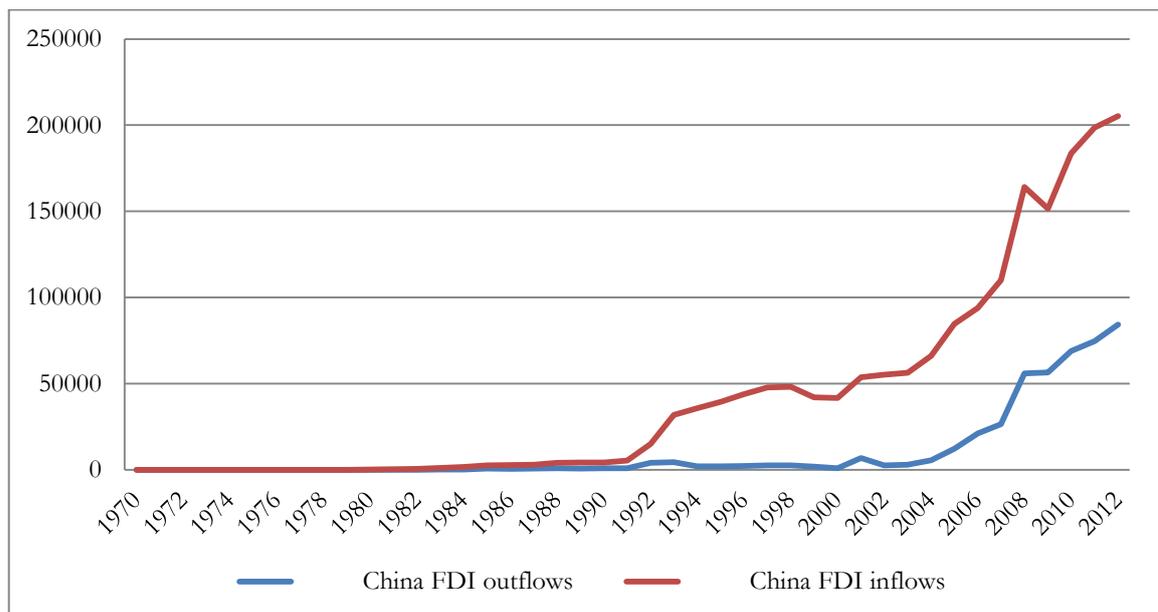

Although China is a newcomer as a source of outward investment, China ranks ninth among the top investor countries in the world (UNCTAD, 2012). Chinese investment has been directed to the four corners of the world, where developed and developing countries have been recipients of Chinese FDI. While in the developing countries Chinese investors are directed towards resource-seeking investments to secure access to raw materials, in the developed world Chinese investors are oriented toward market-seeking and strategic-asset-seeking investment to expand their markets and to have access to new technologies, brand names, distribution channels and managerial know-how. Europe endows Chinese investors with opportunities to expand their markets, but most importantly, Europe provides access to new technologies, brands, sophisticated distribution channels and managerial know-how; consequently, Europe has been the most attractive location for Chinese investment in the last past years (A Capital, 2013). This new trend also relates to Switzerland as Chinese investment in this small European country is growing faster than that from other investors partners (L'Hebdo, 2012).

Despite the major cultural, historical and political differences that exist between China and Switzerland, strong economic cooperation is emerging between these two countries. The growth of Chinese outward FDI in Switzerland emphasizes the need to further comprehend China as a major global investor. In the last few years, we have witnessed the reconfiguration of China's strategies as a global investor, moving from the resource-seeking investment to more sophisticated and competitive market-sites for FDI such as Switzerland. Although Chinese FDI in Switzerland is still relatively small in magnitude, its rapid growth is worthy of reflective examination from both the theoretical and international business points of view. The remainder of this paper is organised as follows: The next section assesses the prominent emergence of Chinese outward foreign direct investment. Section 3 considers Chinese investment in Europe. Section 4 focuses on Switzerland as a market place for foreign investment. Section 5 elaborates on Chinese foreign direct investment in Switzerland. Section 6 presents an analysis of the Chinese outward FDI in Switzerland. Section 7 draws conclusions and recommendations.

2. CHINESE OUTWARD FOREIGN DIRECT INVESTMENT

The participation of China in the global economic sphere has increased considerably during the past decades. Although there are many reasons behind this development, a major factor relates to the economic dynamism of China in the global economy (Greenaway et al., 2010). During the past decades, China has particularly focused on attracting foreign investment; FDI has been a central component of its economic policies. As a result, in 2012, China became the largest recipient of FDI inflows surpassing the long-standing position of the United States (UNCTAD, 2013). Although FDI inflows continue to be a most significant source of its economic growth, Chinese outward foreign direct investment has been increasing significantly during the last past decade. In Figure 1 we observe that while Chinese FDI outflows were practically nonexistent during the 1970s, during the 1980s and 1990s FDI outflows started to grow at a modest rate, and while the developed world was experiencing financial difficulties during the past half decade, Chinese OFDI started to rise notably (see Figure 1).

Figure 1: China FDI Inflows and Outflows, 1970-2012

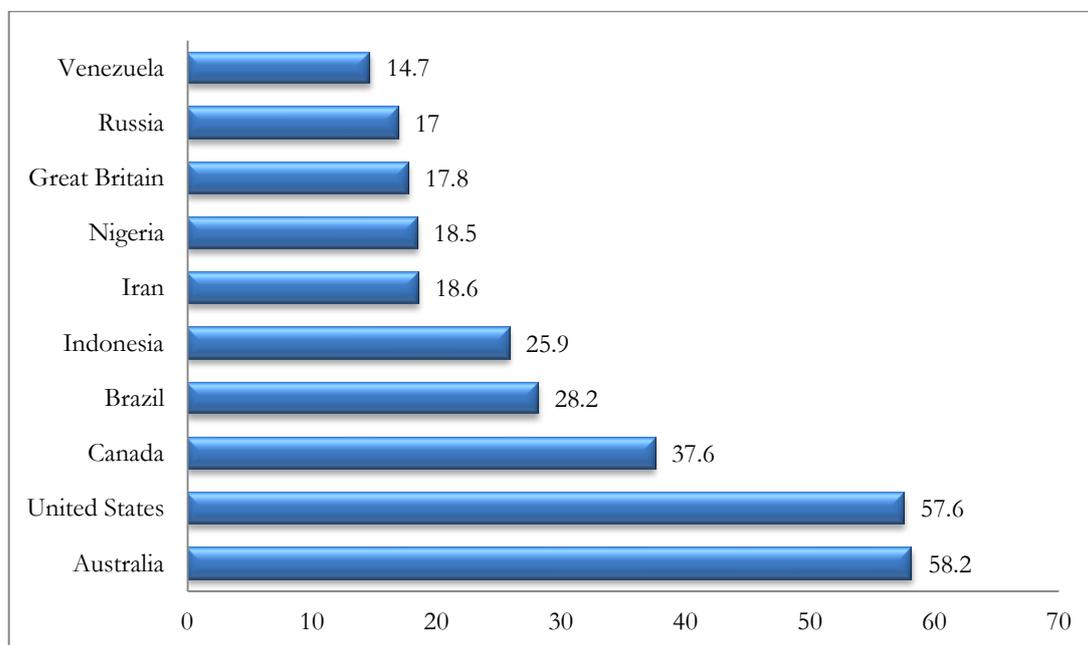

Source: UNCTAD (2013), FDI/TNC database (www.unctad.org/fdistatistics)

A variety of reasons have been offered for the emergence of Chinese OFDI. Although the emergence of China as a global investor has been attributed to its economic dynamism; however, the role of the Chinese government must be acknowledged in shaping the path of OFDI (Dunning and Lundan, 2008; Rios-Morales and Brennan, 2010; Ren et al., 2012). In 1999, the Ministry of Foreign Trade and Economic Cooperation together with other Chinese

departments launched the 'Going Global' scheme to support the internationalisation of Chinese firms. Policies were designed to encourage Chinese firms to invest and set up factories overseas (Ren et al., 2012). The Ministry of Commerce, formerly named Ministry of Foreign Trade and Economic Cooperation has been responsible for the policies and measures implemented to support and encourage the Internationalisation of firms. This institution together with the Department of Outward Investment and Economic Cooperation have been providing relevant support and practical information about investment opportunities, market research and other types of necessary information in the assessment of foreign investment (Rios-Morales and Brennan, 2010).

Figure 2: The Ten Top Chinese OFDI Destinations, 2005-2012 (in US\$ bn)

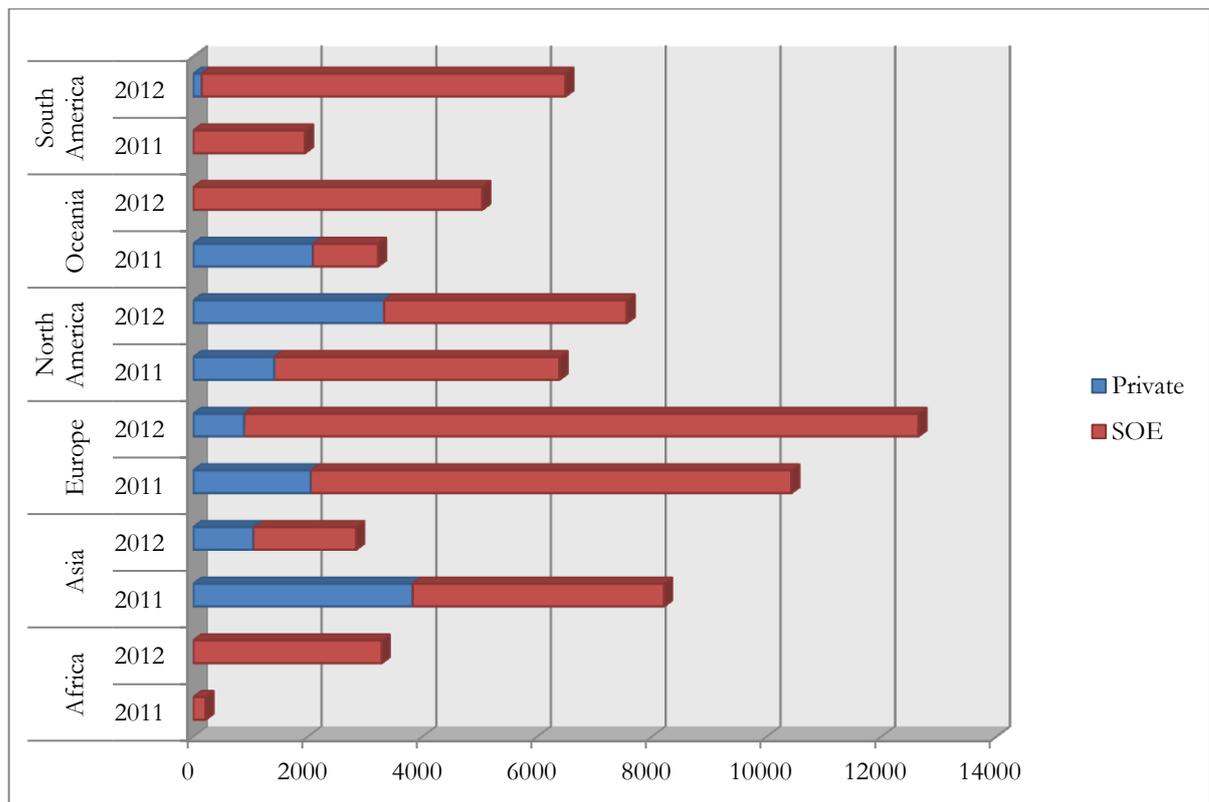

Sources: The Heritage Foundation (2013), China Global Investment Tracker.

China has been seeking investment opportunities in the developed and developing countries. According to the Heritage Foundation, the ten top destinations for Chinese OFDI during 2005-2012 were: Australia, the United States, Canada, Brazil, Indonesia, Iran, Nigeria, Great Britain, Russia and Venezuela (see Figure 2). Chinese OFDI has been oriented to maintain its added value industries, especially targeting suppliers of natural resources such as petroleum and minerals. Australia, Brazil and Indonesia have mainly received FDI from China in the agricultural and steel industries; whilst, the United States, Iran, Nigeria, Russia and Venezuela have essentially obtained investment in the petroleum industry. Unlike the other destinations, the United Kingdom received Chinese investment across a broad spectrum of

economic activities; Chinese firms have invested in the manufacturing sector, financial and business services, as well as in sales and marketing operations (Burghart and Rossi, 2009). China has also invested a considerable proportion of FDI in the Virgin Islands, Cayman Islands and the Bahamas (MOFCOM, 2008); given the status of these islands as financial havens and their prominence as destinations for China's OFDI, some critics have questioned Chinese FDI figures (Nicolas, 2007).

Figure 3: Chinese OFDI 2011-2012.

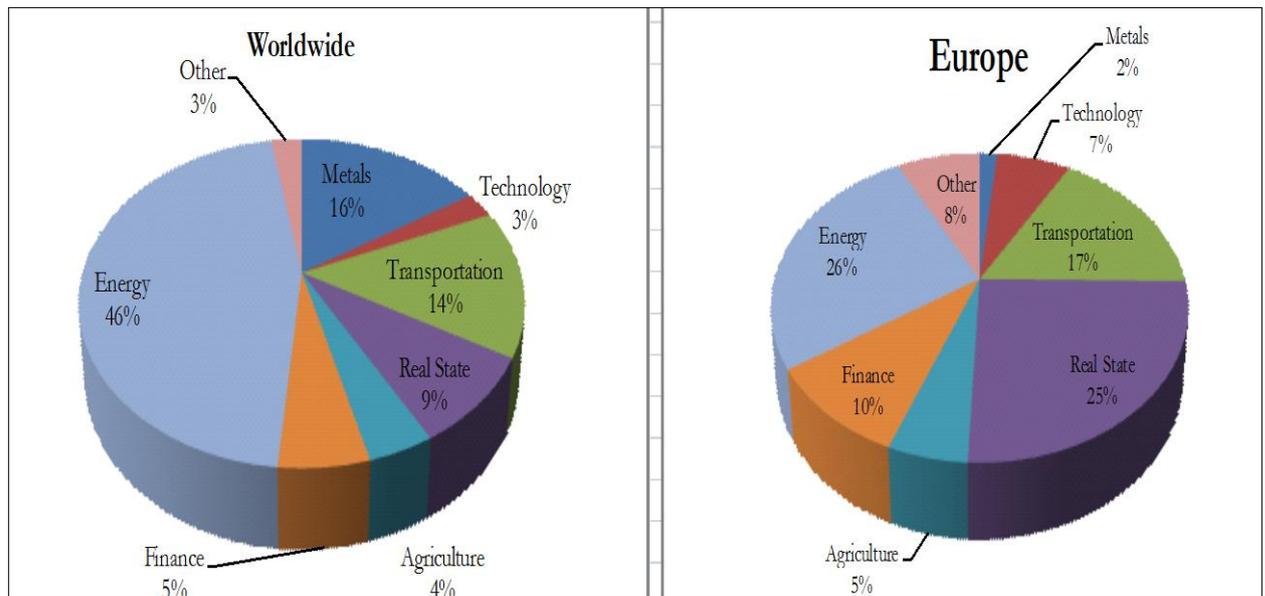

Source: A Capital (2013), The A Capital Dragon Index for the Full Year 2012.

During the period 2011-2012, the growing trend in China's OFDI can be observed across all regions of the world with the exception of Asia (Figure 3). In addition over the period 2004 to 2012 the geographical distribution of Chinese OFDI has undergone a major shift. While Asia was the largest recipient of cumulative FDI from China at the end of 2004, receiving 75 percent of total Chinese investment, Latin America followed as the second most important market site for FDI from China reaching 18 percent; North America, Africa and Europe each obtained 2 percent and the Ocean Continent received 1 percent of cumulative FDI from China by the end of 2004 (MOFCOM, 2005); by 2012, Asia was the smallest recipient of Chinese FDI.

In 2012, Europe was the most important location for Chinese investment, obtaining 33 percent of total Chinese OFDI; followed by North America with 20 percent, South America with 17 percent, Oceania with 13 percent, Africa with 9 percent and Asia obtained 8 percent (A Capital, 2013). This shift also applies to the industrial sector distribution of Chinese OFDI. By investing in Europe, Chinese firms are moving away from resource-seeking investment that has greatly influenced the early internationalisation stage of Chinese OFDI. We can also observe from Figure 3 that investment from state-owned enterprises (SOE) continues to dominate Chinese OFDI worldwide, nonetheless, a sizable proportion of privately own investment has been located in Asia, Oceania, North America and Europe.

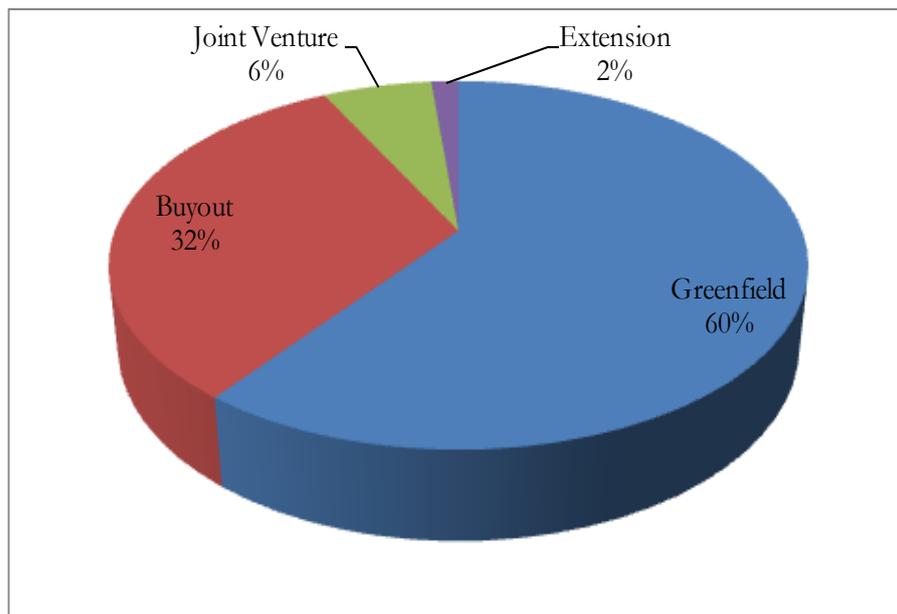

3. CHINESE OUTWARD FOREIGN DIRECT INVESTMENT IN EUROPE

Chinese investment directed to Europe has grown rapidly in the last couple of years; this trend promises to continue growing. In 2011 and 2012, Europe has been the largest recipient of Chinese investment, receiving 34 percent and 33 percent respectively of total Chinese foreign investment (A Capital, 2013). This represents a major increase in the proportion of Chinese FDI going to Europe. Unlike other regions that mostly receive from China investment in natural resources, Europe obtains Chinese investment in a wide range of industries. Chinese firms are locating their capital in the business and financial services, real state, telecommunication, energy, high technology and in other sectors such as healthcare and education (see Figure 4). Chinese OFDI in Europe demonstrates an expansion of its investment programme, moving from resource-seeking investment to a market-seeking and strategic-asset-seeking investment approach. This change of strategy has been confirmed by different surveys conducted on the motives of Chinese investment, including the survey conducted by the World Bank. These surveys have revealed that the primary motive of Chinese investment in Europe is the expansion of their market share in host countries, followed by the strategic-asset-seeking motives that provide access to new technologies, well-known brands, distributions channels and managerial know-how (Nicolas, 2007).

Figure 4: Chinese OFDI by Sectors: Worldwide and Europe

Sources: The Heritage Foundation (2013), China Global Investment Tracker.

Another characteristic of Chinese investment in Europe is framed by the business environment's opportunities. During a period in which the Western economies have been facing severe financial distress in which the business environment has been characterised by liquidity pressure, asset write-downs and risk aversion, Chinese investors have been taking the opportunity to buy struggling European firms (Berger, 2008; Nicolas, 2009; the Economist, 2011). Although Figure 5 displays the entry modes of Chinese OFDI in Europe from 1980-2007 period in which 60 percent of Chinese investment in Europe is *greenfield* investment, while *buyout* constitutes 32 percent, *joint ventures* 6 percent and *extension* 2 percent, we expect that these figures might have been modified in the last few years as it has been observed that a number of European companies have been bought out with Chinese capital.

Figure 5: Entry Modes of Chinese Firms in Europe: 1980-2007

Source: Hay and Milelli (2010), adapted from Table 9.1.

Although Chinese investment in Europe has been increasing rapidly in recent years, Table 1 shows that the share of Chinese OFDI in Europe is still rather small. In 2009, Chinese investment in Europe (27 members of the EU) amounted to €5.9 billion, increasing to €6.4 billion in 2010 and rising to €15 billion in 2011. Table 1 lists the ten top European partners in terms of FDI. While China is represented among the ten top partners in terms of European investment in China, conversely China is not among the ten top investors in Europe during this period despite Europe having been the most attractive location for Chinese FDI. In 2011, Chinese investment amounted for 0.4 percent of total FDI inflows in Europe (European Commission-Eurostat, 2013). However, as displayed in Table 1 we observe that Chinese investment in Europe is growing faster (155.4 percent) than is the case for the other European partners, signalling this trend will continue to grow. It is expected that this expansion will be also fostered by the investment agreement negotiations agreed at the 14th European Union-China Summit held in Beijing in February 2012; the European Commission publically expressed its commitment to bringing this initiative forward in May 2013. The main aims of these investment negotiations have at its core the improvement of the protection of investment, to reduce investment barriers and encourage investment flows (European Commission, 2013).

4. SWITZERLAND AS A MARKET LOCATION FOR FDI

Switzerland is one of the most attractive locations for FDI in the world, in the Global Opportunity Index 2012 Switzerland had scored number eight among the countries in the world. This index measures the attractiveness of a market site for FDI that ranks countries according to the criteria that mirrors the countries' degree of economic openness and opportunity for foreign investment (Global Opportunity Index, 2013). The positioning of this small country amongst the world's most attractive locations for FDI is explained by a variety of factors. Among the most important determinants of attractiveness for FDI are the quality of the business environment and the stability of the legal, political and social system (Gugler and Tinguely, 2010). The highly qualified labor force that Switzerland possesses is also acknowledged as an important determinant; the Swiss education system has been influential in developing a qualified labour force (Swiss-American Chamber of Commerce & Boston Consulting Group, 2008). At present, Switzerland is a world's leader in innovation, scientific research and technology output; features that have been also instrumental in attracting high quality FDI into the country (Rios-Morales et al., 2013). Switzerland's capacity for innovation

has placed this country as one the most competitive countries in the world (World Economic Forum, 2011).

Figure 6: Proportion Swiss Inward FDI by Regions

Source: Swiss National Bank (2013), Investissements directs étrangers en Suisse.

Foreign direct investment has been an important component of the Swiss economy; foreign investment contributes about 23 percent of the Swiss gross domestic product (ACC and BCG, 2007). Foreign firms also contribute to the export sector and job creation employing around 10 percent of the Swiss labour-force (Gugler and Tinguely, 2010). A large proportion of inward FDI comes from Europe, contributing around 80.54 percent of total Swiss inward FDI during period 2007-2011; followed by North America which has invested around 15.96 percent, Latin America has invested around 2.17 percent and Asia, Africa and Oceania having contributed with only 1.32 percent (see Figure 6). A large percentage of FDI is located in the services sector, representing 87 percent of total FDI inflows from which the financial services obtains 56.2 percent, commerce 17 percent, the banking sector 5.5 percent, insurances 3.9 percent, transportation 2.5 percent and other services 1.6 percent. The industrial sector attains around 13 percent of total FDI inflows from which 6.4 percent is located in the chemical industry, 3.7 percent in the electrical and electronics sector, 1.7 in the machinery sector and 1.2 percent in other industries (Swiss National Bank, 2013).

5. CHINESE OUTWARD FOREIGN DIRECT INVESTMENT IN SWITZERLAND

Chinese investment directed to Switzerland has grown rapidly in the last few years. Since the establishment of large Chinese MNEs such as Lenovo, GMT Management and M.E. Times in 2006, we observe that Switzerland has received around 60 more Chinese firms (see Table 2). Although the availability of official data on Chinese OFDI to Switzerland is still scarce, it has been estimated that Chinese investment in Switzerland could have reached the sum of US\$180 million in 2012. Whilst it is difficult to estimate with precision the number of state own enterprises and private firms, Switzerland is hosting both types of firms. We can also recognize that the great majority (71 percent) of these firms have chosen the *greenfield* entry mode which is known for their participation in job creation, while 26 percent of firms have chosen the *acquisition* mode and only 3 percent have chosen the *joint-venture* mode which characterised the early stage of the internationalisation of Chinese investment.

Table 2: List of Chinese Firms Operating in Switzerland

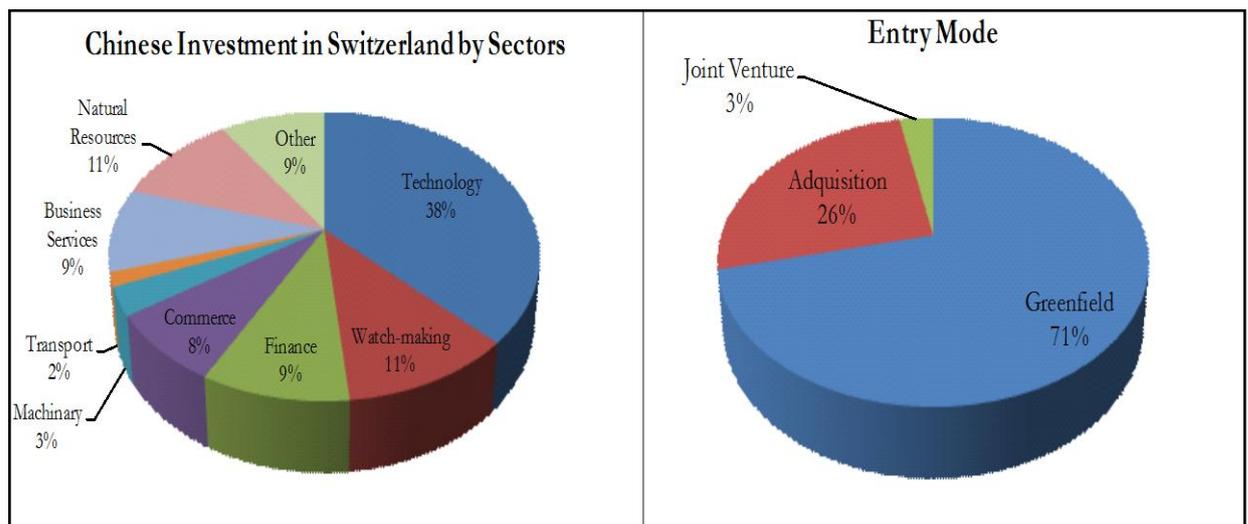

Year of Inv.	Company	Mode of Entry	Activity
2007	Absolut Invest	Acquisition	Software
2009	Addax Petroleum	Acquisition	Natural Resources
2009	Alfex	Joint venture	Watch making
2007	Alibaba	Greenfield	e-commerce
2008	Bank of China	Greenfield	Bank
2009	Balin Precision Technology	Greenfield	Electronic components
2009	Brightoil Petr. Geneva Ltd	Greenfield	Natural Resources
2008	CBC Switzerland	Greenfield	Market research
2002	Cetronic	Acquisition	Electric equipment
2012	China Business House	Greenfield	Business service
2009	CCTV	Greenfield	Television
2009	China Equity Exchange	Greenfield	Finance
2011	CF Asset Management	Greenfield	Finance
2009	China Unionpay	Greenfield	Bank
2009	Chaarat Gold Holdings Ltd	Acquisition	Mine
2004	COSCO	Greenfield	Transport
2013	Duferco	Acquisition	Steel
2008	eBaoTech,	Greenfield	Software
2012	Eberli Holding AG	Acquisition	Construction
2010	Eoply New Energy Technology	Greenfield	Solar energie
2012	Eterna	Acquisition	Watch making
2009	Eurosina	Greenfield	Watch making
2011	E&F Transped Trading	Greenfield	Natural Resources
2012	Fair Wind Europe	Greenfield	Infrastructure

Year of Inv.	Company	Mode of Entry	Activity
1991	Gimelli Produktions AG	Acquisition	Electric équipement
2006	GMT Management	Greenfield	Infrastructure
2009	Great View Aseptic Packaging Europe	Greenfield	Commerce
2005	Hantec Europe	Greenfield	Finance
2008	Heritage Fund management	Acquisition	Bank
2013	Hôtel Europe Europaischer Hof	Acquisition	Hotel
2008	Huawei	Greenfield	Technology
2011	Hubei Chuyuan International	Greenfield	Commerce
2010	Jiangsu Akcome Solar Science and Technology	Greenfield	Solar energie
2010	Jeanstar	Greenfield	Watch making

Figure 7: Chinese Investment in Switzerland by Sectors and Entry Mode

Source: Estimated from figures of Table 2

Chinese investment in Switzerland has been allocated to different sectors of the economy ranging across a wide variety of activities. However, the sector that has attracted the highest proportion of Chinese firms is the technology sector, receiving around 38 percent of the total proportion of Chinese firms established in Switzerland. The natural resources sector and the watch-making industry are the second most attractive sectors for Chinese investment. Each sector accounts for around 11 percent of total firms. Investment in the Swiss natural resources sector differs from those undertaken in Latin America and Africa. Although Switzerland lacks natural resources, it does however have large MNEs operating in this sector. Chinese firms have acquired Swiss MNEs operating in natural resources, for instance, in 2009; Sinopec bought Addax Petroleum a large Swiss petroleum company. Other firms such as Brightoil Petroleum, and E&F Transpeed Trading that have been established as greenfield investments have based their headquarters in Geneva. The watch-making industry which is a traditional industry in Switzerland seems to have attracted a significant proportion of Chinese capital, followed by the sectors of finance and business services which each account for 9 percent,

while commerce accounts for 8 percent, machinery 3 percent, transportation 2 percent and other activities account for 9 percent (see Figure 7).

Although Chinese investment in Switzerland is still relatively insignificant, it has shown a clear upward trend over the past two years. Despite the major cultural, historical and political differences that exist between China and Switzerland, strong economic cooperation is emerging between these two countries. This dynamic cooperation started in 2009 with the signing of a bilateral investment agreement (BIT). This BIT entered into force in April 2010 (SECO, 2010). To broaden economic cooperation, China and Switzerland signed a free trade agreement (FTA) in July 2013. This accord addresses the protection of intellectual property, investment promotion, fair competition, transparency, trade-related environmental and labor issues. However, the main objective of this FTA is promoting the increase of international trade of both signing parties (SECO, 2013). While in 2012, Swiss exports to China accounted for around US\$8.1 billion, representing 3.7 percent of total Swiss exports, China's exports to Switzerland accounted for around US\$10.95 billion (SECO, 2013). Whilst a steady increase of Switzerland's imports from China is observed, accounting for 3.86 percent of total imports in 2010, 3.99 percent in 2011 and 5.08 percent in 2012, Swiss exports to China remain relatively constant, accounting for 3.66 percent of total exports in 2010, 4.27 percent in 2011 and 3.70 percent in 2012 (Swiss National Bank, 2013). Switzerland mainly supplies China with specialised industry machinery, luxury watches and electrical machines, China supplies Switzerland with manufactured products such as textiles, toys, apparel and electronic components (L'Hebdo, 2013).

6. ASSESSING OUTWARD FDI FROM CHINA TO SWITZERLAND

Outward FDI from China to Switzerland is perceived as a new phenomenon. In the last few years, China has deepened its relationship with Switzerland through the bilateral investment agreement signed in 2009 and the free trade agreement completed in 2013. Although Chinese investment in Switzerland is still relatively small, a reflective examination from both the theoretical and international business perspective is necessary. Outward FDI from China to Switzerland conforms to the stages of the internationalisation theory. The evolution of internationalisation of Chinese firms to Switzerland has a trajectory background based on the evolution of trade. However, two features of outward FDI from China to Switzerland challenge the conventional understanding of internationalisation. These features are 'psychic distance' and the political aspect of the internationalisation of Chinese firms.

According to the Uppsala-model of internationalisation of FDI, firms invest in countries or regions with similar idiosyncratic features. Mainstream theories of internationalisation assume that dissimilarity in cultural, linguistic, institutional and developmental levels between the investor and the host country increases the cost of doing business which finally results in a competitive disadvantage for the firm (Child and Rodriguez, 2005). In the case of China and Switzerland, the 'psychic distance' between these countries is enormous. Although China is not the first country that has challenged conventional theory in this respect, the question is whether Chinese investment in Switzerland will successfully integrate. Different studies have revealed that Chinese firms have been unsuccessful with their investments abroad due to their ineffectiveness in integrating their companies' operations in foreign markets, especially in the developed world (Nicolas, 2007; Brown and Wood, 2009). The challenge of "liability of foreignness" is however present and since local firms are more mature than those from the developing world (Hitt et al., 2005; Nicolas, 2007); Chinese investment in Switzerland carries an element of risk.

The other aspect of this case that challenges conventional theory is the political aspects of outward FDI from China. Mainstream theories remain largely focused on the economic factors of FDI that influence the decisions of foreign investors and fail to consider the influence of governments on FDI. In the internationalisation process of Chinese firms, government policies have played an important role. Since the implementation of the market economic model in the late 1970s and the launch of 'Going Global' scheme in 1999, Chinese firms have been encouraged to invest abroad and improve their global competitiveness (Ren et al., 2012). The traditional Chinese firm oriented to the domestic market has evolved into a modern Chinese firm oriented to expand internationally (Erdener and Shapiro, 2005). While most governments nowadays are playing an active role in creating incentives by adjusting economic policies to encourage FDI (Blomström, 2001), the degree of the involvement of the Chinese government in the internationalisation of firms is very high (Ren et al., 2012). In contrast to its counterparts, China provides support in every aspect needed toward the internationalisation of its firms. The Chinese government supports the internationalisation of firms by providing quality information about investment opportunities, preparing market research and given training to nationals on topics concerning international business and providing financial support (Keller and Vanoli, 2012). The Government has also fostered intergovernmental cooperation through bilateral investment treaties, free trade agreements and regional trade agreements; these have been acknowledged as important facilitators of FDI in the global economy (Rios-Morales and Brennan, 2010).

A number of studies have posed the question as to whether Chinese firms would have been successful in their internationalisation process without the support received by the Chinese government, considering that Chinese firms have relatively weak competences in technological know-how, management skills and ability in integrating acquired firms, often with a very dissimilar corporate culture from the Chinese firms (Deng, 2004; Nicolas, 2007). Ren et al., (2012) suggest that the rapid increase of Chinese OFDI is the result of the state involvement in the process of firms' internationalization, shaping not only the trajectory of firms but also of China. Since China becoming a member of the WTO in 2003, an opportunistic approach has characterised the internationalisation of Chinese firms. In the early years of Chinese OFDI, capital was oriented towards rich natural resource countries. The pull factors of Chinese investment were based on stable supplies of natural resources to support China's added value industries (Gottschalk and Prates, 2005). Subsequently, Chinese firms have moved to market-seeking strategies, targeting the developed world and more recently, moving to strategic-asset-seeking investment.

The main motives for Chinese firms locating in Switzerland relates to strategic-asset-seeking. Switzerland offers access to sophisticated skilled labour force, managerial know-how, established brand names and international distribution networks. However, Switzerland has been historically associated with a well-developed manufacturing sector, the production of top-quality custom-built equipment and products of precision engineering. Switzerland is also renowned for its exquisitely engineered luxury timepieces, the watch-making industry have earned world renown for their expertise, workmanship, and creativity. Switzerland also possesses a favourable business environment.

6.1. Drivers and Motivators of Chinese OFDI to Switzerland

The above distinctiveness of Switzerland are some the most important drivers and motivators of Chinese OFDI. In our appraisal of the Chinese OFDI to Switzerland, we have identified that a large proportion of companies investing in the technology sector have placed their investment in the solar energy. The energy sector in Switzerland has been traditionally well-known for its innovation, for centuries the physical energy of falling water has been the main source of the manufacturing sector; contributing to the development of pioneering engineering and advanced know-how in this industry. Nowadays, Switzerland is the world's leader in renewable energy (Rios-Morales et al., 2013). The second most attractive sector for Chinese OFDI in Switzerland is the watch-making industry. As mentioned above;

Switzerland is the traditional world leader in this sector due to its expertise, workmanship and inventiveness. Chinese firms have also placed their capital in the natural sources sector. Although raw materials are scarce in Switzerland, the country has a number of well-established MNEs in this sector. Although there have been a number of acquisitions in this field, a large proportion of Chinese OFDI is greenfield. These Chinese companies have based their headquarters in Geneva, taking advantage not only of the fiscal system but also of the networking system provided by this metropolitan city. The sector of finance is another Swiss targeted sector by Chinese OFDI; again, this is another traditionally well-developed sector in Switzerland. While there has been only one acquisition in this field, greenfield investment in the banking and investment sub-sectors are observed with the Bank of China a leading investor (see Table 2).

Chinese firms in the business services sector have also been established in recent years. However, we have identified that most of these firms are of a small size; their social capital accounts for only about CHF50,000 (approximately €40,575). These firms seem to have identified the need to provide support to Swiss exporting business to China and Asia, as well as providing information about investing in China and in the Asian region. It is noteworthy that the first firm *Shanghai Overseas* was already established in 1980 in Geneva, while its counterparts have launched their business in very recent years (see Table 2). Chinese firms located in the commerce sector are small-medium sized enterprises with similar social capital to those working in the business services sector. The machinery sector in Switzerland is also a well-established and renowned sector; although we have identified only two firms in this sector, one was a Chinese acquisition and the other is a greenfield investment. Similar to other Chinese firms, these firms have their headquarters in Switzerland but their manufacturing plants are established in China; one of these firms have the following logo "*Swiss engineering Chinese manufacturing*". In the transportation industry, COSCO the Chinese State-own MNE has a presence in the Swiss market. Chinese investors have also placed their capital in other sectors such as the hotel industry, television and other activities.

6.2. Opportunities and Challenges for Switzerland

Foreign direct investment has been acknowledged for its contribution to the host economy through job creation, increase in exports and long-term economic development. While a large proportion of Chinese OFDI in Switzerland is greenfield investment (see Figure 7), currently

it is difficult to estimate the number of created jobs by Chinese OFDI. Considering that a large proportion of Chinese companies established in Switzerland are relatively small enterprises and those that have large capital have placed their production plants in China, coupled with the fact that Chinese OFDI is still small, it is estimated that the contribution of Chinese OFDI toward job creation in Switzerland is currently insignificant. With respect to the increase in exports, it is also considered that the contribution toward the export sector is minor; if products are not produced in Switzerland but rather in China, there would not be a contribution towards the export sector. However, Chinese OFDI in Switzerland could contribute with the on-going improvement of efficiency and competitiveness of the economy. It could also provide greater access to Swiss firms in China and the Asian region.

Although Switzerland has attracted Chinese OFDI in various sectors, there is a tendency for Chinese firms to invest in sectors that have particular strength and advantage in the global market; sectors such as advanced-technology, watch-making, finance and machinery. These sectors are distinguished around the world for their top-quality, custom-built, efficacy and innovation. Investing in these sectors indicates the ambition of Chinese investors to attain strategic-assets that have been traditionally known in the international market for their high-value. Although this may well create a genuine competitiveness in the Swiss business sector, challenges with respect to price of products and their quality and unfair competition could develop. While Swiss products produced in Switzerland carry higher costs, "Swiss products" produced in China would be cost-effective. The strategy of "*Swiss engineering Chinese manufacturing*" raises some apprehension concern with the possible leakage of critical Swiss technologies to China, this concern that has also raised apprehension in Europe. The other concern arising from this strategy adapted by some Chinese investors is related to the possible undermining of the long established "*Swiss made*" reputation. Given that Chinese products are known for their generally low-quality levels, there is the possibility that this strategy could harm the reputation of Swiss products and mislead customers in the international market.

7. CONCLUSIONS AND RECOMMENDATION

The impact of OFDI from China to Switzerland is still relatively insignificant; the main reasons are due to the still small share of total FDI in Switzerland, the establishment of a large proportion of small enterprises and that many of the large Chinese companies have established their headquarters in Switzerland but their plants are based in China. Although

developed countries continue to be the most significant source of FDI in Switzerland, Figure 6 shows that the share of FDI inflows from the Asia, Africa and Oceania region, which China is part of, has increased more than threefold in the last few years. Chinese investment in Switzerland is expected to continue growing. Investing in Switzerland indicates that Chinese investors are willing to compete at the global level and to take on the challenge of the 'liability of foreignness', which carries an element of risk. Nonetheless, it is worth noting that outward FDI from China to Switzerland has been influenced by political considerations including home government mandate and host country government' receptivity to Chinese investment.

While the Swiss government has shown enthusiasm in engaging commercially with China, it needs to be mindful that China is determined to have access to strategic-assets to ensure the long-term security of its economic advance. Swiss authorities need to be aware of the challenges that Swiss firms might face in terms of price competitiveness when Swiss technology is transferred to China. Swiss authorities should also protect the long-well-renowned "Swiss Made" label. Swiss authorities should also ensure that the investment and trade agreement treaties work both ways as it is observed that while exports from China to Switzerland have grown in recent years, Swiss exports to China have remained relatively constant.

ABSTRACT

Purpose – The aim of the paper is to analyze the phenomenon of Mergers and Acquisition in high-tech sectors with a special focus on biotechnological firms. In recent years there was an impressive wave of mergers and acquisitions (M&As), but this operations have produced mixed results for their stakeholders. In fact despite their popularity, M&As produce mixed results for stakeholders Fowler and Schmidt, 1988; Lubatkin and O'Neil, 1987; King et al., 2004), and there has been no systemic vision.

Design/methodology/approach – The paper can be classified like a descriptive paper. After a literature review on M&AS processes on high-tech sectors, the paper analyzes the dynamics, the results and the specificities of red biotechnological Mergers and Acquisitions.

Findings – In the biotech sector, over the last few years - during difficult economic times - it was difficult to attract investor capital. In this context, it's possible to identify a specific trend: traditional pharma companies with sufficient cash from their existing sales, but facing a dried-out product and patent pipeline have acquired innovative, but cash-poor biotech firms.

Research limitations/implications – The limitations of the paper consequent to its very nature: a secondary data-based research and a largely conceptual one, requiring further empirical testing and development.

Keywords : M&A, Biotech and Pharma Industries, Strategies

INTRODUCTION

In recent years there was an impressive wave of mergers and acquisitions (M&As). What was traditionally considered to be extraordinary operations have become common business development options. During the first half of 2011, global M&A continued the resurgence that began in the second half of 2010, but markets cooled in the second half of 2011, resulting in aggregate volume of US\$2.38 trillion in 2011.

Stock market volatility, fear of a “double dip”, concerns over European sovereign debt and the future of the Euro zone, and regulatory uncertainty in the United States and Europe have created uncertainty in the market and put a number of deals on hold. However, would-be acquirers’ considerable cash stockpiles, strengthened balance sheets, access to attractive financing (for many investment grade borrowers), and need to expand into new markets are continuing to drive acquisitions. Megadeals returned in 2011, particularly in the energy and pharmaceutical industries; nine deals exceeded US\$15 billion in value, compared to just four during all of 2010 (XBMA, 2011).

Despite being a highly popular form of corporate development (Cartwright and Schoenberg, 2006), M&As produce mixed results for stakeholders (Fowler and Schmidt, 1988; Lubatkin and O’Neil, 1987; King et al., 2004). In spite of the extensive economics debate surrounding M&As, there has been no systemic vision or consolidated models that integrate the different schools of thought (Stahl and Voight, 2008; Weber and Drori, 2008). The complexity of the variables involved in the external growth process has favored analysis based on partial vision rather than a comprehensive and integrated analysis.

In this context, the research analyzes the phenomenon of Mergers and Acquisition in a specific sector: biotechnology. “The nature of high-growth technology-based industries distinguishes them from other types of industries. In addition to their high-growth potential, however, another distinctive feature of high-tech industries is the inherent uncertainty associated with companies whose values rely on future outcomes or developments in unproven, uncharted fields” (Kohers and Kohers, 2000: 40). Moreover, high-tech sectors’ strategies are viewed in the context of the overall business and consumer environment changes of recent years (Vrontis and Thrassou, 2007; Thrassou and Vrontis, 2009); their consequent business transformations, often through innovation and new product development (Thrassou et al 2012a,b; Chebbi et al, 2013); as well as national and locality contexts (Bresciani et al, 2013).

In the following section we present the methodology. Subsequently a literature review is conducted on M&As in high-tech sectors, with a specific focus on biotech firms. In the third section we define principal deals and strategies used by principal acquirers. Finally we present conclusions and managerial implications.

METHODOLOGY

Aims and objectives

The research is based on secondary data (XBMA, 2011; HBM, 2012) and aims to describe the phenomenon of Mergers and Acquisitions in high-tech sectors with a specific focus on biotech firms.

It is an overview of the state of the art of M&A in the biotech industry and has the research objectives of:

1. executing a literature review of M&A in high-tech sectors, with a specific attention on biotech sector,
2. analyzing the dynamics, results and specificities of biotech M&A,
3. describing principal deals and M&A strategies in biotech industry.

Research value and limitations

The paper can be classified as a descriptive paper. On the basis of previous researches (Rossi et al., 2011; Tarba et al. 2013) after a literature review on M&A processes on high-tech sectors, the paper analyze the dynamics, the results and specificities of biotechnological M&A.

The value of the paper stems from the fact that it defines and helps comprehension of the link between the biotech industry and M&A activities. The research offers a valuable theoretical basis for empirical development and practical application. At the same time, this research provides the context of prescribed actions and processes.

The limitations of the paper are a consequence of its very nature, the fact that it is a secondary data-based research and a largely conceptual one. Consequently further research should firstly empirically test this research's findings.

M&As in high-tech sectors: Literature review

M&As have been studied using different approaches that have generated a considerable amount of empirical and theoretical studies, resulting in high fragmentation of points of view (Capasso and Meglio, 2005). This consideration is particularly true for high-tech sectors that were characterized – in last decades – for a significant expansion of Mergers and Acquisition activity. In these sectors “many operations involved the acquisition of small and young start-ups. The principal driving force behind these acquisitions was the need of the acquiring firms to obtain new skills and new technical and technological knowledge” (Tarba et al, 2013: 6). The most important characteristic are the strong link to core business of firms. Kohers and Kohers (2000) sustain that “The nature of high-growth technology-based industries... and the inherent uncertainty associated with companies whose values rely on future outcomes or developments in unproven...” have a strong impact on M&A process in these sectors.

There are difficulties to define what does hi-tech M&As mean. In fact M&As in high technology sectors concern two different typologies of acquisitions: the acquisition of high-tech companies and acquisitions in which technology is only one component of the acquired firm’s assets (Ahuja and Katila 2001).

These factors determine an high heterogeneity in the literature, both in methodology and in the results achieved. For these reasons it’s important to define the subject of the investigation. A common topic is acquisition performances but other important topics are the complex process of integration and/or the complex strategic decisions process. Despite the extreme fragmentation of the literature, in a specific study, Meglio (2009) divided the literature on M&As in technology-driven sectors into these three main areas: strategic decision-making, integration process, and acquisition performance.

Only three of these paper – Schweizer, 2005/2005a; Laamanen e Keil, 2008 – have focused their attention on biotechnology firms.

Schweizer (2005a, 2005b) focuses its attention on Integration process and on knowledge transfer particularly. The first article focuses the post-acquisition integration of biotech firms by pharmaceutical companies. It is based on a short analysis of recent issues in the pharmaceutical and biotechnology industries and on five in-depth case studies. In view of the complexity and the multifaceted nature of M&As, Schweizer (2005a) concluded that pharmaceutical companies should apply a hybrid post-acquisition integration approach with simultaneous short- and long-term motives/orientations, and segmentation at a different pace

across different value chain components. In his second paper Schweizer (2005b) analyzed the consequences of the acquisition of biotech companies for knowledge transfer and the organization of R&D at acquiring pharmaceutical companies. The author concluded that there is no systematic biotechnological know-how transfer from the biotech to the pharmaceutical company after the acquisition. Instead, the biotech companies remain independent and assume the role of centers of excellence for R&D within the pharmaceutical companies, which is the only way of preserving the innovative capabilities of the acquired biotech company.

In their study Laamanen e Keil (2008) focus their attention on acquisition performance. Biotech is only one of seven sector considerate form authors. In fact they examined acquisitive performance among several of the most active acquirers in seven industry sectors (pharmaceuticals and biotechnology, computers and office equipment, packaged software, communications equipment, measuring and medical equipment, telecommunications, and health services) in the US in the 1990s. They found that a high rate of acquisitions is negatively related to performance: "An acquirer's size, the scope of its acquisition program, and acquisition experience moderate the relationship by weakening the negative effects" (p. 663).

BIOTECHNOLOGY M&AS: DEALS AND STRATEGIES

"Biotechnology Mergers and Acquisition (Biotech M&A) can help the industry's fully integrated players to increase in size and market value, boost the emerging players' efforts to reach full integration or allow horizontal players to survive cyclical financial crises" (Pavlou, 2003: 85).

In his research Pavlou (2003) defines principal reasons for M&A in the biotechnology sector: increase pipeline productivity, support market expansion, aid the transition towards full integration.

"Pharmaceutical companies are facing the challenges of a declining pipelines of products, a continuing increase in the costs to develop and commercialize new products and a more demanding market that is reducing the prospects to achieve premium pricing for new drugs. These market dynamics are likely to effect pharmaceutical M&A activities in the following ways" (Kohl, 2005: 105)

Traditionally it's possible to define two different typologies of M&A:

1. acquisition of biotechs by pharmaceutical firms (intersector activity);
2. biotech-biotech mergers (intrasector activity).

The intersector M&A concern a phenomenon of acquisition by Pharma companies of biotech firms. Biotech companies offer one obvious source of new products. Large pharmaceutical companies have partnered with biotech to develop and commercialize particular products for many years. A more recent, less cautious, trend is for pharmaceutical companies to make outright acquisitions of biotech. There are many examples in recent years: the acquisition of Antisoma by Roche the acquisition of Esperion Therapeutics by Pfizer and the Johnson & Johnson acquisition of Scios. Through the acquisition of a biotech, a pharmaceutical firm can add new technologies, new product platforms in a way that is more cost effective than developing these items from scratch. Additionally, biotech products are more difficult to reproduce by competing generics companies and therefore may be less vulnerable to patent expiration. A biotech company, in turn, can benefit from a pharmaceutical company's improved financial and marketing strength and greater experience in developing drugs through trials. Also, in the absence of a robust IPO market for biotechs, a sale may be the best way for the biotech founders and venture capital backers to realize a return from their investment. There may, however, be greater difficulties in achieving a successful integration of a pharma-biotech merger. The R&D expertise of a biotech may not be compatible with that of a pharmaceutical company, although this issue may become less of a factor as the therapeutic platforms of biotechs and pharmaceutical companies move toward convergence. Perhaps more important are the differences in culture that may be faced between pharmaceutical firms and biotechs. Biotech scientists and managers, who have generally grown up in an entrepreneurial culture, may have difficulty in adjusting to a big-business culture of a large pharmaceutical company (Kohl, 2005).

The intrasector M&A concerns a process between two biotech firms. This is a relatively recent trend. Examples are the Biogen-Idex merger and the acquisitions by Amgen of Immunex and, most recently, Tularik. As biotechs have grown into significant players large biotechs, like the big pharmaceutical companies, have increasingly looked to mergers with other biotechs to achieve needed critical mass and economies of scale. Merged biotech companies hope to achieve enough sales revenue to support their own manufacturing, marketing and sales operations. These types of deals demonstrate an increasing maturation of the biotech

industry. Also, a biotechbiotech merger may face less problematic integration issues than pharma-biotech acquisitions (Kohl, 2006).

In sum, the pharmaceutical industry faces numerous uncertainties driven by market, technological and regulatory factors. In light of these factors, pharmaceutical and biotech companies certainly will continue to employ M&A activities as a short-cut in product development and a means to maintain and enhance their competitive edge.

The number of M&A transactions in 2011 (71 deals) was a bit lower than in 2010 when a record number of 79 transactions were completed. 24 public companies were sold in 2011 (compared to 20 in 2010). 2011 showed strong M&A activity in the North American and European pharma/biotech sectors with upfront transaction volumes reaching \$64.1 billion. When comparing 2011 with 2010, one should consider that the deal volume in 2010 includes the purchase of Novartis' remaining stake in Alcon for \$41 billion which accounted for over half of that year's transaction volume (HBM, 2012).

In 2011, US target companies accounted for almost two thirds of deal volume (\$42.8 billion, 39 deals). The 28 European biopharma companies sold generated \$21.2 billion of transaction volume. Even if one excludes the Nycomed/Takeda deal, transaction volume in Europe was at a similar level (\$7.5 billion) as in 2010 (\$7.6 billion). Finally, 4 Canadian companies were sold in 2011 for a total of \$133 million. The largest deal in 2011 was the purchase of Genzyme by Sanofi for \$20.1 billion plus contingent payments of approximately \$2.8 billion. The sale of private-equity-backed specialty pharma Nycomed to Takeda for \$13.7 billion marks the largest-ever trade sale of a private pharma company. Other notable transactions were the sale of Cephalon to Teva (\$6.8 billion), the sale of King Pharmaceuticals to Pfizer (\$3.6 billion), the sale of Talecris to Grifols (\$3.4 billion) and the sale of Crucell to J&J (HBM, 2012).

The number of trade sales of VC/PE-backed companies also held up well (31 trade sales vs. 32 trade sales in 2010), whereas the number of "other" private companies sold dropped from 27 in 2010 to 16 in 2011.

In 2011, as in previous years (with the exception of 2009), European buyers again significantly outspent their US peers on biopharma acquisitions. European buyers not only have been more active buyers in their home region, i.e. in Europe, they also put up more money for US acquisitions than US buyers (HBM, 2012): Since 2005, European pharma firms have purchased US companies for a total of \$192 billion whereas US pharma buyers "only" spent \$170 billion (of which \$109 billion was accounted for by the two megadeals Pfizer/Wyeth and

Merck Inc./Schering Plough). Even if one excludes the two largest US acquisitions by European firms (Roche/Genentech \$46.8 billion and Novartis/Alcon \$52.1 billion¹), European buyers still disbursed close to \$100 billion on other US acquisitions.

In every year covered by this report, large pharma companies have been clearly the most important buyers of US and European biopharma companies contributing 58% (2005) up to 96% (2009) of yearly transaction volume (see chart on next page). This percentage is of course strongly influenced by “mega deals” with big pharma firms on the buy side. But large pharma companies also dominate the smaller end of the M&A market. Their share of acquisition dollars spent to buy of VC-backed private companies has since 2005 averaged roughly 50%. After an increase to 67% in 2007, the share dropped to below 50% in 2009 and then picked up again reaching 56% in 2011 (HBM, 2012). Big pharma’s continued interest in innovative companies – as demonstrated by the increase of their share of VC-backed companies bought in 2010 and 2011 - is encouraging. However, most industry observers would agree that large pharma companies have become very selective and – if they are interested in buying a company – try to offload some of the risk to the sellers of.

The most acquisitive company in the period – for US and Europe – was Sanofi, which did 9 deals from 2009 to 2011 (after having only bought one company in the period 2005-2008). Pfizer, having done most acquisitions during 2005-2008, is still actively acquiring companies (5 acquisitions during 2009-2011, 3 in 2011). Another very active acquirer during the last three years was specialty pharma company Valeant (5 acquisitions 2009- 2011, 3 in 2011) (HBM, 2012).

After a very strong first half of the year which included the landmark sale of PE-backed Nycomed to Takeda, fewer venture- and private-equity-backed companies were sold during the second half of 2011. The 12 transactions in H2 2011 generated an upfront transaction volume of \$1.3 billion (\$1.9 billion including biodollars). These numbers are somewhat disappointing as industry participants and especially investors in private biopharma companies hoped that the great momentum seen during H1 2011 would continue into H2 2011.

Private M&A activity dropped strongly especially in Europe where in H2 2011 only 4 VC-backed companies (Astex, Cellartis, DuoCort and Lectus) were sold, with only Astex and DuoCort yielding a significant upfront consideration, but on the private-equity side, the action was mostly in Europe (HBM, 2012).

The sale of Nycomed (Switzerland), backed by Nordic Capital and some other investors, to Takeda was, the principal operation. The multiple of this deal is unknown, but investors' gains are in the billions of dollars. This hugely successful transaction could whet the appetite of larger buyout firms to enter the pharmaceutical space.

Another notable deal was the sale of specialty pharma company PharmaSwiss to Valeant for about \$475 million. The sale of PharmaSwiss, backed by HBM BioVentures and Enterprise Investors, was the second largest European exit of a VC- or PE-backed private pharma company during the last 5 years (HBM; 2012).

Average transaction values from trade sales of VC-backed biopharma companies (PE deals excluded) were high in 2011 when compared to 2010 values. Average upfront proceeds notched above \$200 million, and average total deal value jumped to \$333 million, the highest number for the period covered by the survey. It is interesting to note that the average total VC investment into companies that were sold remained pretty stable over the years, averaging \$50 million to \$70 million. In Europe, average transaction values and average investment amounts were significantly lower, confirming that US biopharma companies are significantly better capitalized, but can also command higher exit values (HBM, 2012).

CONCLUSIONS

In the biotech sector, the last few years faced significant difficulty in attracting investor capital. "Small- and mid-cap biotech companies have heavy investments in R&D, and it's not uncommon for them to raise capital through the capital markets every two or three years. Whenever the economy and the financial markets are in a down cycle, it's increasingly difficult for biotechs, especially ones under \$1 billion in market cap, to successfully access the capital markets, or at least access them on favorable terms. Small- and mid-cap biotech is considered a speculative investment space, and thus investors are less willing to invest there in times of economic turbulence, and especially in companies that are smaller in market cap" (Simeonidis, 2010:1).

In this context it's possible to explain the specific trend of recent years: traditional pharma companies with sufficient cash from their existing sales but facing a dried-out product and patent pipeline have acquired innovative, but cash-poor biotech firms. In fact the pharmaceutical and biotechnological industry had to face severe structural challenges in the previous years. Factors like changing patent or regulatory laws have tightened the cost

pressure. The growing complexity of R&D has made it more difficult to refill the product pipeline, which is responsible for future revenue streams. M&A have been a frequent strategic response to these challenges. In fact 2011 was a very strong year for biopharma M&A: the number of both larger and smaller transactions was high. This phenomenon will increase because “The overall slowdown in prescription drug sales in Western Europe and the US will accelerate the need for further consolidation” (HBM, 2012: 14). Moreover there are other important trends “that favor growth via acquisitions, including US health care reform, evolving FDA standards, and increasing pressure for pharmaceutical companies to diversify into generic products, consumer health, devices, and emerging markets” (Accenture, 2011: 15).

ON THE CONSISTENCY AND LINEARITY OF ASSOCIATIONS BETWEEN NATIONAL CULTURAL DIMENSIONS AND ENTREPRENEURIAL INTENTIONS RATES

Rotem, Shneor

University of Agder, Norway, rotem.shneor@uia.no

ABSTRACT

There is growing interest in the cultural contextualization of the entrepreneurial mind-set. The purpose of the current study is to analyse associations between aggregate national scores along cultural dimensions and national levels of entrepreneurial intentions. Results show that when using Hofstede's dimensions, individualism and power distance have a non-linear association, time orientation has a linear association, while masculinity and uncertainty avoidance have no association with entrepreneurial intentions. However, when using the GLOBE dimensions, results show that institutional collectivism, humane orientation and uncertainty avoidance have a linear association with entrepreneurial intentions, while all other dimensions have no such association. The similarities and differences between these results are discussed, and some explanations for gaps are suggested.

Keywords: Entrepreneurial Intentions, Culture, Hofstede, GLOBE, Linearity, Individualism, Power Distance, Masculinity, Uncertainty Avoidance, Time Orientation

INTRODUCTION

Entrepreneurship literature has often focused on the entrepreneurial individual in terms of demographic and psychological dimensions that influence his or her intentions, attitudes, motivations and actual engagement in entrepreneurship. However, there is growing interest in the socio-cultural contextualization of the entrepreneurial mind-set (Hindle et al., 2009), while aiming to identify favourable conditions for entrepreneurship (Davidsson, 1995, Hofstede et al., 2004, Mueller and Thomas, 2001, Shane, 1993). The current study seeks to contribute to this line of inquiry by analysing associations between aggregate national scores along key cultural dimensions and national levels of entrepreneurial intentions.

LITERATURE REVIEW

As culture strengthens certain characteristics while discourages others, it is plausible that some cultures will be more entrepreneurially oriented than others (Mueller and Thomas, 2001). This logic attracted researchers to explore associations between cultural dimensions and various expressions of entrepreneurial orientations and activities across countries.

In a review of research at the intersection of culture and entrepreneurship at the national level, Hofstede et al. (2004) identified two main approaches, each with its own supporting studies. The first, referred to as the 'aggregate psychological traits perspective', assumes that cultures characterized by low power distance, low uncertainty avoidance, high masculinity, and high individualism represent social settings in which more individuals have entrepreneurial values, and hence a larger supply of potential entrepreneurs (Davidsson and Wiklund, 1997).

A second approach, referred to as the 'dissatisfaction perspective', assumes that cultures characterized by high power distance, high uncertainty avoidance, high masculinity, and low individualism represent social settings in which entrepreneurial individuals cannot follow initiatives within existing organizations, and, therefore, are forced to engage in self-

employment. This approach draws on social legitimation perspectives (i.e. Etzioni, 1987), and the theory of the displaced entrepreneur (Shapero, 1975, Shapero and Sokol, 1982).

At this stage, it is worth noting that the previous studies assumed linear relationships between cultural dimensions and various indicators of entrepreneurship at the national level. However, such assumption should be challenged. Indeed, earlier studies have identified non-linear relations between entrepreneurship and a number of cultural variables (Minniti, 2005, Zahra et al., 2004, Morris et al., 1993, Wennekers et al., 2005).

Hence, the current study will aim to clarify and pacify some of these controversies through evaluation of associations between cultural dimensions and entrepreneurial intentions, while using both Hofstede and GLOBE in both linear and non-linear models.

METHODOLOGY

Culture is captured by using scores from both Hofstede (2001) and the Globe project (House et al., 2004). National levels of entrepreneurial intentions are captured by average of multiple annual scores adopted from the GEM Reports (Global Entrepreneurship Research Association, 2012). The relationships between them are analysed through regressions of both linear and non-linear (e.g. curvilinear and cubic) models.

Since various cultural dimensions have shown to exhibit significant intercorrelations within and across cultural frameworks (Hofstede, 2001, House et al., 2004), in order to avoid problems of multicollinearity, the analyses are run for each cultural dimension separately, while comparing linear and non-linear models.

The number of observations in each analysis is set by the availability of data in every source used. Hence, the number of observations is 40 when using the GLOBE dimensions' scores (House et al., 2004), 51 when using Hofstede's scores for the original four dimensions (Hofstede, 2001), and 53 when using the new scores suggested for the long term orientation dimension in Hofstede, Hofstede and Minkov (2010).

FINDINGS AND DISCUSSION

Specifically, the current study shows that when using Hofstede's dimensions, individualism and power distance have a non-linear association, time orientation has a linear association, while masculinity and uncertainty avoidance have no association with entrepreneurial intentions. However, when using the GLOBE dimensions, results show that institutional collectivism, humane orientation and uncertainty avoidance have a linear association with entrepreneurial intentions, while all other dimensions have no such association.

Explanations for differences in findings across frameworks are traced to differences in operationalization and measurement of related aspects of similar dimensions in the two cultural frameworks that were used.

Non-linearity of associations in the case of power distance and individualism-collectivism are explained by identification of "turning points". Such points reflect a momentum, where culture facilitates change in environmental conditions sufficiently so as to give priority to different considerations towards entrepreneurial engagements. More specifically, these reflect changes between the dissatisfaction approach to entrepreneurship (Hofstede et al., 2004, Baum et al., 1993, Shapero, 1975, Shapero and Sokol, 1982), and the aggregate psychological trait approach (Davidsson, 1995, Davidsson and Wiklund, 1997, Shane, 1993).

Finally, it is suggested that since more observations are available for analysis when using the Hofstede dimensions, and since these are bi-polar in nature, an identification of significant non-linear associations becomes possible, in comparison to when using the more limited number of observations of the GLOBE's unipolar dimensions.

Conclusion

While earlier cross-country studies did identify significant differences between countries (Giacomin et al., 2011, Lee et al., 2006, Pruett et al., 2009), these have rarely been traced back to cultural explanations. And those that did so came up with conflicting hypotheses

(Hofstede et al., 2004). Hence, conducting the analysis presented in this paper contributes to existing knowledge in three ways. First, it enhances our understanding of the relationships between culture and entrepreneurship at the national level, while pacifying conflicting findings in earlier studies. Second, it highlights the non-linear nature of some of these associations, which was largely unaddressed in earlier studies. Third, it does so by employing concepts from the two main competing cultural frameworks, while contributing to a more pluralistic and complimentary discussion of culture in the context of entrepreneurship.

ABSTRACT

Purpose In a turbulent economic climate, characterised by pressures to improve productivity and reduce costs, performance management has a more central role in helping to ensure competitive advantage. A focus on teamwork has become an almost universal feature of performance management in modern organizations. It is essential that messages concerning teamwork and rewards are clear and seen to be fair if they are to bring about commitment to discretionary effort, which is increasingly a key feature in gaining competitive advantage.

Methodology. This paper uses the concepts of equity and motivation to explore the outcomes, procedures and implementation of teamwork in contemporary organizations. It draws on a range of theoretical frameworks from both philosophy and social science, examines current practices and experiences and considers future trends. Empirical research includes a ten year study of practising managers and also ethnography, questionnaires and interviews in two large manufacturing and service organizations

Findings. Investigations show that the espoused theory of organizations concerning the need for teamwork is often at odds with their theory in use. This frequently creates both actual and perceived injustice in organizations and a tension between managing performance and encouraging engagement, which is dependent on perceptions of fairness.

Implications Organizations are sending out mixed messages that are causing tensions which may affect productivity.

Value This research opens a debate that seeks to assess the contribution of teamwork to the achievement of an organization's goals and how this may be applied in the practice of performance management.

Keywords: Performance Management, Teams, Performance-related pay, Fairness, Competitive advantage, Motivation

INTRODUCTION

In a challenging economic climate, characterised by pressures to improve productivity and reduce costs, performance management has a more central role in helping to ensure competitive advantage (CIPD, 2009). A focus on teamwork has become an almost universal feature of performance management in modern organizations. Leaders are saying that teamwork is an essential component in the achievement of organizational objectives. However, the emphasis of appraisal, development and pay continues to be on the individual (Armstrong and Baron, 2005). The challenge for managers is to bring about commitment to discretionary effort, which is increasingly a key feature in gaining competitive advantage.

As organizations have developed more structured approaches to strategic management, there has been some movement towards the integration of these processes with the management of human resources. This has involved many organizations in the introduction of formal performance systems, frequently characterised by appraisals or performance reviews (Prowse and Prowse, 2009).

As the prevalence of performance appraisal has grown so has its influence in shaping employee perceptions of justice. Outcomes and processes which are perceived as unfair in an organization will result in a workforce whose contribution through enthusiasm and “going the extra mile” is not fully achieved (Suliman, 2007).

Equity theory and Organizational Justice are concerned with the fairness by which the benefits and burdens of an organization are allocated and the fairness of the process by which decisions are made (Adams, 1963, Greenberg, 1987; Folger and Bies, 1989; Beugre, 1998; Greenberg, 2006). Equity is a useful concept through which to examine the outcomes and processes of performance review and management. It is core to the psychological contract and to employee engagement and discretionary effort.

THEORETICAL BACKGROUND

Equity and Justice

Social scientists have explored concepts of fairness and justice since the beginning of the 20th Century, but it was not until the 1980s that the workplace became a focus for what has become known as Organizational Justice (Greenberg, 1987). Theorists have made a distinction between distributive justice – the fairness of outcomes- and procedural justice – the fairness of process to achieve these outcomes. More recently there has been a theoretical separation within procedural justice between how decisions are made and how they are implemented and communicated (Bies, 2001). Notions of distributive justice are present in political theory

(Marx, 1969). However, the early focus of Organizational Justice was grounded in the contributions of Homans (1961) and Adams (1963), whose equity theory suggested that workers compare their own input/output ratios with that of others. A corollary of this was that both behaviours and attitudes changed where there were disparities as workers attempted to achieve equilibrium.

Models of fairness and justice in outcomes go back considerably further. Aristotle considered justice to be people receiving that which they deserved. Bentham (1789) considered the outcomes of utilitarianism/fairness to be happiness. Later commentators suggest linkages of happiness to both work and personal performance (Blanchflower and Oswald, 2011). Stakeholder theory considers the 'sustaining corporation' making a positive contribution to human performance (Clifton and Amran, 2011). Utilitarianism cites the importance of healthy, respectful and supportive organizational culture and fair treatment, security and recognition (Ashkanasy, 2011).

Teamwork, Motivation and Reward

Much has been written about the importance of teams since the early 1980s. In many areas this research has focused on motivation and contributions to organizational success.

In the 1990s there was a shift away from behaviourism and expectancy theory coalescing around the three main areas of goal setting, social cognitive theories and organizational justice (Latham and Pinder, 2005).

The importance of management culture and explicit and implicit management values have been partially explored (Hofstede, 2001, 2010; Solatari, 2006) but little has been discussed regarding teams.

The appraisal, performance and reward of individuals has been well reported but those of teams has received less attention. Meyer, (1994) indicated possible systems of appropriate rewards for teams; but there is a paucity concerning the linkages between team reward motivating performance despite the almost universal belief that teams are a crucial component in organizational effectiveness (Prowse, 2009; Mullen, 2010; Clopton, 2011).

The importance of teams is reflected in the belief that they can achieve more than individuals and that this synergy is a pivotal part of gaining competitive edge (Clark, 2005).

Appraisal and Performance Management

Appraisal is usually part of a performance management system and can result in increased pay and other rewards such as promotion, career opportunities or actions to remedy disciplinary or capability issues, perhaps resulting in dismissal. Appraisal systems can result in unfair or inequitable distributions of organizational rewards and punishments. If the

outcomes of appraisal are considered unfair then it might explain the attitudinal and behavioural outcomes predicted by Adams (1963), including reduction of effort and a lack of engagement.

Since the late 1950s research into appraisal systems has shown repeatedly that schemes which link interviews with remuneration are at best unhelpful and at worst counterproductive (Maier, 1958; O'Neill, 1995; Oliver, 1996 and Prowse and Prowse, 2009). The same is true for schemes linked to teamwork (Geary, 1992; Mullen, 2010). No evidence currently exists from any controlled study in the UK or USA to show that long-term improvements in the quality of performance result from appraisal-based extrinsic rewards. Nonetheless, providing information for remuneration purposes continued to be one of the major objectives of appraisal, along with objective setting and training needs analysis for employee development purposes (CIPD, 2009).

However, there are few reported instances of group or team appraisal. There is some evidence of the evolution of e-appraisal carried out in a small number of organizations and in some instances there is an element of self-appraisal (Payne et al, 2009).

There is clearly a link between the methods in use, the reasons why appraisal is employed and the underlying philosophies of performance management (Neeley, 1998; Bennett, 2006; Rowland and Hall, 2010). Recent shifts in both the articulated purposes of appraisal and the methods employed may signal a fundamental change in the underlying philosophies of human resource management. At face value the trend seems to support this interpretation. The values of utilitarian instrumentalism, exemplified by the Michigan school (Fombrun et al, 1984) appear to have given way to the Harvard approach of developmental humanism (Beer and Spector, 1985). Concepts of ideology, politics and power have been replaced by ideas of empowerment, commitment, culture and consensus. Yet there seems to be little congruence between the espoused theory of "people are our greatest asset" and theory in use.

It is clear that many organizations have taken a more strategic approach to human resource management and see performance management as fulfilling a key integrative role. However, the extent to which this strategic emphasis reflects a change in values remains largely unanswered and perceptions of fairness are not fully considered in a climate where discretionary effort is critical to success.

RESEARCH FOCUS

The recent downturn in economic activity has placed a premium on effective performance and the harnessing of discretionary effort for competitive advantage. At the same time the connection between performance management, equity, teamwork and fairness has not been adequately explored. The focus of this research was on whether employee perceptions of the fairness of performance management systems have an impact on the effectiveness of team performance and discretionary effort.

Do mixed messages regarding team and individual contribute to disparities in organizational rewards and burdens?

Do employees perceive outcomes and procedures as fair?

Do the espoused standpoints of organizations regarding teams fit with the theories in use as perceived by employees?

Is there a tension between control and commitment influencing the effectiveness of performance management?

METHODOLOGY

A mixed methods approach was used with documentary analysis, formal and informal interviews, questionnaires and observation as primary tools. Literature reviews were carried out to establish comparable current research findings and theoretical frameworks. The research commenced with an exploratory phase using informal interviews followed by content analysis to identify emerging trends and patterns.

The information came from three main samples:

Sample one was a longitudinal study and comprised of over 100 managers engaged on management development programmes at two higher educational institutions over a period of ten years. The sample was also a convenience sample representing both the public and private sectors. There was a 100% response rates from these participants due to personal and prolonged contact with each participant. All participants in this sample were interviewed informally and also completed a questionnaire.

Samples two and three were taken simultaneously from two large service and manufacturing organizations and comprised of a purposive diagonal ethnographic survey of 40 employees followed by a postal questionnaire sent to all employees and completed by 495. Response rates were 30% from Organization A and 16% from Organization B. All participants were based in the United Kingdom and were in full time employment.

All participants in sample one (100 persons), and all those from samples two and three who had taken part in the ethnographic survey (40 persons) completed a semi-structured account of how appraisals, performance management and reward systems operated in their organizations. They were also asked to give their own perceptions of the effectiveness and appropriateness of any of the systems and outcomes they had experienced. Content analysis then took place and identified themes. These were used to design questionnaires with categories that could be interrogated by a mixture of quantitative and qualitative means. The emphasis of the questionnaires was to test the tools, systems, procedures and outcomes of appraisal and the participant's perception of linkages to individual performance, team performance, motivation and organizational effectiveness.

Significance testing was undertaken by means of Chi-Squared (Bhattachary and Johnson, 1977). The purpose of this was to examine whether there were any significant differences between responses from different organizations, sectors, occupations, length of service and gender.

FINDINGS

Ethnographic survey findings

Several themes emerged from the ethnographic survey that were common to both organizations. The common themes were a distrust of appraisal and performance related pay and a belief that there was an inequity of treatment between high and low producers centring on arbitrary standards of discipline. A large proportion of those interviewed were cynical about appraisal and although they believed that in an ideal world it could be a useful and positive experience, in reality it was often *"just going through the motions"* and was not carried out in a fair and systematic way. Most participants were strongly against being rated for performance related pay even some that received it. In one case, a manager responsible for administering the performance related pay systems said, *"it is unrealistic and complicated ... we must spend many hundreds of man hours performing paper exercises which have very little impact on the performance of people, thus the business"*.

During the ethnographic survey many participants spoke about the importance of team work. These values were observed to be strongest amongst managers and workers directly involved on the shop floor. Nevertheless, these beliefs were also expressed by senior managers and administrators.

"In my area we are highly reliant on teamwork. I have little or no control over spares from Stansted or Copenhagen. This is a common hold up, on a typical day this happens at least twice. I am not over fond of P.R.P., I don't think it would work." (Participant 6, Organization B, Ethnographic Survey)

Management values and systems at both organizations encouraged teamwork by speaking positively about the need to work together and the organization of work. However, both workers and managers were often dismissed this as being disingenuous.

"If you speak the truth you are perceived as being a non-team player - it seems to be mainly a production thing. People are frightened to speak the truth. Real teamwork is not just talking about teams." (Participant 1, Organization A, Ethnographic Survey)

Union views

Both organizations in the survey had strong union memberships representing over 75% of the workforce. Union officers from both organizations were interviewed using the same semi-structured format experienced by other participants.

Interviews with the unions at both organizations revealed very strong inculcated beliefs in equity, collectivism and teamwork. All union representatives believed that performance management should be team centred rather than focused on the individual. However, payment for team results was also seen as divisive and would result in isolation of winners and losers leading to de-motivation. These findings reinforce the views of Porter and Lawler (1968) and Deery et al. (1999). They speak of deeply entrenched beliefs in the importance of equity and pluralism that would make changes based on individual reward very difficult to implement. Typical employee comments at the host companies concerning individual and team based payments were *"PRP ... it didn't work, too divisive"* and *"team PRP - it would be a nightmare, too many elements out of your control"*.

This divisive aspect of performance management seems to confirm Grint (1993) who sees a major problem of appraisal schemes often being their aim to limit the collective aspects of work and individualise the employment relationship.

Interviews with union officers at both organizations found there was a belief that there were hidden agendas for performance systems other than rewarding contribution. Evidence and anecdotes were given of the use of yearly reviews and being used for redundancy choices or as tools for disciplinary action. Performance related pay was seen as wide open to systematic abuse with constant references to favouritism, subjectivity and politics. It was seen as counter to the central values of trade unionism represented as pluralism and equity. Quotes were

made such as *"We are against PRP," "We refute the principle and we would not co-operate," "We tried it once; it didn't work - too divisive."*

Management Views

Interviews with senior managers showed a variety of beliefs. Some were in favour of individual measurement and rewards, some were for team measurements and rewards and some were for all in the organization sharing the same reward in the form of gain sharing. As a rough guide those who tended to favour individual and team rewards tended to be managers from a human resource background and those who favoured the gain share approach were from an operations background. This reflects similar findings from Armstrong and Baron (1998) who observe that human resource practitioners may often have different perceptions than operations managers. These findings do indicate an interesting divide worthy of further investigation.

Interviews with Managing Directors at both organizations found a similar prevailing theme. This was a desire for rewarding contribution. Both recognised the need for a general framework and the need for equity. There was recognition that the large number of variables would prove difficult in the design and implementation of such a system. Both Managing Directors favour a less complicated bonus or gain system. Individual performance pay was discussed but was not pushed as being highly beneficial. Change and good performance management systems were seen by both Managing Directors as being crucial and were high priorities.

Again, an interesting contrast to the approach taken by the Managing Director was apparent in the interviews with the Human Resource Directors at both organizations. Both took a positive view towards performance related pay, in particular it was seen as a motivator and reward for contribution. Both HR Directors believed that a large balance of the workers' wages should be based on individual contribution.

"A significant portion of salary that is at risk based on individual performance."(Organization A, HR Director)

"I believe that all should have a significant proportion of their pay linked to their contribution to the Organization."(Organization B, HR Director)

All managers in the study recognised the complexity and difficulties inherent in such systems but were convinced of their potential to increase productivity. This difference of emphasis on the benefits of PRP is consistent with the findings of Geary (1992), Armstrong and Baron (1998), and (Kessler, 2000). They draw conclusions concerning different perceptions between

Human Resource practitioners and Operations Managers and also workers and middle managers concerning performance related pay.

Employee Views

Observations, surveys and interviews confirmed that the majority of people felt that equity and change could only be ensured if teams were empowered and trusted the management. Meyer (1994) argues much the same, he sees the overriding purpose of performance management as being devised and used by teams to help the team to help improve performance rather than for the use of top managers to gauge progress.

Many of those interviewed at both organizations spoke of the difficulties of controlling external variables that teams depended on to achieve targets. These were things such as parts or services from within the organization, or from different bases and also parts from suppliers based in the UK or abroad.

An interesting belief prevalent in past surveys carried out by the author at other organizations and also occurring in both the Organization A and B ethnographic surveys and questionnaires concerns individual perceptions. This is the belief by individuals that performance related pay would work for them if fairly supervised but not for others. This belief was underpinned by the conviction that the individual's own performance was well above average and therefore he or she would benefit from PRP. However, for most other people it would not be of benefit because many of them were below average and some even needed disciplining. *"If we had PRP I would be a very wealthy person indeed."* (Organization A, respondent 483)

Share schemes were discussed and views were positive. These schemes had proved popular and workers had made money from them. Gain share was also discussed and again opinions were positive although somewhat lukewarm. There seemed to be a certain amount of cynicism reported back from union members concerning the small amounts set aside in the scheme resulting in very small pay outs.

Questionnaire findings

Data was interrogated to see if there were any groups that were unrepresented by the survey. No groups were unrepresented. The information was based on up-to-date personnel print outs from both organizations.

There was no statistical significance in expected frequency between organizations. These participants were found to be a representative sample consistent with the profiles supplied by both organizations in the form of personnel and departmental records. The findings of the questionnaire showed a marked consistency between organizations and also consistency

between gender, occupation and length of service in the majority of cases. This allowed for generalisability in many areas.

Respondents were asked to comment on anything not included in the questionnaire concerning teamwork, performance related pay or company culture that they felt was important.

Results

Almost 75% of those who responded had experienced some form of performance management including formal appraisal at their present organization and many had also experienced appraisal in their previous organization.

The results from the questionnaires showed that there was no majority in either organization in favour of individual performance pay. Over 25% in each organisation were *strongly* against it, and a further 20% at Organization B and 26% at A were against it. These results point to a strong culture of collectivism. This argument is further strengthened by identical questionnaire results showing the belief that performance related pay would be counter-productive. It would *cause disagreements within teams* (64% of respondents from each organization) and *it would cause disagreements between teams* (58% of respondents from each organization).

The results from questionnaires showed a majority in each organization being against performance related pay. Over 25% of respondents from each organization were strongly against it. 41% of respondents from A and 59% of respondents from B would like all workers to receive the same yearly performance pay based on the performance of the organization. This seems to be in line with the CIPD (2009) who concludes that profit sharing is a popular choice with workforces as it is perceived as giving all in the organization a chance to share in its success.

Longitudinal Study Sample

There was a constant and almost universal concern about "fairness" from all participants in both the study of two organizations and the longitudinal study. There was no shift in emphasis over a ten year period up to and including 2009.

"It's a joke, PRP does not work it prevents sharing". "It is about your face fitting". "We call ourselves teams but managers don't walk the talk". "What's the point, we are making people redundant and it is not the poor performers who are going."

Content analysis showed a marked emphasis on the tension between the espoused theory of fairness and teamwork and perceptions of inequality, subjectivity and inconsistency.

SUMMARY OF FINDINGS AND DISCUSSION

All participants volunteered information freely. Employees at all levels spoke openly at both informal and formal exchanges. There were no significant differences between responses from males and females, different age groups, length of service and area of work.

The issues that arose from the author's research at both organizations, the longitudinal study and the body of research and literature prior to this gave rise to some interesting discussion concerning performance-related pay, team working and theory in use.

Three interesting things from the researcher's viewpoint were:

The similarity in beliefs from a diagonal slice of the workforce taken from Organizations A and B and participants in the longitudinal study who were all managers.

The preference of HR professionals for individual performance rewards as opposed to the preference of operations managers and workers for team based reward schemes.

The practice at both organizations of rewarding individual contribution yet their consistent and emphatic official message that "it is all about teamwork".

There was a convincing raft of evidence from all sample groups based on anecdotes, chats, ethnographic surveys, formal interviews and questionnaires to make the following observations: Findings reflect a cultural web where values of steady state strategy, teamwork and pride of membership are highly regarded. Teams and the belief in their importance play a major part in the cultural assumptions, values and heroes making up the cultural web at every organization (Hofstede, 2001, 2010; Johnson and Scholes, 2005).

Anecdotes and statements from both questionnaires and interviews constantly refer to entrenched beliefs on the shop floor concerning hard work, a job well done, knowledge, quality and discipline. Pluralism and teamwork were also highly esteemed.

The belief that everyone *should* work hard was well represented and as such represents the normative nature of the established culture. Managers and workers at both organizations spoke freely about different standards of performance management and many expressed anger and frustration concerning discipline.

"At this time I do not believe there is a proper and accurate way to measure staff individual or team performance."

Union officials stressed the difficulties of measuring activities and placing similar value on different activities. Statistics were often seen as open to manipulation and distrusted. Rewards for individuals were seen as counter to the union's belief in equity and objectivity.

Equity was a central issue in all research findings. It was mentioned by almost every participant and was of equal concern for managers and employees alike. Perceptions of

inequalities arose in many areas but most concerns occurred in the areas of discipline, payment and trust. Anecdotes, observations, interviews and questionnaires constantly referred to the need for team work, fairness, unfair treatment, inequity; and most involved strong emotions concerned with self-worth. Anecdotes of workers taking action to balance the perceived inequity were also related (Adams, 1963; Porter and Lawler, 1968.) There was widespread evidence of pervasive cultural beliefs holding equity as a lynchpin of working life. *"I would like openness and honesty."* The belief that everyone should work hard represented the normative culture of participants. Both managers and workers spoke at length about different standards of performance management and many expressed anger and frustration concerning the procedural and distributive justice of discipline in their workplace. *"Nothing happens here if people aren't pulling their weight."* Trust was a concern for many participants and there were many complaints about managers and their different agendas. Some managers also spoke about the need to build and establish trust.

Equity and trust were found to be highly valued but it was debatable if they existed other than as espoused theory at organizational level. It had been expected that the notion of equity would be an important aspect of this research but the overwhelming pre-occupation of the majority of participants provided a rich source for future research and discussion.

Observations, surveys and interviews confirmed that the majority of people felt that equity and change could only be ensured if teams were empowered and trusted the management (Meyer, 1994; Brown, 1995). There was a widespread distrust of both appraisal and performance related pay.

Performance management systems were viewed as bureaucratic, costly and often a waste of time. Performance related pay (PRP) was seen as being too dependent on variables outside the individual's control. This was seen as unfair by many who were unclear as to how it could consciously increase organizational performance.

The concept of PRP remained popular with Human Resource Directors and personnel practitioners despite the reservations of managing directors, the deep misgivings of many operations/line managers, the resistance by the majority of workers and the total opposition of the unions. Experiments with performance related pay at both organizations and further enlargements of such systems still remain a distinct possibility, despite the negative experiences in the past. There was an interesting and widespread belief by most individuals that PRP would work for high producers like themselves but not for the vast majority of others who were either not competent or not motivated. The possible move to person based pay rather than job based pay did not reflect the espoused belief systems of both

organizations, or those of participants in the longitudinal study. These belief systems value team working, quality and achieving value for stakeholders and it is the enactment of these beliefs that motivate workers (Brown, 1995; Latham and Pinder, 2005). There was common belief of workers that more money did not result in their doing a better job. This was opposed by the belief of some managers and both senior Human Resource executives that money would motivate workers to perform better once they realised they had been rewarded for their contribution.

Managing Directors at both organizations struggled with the conundrum of which comes first, paying for performance or performing for pay. There seemed to be no preferred strategy. This situation was also reflected in the research with managers at other organizations participating in the longitudinal study. Human Resource Directors were working towards the future adoption of HRM mechanisms of performance related pay for both teams and individuals. However, this strategy may not solve management problems but could in many ways generate new ones (Kerr, 1975; Geary, 1992).

Hofstede's (2010) research into culture concludes that institutions may often write down their missions or values but other value systems may also exist in the organization. These assumptions underlying the explicit 'official' values of the institution are evident in the day-to-day conversations of people. They may also be so taken for granted that they can only be observed in what people actually do. The author's free access to both host organizations and the relationship of mutual trust enabled these findings to be further tested. Over a period of several years the author observed interesting differences between the explicit management/institution values and the implicit but equally influencing values of the workforce and unions.

CONCLUSIONS

Performance management systems based on individual rewards are not congruent with established cultures of teamwork and the move to autonomous self-managed teams.

They are commonly perceived as being divisive and contrary to team productivity.

Although literature confirms the place of equity theory in motivational studies it does not emphasise the crucial role it seems to play in the arena of performance management and measurement (Latham and Pinder, 2005). It is postulated that this importance may well be seen in organizations and cultures other than those in this study.

The move by many organizations to management systems, which espouse teamwork and a shared mission, lies uneasily with an approach to performance management which is reliant on individual appraisals and performance related pay. Many of these same organizations believe that performance related pay is congruent with a unitarist value system. However, it is ironic that the application of performance-related pay undermines unitarism by introducing a culture of individualism and plurality of interest.

A fundamental issue that has yet to be resolved lies at the heart of the performance management debate. This is team versus individual contribution. One side believes that emphasis on the individual stretches targets and increases personal productivity for those who have significant discretion over their own output. The other side believes that individual targets are counter-productive because they create individual competition at the expense of the collaboration so crucial to team success.

To achieve positive outcomes organizations need to be clear about why teamwork is espoused, is in place and how it fits with strategy, culture and philosophy.

This research builds on previous research in the following respects:

- It places teamwork and performance within a framework of organizational justice; perceptions of fairness are important in harnessing goodwill (Greenberg, 2006).
- It confirms findings that performance management reinforces power relationships and is often perceived as being open to abuse (Geary, 1992; Greenberg, 2006).
- Dissatisfaction with processes and the resulting distributive justice had a negative impact on employee perceptions of fairness and could act as a barrier to organizational effectiveness (Holbeche, 2001; Cook and Crossman, 2004).
- Performance management often ignores systems factors (Deming, 1986; Soltani et al, 2006; Clopton, 2011), particularly relationships in teams *and* between teams; and can work against the establishment of a quality culture. It often seeks to act as an agent to bolster managerial power rather than to enhance quality.
- This research supports the case put forward by others that effective performance will not be obtained unless all dimensions of organizational justice are satisfied within the performance management system and that there is a strong argument for all stakeholders views to be incorporated in the system (Cook and Crossman, 2004; Suliman, 2007; Simmons, 2008; Brebels et al. 2011.)

- There is a significant disparity between espoused theories and theories in use (Townley, 1993; Suliman, 2007). Unitarist assumptions of a commonality of interests are a much repeated management message in selling teamwork. However, the theory in use, which may be inferred from the actions of many managers, is that performance management acts to reinforce management hegemony through political processes. In denying a plurality of interests it serves primarily as a covert compliance system. This has generated much cynicism in workforces.

These conclusions add some weight to the research findings that confirm that most appraisal and performance systems do not work well and can be divisive (Armstrong and Baron, 1998; Kaplan and Norton, 2007; and Holloway, 2009).

The move by many organizations to management systems, which espouse teamwork and a shared mission, lies uneasily with an approach to performance management, which is reliant on individual appraisals. It is also ironic that many of these same organizations believe that performance related pay is congruent with a unitarist value system.

For many decades adherents of the human relations movement have argued that organizations, with their emphasis on control systems, discourage the full participation of their members. This may well be detrimental to performance and could affect competitive advantage (Deming, 1986; Wiese and Buckley, 1998; Simmons, 2008). Organizational experience is often demotivating rather than empowering. A growing emphasis on knowledge management has encouraged organizations to believe in the rhetoric "People are our greatest asset." Only by creating a culture in which people can fulfil their potential can organizations survive, compete and grow in today's global environment. Yet, few organizations have thought this through to the extent that the development of teams and individuals is a key component of corporate strategy, embedded in all aspects of the organization. The idea that individuals need to be controlled persists. If a control philosophy permeates notions of empowerment, development and continuous improvement, paradoxically it will dilute both control and motivation.

CONTRIBUTION

This research clearly indicates that both managers and employees see a potential for teamwork, which is rarely achieved in practice. This is almost universally seen as desirable and perceived as an effective method in gaining commitment. If, at the same time,

management say they value teamwork *but* appear to be rewarding individuals then commitment degenerates into resigned compliance with widespread resentment and perceptions of inequity. This research also confirms the findings of others most significantly in terms of reinforcing perceptions of mistrust, inequity and managerialism. Happiness and stakeholder interests are not addressed and stakeholders are often left feeling aggrieved.

Organizations are purposive entities. They have goals and need to measure the achievement of those goals. But, by sending out mixed messages the cynicism engendered by the performance management system and process may hamper development. Creating an environment where individuals can grow and develop as part of a team may be an appropriate competitive strategy. If, at the same time, performance review is focused on individual contribution then commitment to teamwork may be prevented. This research also confirms the findings of others most significantly in terms of reinforcing perceptions of dishonesty, mistrust, inequity and managerialism; both employees and managers are often left feeling dissatisfied.

Measurement and performance related pay of individuals is of dubious relevance in team working environments. Judgements, about how individuals contribute to teams, are perhaps best made by teams themselves. If teamwork is to contribute to the achievement of an organization's goals, then the organization needs to be clear how this fits with strategy, culture and philosophy. Performance systems and procedures say much about organizational value systems and how these relate to societal values. This research shows that it is helpful to examine teamwork and reward through the lens of concepts of fairness and wider frameworks of employee perception and motivation, which have not previously been considered. To achieve competitive advantage through teamwork and discretionary effort organizations need to not only *say* they value teams but have to be seen as practising what they preach.

LESSONS FROM THE PAST: LIGHTS AND SHADOWS OF PUBLIC-PRIVATE PARTNERSHIP IN THE ITALIAN HEALTHCARE SECTOR

Russo, Salvatore

Department of Management, Ca'Foscari University Venice, Italy, salvus@unive.it

ABSTRACT

This paper outlines characteristics of the diffusion of public-private partnership (PPP) and focuses attention on its use in Italy, especially in the healthcare sector. After more than a decade since its introduction, inspired by foreign experiences, the academic literature contribution to the debate and the empirical experiences have highlighted several gaps of the instrument with financial and managerial implications for the public sector. In particular, in Italy, with reference to the value for money, risks and accounting treatment, the initial uncertainty about appropriate measures for evaluating the projects, now, should lead to a more accurate reflection. Through a comparative analysis of two case studies - public hospitals -, the paper shows the most relevant areas in which it is a time for an urgent rethink of PPP utilization, as a lesson for the future.

Keywords: public-private partnership, healthcare management, hospital infrastructure finance, value for money

INTRODUCTION

Throughout the evolution of the Italian NHS, particular attention has been paid to investments for the renovation of hospital infrastructures and the creation of new healthcare facilities.

According to recent national health plans, hospital redevelopment – expansion, modernization, reconversion of small size hospitals – as well as the construction of other types of healthcare facilities require substantial consideration. In order to implement this renovation process, the government has been encouraging the regional authorities, who are

responsible for the local healthcare services, to practice the special plan for investments, which is historically hard to manage and does not always have the capacity to respond to real financial needs. Further, taking into account the global financial crisis, a matter of considerable concern relates to the search for new solutions to access financial resources without negatively affecting public debt. For that reason, *Public-Private Partnerships* (PPPs) have once again come to the forefront, following the recommendations contained in the Communication of the European Union (COM 615, 2009) *Mobilising private and public investment for recovery and long term structural change: developing Public Private Partnerships*, claiming (p.2): “Public Private Partnerships (PPPs) can provide effective ways to deliver infrastructure projects, to provide public services and to innovate more widely in the context of these recovery efforts”.

After its debut in the early 2000s in Italy, Project Financing (PF) has been the best-known formula identifying the public-private partnership (PPP), as in many other countries (Broadbent and Laughlin, 1999; Froud and Shaoul, 2001; Akintoye *et al.*, 2002; Grimsey and Lewis, 2002, 2004; Broadbent *et al.*, 2003). In the light of the literature debate, the most frequent issue concerns whether the support given to PF is still acceptable, according to an optimism bias (MacDonald, 2002), “as a measure of the over optimism in project estimates” (Broadbent *et al.*, 2008), or whether any additional precautions should be taken so that the PPP model can be virtuous enough to create effective advantages and social benefits. The achievement of *value for money* (VFM), the testing of a long-term *affordability* and the *risk transfer* continue to be the cause of the serious concerns that have so far accompanied PPP contracts (Broadbent *et al.*, 2008; Demirag and Khadaroo, 2008; English *et al.*, 2010). As observed in the experiences carried out in other countries (mainly Australia and the UK), the frequently-asked question is whether such investment strategies are the result of an opportunistic approach rather than of a rational choice. This has unavoidably pushed academics and scholars to explore “the underlying nature and rationale for PPPs; processes and procedures aiding decisions to undertake PPPs; processes and procedures for ex-post evaluations of PPPs; the merit and worth of PPPs; PPPs regulation and guidance” (Andon, 2012: 878). In the last decade, several articles have offered research findings and reflections on these topics (see, for example, Broadbent and Laughlin, 1999, 2002, 2003; Froud, 2003; Edwards and Shaoul, 2003; English and Guthrie, 2003; English and Skellern, 2005).

In particular, the paper aims to investigate two issues : 1) whether hospital investments made by PF in Italy have a positive impact on the whole system in terms of social and economic

benefits; 2) how the PPP experiences of the “first wave” could be an effective guide for the future according to an accounting logic. As a matter of fact, it is a common conviction that PF is proving a financial drain for the healthcare sector, especially because some of these experiences are now in the operational phase. Inevitably, that should entail reconsideration of the key variables and their accounting relevance to make the choice of PPP more reliable.

Section 2 examines PPPs in greater detail, inspired by theoretical approaches, at national and international level. Section 3 focuses on the PF features in the healthcare sector, its actual ability to represent a strategic alternative for the future and the critical variables to which the government must pay more attention. Section 4 illustrates a comparison of PF in two Italian hospitals, highlighting and discussing the most controversial issues of the contracts. Finally, some concluding reflections.

THEORETICAL ASPECTS OF PPPS

The *New Public Management* (NPM) reforms, through a redefinition of the boundaries between State and market, have encouraged the acceptance of a contractual approach to public service delivery (Hood, 1991, 1995; Lane, 2000; Osborne, 2000; Hebson *et al.*, 2003). “A major implication of all of these reforms [has been] an increased emphasis on management rather than administration of services, with a concomitant shift in emphasis from the traditional stewardship role of accounting to cost management” (Jackson and Lapsley, 2003). PPPs have been coherently considered an “extension” of the NPM agenda for change (Broadbent and Laughlin, 2003) and their introduction “has largely been evaluated through conceptual lenses that emphasise either the administrative, managerial, financial or technical dimensions of this reform strategy” (Flinders, 2005:215). The expression PPP is intensely “malleable as a form of privatization” and “despite its ambiguity, is sometimes a useful phrase because it avoids the inflammatory effect of “privatization” on those ideologically opposed” (Savas, 2005:1). As has been claimed, the PPP stresses “the use of contracts for the management of the risk”, thus representing the highest expression of the reforms due to NPM (Froud, 2003). In addition, the very concepts of accountability and transparency, as main elements of NPM, seem to have a direct effect on PPPs (Demirag and Khadaroo, 2008).

In this context, the concept of cooperation between public and private sectors flourished to form an inter-organisational partnership, especially in those countries where the privatization

process has been actively undertaken (Pongsiri, 2002). PPPs were immediately perceived as a broad umbrella, which can safeguard the public interest while creating potential investment and adding value from the private sector (Carr, 1998; Pongsiri, 2002). That would corroborate a conceptual model based on the “mixed economy” with a sort of liberalisation policy in the way public services are produced and delivered. The idea that PPPs open up possibilities for public service delivery, deriving not only from organisations owned and controlled by the public sector, but also from both public and private sectors in partnership, is convincing (Broadbent and Laughlin, 2003; Flinders; 2005). In a certain sense, PPPs could be described as the result of a troubled search for new formulas to soothe the impact of public expenditure on national accounts but also to avoid the consequential complexity in the operational process of the public administration.

A brief history

In Europe, the origins of PPP (acting as PF) date back to 1979, when the UK Conservative government began the still-continuing shift of activities away from the public sector. Early financing proposals were mainly designed to evade the controls on public expenditure (Grahame, 2001). The actual Private Finance Initiative (PFI) program was announced in 1992, with the aim of achieving closer partnerships between the public and private sectors. This policy was introduced to increase the involvement of the private sector in the provision of public services (Grahame, 2001; Spackman, 2002; Pollock *et al.*, 2002; Broadbent and Laughlin, 2003). Some years later, with the Labour Government (1997), the program was proposed with a different label, but with its contents essentially unchanged. The objective was “to accelerate the process by which PPP contracts are agreed, in part by taking equity stakes in projects and in part by providing loans to public bodies” (Parker and Hartley, 2003).

Even if the primacy remains in the UK, PPPs have spread to many other countries; and after a first phase of experimentation, in 2004, the European Commission issued the *Green Paper on Public-Private Partnerships and Community Law on Public Contracts and Concessions* to launch “a debate on the application of Community law on public contracts and concessions to the PPP phenomenon” (Green Paper). The recent financial crisis led to a dramatic reduction in the capital value from almost EUR 30 Billion in 2007 to EUR 16 Billion in 2009 (EPEC, 2010). This poses a series of questions about the factors that are negatively influencing the use of PPPs and, once again, what obstacles have to be overcome in order to make the practice more reliable and viable (Connolly and Wall, 2013).

A PPP is usually a long-term contract between a public party and a consortium of private companies - referred to as a *Special Purpose Vehicle* (SPV) - under which the private company is required to *Design, Build, Finance and Operate* (DBFO) an infrastructure in return for payment for both the cost of construction and operation of the related services (Grimsey and Lewis 2004; Yescombe, 2007). The facility remains under public-sector ownership, or reverts from private partner to public-sector ownership at the end of the PPP contract. Its economic relevance depends on the fact that:

- cash flows generated by the operating process are the main guarantee and the source for covering the debt service;
- implementation of the private initiative should be accompanied by an adequate level of project certainty and reliability deriving from a rigorous analysis and an indispensable risk adjustment;
- sustainability of the initiative does not depend on the reliability of a company but concerns the quality of the single project (including the capacity to generate the cash flows with reference to a given level of risk);
- the initiative takes advantage of a project autonomy – due to the constitution of an ad hoc company to safeguard the stakeholders' interests;
- the operational phase represents the critical success factor as only a management based on a high level of performance can contribute to generate the cash flows that are indispensable to satisfy shareholder expectations;
- the most significant guarantees connected with the initiative have a contractual nature rather than a real one (this is the so-called “without recourse operation”);
- all the phases of the operation converge in a negotiation process, which has a variable duration and is considered to be a decisive factor in the risk allocation between public and private partners.

This partnership procedure cannot be explained just by the concession of both the construction and the management of an infrastructure to a private partner because of the lack of financial resources but it must be based on an effective assessment of VFM, through the appraisal of the public sector comparator (PSC) (Gaffney and Pollock, 1999; Edwards and Shaoul, 2002). “A public sector comparator is a costing of a conventionally financed project delivering the same outputs as those of the PFI [PPP] deal under examination. It is just one of a number of ways of evaluating a proposed PFI deal. It is directly relevant only when the option publicly financed on which it is based is a genuine alternative to the PFI deal” (House of Commons, Committee of Public Accounts, 2002, 9 June 2003). In that way, the possibility of

a traditional financing procedure must not be ruled out. In the UK, the VFM methodology proposed by the government is based on an economic appraisal that compares costs and benefits of alternative investment decisions. It provides for two critical variables such as the method used to discount the future annual cash cost (in order to get the net present value) and risk transfer (Pollock *et. al.*, 2002:1206).

From the financial point of view, the PPP rationale turns round the conventional financing “from subject to object”, mainly by taking into account the intrinsic value of the project rather than the eligibility of a subject. Through the PF formula, the Public Administration entrusts a third party with the realization of public infrastructures and the management of its operational process. This approach can enable public organizations to undertake projects which they would be unable to finance conventionally, because of the lack of financial resources for the capital asset during its construction. It implies also a concrete change in the way the public sector intervenes in the economic field for public service delivery but, although responsibility for many elements of service delivery may be transferred to the private sector, the public sector remains responsible for (Torres and Pina 2001):

- deciding on the level of services and resources to pay for them;
- setting and monitoring safety, quality and performance standards for services;
- enforcing those standards, taking appropriate action if they are not delivered.

The public sector should benefit from the presence of the private party, above all in terms of reduction of the total financial commitment, investment promptness and, consequently, the timeline of service use. This implies that the convenience of the operation must be analysed under two different profiles. On the one hand, it would be advisable to verify the advantage for the Public Administration by taking into account VFM and, on the other hand, risk transfer. VFM is the key rationalising motive for partnership. As Edward and Shaoul (2002) assert, “its meaning in the context of PFI is no more precise and is similarly based upon the economy as reflected in the use of discounted cash flows over the lifetime of the project”. VFM depends on the “estimate of future costs and operates only at the point of procurement”. Many studies and reports have been carried out in the UK on this topic given that accountability depends on the detailed recognition of VFM, by discharging accountability to the stakeholders, the lack of which in PPP has been persistently criticized (Demirag *et al.*, 2005; Demirag and Khadaroo, 2008).

Risk transfer and uncertainty seem to be the crucial elements under discussion since under PFI private sector borrowing, transaction costs and the requirements for profits necessarily generate higher costs than conventional public procurement (Broadbent, *et al.*, 2008). Further,

many authors sustain that the PFI contract reduces the ability of the public sector to deal with uncertainty, given the long-term duration of the contract in which the public sector is locked (Froud, 2003; Lonsdale, 2005). It is, therefore, necessary to analyze what the principal vulnerabilities are that derive from risks (Broadbent *et. al.* 2008; EPEC, 2011). Traditional risks are identified as follows: demand and economic context; residual value; design; performance/availability; changes in relevant costs; obsolescence (ASB, 1998). Actual risks seem to be (Burger *et al.*, 2009): the risk of an increase in the interest rate, leading to rising costs; liquidity problems and project feasibility considerations for private partners; the risk of credit being unavailable, leading to the termination of existing projects failing to reach the financial close.

Most of the considerations on the costliness and convenience that the public sector can have in undertaking a PPP depend on the solution of problems related to risk. Several studies show that private cash can be more expensive than public finance since PF causes an increase in the annual cost. It is claimed that costliness could be acceptable since it should usually be balanced by the private sector taking on the risks of a project failure or default (EPEC, 2011).

Accounting treatment and risks

One of the acclaimed advantages of PFI/PPP is not only that infrastructure can be built without recourse to direct public-sector borrowing but that the assets (and associated liabilities) are deemed to be off-balance sheet for the public administration which commissions the PFI/PPP (Private Finance Panel, 1996; Froud, 2003). The accounting treatment of PPP falls under FRS 5, revised in 1998 by the Accounting Standards Board (ASB) (ASB, 1998; Broadbent and Laughlin, 1999). In deciding whether the owner of the asset is the public or the private sector, risk is central to any evaluation. This orientation has visibly influenced statements at the European level.

In this regard, Eurostat established that the deficit and debt treatment should follow the requirements of the European System of Accounts (“ESA95”). For the purposes of recording PPPs, ESA95 requires national statisticians to look at the risk/reward balance in the underlying PPP arrangement. This balance is evaluated by analysing the allocation of two key risk categories between the public sector and the SPV, construction risk and market risk (i.e. *availability* and *demand*). The decision specifies the impact on government deficit/surplus and debt and it is in line with the European System of Accounts (ESA95), according to the opinion

of the Committee on Monetary, Financial and Balance of Payments Statistics (CMFB). Eurostat recommends that the assets involved in a PPP should be classified as non-government assets, and, therefore, recorded off-balance sheet for government, if both of the following conditions are met:

- the private partner bears the construction risk;
- the private partner bears either the availability or the demand risk.

If the government bears the construction risk, the PPP will always be on the government's balance sheet, irrespective of the allocation of the demand and availability risks. If the private partner bears the construction risk, the PPP will be classified off the government's balance sheet unless the government bears both demand and availability risks.

The *construction risk* covers events related to the construction and completion of assets. In practice, it makes reference to events such as late delivery, non-compliance with specified standards, significant additional costs, technical deficiency and external negative effects (including environmental risk) which trigger compensation payments to third parties. The *availability risk* covers situations where, during the PPP operational phase, an underperformance linked to the state of the PPP assets results in services being partially or wholly unavailable, or services fail to meet the quality standards specified in the PPP contract. Finally, the *demand risk* refers to the variability of demand (higher or lower than expected when the PPP contract was signed), irrespective of the performance of the PPP company. A change in demand could be the consequence of factors such as the business cycle, new market trends, a change in final user preferences or technological obsolescence. The demand risk is part of the usual economic risk borne by private businesses in a market economy.

At this critical time the view of the aforementioned risks is obviously an element of additional concern. In order to comply with the *Stability and Growth Pact*, EU Member states have considerable interest in promoting PPPs, but at the same time they have to ensure that the costs arising from investment in infrastructure be considered off-balance sheet. Given the importance of the national debt and deficit treatment of a PPP, this represents a decisive issue for the Public Sector (Connolly and Wall, 2011).

THE IMPLEMENTATION OF PPPS IN ITALY

In Italy, even though there have been no PFI programs, in the last decade some actions have been undertaken with the purpose of making rules more flexible in the context of public procurement and facilitating private participation in the realization of public infrastructures (most frequently by the DBFO formula). As is clear from a study by the Bank of Italy, the projects funded are relatively small. In the period 2002-2008, the average amount of bids amounted to around EUR 14.1 million and concerned the field of local public services with not very complex interventions. In the same period, the total value of the tenders increased from EUR 1.3 billion to EUR 5.8 billion, their number from 184 to 411 (representing 1,7 % of the total number of tenders for public works and 17.6 % in value terms) (Giorgiantonio e Giovanniello, 2009). According to data collected by Finlombarda (2012), in 2011 there was a decline in PF, although the government has repeatedly encouraged the use of the procedure. However, several obstacles seem to stand between the launch of initiatives and financial close, mainly due to the shortage of liquidity together with lengthy procedures and unpredictable times. The awards amounted to approximately EUR 6.6 billion a year, but in the last four years, the financial close has stopped at EUR 1.8 billion.

A regulamentary approach

In the Italian system, the PPP has its normative point of reference in the model of the “concession”, with or without private initiative. The PPP is, in fact, regulated by law, as in other countries (Belgium, Poland, Spain, Portugal) even if it is widely known that a specific PPP law is not a necessary condition for PPP development. The legal framework can also be provided by changing existing legal provisions which may have an impact on the PPP project (EPEC, 2011). Through a concession, the public sector, interested in the realization of an infrastructure, allows a private subject a concession whose provisions include:

- the duty, for the concessionaire, to construct the infrastructure through his own resources with a risk transfer to the private party;
- the right to manage it for an extensive duration, in order to allow a satisfying return on investment;
- the consequent ownership transfer to the public institution by the end of the concession.

The PPP arrangements are based on a long-term contract and must have appropriate mechanisms in place to ensure that VFM is maintained for the duration of the partnership.

Since 1998, these rules have cleared up ambiguities regarding the utilization of *projet financing* as a financial instrument, by widening the range of application of the discipline and increasing the transparency of some norms relating to contracts, controls, guarantees and risks. Moreover, a few European countries have provided further regulation in this sector by setting up a specific taskforce at governmental level. Even if an explicit program has not been launched, such as the PFI/PPP in the UK, in 1999 the Italian Government created a centralised office, the *Technical Unit for Project Financing* (It. *Unità Tecnica Finanza di Progetto, UTEP*) to facilitate privately-financed infrastructures. This organization as a taskforce of the Ministry of Economy and Finance, has the aim of promoting the use of PPPs, also supporting the public administration at the regional and local level, for its implementation. After the uncertain debut of the implementation procedures and an unclear meaning attributed to the PPP, the UTEP outlined a stable framework tending to identify PPPs in three main subcategories:

1. the granting of construction and operation;
2. the granting of services;
3. other residual formulas.

Such a framework derives from the empirical analysis of the views of the PPP carried out by the National Observatory of PPP, sponsored by Union of Chambers of Commerce and the Chamber of Commerce of Rome with the Ministry of Economy and Finance and the UTEP. The construction of an infrastructure is the key element distinguishing the first model from the remaining categories. The first group includes bids involving the preliminary design, the definitive design, the executive design, the execution of a work and its management. The second group includes the tenders carried out with the procedures concerning the granting of public service management through existing structures. For this second procedure, the private concessionaire normally pays a license fee, although government grants are not ruled out. The third group includes various formulas, such as joint ventures for the operation of public services, district contracts, and sponsorships.

PPP in the Italian NHS

As seen above, the typical PF features imply some observations about its beneficial application in the Italian NHS, by considering an increasing need for buildings and modernization, above all with regard to hospitals (Amatucci and Vecchi, 2009). In the last decade, the hospital sector has appeared particularly interested in the use of PF, because of

the continuous evolution of technology and strategies implemented for a rationalization of health expenditure. The main factors behind the need for modernization are attributable to the following:

- the gradual increase in the average age of the population (involving an increase in per capita expenditure);
- innovation and advanced technologies;
- the scientific and cultural progress of the population catalysing the demand for services in healthcare in terms of quality and quantity.

In addition, there has been a gradual reduction in the number of ordinary admissions (acute patients) and a greater development of day hospital and day surgery care. More importance is given to the long-stay structures, where healthcare needs are to be considered with the request for comfort of the accommodation and the quality of the service. In general, according to the experience observed in the *first wave* (2000-2006) of PPPs, the method focused on a cost-benefit evaluation for both the *Local Healthcare Units* (LHUs) and users/patients, although this appraisal has led to large uncertainties. The PSC technique was never used in this first phase. Suffice it to say that it was only in 2008 that new, corrective legislation introduced the rule that in assessing the feasibility projects public authorities must draw up a real *business plan* to verify the economic and financial feasibility, the value creation and the sustainability of the initiative. VFM and PSC received a real impulse from the UTFP in a special document, in 2009 (Martiniello e Zaino, 2009).

In the Italian PPPs, the private partner usually takes on the responsibility for the management of the services mix regarding the functioning and maintenance of the structure and part of the core and non-core services. In particular, the system of services includes the following categories:

- the facility management for buildings and supporting systems such as the thermic heating system, refrigerator system, air conditioning, electrical equipment and plumbing, medical gas supply systems;
- hotel services (catering for in-patients and staff, cleaning, disposal of waste material, reception, reservation centre, parking);
- other services (stock management, hospital information systems, supply management, chemist, set-up of operating theatres, etc.).

Initially, the Italian model of PPP in the healthcare sector was not supposed to modify the hospital management, which normally has recourse to outsourcing for building maintenance. It should have achieved through the management of the concession an administrative

simplification and an improvement in management, with consequent economies of scale. In the case of the PPP proposed in Italy, the only private aspect is the operation of the healthcare facility itself, not the provision of clinical care. Between 2002 and 2005 there was a 30.6% rise in the number of projects (27) and a 56.7% increase in spending (EUR 1,298 million). In value terms, 93% of the initiatives promoted involve the building or refurbishment of healthcare facilities, with non-medical support services (non-core) entrusted to the concessionaire. This proportion has remained unvaried over time. (Finlombarda, 2005; 2008; 2012). It is to be expected that LHUs will continue to control and monitor the impact of quality on users/patients.

The composition of the price for the economic exploitation of the concession consists of an annual fee and a tariff. The annual fee is paid by the LHUs when a new structure starts to run (from the service availability date). This consists of two components, fixed and/or variable, and has to cover the services management, the facility management and the assistance to the medical structure. The private partner is thus allowed to have a return on investment. The fee is determined and paid according to different criteria.

The tariff relates to the operating costs of both commercial spaces and services. The payment consists of revenues deriving from the lease or direct management of the adjacent commercial areas. Such a payment concerns the volume and typology of activities regarding the structure itself and is a function of the management system defined and/or contracted, from time to time, between the SPV and the LHU. For this revenue, the commercial risk is borne by the SPV. It is, however, clear that the main risk concerns demand. This means that any compensation arising from the operations of additional services partially affects the risk simulations contained in the business plan.

These two heterogeneous components justify the potential application of the PF in the Italian healthcare sector and in the specific case of the hospitals make it possible even in the presence of a public payment (*subsidies*). Hospitals appeared initially as belonging to a not self-financing category because of the lack of correspondence between utilization and payment of tariffs by users – reimbursed by the LHU on behalf of the patients (Amatucci, 2002).

Through hospital activity development and a clear identification of its components, it has been possible to postulate the application of PF for hospital construction. On one hand, the fee is like a shadow toll, paid by the LHU for supporting services; on the other hand there are the prices paid by users for commercial services. This mechanism does not rule out placing the instrument of the public contribution side by side with the two mentioned above

(Amatucci and Biondi, 2002). In fact, the application of shadow tolls is commonly considered inappropriate because it implies such a low risk transfer as to put the project back on the public sector balance sheet (Yescombe, 2007:235).

Another issue regards the structure of the fee. It consists of a fixed part corresponding to the equivalent amount in order to cover building availability; and a variable part, representing the equivalent sum in order to reimburse the services delivered by the SPV, according to volume and quality parameters (payment for usage, volume or demand).

As a sector analysis by UTFP (2002) explained, greater attention is to be paid to the fixed component, which has a structure essentially correlated to the risk allocation according to the models of 'availability payment' and 'capacity charge'. In the first case, the amount is a function of the *bed occupancy rate*. The availability services include everything from cleaning services, to the reception and clinical data information systems. This method contributes to the allocation of the commercial and operating risks between contractors and the LHU, using the bed occupancy rate as a reference parameter. As an alternative, the 'capacity charge' model consists of a fixed amount that the LHU has to pay independently of the utilization level of the infrastructure. Usually, this amount is not comprehensive of the relative amount for the special maintenance of buildings, systems and equipment. The criterion, therefore, does not transfer the risk to the private contractor. Consequently, in the case of the 'availability payment' method, the LHU makes a unitary payment, limited to the availability of areas and/or wards and to a given level of quality and efficiency of the services. According to this formulation, the contracts usually provide a proportional reduction in the case of an interruption of services or a lower level of quality or efficiency, with a series of contractual penalties. On the contrary, postulating the "capacity charge" application, LHUs make a separate payment of the two fee components. The fixed one must always be paid, and its reduction occurs only in a few cases; while the variable component concerns the quality and efficiency parameters in a more generic way than the availability payment.

TWO CASE STUDIES: A COMPARISON

The research team has carried out the study starting from a definition of a legal framework and variants of the contractual formula, followed by an analysis of the conditions of applicability. Finally, it proceeded by the case study methodology, with reference to two

LHUs of the Veneto Region (Stake 1995; Yin, 2008). The study benefited from the collaboration of the *Managers of the Technical Departments*, responsible for the procedure. Several interviews were conducted with them during the construction of the case studies, also with the support of documentation regarding the different phases of the PPP implementation (business plan, agreement, make or buy simulations). In both cases, the managers gave their utmost in terms of commitment and effort for the implementation of the procedure; and their ability in planning the preliminary project, following the procedure, and steering the internal and external coordination must be duly acknowledged.

In the course of the case studies, some different models of partnership emerged, which take into account various critical aspects and offer different solutions to legal, economic, social and environmental issues. In both cases, we reconstructed the PPP logic to explain the choice of the private financing in comparison with other financing formulas, by running the methodological framework again and analyzing the economic motivation, the influence of the critical aspects and their impact on management. Effectively we have traced a comparison between the empirical evidence drawn from two different experiences: the first for the renovation and extension of two hospitals (Case X); the second for the construction of a new hospital (Case Y). In both cases, the hospitals are not autonomous entities but are dependent on LHUs in different local contexts of the same region. We gathered information during 2005-6-7-8 with successive monitoring of the operation phase. To facilitate the comparison in this occasion, we used the criteria selected by the *Resource Book on PPP Case Study of European Commission Directorate-General Regional Policy* (June, 2004) with some additional information as follows (Schemes 1 and 2):

- *Value of Investment and financial structure*– the capital investment of the project as a stand-alone investment exclusive of the income stream or operational costs;
- *Contract Duration* – the duration of the PPP contractual relationship with respect to the initial investment;
- *Transfer of Responsibility* – the degree to which the private party is involved in the project defined by the contractual model and obligations, ownership of assets or operating rights and the project operational structure;
- *Demand Risk and Availability Risk* as explained above;
- *Contract Type* – the type of PPP contractual arrangement, using the typology of the Guidelines.

Scheme 1 – Case X

Case Study X	Two Hospitals: completion of a hospital and construction of another one (in two different locations of the same territorial area under control of the LHU)
Total Amount	EUR 147.328.168 (including VAT)
Private Finance	EUR 91.340.754
Rationale/Objectives of the PPP (from the documents analysed)	To increase efficiency; introduce new financial resources to complete the existing hospital, seize the opportunity to build a new hospital to meet an increasing demand
PPP Actors	LHU-Firm, Private Consortium (SPV)
Financial Structure	The investment is financed by public money (1/3) (LHU-Firm) and private (2/3)
Contract Agreement between Parties	DBFO and concession
Risk Allocation	The risk is principally borne by the private party, which is covering maintenance and operating costs.
Institutional/Managerial Structure	Healthcare services are managed by LHU and non-core services (12), such as parking, catering, facility management are managed by a private <i>Special purpose vehicle</i> with LHU oversight on quality service. A particular tariff mechanism is in place to ensure equipment replacement.
Tariff settings	Availability payment with some reference to qualitative standards aimed to boost the quality in service Monthly fee 51.94% for service management, 27.72% as payment for works carried out, 20.33% for plant and technological renewal
Causes of tariff variations	Execution of additional works Additional changes in services Service fees fixed in proportion to the actual management activities: Variations for the reduction in services (e.g. meals provided etc.) A decrease in service fees of more than 70% of the value outlined in the business plan Meals for in-patients: number of days patients stay in hospital Meals for fee-paying* patients: number of days spent in hospital (* fee paid for single-room occupancy) Change in the tax system relating to activities and materials New laws and regulations setting out new tariff mechanisms or new conditions for the activity Extraordinary and unexpected events, other than those mentioned above, if the pure cost of service management increases or decreases by more than 5%
Strong Points	Transformation of the existing outsourcing of facility management (Global service) into PF with a low impact on the operational phase
Weak Points	Lack of a management culture in order to effectively assess the

	<p>investment convenience</p> <p>Rigidities dictated by excessive duration of the contract</p> <p>Increase of the investment for the presence of VAT, which represents a cost for the LHU</p> <p>There is no surrender clause</p> <p>There are only <i>clauses of withdrawal</i> for the SPV</p> <p>There are no provisions for reduction of the fee if the company proceeds to renegotiate the conditions of the loan at an interest rate lower than the original</p> <p>Excessive burden on the budget of the fee paid by the LHU</p>
--	---

Scheme 2 – Case Y

Case Study Y	A hospital in an area with high population density
Total amount	EUR 254.902.050
Private finance	EUR 120.163.197
Rationale/Objectives of the PPP	To find funds to build a new hospital according to the standards of national planning in healthcare, with respect to an old project that was never realized
PPP Actors	LHU-Firm, Private Consortium (SPV)
Financial Structure	The investment is financed by public money (1/2) (LHU-Firm) and private (1/2)
Contract Agreement between Parties	DBFO and concession
Risk Allocation	The risk is principally borne by the private operator which covers maintenance and operating costs but the security package is less detailed than in Case X
Institutional/Managerial Structure	Healthcare services are managed by LHU, non -healthcare services (22), such as parking, catering, facility management are managed by a private <i>Special purpose vehicle</i> with LHU oversight on quality service. There is a particular element with reference to the Radiology Ward and Analysis Laboratory whose administration, and not only maintenance, are attributed to the private contractor
Tariff settings	Availability payment with some reference to qualitative standards aimed to boost the quality in service
Causes of tariff variations	<p>Meals for in-patients: number of days patients stay in hospital</p> <p>Meals for fee-paying* patients: number of days spent in hospital (* fee paid for single-room occupancy)</p> <p>Change of the tax system about activities and materials</p> <p>Execution of additional works</p> <p>Laboratory service: number of tests</p> <p>Diagnostic service: number of tests</p> <p>Mandatory adjustment every four years</p>
Strong Points	Realization of infrastructure without making healthcare

	expenditure for investment worse. Outsourcing of facility management
Weak Points	Lack of a management culture in order to effectively assess the investment convenience Rigidities dictated by excessive duration of the contract Increase of the investment because of VAT, which represents a cost for the LHU. There is no surrender clause There are only clauses of withdrawal for the SPV There are no provisions for reduction of the fee if the company proceeds to renegotiate the conditions of the loan at an interest rate inferior than the original Excessive burden on the budget of the fee paid by the LHU Progressive emptying of internal capabilities and unsuccessful involvement of the medical personnel in the major decisions regarding the project (e.g. the lay-out)

The comparison between the two procedures examined has made it possible to highlight the following characteristics:

- in Case Y, the PF initiative represents a true point of reference at the national level because it constitutes one of the first experiences conducted in the healthcare sector; furthermore there has been continuity in the implementation, for the legal provisions of “urgency and necessity” and given that it is deeply rooted in a project dating back to the 1990s. The concession started in 2002 and the PPP model is inspired by the first regulatory approach of the Italian law. Therefore, it may be considered as a pioneer experience in the Italian context;
- in Case X, the solution of some critical aspects of the procedure has indirectly benefited from an evolving practice of PPP in healthcare, even though it has suffered from a series of events holding up the course of the procedure. The first factor to consider (an instability factor at the decision-making level) was the uncertainty about the general manager’s permanency in the same LHU. The choice to undertake a PPP coincided, in fact, with the end of his appointment, so it was necessary to wait for a new general manager. At the same time the change in legislation caused further interruptions due to differences in interpretation and practice. The concession started in 2004;
- the two procedures started in a different manner. In Case X, the LHU did not need a request for proposal because the private party took full advantage of the opportunity offered by the change in the law in order to submit a proposal in relation to the requirements listed by the LHU in its three-year plan. Instead, in Case Y the request for

proposal to activate PF played a focus role by attracting proposals from promoters and launching a new procedure;

- the object itself of the initiative may well be considered a focus element of distinction since it introduces some differences, influencing the procedure in terms of “time and costs”. In Case Y, the manager dealt with a project already discussed at the political level but with a strong socio-economic impact on the territory of reference, while in Case X it was the completion of an existing infrastructure and its impact was smaller than in Case Y.

Despite the above-mentioned differences, the procedures have many elements in common, above all from the evaluation point of view, because at an institutional level, they were examined by the same advisors, the Regional Audit Office and the UTFP. So, both cases present an in-depth preliminary study, well-matched with the economic and financial model of the project, as intended in the first wave of Italian utilization of PPPs, in order to assure the maintenance of an adequate economic-financial equilibrium to the private contractor. From a financial standpoint, the initiative presents a different amount of investment.

Although in mixed proportions, both initiatives have benefited from a public payment including the LHU's own funds in Case Y. It means that in relation to the new financing mechanisms in force for LHUs, PPP in the healthcare sector may be implemented with the participation of the regional administrations in the financing. This raises a series of doubts and criticisms of the PPP utilization for the sole purpose of obtaining some of the missing resources, rather than through recourse to traditional forms of finance. Under the profile of the financial sustainability the business plan highlighted a provisional detailed articulation and a consistent economic return for private investors without a very substantial assumption of risk. As the accounting treatment imposes, this may constitute a severe problem in order to demonstrate the debt as off-balance sheet, above all in the light of several critics that have been descending on the intrepidity of the regional government that allowed the procedures. In general the LHUs dealt with a grid of financial ratios aiming to demonstrate the financial sustainability of the investments, their convenience, and the profitability for the private counterpart. A discouraging note derives from the fact that neither case presents the same perspective of internal procedure analysis, since in Case X a series of estimates and comparisons with the traditional procedure were made and are available. In Case Y, there was no validation test about the real VFM of the initiative. The same thing seems to occur in many cases of the UK experience also outside the hospital context (Kakabadse *et al.*, 2007). With reference to financial sustainability, in both cases, the *debt service cover ratio*

(DSCR) is positive, so it should ensure coverage of the loan repayment and guarantee the conditions for financial stability of the SPV. Under the conditions examined and tariffs charged, the results show that the two PPPs are too expensive. The hospitals remain the property of the SPV for the length of the contract and the remuneration obtained is superior to any other investment. Thus the private sector seems to be the only one to have convenience.

From an accounting point of view, the assets do not appear in the budgets of the healthcare organizations, and the tariffs are treated as operating costs. Their incidence, therefore, has a double meaning. On the one hand, the costs weigh very heavily on the management of the LHUs and, consequently, of the regional group of reference, by eroding part of the funds allocated to healthcare; on the other hand, an evaluation according to the Eurostat statements would indicate that this kind of PPP has a negative effect on the public deficit.

CONCLUSIONS

The real and tangible advantages of PPPs lie in the contribution of private capital for the realization of infrastructures that would not otherwise be possible, and a reduced incidence on public expenditure for investments. This should mean that initiatives may be considered somewhat off-balance sheet. Another key advantage is that a single approach gives multiple answers to the potential complexity of many outsourcing contracts whose risks are on the private partner. However, as highlighted in the two cases examined, the contractual formula should certainly be refined in order to mitigate those risks that in the PPP framework should be on the private sector.

In the case of hospitals, if the construction risk is on LHUs or Regions (on which they depend), or if the private partner bears only the construction risk and no other risks, the assets are classified as public assets. This implies significant consequences for public finances, both for deficit and debt. The initial capital expenditure relating to the assets will be recorded as public fixed capital formation, with a negative impact on public deficit/surplus. Above all, the most relevant effect lies in the integration of forces aimed at the functioning of a public service. It is advisable to envisage two counterparts (public and private) only in the programming phase, when rules and roles are fixed, but, once the work is implemented, the strategy for a successful partnership consists of a coordinated combination of actions in a unitary perspective. Therefore, in national accounts the assets involved in a PPP can be

considered as non-government assets only if there is strong evidence that the partner is bearing most of the risk. What is mentioned above may lead to some repercussions on the utilization of PPP since effectiveness and efficiency in the long term may be affected by the private partner with an overestimation of costs in order to ensure a surplus in the PPP. Last but not least, it is possible to claim an effective contractual risk transfer by observing the contract performance when in use. This delegation of the operating process does not mean a loss of control on hospital functioning and service quality, for which the LHUs (NHS) remain responsible. The message launched by these experiences emphasizes the concept of mutual exchange in the PPP regarding the lack of financial resources. It is crucial to know whether, in the long run, the results will meet expectations.

In general, the hospitals observed in the case studies seem to take advantage of potentialities offered by this financing and operational mechanism since it represents the ideal tool for a realistic example of public-private integrated management.

Several PPPs, already underway, present some elements of analysis from which to draw lessons for the future, given that the system is aiming to increase exemplary practices. As observed, what is problematic concerns the following factors: overcoming the merely opportunistic propensity to use the PPP, the use of ex ante test methodologies able to make realistic simulations on the future of the partnership, the flexibility to be given to contracts, so that risks shift to the private party but can also be adjusted when external variables require it. Of course, in the hospital case it is necessary for an ex ante evaluation to be able to count on reliable estimates concerning the use of hospitals and that the risk on the private party is not being excessively compensated by revenues that the private party itself would be prevented from reaching under normal market conditions. This is the paradox to be avoided.

CLUSTERS – A KEY ELEMENT OF REGIONAL DEVELOPMENT IN ROMANIA

Sabău, Cosmin

West University of Timișoara, Romania, cosminsab@yahoo.com

ABSTRACT

In the recent years, due to the increasing development gaps between regions in Europe, the clusters have an increasingly important role. Although the literature has treated this subject a long time ago, experts like Porter, Marshall have recalled into question the importance of clusters for regional economies in recent years. Their role is important in the difficult process of reducing regional disparities and the local authorities are supporting the establishment of such conglomerates between companies and specialized institutions. As for Romania, only after joining the European Union in 2007, the concept of cluster began to be mentioned as important for the development of the national territory. The transition to a market economy meant for Romania the increased competition and competitiveness on foreign markets. Thus, the establishment of clusters in various fields and in as many areas of the country as possible has been an important factor for the growth of the Romanian economy in the mid-2000s. However, their coordination and follow-up should be performed with great responsibility, otherwise undesirable phenomena such as the deepening of intraregional economic and social disparities may occur. As investigative methods used in the preparation of this research we can remind the analysis and synthesis, the normative and explorative approach, the quantitative analysis and the qualitative assessments. Also, this paper also uses modern investigative methods, but also frequently used methods in the research activity like the statistical methods of interpreting the data (the tabular method and the graphical method)

Keywords: cluster, regions, economic growth, regional development, regional policy, agglomeration

THE CONCEPT OF CLUSTER

Throughout the history the concept of "clusters" have been assigned different names: pole of competitiveness, industrial district, industrial agglomeration; through the terms that have won there were: pole of competitiveness (in France and Belgium) and cluster (the most used term). (Cismaş *et al.*2010)

The term is originated in English and in free translation has the meaning of "*bouquet*" or "*group*". The specialized literature has given several different definitions to this term.

For example, the definition given by Michael E. Porter, a staunch promoter of the concept, says: "Clusters are the interconnected companies and institutions' geographic concentrations in specific areas." (Părean *et al.*2010)

Continuing the analysis of the development of industrial structures, Porter demonstrates the influence of competitive relations between national industries and economic development, through the model of competitive advantages of national industries. He claims the need of substantiation of strong industrial links between competitive sectors, so as to result in a significant increase in the national prosperity. (Cismaş *et al.*2010)

In his studies, professor Porter, analyzed the business environment from 10 countries and also from over 100 industries with an important competitive position. Thus, he emphasized how the firms manage to become competitive and to contribute to raising the living standard of the countries in which they are located. (Cismaş *et al.*2010)

As professor Porter did, other scholars especially from the Economic Geography field, drew attention to the fact that both clustering and industrial and regional specialization were evident phenomena in all economies. Clusters could also be identified in many types of industries: the high-tech and traditional fields, manufacturing field, the services field, etc. (Solvell *et al.*)

The Official Journal of the European Union defines cluster as a "geographic concentration of specialized firms in a particular sector, related to certain suppliers and other companies from connected sectors that are competing, while working at the same time." (Părean *et al.* 2010)

In other words, we can say that these clusters are a kind of economic activities taking place within related sectors, forming in a certain period of time, their emergence being one of the greatest challenges of achieving economic development in a given region. From a historical point of view, it should not be forget that the development of the concept of *cluster* is closely linked to academic trends and schools of thought from the time of Alfred Marshall.

In his studied, Marshall talks about the industrial regions of England in the Nineteenth century, where these groups between firms acted in the same field were quite common. Later in the 80s, in Italy, the term was developed by ties that were formed between several small and profitable businesses in this country. In the mid 90s, the clusters played a special role especially in the Netherlands, specifically in the Eindhoven region. The region was passing through a sharply economic decline and the local authorities have decided to develop a program called STIMULUS, which was based on clusters, in which small and medium-sized groups received funding for development and implementation of new products. (Sabău, 2012)

Finally, Buro and Katz, two other authors concerned with this issue, believe that *the clusters are groups of related companies, actors and institutions located near each other that gain a productive advantage from this mutual approach*. Clusters are steadily growing because the companies within the group are making an important profit due to the competitive advantages resulting from the existence of a specialized workforce and exchange of information. (Muro and Katz, 2010)

Therefore we will consider the clusters as conglomerates (associations) of several specialized companies in a particular industry, which obtain various benefits from these approaches.

Actually, clusters help increase national regional and local competitiveness and represent an important lever which a country is better to use in dealing with tough competition that the market economy represents. Also, it should be noted that a growth of regional or local economy depends not only on the existence of clusters, but also by other factors such as: climate and natural conditions, fertility of the soil in the area, the existence of advanced technologies, the skills and structure of the labor force, and so on.

THE ADVANTAGES AND THE CLASSIFICATION OF CLUSTERS

The emergence and development of clusters in a specific region or in a specific administrative area is achieved either naturally or planned. During this complex process a particularly important role have the local governments as they know quite well the companies belonging to a specific branch.

According to the specialized literature, clusters have more complex features such as: (Părean *et al.* 2010)

- they have a certain identity and are geographically located in a well determined

regional, national and international place;

- they are a great potential for the development of regional, national and international markets from a particular field of activity;
- encourages the competition and strengthens the internal and external cooperation relations between the branches of the national economy;
- provides a solid basis for increasing the competition and the standard of living within the regions.

The main elements that can justify the formation of these organizations are: (Părean *et al.*2010)

- access to specialized factors (in saying this, we understand well-trained workforce, the quality of professional services, etc.);
- access to information (inside a cluster there is a continuous accumulation of information that is later disseminated to stakeholders);
- complementary: positive results from a field of work affects the ones from the sectors where it has relationships with;
- the access to public institutions and goods; if we are dealing with a well-organized cluster, which plays an important role for the economy of the area, it is indicated to deal with public investment that will have a positive effect also on component companies.

Also, authors Mihai Părean, Maria Oțil and Monica Boldea believe that the crisis affecting the global economy in the recent years can be achieved through the existence of these clusters. (Părean *et al.*2010)

The competition generated by companies included in a cluster forces the companies to innovate and to develop, they stimulate research and introduce new forms of economic development. Clusters affect the competitive advantage on three major directions: (Cismaș *et al.*2010)

- growth of the productivity of the companies that are part of a cluster;
- stimulate innovative capacity;
- helping the attraction of new businesses within the cluster.

The key benefits identified after adopting the clusters organizational model are the productivity, regional specificity, the increased mobility of information.

In attempting to form clusters, the involved entities take into account several factors, such as productivity, the increase of wages and of employment. However, the authors *Laura*

Cismaş, Andra Miculescu, Maria Oţil believe that: "the creation and development of a specific regional, through the formation of clusters, help regions in creating a favorable and productive business environment, which leads to attract as many profile companies as possible to their territory ". (Cismaş et al.2010)

Therefore, we can state that the development of a dynamic business environment in a certain region is also influenced by the existence of as many clusters specialized in various industries.

To all these it must be added the very important and increasingly growing role of the information, its mobility increasing greatly and is actually a benefit of clustering (Cismaş et al.2010). It is a known fact that technology and innovation does not develop in isolated organizations, but in open environments where there is interaction between competent individuals from different organizations.

Yet often the result of sustained increase of competitiveness of a region is not directly related to the existence of clusters, because if there is too much concentration of clusters within a certain area, that area may become vulnerable. (Cismaş et al.2010)

Nowadays more and more voices appeared stating innovation as one of the factors that may cause the economic growth. Starting from this idea it was concluded that clusters are an enabling environment to promote and support innovation, so indirectly they are a source of growth and development of the national economies.

The authors Jorg Meyer-Stamer, Ulrich Harmes-Liedtke question the existence of four types of clusters. Therefore, they state: (Meyer-Stamer and Harmes, 2005)

- o *The latent clusters* are identified through a critical mass of firms from connected industries sufficient to reap the benefits of clustering. However, under this type of organization, the interaction and information flow necessary to truly benefit from the collocation, is not very well developed;
- o *The potential clusters* have some of the elements necessary for successful cluster development, but these elements should be more carefully studied in order to benefit from the impact of agglomeration;
- o *The policy-based clusters* are chosen by governments for support, but which don't have in their componence the minimum number of firms to create favorable conditions for the regions' development;
- o The „dream” clusters are groups of policies based not only on the lack of a minimum number of fcompanies, but also of basic resources.

A very interesting and comprehensive classification is performed by George-Marian Isbășoiu, which, reminiscent of Porter, presents two types of clusters: (Isbășoiu, 2006)

- *The Vertical clusters*: composed of industries that are linked through buyer-seller relationships;
- *The Horizontal clusters*: include industries that might share a common market for goods, use a common technology, labor skills and similar resources.

Within these clusters a leading role is also played by the innovation. This topic has received in recent years, growing attention from regional analysts.

This division of the clusters actually starts from Porter's classification of clusters performed by Jacob and De Long in 1996. They analyze more deeply the definition of industrial cluster, taking into account the geographical and spatial economic activities, the horizontal and vertical relationships between sectors, the presence of a main actor, the cooperation between companies and the intensity of ties between people. (Isbășoiu, 2006)

Ian R. Gordon and Philip McCann, step a little further and link the issue of innovation to the agglomeration economies, bringing into question two known authors: Krugman and Porter. Gordon and McCann recall the link between innovation and regional development, but also draw attention to the fact that innovation differs from invention. (Gordon and McCann, 2010)

Therefore, the creation of clusters brings a direct economic benefit to a region and to local economies. Firstly, it is stimulated the entrepreneurship and the increase of innovation in as many sectors of the economy as possible. Secondly, they are supplemented by the development of local industries and the increase of employment in the area. (Muro and Katz, 2010)

CLUSTERS - A CHANCE FOR THE DEVELOPMENT OF REGIONS IN ROMANIA

As the authors Michael Guth and Daniel Cosniță recall, in Romania, the existing planned economy until 1989 led to the existence of clusters as industrial centers.

What followed after 1990 signified an important decrease of the industrial activity which inevitably led to a relocation of resources and a repositioning of the economy as a whole. But regarding concentrations or industrial agglomerations it really began to speak only after 2001 when the Romanian economy began gently to register on a growth trend and after the EU accession in 2007. (Guth and Cosniță, 2010)

The first study that presented in detail these industrial agglomerations in the form of clusters was the one conducted by the International Center for Entrepreneurial Studies in 1998. The research was conducted at the indications of the World Bank Institute for Economic Development and aimed mostly the Romanian entrepreneurs competitiveness. This resulted in the appearance of three areas in which it is possible to speak about the existence of clusters: making software, engineering and wood industrz. (Guth and Cosniță, 2010)

The same authors, Guth and Cosniță recall another survey, this time conducted by Marco Riccardo Ferrari, research assistant at the Economic Department from the University of Milan. In this case, again, it were identified three "proto-districts" 19, for wood, textiles and ceramic industry. (Guth and Cosniță, 2010)

A third relevant study was conducted by Valentin Ionescu, whose research was based on the previous analyzes. During his study, as stated by Guth and Cosniță, Ionescu shows the differences between the methodological criteria applied by other studies and emphasizes the uncertainty of a cluster definition. The researcher states conclusion is that in Romania there are emerging clusters and applied questionnaire focused only two possible clusters, one in the ceramics industry – Alba Iulia county and the other one in the software industry in Bucharest. (Guth and Cosniță, 2010)

Another significant work which deals with the clusters in Romania is VICLI21, a project within the European program INTERREG II C - CADSES22. The project started in 1999 and ended in 2001. It was meant to identify and support the development of cluster groups through the transfer of regional know-how. On the completion of the project four potential clusters in Harghita county were mentioned: woodworking, pottery, printing and equipment. (Guth and Cosniță, 2010)

In addition to these studies and researches, over time there have been carefully examined all types of clusters across the country and also divided by regions.

The table and figure below show, on one hand, a situation with the clusters identified at a regional level, and on the other hand, it presents a situation with the clusters eventually recognized as functional.

As evident from these cases the number of identified potential clusters is quite large, and in the most diverse fields. Certainly an important factor in establishing these regional clusters is the specific of the area.

Table no.1 Identified Regional Clusters

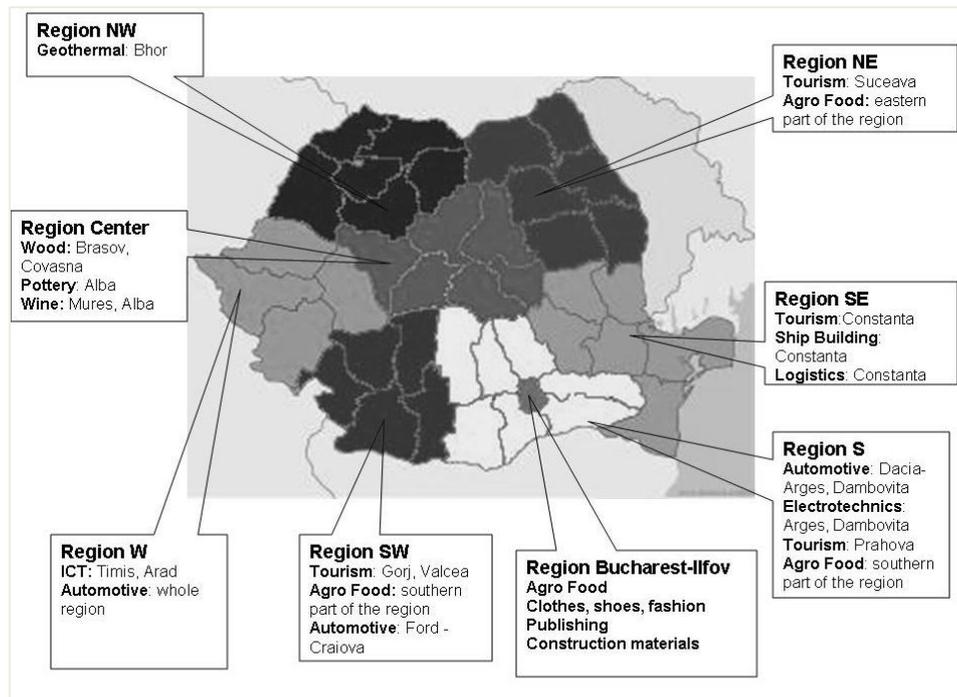

Region	Workshop Location	Identified clusters
Bucharest Ilfov	Bucharest	<ul style="list-style-type: none"> • Furniture • ICT • Clothes, shoes and fashion • Audiovisual services • Construction materials • Food industry • Logistics • Publishing
West	Timișoara	<ul style="list-style-type: none"> • Automotive • ICT • Construction & Material • Printing • Tourism • Agro Food • Machinery Production • Textile
Centre	Sibiu	<ul style="list-style-type: none"> • Wine • Automotive Sibiu • Automotive Brasov • Pharmaceutical Industry • Pottery
North-West	Cluj	<ul style="list-style-type: none"> • ICT • Electro Technology • Medical Services • Geo Thermal Energy • Bio Products • Bio Nutrients and Cosmetics • Bio Fuels
North East	Piatra Neamț	<ul style="list-style-type: none"> • Clothes and Footwear • Bio Medicine • Tourism • Agro Food • Wine • Pharmacy • ICT • Wood
South West	Craiova	<ul style="list-style-type: none"> • Automotive • ICT • Energy • Tourism • Chemical Industry and Biotechnology • Agriculture
South	Călărași	<ul style="list-style-type: none"> • Automotive • Agriculture • Petro Chemical Industry • Bio Fuels • Tourism

		<ul style="list-style-type: none"> • Glass Industry • Electro Technical Industry • Metallurgy
South East	Brăila	<ul style="list-style-type: none"> • ICT • Agro Food • Tourism • Ship Building • Alternative Energy

Source: Michael Guth, Daniel Cosnița – *Clusters and Potential Clusters in Romania, A Mapping Exercise*, February 2010

From the analysis of the table it results that the ICT field is present in most regions of the country, followed by tourism and bio industry. Clusters in certain areas are made depending on the geographical location and climate of certain areas. For example, agriculture is present mainly in the southern, south-west regions where there is lowland terrain very suitable for growing grain.

Figure no. 1 illustrates better the specialization of the areas mentioned before. Thus, the North-West region has reserves of geothermal water, the Center region has reserves of wood processing, wine production and ceramics, while the Western Region is specialized in ICT and automotive industry. On the other hand, the North-East region is known for tourism and agriculture and the Eastern region has a significant specialization in tourism, logistics and shipping industry. In the South region, the attractions include agriculture, automotive, electronics and tourism, while in Bucharest-Ilfov region there are activities concentrated mainly in agriculture, textiles, advertising, construction. Finally, the South-West region is specialized in automotive, tourism and agriculture.

Figure no.1 Regional Romanian Clusters Recognised

Source: Michael Guth, Daniel Cosnița – *Clusters and Potential Clusters in Romania, A Mapping Exercise*, February 2010

The new thinking on regional development raises the question "How does clusters integrate in the economic development?" For example, the cluster analysis can diagnose the opportunities and threats from an economic region and help identify the future actions.

At the EU level, clusters occupy an important place, which results from many documents and position papers adopted by the European Commission since 2005 and especially from the setting up of the European Cluster Policy Group. In 2008-2010 it studied clusters policy in countries outside the EU. (Dan, 2012)

As Mihaela Cornelia Dan mentions, the policy regarding clusters was including into other policies (competition, industry, entrepreneurship, education and science). At the European level there is not yet implemented a policy in its own right on this issue, as it is at the stage of searching and testing strategies, tools. (Dan, 2012)

Clusters are now the subject of a whole series of documents issued by national and international organizations (OECD, 2005, 2010, The European Commission, 2008) and based on the vast experience including in Romania, authorities supports the creation of clusters that have direct effects on local economies by increasing competitiveness, increasing employment, businesses and regional economies are growing. (Dan, 2012)

Yet somehow the natural question arises: why should clusters be supported? And the answer to this question can be obtained after completing the research conducted on this topic. Thus it was concluded that during a period of economic instability (as it is the one we are passing through now), these forms of organization bring a series of benefits which directly relate productivity, the private initiative, innovation, research, industry, businesses and last but not least the economy performance as a whole. (Dan, 2012)

However, some theorists (Muro, Katz) support the idea that clusters should act solely in areas where there some partnerships are already built and there are communication networks between companies. Also, due to underdeveloped economy in certain regions, the state should support through various means the private companies.

In Romania, the beginning was made by the Ministry of Economy, which has funded, some years ago, several studies in order to define the Romanian concept of cluster. Thus it was started from "triple helix" model which includes the three natural partners (the industry, especially SMEs, the universities and the state). In their case it was found that there was no effective cooperation and then there was brought into question a fourth element represented by the promoters. Their role is primarily to ensure a promotion among potential participants recognizing the benefits of clusters, and then to handle the technology and innovation transfer. (Dan, 2012)

To all those listed above the author Mihaela Dan recalls that regions must face some risks; these risks come mainly from the authorities because they assume major responsibilities and objectives regarding competitiveness, industrial policy and clusters, but eventually they never get to complete them or even worse, they give up on them over time. In Romania, the state's involvement regarding the clusters policy is different. As in other European countries, regional development policies, clusters, the role of SMEs in the economy are included the programs of several ministries and institutions. The main actors are the Ministry of Regional Development and Tourism. (Dan, 2012)

Through the ministries involved in the clusters issue, we include: the Ministry of Economy, the Ministry of Environment, the Ministry of Transport, the Ministry of Administration and Internal Affairs (responsible with industrial parks). In Romania, in the years to come (programming exercise 2014-2020) the most important role will be held by the development regions because the projects evaluation will be performed by the regional authorities. All these will make the local government's involvement more intense than ever before. (Dan, 2012)

As previously noted, in Romania in terms of clusters, it was passed to a four-leaf model, entitled "Four clover"; this model is mentioned by the authors Cosnița D. and Guth M. in their paper entitled, *Clusters and Potential Clusters in Romania*. They reinforce the idea that in this model we deal with different actors having different interests that will try to harmonize.

These can be summarized in the form of the following table:

Table no. 2 The interests of various actors in "Four clover" Model

Partner	Contribution	Effects/Benefits
R&D Sector	Up to date and applied research Informații, transfer de know-how	- adapting the curriculum - new industry-sponsored laboratories - continuous learning - research centers
Industry	cooperation availability of production capacity	- increase added value - other competitive advantages
Public authorities	mediator central, regional and local dissemination direct support	- central, regional and local economic development
Expert consultants	know-how transfer	- added value
General consultants	Coordination National and international dissemination Know-how transfer	-participation in an innovative network

17	Oltenia Tourism competitiveness pole – Innovation and Traditions in Tourism – Tur Olt InTT
18	South -West Oltenia Automotive competitiveness pole

Source: conducted by the author based from the data from <http://www.clustero.eu>

As from the above table, the clusters in Romania are among the most diverse areas. Starting from the clusters in the food industry, electronics, information technology and continuing with textile industry, the regional tourism and and the automotive industry, these forms of organization are seen as an important element for the future development of the national regions. The authorities have realized the benefic effect of the clusters and therefore have begun in recent years to support their establishment by different measures.

Based on Ketels's statement from 2003, quoted by George Marian Isbășoiu (Isbășoiu, 2006) "clusters develop in time: they are not a phenomenon that appears or disappears overnight," we can say that, in Romania's case, the concept developed gradually and, when joining the European Community, more associations of this type made their place into the national economy. Now the only thing that needs is to see their direct effects on local economies.

CONCLUSIONS

Following the conducted research a few key ideas emerge, such as:

Firstly, it was found that at the European level but not only, clusters represent an effective element that can ensure the economic development of certain regions, the effects of such agglomerations being the most beneficial. Many regional economies within the European Union have increased greatly after the emergence of clusters and the involved actors (companies, the local public authorities, the national states) created the necessary means for it to grow even more in the future.

Secondly, Romania has a fairly new experience in the problem of clusters, although, before the Revolution from 1989, they existed in the form of industrial clusters in different parts of the country. The accession to the European Community in 2007 brought the

emergence of a large number of clusters in the eight Romanian regions, many of which are specific areas in which those territories are specialized.

Thirdly, after the fall of the communism, Romania has gone through some major social, economic and political changes, which led to significant opportunities for foreign companies to locate their activities in this part of Europe.

Fourthly, and perhaps the most important conclusion of this research is that for urban settlements, regions or even private investors, the industrial clusters represent a particularly important point in the development strategies for the future. However, there is a prerequisite: the state must implement at its highest parameters the market economy mechanisms, thus we will witness a much stronger economical growth.

Besides all these, it is necessary for the companies from the production area operating in the clusters to be able to cope with the new technological challenges and at the same time, to meet, through the provided products, the requirements of the national and international markets.

Most of the clusters mentioned throughout this research are beginning their activity, that is making them easily vulnerable through the challenges that will be faced them in the future especially in economic field.

In the future this paper can be extended by identifying a model for the development of these forms of organization, which can be put into practice by those who are involved in the clusters.

Pe viitor aceasta lucrare poate fi extinsa prin identificarea unui model de dezvoltare a acestor forme de organizare, care va putea fi pus in practica de cei ce sunt implicati in cadrul clusterlor.

IMPACT CAPITAL FOR SUSTAINABLE DEVELOPMENT IN THE MEDITERRANEAN REGION

Saltini, Tommaso

Università Cattolica del Sacro Cuore di Milano, Italia, tommaso.saltini@unicatt.it

ABSTRACT

Impact capital is representing a new asset class, it is the new venture capital industry ready to face the institutional, structural, and cultural problems characterizing the Mediterranean region, as well as legal imperfections that must be overcome.

This paper presents prominent elements shaping and fostering impact capital in the Mediterranean region such as environment, social and governance elements in the frame of sustainability, as well as a new way to connect philanthropy to investors and investors to philanthropy.

Venture philanthropy is a concept getting closer to venture capital. Several philanthropic entities are using their capital following the techniques of venture capitalists in order to optimise management and use of resources

It also provides a description of the congruency between Islamic finance and venture capital industry which stand for a positive factor to catalyze capital flow in the region and making value from cross-border investment deals, connecting successful business model all over the Mediterranean region and improving cultural interrelation.

Impact capital is a new industry characterized by passion and broad-mindedness. Investors and entrepreneurs shall know that lack of idealism and values is proportionate to failure, since success is traced and reckoned not only with profit but also with satisfaction and peoples real needs.

This paper is part of a larger project on venture capital in the Arab-Mediterranean countries and is based on information collected from various sources, including case studies, interviews, and archival data.

Keywords: Impact Capital, Venture Capital, Venture Philanthropy, Arab-Mediterranean Region, Sustainable Development, Sustainability, Islamic Finance, Values.

This paper aims at recalling the importance of the impact capital industry, representing a new asset class for investor worldwide and particularly for emerging markets.

Impact capital is the industry where impact investments are carried out. Impact investments are investments made into companies, organizations, and funds with the intention to generate measurable social and environmental impact alongside a financial return. Impact investments can be made in both emerging and developed markets, and target a range of returns from below market to market rate, depending upon the circumstances. Impact investors actively seek to place capital in businesses and funds that can harness the positive power of enterprise (JP Morgan 2010).

The paper come out from empirical analysis about impact capital industry carried out in the Mediterranean Region. It was important to operate and spend time locally to get a closer insight for a better understanding of the region stage of development and to identify ways to improve social solidarity.

The following countries were selected to collect information as representative of the different areas of the Mediterranean South East region: Tunisia, Egypt, Jordan, Palestine, Israel.

Tunisia was selected for the Maghreb (the term is generally applied to all of Morocco, Algeria, and Tunisia), Jordan for the Mashreq (the term refers to a large area in the Middle East, located between the Mediterranean Sea and Iran) and both Egypt and Palestine as significant countries in the region.

Israel was selected not only because it represents an active country in the region but because it is significant in terms of public participation and the governmental role in developing the venture capital industry. Nevertheless, Israel's circumstances are peculiar and not comparable to any of the neighbouring countries. Attention was paid particularly to the policy framework level.

Jordan, Egypt and Tunisia were chosen not simply for geographical reasons, but having regard for the strong commitment governments and both public and private national

institutions in these countries are showing to facilitate venture capital industry development in their respective countries. Palestine's selection takes into consideration the peculiar challenges this economy is facing today and the interrelation with the region.

VISION AND VALUES TO FOSTER SOLIDARITY

Principles and values respecting people and environment are weakly taken into consideration by policy makers, investors, managers and entrepreneurs. This lack is particularly strong in the Mediterranean region where countries have weak governance from one side and from the other side investors are taking advantage from significant factors such as abundance of natural resources and cheap labour forces. The risk for corporations to exploit illegally precious resources and violate human right is very high.

Main economic theories developed and followed in the last century, Marxism and Capitalism, have always reckoned ethics as an independent entity relevant to the economy in a deterministic way (Cohen G.A. 1977), (Gouldner A. W., 1980), (Blackledge P., 2008) (Critchley P., 2001).

In Marxism, ethic is traced as an obstacle to correct knowledge and action, as an obstacle to progress, at which the natural laws of history aim. Capitalism, based on liberalism, it is also deterministic in its core. "It presupposes that the free play of market forces can operate in one direction only, given the constitution of man and the world, namely, toward the self-regulation of supply and demand, and toward economic efficiency and progress" (Ratzinger, 1985). Economy, it is said, should be guided by its own rules, which are in essence good, and not in accordance with imposed moral considerations. "Following the tradition inaugurated by Adam Smith, this position holds that the market is incompatible with ethics because voluntary moral actions contradict market rules and drive the moralizing entrepreneur out of the game" (Ratzinger, 1985).

After international financial crises break out during these last years and the numerous scandals and bankruptcies that have hit many corporations as well as violations made by foreign investors in emerging countries in the last years, it seems to be more clear that man and his moral freedom can not be excluded from the world of economics and businesses. It is becoming ever so clear that the development of the world economy has also to do with the development of the world community and with the universal family of man, and that the development of the spiritual powers of mankind is essential in the development of the world

community. These spiritual powers are themselves a factor in the economy: the market rules function only when a moral consensus exists and sustains them (Ratzinger, 1985).

In the last decades and more since the end of the cold war, the power of multinational corporations has risen sharply as a result of globalisation and the liberalisation of international trade. Private and public stakeholders have been engaged in a debate about nature of these responsibilities (Kincaid, 2012). It is today widely accepted that corporate activity and profit goal should be balance with responsibility and accountability for both its positive and negative impact on human rights and the natural environment (Friedman and Milton, 1970). Entrepreneurs, managers and investors have a moral obligation to society besides personal believe and own value obligation.

Corporate codes of conduct, guidelines and recommendations on model corporate behaviour proposed by international institution, provide a framework within which corporations should operate to generate profits in a manner that maximises the enjoyment of human rights and the environment. Many global codes of conduct and conventions have emerged in attempts to ensure a positive impact of corporate activity as well as many industry specific codes of conduct. OECD Guidelines, which are recommendations accepted as a model code of conduct with global application, recommend among other things the companies which carry out global trade and investment refrain from the use of child, bonded and slave labour, pay decent wages and provide acceptable terms and conditions of services. Financial transparency is also encouraged in order to avoid corruption and bribery (Getz, 1990).

Nevertheless all these codes and conventions, whether global or industry specific, violations in emerging market are still numerous. Guidelines are not binding and mechanism of control till weak. Although legal and non-legal efforts regarding human right and environment have been made and more in the future should be done, it must be said that without common values recognised at personal and society level, the human being and natural law will be always easily violated.

The respect for the dignity of the person express the proper aspirations of the human spirit, and constitute the ideals that should underpin any development and investment process. Centrality of person, as a method to look for and start working with entrepreneurs, is important for any investors and particularly for impact capital stakeholders. The single person with its own capacity, desire and project should be set at the centre of any valuation and investment process.

This is mostly relevant when investors are looking for seed and early stage investments. Investors and fund managers shall set together with entrepreneurs having value and passion for reality that should be transform in products and services in order to improve life quality and conditions.

Impact capital industry fits well with passionate person, moved by curiosity and willingness for new challenges. Both investors and entrepreneurs have to be characterized by this passion, broadmindedness and opening to the world. Keeping social and environmental impact dimension is mandatory to make a profit that is inclusive of values fully corresponding to human nature.

Lack of ideals and values, whether in investors or entrepreneurs, is proportionate to failure. Respect the natural law engraved in any human hurt and therefore having respect of human rights and standard rules of conduct is a guarantee for personal and companies success. So must be said, recalling history and empirical analysis that utilitarianism, the doctrine which defines morality not in terms of what is good but of what is advantageous, threatens the freedom of individuals and nations and obstructs the building of a true culture of freedom (Wojtyla, 1995).

The question about markets and ethics, businesses and ideals, it is correlated to the development of economic systems so to the development of the venture capital industry strongly anchored to single man creativity and idealism. Policy and strategy therefore, cannot be based only to the good of the single or group, but indeed to the common good of a determinate countries as well as to the common good of the family of man. The common good shall be pursue together by stakeholders in order to obtain profit but always being aware that single life and earth resources are part of a mysterious transcendent level.

Promoting venture capital operations pursuing this ideal dimension is a means to prevent improper exploitation and as well a good way to foster human creativity, industry potentiality and nations development. The real answer to human right violation and illegal business development is not only coercion nor repression, nor the imposition of one social "model" on the entire world but more a common effort to move first from human person inside desire of good for the earth and all humanity. Investors and entrepreneurs, must be aware that they have within them the capacities for wisdom and virtue which should be used in the attempt to create wealth and profit.

Ideal sphere and values in the economy are nowadays linked to some words and issues such as corporate sustainability, responsible investments, environment, social, governance, international cooperation for development, others. So the following paragraphs aim at presenting positive mutual relation between these issues, impact capital industry and economic development.

PATIENT CAPITAL FOR SOCIAL INVESTORS

Doing business has to be understood, now more than ever before, in an articulated and broader way in order to construct an economy that will soon be in a position to serve the national and global common good. There is a shifting of competences from the “non-profit” world to the “profit” world and vice versa, from the public world to that of civil society, from advanced economies to developing countries (Ratzinger 2009).

Both the philanthropic sector and the pure profit oriented venture capital industry are rapidly changing. The lines between the private and social, profit and non-profit are beginning to blur. As has been set forth heretofore, over the last decade, several venture capital actors have increasingly kept in consideration environmental and social values. Many venture philanthropy organizations are benefiting from following venture capital principles and organizational methods (Kohn H., Karamchandani A., Katz R., 2012).

The concept of venture capital is linked to impact capital and impact investments. Venture capital industry and technique represents a way to improve impact investments. “Impact investments are investments made into companies, organizations, and funds with the intention to generate measurable social and environmental impact alongside a financial return. They can be made in both emerging and developed markets, and target a range of returns from below market to market rate, depending upon upon the circumstances” (JP Morgan, 2013).

A new breed of venture capitalists is emerging, and have various labels but are mainly being dubbed social or impact investors. These investors seek to combine financial returns with social impact by using the tools of venture capital to make investments in promising private companies that have the potential to deliver some measurable social or environmental benefits. Investment valuation analyses are therefore carried out not only based on financial assumptions but on primary products distributed and on people reached with relevant services.

Traditional charity and aid alone will not solve the problems of poverty. This is also true of markets - the market alone will not solve the problems of fair and complete development. Traditional charity often meets immediate needs but too often fails to enable people to solve their own problems over the long term.

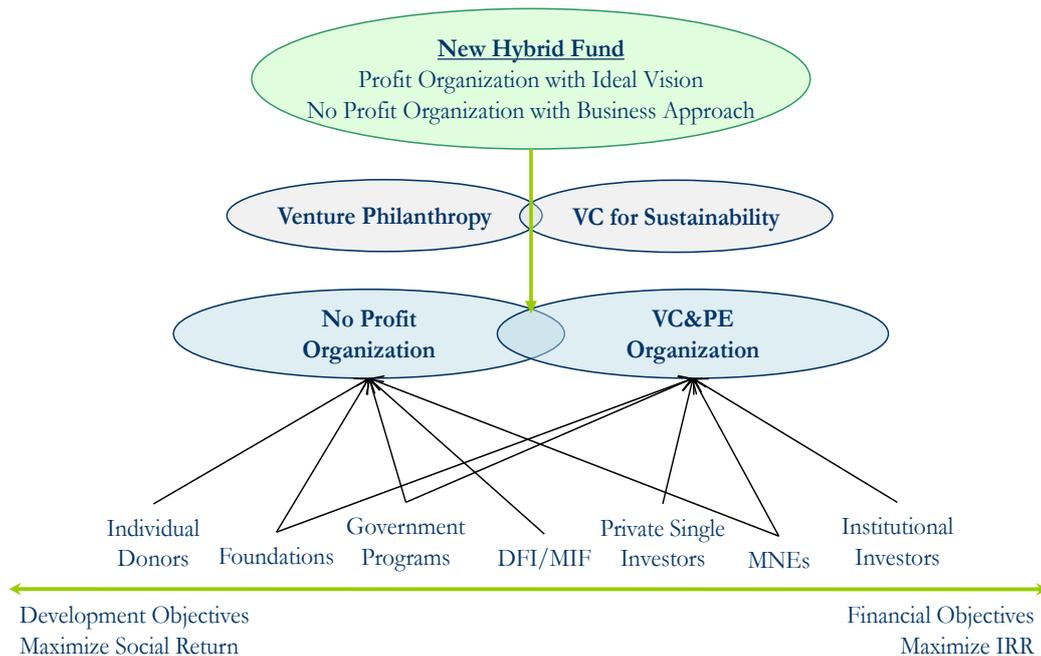

Development projects and initiatives must be run as a business, but fully respecting people's uniqueness, their ultimate good and the good of the society within which they live. Together with a deep idealism, it is surely necessary to find someone who can provide the philanthropic support such as training, strategic advisers, management and access to new contacts and new markets. There is a real need and role for a combination between investors and philanthropists.

More companies are integrating charitable initiative (or even a defined charitable mission) often correlated to their own business. Non-profit organizations are becoming more businesslike, and more individuals desire to pursue second careers in order to "give back" to local and international development by sharing their ideas, skills, time, and money.

New hybrid actors are taking form strongly focused on "patient capital" bringing sustainable jobs, goods, services and dignity to the world's poorest.

Patient capital means make available funds for long-term use, being focused more on business development than on stellar rate of return. The investment strategy is therefore to provide social and environmental returns in addition to financial returns with an emphasis on returns over the long-term.

The motivations of investors can vary widely along a spectrum of having development objectives at one end, and financial objectives at the other. Indeed, the boundary line among investors' categories can diverge. There are always pure donors focused only on philanthropy and pure investors focused on profit but there is also very often a dynamic crossing of interests. More and more institutional investors and large corporations operating globally such as in the industrial, insurance, and banking sectors tend to increase action of corporate responsibility in order to please governments of countries where they seek to expand their business.

Responsible investors must refuse conventional assumptions (IRR of 25 to 40 percent and short time horizon, usually 5 to 7 years) and ideological bias but also, in turn, look for enterprises run by social entrepreneurs who are unafraid to work in markets where individuals have minimal income, where infrastructure is often non-existent, and where the institutional system is very corrupt. Very often entrepreneurs must pay bribes to get a license and to start a business. This means not simply invest and expect quick results. An intense work alongside entrepreneurs is necessary, offering management advice and technical help and, most importantly, connections to a wider network (Kohn H., Karamchandani A., Katz R., 2012).

Investors must be realistic about how and when loans would be repaid and equity share would be sold, while always remembering that businesses at the bottom of the pyramid could take a long time to grow and that primary goal is not only money but to effect long-lasting change.

Patient capital has all the discipline of venture capital – demanding a return, and therefore rigour in how it is deployed – but expecting a financial return that is more in the 5 to 10 percent range, with the plus of a great social return that is measured by the incisiveness to bring primary products and services at a lower cost to millions of poor people.

This approach can be merely driven by funder and investor idealism (such as environmental and social impact) as well as institutionally driven thus sponsored by government and development financial institutions (DFI) or driven by regulatory framework and political programs.

Patient capital can include for-profit funds, non-profit organizations, government-sponsored funds, domestic funds, global funds, technology funds, and many others. Patient capital funds can raise money from a vast range of investors.

The organizations which are more inclined towards development objectives can raise a significant amount of money from individual donors and obtain grants from foundations. (EVPA 2012). While funds that tend to be more profit oriented usually raise money from financial institutions, pension funds as well single high-worth individuals. In between, there are governments and a range of institutional funds, which invest in both strategic business and social funds, as well as strong promoters of creative hybrid funds.

Venture capital organizations focused on sustainability and in delivering affordable, basic services to the poor, are considering partnership with governments in different ways. Creative new models and forms of partnerships emerge. New hybrid funds operating in between extreme profit and poor non-profit models are considering to define alternative constructive ways to be more effective in solving problems of lack of development using a mix of markets and smart subsidies.

VENTURE CAPITAL FOR SUSTAINABILITY

Venture capital and sustainability are increasingly being linked together as investors see that financial returns can also coincide with societal benefits.

Venture capital for sustainability is deemed a specific area within venture capital where profit objectives are supplemented by a mission, which has direct impacts on sustainability. A mission can be grouped in term of: sustainable products, portfolio company economic impact, processes and internal operations utilised by the company with regards to sustainable management.

Venture capital companies sensitive to sustainability are usually more open to search for opportunities in developing countries as well.

Sustainability, in a general sense, is the capacity to maintain a certain process or state indefinitely. The concept of sustainability applies to all aspects of life on earth and is commonly defined within ecological, social and economic contexts. In an ecological context, sustainability is defined as the ability of an ecosystem to maintain ecological processes, functions, biodiversity and productivity into the future. In a social context, sustainability is expressed as meeting the needs of the present without compromising the ability of future generations to meet their own needs. When applied in an economic context, a business is sustainable if it has adapted its practices for the use of renewable resources and is accountable for the environmental impacts of its activities.

Corporate sustainability is a business approach that creates long-term shareholder value by embracing opportunities and managing risks deriving from economic, environmental and social developments. Corporate sustainability is an evolution on more traditional phrases describing ethical corporate practice such as corporate social responsibility (CSR, also called corporate responsibility, corporate citizenship, responsible business and corporate social opportunity) is a concept whereby organizations consider the interests of society by taking responsibility for the impact of their activities on customers, suppliers, employees, shareholders, communities and other stakeholders, as well as the environment.

Sustainability is a notion that has been growing steadily in the financial services sector in the last decade and it is particularly bound to venture capital industry which have seen as a tool to foster economic growth, innovation and job creation. As well, it must be noticed that sustainability is often the fruit of innovation and innovation is often driven by the creativity and energy of young entrepreneurs and start-up companies. Venture capital can therefore be an important leverage for the development of innovative and sustainable technologies, products and processes.

At present there is not a large number of sensitive investors among institutional investors such as pension fund and foundation, which are not so careful to pay attention to sustainability comparing to smaller and family investors. On this regard, policy makers should encourage and incentive institutional investors to direct more of their portfolio allocations to venture capital funds that have sustainability as a part of their missions.

VENTURE PHILANTHROPY

Venture philanthropy is an approach to charitable giving that applies venture capital principles, such as long-term investment and hands-on support, to the social economy. Venture philanthropists work in partnership with a wide range of organizations that have a clear social objective. These organizations may be charities, social enterprises or socially driven commercial businesses (Mario Morino 2012).

Venture philanthropy is a concept getting closer to venture capital. Several philanthropic entities are using their capital following the techniques of venture capitalists in order to optimise management and use of resources.

Venture philanthropists assess progress and track the outcomes of their investments in terms of the social value produced. They maintain a close and active relationship with grantees, providing ongoing strategic guidance in addition to financial capital.

The fundamental objective of venture philanthropy is to achieve higher social or financial return (or both) from non-profit organizations.

The term venture philanthropy was probably first coined in 1969 by the American philanthropist, John D Rockefeller III, but in connection to funding unpopular social causes. In the meaning it is used now the term, it was certainly first utilized among US dot.com companies and related venture capitalist. The concept took off during the time of the high-tech boom, when profitable companies and venture capital funds were looking for more innovative ways to put their donations to work.

Its focus on building organisational capacity in entrepreneurial social purpose organisations, matching appropriate finance with strategic advice, makes a venture philanthropy fund a distinctive provider of capital. Not like traditional charitable giving institutions, venture philanthropy invests in core capabilities and growth, with the aim of scaling the impact of social purpose organisations – charities and non-profits, but also social enterprises and ethical

firms. Funding is typically provided over a multi-year period, tied to mutually agreed benchmarks, with a clear “exit strategy” for ending the relationship. Unlike a grant making model that relies on proposal submissions, venture philanthropy organization actively seek out organizations that would benefit from funding and expertise, including innovative start-up charities perhaps more open to innovative charities funding models. Each charity institution selected is treated as an investment, subject to a due diligence process, evaluation analysis and board approval.

As venture philanthropy is spreading all over the world, also in emerging markets, specific practices should be adopted to local conditions, taking into consideration specific legal norms and cultural practices.

Venture philanthropy is nowadays more developed in Europe where it has strong links to the private equity and venture capital community. Venture philanthropy concept is also influencing the corporate social responsibility of a set of major players in Europe’s financial services industry. Several new venture philanthropy funds have been established by philanthropists with successful careers in private equity. A European tradition can be discerned which is more pluralistic than that of the early US pioneers with the use of a wider range of financial instruments and performance management strategies.

European venture philanthropy organizations tend to have worked more closely with traditional charitable foundations, co-investing, learning from one another and influencing each others’ practice. The evolution of European VP industry has been closely allied to the European venture capital sector. As a result, VP is well placed to provide a synergistic model for corporate social responsibility in VC and private equity firms – again, offering distinctive prospects for growth. The movement is still nascent, and total funds in VP are currently small.

Venture philanthropy entails the application of venture capital principles, including long-term investment and hands-on support. Principles which must be adopted, defining specific investment tools, processes and methodologies in a way they may work effectively in the social sector.

Venture Philanthropy commitments maintain a set of widely accepted characteristics (Balbo, Mortell, Ostlander, 2008) which can be so explained and summarized:

- A high level of engagement. Venture philanthropists have a close relationship with the social entrepreneurs and ventures they support, driving innovative and scalable models of social change. Some may take board places on these organisations, and all are involved at strategic and operational levels;
 - Tailored financing using a variety of financial instruments (including grants, loans, mezzanine/quasi-equity and equity). Depending on their own missions and the ventures they choose to support, venture philanthropists can operate across the spectrum of investment returns. Some offer non-returnable grants (and thus accept a purely social return), while others use loan, mezzanine or quasi-equity finance (thus blending risk-adjusted financial and social returns). As in venture capital, venture philanthropists take an investment approach to determine the most appropriate financing for each organisation.
 - Multi-year support, which support typically lasts at least three to-five years, with an objective of helping the organisation to become financially self-sustaining by the end of the funding period. Financial support, if offered, it is provided to a limited number of organisations.
 - Non financial support to help organisations build strategic and operational capacity. Venture philanthropists provide value-added services such as strategic planning, marketing and communications, executive coaching, human resource advice and access to other networks and potential founders.
 - An emphasis on performance measurement. Venture philanthropy investment is performance-based, placing emphasis on good business planning, measurable outcomes, achievement of milestones, and high levels of financial accountability.
- So value is added to non-profit organizations and social businesses beyond financial support, enhancing the organisation's capacity, market understanding, strategy and operations as well as governance and organisational structures.

CONGRUENCY BETWEEN ISLAMIC FINANCE AND VENTURE CAPITAL

The aim of this paragraph is not to provide an in-depth background about Islamic finance nor to introduce all the essential elements of Islamic finance but to give evidence of the natural link between venture capital operations and Islamic finance, representing therefore a chance to improve cross border relations in a complex region.

Islamic finance refers to a system of banking or financial activity that is consistent with the principles of Islamic law (Sharia) and its practical application through the development of Islamic economies. Sharia prohibits the payment of fees for the borrowing of money (Riba) for specific terms, as well as investment in businesses that provide goods or services considered contrary to its principles (Haraam). It is also not permitted to insure against uncertainties (gharar) or carry out any speculative activity similar to gambling (maisir)

These restrictions preclude most traditional western banking practices, including taking interest-bearing deposits, granting interest-bearing credit facilities, providing trade credit insurance, providing guarantees or investing in speculative ventures.

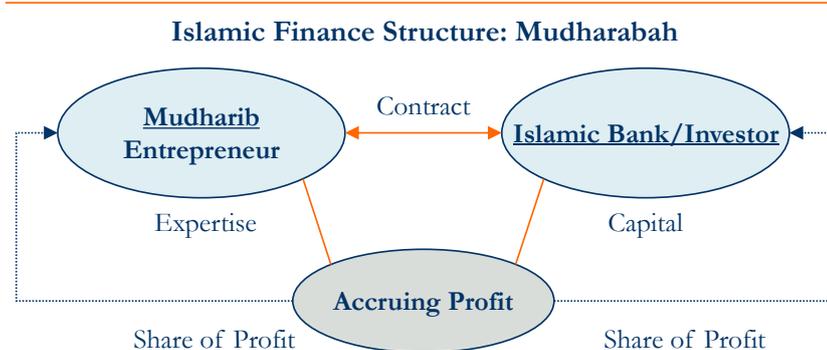

Islamic banks offer a range of alternative services and products. Islamic banks in effect enter into transactions or investments with the same rights and obligations as their customers and an equal share in their success or failure. Many Islamic economists have been calling for a re-orientation of this sector towards a greater role in profit-sharing and risk capital (Durrani, Boocock, 2006).

Islamic venture capital funds must adhere to the following fundamental requirements: underlying assets and an acceptable structure from a Shariah viewpoint.

Venture capital as an asset class is very close to equity-based Islamic finance structures, notably *mudharabah* and *musharakah*, although these have to be adapted to create the flexibility required by venture capitalists. Those financial structures are based on the principle of partnership, where no collaterals are required.

It is believed by Islamic economists that venture capital finance has its original roots in the Islamic world, especially in the concept of *mudharabah*. In *mudharabah*, the Islamic bank contributes funds, and the client/entrepreneurs contributes expertise and works to execute a potentially successful project. Profits are distributed in a percentage agreed beforehand, but the bank bears any

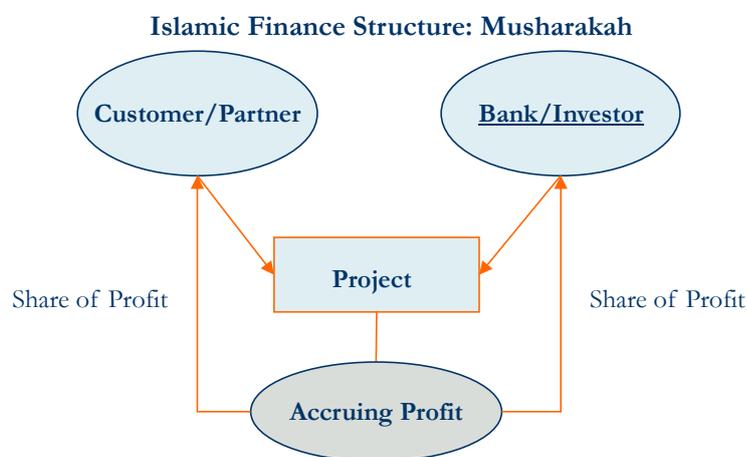

loss, though an exception may be made if the client is not negligent or in violation of the terms. Thus, *Mudharabah* is a

contract between those who have capital and those who have expertise, serving therefore the interest of the capital owner and the Mudarib (entrepreneur). The capital owner may not have the ability or the experience to run a profitable business. On the other hand, the entrepreneur may not have adequate capital to invest in a business or project. Therefore, by entering into a contract of *Mudharabah* each party complements one another, allowing a business venture to be financed.

Mudharabah can cover one deal, several deals, or a specified period of time up to a specified ceiling. This funding mechanism provides working capital finance to support entrepreneurs with skills (IT managers, engineers, traders, craftsmen) but lacking financial resources. It is the primary profit and loss sharing of asset and liability creation in Islamic banking. The bank's return is therefore determined by a share of the profits; but if a business venture fails, the capital provider (bank) loses its capital and the labor provider (entrepreneur) loses his/her time and efforts. However, the bank is not authorized to participate in the management of a *mudharabah* project, hence this form of financing carries a greater degree of risk. So profit from the venture will be shared at a pre-agreed profit sharing ratio. The key to a *mudharabah* structure is the fact that the manager cannot be placed at risk to bear losses, unless proven negligent. The capital provider will bear the risk but is limited to the amount of investment made.

Another form of Islamic finance is *musharakah*, which is similar to the former equity-based structure, but differs in the way that all the partners that join the business are committed with an amount of capital. *Musharakah* is a partnership concept where two or more investors come together to invest in a business venture, all partners are committed with an amount of money. Profits are shared at a pre agreed ratio and losses are split according to the proportion of capital injected. Each single partners has a right to participate in the management of the business venture, however they can waive the right of participation in favour of any specific partner and/or person.

The word *musharakah* is derived from the Arabic word *sharikah* meaning partnership. Islamic jurists point out that the legality and permissibility of *musharakah* is based on the injunctions of the Koran, Sunnah, and Ijma (consensus) of the scholars.

The two structure are similar, there are differences in the way investors' involvement is regulated and in the way risk is shared in case of losses; in that case each partner in the *musharakah* bears part of the loss proportionate to its share in capital. The *mudharabah* partnership was moreover originally intended to continue up to the dissolution of the company. But it is possible and permissible that for one reason or another, one of the partners sells its share in the capital to withdraw from the project.

It can be affirmed that venture capital and private equity funds have a natural fit for Islamic investors, since at the core of Shari'ah principles money should be directed to the real economy through investing in businesses that offer ethically acceptable products and services. This means that returns should be earned through active involvement and participation in the business risk in Shari'ah compliant investments. An Islamic VC industry could apply almost all of the conventional valuation, structuring and monitoring techniques used for risk mitigation purposes. It might be argued that the valuation technique currently adopted by the global VC community involves the use of interest rates (*riba*) that are forbidden under Islam. Islamic objections do moreover arise in respect of the most popular techniques used by venture capitalists, the discounting of future cash flow. Although the use of interest in financial transaction is prohibited, it may be acceptable to use interest rates as a benchmark to gauge a project's relative value.

The widely practised risk management techniques in conventional VC very rarely contradict the Islamic principles. With minor adjustments and innovation, VC can thus be added to the list of high priority asset classes that Islamic financiers should target. Although certain types of financial instruments, notably preferred stock, are forbidden, Islamic variants can be utilized to give Islamic VC funds the capacity to offer flexible financial packages. The Islamic finance industry can therefore begin to make safe forays into VC investment and could even incorporate some of these practices into Islamic banking procedures.

In conclusion, it can be said venture capital industry focus on social and environmental impact represent an opportunities to foster cultural and business relation between northern and southern shores of Mediterraneo, as well as among Arabs countries and between Arabs countries and Israel.

CONCLUSION

Empirical analyses show difficulty in obtaining financing in the region especially for small enterprises; particular problems are faced by start-ups and young entrepreneurs.

Domestic credit to the private sector is insufficient. Some regional governments such as Jordan, Egypt, and Tunisia have introduced public guarantee instruments in cooperation with banking sectors in order to meet borrowing requirements of young firms and for strategic sectors. These efforts, although worthy, are not sufficient to meet entrepreneurial financing needs in the region.

A cultural gap over impact capital finance is still present in the Mediterranean area. From the investment side, small business entrepreneurs are usually reluctant to relegate control and reduce ownership preferring to rely on self-generated funds, which include family and trusted close friends. From the investor and market side, financial institutions are not well equipped to evaluate and monitor the risks of equity investments in small firms focus to bring primary goods and services to the lower class of people.

Despite several problems, opportunity are present in the Mediterranean area. The growing population and the increase in the number of people that are exiting the poverty level, offer the opportunity to create economies of scale all over the region.

An opportunity for further development of the impact capital industry is underscored by the presence of ample liquidity in the region. Furthermore, the region possesses a number of high net worth individuals which are more and more amenable to impact capital finance. These high net worth individuals provide a base for new impact capital fund, thereby acting as a “substitute” for institutional investors or bank finance.

There is a growing need in this region for alternative methods of financing to support promising projects and enterprises. In this regard, impact capital is becoming increasingly attractive to investors and entrepreneurs, as it provides investors with more involvement in the entrepreneurial process and it gives entrepreneurs a comprehensive opportunity to facilitate success and support growth.

SUPPORTING PROGRAMS TO DEVELOP IMPACT CAPITAL IN THE MEDITERRANEAN REGION

Saltini, Tommaso

Università Cattolica del Sacro Cuore di Milano, Italia, tommaso.saltini@unicatt.it

ABSTRACT

The paper aims at underling the great opportunity that impact capital represents, as well the role institutional actors can play in improving policies, norms, and setting up supporting programmes to be carried out in order to attract new capital and to facilitate the creation of new impact capital funds.

Country empirical analyses have been carried out spending long periods in the field (Egypt, Jordan, Tunisia, Palestine, and Israel) researching in close cooperation with local and international stakeholders, which are made-up of both past and present actors in the venture capital industry of the region.

The paper highlights the role of the policy makers to ensure impact capital industry development. A complete set of policies must be set in place geared toward the local and regional conditions that continuously enable the following of changes in circumstances and market evolution.

As learned from the time spent in the region, a long-term economic development strategy should be adopted. Extremely challenging but relevant for the region is to implement programs focus upon supporting R&D activities to bring technology into traditional industries and products, the enhancement of innovation capabilities, and the stimulation of entrepreneurship culture. Therefore, governments should commit resources and all kind of efforts to enhance programs and projects leveraging capital and commitments of both public and private institutions.

Initiatives must be always undertaken aiming at fostering collective learning and increase awareness about the importance of fostering impact investments to create positive impact alongside financial return.

Keywords: Impact Capital, Venture Capital, Mediterranean Region, Emerging Market, Supporting program, Policy maker.

INTRODUCTION, METHODOLOGY AND OBJECTIVES

This paper aims at understanding methodology and programs to develop and foster impact investing in emerging markets with a focus on the Mediterranean region.

Impact investments are investments made into companies, organizations, and funds with the intention to generate positive measurable social and environmental impact beyond financial return (O'Donohoe N., Leijonhufvud C., Saltuk Y. 2010; Saltuk 2011). Therefore, impact investors are investors setting a strategy that generates financial return while intentionally improving social and environmental conditions (Bugg-Levine and Emerson, 2011).

The specific objectives pursued during the entire analysis were: to draw policy-makers' attention to proposals and recommendations to set up and consolidate an impact capital industry in emerging markets; and to define some concrete and creative support programs to be carried out by both public and private actors in order to exploit synergies and reach common interests.

Considerations reported are based on information collected in the following countries: Egypt, Jordan, Tunisia, Palestine, and Israel. Five researchers spent time over three years (November 2006, February 2010) meeting key stakeholders, grouped in the three main categories: investors and fund managers; entrepreneurs and industry associations; and officers of public institutions and international organizations. The empirical research was supported and carried out in collaboration with United Nations Industrial Development Organization (UNIDO) field offices in Cairo, Tunis and Amman.

The following actors were interviewed and proposals drawn with their support: 14 regional investors active in the **MENA region**; 3 incubators, 4 entrepreneurs, 4 investors, 2 public institutions, 2 international organizations **in Jordan**; 1 incubator, 3 entrepreneurs, 9 public institutions, 3 investors, 2 international organizations **in Palestine**; 2 incubators, 10 investors, 4 public institutions, 3 industry associations, 3 international organizations **in Egypt**; 2 incubators, 4 public investors, 8 private investors, 7 public institutions, 3 international organizations **in Tunisia**. International regional conferences in Dubai, London, Bethlehem, Tel Aviv, Amman and Milan, in the period 2006-2010, were also attended and proved to be useful for collecting significant information, and data and feedback from stakeholders.

Country empirical analyses have also been carried out spending long periods in the field researching in close cooperation with local and international stakeholders, consisting of both

past and present actors in the venture capital industry of the region (Saltini 2006; 2009a; 2009b; 2010).

The theoretical framework and literature taken into consideration is that relating to the venture capital industry development (Black and Gilson, 1998; Gilson 2003; Gompers and Lerner 1998, 1999, 2001). However, this paper does not address the many theoretical papers that deal with the venture capital industry but it focuses on the interrelation that exists with the new impact capital industry. The study pays special attention to the investors that seek to combine financial returns with social impact by using the tools of venture capital to make investments in promising private companies that have the potential to deliver some measurable social or environmental benefits.

The analysis carried out is also based on potential lessons learned from other countries [Israel (Avnimelech 2008; Avnimelech and Teubal 2003a; 2003b; 2004a; 2004b;), Germany (Becker and Hellmann 2005), Italy (Finlombarda 2002, 2003)] drawing important conclusions for emerging countries.

Previous work has stressed the importance of proper policy framework and supporting programs to foster venture capital industry development (Avnimelech 2008; OECD 1997; 2000; 2002; 2003; 2004; 2006; Saltini 2006). This paper maintains its focus on particularities and specific actions needed in emerging markets of the Mediterranean region.

A model to foster venture capital industry development in emerging markets is therefore presented, focusing on pursuing social and environmental impact investing as an innovative solution for traditional businesses. The model proposes that policy makers follow five coherent consequential phases. Actors to be involved for each of the phases and activities to be implemented are also presented.

Keeping the focus on emerging countries of the Mediterranean region, as mentioned by the stakeholders interviewed, attention is paid to the emergence phase. Recommended actions for government policy makers are presented. The design of a comprehensive policy framework represents a key issue particularly for countries where social problems are spreading and where political turmoil is a threat. A significant part of the paper is devoted to explaining the role that supporting programs may have in catalyzing impact investors and leveraging public funds.

The research highlights the great opportunity that impact capital represents, as well as the role institutional actors can play in improving policies and programs to be carried out in order to attract new capital and to facilitate the creation of new venture capital funds (Black and Gilson, 1998; Gilson 2003). Gilson affirms that to create a venture capital industry significant efforts and coordination among different actors are required, and that three groups of actors are necessary: promising new enterprises, investors and venture capital companies.

This paper underlines how crucial can be the role of some public and private organizations and institutions (such as government bodies, development financial institutions, multilateral development organizations, universities, R&D centres) for catalyzing impact investors. These key players need to act simultaneously in setting up special programs and policies to encourage the emergence of these first level of actors, and hence of new industries able to improve development and ensure a positive impact on society.

Special attention is paid to understanding the positive role institutional investors can play in setting up institutional venture capital, also called formal venture capital (Landstrom 2007). Government institutions can finance venture capital organizations with a mission to invest in industries that are crucial for the country's development as well as fostering particular issues such as innovation for traditional industries (Nelson 1994), thus setting up new companies and supporting growth of micro-small enterprises operating in important sectors and in underdeveloped regions.

CONCERNS TO DEVELOP IMPACT CAPITAL

The concept of venture capital is linked to impact capital and impact investments. Venture capital industry and techniques represent a way to improve impact investments.

The definition of venture capital is very controversial due to the mixed use of the terminology of venture capital and private equity, especially when it comes to investing in later stages of company operations. Venture capitalists act as financial intermediaries between investors and entrepreneurs, most commonly drawing funds from a wide variety of sources including private investors, pension funds, banks and insurance companies (Gompers and Lerner 1999, 2001).

Venture capital can be presented as a financial activity by which professional investors support high-growth small to medium size entrepreneurial talent with medium to long-term

equity finance and business skills in order to exploit market opportunities and thus obtain long-term capital gains (Bygrave and Timmons 1992).

There are many factors to be taken into consideration in setting up initiatives and encouraging proper processes in order to foster venture capital operations for impact.

A calibrated and well-defined institutional action plan can play an active role in spurring impact capital industry emergence and developments. Three main issues are identified as priorities in order to create the preliminary conditions necessary for impact capital emergence and consolidation:

- Supporting education and R&D programs through a number of special incentive schemes, using grants and awards.
- Financing early stage high-tech investments and innovative start-ups; in many countries governments are engaged directly or indirectly in supplying capital to new technology based firms (OECD 1997).
- Supplying capital for social impact venture capital funds.

Empirical analyses carried out seem to confirm the importance of government intervention and its playing an active role at a policy level. This is also supported by the Israeli experience, where the government implemented, both successfully and unsuccessfully, several special programs (Avnimelech and Teubal 2004b). The Israeli experience was then worked out again by other European governments (Finlombarda 2002).

Nevertheless, it is controversial and difficult to establish a permanent and viable set of policies. It is important to promote partnership among public and private institutions to foster R&D programs and launch special initiatives to enable conditions ensuring a sound impact capital industry. Governments must also sustain education by supporting universities and executive training centres, projects, and proposals. Increasing ways to improve technical know-how and educate a young generation of researchers, entrepreneurs, financial experts and specialized professionals significantly contributes to the development of new impact funds.

PROCESSES TO SET UP A VENTURE CAPITAL INDUSTRY FOR IMPACT IN EMERGING MARKETS.

Most of the literature related to venture capital development and policy for venture capital emphasizes the need for effective financial regulation and capital market structure, as well as

legal and tax frameworks for LP and GP operations (Black and Gilson 1998; Gompers and Lerner 1998; OECD working papers and country studies).

A lack of venture capital investors and operations is due not only to a lack of money but also to a lack of a comprehensive system representing a new industry. During the last few decades, governments and national policy-makers in different countries and states have tried to establish a venture capital industry working exclusively at the regulation level by reducing capital gain taxes, providing tax benefits programs, offering guarantee systems, among other initiatives. All these initiatives, although important, are not sufficient.

Venture capital industry is correlated to a more evolutionary perspective and to a broader context; an approach that is confirmed by the relevant literature (Becker and Hellmann 2005; Bottazzi 2004; Florida and Kenney 1998). In other words, attention must be paid not only to the money supply side but an emphasis must be placed on the investment opportunities side as well. It is essential to establish the conditions for the existence of an adequate number of high quality deals and to have a good number of entrepreneurs that understand the venture capital investment process as an opportunity for their business growth and success.

In this regard, R&D support and innovation is required (Kim and Nelson 2000). Capable policy makers, academic consultants, and specialized professionals are called upon to define proper policies and programs, and to undertake research about policies implemented in other countries, their effectiveness and impact in the given context. It is important to learn from relevant experiences, successful actions, and from failures and deficiencies as well.

Empirical analyses carried out and the failure of venture capital policies in many other countries confirm the assumption that an appropriate policy framework to properly develop venture capital operations should be based on sequencing phases rather than on a simultaneity of actions. It is not true that once there are investors and venture capital firms, the right investment opportunities (start-ups and SMEs) will automatically emerge (Avnimelech and Teubal 2004).

For this reason, a model to develop an impact capital industry, aimed at fostering emerging markets development and pursuing social and environmental impact, is hereafter presented together with recommended actions for policy makers that should be set in place to facilitate the emergence of this strategic industry.

A MODEL FOR VENTURE CAPITAL INDUSTRY DEVELOPMENT IN EMERGING MARKETS

The lack of good investment opportunities and well-prepared entrepreneurs is as important as a lack of investor capital. From past experience and the failure of European and American policy makers during the 80s and 90s, it is more clear how important it is to create a positive environment for venture capital development supporting innovation and technology growth as well (Becker and Hellmann 2005; Nelson 1993).

Government programs and public policy failures were related to initiatives committed to establishing venture capital industries independent of any related efforts to establish high-tech centres and clusters focused on innovative enterprises (Florida and Smith, 1993).

It follows that for public action to be successful in fostering the venture capital industry these must be part of a broader and more comprehensive set of policies, which support financial issues on the one hand and industrial clusters on the other. A comprehensive support which embraces the whole high-tech issue such as R&D, innovation, business application, start ups, together with industry, marketing, management issues and necessary coordination is required. It is also crucial for an emerging market to define its strategy on how to attract and/or train high quality professionals for the venture capital industry, with venture capital capabilities and full venture capital industry comprehension (Avnimelech and Teubal 2005).

Therefore, considering the complexity of this matter and based on industry research and empirical analyses carried out, a model is proposed to foster venture capital industry development, particularly in emerging markets. The model introduces correlated processes to be faced in order to develop an impact capital industry and each of these processes has been carefully linked to its environment and geographical context.

The model has been developed taking input from the analysis and evolution of the Israeli experience of the last four decades (Avnimelech 2008; Avnimelech and Teubal 2004a; 2005a; 2006). The case of Israel adheres to a different logic and context, but it provides important hints to policy makers and key industry actors operating both in Europe and the Mediterranean region. The development of the venture capital industry in Israel has been particularly rapid and successful given the particular circumstances in which its development has transpired. However, the development of the venture capital industry in Israel was possible also because an unprecedented range of supporting programs was launched putting together private and public money to foster the small business sector.

This experience is here reposed, reviewed and remodelled, referring to the Mediterranean region, taking into consideration regional weaknesses and threats as identified in the empirical analyses carried out in Jordan, Palestine, Egypt and Tunisia (Saltini 2006; 2009a; 2009b; 2010).

Industry

A process is here identified as a set of structured activities and related relationships among categories of actors that are typically part of a venture capital industry. These actors and the actions they can set in place to foster venture capital operations have to confront different issues along five main sequential phases: preliminary, emergence, beginning, development and consolidation phase. Special attention was paid to catalyzing investors willing to foster social and environmental impact, making money but also making a difference improving country development and comprehensive access to primary goods and services (Bugg-Levine and Emerson 2011). In this regard, R&D and innovation is deemed crucial to transfer technology into traditional businesses.

The preliminary process sees mainly interaction between supporting institutions and the young generation of innovators. Preliminary and basic initiatives must be set in place to create R&D centres and to foster a university approach to research and business culture. Development Financial Institutions in coordination with governments can set up creative and dynamic programs to help in creating preliminary conditions. Governments must also attempt to reduce bureaucracy and cumbersome regulations.

In the emergence phase policy makers, governments, MNEs and DFI must all be part of a common attempt of supporting innovation together with high-tech centres and engineering universities, thereby fostering advanced education development. Many of the greatest venture capital successes have had a relationship with research centres and universities.

R&D capabilities have to be directed toward creating new products and services and consequently new start-up companies; this is a major condition to move from the first phase to the second one (Avnimelech 2008). In the region, a special focus should be given to applying innovation and technology to traditional business, innovating industrial processes, products and services. Programs based on technology transfer should be implemented.

The government, in particular, plays a multi-faceted role. There is a political level that relates to maintaining currency and economic stability as well as developing a favourable tax and legal system. Attention must be paid to protecting intellectual property and properly regulating the capital market.

This is a time to create a critical mass of start-ups in order to have an effective demand for venture capital, and therefore a good number of suitable and promising investments.

In the beginning phase the processes which take place are on programs and activities between the public and private spheres. Institutional and private stakeholders are moved to pay attention on ways to finance innovation and business technology projects.

In this phase the main target is the venture capital industry. Technical supporting institutions are established and programs launched to leverage positive conditions, accelerate venture capital demand and company growth, and foster local capabilities. Local investors make the first move to establish venture capital firms and local managers and entrepreneurs have a key role in allowing start-ups to survive and grow.

Venture capitalists look for growing industries and high returns that are always linked to high technology industries or to innovation applied to traditional sectors.

During the development phase processes involve development of relationships between venture capital firms and entrepreneurs at a broader level: local, regional and international. Venture capital teams of managers have to be put together leveraging local networks and knowledge in order to be able to catalyse capital resources available in the region and to allocate them intelligently.

In these first phases the size of funds should not be so large as to lose the focus on small investment size. If these initial investors and firms build up a good reputation, the funds size and investment target will increase spontaneously.

Focus has to be placed on attracting not only capital but also consistent entrepreneurial and technical know-how. Moreover, during and after venture capital growth (in order to provide a broader perspective to the process) an extensive category of specialized professionals has to take part in supporting operations such as attorneys, accountants, tax experts, advisers and consultants.

The consolidation phase sees interaction among all previous actors, in addition to institutional investors, global professionals, and industry associations. Coordination among local and international actors must be ensured and standardization of contracts, procedures and guidelines pursued. The strength of the local IPO market and country stock exchange dynamism is mainly related to late stage venture capital investments and venture capital industry development rather than earlier stages (Matheson 2005).

Success in consolidation depends on the industry's capacity to design a new structure and a new institutional framework promoting broader policies able to enhance the contribution of high-tech to other non high-tech and traditional sectors, thus sustaining demand and capital

raised which become more difficult in time of maturity (OECD 1997; OECD 2001; Nelson 1993).

Venture capital firms become more specialized investing in identified industries and targeting deals strictly for investment size. It could be advantageous to have a vertical expansion by raising a large fund, and thereby developing global venture capital players with specialized divisions that will invest throughout the different stages of development, from start-ups until expansion and large growth of the companies. Another possibility is for a single venture capital firm to expand horizontally to new geographic markets, and thereby help to consolidate country venture capital industry at a regional level.

During the consolidation phase crises can arise. In this case, priority should be given to assuring a minimum level of activity in start-ups, targeting innovation. During critical times government involvement and forms of direct financial support could be a determining factor in the industry's survival and therefore help to overcome the crisis and reach a stronger consolidation status. Interesting forms of support have been set in place in the last thirty years by some European governments such as Sweden and Norway (Karaomerlioglu and Jacobsson, 2000).

Throughout this period, it is essential to encourage a process of consolidation and strengthening (or renewing) of supporting institutions and programs.

Difficulties encountered in implementing policies for encouraging venture capital operations are due very often to a misunderstanding of the evolutionary nature of the venture capital industry (Avnimelech and Teubal 2003). The Israeli success story, as is also well shown by the US case, demonstrates very well how venture capital industry development and start-up formation and growth can be strongly correlated (Avnimelech and Teubal 2004b). The enhanced venture capital activity spurred additional start-ups, and additional start-ups spurred further venture capital activity. In the US successful start-up founders became venture capital partners while venture capital partners and managers took active roles in founding and developing portfolio companies. This virtuous circle of enhanced capabilities and networking contributed to the further success of venture capitalists and enhanced value adding services to start-ups (Avnimelech, Kenney and Teubal 2007).

What appears to be evident (and better supported with useful elements by the following paragraph) is that government policies must play a key role during each phase of venture capital industry development starting from the background conditions until the consolidation period. Venture capital policies require adoption of an evolutionary perspective to venture

capital as an industry and a perspective of the venture capital policy framework as a system in constant evolution (Avnimelech and Teubal 2003a; 2005a).

AN EXTENSIVE EVOLUTIONARY POLICY FRAMEWORK IS CRUCIAL

A nascent venture capital industry can be market driven, supported by policy or triggered by policy. This is more the case in emerging countries where both market preliminary conditions and external supportive programs are weak or absent.

Improving the investment climate by reducing government failures is a necessary but not a sufficient condition for fostering rapid growth through investment. Market failures also need to be addressed. The lack of equity capital can be partially attributed to an excessive perception of high risk and information asymmetry.

Emerging market governments call for contributions recognizing the important role risk capital can play in broadening the private sector, and should therefore willingly institute the necessary reforms. On the part of financial institutions the expectation is that they fulfil their role by sharing risk with private sector counterparts and assisting governments to strengthen regulatory environments. They should also provide support for creative new approaches to venture capital investing.

Choosing the appropriate form of assistance is in general related to individual country weaknesses and opportunities. In order for a government to be successful it must be able to assess, and even to influence, the context under which venture capital policies and programs will be implemented. However, a good measure is expected to encourage good investors to provide risk capital to target enterprises and to support entrepreneurs in exploiting in a proper manner the incentives offered.

Considering global trends on venture capital development in the region, and having carried out empirical country analyses at the regulatory level, some recommendations to policy makers are listed herein.

Table 1–Recommended Actions for Government Policy Makers to Develop Impact Capital

Area	Actions	Recommendations
<i>Investment Regulations</i>	Equity guarantee schemes Incentives' programs to new investors categories.	Reduce perceived risk and increase motivation toward excluded areas and industry. Reduce restriction for domestic insurance, pension funds, universities.
<i>Legal & Tax</i>	Tax reductions and exemptions	Reduce capital gain taxes on VC investments and consider tax incentives to local and

	Intellectual property system Company legislation Labour regulation Stock Markets and M&A	international investors. Ensure legal property rights as well a simple and transparent commercial legislation. Facilitate and ensure ways of exiting.
<i>Innovation</i>	Business incubators Start-ups grant programs Finance R&D institutions	Set up incubators to launch new innovative products and services. Sustain start-ups with institutional programs and R&D centres with substantial resources.
<i>Capital Market</i>	Set up proper laws Simplified Stock Exchange procedure	Enforce M&A and securities law. Ensure transparency and efficiency. Allow dual listing on local and foreign Stock Exchanges.

Source: own elaboration

According to the experience developed in transition economies about venture capital matters, governments are expected more and more to take actions on several priority matters, hereafter some recommendations to policy makers:

- Area Investment Regulations – Since the economic landscape in the region is largely dominated by SMEs and small family enterprises, the country regulatory framework should consider encouraging venture capital investment focused on this specific company target. Equity guarantee schemes and programs based on incentives should be designed to increase investor confidence.

Local and regional pension funds and insurance companies can be good prospective investors having long term liabilities, which gives them both the necessary liquidity and the ability to absorb risk. Special and suitable measures must be undertaken to induce them to target and pay more attention to venture capital firms. Alternatively, individual wealth in the region as well as foundations, universities, and charitable endowments, may be a substitute for bank or institutional investments. Governments should develop measures to encourage these individuals and actors. Collective schemes to facilitate retail investment in venture capital must be developed. Ministries such as the Ministry of Finance, Industry, Trade can offer government equity guarantees to institutional investors who participate in (or initiate) impact capital funds.

- Area Legal and Tax – It is crucial for the development of a local venture capital industry to mobilize local investors, as well as to attract foreign equity (OECD 2006). The most relevant issues (as has already been stated) include a taxation system, reducing barriers to entrepreneurship, setting up appropriate regulations, intellectual property, and

commercial legislation, as well as improving access to public stock markets and fostering M&A so as to improve exit ways for investors.

Tax system

Assessing existing tax and regulatory systems to eliminate unnecessary complexity in tax treatment of capital is a priority. Some countries have responded to this demand by providing tax relief for various forms of investment in unlisted companies or companies listed on second tier of growth exchanges. In this regard, several European countries (OECD 2006) have recently reduced tax pressure.

It is extremely important to define policy to encourage not only financial investors but also to target new people to become impact entrepreneurs investing their savings. In this regard here are listed some significant measures:

- o Since venture capitalists depend upon capital gains for their income, the industry tends to press for low rates of capital gains taxation; reduction or exemption of capital gains taxes for local and foreign investors (in order to encourage impact capital investments and entrepreneurs) is therefore a high priority since taxation of capital gains has long been pointed to as a driver for both entrepreneurship and venture capital operations.
- o Optimizing all the tax regulations affecting R&D, innovation, and start-ups.
- o Providing tax reduction and exemptions to encourage students and employees to become entrepreneurs.
- o Providing tax incentives to key institutional investors, such as pension funds and insurance companies, when open to invest patiently, fostering a social and environmental impact business model.

Legal framework

- o Improving labour regulations and the intellectual property protection system as well as providing sufficient incentives for innovative activities to exist.
- o Providing a simplified legislation for establishing enterprises and venture capital funds, as well as a transparent regulation for exit of unsuccessful enterprises, specifying clear insolvency procedures and standards.
- o Promoting sound corporate governance standards in line with the international consensus, aimed at establishing standardized public disclosure and management accountability (including accepted accounting practices, independent audits, and defined responsibilities of boards of directors).

Stock Markets and M&A

A significant number of legal and regulatory changes will need to be implemented to strengthen local stock exchanges in the region. Significant measures should be focused on:

- o Liberalizing investment restrictions for local institutional investors such as pension funds, insurance companies, mutual funds and other financial intermediaries.
 - o Striving for closer co-operation with sister organizations and other development financial institutions, with the objective of creating a well-functioning network that promotes effective risk-spreading and helps to secure financing.
- Area Innovation – It is impossible to talk about venture capital emergence and development without providing a suitable environment for innovation. In this regard, empirical analyses give evidence of all the attempts made by authorities to institutionalise programs (such as business incubators) to raise the level of patentable innovation and innovative start-ups. Experience has demonstrated that venture capital activity tends to be geographically clustered in areas rich in skilled human capital, universities and research centres, as well as legal and technical services.

Governments should foster innovation and entrepreneurship through business incubators and facilitate linkages among incubators, R&D institutions, universities and sources of finance. It is important to create a social and economic climate conducive to the emergence of clusters, where innovative enterprises can find an environment in which to grow and be exposed to target investors.

Achieving sufficient results on R&D and innovation capabilities to also support traditional sectors requires a long-term policy program and financial resource long-term commitment.

- Area Capital Market – Since capital markets and company listings on stock exchanges is always one of the main and most consistent ways of exit for venture capital firms, and given that domestic markets may not be able to accommodate listings, governments should foster local stock exchange development as well as facilitate listing of domestic companies in overseas markets.

SUPPORTING PROGRAMS TO FOSTER IMPACT CAPITAL, BETWEEN PUBLIC AND PRIVATE

The paper notes the crucial role that public actors and policy makers can have in developing an efficient policy framework, in fostering capacity building and education, and in supporting R&D programs and innovative start-ups and small enterprises focused on impact solutions. The government and public institutions can play an active and fruitful role in fostering innovation, entrepreneurship, and business orientation. Appropriate and effective investment regulations facilitate the emergence of preliminary conditions and their positive exploitation.

Governments supported by developed financial institutions, multilateral development agencies and ordinary banks, planning together with other institutional investors such as pension funds and social responsibility investments organizations, along with the support of specialized professionals and private direct investors can develop specific creative investment funds and programs that directly foster emerging countries' efforts to improve investment climates as well as strategic sectors, industries and geographically critical areas. It is important to act as a catalyst for first-time risk capital operations, creating the conditions and confidence for subsequent operations through demonstration effects.

Governments are requested to design and launch concrete programs that could be developed at the national and regional level to make the most of public and private capital.

A creative public and private approach is recommended to foster impact capital industry emergence. Partnerships between public and private entities can be an optimum way to set up funds well focused in scope and committed on a long term basis. Public money can be crucial to catalyse both local and international capital as well as to bring in technical and financial expertise. Developing funds and programs with public and private capital and know how, strategic industry and underdeveloped regions can be supported. Government sponsored initiatives can also easily help micro and small enterprises to access innovative financial instruments, encouraging investors to become involved even where environments lack the regulatory requisites and preliminary conditions.

Public involvement to foster the development of a new impact capital industry is welcome but it is important to recall that the government as facilitator and investor should have the ultimate goal of creating self-sustainable markets rather than creating conditions for dependency. After target goal achievement, public actors are expected to timely remove their presence.

In order to set up an efficient impact capital industry in an emerging market, it is important to create conditions and launch a process to facilitate the establishment of more than one impact

fund contemporaneously which can operate as an intermediary between the country's resources and private corporate counterparts in the industrialized world. Different funds can be set up according to geography, industry, size, export or local country priority strategies.

Hereafter are listed some specific and concrete forms of governmental intervention which could be launched to increase motivation and facilitate activities of venture capital investors and venture capital firms aiming at supporting impact businesses:

- Establishment of investment funds (venture capital) in which the state (through a public institution) is a partner, investor or participant, even if on less advantageous terms than other investors;
- Grants to impact VC funds to cover part of their administrative and management costs;
- Providing guarantees to impact funds against a portion of investment losses, or with respect to loans to investors/funds for investment risk capital;
- Public launch programs and setting up of alternative institutions to finance seed capital at a very early stage.

It is not only important to set up far-sighted policies and supportive programs, but to adapt them carefully to the context and to the right timing concerning phase of development. Unfavourable background conditions may prevail and, if not taken into account, they might hamper positive effects.

Finally, it must be said that pressuring governments to take action on all these matters entails steady risk as this involvement could become too intrusive, thereby stifling real development. Again, government roles should last for a limited period and any programs and initiatives launched should always be geared toward increasing the numbers and the role of private stakeholders.

SUMMING UP ACTIONS FOR THE REGION, RESULTS AND CONCLUSIONS

This paper endorses the great and crucial role policy makers have in developing impact capital industry in the Mediterranean region. The entrepreneurial spirit of the young generation in the region must be supported by effective programs able to leverage virtuously public and private capital. This paper has adapted to the local regional context inputs and conclusions taken from previous work focused on Israeli and European experiences

(Avnimelech 2008; Avnimelech and Teubal 2003a; 2003b; 2004a; 2004b; Becker and Hellmann 2005; Finlombarda 2002, 2003)

The paper's conclusions are in accordance with the relevant literature on venture capital policies for industry development that affirms the importance of a simultaneous effort by all main industry actors including investors, entrepreneurs and institutions (Avnimelech 2008; Gilson 2003).

The model presented in order to foster impact capital development and the concept elaborated of supporting programs give a prominent role to academics and particularly to policy makers. A major contribution is offered having adapted policy and model to develop venture capital industry to impact capital for impact entrepreneurs in emerging countries of the Mediterranean region.

The role that governments and public institutions can play in fostering and facilitating the initiatives taken by impact entrepreneurs and impact investors is crucial, particularly in emerging markets. The presence of active impact capital investors can be encouraged and strengthened by programs undertaken both by public and private institutional players including governments, research institutes, universities, financial institutions and international organizations. Identifying and encouraging programs – such as financial and technical support schemes, tax incentives, higher education, and risk-sharing plans – may be useful for optimizing resources, by attracting new capital and so supporting universities, technological parks, industry associations and industrial clusters to allow new businesses to emerge, start-up and grow.

Policy makers must play an important role to ensure successful venture capital industry development focus on social and environmental impact. A complete set of policies must be set in place geared toward the local and regional conditions that continuously enable the following of changes in circumstances and market evolution.

A critical factor in the region is the policy makers' lack of capabilities to set priorities and translate them into programs and policies. Accordingly, assembling highly skilled teams of policy makers, academic consultants, and specialized professionals is essential in order to undertake analyses about policies implemented in other countries, their effectiveness and impact.

As learned from empirical analyses, a long-term economic development strategy should be adopted. Extremely challenging but relevant in emerging markets is to focus upon the enhancement of innovation capabilities, and the stimulation of entrepreneurship culture. Therefore, governments should commit resources and maximum efforts to enhance R&D programs and projects, as well as creating other favourable conditions.

As a further step, actions must be undertaken to move technology and innovative solutions toward traditional sectors, facilitating the creation of new products and services. A critical mass of promising start-ups with a strong focus on social and environmental sustainability is required prior to setting policies directly focused on impact capital.

Supporting programs should be designed and pinpointed confronting past and present policy programs failures and weaknesses. It is also crucial to design programs aimed at leveraging the positive conditions of the local context and confronting the fragile state of the local economic situation of the Mediterranean region. Supporting programs should also be designed to utilize and leverage public resources in order to catalyse private capital, locally and internationally.

At this point policies targeted at directly developing impact capital funds are required. Policy makers and policies that they design and implement should be aware of the preliminary market and industry needs and should be able – in a proactive way – to identify, bring out, and direct all these crucial factors to develop impact capital funds in tune with the local context.

New hybrid actors are taking form strongly focused on patient capital bringing sustainable jobs, goods, services and dignity to the world's poorest. Patient capital will accordingly make available funds for long term use, being focused more on business development than on stellar rates of return. The investment strategy is therefore to provide social and environmental returns in addition to financial returns with an emphasis on returns over the long-term (Trelstad 2009).

Entrepreneurs and visionary leaders using a business approach to solving big social problems must be sought and supported by both private and public institutions. Investors must be realistic about how and when loans will be repaid and equity shares be sold, while always remembering that businesses at the bottom of the pyramid may take a long time to grow and that the primary goal is not only money but to effect long-lasting change.

In emerging countries, more than in an advanced context, this approach can be driven by funder and investor idealism (such as environmental and social impact) but it must be institutionally driven, thus sponsored by government, international organizations and development financial institutions as well as driven by regulatory framework and institutional supporting programs.

ABSTRACT

Purpose – Health is considered to be an integral part of the socio-economic development of a country. The purpose of the paper is to analyze potential contribution, criticalities and conditions of success of *Public-Private Partnership* (PPP) as a strategy to face the complexity of nationally relevant Italian-Indian service systems.

Design/methodology/approach – The methodology is built upon the basis of the *Viable Systems Approach* (VSA) as integrated with the fundamental interpretative elements of Service Science (SS) and Service-Dominant Logic (SDL) to contextualize interpretation to the management of service systems.

Findings – PPPs appear to be an interesting solution when resources are scarce leading to a positive conclusion.

Practical implications – From theoretical perspective, the study contributes to the scholarly understanding of complex health care system in Italy and India. It also suggests a generic framework for VSA as applicable. Also from practical perspective, the study stimulates managers to a critical reflection about current health care management approaches.

Originality/value – The paper proposes a new approach to the study of health care, capable of highlighting relevant aspects of the system's dynamics, shifting focus from its structural, objective description to its systems, subjective interpretation. The paper also discusses decision making challenges, such as the equality in the populations' access to health service, suggesting managers to leverage on creating

conditions of consonance among the diverse stakeholder for a successful health care PPPs.

Keywords: Health Care System, Viable Systems Approach (VSA), Public-Private Partnerships (PPP), Stakeholders, Public-Private reports, Service Science (SS), Service Dominant Logic (SDL).

INTRODUCTION

One of the largest and fastest growing industries in the service sector is health care industry (Andaleeb, 2001). The ability of the healthcare system of a country is to meet the emerging challenges and carter health needs of the population effectively and adequately (Guruswamy *et al.*, 2007).

Health care is a worldwide great concern. However, despite the relevant economic, technological and social progress, access to health care service still significantly varies across the countries and populations that is not only being affected by the countries' social and economic conditions, but also by the health policies adopted by governments. Yet, health is the main need of individuals and populations in front of which no differences should be justified. In a context of significant inequality, some observed phenomena may appear paradoxical in a context in which the main concern should be to alleviate the consequences of conditions of poverty or resource scarcity for populations. Think about *medical tourism* (Pollock and Williams, 2000) –an emerging phenomenon in health care industry as it occurs in countries where the largest part of population has no (or minimum) access to very basic primary health care services. It is the case of India, where we observe the coexistence of an increasing trend of “luxury health care” service and of a totally underserved large part of population. It has been predicted, by the Confederation of Indian Industry (CII), that India would have seen revenues of US\$2 billion from medical tourism by 2012. Nevertheless, despite the industry's predicted growth of 30%, the country has not produced any guidelines on this issue. Moreover, “Indian doctors are worried about how to gear the health care system so that rich foreign patients will affect the care of India's millions of impoverished people” (Shetty, 2010).

In developed countries, the medical community “has started to recognize medical tourism

as a real phenomenon that involves the professionals, practitioners, and patients [and] peer-reviewed medical and health journals began publishing papers on this topic in 2006" (Horowitz *et al.*, 2007: 33). This phenomenon, which is mainly characterized by a direction from developed to emerging economies, may be seen, indeed, as an aspect of a wider phenomenon of a health care technological progress, that is reaching great results pushing up the level of service, but still coexists with the reality of almost no access to even very basic services for large part of world population.

In such a context, private organizations appear to play a relevant role and are ever more involved into the health systems. In fact, collaboration between public and private organizations, especially at international level, is considered as an effective strategy to reduce disparity in health between rich and poor (Widdus, 2001). The questions raised are: *Does the involvement of private organizations help to improve the overall health conditions of population? Given that governments are generally considered as responsible actors in the management of national health care systems, how does the involvement of private sector affect the health care services?*

These questions lead to the well known phenomenon of *Public-Private Partnership* (PPP) that represents a solution that is frequently adopted in many industries and countries, particularly when public funding is not adequate to the society needs. In this respect, we observe that the adoption of such partnership solution occurs both in developed and in developing countries where the social and economic scenario is dramatically different. Then, such solution is expected to be useful in different situations whose common feature is just a resource scarcity, although to a very different extent.

Therefore, with the aim of analysing potential contribution, criticalities and conditions of success of PPP as a strategy to face the complexity of nationally relevant service systems, in this paper a joint Italian-Indian research group has started a shared reflection on the subject, by leveraging on a common methodological interpretative framework built upon the basis of the *Viable Systems Approach* (VSA). The VSA is then integrated with the fundamental interpretative elements of Service Science (SS) (Maglio *et al.*, 2010) and Service-Dominant Logic (SDL) (Vargo and Lusch, 2006) to contextualize interpretation to the management of service systems benefitting from recent advances in these research fields (Vargo, 2011; Mc Coll-Kennedy *et al.*, 2012; Wieland *et al.*, 2012).

The methodological choice has a particular relevance. Our aim is to investigate two different realities in which the phenomenon of PPPs is showing a growing relevance: one in

the Mediterranean area that refers to a relatively successful and effective healthcare system – that of Italy–, and one outside the Mediterranean area that refers to a far more problematic healthcare system –that of India–, increasingly engaged in a positioning strategy as a key player in global health care sector. The two countries appear to be linked also by the growing phenomenon of medical tourism. Considering the significant differences and commonalities characterizing the two realities, we recognized the necessity to adopt the same perspective in order to avoid the results of observation being affected by our dominant interpretation schemes. Accordingly, in order to minimize the methodological implications in the analysis of the two cases, we decided to identify a methodological approach that could result as a meta-level lens with respect to the specific observed phenomena. In this respect, the *VSA* represents a good reference in that it provides *general* interpretation schemes, which, being based on systems thinking, are useful to highlight key elements of analysis common to any system's functioning in a social as well as economic context.

PUBLIC-PRIVATE PARTNERSHIP (PPP) IN HEALTH CARE SYSTEMS

In order to function effectively, any health care system generally needs to combine and organize resources (competences) and capabilities that are owned by different actors making them to converge toward a shared health care finality. These actors may represent public as well as private organizations, so inevitably expressing different logics and expectations.

In this context, PPP, by integrating public and private resources (Barile and Saviano, 2013) represents an ever more common solution, adopted particularly in the situations where public and private organizations recognize the opportunity of creating synergies in pursuing a given finality. In this respect, it should be considered that “the term ‘partnership’ has recently been used to cover collaboration in general and the emerging forms of collaboration. However, it poorly represents the diversity of new relationships, a wide variety of which have been placed under the umbrella term of ‘public–private partnerships’” (Widdus, 2001: 716-717). The subject of collaboration between health care organizations and professionals has been discussed by many scholars and from different perspectives (Field and Peck, 2003; English, 2005; Nikolic and Maikisch, 2006; Akintoye *et al.*, 2008; Basu *et al.*, 2012; Luijten *et al.*, 2012). It has been interestingly argued that the “public-private partnerships should generally be viewed as social experiments that are attempting to learn how to tackle intractable health problems in better ways. There is no formula for constructing them and it is unlikely that a universally applicable one will be found” (Widdus, 2001: 718). Agreeing with this opinion, we

believe that there is no “one best way” (especially in health care) but only general principles (and values) of reference that need to be shared by decision makers if an agreement is to be reached when pursuing general level goals. However, any kind of PPP configuration is the result of the partners’ mutual agreement on finalities and interests. To deepen this aspect, systems thinking can represent a fundamental support providing general principles of reference on which decision making can be based directing toward sharable choices.

Moreover, the wearing of the systems thinking lens makes apparent the main implications of the subjectivity and diversity of perspectives and interests in multi-stakeholder contexts offering useful guidelines for decision making. In fact, PPPs typically define multi-actor and multi-subjective contexts in which the obviously different interests need to be harmonized to make the partnership effective. In this harmonization process, the partnership ultimate goals should be clearly set in the partnership agreement and agreed on by the partners (especially when the partnership scope and finalities go beyond the direct interests of the partners). In other words, when the object of the partnership is an activity oriented to the benefit of third parties, there is a risk of speculation or opportunism. The case of health care, in particular, qualifies a context in which, while the public party should act in the interest of the community and is responsible to it on the basis of an “agency” relationship (Jensen and Meckling, 1976), the private party essentially acts in its own interest.

In order to reflect upon such issues, deepening the criticalities of PPPs and the conditions for their effectiveness in the context of healthcare, we propose the adoption of a *vSA*-based interpretative framework capable of evidencing key elements of analysis. Accordingly, in next section we will introduce the basic assumptions and fundamental concepts of the *Viable Systems Approach* with the aim of developing a general scheme of reference for reading the healthcare scenarios in Italy and India evaluating the criticalities and the potential role of PPPs in the improvement of national health care systems.

THE VSA: BASIC ASSUMPTIONS AND CONCEPTS

The *vSA* has been developed within the Italian research community (Golinelli, 2000, 2008, 2010; Barile, 2000, 2008, 2009a, 2013; Barile and Saviano, 2011) on the basis of an updated version of the Viable System Model of Stafford Beer (1972). It has been developed within the disciplinary field of business management starting from the early works of Barile and Golinelli, following a rich research stream of systems theories, such as the theories of open

and closed systems (von Bertalanffy, 1968), socio-technical systems (Emery and Trist, 1960), law of requisite variety (Ashby, 1958), and systems dynamics (Forrester, 1994). The main aim of the *VSA* research community is the study of business as well as social organizations as *viable systems* that aim to survive in a dynamic context by establishing *consonant* relationships with other viable entities so gaining access to the resources necessary to the system's functioning, with the ultimate aim of achieving viability through a sustainable governance approach to business phenomena (Barile *et al.*, 2012).

The interpretative paradigm of *VSA* summarizes its fundamental premises and key concepts in five postulates (Barile, 2008: 24), in accordance with the key concepts of *VSA*, viz. the *survival* as ultimate purpose of the system; the dual *structure-system* perspective; the *isotropy* of the viable system consisting by a governing body and an operative structure; the system's *context* as composed by sub- and supra-systems; the *consonance* and *resonance* as criteria of governance of intra- and inter-systemic relations; the *recursion* of systemic levels as characterizing the system's structure (Saviano and Caputo, 2013: 229).

According to *VSA*, three fundamental systemic conditions characterize the functioning of business and social organizations (Barile and Saviano, 2011) which are as follows: (a) *openness*, which is the ability to exchange resources with the other systems of the context in a selective manner; (b) *contextualization*, which is the search for viability through interaction with certain privileged entities, such as supra-systems that influence its survival, and (c) *dynamism*, which is the development of structure in accordance with emerging changes.

When defining the system's viability strategies, decision makers should take into account these three systemic conditions that essentially imply that any phenomenon (or system) cannot be observed in isolation but needs to be interpreted with reference to the specific context in which it occurs (or is organized), in particular considering the various interests that it needs to effectively involve and harmonize so as to achieve its goals.

A VSA-based interpretation framework

Integrated with the main assumptions and key concepts of SS and SDL, the *VSA* highlights key elements to analyse in order to define the most appropriate governance approach of health care organizations. By following the general framework of Figure 1, as has been developed on the basis of the integrated *VSA*-SDL-SS view (Saviano *et al.*, 2010; Saviano, 2012), our conceptual pathway starts by selecting the system under observation, focusing on health

care systems with a Service-Dominant logic mind set that is with a logic of *service* as “the applications of competences (knowledge and skills) for the benefit of a party” (<http://sdlogic.net/>). This logic helps in particular to identify resources and relational operative mechanisms to integrate competencies and co-create value. The *vSA*, instead, reveals the different perspectives in play, the priorities, and the mechanisms of influence of suprasystems to take into account in the service system governance. The application of *vSA* in the context of health care management is essentially aimed to identify conditions for improving the overall level of a community health (the ultimate goal of the whole system) and the responsiveness of the system to people’s needs and expectations, at the same time ensuring financial fairness in the way funds are collected.

The pathway follows with a focus on the parts and relations that define the system’s structure configurations. However, to understand the system’s functioning, a change in perspective is required, shifting from a static to a dynamic view, according to the *structure-system* paradigm (Barile and Saviano, 2011), and interpreting the system’s potential dynamics through the reading of the intra- and inter-systems interaction, keeping in mind that *from the same observed structure several systems can emerge depending on the actors’ pursued finality*. It is fundamental, then, to recognize the roles played by the various actors involved in the system’s value-creation process by focusing both on the internal and the external context going beyond the structure ‘boundaries’. This wider view is necessary to identify all relevant suprasystems, which own resources critical for the system’s functioning and may consequently exert a power of influence on its survival dynamics. These aspects suggest the decision makers to carefully evaluate the conditions of *consonance* (relational harmony) and *resonance* (value outcome) within the whole system and accordingly define appropriate strategies to improve efficiency, effectiveness and sustainability of the system as a fundamental requirement for the system’s viability (Saviano *et al.*, 2010). On this basis, the health care value propositions should be defined directing all involved actors toward the sharing of the ultimate health care finality by harmonizing their specific goals through their progressive alignment. The key elements upon which decision makers can act, are those qualifying a service system according to SS as follows: *people* that represent the human side of health care service and set the effective requirements not only from a technical perspective but also considering personal emotions, feelings and values; *organization* that directs focus on efficiency; *technology* that is relevant for innovation and competitiveness; and finally the *shared information* that represent a key factor in developing an efficient, effective and

sustainable service system, overcoming the typical problem of information asymmetry and building upon the actors' variety alignment (Barile, 2009; Saviano, 2012).

Thus, decision makers should govern and manage the system by accomplishing an on going learning process that allows it to constantly adapt itself to the changing requirements of a growing context complexity so that the system could contribute to the improvement of the physical and psychological conditions not only of the patients directly involved in the service process, but of the whole social context, at the same time increasing public awareness of the healthcare leading to welfare community. As suggested by SS, the reaching of these goals require the seeking of positive interactions between providers and clients considering that they are dynamic and changing; this in turn requires a dynamically changing configuration of resources (physical or non-physical with rights or no-rights) on the basis of an actors' mutual agreement on reciprocal value propositions.

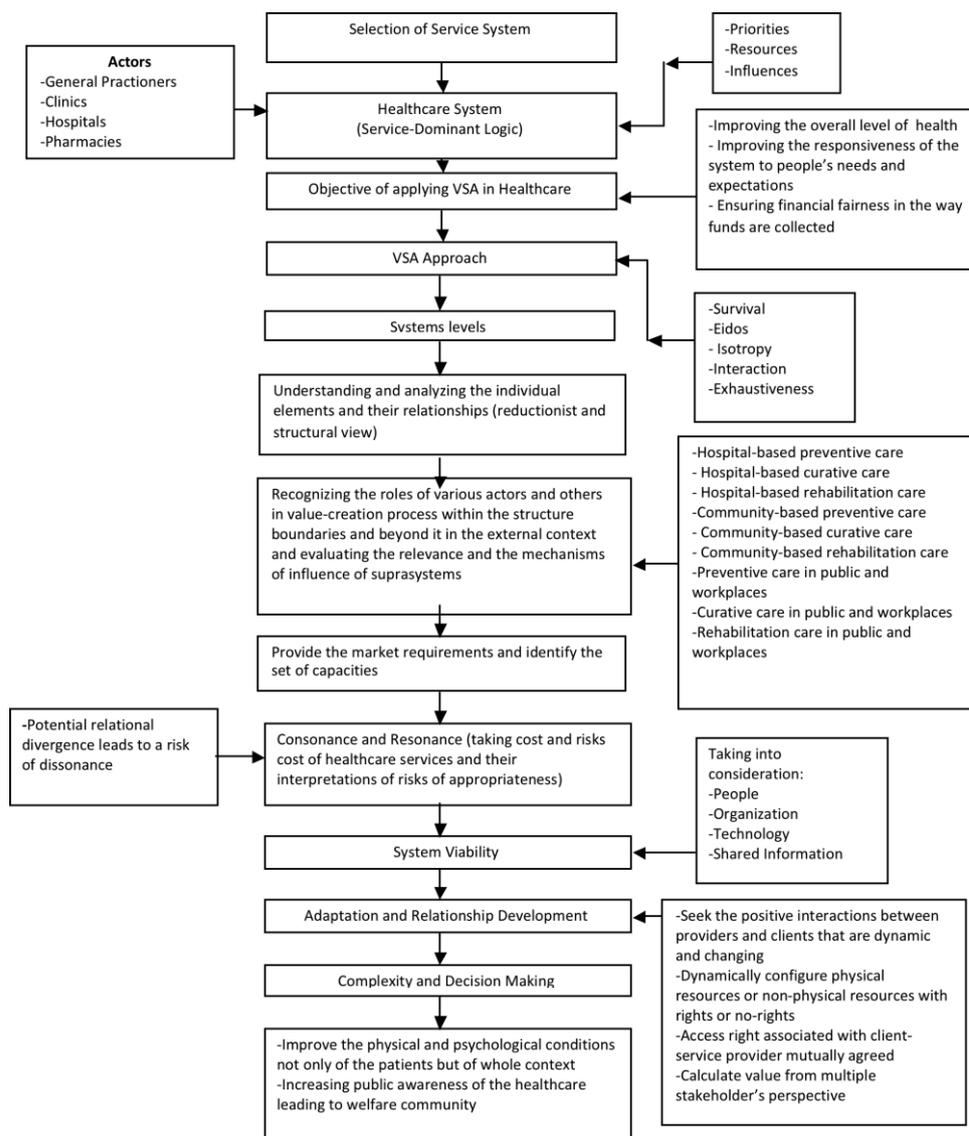

On the basis of this general framework, in next section we will shortly describe the Italian and Indian scenarios as different contexts for PPPs that offer lessons to learn highlighting interesting peculiarities of the PPPs phenomenon that appear common to the two countries.

HEALTH CARE SYSTEMS AND PPPS EXPERIENCES IN ITALY AND INDIA FROM A VSA PERSPECTIVE

The Italian scenario

The Italian National Health Service, founded in 1978, is a universal system with comprehensive insurance and uniform healthcare for the entire population. It is financed mainly by general taxation. Primary care is provided by GPs (General Practitioners), who have the status of independent, self-employed physicians, working for an LHA (Local Health Authorities) under a public contract. They are paid according to a capitation fee, determined by the number of people registered with each doctor. They also act as gatekeepers for access to secondary services whose provision is refunded by the NHS, such as diagnostic checks, hospital admissions, and specialist visits (Fabbri and Monfardini, 2009: 291).

Figure 1: A Generic Research Framework of VSA as applied to Healthcare Systems

Source: Our elaboration

It would certainly appear clear, reading the results of Economist Intelligence Unit survey on Italian Healthcare (Economist Intelligence Unit, 2012: 2), that there is a strong focus on performance indicators and, in particular, on the measurement of economic resources absorption due to health service as it is a main concern of the Italian system.

The strong focus on performance indicators and the intense pressures from political institutions with a need to lower the cost of services provided, in the last decade, affected the livelihoods of the NHS. It should be noted that in 2010, there was an average of 6.3 nurses per 1.000 people (about 159 patients per nurse) compared to an average in OCSE Countries of 8.7

nurses per 1.000 people (about 115 patients per nurse) in Italy (Economist Intelligence Unit, 2012: 2).

As a consequence, a lowering of the level of service is observed together with an increase in demand for private healthcare services. The Italian NHS plays a major role in the market for specialist consultations, where public, closely regulated and mainly salaried specialists compete with private, less strictly regulated ones. Specialized NHS outpatient services, including visits, diagnostics and treatment, are provided either by the LHA's salaried specialists or by accredited public and private facilities with which the LHA has agreements and contracts. People can access NHS specialist care only with their GP's authorization and referral. Because of waiting lists, co-payments and unsatisfactory quality, many patients seek care outside the NHS, resorting to the private market for specialist care (Fabbri and Monfardini, 2009: 292).

In this context, we observe a growing mobility of population seeking for a better/cheaper service in other Nation's regions. This phenomenon is often related to that of medical tourism, especially when directed toward emerging economies countries essentially because of their economical accessibility (Connell, 2011) given a certain quality level of service.

The internationalization of health, in this perspective, acquires a new meaning especially considering the transition from *health tourism* to *medical tourism* where the health tourism is based on "travel where the primary purpose is treatment in pursuit of better health" while medical tourism "incorporates health screening, hospitalization, and surgical operations" (Henderson, 2004: 113).

To seek for health service outside, the NHS contribute to the increasing of the private organizations involvement in the health care systems also increasing opportunities for potential PPPs for leveraging on resource integration and value co-creation consistently with a SDL mindset (Barile and Saviano, 2013). PPPs, in particular, could have a positive impact on economic efficiency of health care system (Iandolo *et al.*, 2013).

Health care PPPs experiences in Italy are still under discussion with regard to their potential contribution to face uncertainty related to a growing health demand in a general context of economic crisis that urges the identification of more sustainable solutions. Several organizational solutions are possible for implementing PPPs requiring a deep analysis of alternatives considering their criticalities (Martinez *et al.*, 2011). This variety suggests

identifying key elements of analysis supporting decision makers in defining the most appropriate strategy.

The Indian scenario

Healthcare system in India being the responsibility of the state, local and central government has emerged as one of the largest service sectors. In 2004, national healthcare spending equalled about 5.2 per cent of nominal GDP, or about US\$ 34.9 billion. Healthcare spending in India was risen by 12 per cent per annum through 2005-09 (in rupee terms) and scaled up to about 5.5 per cent of GDP, or US\$ 60.9 billion, in 2009 (WHO, 2013). The delivery of healthcare services may be segmented into three stages, viz. primary, secondary and tertiary care. Primary care constitutes treatment on an outpatient basis. Secondary care refers to hospitalization for 'non-critical' ailments. Tertiary care relates to treatment of critical ailments and requires high-tech and expensive facilities and equipment. As of now the corporate sector is focused on tertiary care. The opportunity exists because of the lack of adequate facilities, high investment requirement (which becomes an entry barrier for smaller players), higher revenue realization per patient, less competition from doctor-entrepreneur led facilities as well as an ability to differentiate product offerings.

The drivers for the growth of healthcare sector in India are due to the following reasons: (a) increase in population, (b) shift in demographics, (c) rise in disposable income, (d) increase in incidence of lifestyle-related diseases, and (e) rising literacy. Apart from these factors, several other economic factors, such as tax benefits, medical tourism, insurance tourism, etc. also affects the growth of healthcare sector. However, Indian health financing faces a number of challenges, such as increase in healthcare costs, high financial burden on poor effecting their incomes, need for long term and nursing care for senior citizens because of increasing nuclear family system, increasing burden of new diseases and health risks, limited government funding leading to negligence of preventive as well as primary care and public health functions. Both the public and private sector need to work in tandem to make healthcare available, accessible and affordable. In order to tackle the above-mentioned challenges, government has taken various initiatives to improve the public healthcare system in India. The Indian government is focused on developing the PPP model to cover the demand-supply gap prevalent in the healthcare sector. Private sector expertise coupled with efficiencies in operation and maintenance would lead to improved healthcare services to the

clients (patients). The healthcare sector in India is still required to be addressed both in terms of accessibility of healthcare services and quality of patient care.

Although India's healthcare system has gradually improved in the last few decades, it continues to lag behind those of its neighbouring countries. The poor state of healthcare in India may be attributed to the lack of government funding on healthcare initiatives, as estimates reveal that the per capita spending on healthcare by the Indian Government is far below international recommendations (National Coordination Committee, 2006). However, India's healthcare infrastructure has seen steady improvement in the recent past. There still exists a severe shortage of sub-centres, primary health centres, and community health centres. PPPs have emerged as one viable method of growing the healthcare sector while keeping public goals into consideration. The main objectives of PPPs are to improve quality, accessibility, availability, acceptability, and efficiency of healthcare services. While different states in India have had different levels of success with implementation of such initiatives, it is expected that the private sector will continue to take on an increasing role in India's healthcare system (Boston Analytics, 2009). The provider (public or private) plays a major role in providing the core services of designing, building, and operation of healthcare units. However, they are constrained by several areas of growth leading towards various advantages.

Table-1: Public and Private Providers in Healthcare (CII, 2011)

Provider	Areas of Growth	Advantages
Public	<ul style="list-style-type: none"> • Efficiency issues in management and operations hamper the system from realizing complete potential • Inflexibility and issues in responsiveness • Customer satisfaction and quality perception low 	<ul style="list-style-type: none"> • Motive of improvement in overall health of population drives growth and expansion strategy • Potential for economies of scale can be realized both within a unit as generally facilities are large and across units due to extensive network • More equitable in outlook
Private	<ul style="list-style-type: none"> • Financial sustainability without Government support restricts expansion into all regions • Quality of service can suffer in areas of low competition and lack of regulation • Higher costs exclude large sections of the poor population 	<ul style="list-style-type: none"> • Efficiency in management and operations with a thrust towards employing technology and latest best practices • Increased access in areas of operation and availability of round the clock services • Increased flexibility and responsiveness

While private players are keenly entering this "social" infrastructure sector, innovative measures are needed to improve financial performance using *vSA*. The last decade has seen a significant increase in private sector participation in healthcare delivery. Existing players, such as AIIMS, CMC, Apollo, Wockhardt, Manipal, Care Hospitals and Narayan Hrudalaya

have expanded aggressively. New players, such as Fortis, Max, Sterling, Global Hospitals, AMRI, Ruby Hall and Reliance and ADAG have entered the sector with plans to establish national and regional presence. International players, such as Elbit, Columbia Asia and Parkway have also entered India with plans of establishing a network of hospitals.

These corporate players together operate around 25,000 beds across the country. Healthcare providers have also attracted investments from private equity players such as IDFC, Apax Partners, Actis, Indivision, ICICI Ventures, Trinity Capital, etc.

In such a context, the medical tourism industry is worth about \$108 billion (Press Trust of India (PTI), 2005) and, according to recent estimates, the number of foreign patients that visit the country for medical services is expected to exceed 3.200.000 units by 2015 (Assocham, 2011) as effect of National policy that “promote medical tourism took off in late 2002, when the Confederation of Indian Industry (CII) produced a study on the country’s medical tourism sector, in collaboration with international management consultants, McKinsey & Company, which outlined immense potential for the sector” (Chinai and Goswami, 2007: 164).

The above drivers are likely to result in an annual increase of 10-12 per cent in the size of the healthcare delivery market over the next five years.

The challenges the sector faces are quite substantial, from the need to improve the physical infrastructure for improving the healthcare assess and quality of healthcare. However, the opportunities equally compel better use of technology, such as telemedicine that may efficiently provide diagnostic services to remote areas so that they can take proper advantage of it (Mehr, 2008).

Therefore, public and the private sector must work together to not only take-up the massive job of improving health care services in India but also strive to exploit the massive potential to make India a destination for health care for the rest of the world (Lath, 2008).

DISCUSSION AND INTERPRETATIVE HYPOTHESIS

As it may appear to the reader, our choice to discuss two cases characterized by very different historical, economic, social and cultural scenarios, can be better understood if we make more explicit our aims and assumptions.

Consistently with a systems thinking approach, we move from a wide view of business as well as social phenomena in which several aspects and perspectives are required to be considered and integrated within a unitary and general framework. Accordingly, we consider it as interesting to analyse the Italian health care system widening the perspective outside its "borders". This wider perspective and view have lead us to search for stimuli to reflection outside the "box" (both conceptually and geographically).

In addition, awareness of a globalized world where complexity typically emerges from unexpected interconnections, our look at health care phenomena and trends was also directed toward the identification of uncommon reasoning pathways. Thus, it appeared to us interesting to explore a comparison between countries clearly "distant" with respect to the specific health care system as well as the general conditions, but potentially related for particular phenomena, such as those of health tourism and medical tourism that typically imply the involvement of private organizations.

The adoption of our approach is not much directed to empirical research but to a conceptual reasoning that is based on very general (if not universal) principles and properties of systems theory (von Bertalanfy, 1968) that is expected to deductively give evidence to possible characterizations of the investigated phenomenon. Accordingly, our 'findings' are derived not only from the more or less objectively described scenarios but from a conceptual reasoning based on systems thinking.

CONCLUSIONS

Shifting focus from the descriptive (structural) representation of the phenomenon to its systems interpretation, considering, in particular, the implications of subjectivity and contextualization, other aspects emerge to consider. In the Italian case, the public role in health care system is prevalent. Conversely, in the Indian case they are the privates to play a more relevant role.

Then, when considering PP partnership in the two cases, we should expect that this different relevance has an effect when considering the radically different logics, expectations and interests of a public compared to a private player. Accordingly, we may expect that health organization managers will direct their decision making and choices looking for consonance with the suprasystems perceived as more relevant suprasystems, i.e. owning

more critical resources and capable of exerting a greater power of influence on the managed organization survival dynamics.

In this respect, it appears that while in the Italian case, public health care organizations' managers (who are politically appointed) perceive the political-institutional suprasystem as the most relevant one, often ending up for disregarding the service expectations of the client suprasystem (Saviano *et al.*, 2010), in the Indian case, private health care organizations' managers are expected to give more attention to the interests of shareholders.

In a nutshell, while Italian health managers are mainly focused on cost (cutting), Indian health managers are expected to put greater attention on profits. This may lead Indian managers to 'celebrate' the richest segment of population, risking to disregard even the basic service expectations of the largest part of poorer population.

As a result, both the Italian and the Indian health managers may appear to direct little or any attention to the populations' needs. Clearly, PPPs are expected to be affected by these conditions and dynamics. This possible result, indeed, reveals how health care managers may vary away from the original finality that legitimates their appointments. Any health care system is legitimated to exist to the extent which the ultimate goal is achieved (or at least concretely pursued): populations' health.

Costs on the one hand, profits on the other hand catch the greater attention of managers. *What about keeping healthy populations? What about the declared finalities of resource integration, creating synergies, etc. if these hypotheses be confirmed?*

LIMITATIONS, CHALLENGES AND FUTURE RESEARCH

In the light of the above discussed hypothesis, countries' governments should deepen the reflection on their current and future health care strategies. It would be at least paradoxical if the effort for progress and economic development in the name of the health care mission might result in maintaining (or even increasing) a so apparent disparity.

In this respect, we point out that we are absolutely not critic with PPPs. It is not the phenomenon or the strategy in itself under criticism; it is the way decision makers take these collaboration opportunities. The way they direct the country's effort toward sharable and valuable (or not) goals. Thus, our vSA-based interpretation stimulates such reflections and sets the main challenge for health care managers: to keep in mind the ultimate finality that

legitimizes their appointment being aware of the risks of becoming excessively focused on costs or profits targets.

Obviously, our reflections may appear an abstract reasoning if not supported by empirical evidences. This is an objective research limitation that, however, does not imply a weakness of the overall methodology whose contribution remains valuable, if assumptions and finalities of observations are shared. Conversely, there are significant opportunities for future empirical research in which a multi-stakeholder systems approach should be adopted investigating the phenomenon by appropriately adopting the different perspectives involved in the observed dynamics, subsequently trying to harmonize them in order to effectively integrate knowledge resources and co-create value to the benefit of everyone.

ARE PUBLIC PRIVATE PARTNERSHIPS WORTHWHILE?

Schein, Andrew

Netanya Academic College, Israel, ajayschein@gmail.com

ABSTRACT:

This paper examines whether public private partnerships (PPPs) are a good value for governments. The paper begins with a brief historical review of PPPs and discusses the arguments that have been proposed to support PPPs. Afterwards, the paper assesses recent instances of PPPs and examines other studies of PPPs. This appraisal leads to the conclusion that PPPs are more expensive than the traditional procurement approach. However, there are some circumstances where the benefits from the PPP can justify the additional costs of a PPP. One case is where the PPP shortens the building of the project. A second case is where due to budgetary limitations, the government is unable to build the project at all. A third case is that the PPP frees up money for other purposes whose benefits are deemed as being greater than the additional costs of the PPP. Furthermore, it is argued that there is a higher probability that the benefits of a PPP project are greater than its costs by "hard" infrastructure projects, while by "soft" infrastructure projects, it much less likely that the benefits will be greater than the costs. The paper ends by noting that if a government does go ahead with a PPP project it needs to take into account several factors with regard to the contract and the bidding process to insure that the benefits of the project truly end up being greater than its costs.

Keywords: PPP, government spending, government decision making, infrastructure

INTRODUCTION

Throughout history the public and private sectors have worked together. Wettenhall (2010) notes that such partnerships existed in ancient Egypt, China and Rome. Wettenhall lists eight different ways that private organizations and individuals worked with the government throughout the centuries: privateer shipping, mercenary armies, trade, commerce and colonial expansion, treasury and public finance, collaboration in agriculture, health and

education, infrastructure provision, organizing hallmark events and public and mixed enterprises.

One example was turnpikes in Great Britain (Grimsey and Lewis, 2004). In 1706-7, turnpike trusts began to be established in which private individuals were responsible for building and maintaining a road and in return they received the tolls from the people who travelled on the roads. By the 1840s there were almost 1,000 turnpike trusts for various sections of roads in Great Britain, but then the government began to take control of the roads and the last private toll road was closed in 1895. A similar story occurred by the London Underground, which was built by private companies between 1894-1907 and then the lines were nationalized in 1933.

In France, in 1638 and 1666, concession were granted to private companies to build canals, bridges and tunnels. In 1782, the Perrier brothers were granted a concession to provide water to the city of Paris, and still in 1995, it was estimated that 75% of the French population receives their water from private companies (Wettenhall, p.26). Barjot (2011) notes that in France the concession system developed in two dominant sectors, public works and public utilities.

In 1992, there was a new impetus for public private partnerships (PPP). The British government had limited budgetary freedom, but the government wanted to update the country's infrastructure. To solve this problem, it proposed a scheme called private finance initiative, PFI, under which a private company would design, finance, build and operate such facilities as roads, bridges, tunnels, schools, hospitals and prisons subject to government specifications, and eventually the facility would revert to state ownership and control. According to one estimate, in the UK from 1992-2009 there were approximately 800 deals between the government and private companies with a combined value of £64 billion (Private finance projects and off-balance sheet debts, March 2010, p.10, point 19).

In the mid-1990s, the term PPP began to replace the term PFI, though PFI still remains in use. Other names are also used. The World Bank uses the term PPI, private participation in infrastructure. In North America the term P3 is used, while in Australia and in the UK, the term PFP, privately financed projects, is also used. In this paper, we will use the term PPP, which appears to be the most popular.

This concept has been embraced by government throughout the world. Some cases of PPP are "hard infrastructure" projects where a good is moved, produced or processed, such as transportation, energy, waste management, while others are considered "soft infrastructure" projects where the goal is to provide services such as hospitals, school and prisons. One

interesting example of a PPP by "soft infrastructure" is that it is estimated that 70% of the US intelligence budget is spent on contractors, (Hamburger and O'Harrow, 2013).

With the growing use of PPPs it is important to determine whether PPPs are an efficient use of government funds or a waste of taxpayer money. This paper will review the arguments for and against PPPs and examine the success and failures of recent PPP projects. Based on this review, we will offer criteria as to when there is greater likelihood of success with the PPP approach as opposed to the traditional procurement system. We will start with a definition of PPP and a brief review of some of the variations that have developed in the past few years.

DEFINITION OF PPP

Forrer, *et. al.* (2010, p.476) write, "Public-private partnerships are ongoing agreements between government and private sector organizations in which the private organization participates in the decision-making and production of a public good or service that has traditionally been provided by the public sector and in which the private sector shares the risk of that production." They note that there are three key aspects to this definition which distinguish PPPs from concessions and franchises that governments traditionally granted. They explain that these aspects are:

1. The relationship between the public and the private sector organization is long term, rather than a one-time relationship, such as might occur in a conventional contract for a good or service (such as office products or secretarial assistance).
2. The private sector cooperates in both the decision making as to how best to provide a public good or service and the production and delivery of that good or service, which normally have been the domain of the public sector.
3. The relationship involves a negotiated allocation of risk between the public and private sectors, instead of the government bearing most of the risk.

This definition highlights some of the differences between a PPP and traditional public procurement. In traditional procurement with private contractors, once the work, for instance constructing a facility, is done, then the relationship between the contractor and the government is over. However, with a PPP, the relationship between the private company and the government is long term, for example thirty years, which means that the firm not only builds or refurbishes the facility but also runs the facility for many years. Due to this double role of the firm, it also plays a much larger role in the design of the facility than by

traditional contractors. Furthermore, in a PPP, the private firm takes on debt to build the facility, and then the profits from running the facility will allow it to pay back the debt. On the other hand, in traditional procurement projects, the government funds the project, usually by borrowing, while the contractor has no loans or just limited and short term debt.

In a PPP due to this long term relationship, the crucial idea is that there is a partnership between the private firm and the government and this partnership can take on many different formats. Urio (2010, p.7) divides these partnerships into three categories. One, "the private sector designs, builds, owns, develops, operates, and manages an asset with no obligation to transfer ownership to the government. These are variants of design-build-finance-operate (DBFO) schemes." Within this category are partnerships which are termed: Build-own-operate (BOO), Build-develop-operate (BDO) and Design-construct-manage-finance (DCMF). The second category is where "the private sector buys or leases an existing asset from the government, renovates, modernizes, and/or expands it, and then operates the asset, again with no obligation to transfer ownership back to the government." Within this category, the partnerships are labeled: Buy-build-operate (BBO), Lease-develop-operate (LDO) and Wrap around addition (WAA). In the third category of partnerships the "private sector designs and builds an asset, operates it and then transfers it to the government when the operating contract ends, or at some other pre-specified time. The private partner may subsequently rent or lease the asset from the government." Within this category, the partnerships are branded: Build-operate-transfer (BOT), Build-own-operate-transfer (BOOT), Build-rent-own-transfer (BROT), Build-lease-operate-transfer (BLOT) and Build-transfer-operate (BTO).

PROS AND CONS OF PPPS

Does the PPP lower the costs of providing the goods and services? Yescombe (2007, p.18), a proponent of PPPs, notes that "private sector finance for a PPP clearly costs more than if the project were procured in the public sector and financed with public-sector borrowing." The reason for this is that is costlier for the private sector to borrow than for the government, and the government pays for these extra borrowing costs of the private company in its payments to the company. Why then should the government have the private sector build the asset?

One possibility is that the government is limited in its borrowing capacity due to budgetary problems, and hence is unable to produce the project at all. Podkul (2011) reports that in 2008, the city Chesapeake, Virginia had a crumbling, 80-year-old bridge, and had no money to fix the bridge. Instead, the city sold the bridge for \$10 to private investors, who tore

it down, are building a new one, and will receive a \$2 toll for each car that uses the bridge. One of the investors noted that the choice for the city was either the private bridge or no bridge at all. In addition, if there are budgetary restrictions, by using the private firm, the government has postponed its payment to after the project is built and if the government gives the private firm the right to collect services fees from users of the project instead of the government paying the private firm, then the government never "pays" for the project.

If there are no budgetary limitations on the government, admittedly a rare situation, then can a PPP save taxpayer money even though the private company's borrowing costs are higher than the governments? Yescombe lists several advantages to having a PPP.

One, projects by the public sector tend to have delays and cost over-runs, while with the private sector, the payments are fixed by the contract between the government and the firm, which means that the construction risk is transferred from the government to the private sector. The idea being that if the facility is not finished on time and running, then the private contractor will have a problem repaying his loans, which forces him to finish on schedule.

Two, there can exist economies of scale that enable the private company which has experience in building large projects to build the project cheaper than the government.

Three, if the private sector is going to build and operate the facility, then they have an incentive to design and build the facility in such a way to produce the greatest cost saving from running the facility. This idea, called "value for money" (VFM), is that even if it costs more for the private firm to build the facility, in the long run the combined costs of building and running the facility will be lower with the private company.

Silversides (2008) reports one example of this argument with regard to a hospital that was built in Canada as a PPP. The private company, Infrastructure Ontario, that was arranging the deal admitted that "the basic cost of the new Sault Ste. Marie hospital would be lower if the public sector financed and negotiated the procurement." However, David Livingston, president of Infrastructure Ontario, argued that the "higher costs are offset by the value of the "risk transfer" to the private sector, in which the consortium agrees to assume the risk of delivering projects on budget and on time." He claimed that "these value-for-money calculations are a mathematical puzzle and in the end the math has to prove that there is value for doing it." The company claims that in "the long run "taxpayers will save \$101.7 million on the cost of the hospital's development, which is now pegged at \$988 million over the 30-year deal." However, Silversides notes, "the public documents don't provide details on exactly how that risk transfer calculation was made," and one wonders how accurate these calculations can be based on thirty years in the future.

Four, the private sector has skills which government workers do not always have. These skills range from specific expertise in certain fields, a greater willingness to innovate, and a better judgment as to worthiness of a project when the payments to the private firm is based on future service fees. A single manager of the entire project can also save the government from having to monitor all the steps in building and operating the facility. It is also claimed that by having a "single address" there is greater transparency to the building and operating of the facility than if it run by the government.

Five, since the private company has to borrow to pay its costs to build the facility, the banks providing the finance add another layer of due diligence in determining whether the project is worthwhile. This differs when the government borrows to pay for the PPP since government borrowing is not related to specific projects.

Ferror *et al.* (p.477) note that these benefits are based on an assumption and a presumption. "The assumption is that governments often do not have the in-house knowledge of the most cost-effective ways to deliver many types of public goods and services—either directly or through contracts." And the presumption is "that governments can partner with private firms in a relationship in which government gains access to the technical expertise it requires and can assess the cost-effectiveness of private delivery, and firms are willing to share their expertise in exchange for long-term service contracts." Thus, they argue that "public managers need to sort out, assess, and address various dimensions of public accountability when considering a PPP" to ensure that this assumption and presumption are applicable.

Nevertheless, even if one accepts this assumption and presumption, this is not enough to justify the use of PPPs. The problem is that the private firm's emphasis is on generating income, while the government's goal is to provide service to its citizens. Accordingly, even if the private firm can build and operate the facility cheaper than the government, the government still has to insure that the firm provides the services at the level that the government desires. The government has to specify the services it wants provided at the time when it signs the contract with the private firm but here is the problem.

There are several difficulties with relying on the contract to provide the level of services desired by the government. One problem is that in some cases, such as by "soft infrastructure" it is difficult to quantify the level of services. For example, it is desired that health care workers treat their patients respectfully, but this cannot be measured by a contract, though this same problem exists by government workers.

A second problem is the length of the contract, that the private firm generally wants it to be longer to enable it to recoup its initial investment, but this protects the firm from competition, and reduces its incentive to innovate. For example, the private firm may not be required by the contract to use new technology which is developed after the contract is signed, and hence throughout the years of the contract, the private company might have higher costs or provide lower quality of services than what is available. Thus, many long term contracts have included a requirement for the private firm to abide by all government legislation, but this cannot help in all cases where there are small and specialized developments that are not subject to government legislation. Brenninkmeijer (2010, p. 122) notes that "in order to ensure that services remain of high quality, procurement contracts have become longer, more complex, and include increasingly detailed descriptions of what is expected from the private sector partner... There is, in other words, a greater focus on regulatory principles in PPPS where previously more traditional government procurement relied on inter-personal trust and cooperation." In addition, the longer contracts contradict the need for simple contracts to measure performance. One possible solution is to have periodic re-evaluations of the term of the contract. Highway concessions in France are re-evaluated every five years, and their contracts are much shorter than UK, US and Dutch concession contracts (Brenninkmeijer, p. 109).

A third problem is that inevitably a percentage of contracts generates disputes arise as to interpretation of the contracts, and this means that court proceedings concerning the contract can slow down the infrastructure project. Thus, there needs to be some method of binding arbitration included in the contracts to insure that disagreements are resolved speedily.

A fourth problem is that that one cannot use "boiler plate" contracts for a PPP since each situation is unique, and hence government workers and agencies are usually not as well trained in preparing these contracts as are the private firms, which enables the private firms to acquire better terms than need be. This is even a problem in the UK, which has the longest and most extensive experience with PPPs. In an inquiry by the House of Lords in 2010, a Mr. Sutherland, from the firm Interserve Investments and the Confederation of British Industry, stated (Private finance projects and off-balance sheet debts, 2010, p.25, point 111) "I find it amazing that we are still finding people on the public sector side who are doing it for the first time. When I look across the deals that we get involved in I think that there are some really excellent teams and there are some really poor teams."

A fifth problem is that the government will only be able to make an effective deal if there are various private companies that are competing for the contract. If there is only one private company that is bidding for the contract, then the private company has the ability to demand high payments. This problem arises even when there are several bidders in the beginning stage of the process, but towards the final stages of the negotiations, the government enters into exclusive negotiations with the preferred company and the benefits of competition melt away. Furthermore, after the contract is signed, the government loses all of its bargaining power and if there are new conditions in the industry, then the private company can demand high payments to meet these new conditions. Finally, due to the long term nature of a PPP contract, the government has limited its budgetary freedom in the future.

Accordingly, due to all the problems with the contracts, it is not clear that PPPs provide the best service and it is not intuitively obvious that they reduce costs. Thus, it is not apparent that PPPs are beneficial to society. We will now review some of the evidence as to their effectiveness.

EVALUATING PPPS

It is not simple to evaluate the success and failures of PPPs for several reasons. One, it is difficult to make comparisons as to what would have been without the PPP since most of the alternatives are theoretical. Would the government really have been able to build the facility and at a cheaper price? Two, private companies do not divulge all the information necessary to make precise calculations. Three, there appears to be a great deal of subjective bias in discussions of PPPs. Contractors, consultants and lawyers who profit from these deals have a personal interest in PPPs and people who are "pro-capitalist" will have a proclivity to view them favorably since they reduce government involvement in the economy. On the other hand, unions and their workers who feel threatened by the private firms and people with an "anti-capitalist" bent tend to view PPPs negatively. Nevertheless, in some cases the failures of PPP were quite evident.

One clear failure of a PPP type arrangement was Railtrack, a private company that won the right to run the trains in Britain, after the railways was privatized in 1993. Due to poor maintenance by the company, there were three crashes with multiple fatalities, and the government re-nationalized the railway in 2001 (Flynn, 2007, pp. 259-263). Furthermore, in 2002, the British government bailed out the shareholders of Railtrack, and *The Economist*

(March 2002) noted that "the message from Railtrack's bail-out is that there is no genuine risk transfer when the government deals with the private sector." The article points out that "PFI deals are supposed to transfer risk from the public to the private sector. But with so much at stake politically, the government cannot afford to let them fail. One way or another, the railways have to work and the underground has to run. This makes it genuinely impossible to transfer risk from the public to the private sector, which undermines the purpose of PFI."

Another disappointing example of PPP is the London Underground, which was set up as a PPP in 2002, with two private companies Tube Lines and Metronet, who were responsible for maintenance and upgrade of the infrastructure. Initially, there was some improvement service, but in 2007, Metronet went into public administration due to "poor corporate governance and leadership" and Metronet's failure caused the British government a "loss of between £170m and £410m," (BBC News, 2009). In 2010, a report by the Commons Transport Select Committee reported that the contract with the second infrastructure company Tube Lines was "flawed, failed to prove value for money... and the company's "failure to deliver the upgrade of the Jubilee line on time was unacceptable," (Transport for London, 26 March 2010).

Not with standings the failures mentioned above, on the positive side, PPPs have a much better record of completing projects on schedule compared to traditionally procured projects, and have led to an increase in innovation. Hodge and Greve (2007) is a review of PPPs, write "traditional public infrastructure provision arrangements are on time and on budget 30 percent and 27 percent of the time, respectively, while PFI-type partnerships are on time and on budget 76 percent and 78 percent of the time, respectively." Similarly, they quote a study from Pollitt (2005) who argued that projects under PFI "are [now] delivered on time and to budget a significantly higher percentage of the time ... with construction risks generally transferred successfully and with considerable design innovation." An inquiry by the House of Lords in 2010 states (Private finance projects and off-balance sheet debts, March 2010, p.19, point 69, p. 26 point 123 and p. 24 point 108), "There is strong evidence that PFPs have a better record of on time and on budget delivery than traditionally procured projects, although it appears that the gap is narrowing." They also list various innovations such as "prison where long wide corridors enabled better use of CCTV and improved safety for inmates and staff; hospitals where better designed corridors enabled smoother transport of patients; and better road surfacing treatment which reduced disruptions to motorists." Furthermore, they stated that "private finance has led to a much needed focus on maintenance of public infrastructure."

These improvements in infrastructure have not been cheap. Acerete, *et. al.* (2010), studied PPPs with regard to roads in Spain and the UK. They conclude "the use of private finance has proved expensive for both the taxpayers and road users, but it has been beneficial for the construction industry, road operators and their financial backers."

Sarmiento (2010) studied the experience in Portugal with a PPP called SCUT, where a private company was contracted to construct and maintain 930 kilometers of highways and in return to receive shadow toll payments from the government. Sarmiento compared the costs of this deal with a publicly owned company BRISA which was largest highway operator in Portugal and whose "territory" was a more difficult terrain than SCUT. He writes (p.116)

The results confirm that using private-public partnerships in the conditions set up in the contracts did not add value for money to the public sector. If traditional procurement had been used, it would have been far less expensive, even given the public sector's tendency to be less efficient. We find that, carrying the same costs in mind, it would have been 2 billion or 3 billion euro less, when considered 4.5% or 6% as the discount rate. Even with a 50% extra cost of capital expenditure and operating costs, it still would have been a better solution to use public procurement rather than the public-private partnership. The level of risk transfer to the private sector in the SCUT was very low and that undermined the performance of the public-private partnership. We question whether a shadow toll system is the most appropriate one. We conclude that the negotiation of the SCUT public-private partnership was not correctly managed, mainly because no studies were undertaken prior to the negotiation. Having carried out a public sector comparator would have shown that the bidders' offer was unrealistic and that taxpayer's money could have been saved.

On the other hand, Pereira and Andraz (2012, p.337) argue that "overall the investments in SCUTS make sense from an economic perspective" since it led to positive economic effects in all regions of the country. Yet, the question is whether the same benefits would have occurred if the government had built the roads, and would the government have been able to build the road cheaper, as argued by Sarmiento?

We turn now to the "soft" infrastructure projects such as hospitals. Again in terms of speed and actual construction, PPPs appear to be an improvement on the traditional procurement system. In the UK, from 1997-2005, nearly all new hospitals and extensions in the UK were done through PFIs. Flynn (2007, p.264) notes that this building program modernized the hospitals in the UK. "In 1997, the average of buildings in the National Health Service (NHS) was older than the NHS, which was founded in 1948. By 2005, fewer than a

quarter of NHS buildings were built before 1948." Without the PPPs, it is very unlikely that there would have been so much improvement in the hospital infrastructure in the UK. Yet, what were the costs of this building boom?

Shaoul, *et. al.* (2008) argue that in the hospitals in England that are PPPs, the "annual payments to their private sector partners are higher than expected" and "the additional cost of private over public finance for the first 12 hospitals is about £60M a year." In addition, they argue that "PFI charges create budget inflexibilities and are increasing the pressure on the National Health Service to cut their largest cost: the jobs, working conditions and pay of their staff." In another study of the PPP's in Britain's National Health Service, Hellowell and Pollack (2010, p. S23) argue that that "there is no evidence that the excess cost to the public sector is offset by greater efficiency through the contracting process," and "that the effect of PFI has been to reduce the NHS capacity."

Similarly Gilbert (2009) reports that in an audit of Canadian hospital, the Brampton Civic Hospital that was built and operated as a PPP, the Ontario Auditor General, Jim McCarter, concluded that "The government could have saved almost \$100 million on the cost of design, construction and provision of nonclinical services if it had followed traditional procurement methods. Because the government can obtain lower interest rates, another \$200 million in savings could have accrued had the government, rather than industry, borrowed money for the project. Furthermore, McCarter' claimed, that "the value for money assessment was overestimated by \$634 million, while the cost of construction using the P3 model nearly doubled. The value of "risk transfer," the estimate of what it will cost the consortium to deliver the project on time, was also overestimated by a wide margin."

There also have been cases of increased costs with a PPP due to poor contracts. One example is desalinated water in Israel (Bar-Eli, 2011). Israel's main water company, Mekorot, is a government company but when Israel wanted to construct desalination plants it issued a tender for private companies to build the plants. By 2011, eighty percent of Israel's desalinated water is treated by a single private company, IDE, and the government realized that it needed to buy more water than originally stipulated in the contract. When the Israeli government asked IDE to produce more water, the company agreed provided the government would pay more than what was agreed in the initial tender. The government had no choice but to agree.

Another example is day care facilities in UK hospitals, as explained by Sir Peter Dixon, of University College London Hospitals. "These facilities had not been provided for in the

original design due to a planning error.... Rectifying this was very expensive because under the private finance contract the hospital was stuck with the one provider and could not get quotes from alternative contractors. We had no ability to challenge the capital costs of our provider and of course they did it to suit them and we just had to cough up," (Private finance projects and off-balance sheet debts, March 2010, p.28, point 133.)

This review indicates that PPPs are costlier than traditional government procurement projects, they add significant budgetary limitations due to their long term contract, and at times they cause the government to relinquish control of the facilities. On the other hand, they have enabled facilities to be built, which might not have been built without a PPP, and the facilities are built quicker with PPPs than by the traditional government procurement process. Thus, PPPs, like most things in life, have benefits and costs, and we now will list criteria to help one determine ex ante whether the benefits of a particular PPP project are likely to be greater than its costs.

CRITERIA FOR USING PPPS

In what circumstances is it better for the government to use a PPP and when is it better for the government to use traditional procurement approach, where the private contractors just build a facility without also running the facility? When a government contemplates doing a PPP it needs to do a meticulous examination of the costs and benefits from the project and the various alternative options. The government must find that the benefits from having the facility are greater than the cost of using the private company to build the facility and all the future payments to the contractor. These are not simple calculations since the benefits are not easily quantifiable and it is difficult to identify all the future costs.

There are three situations where the PPP could be worthwhile. One, the PPP could be worthwhile if the due to budgetary limitations the government is not able to build or refurbish the facility. In this case, the question is whether the benefits from the facility are worth the higher costs. Two, since a PPP has a higher probability of being completed on time than the traditional procurement process, it could be that the time benefit of finishing the project sooner is worth the extra costs of the PPP. Three, a PPP could also be worthwhile, if the PPP frees up money for other projects, and the benefits from these projects are believed to be greater than the additional long run costs of using a PPP.

All three of these scenarios might be tempting for a person with a limited time horizon (i.e. politician), but they are all dangerous to the long term financial soundness of the

government since it will be burdened with costs that contractually cannot be changed for many years. In all three cases, the problem of budgeting the building of the facility is pushed off to the future but is not removed by using a PPP. The PPP is functioning as a loan from the private company to the government, and these future liabilities can create a large drain on future expenses.

For all three scenarios, the calculation is simpler when the PPP is a "hard" infrastructure where the "output" can be measured and the users of the facility pay for the facility since then the government is not limiting its future budget. The user of the facility might be paying a higher price than if the government built the project, but one could argue that the high costs of the private company are closer to the "true" costs as opposed to the theoretical cost. On the other hand, by "soft" infrastructure projects, where the cost is all borne by the government and it hard to define the level of services, the government should be very wary about doing a PPP.

If the benefits of the PPP are thought to be greater than the costs, then there still needs to be competitive bidding for the project, a method for quickly arbitrating disputes in the contract, flexible contracts which allow periodic review, an awareness of the future liabilities if applicable, and a very thorough understanding of the contract by the government workers involved in approving the PPP contract.

It is hoped that the review here of PPPs will help government officials make better decisions in choosing whether to use PPPs and if they decide to do a PPP, to make it more effective. Of course, more studies on measuring the costs and benefits of PPPs are to be encouraged to further our knowledge of whether PPPs are worthwhile.

ABSTRACT

In Sicily in the 2010-2012 period green harvesting is the most successful of the 9 measures provided by the Italian National Support Programme (NSP) for wine. Its main goal is to contribute to restoring the balance between supply and demand by destructing or removing grape bunches in their immature stage in order to prevent market crises.

The paper firstly presents the main results of a “three-year” application of Green Harvesting measure to the Sicilian wine sector. Firstly the implementation of Green Harvesting Measure was examined at EU, national and regional level through the analysis of the available statistical data; at a later stage its effects on the Sicilian wine sector were investigated. The trend of vineyard area and wine production was studied by comparing them before and throughout the application of Green Harvesting. Another stage of the research consisted of a survey carried out through direct interviews to 30 Sicilian wine cooperatives, the aim of which was to collect and analyse the trend of grape quantities delivered to the cooperatives, as well as the correspondent prices concerning the last 6 grape harvests (2007-2012). Another aim of the research was to collect the most common viewpoints and impressions of people working in the wine sector cooperatives with regards to the above-mentioned measure.

The study has pointed out that “Green Harvesting” has been contributing – together with other elements - to reduce the supply of wine grape in Sicily and partially to

raise the prices of the wines involved in this region. This measure has been however object of criticisms in relation to its impact in economic, social and ethical terms.

Keywords: Wine-CMO, Green harvesting, Sicily, wine cooperatives.

INTRODUCTION

The Common Market Organisation (CMO) of wine has always been distinct from those of the other agricultural products as, in addition to common problems, it has had to deal with questions specifically covering the sector such as regulations governing the control of and reduction in production potential, the movement and introduction to consumption of viticulture products, the oenological practices and treatments as well as the regulation of the quality of the wines.

Despite a wealth of complex regulations, the European Union (EU) wine market has suffered from structural imbalances stemming from the surplus wine production, the concurrent steady reduction in wine consumption, the slower growth in EU exports and the growing competition from “New World” wines (European Commission, 2006a, 2007c; Čačić et al., 2012; Meloni and Swinnen, 2012). The latest reform of the wine CMO which became effective in 2008, among other innovations, introduced the National Support Programme (NSP) or envelope measure, an array of eleven different regulatory measures. Together with the progressive elimination of traditional market measures (including potable alcohol distillation, crisis distillation and the use of concentrated musts, known as *phasing out* measures), the new CMO has resulted in the consolidation of two measures previously adopted with Agenda 2000 (restructuring and conversion of vineyards and distillation of by-products of winemaking), and also the introduction of other six measures aimed at improving the competitiveness of the production chain during its various phases (promotion on third-country markets and investments), reducing risks and crises (green harvesting, mutual funds, harvest insurance) and cutting the link between subsidies and production with the decoupling of direct aid to producers (single farm payment) (European Commission, 2006a, 2006b, 2007a, 2007b, 2007c; Cagliero and Sardone, 2009, Meloni and Swinnen, 2012). The aims of the reform featured the reduction of wine surpluses via ex-ante measures (e.g. green harvesting) rather than ex-post measures (aid with private storage or distillation) (Iannettoni, 2009; Meloni and Swinnen, 2012).

More particularly, the green harvesting measure was one of the recommendations made in the 2004 Ex-Post Report (European Commission, 2004) to control occasional surpluses of wine

on the EU market via the *“total destruction or elimination of grape bunches while still in their immature stage”* in order to restore a sustainable balance between supply and demand, and to contain the collapse in the product price at source.

By playing a significant role in the production and commercial levels of EU viticulture (OIV, 2013), Italy is the only country, together with Slovenia and Cyprus - both marginal due to the size of their viticulture – that since 2010 introduced the green harvesting measure into its NSP. The most active and receptive Italian region is Sicily. In fact, among the 9 measures introduced by the Italian NSP, the most successful in Sicily has been the one relating to green harvesting, with the highest expenditure equivalent to just over 40 million Euros (RRN, 2013) during the financial years 2010-2012. The strident criticism from one sector of operators in the production chain, and in particular those in the cooperative section, urged the Sicilian Region to issue a provision supporting wine cooperatives, whose members had embraced the measure substantially, thus protecting them from the ensuing downturn in rewards and the increase in unit processing costs.

This paper aims to investigate the effects of the implementation of the green harvesting measure in Sicily in economic, social and ethical terms, by analysing the official statistics as well as carrying out a direct survey on the wine cooperatives operating on the western side of the island (in the provinces of Trapani, Agrigento and Palermo) where the measure registered its quasi-entirety of adhesions on a regional level (99.9% in the 3 years 2010-2012).

The paper is structured as follows. After examining various studies relating to the wine CMO, it will show the methodical approach used. Then, the production figures in Sicily will be delineated also by drawing on the data concerning the implementation of green harvesting during the financial years 2010-2012 and its relative effects sourced from various structural and production indicators. In the following section the results of the research into wine cooperatives will be analysed. The paper will then illustrate a number of conclusions.

LITERATURE REVIEW

Thanks to the ceaseless reforms affecting the wine CMO, as well as the importance attached by the viniculture sector to the economic range of the agricultural and food industry in the EU, there is a rich source of literature existing on the subject, and particularly official documents covering programming and/or evaluation of the CMO (European Commission 2002, 2004, 2006a, 2006b, 2012a).

Over the years, various economic studies on the EU's wine market assert that policies have caused some major distortions in the wine sector instead of contributing to a solution (European Commission, 2004, 2006b, 2007c). The overproduction problems that have plagued and continue to plague the EU wine sector were not caused by bumper harvests, but were rather a result of regulatory measures and market intervention on the part of the CMO for wine (European Commission, 2002). Measures related to planting rights limitation and premium for definitive abandonment were effective in reducing the area of low quality vineyards though not fully effective in controlling production levels nor preventing surpluses (European Commission, 2004). In contrast to planting rights, distillation measures and market intervention were largely inefficient in their attempts to decrease structural surpluses (European Commission, 2002), stimulating overproduction of low quality wine and causing fairly high EU expenditure (Grant, 1997; European Commission, 2004).

Looking at the previous wine CMO, Pomarici and Sardone (2001) provide some critical remarks on the 1999 reform through a detailed reading of its contents, especially with regard to its application in Italy. Conforti and Sardone (2003) assess the ability of wine potential constraints and of the oenological practices in attaining the reform goals and assert that potential control system contribute to create distortion in production localisation. Some studies analyse the effect of the 1999 CMO on the Hungarian wine economy before EU accessions (Sidlovits and Kator, 2007), whereas others focus specifically on territories endowed with a strong viticulture tradition, such as those in Tuscany in Italy (Bongini et al., 2007) or in France, thus appraising the effects of specific measures such as distillation (Salies and Steiner, 2011).

More recent studies focus on the latest reform of the wine CMO. Meloni and Swinnen (2012) analyse the political economy mechanism that created the existing set of quality and quantity/price regulations by documenting their historical origins, and relate them to political pressures resulting from international integration, technological innovations and economic developments. Iannettoni (2009), after a brief overview of the various reforms of the wine CMO, evaluate the latest one demonstrating that the majority of the current regulatory reforms codified by the Council Regulation (EC) No. 479/2008 are based upon prior reforms employed during the 1987-1996 period. Others studies refer to how the new CMO will affect producers in California and the rest of the United States (Brunke et al., 2008) and in Croatia (Čačić et al., 2012), many others analyse specific measures: in particular, Brunke (2010) assesses the early impacts of the grubbing-up scheme and conduct country-by-country comparisons on participation in this scheme to evaluate which EU members are most

successful in addressing their problem of overproduction. Tudisca et al. (2012) calculate that in the western area of Sicily the grubbing-up premium does not compensate the loss of income due to cessation of production. However, according to the 2012 Evaluation Report (European Commission, 2012a) the resulting income loss is more than compensated in most analysed regions in those cases where vineyards are replaced by other permanent crops. Although grubbing-up represents both a surplus management measure and a quality measure by reducing in primarily low-quality wine (European Commission, 2004; Iannettoni, 2009), the European Court of Auditors (2012), in its analysis, find that the scheme is not sufficient to correct the existing market imbalance; on the contrary, the restructuring and varietal conversion measure improves the competitiveness of vineyards, but in a number of cases also lead to an increase in wine production. In addition, there are studies directed at simulating potential future scenarios in the sector or evaluating the effects of politics on the liberalisation of the wine planting rights due to be abolished by 2015 (Bogonos et al., 2012; European Parliament, 2012; Corsinovi et al., 2013, Deconinck and Swinnen, 2013, Gaeta and Corsinovi, 2013).

There are, to date, no bibliographic references on green harvesting implementation and its effects other than small references to the analysis boundaries referring to the broadest characteristics relative to the CMO in its entirety (Iannettoni, 2009; Pomarici and Sardone, 2009; RRN, 2012 and 2013; Piras and Gutierrez, 2012) due to the limited take-up of the measure among Member States. This study has been conducted in an attempt to bridge these gaps.

MATERIALS AND METHODS

The methodology applied within this study combines the statistical analysis of data relating to the vitiviculture sector and to the implementation of green harvesting in Sicily from various sources, with data directly stemming from the information retrieved from various Sicilian wine cooperatives.

Specifically, regional productivity was firstly analysed data from the 5th and 6th General Agricultural Census made by Italian National Institute of Statistics (ISTAT) that take into account the structural data of farms every 10 years (in this study, 2000 and 2010). At the same time we took into consideration the economic data provided by the Vitiviculture Observatory of the Regional Vine and Oil Institute (RVOI) which covers the area under vine and the weight of wine grapes produced in each province, as well as the hectolitres of wine

per wine designations of origins (PDO, PGI and table wine). This latter analysis covers the 2007-2012 period, both during the three previous years (2007-2009) and throughout the application of green harvesting (2010-2012). Furthermore, the analysis of the implementation in Sicily takes into account the current regulatory framework as well as various other sources of information and statistics (DG AGRI, EU Regulations, ISTAT, MiPAAF, AGEA, RRN, official regional statistics). In particular, we have looked at the number of applications approved, the amount of aid granted, the relative surface area also based on wine appellations (PDO, PGI and table wine).

The direct survey, carried out in 2013, looked at all the 30 wine cooperatives receiving regional financial support in 2010 in order to cover increased operating costs resulting from their members which implemented the green harvesting measure. These wine cooperatives are situated in the western area of the Island, in particular in the provinces of Agrigento, Palermo and Trapani which, as well as being responsible for more than 4/5 of the Sicilian area under vine have also recorded almost all of the adhesion out of all regional vintners who benefited from the measure. The managers of the wine cooperatives took part in a survey so as to obtain information on the quantity, volume of grapes by wine designation of origin (PDO, PGI and table wine) and the correspondent prices paid to members during the last 6 grape harvests (2007-2012), and in terms of quality, in relation to their opinion concerning the effects produced by the “three-year” application of green harvesting measure to the Sicilian wine sector (2010-2012) at the economic, social and ethical levels.

THE SICILIAN VITIVINICULTURAL SECTOR

According to the data in the 6th General Agricultural Census, Sicily which has 114,291 hectares of wine growing surface area (with an average farm size of 2.81 hectares), is the largest wine-producing region in Italy.

When compared with the data from the previous census, there is a decrease of 6.2% in the regional area under vine, which is slightly lower than Italy. Sicilian viticulture is characterised on one hand by the concentration in the western part of the island (85% of the overall wine growing surface area) and on the other by a traditional structural conflict between several small family businesses and a few large production businesses which could be capable of closing down the whole supply chain also through the commercialization of wine in foreign markets.

Because of the smaller production businesses, the cooperative phenomenon in the wine sector becomes very important in Sicily where more than 80% of total production is condensed in wine cooperatives (Sarnari, 2011). According to data from the Institute of Services for the Agro-Food Markets (ISMEA) in 2011 there were 85 wine cooperatives (with 72 in the three provinces we have looked at).

The recent dynamics of the Sicilian wine industry have been analysed using data supplied by the Vitivinicultural Observatory of RVOI, which in turn has used information from the Office of General Vitivinicultural Statistics 2000/SRRFV, from the Agency for Agricultural Payments (AGEA) and from ISTAT for the period 2007-2012.

Table 1 shows an overall recessive trend from 2008 as regards both the area under vine (except for the last year) and the volume of grapes produced, which is not only attributable to climatic, phytosanitary and surface trends, but also to the application of green harvesting. In particular, according to the census data, the largest territorial concentration of regional vitivinicultural production is in the west of the island, and over the period covered, it is this area which has the highest level of reduction in vineyard surface area. By contrast, however, there is a positive trend in productive cultivation in the provinces of Catania and Ragusa, due in part to the emergence of business ventures concentrating on production of quality wines to compete on the national and international markets (D'Amico, 2011). The latest available figures from RVOI for 2012 show an area under vine of 108,595 hectares producing 657.5 thousand tonnes of wine grapes.

Provinces	2007		2008		2009		2010		2011	
	Ha	000 tonnes								
Trapani	68,121	380.0	68,780	462.0	68,075	415.0	66,558	374.0	65,031	324.4

Sicily*	118,906	716.0	119,894	854.2	118,581	794.0	115,687	746.4	112,734	569.1

Table 1: Regional area under vine and wine grape production.

* The regional total data is the only available for 2012 (108,595 hectares of surface area and 657.5 thousand tonnes of wine grape production).

Source: RVOI.

Wine production in 2012, according to the same source, is 4.7 million hectolitres, which during the six-year period follows more or less the same trend as the production of wine grapes (Table 2). In particular, the entire regional production, made up in 2012 of mainly PGI wines (44.2%) followed by table wines (39.8%) and PDO (16.0%), has greatly changed in the period under review, showing that the Sicilian vitivincultural sector has moved towards production of vineyard-designated wines.

Vineyard designation	2007	2008	2009	2010	2011	2012
PDO	153,015	229,508	213,256	170,188	166,568	756,527
PGI	1,147,173	1,561,600	1,710,177	2,365,823	2,183,170	2,092,998
Table wine	2,641,120	3,233,913	3,010,838	2,364,152	1,144,343	1,888,912
Total	3,941,308	5,025,021	4,934,271	4,900,163	3,494,081	4,738,437

Table 2: Regional wine production by vineyard designation (hl).

Source: RVOI.

Analysis of the production data shows the effects of the introduction of green harvesting as from 2010, in synergy with other factors, with an inversion of the trend in 2012 in relation to the reduction in financial budget and, consequently, its implementation, compared to prior years.

GREEN HARVESTING IMPLEMENTATION IN SICILY

An examination of the data covering the financial execution of the NSP of the three recipient member countries, shows that the measure absorbed around 1.2% of the total cost envisaged by the wine CMO for the period 2009-2012 (European Commission, 2012b). In particular, Italy received 97.6% of the budget available, while the rest was split between Cyprus (1.7%) and Slovenia (0.7%). Within Italian boundaries, Sicily received the largest share, absorbing 84.5% of the national budgetary envelope (81.5% of the total EU expenditure for this measure) distributed over the 2010-2012 three-year period. Nevertheless, the implementation of green harvesting has instilled contrasting views among the people operating on different levels in the regional vitivincultural sector. If on one hand it has been a great success in terms of adhesion among regional vintners, on the other hand it has also produced several negative opinions, as it is viewed as damaging for the supply and operating procedures implemented by the wine cooperatives (Pomarici and Sardone, 2010) and as an additional form of excessive state aid to the revenue of agricultural producers.

The conditions for accessing the measure in Sicily forecasted that the harvest would only be conducted via a manual method and that it could not be carried out over two successive seasons on the same vineyard. The latter, at the time of the tender, had to be planted since at least 4 campaigns and also to have made up the object of the harvesting declaration of the previous season. During the first two seasons of implementation, the minimum farm surface area was established as 1 hectare and the maximum at 6 hectares; the maximum surface area however could be extended to 20% of the area above 6 hectares, up to a maximum of 15 hectares. The third participation session reduced the maximum area to 3 hectares which could be extended to 20% of the excess area up to a maximum of 6 hectares.

Since the first tender, the Regional Department of Agricultural and Food Resources (RDAFR) of the Sicilian Region has regulated the aid per hectare according to the vineyard designation concerned: €1,500/ha, €1,700/ha and €2,000/ha respectively for grapes destined for production of table wine, PGI wine and PDO wine.

Compared to the first two tenders, the third, whereby fewer financial resources were available, linked the funding to a regional classification taking into account a specific score attained by adding points gained on the basis of precise evaluation parameters (qualification of the applicant; participation in the first tender; age of the vineyard).

During the three years of participation, the total financial execution was around 40 million Euros (Figure 1); in particular the three western provinces of Sicily absorbed around 98.8% of the total, with Trapani receiving 76.9%.

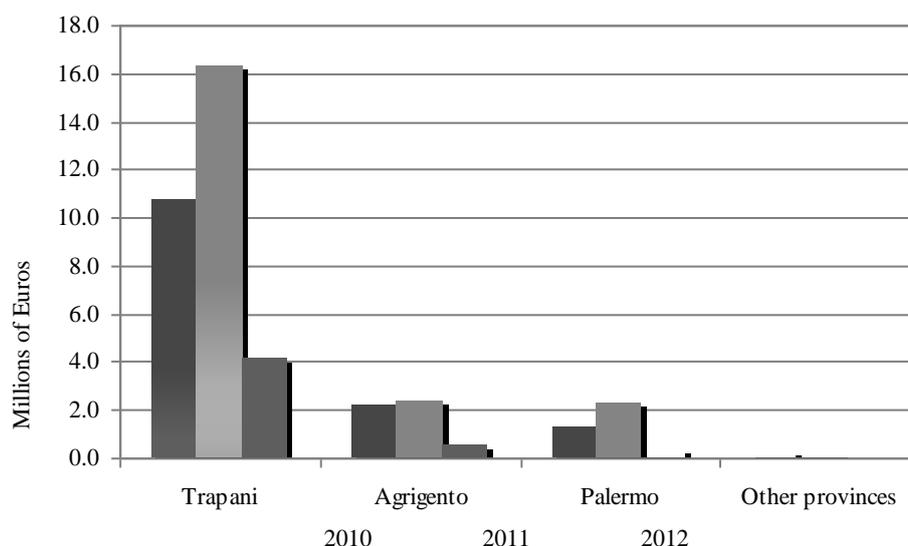

Figure 1: Financial execution of green harvesting implementation in the period 2010-2012.

Source: Our elaboration on RDAFR data.

In the three 2010-2012 grape harvests Sicily had 8,823 applications financed and registered with the highest degree of adherence equivalent to 88.5% of the national total (9,853 applications): the other regions involved were Marche, Umbria and Piedmont. In Sicily adherence to green harvesting was concentrated in the province of Trapani (73.9% of the total), Agrigento (15.4%) and Palermo (9.7%). A close examination of the trends relating to the applications financed in the three provinces analysed shows a boom in requests during the second tender, namely more than 50.0% compared to the first one (Figure 2). In the last tender, however, there was a large reduction in the number of requests mostly due to the lesser financial eligibility from MiPAAF.

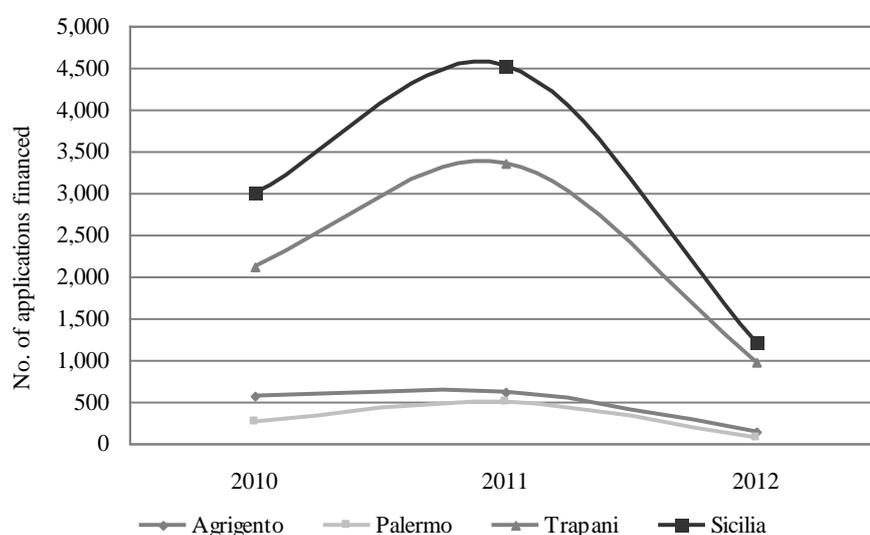

Figure 2: Applications financed in the 2010-2012 period.

Source: Our elaboration on RDAFR data.

The surface area benefiting from financing in the same period was equivalent to 24,453 hectares, concentrated in the province of Trapani (76.9%), Agrigento (12.3%) and Palermo (9.6%). As pertains to vineyard designation, it emerges that PGI wine benefited most from green harvesting (equivalent to 67.8% of the total subsidies) followed by table wine (28.0%) and PDO wine (4.0%) (Figure 3).

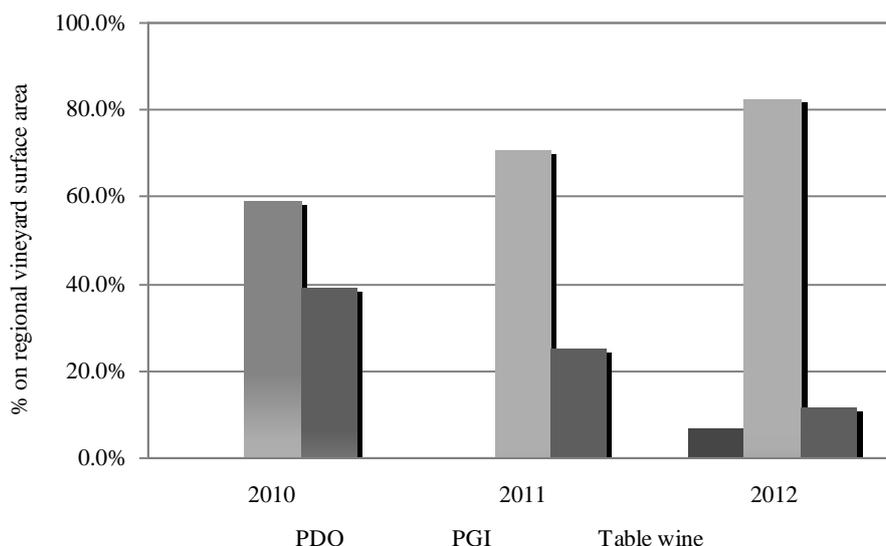

Figure. 3: Benefiting area under vine divided per types in the 2010-2012 period (% on regional area under vine).

Source: Our elaboration on RDAFR data.

As regards the impact on wine cooperatives, the smaller quantity of grapes produced by the vine growers and delivered to the cooperatives, caused an increase in operating costs, urging the RDAFR in Sicily, in association with the professional Organisations and categories, to undertake a supporting measure in 2010 restricted to the wine cooperatives whose members adhered to the first green harvesting tender. In particular, the funding was differentiated according to the surface areas resulting from the cadastral plan relating to the partners in the same year, amounting to €250/ha, €220/ha and €200/ha for the wine cooperatives with surface areas respectively between 200 and 1000 ha, between 1000 and 2000 ha and greater than 2000 ha. According to the figures provided by RDAFR, 30 wine cooperatives benefited from a total funding of approximately 1.5 million Euros.

RESULTS

The 30 wine cooperatives in this study are mainly located in the province of Trapani (17) with the others located in the provinces of Palermo (7) and Agrigento (6).

With reference to the quantity of grapes delivered to these cooperatives, the figures registered during the last 6 harvests, apart from the production which was lower in 2007 due to a bad attack of downy mildew, show a significant decrease in volume compared to 2010 (-27.7% compared to 2009) coinciding with the first year of green harvesting implementation,

followed by an almost identical result the following year (-26.0% compared to 2010). In 2012, and in accordance with the figures supplied by RVOI, there was an increase in production delivered to the wine cooperatives which reached 287,257 tonnes of wine grapes (+47,3% compared to 2011) (Figure 4).

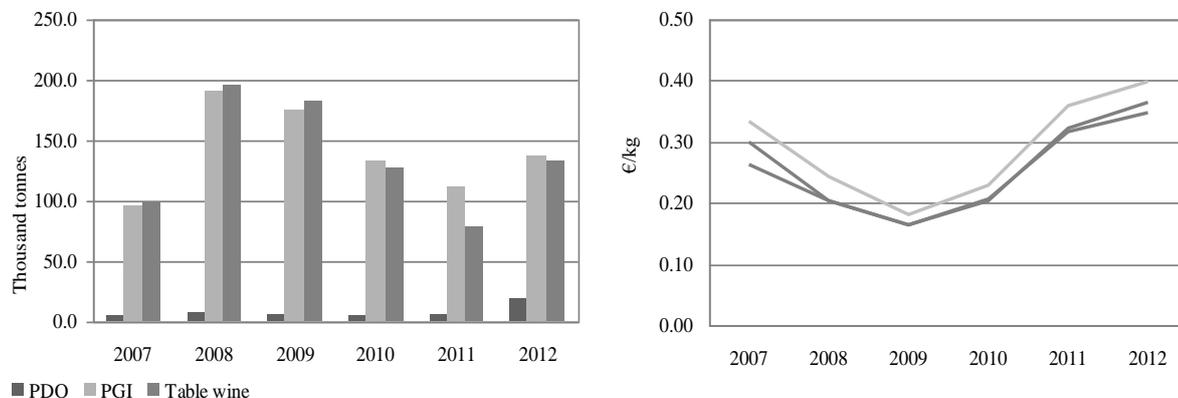

Figure 4: Evolution of the wine grape production delivered to wine cooperatives and the price paid during the 2007-2012 period.

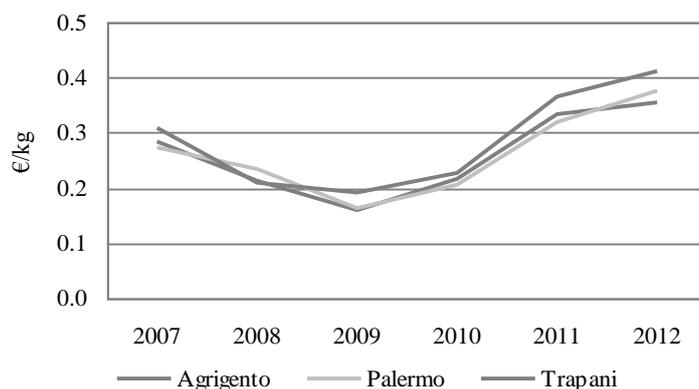

* Data relating to 2012 price is an estimated projection..

Source: Own calculation based on survey data.

In particular, with regard to the types of grapes (PDO, PGI and table wine), the drop in volume was mainly in the grapes destined for production of table wine and PGI, as opposed to those destined for PDO which were hardly affected by the implementation of green harvesting, after a decrease in 2010 showed a rapid increase stemming from the adhesion of several enterprises to the investment measure by the NSP.

An analysis conducted on the prices granted to members, which decreased until 2009, shows an increase to which green harvesting also contributed. In particular, the grapes with the best performance are those used in the production of table wine and PGI as opposed to the PDO grapes. Furthermore, these PDO grapes strangely appear to be endowed with a lower commercial value that is due, according to several growers interviewed by us, to the low quality value of the cultivar with this designation delivered by the members to the cooperatives.

An analysis by province shows that the grapes delivered to the Trapanese cooperatives are better paid (Figure 5). This could be due, on the one hand to the ability of the enterprise to make financial savings thanks to the high volumes produced, and on the other hand to the competition between the many wine cooperatives operating in one of the most substantial areas of vitivinicultural industry in the EU.

Graph 5: Evolution of the price of wine grapes by province (€/Kg).

Source: Own calculation based on survey data.

Moreover, the survey shows an increase in average fixed operating costs, due to the smaller volumes delivered, which went from €70-80/tonne to €140-160/tonne of grapes, and was only partly compensated for by financial support granted on a regional level equivalent to €20/tonne for the 2010 grape harvest. According to the people interviewed in the survey, it is felt that there is a loss on not only in economic and social terms connected to the entire vitivinicultural industry which employs thousands of people, as well as a loss relating to the value of the farms and the exclusion from some markets due to product shortage, but also on an ethical level related to production destruction.

CONCLUSION

This study has striven to appraise the salient aspects regarding the implementation of green harvesting in Sicily, with particular reference to the western area of the island which, during the 3 years of implementation (2010-2012) obtained, on a national level, almost all subsidies and relative surfaces as well as the EU expenditure for this measure.

Within the three-year period, these indicators (applications, surfaces and expenditures) recorded a growing trend between the first and second year of implementation, whereas a significant decrease during the last year. In this regard, it is to note that even though in the 2013 financial year 30 million Euros were made available on a national level (with Ministerial Decree No. 3525 of 21/05/2013, other 10 million Euros were earmarked for the measure for 2014) the measure was not activated in Sicily (on the contrary, it was activated in Lombardy, Sardinia, Campania, Calabria and Apulia).

By aiming to reduce vitivinicultural production charges, an analysis of the regional scenario shows a reduction in wine grape production during the first biennium, due in part to

green harvesting, in conjunction with an increase in the production of wines with a designation of origin and to favourable market trends, and to a small increase in the prices of grapes after the 2010 harvest.

If on the one hand the measure has proven extremely successful among vintners, albeit in some cases with amply justified reservations of an ethical nature, on the other hand it has damaged the island's wine cooperative system which, in addition to involve almost all of the regional vintners, is responsible for a large portion of the vitivincultural production. The smaller volume of grapes delivered to the cooperatives, according to the people interviewed in the survey, brought about an increase in operating costs as well as difficulties in the programming of the cooperatives activities, affecting all members across wine cooperatives (regardless of whether they participated in green harvesting); the whole, however, was partly offset by the rising of the sales price of the wine and consequently the liquidation paid to members. At the same time the green harvesting measure definitely entailed strong repercussions on all satellite activities of wine industry, particularly in the territories concerned.

ABSTRACT

The development of Web 2.0 lead to an evolution in the Enterprise – Customer relationship, allowing the latter to access a wide range of information with a growing importance in the purchase process. Enterprises – particularly the small ones – have been required to use the web with greater awareness and a sense of observation to deal with consumers' empowerment and to generate sustainable benefits to both the territorial and business systems.

In the light of these considerations, this study aims at highlighting the contribution of web communication to agri-food Small and Medium Enterprises' (SMEs') competitiveness and at analysing agri-food SMEs' web communication patterns.

In line with these goals, a field research on Italian- and English-language websites has been conducted to identify the essential determinants in the "brand-land-product" web communication as well as the most common verbal contents adopted by agri-food SMEs and their transmission through the Internet.

Managerial implications are indicated in the possibility for Mediterranean agri-food business SMEs to acquire deeper semantic and lexical expertises in communicating their products on the web, in support of their competitiveness, by filling the gap between their opportunities and capabilities to compete on the global scene.

This study is part of a project named *ISCI – Innovative Services to Strengthen Cooperation and Internationalization between SMEs in the field of Agri-food Industry*, financed by the European Territorial Cooperation Programme (Interreg) Greece - Italy 2007-2013.

Keywords: agri-food, SME, consumer empowerment, competitiveness, web communication, Internet, local development, territory, brand, place of origin.

1. INTRODUCTION

In defining the concept of a “typical product”, its origin from a specific geographical area is highlighted because it conveys a high degree of differentiation (in terms of organoleptic characteristics as well as of production techniques, which guarantee specific qualitative standards) thanks to the strong relationship developed with the territory where the product comes from (Maizza, 2010).

However, such uniqueness features are not perceptible exclusively in reference to the *geographic component* (intended as a localisation of the production area) but also in its coexistence with a specific *cultural* (converted in values, beliefs, knowledge, and traditions), *social* (rules of behaviour, relationships, sense of community), *landscape*, *climatic* and *historical* heritage that, permeating the entire chain, conveys a unique value to the product.

For such a heritage to be transformed into an economic value, *brand name capital* is necessary (Williamson, 1985), which, acting through *image* and *reputation*, confers typical product *awareness* (as a result from the collective action of tangible and intangible resources of a specific territory), *appeal* and *fame* (Keller, 1993; Aaker, 1997).

For this purpose, communication has a fundamental importance (Sriramesh and Verchic, 2009) in, on the one hand, making people aware of those territorial features that have a decisive impact on the agricultural production and, on the other hand, conveying a series of symbolic and experiential elements, geared at creating positive perceptions and unique associations in the consumer’s mind. In fact, beyond the cognitive or tecno-functional content of the message transmitted, the “story” of the relationship between a product and its territory (which cannot exclude, for example, the eno-gastronomic culture or the connection among raw materials, cultivation techniques and organoleptic features of the product) causes local Enterprises to join their forces and to be constantly, enduringly and coherently committed to the protection and conservation of territorial resources by applying a model of sustainable development based on the Triple Bottom Line (Elkington, 1997).

The growth of such a complementary relationship between the territory and the product boosts, in the perspective of systemic consonance (Golinelli, 2000), the competitive potential

of both. In fact, by giving value to the territorial vocation and by promoting the identity of the product, *reputational capital* is developed (Dowling, 2001), which is not reproducible by competitors and which represents a great source of differentiation able to do the following:

- Increase a product's awareness and a producer's reliability;
- Involve a consumer into highly committed experiences that strengthen his/her *brand loyalty* by allowing him/her, on the one hand, to taste a product's authenticity and, on the other hand, to dive into the atmosphere and mood of its territory;
- Reduce perceived risks and transactional costs connected to the purchase because the territory guarantees certain qualitative attributes incorporated by the product;
- Reinforce local *attractiveness*, allowing those benefits deriving from marketing efforts to be spread from the product itself to the whole farming area;
- Strengthen both the product's and the territory's *brand images*, demonstrating that they are not the results of a fictitious or short-term process but the proper realisation, in a long-term perspective, of the promises conveyed through communication.

As such, the typical product becomes the facilitator of attention for the territory, and the territory becomes the facilitator of attention for the typical product. Therefore, when this synergic and mutual relationship is established, an even more complete strategy of Customer involvement could take place by promoting engaging experiences, encouraging word of mouth to positively affect the branding processes, and exploiting all possibilities included within the Web 2.0 instruments.

Thus, the aim of this current research is twofold. The first aim is to highlight the contribution of web communication to agri-food Small and Medium Enterprises' (SMEs) competitiveness, particularly in terms of shifting away from traditional marketing techniques to consumer empowerment. The second aim is to analyse agri-food SMEs' web communication patterns, by identifying the essential determinants in the "brand-land-product" communication.

The paper is structured as follows: after a literature review on the role of the Internet in defining new patterns in the Enterprise-Customer relationship, how marketing has boosted consumer empowerment is discussed. Then, the main results of the field research are analysed, also to support agri-food SMEs in developing their semantic and lexical skills and communicating more efficiently on the web.

2. HOW THE WEB HAS DEFINED NEW PATTERNS IN THE ENTERPRISE – CUSTOMER RELATIONSHIP

According to the definition by Tim O'Reilly (2007), Web 2.0 is not a technology in itself but rather a social attitude, centred on the rediscovery of the value of relationships.

The opportunity of sharing experiences and exchanging opinions has, actually, imposed a meaningful overturn in both traditional marketing approaches and business communication paradigms (Hennig-Thurau *et al.*, 2004) by stimulating horizontal cooperative processes and thus transforming consumers from “targets” to “sources” and “channels” of the communication stream.

Thanks to the development of the web, the hierarchal and mono-directional (from the Enterprise to the Consumer) communication between two subjects has been replaced by a network model, where the Enterprise, through its very own brand, is just one of the different subjects involved in an equal relationship: the Enterprise communicates in real time with other figures of the web (the Consumers) in the same way in which Consumers entertain relationships with other users (Esch *et al.*, 2006).

This development has triggered off innumerable processes of co-created content (Vargo and Lush, 2008), meanings (Galimberti, 2011) and values (Godes and Mayzlin, 2004), thus maximising the collective intelligence of the individuals participating in these relationships. The Enterprise, therefore, delves into such a stream of intersubjective and multidirectional conversations, not so much as to define Customer needs but rather to build and nourish in the course of time a set of connections allowing to a) acquire more *knowledge* by gathering feedback and functional suggestions for a complete improvement of the product/service and towards the development of innovative processes (Cova and Dall'i, 2009); b) generate *trust* by raising Consumers' choice options and product loyalty (Riegner, 2007); c) create *brand awareness* and increase corporate reputation by developing different forms of *brand interaction* (Kaplan and Haenlein, 2010) and *brand engagement* (Wenyu and Krishnamurthy, 2007); d) fasten cognitive and affective *ties* by offering consumers the possibility to enhance their own identity and express their creativity through storytelling and socialisation (Brown *et al.* 2005) and to live unique, deeply engaging and memorable experiences (Csikszentmihalyi, 1997).

The main potential that, in return, Consumers recognise when these different forms of Web 2.0 sociality take place can be summed up into three main levels (Graffigna *et al.*, 2012): a) the *brand relationship* level, linked to the possibility of feeling as an “expert interlocutor”, able to

contribute, thanks to one's own feedback, to an Enterprise's marketing strategies; b) the *relationship-with-equals* level, through the possibility of coming into contact with other consumers recognised as akin and giving life to an "elective community"; and c) the *inspirational-project-for-oneself* level, guaranteed by the access to branded "possible worlds" (Semprini, 2006).

The new forms of interaction allowed by the development of Web 2.0 have, in general, made the consumer more informed, networked, empowered, and active. That is, Web 2.0 has given him/her a more active role within the complex value chain, making the market a forum of conversations and interactions among Consumers, Consumer communities, and Firms (Prahalad and Ramaswamy, 2004). In particular, *consumer empowerment* is recognisable in a) the reduction of the Enterprise's control of communicational content and fluxes (Gorry and Westbrook, 2009) through the development of a never-ending dialogue where access and transparency are the pivot for value co-creation; b) the generation of more informed and aware paths of consumption, thanks to the possibility to easily monitor and promptly report inconsistencies or non-fulfilment in companies' behaviour, thus triggering word of mouth on a global scale (Fombrun *et al.* 2000); c) the resulting increase of the User's power of weighing on *brand reputation*, influencing the success or failure of a brand, product or service (Brown and Reingen, 1987).

3. IMPACTS OF CONSUMER EMPOWERMENT ON SMES' MARKETING STRATEGIES

The possibility of sharing information, experiences and meanings in *flow* situations (Csikszentmihalyi, 1997), which are much more emotionally involving and intensely experiential than when they occur in traditional contexts as, for example, in retail stores or through mass media advertising, has given Web 2.0 users the power of orientating other users' attitudes and purchasing behaviours, as well as the possibility to reduce costs, in terms of both money and time, in all phases of the purchase process (Berthon *et al.*, 2007).

In particular, the spread of Web 2.0 has provided a large number of information sources and virtual spaces, as well as growing sophistication in terms of efficiency and effectiveness of the virtual communities and software instruments, for the simplification and the automation of the assessment of alternatives, thus reducing the cognitive costs of elaborating the large quantity of information potentially available online (Simon, 1955). In this way, informative

asymmetries between the Enterprise and the Consumer have been weakened, while individuals' learning circuits have been widened, thus enabling the production of new knowledge through interactions and shared experiences and simultaneously leading to the reinforcement of the consumer empowerment process (Pires *et al.*, 2006).

Cost reductions and effectiveness increases are also definable in terms of major conveniences due to the almost unlimited availability of (virtual) sites where purchases can take place at any time of day, in a simple and highly personalised way, without having to physically reach a retail store, as well as in terms of an easier *use of voice*, related to the possibility to share personal consumption experiences (whether negative or positive) in the virtual communities associated with the specific product or category of products, thus triggering word of mouth on a global scale.

Therefore, the Enterprise needs to seriously evaluate its Customer orientation that, far from the mere adoption of a specific technology, is connected to its culture and reputation. Customer orientation takes shape in the growing capacity of listening and quickly answering to Consumer requests and analysing an even more pronounced multi-channel purchase process; otherwise, the risk is the breaking down of *trust* relationships and *loyal* behaviours (the latter made even more ephemeral by the reduction of the *lock-in* effect, which, on the contrary, grows in presence of informative asymmetries).

To stabilise the relational and trust aspects in transactions connected to the development of Web 2.0, increase the amount of clear information conveyed to the market and strengthen their own competitive advantage, Enterprises are also called to share objectives and values on the basis of collaboration by restructuring B2B relationships in terms of greater interaction and cooperative value-creation (Grieger, 2003). Initiating cooperation with other players along the entire production chain is effective in allowing the development of creative learning processes, while the improvement of trading functionalities and the expansion of value-added services are the primary lines for the development of platforms projecting the emergence of a more networked agri-food industry with an embedded Web 2.0 infrastructure.

4. GOALS AND RESEARCH METHODOLOGY

The current research aims at highlighting the contribution of web communication to SMEs' competitiveness and analysing SMEs' web communication patterns, particularly in terms of

verbal content conveyed and with regard to how communication is transmitted through the Internet. Due to the specific characteristics of the sector and its role in the development of the whole Mediterranean area, as well as for its capability to put into practice the EU Horizon 2020 perspective, in terms of local preservation, sustainable development and Consumer empowerment, the analysis has been focused on the agri-food sector.

Previous studies (Fritz e Schiefer, 2008; Duffy *et al.*, 2005; Sparkes and Thomas, 2001) have suggested that effective communication is one of the most important determinants for sustainable competitive advantage in this sector, both in terms of adequate frequency and information quality. Important research has been conducted on Greek (Manthou *et al.*, 2005; Matopoulos *et al.*, 2007; Baourakis *et al.*, 2002) and UK (Leat and Revoredo-Giha, 2008; Sparkes and Thomas, 2001) SMEs; thus, there is high demand for research on how the Internet's potential as a new communication tool is exploited in other countries to observe potential differences in how the Internet allows the engagement of all participants in the production and distribution of agri-food products.

With the aim to contribute to filling these gaps, field research on Italian- and English-language websites has been conducted to identify the local determinants in the "brand-land-product" communication as well as the most common verbal content adopted by agri-food SMEs and their transmission through the Internet.

A content analysis of the first 30 Italian-language and the first 30 English-language web channels on typical agri-food products was done. For each language analysed, both basic and in-depth research has been conducted. The first step consisted in the selection of web sources dedicated to typical agri-food products through the identification of keywords to be inserted in the most common search engines (Google and Yahoo). For this purpose, the annual report Zeitgeist and Google Trends have been used. Then, a comparison of the data obtained was conducted through the analysis of their visibility on the result page.

The second step consisted in the identification of top search tools in Google and Yahoo, validated through Alexa's service rank analysis.

Third, the keywords identified in the first step of the analysis were inserted into each of the top search tools selected in the second phase, leading to the identification of 1200 websites. To reduce this number to 30 for each language analysed, a further validation was conducted by eliminating websites (such as e-commerce websites) that were not relevant to the purpose of the survey. Finally, through Alexa, each of the identified links has been evaluated in terms of

its a) *traffic rank*, as an indicator of the global popularity of the site; b) *rank in*, as an indicator of the national popularity of the site; and c) *sites linking in*, as an indicator of the reputation of the site among web users.

In reference to the texts (23,466 Italian words, 67,405 English words) of the identified websites, an exclude list and an algorithm for the normalisation of words with the same semantic root have been enforced. Then, a quali-quantitative content analysis took place through Catpac. The use of this software is justified by the possibility of identifying not only the most-used words but also connections activated by specific words, with the help of neural network models (Woefel, 1993).

The elements on which the research mostly concentrated on were the analysis of frequencies, to set the *porosity* of the words, and the identification of specific topics, by grouping words in semantic clusters. For the creation of the latter, among the different hierarchical methods used in the literature, the Ward method was adopted (Johnson, 1967; Everitt, 1979) to create groups of words that, at every phase of the process, have a minor increase in the inter-group deviation (DEV_{IN}) and a major increase in the intra-group deviation (DEV_{OUT}). The analysis of non-hierarchical clusterisation started from the identification of the most-frequently used words (that were found to be “product” in Italian and “food” in English) and the measurement (within a 0, +1 range) of the intensity of co-relationships between these words and all the others within each text. The analysis took place in mobile windows of 7 terms each. Words included in clusters reveal an important co-relationship (persistently superior to 0,41) with the word that brings to life the same cluster.

5. RESULTS

From the analysis of the first 160 (maximum number Catpac is able to elaborate) unique and most-frequently used words on the analysed websites, it is possible to identify differences connected to the lexical choices of web users that communicate in Italian with respect to the English-speaking ones (see Tab. 1).

Websites in Italian			Websites in English		
<i>Word</i>	<i>Frequency</i>	<i>Percentage</i>	<i>Word</i>	<i>Frequency</i>	<i>Percentage</i>

Product	1.037	4.4	Food	2.744	4.1
Italy	876	3.7	Agriculture	2.070	3.1
Agri-food	754	3.2	EU	1.669	2.5
Agriculture	738	3.1	Market	1.298	1.9
Production	699	3.0	Research	1.115	1.7
Time	595	2.5	Development	1.097	1.6
Cooperation	483	2	Information	1.021	1.5
New	463	1.9	Production	998	1.5
Region	455	1.9	Project	957	1.4
Firm	418	1.8	Price	925	1.4

Note: due to display requirements, only the first 10 words in terms of frequency are reported. However, it is interesting to observe that 53,4% of the whole textual content of Italian-language websites, as well as 56,6% of the English-language websites, is concentrated within the first 50 words in each group. Differences in percentages between Italian- and English-language websites may be explained in light of the fact that English websites are more complex, both in terms of number and length of contents, than the Italian ones.

Tab. 1: The 10 unique words used more frequently by Italian and English spoken web-user referring to agri-food products

The basic informational requirements of Italian-speaking web users are concentrated on specific product types such as “wine” (482 times), “milk” (252), “meat” (131) and “oil” (154), on the individuals involved in realising them (“enterprises”, “farmer”, “consortium”, “operator”, “agriculturier”, “producer” and “production line”, with 837 occurrences in total, are the most-frequently used words), and on the territory of production. With regard to the latter the use of the words “Italy” (876), “region” (467), “territory” (199), “town” (226), and specific geographical areas such as “Calabria” (314) and “Tuscany” (115) are considered, all of

which are evidence of the value, in terms of competitiveness, of the *uniqueness* originating from the relationship between a typical product and its territory of origin.

Differently, web conversations of native English-speaking users are influenced by the political and economic environments, considered as supra-systems that are external to the Enterprise, and capable of influencing the competitive scenario by exerting pressures and expectations. With this regard, the occurrences of words such as “policies” (770 times), “projects” (957), “EU” (1.669), “opportunity” (238) “development” (1.097), “growth” (825), for the “local” (530) “community” (652), thanks to “research” (1.115), “organic” (889) “production” (998), “traceability” (233), and the dissemination of “information” (1.021) through “reports” (673) could be considered.

It is worth noticing that Italian-speaking users pay greater attention to the “quality” of agri-food products (330 times) with respect to “price” (273), in contrast to the English-speaking users (398 and 925 times, respectively). Quality is considered, particularly by Italian speakers, as one of the essential conditions for “development” (140), together with the relationship of the product with the “territory” (199) and the capacity of the local operators to co-operate as a proper “system” (132).

Regarding marketing mix tools, essential elements are “product” (quoted 922 times on English-language websites and 1,037 times on the Italian-language ones) and “price” (quoted 925 times on English-language websites and 273 times on Italian-language websites); however, there are also clear references to “communication” (mentioned 586 times by English-speaking users) or “marketing” (mentioned 122 times by Italian-speaking users) and “distribution”, the latter referred to, on English-language sites, by words such as “sales” (203 occurrences) , “commerce” (171 occurrences), “supply” (350 occurrences), and “trade” (825 occurrences).

If clusters activated by the most-used word on Italian- and English-language websites are compared, it appears that Italian consumers have a more *production-orientated* approach, as shown by the higher co-relationship of the word “product” with words such as “production” and “wine” and the lower co-relationship with aspects connected to “sales”, “time” and “results”. On the contrary, English speakers are more *communication orientated*, as demonstrated by the fact that the first two words correlated to “food” are “information” and “social media”, followed by “production”, “system”, “crop”, and “people”.

In the study of clusters, the specific topics created by more significant words have been identified. Three areas of meanings in particular may be found, linked to the following (see figure 1):

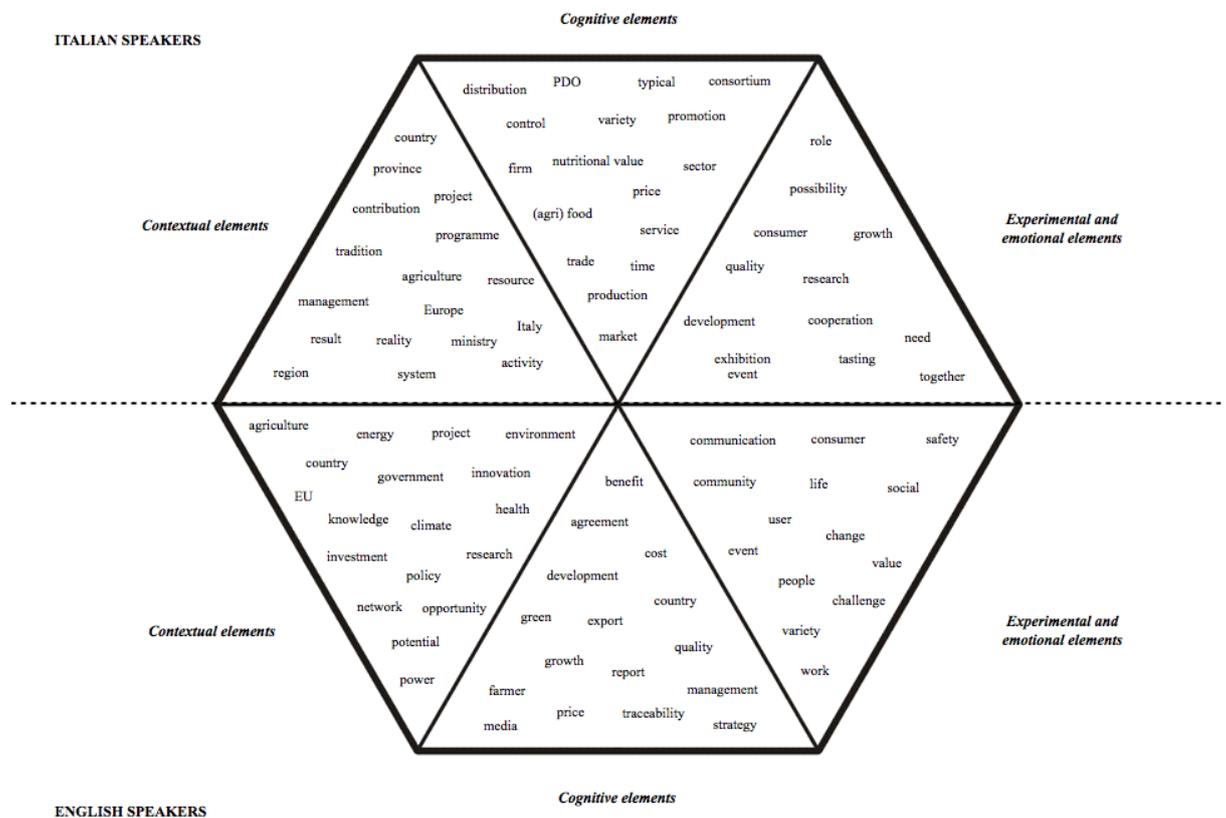

Fig. 1 – Areas of meaning and keywords in clusters

- a) *Contextual elements*: words referring to the sphere of features linked to the geographic area of the product, which are utilised by web users as indicators of product quality (Steenkamp and Geyskens, 2006). Explicit reference to local “culture” and “tradition” is also considered, thus emphasising the role of relational and social capital in conferring typicality, uniqueness and fame to the product as the result of the collective action of a territory’s tangible and intangible assets.
- b) *Cognitive elements*: terms that refer to the intrinsic and extrinsic features of the product and the product line (in this area, terms referring to organisational or marketing elements have been found), which are able to influence consumer decisions to reduce the quantity of information potentially available online (Olsen and Jacoby, 1972).

- c) *Experimental and emotional elements*: words that link the product within a perceptive system (Tregear and Ness, 2005), which is able to bring to life intense experiences and unique emotions. Within this area of meanings, there is also the interaction with “consumers” and the respect for their needs as well as the needs of the Enterprises of production and the environment, showing how the requests of the Triple Bottom Line increasingly enter web users’ conversations.

Finally, the presence of a high number of terms with low frequency but an elevated co-relationship with the words “territory”, “typical”, “quality”, “price”, “wine” and “oil” has been considered. Particular reference has been made to “service”, “information”, “business” and “results”. This fact shows the need, particularly for Italian agri-food SMEs, to establish a more effective communication relationship with their consumers and to build services based on a constant exchange of information.

6. MANAGERIAL IMPLICATIONS

This paper has tried to demonstrate that the use of Web 2.0 as a communication and marketing platform provides agri-food SMEs with considerable competitive advantages, particularly in terms of information quality, efficiency and economic feasibility. This paper a) supports the development of integrated digital environments that could provide platforms for the reorganisation of sector activities, by giving birth to virtual networks; b) fills the gap between the agri-food industry and consumers, by easing the problem of limited communication budgets of individual organisations and, above all, by engaging all participants in the production and distribution of products with respect to the wider establishment of collaborative supply chains.

A dynamic strategic approach in the adoption and utilisation of Web 2.0 communication is needed. In particular, the words connected to the above-mentioned areas of meanings can be considered as a dataset of keywords around which a more efficient online communication of agri-food products can be arranged.

Particularly, this dataset provides support for web marketing activities, both in terms of visibility and product commercialisation. For Enterprises that have already adopted a web communication strategy, the dataset contributes to satisfying the need to control and manage these processes. For Enterprises that have not yet adopted these processes, the current

analysis appears useful because it stimulates interest in and consideration of web marketing themes and the need to be adequately aware of them.

This study has also tried to understand whether web communication may be based on single words or if there are groups of words able to communicate more persuasively the typicality of the agri-food product. The study of co-relationships among words, in particular, intends to move from a purely *lexical* program to a *semantic* one, so as to have a more realistic picture of the neural itinerary users follow when they communicate on the web.

Moreover, the research has demonstrated how the characters of *web communication* (absence of space-temporal restrictions and full involvement of web users) ease the perception of the complex “brand-land-product” relation. In particular, this study offers a considerable contribution to the appreciation of local production, favouring the protection of specific rural geographic areas; as such, in line with the European program Horizon 2020, the “local” product can be preserved, intended as the harmonious combination of a territory’s tangible and intangible assets. Enterprises are called to plan a strategy and a device of contact that appear to be important in the temporal-space combinations in which the User is found, with the aim of satisfying at best his/her informative needs and establishing long-term relationships. Should such an action be successful, Enterprises will consolidate their competitive advantage and simultaneously contribute to the sustainable development of the territory in which they operate. In fact, when efficient typical production communication strategies are developed on the web, the benefits are reaped not only by the individual Enterprise but also by the entire geographic area referred to, allowing the pursuit of forms of socio-economic developments compatible with the tradition and culture of places.

ABSTRACT

According to Ailawadi and Keller (2004), those who manage private labels currently make use of the principles of Brand Management in order to define their strategies vis à vis the expectations of their consumers. Nevertheless, retailer brand management effectively differs from national brand management inasmuch as the private label will take into account the diversity of their supply and consider how it embodies their corporate policy.

After reviewing the existing literature about private label, this research tries to estimate the impact of customer orientation, brand affect and brand choice (as antecedent variables) on brand trust and brand commitment (as mediating variables). The interaction results must show us the conditions for getting loyalty behaviours. The future intention of this project is generate an on-line survey by using a convenience sample for applying a structural equation modeling in order to test hypotheses about the model's variables.

Keywords: Private label; brand retailer; customer value; customer orientation; brand trust; brand loyalty.

INTRODUCTION

This working paper is part of a larger study that will – upon completion of a review of the literature – enable an empirical study to be undertaken in northern Portugal and Galicia. In this research we'll use private labels from both regions to analyze different consumer's behavior.

In accordance with the above, our model is most strongly justified when its framework is based on interpreting the constructs that can explain the generation of loyalty to a retailer brand; in this sense, trust, affect and risk perception are critical information units with regard to the degree of acceptance of private label supply.

Consequently, users' degree of commitment to a private label will increase according to the value that the brand offers them. A private label's customer orientation may therefore play a fundamental role.

This research tries to estimate the impact of customer orientation, brand affect and brand choice (as antecedent variables) on brand trust and brand commitment (as mediating variables). The interaction results must show us the conditions for getting loyalty behaviours. According to Ailawadi and Keller (2004), those who manage private labels currently make use of the principles of Brand Management in order to define their strategies vis à vis the expectations of their consumers. Nevertheless, retailer brand management effectively differs from national brand management inasmuch as the private label will take into account the diversity of their supply and consider how it embodies their corporate policy. There are also other variables, such as the perception of the point of sale, which are equally relevant to the choice of retailer.

Private labels account for a major market share in retail sales both in Europa and in the USA, according to Ailawadi et al. (2008) and Kumar and Steenkamp, (2007), and their study is therefore of considerable importance.

This work intends to be a contribution to private label's knowledge and also understand the different strategies they could adopt to generate loyalty behaviours in their customers, increasing its market share and creating more attractive offers.

Portugal and Spain offer a clear example of this inasmuch as they exhibit a high growth rate, while private labels in both countries have committed themselves strongly to the whole supply range available to the consumer. In particular will also examine whether the cultural differences between the two regions (Northern Portugal and Galicia) are reflected in purchasing behaviour. Hofstede (2001) proposes five cultural parameters – individualism, the ability to distance oneself, aversion to uncertainty, masculinity and a desire for long-term relationships; it is indeed the case that there are cultures in which consumers privilege these relationships, resulting in the existence of bonds of loyalty together with a low level of openness to risk and new suggestions. This fact is not advantageous to private labels, however, insofar as purchasing risk may be interpreted as higher – since if the customer is

happy with the product they have purchased, their expectations will readily create a relationship with the brand in question.

Portugal and Spain are countries in whose cultures perception tends to be extremely feminine and collectivist, fostering and developing long-lasting relationships with brands – which means that maintaining these relationships is of the highest importance. On the basis of this cultural element, hinging on long-term relationships, we therefore propose to examine whether there is any difference between the two countries in terms of brand loyalty relationships (repeat purchasing).

THEORETICAL BACKGROUND

Customer orientation

Since Narver and Slater (1990) conceptualised the construct of market orientation, various authors have shown a particular interest in their study. Our focus in the present paper is on the customer orientation construct, whose role in the proposed Model is as an antecedent variable of brand loyalty; we will seek to estimate to what extent customer orientation is a determining factor in customers' choice of a private label.

This fact justifies the inclusion of this variable in the model inasmuch as it encourages repeat purchasing of the product; the customer will perceive that the main purpose of this technical investment and the added value created by the brand is to satisfy their expectations.

Customer orientation is based principally on the brand's concern for the customer's well-being; that is to say, the retailer's goal as an organisation is to deliver solutions based on satisfying their best interests (Deshpande and Webster, 1989 and Slater and Narver, 1994).

In this context, Brand Management policies will only be effective when they target the interests and benefits perceived by customers as added value in a policy of innovation, production and the level of performance delivered.

According to Martin and Bush (2006), the performance of staff at the point of sale can increase customer satisfaction depending on the quality of service provision.

The retailer's concern with customer orientation goes beyond delivering service; it requires them to adopt a more comprehensive policy – that of CRM (customer relationship management), Payne and Frow (2005).

According to this point of view, value to the customer is an outcome of their co-production of the private label's value.

For most authors, however, as for Nasution and Mavondo (2008), value to the consumer is a trade-off between the cost and the recognised benefit. These are the main points that have to be present in a private label, to the extent that having a lower price than that of the national brand is one of the principal features of these brands; nevertheless, the customer has to perceive a positive trade-off and if they do not perceive this they do not recognise the brand as having value, and their relationship with the brand ceases.

Brand trust

Trust is perceived as an influential variable in the purchasing decision process.

According to Morgan and Hunt (1994), brand trust only exists if the consumer believes in its good intentions as well as in all the characteristics that describe the nature of the brand and the supply.

It should also be emphasized that for Moorman et al. (1992) trust is defined as the intention to establish an exchange relationship based on confidence. There are two distinct principles here:

1. Trust in a brand is perceived as a belief, a feeling, an expectation with regard to this exchange – reliability (Pruitt 1981).
2. Brand trust is understood as a behavior of intention, or a behavior that reflects how much the consumer is able to expect that those promises will be kept, resulting in their reliance on a brand/consumer partnership. Nevertheless, trust arises out of the uncertainty and vulnerability of the truster. That is to say, trust arises as the result of an evaluation of the brand (Moorman et al. 1992). These are the principles and definitions used as the basis for the present text.

Hence brand trust has the function of reducing uncertainty in a consumption situation where the consumer feels particularly vulnerable, inasmuch as they may perceive that the quality of [their] purchasing decision can depend on their trust in and knowledge of the brand. Accordingly, they do not consider other purchasing options. In the case of the private label, this trust is associated not only with retailer brand products but also with the services provided by the point of sale (store).

It is noteworthy that in the case of the private label, trust includes the consumer's perception of the product and of the service provided. The private label employee recognizes and identifies the consumer's need or desire and advises them appropriately. As the retail sector is positioned extremely close to the consumer, this facilitates their ability to be customer-oriented.

According to Hong-Youl Há (2004), however, building trust involves [no fewer than] 6 elements: security, privacy, brand name, word-of-mouth, experience and information. All these variables define private label policies and its strategic orientation.

Brand loyalty

The present text focuses on identifying to what extent the private label generates loyalty to the point of sale.

According to Agustin and Singh (2005), the customer's intentions of loyalty are associated with a tendency towards a [particular] set of behaviours as a sign of motivation with the aim of encouraging long-term relationships with the person in charge of service, including repeat purchasing. Satisfaction with the service or product may mediate the relationship between trust and the intention to be loyal, as a relational mechanism that can encourage exchanges between customer and brand.

Trust in the service provider is thus essential as a way of increasing loyalty when it comes to relationships that fulfil their promises.

According to Brexendorf et al. (2010), the level of customer satisfaction [observed] through brand loyalty is important in relationships inasmuch as when [one takes on] loyalty to a point of sale that makes it easier to consider loyalty to the private label.

Ailawadi et al. (2008) point out that, as is generally known, the use of private labels is associated with high [levels of] loyalty to the point of sale. Moreover, Richardson et al. (1996) argue that private labels help retail companies increase the frequency of customer visits to the point of sale by increasing their loyalty to it as long as they offer own-label products that cannot be found in other competing outlets. Furthermore, according to the *Private Label Manufacturers Association* (2007), retailers use their brands to increase business as well as to gain customer loyalty. According to our review of the literature, however, this topic can be controversial. Firstly, a positive relationship has been observed between the use of the own-brand and loyalty to the point of sale (Kumar and Steenkamp, 2007). On the other hand, it can also be observed that customers may not perceive any difference between different private labels; in other words, as Richardson (1997) points out, private label customers may be loyal to private label products without being loyal to a point of sale. If this proves correct, it could be a knotty issue to see how a private label could increase loyalty to its point of sale. Singh et al. (2006) show how private label customers are more likely to change after entering the point of sale, and it thus remains pertinent to check what link there is between private label customer and loyalty to the point of sale.

Ailawadi et al. (2008) also identify two important issues:

1. If there is a positive relationship between private label users and loyalty to the point of sale, could the causality of this relationship be reversed? Customers who are loyal to a point of sale are more likely to buy products of this private label brand and not another. The fact that the customer makes a great deal of their time and money available at a given point of sale increases the customer's familiarity with the retailer, and this familiarity is fundamental to their perception of the promises that the brand impresses upon them. Moreover, the behaviour of customers who constantly shop at a particular point of sale, to the detriment of others, may be explained in terms of the quality of the retailer, whether with regard to their brand or with regard to the surroundings at the point of sale. Such customers are more likely to purchase private label products from that point of sale.

2. Relationships need not be linear. Ailawadi and Harlam (2004) find that an average own-brand user contributes more to the brand than a "weak" or non-user and accordingly less than a high user. The ability of private labels to increase loyalty to the point of sale, according to a study by Corstjens and Lal (2000), is a quality that "tips the scale" between customers who prefer private label brands and those who prefer manufacturers' brands. This issue is critical to understanding the non-linear relationship between the effect of using private labels at the point of sale and loyalty to that same point of sale, and vice versa, [and to understanding the effect] if retailers were to increase their strategic decisions about the form and duration of strategies adopted to push their brand. Nevertheless, according to the authors Ailawadi et al. (2008), empirical evidence is still scarce.

This authors constructed a model for the relationship between household "expenditure" (the household share) on private label [products] at a given point of sale and loyalty to this retailer.

The model allows the causality of nonlinear relationships between own-brand share and SWO (shared-of-wallet) to be reversed, including determining factors for both constructs, as there are econometrically identifiable determining factors that can influence either one construct or the other.

The primary concern of Ailawadi et al. (2008) is to evaluate whether this relationship takes a specific and potentially non-linear form between the customer *share* in the private label and the SWO given to a particular retail chain.

It can be accepted that consumer behaviour is a function whose characteristics are stimulated [both] by the point of sale and by the subject (the consumer) Assael (1998). Previous research

has identified four important roles in customer purchasing behaviour at retail outlets (Ailawadi and Keller, 2004; Steenkamp and Wedel, 1991):

1. quality and diversity of supply;
2. price;
3. service at the point of sale and the atmosphere of the surroundings;
4. location

Ailawadi et al. (2008) developed an econometric model to evaluate the relationship between the market share of household products and loyalty behaviours with regard to the point of sale.

The results obtained show that private labels have a significant impact on two measures of loyalty: the volume of items purchased and the number of times the customer visits the point of sale. Similarly, they suggest that loyalty has a significant effect on the market share of the private label.

The results of our model's structural equations could indicate that the private label's market share plotted against money spent gives an inverted-U graph. In other words, an increase in the private label's market share increases the money spent on this brand's private label products, but only up to a certain point; when the market share exceeds 40% the effect is inverted, i.e. the more the market share is increased the less investment there will be in private label products. The inverse effect is also strongly marked. Moreover, this inverted-U relationship is observed in all three behavioural clusters: low, medium and high levels of private brand purchasing.

According to Ngobo (2011), private labels have shown rapid market development and are particularly well-known for high annual growth. It transpires that almost all of a retailer's points of sale carry its own-brand products, and that the number of product categories in which these brands are present has grown.

The payback for the points of sale is high, though it should be noted that retailers have to ensure that they have a good mix of supply at their points of sale and that the manufacturers' brands they sell cover all product categories and meet [all] their customers' needs.

Although the low prices of private labels attract a considerable number of consumers, other consumers are more receptive to and inclined to trust the quality of manufacturers' brands and are sometimes a little reluctant with regard to the private label.

FINAL REMARKS

Understanding Private Label Management is a [highly] topical issue, in that this [is what] enables the private label to closely match its supply to customer demand. The present paper examines customer orientation as a novel variable in the study of the private label, on the grounds that understanding what customers want in terms of features and benefits should increase levels of loyalty to the supply offered by the private label. In this paper, the loyalty is associated not with mere repeat purchasing but also trying to evaluate the impact of customer orientation and brand trust generating long-lasting relationships of loyalty which will be able to provide economic returns and strengthen the capital of the private label.

Figure 1: An integrative model of private label's loyalty

The future intention of this project is generate an on-line survey by using a convenience sample for applying a structural equation modeling in order to test hypotheses about the model's variables.

ABSTRACT

Fletcher & Nusbaum (2010) suggest that, in organisations, the existence of a competitive climate among peers can influence the adoption of customer- or sales-oriented behaviours depending on the perception of threats or challenges. In this way, an organisation's guidelines, through its organisational culture, are able to reduce salesperson "role ambiguity and role conflict" and therefore impact on their performance through the adoption of customer-oriented behaviours. The transmission of customer-focused values will lead the salesperson to adopt customer-oriented sales behaviours (Schwepker, 2003).

This research show the impact that the adoption of customer orientated or sales orientated behaviours might exert not only on performance in meeting fixed sales targets, but also on the performance achieved when the force of sales are perceived to have high average levels of competitive climate. The results show that a customer orientated sales force achieves increasingly better levels of performance when compared to the adoption of short term strategies geared towards applying sales pressure on potential clients.

Keywords: *Sales Management; Competitive Climate; Adaptative Selling; Customer Orientation; Sales Orientation; Hard-selling; SOCO Scale;*

THEORETICAL DEVELOPMENT

Recent research (Zhan, 2010) points to how analysis of the competitive environment can be decisive in more efficiently managing the factors that can induce higher levels of sales team

motivation and performance. The working environment is not immune to fast-moving external changes. Because of this, an organisation's working environment must be able to sustain rapid changes and the implementation of changes in organisational dynamics will have to be carried out in a way that meets and fulfils employee needs while also maintaining the company's productivity.

Arnold et al. (2009) report that a competitive environment is present within an organisation in which employees perceive that their productivity rewards will always be dependent on the results of performance compared to their peers. There is no consensus in the literature (Brown, Cron and Slocum 1998) as to which motivational and performance benefits a competitive internal environment can generate (Reeve & Deci 1996; Stanne, Johnson, & Johnson, 1999).

A study, together with a survey of half a million salespeople, concluded that competitiveness is a personality trait of successful salespeople (Brewer, 1994; Schwepcker & Ingram, 1994). Moreover, organisational climate has been defined as the "perception" of what the organisation is like with regard to "practices, policies, procedures and routines" (Bowen & Ostroff, 2004). Rogg, Schmidt, Shull & Schmitt (2001) suggested that if organisational climate affects the attitudes and behaviour of employees, then consequently it impacts on performance.

Bigné, Boluda & Torres (2001) consider the sales force: (1) acts as the frontier between the company and the market; (2) constitutes a two-way platform for communication with unique potential between the company and the clients; (3) assumes control over the value of the offer with the customer; (4) acts as the function that contributes most to the overall success of the organization.

More particularly, the interpretation of the qualities associated with the sales force of the organization assumes a positive correlation between the degree of the company's market orientation, competitive climate and the sales team performance. It is, indeed, the responsibility of the organisation to instil and mould its members' behaviours in accordance with its guidelines and policies. In other words, an organisational culture that defends and takes on board customer interests, i.e. one which is customer oriented, will confirm the behaviour of its salespeople, focusing it on the customer. A customer oriented culture can be defined as "a set of beliefs that puts the customer's interests first, while not excluding those of other stakeholders, in order to develop a long-term profitable enterprise" (Deshpandé, Farley, and Webster 1993, p. 27). A customer-oriented organisational culture could be translated into

the development and dissemination of shared values and behavioural guidelines aimed at putting customer interests above all others. In this way, an organisation's guidelines, through its organisational culture, are able to reduce salesperson "role ambiguity and role conflict" and therefore impact on their performance through the adoption of customer-oriented behaviours (Flaherty, Dahlstrom and Skinner, 1999). The transmission of customer-focused values will lead the salesperson to adopt customer-oriented sales behaviours (Schwepker, 2003).

As a result of profound changes in the perception and role of marketing in organizations, the 1990s mark the emergence of the concept of marketing relationships. The impact of this on sales management extends the concept of sales relations which finds its praxis in adaptive sales. The adoption by organizations of more market orientated behaviour has facilitated the move from a transactional focus to one that emphasizes the importance of sustainable management that supports sales through relations. With regard to this, Homburg & Becker (1998) and Jairo & Küster (2003) reported that traditional definitions of personal sales show an orientation towards short-term transactions. The information that the sales person shares with the client is more contingent on the interests of securing the first sale than on the satisfaction obtained by the client through the purchase.

However, the literature on relationship marketing (Rapacz & Reilly, 2008) draws attention to the particularity of the sales process that it makes sense to apply. Some customers might not be classified as profitable customers, necessitating a more transactional approach for this group than one based on relationships. It is crucial that the sales director selects those clients with whom they should establish or maintain a relationship (R.A.C., read as Return on Assets per Customer). The concept of "relationship selling" refers to a broader interpretation than a mere seller-client relationship. Thus it contributes towards strengthening the concept of relationship marketing: long-term projected sales, sustained by trust, services of superior value offered to the client and collecting the information about them and the competition.

As such, it can be said that customer orientation will not only stimulate market-oriented organisational behaviours but will also individually impact on its Performance. Indeed, a customer-oriented organisation will value customer orientation traits when recruiting staff, as well as in its incentives and / or rewards programme. In this sense, sales force training will focus on developing customer-focused skills. Based on social learning theory, Guenzi, De Luca & Troilo (2011) state that customer-oriented organisations recruit team leaders with a strong sense of customer orientation who act as an example, inspiring others to assimilate similar types of behaviours.

1. DATA AND METHODOLOGY

A medium-scale data collection (n= 120) was conducted in Portugal. In this study the sales people were from telecommunications (n= 65) and LPG Bottles (n=55) companies. The sample is composed of 78% male and 22% of female respondents. Also, our sample corresponds to that with the following age representation (18-29: 15%; 30-39: 22%; 40-49: 35%; 50-59: 16%; 60 or more: 12%). Their educational qualifications lie between (55% finished the 9th year of school; 25% completed the 2nd cycle; 20% have a degree) and are members of a company.

To measure the degree of customer orientation or the degree of the orientation of the sales force for the sales in question, we used the most common approach (SOCO Scale de Saxe & Weitz, 1982). The scale reflects how important it is for organisations that apply the concept of marketing to configure the relationships between their sales teams and their clients. It should be emphasised that this scale was tested and validated in a b2b context in which the level of repeated purchasing is a critical factor for business. More specifically, in the creation of this measure lay the assumption that the results obtained by its application would lead to the implementation of the concept of marketing (ever concerned with the degree of market orientation adopted by organizations clearly reflecting the effort of client orientation) to the level of individual relationships established between each element of a sales team and their clients (Singh & Koshy, 2008).

Therefore, as far as the initial description of the SOCO scale is concerned, literature classifies it as a multidimensional scale comprising 24 items (12 items expressed positively and the remaining 12 negatively). Each of these items corresponds to a concrete action that can and should be implemented at the time that the seller/business interacts with its customers. In particular this scale is intended to measure six dimensions in terms of the behaviour adopted by the sales force when: (1) customers are helped to make better purchasing decisions; (2) it helps to ensure that clients are aware of their consumer needs and are able to communicate them; (3) it is able to identify offers (products and/or services) capable of meeting those needs; (4) it objectively discriminates the tangible and intangible attributes of the products and services wishing to be sold; (5) it avoids using manipulative actions that might influence the client's decision making process concerning the purchase (6) it avoids using excessive pressure to force the purchase of what is being offered.

Hence we assume that (H1a) the orientation of the Sales force towards the client should have a positive effect in accomplishing the sales objectives and that the sales orientation should have a negative effect in meeting the sales objectives of the sales force (H1b). On the other

hand, to measure the concept of competitive climate and its impact on the performance of the sales force we used the scale developed by Brown, Cron & Slocum (1998).

In this sense, we assume that (H2a) the sales force orientation towards the customer should have a positive effect on the perception of the extent to competitive climate impacts on performance, while the (H2b) sales orientation should have a negative effect on the sales force's perception of how much competitive climate impacts on performance. These 24 items (SOCO Scale) were subjected to a principle component analysis with varimax rotation, using SPSS 18. As previously described, the literature usually recognises two components in Soco Scale: Client orientation and sales orientation. The global scale Cronbach's Alpha is .85 is equivalent to that obtained (.86) by Saxe & Weitz (1982).

The hypothesized model was tested with Oneway ANOVA and "Cluster Analysis", by the method K-means Cluster.

2. RESULTS

The dependent variable "achieving the sales objectives" assumes three (3) performance levels in this study: 1 = not achieved; 2 = achieved the sales objectives; 3 = exceeded the sales objectives. In this sense, it represents the performance of the sales force in an analysis based on the previous classification of the companies studied based on the contrast between the sales objectives and the results achieved. To test the "H1a: The orientation of the sales force towards the client should have a positive effect in accomplishing the sales objectives", the data was subjected to a "Oneway ANOVA" analysis to observe significant variations in the intensity of customer orientation over the three (3) distinct levels of objective achievement. The results obtained (see Table I) confirm the first hypothesis, in that the two levels of objective achievement being tested : "hit" ($\bar{x} = 4,40$ sd = ,383) and, "exceeded" ($\bar{x} = 4,24$ sd = ,381 -) express a high customer orientation from the responding sales people. If a negative evaluation of the sales people who fail to meet the sales targets is not registered ($\bar{x} = 4,30$, sd = ,634), the culture of the sales forces from the companies studied is transversely orientated to the market. The value F ($F=, 303$, $p=, 740$) shows this general orientation of the organizations in test.

Table I
Oneway ANOVA - Customer Orientation Factor by Sales Objectives

	Std.	Std.	95% Confidence		
N	Mean	Deviation	Error	Interval for Mean	Minimum Maximum

					Lower Bound	Upper Bound		
Fail to meet the sales targets	48	4,30	,634	,135	4,02	4,58	3	5
Hit	15	4,40	,383	,145	4,05	4,76	4	5
Exceeded	57	4,24	,381	,075	4,09	4,40	4	5
Total	120	4,29	,493	,066	4,15	4,42	3	5

To observe significant variations in the intensity of sales orientation over the three different levels of objective achievement (H1b), we used the same methodology (Oneway Anova). The results confirm that H1b, in the extent to which the third (3) level of objective achievement - "exceeded" ($\bar{x} = 3,16$ $sd = ,922$ -) is significantly less than the other levels (2) "hit" ($\bar{x} = 4,08$ $sd = ,629$ -) and (1) "did not reach the sales objectives" ($\bar{x} = 3,44$ $sd = ,700$). Table II shows the significant impact that the sales orientation had on reducing the performance of the salespeople studied ($F=3,702$, $p = ,031$).

Table II
Oneway ANOVA - Sales Orientation Factor by Sales Objectives

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	4,832	2	2,416	3,702	,031
Within Groups	33,934	116	,653		
Total	38,766	118			

In order to have an ordinal variable that collects the intensity of the sellers' perception towards competitive climate which impacts on performance, the scale developed by Brown, Cron and Slocum (1998) serves as a base for a "Cluster Analysis", using the method K-means Cluster, for the group of respondents in relation to this behaviour. The results obtained enable the classification of the 120 sales people analysed in three clusters with a perceived distinct and increasing competitive climate: 1 = Below Average - $\bar{x} = 2,89$; 2= Average - $\bar{x} = 3,28$; 3= Above Average - $\bar{x} = 3,40$. As can be seen in Tables III a and b, the differences between clusters are statistically significant ($F= 17,086$, $p = ,000$) which allows the unquestionable use of this variable as a dependent variable, in the testing of hypothesis in relation to the impact of the client orientation and to the sales performance of the sales force being tested.

TABLE III a)
ANOVA - Sets of Competitive Climate

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	2,996	2	1,498	17,086	,000
Within Groups	3,857	109	,088		
Total	6,853	111			

TABLE III b)
Multiple Comparisons - Scheffe

(I) Cluster Number of Case	(J) Cluster Number of Case	Mean Difference (I-J)	Std. Error	Sig.	95% Confidence Interval	
					Lower Bound	Upper Bound
1	2	-,38804	,21828	,217	-,9410	,1650
	3	-,51304*	,08830	,000	-,7367	-,2893
2	1	,38804	,21828	,217	-,1650	,9410
	3	-,12500	,21867	,850	-,6790	,4290
3	1	,51304*	,08830	,000	,2893	,7367
	2	,12500	,21867	,850	-,4290	,6790

*. The mean difference is significant at the 0.05 level.

The results obtained partially confirm the H2a (a sales force orientated towards the client must have a perceived positive effect on how much competitive climate impacts on performance): "average competitive climate" ($\bar{x} = 4,67$ $sd = ,333$) and "above average competitive climate" ($\bar{x} = 4,27$ $sd = ,366$), show an elevated degree of customer orientation (CO) from the sellers above the global average for customer orientation (CO) ($\bar{x} = 4,25$ $sd = ,494$) that will lead to higher performance. In turn, hypothesis 2b ("the sellers' sales force orientation must have a perceived negative effect on how much competitive climate impacts on performance") was confirmed to the extent that the intensity of sales orientation in the perceived third level of competitive climate "perceived above average competitive climate" ($\bar{x} = 2,31$ $sd = ,875$) is significantly less than the other levels: "perceived average competitive climate" ($\bar{x} = 3,41$ $sd = ,696$) and "perceived below average competitive climate" ($\bar{x} = 3,79$ $sd = ,665$). The Table IV shows the negative impact of the sales orientation of the sellers surveyed concerning their perceived competitive climate and therefore their performance ($F=12,007$, $p = ,000$).

TABLE IV
Oneway ANOVA de Sales Orientation Factor by competitive climate

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	12,214	2	6,107	12,007	,000
Within Groups	25,939	116	,509		
Total	38,152	118			

3. GENERAL DISCUSSION

The growing constraints that the markets have been exposed to gives the impression that the sales force is reconstituted in the strategic element of an organisations proximity to its clients. Now supported by the development and sophistication of new information technologies (CRM and Database Marketing), marketing departments have the operational and analytical strategic means to organize and rationalize the quantity and quality of the information necessary to make more accurate decisions, without incurring unnecessary costs, but above all, providing higher levels of profitability and customer satisfaction. This combination undoubtedly forms a desirable platform for the hoped for enhancement of competitiveness that the commercial area can bring to the role of marketing for organizations. In this way, the paradigm of relationship marketing finds in the sales force management a fair contribution to the interfunctional coordination that the market orientation models of Narver & Salter (1990) and Kohli & Jaworski (1990; 1993) propose, emphasizing the importance of strict collaboration between organizations, their human capital and their actual/or potential clients. The client orientation versus the sales orientation remains a central research theme in the analysis of best practices for the direction and management of sales forces in the way that they impact on individual and collective performance. This justifies that organisations seek to systematically measure and understand the nature of the behaviour of their sales force and marketing professionals.

This research indicates that organisational environment significantly affects the organisation's salespeople's attitudes to work and the resulting "outcomes".

MUTUALLY BENEFICIAL RELATIONAL VALUE: AN ANTECEDENT OF BUSINESS-TO-BUSINESS INNOVATION

Shams, Riad

Central Queensland University, Sydney, Australia

ABSTRACT

Purpose

The intensified competition of business-to-business value innovation creates a commotion, where incorporating the 4Ps marketing mix, Relationship Marketing (RM) endeavours to establish a long-term commitment and relational bond among the key stakeholders to nurture the mutually beneficial stakeholder relationship value, with the aim of innovating further value for customers. From this perspective, this study aims to recognise the implications of RM in stakeholder relationships, interactions and subsequent mutually beneficial stakeholder relationship value to nurture business-to-business product/service innovation for customers.

Design/Methodology/Approach

A case study is conducted on England and Wales Cricket Board (ECB) to familiarise how ECB fosters their stakeholder relationships to innovate value in association with their business partners.

Findings

Eleven RM indicators are recognised that the ECB utilises to construct/nurture their mutually beneficial stakeholder relationship value in order to innovate further product/service value for their customers and share that innovated/enhanced value with the key stakeholders in a venture.

Originality/Value

The identified RM indicators are recognised as value innovating constructs in a business-to-business setting, where the indicators nurture (identify, establish, maintain, enhance, regulate and sustain) the mutually beneficial stakeholder relationship value as an antecedent of further value innovation for the target markets of all associated stakeholders. Moreover, such a relational approach of value innovation appears as feasible across industries and markets.

Keywords: relationship marketing; value; innovation; business-to-business; relationship marketing indicators; England and Wales Cricket Board.

INTRODUCTION

Relationship Marketing (RM) as a stakeholder relationship value centred approach of the contemporary marketing practices ensures the mutually beneficial stakeholder relationship and interaction, while stakeholders work interdependently towards reciprocally advantageous multifarious goals. Incorporating the traditional 4Ps in the total marketing management, RM extends a long-term commitment and relationship bond among the associated stakeholders/business partners to nurture the mutually beneficial stakeholder relationship value, with the aim of innovating further value for customers and share that innovated/enhanced value among the stakeholders. Eleven RM perspectives emerge as value innovating RM indicators in the England and Wales Cricket Board's (ECB) business partnership management, where the ECB has been utilising these RM indicators to innovate enhanced product/service value for customers through the underlying mutually beneficial relationship value of their partners. Such a value innovation approach of ECB appears as feasible across markets and industries.

EVALUATIVE VIEWPOINT

Relationship Marketing (RM) focuses on rational perspectives of business management, while centralising the cause and consequence of stakeholder relationships and interactions. RM engages the key stakeholders to work interdependently to design and realign processes in order to pursue mutually beneficial multifarious goals and subsequent relational value. Primarily, there is a continual and mutually beneficial attempt in order to pursue the multifarious goals of the business partners towards a cooperative and prolific relationship/partnership, and an understanding of long-term commitment (Tomer, 1998). This long-term commitment originates a bond among the business partners, which gradually becomes more valuable and forms a chain of relationships (Gordon, 1998) among stakeholders, where underlying this valuable chain of relationships, the associated stakeholders establish their mutually beneficial relational value through their joint power in order to collectively sustain their competitive advantage in the market. In fact, RM helps the

associated stakeholders to create value for customers and share that value with the key stakeholders in a venture (Gordon, 1998). More specifically, RM systemises the

Mutually beneficial relationship values and multifarious goals of associated stakeholders, while the stakeholders working interdependently in order to (identify) establish, maintain and enhance (regulate and sustain) value for customers by meeting and exceeding customers' anticipation in a way that customers expect and accept, and share that value with the involved stakeholders towards a win-win outcome (Shams, 2012a, p. 244).

On the other hand, creating mutually beneficial superior value for all associated stakeholders including customers is a crucial factor of the contemporary business practices in order to sustainably attain, retain and enhance relational bond (Shams, 2012b). However, it requires a logical flow of long-term outlook in marketing management to let the associated stakeholders know what they can expect from an organisation and be sure that the organisation will deliver the promised/contracted value to the stakeholders. When such a mutual understanding will be established among the associated stakeholders, it would be convenient to sustain that relational bond. RM works from this viewpoint incorporating traditional 4Ps marketing management philosophy and including logical flow of long-term outlook from stakeholder relationship management perspective (Gummesson, 2002), while associated stakeholders work interdependently towards mutually beneficial multifarious goals in order to innovate value for customers and share that value among the key stakeholders as a mutually beneficial relational value. As a result, "relationships and (value) networks form the backbone of business and industrial marketing" (Håkansson, 1982; Håkansson and Lundgren 1995; Håkansson *et al.*, 2009, as cited in Zolkiewski, Story and Burton, 2012), particularly when innovating (identify, establish, maintain, enhance, regulate and sustain) mutually beneficial relational value. Value is defined as, "what customers (and other stakeholders) receive in comparison to what they give" (Ioannou, 2012, p. 170). More expressively,

Value is perceived as an anticipated outcome of any sort of planned and organized activity. The activity could be derived from monetary, psychic, or physical resources. The more the outcome meets initial anticipation, the more the possibility of win-win outcomes or value optimization for all involved stakeholders (Shams, 2012a, p. 244; 2012b, p. 263).

From this perspective, focusing on an anticipated outcome (for example, the result of a prospective value innovation for customers) of any sort of planned and organised product or service innovation activity of the business partners/associated stakeholders; RM integrates

the inter-reliant relational bond and subsequent innovative effort of the stakeholders to attain and enhance the anticipated mutually beneficial relational value for the associated stakeholders. Examples are illustrated in the Mutually Beneficial Relational Value and Business-to-Business Innovation section of this paper. Eleven RM perspectives are recognised as value innovating RM indicators to innovate value for customers and share that value with the key stakeholders as a mutually beneficial relational value from the RM practices of the England and Wales Cricket Board (ECB) as a organisation that has been experiencing steady growth in the recent years (Shams, 2011). The value innovating RM indicators are:

- adaptation;
- relationship and service values instead of bureaucratic legal values;
- quality is the concern of all;
- high stakeholder service, stakeholder commitment and stakeholder contact;
- further segmentation of a segmented market or niche marketing;
- innovative offerings;
- joint power;
- share of dependency, risk and uncertainty;
- orientation on benefits or knowledgeable customers and/or other stakeholders;
- value-breeding bond (VBB) network;
- customisation.

RM centred value innovation keeps an inquisitive eye on changes that helps to timely adapt the innovation process with any transforming circumstance (Gummesson, 2002) by flourishing further opportunity and/or minimising weakness and threat. Gummesson (2002) further added that RM promotes relationships and service values in a value network rather than bureaucratic legal values. Such a relationships and service values smoothens the progress of joint value innovation process by promptly responding to the anticipation of the involved stakeholders/business partners and avoiding any bureaucratic complication. Furthermore, RM entrusts and ensures all staff members of an organisation (and other external stakeholders, such as business partners) to deliver superior service quality to the customers (Kurtz, 2009). Likewise, Stavros (2005) summarises that “In RM, it is the responsibility of all employees to promote the quality because RM is not just concerned with relationships administered by a marketing department within an organisation, but with all departments of an organisation” (as cited in Shams, 2012a, p. 224), as well as the associated business partners. Therefore, quality is the concern of all, as a RM indicator signifies its prominence in value innovation

process for customers, while the dedication and innovative value contribution scopes of all involved stakeholders are encouraged during the service innovation, delivery and evaluation process.

Another RM indicator is acknowledged as high stakeholder service, stakeholder commitment and stakeholder contact. Since, these are one of the crucial factors of RM (Stavros, 2005) in order to nurture mutually beneficial relational value through superior stakeholder commitment, service (Kurtz, 2009) and contacts. Moreover, RM bases on customers' and other stakeholders/business partners' preferences in terms of innovating alternative products and service value for customers. RM helps to realise customer and other stakeholders' contemporary and latent needs, wants, demands, anticipation and preferences through high stakeholder contact, commitment and interaction. "RM service providers gain a better knowledge of the client's requirements and needs. This knowledge can then be combined with social rapport built over a number of service encounters to tailor and customize the service to client's specifications" (Little and Marandi, 2003, as cited in Shams, 2012a, p. 223). Similarly, Kurtz (2009) illustrated that the level of customisation is advanced in RM, compared to the transactional marketing. As a result, customisation appears as another value innovating RM indicator, which keeps a keen eye on customers' and other stakeholders' requirements, while attempts to create value.

The next analysed RM indicator of this study is further segmentation of a segmented market or niche marketing. "The division of the total market into smaller, relatively homogeneous group is called segmentation" (Kurtz, 2009, p. 28).

RM helps marketers to identify, meet, satisfy and delight the latent needs of the market by further segmenting of a segmented market. The further segmentation of a segmented market helps to closely realize and serve (design/innovate offering) every single and even smaller needs, wants and demands of the market through niche marketing (Shams, 2012a, p. 221).

According to Kotler *et al.* (2009, p. 228) a "niche is a more narrowly defined segment of a market or customer group seeking a distinctive mix of benefits. Marketers usually identify niches by dividing a segment into sub-segments". As a consequence, the sub-segments of a segmented market of the total target market(s) make convenient to closely scrutinise the alternative needs, wants and demands of the total target market, where the mutually beneficial stakeholder/business partners' relationship value collaboratively engages the stakeholders to advantageously design/innovate product or service offering to meet and

delight that needs, wants and demands. On the other hand, Donaldson and O'Toole (2007) exemplified that a relational approach of marketing has an influence upon innovative product/service development process through the interaction of customers in a network. RM helps to proffer new and existing ways to innovate products and services, including from the prospective value identification phase to the design phase, product testing phase, product marketing phase and even product life-cycle management phase; ultimately that identifies alternative routes for mutually beneficial relational value based marketing. Consequently, centred on the mutually beneficial effort of the involved stakeholders for innovating/offering value to the customers, innovative offering evolves as another value innovating RM indicator. Joint power of the associated stakeholders recognised as a relevant RM indicator that also significantly contributes to the value innovation process. Based on the mutually related trust, commitment and relational bond, RM develops a joint power among the stakeholders (Kurtz, 2009), which helps an organisation to utilise the stakeholder/business partners' relationship value that originates from their relational bond to innovate further value for customers. RM also shares the dependency, risk and uncertainty among the key stakeholders (Gummesson, 2002). RM inspires business-to-business interaction based on stakeholder cooperation and trust (Kurtz, 2009). In return, stakeholders are able to share the mutually beneficial relational value at a profit, as well as share any unforeseen risk and uncertainty during the value innovation and delivery process. Simultaneously, an encouraging approach is likely as part of the relational interaction. The relational interaction should be consequential through customers' and/or other stakeholders' adequate knowledge about the organisation or about the offering (Gummesson, 2002). Since, *client knowledge* is positively allied to the quality of relational interaction (*Rajaobelina and Bergeron, 2009*). Consequently, RM emphasises on stakeholder's orientation on benefits about the business with an organisation that helps stakeholders to properly allocate resources in the value creation process. On the other hand, Value-Breeding Bond (VBB) network is acknowledged as:

A significant value proliferating network of RM, centred on a steady and continuously re-processable approach 'to identify, establish, maintain and enhance value' (Grönroos, 2004, p. 101) within and some time beyond the value network or group of stakeholders, so that value can be generated repeatedly through the re-productiveness of existing value, while each stakeholder plays some value added role, by way of stakeholders working interdependently towards mutually beneficial, multifarious goals (Shams, 2012a, p. 228; 2011, p. 43; Gide & Shams, 2011c, p. 1086).

Similar to the other value innovating RM indicators, VBB also shares the mutually beneficial relational value among key stakeholders/business partners to innovate further value for customers. An example is illustrated in the Mutually Beneficial Relational Value and Business-to-Business Innovation section of this paper. These value innovating RM indicators are favourably utilised to innovate value for customers through the underlying mutually beneficial stakeholder relational value from business-to-business, as well as business-to-customer contexts in order to innovate value through:

- competitive advantage (Shams, 2013);
- nurturing stakeholders' value contribution scope through the cause and consequence of stakeholder relationships and interactions and subsequent organisational growth (Shams, 2012a; Gide and Shams, 2011a);
- brand positioning, rebranding, corporate identity and reputation (Shams, 2012b; 2012c; Gide and Shams, 2011b);
- VBB network (Gide and Shams, 2011c).

As a result, this study aims to recognise the implications of these value innovating RM indicators in the mutually beneficial stakeholder relationship value in order to innovate further value through product and/or service innovation for customers, while the associated stakeholders/business partners work interdependently, with the intention to share that innovated/enhanced value among themselves in a business-to-business context.

METHODOLOGY

Pertinent to the aim of the study, a case analysis is conducted on England and Wales Cricket Board (ECB), highlighting ECB's mutually beneficial stakeholder relational value in business-to-business setting. The ECB is selected to analyse because recently in 2009, they have restructured the policy of their business-to-business stakeholder relationships, interactions and partnerships (Building Partnership, 2009), as well as following this restructured policy, they have been experiencing steady growth in recent years, where the commercial

partnerships of ECB with various stakeholders, and their mutually beneficial stakeholder relationship value have been contributing prolifically to their growth (Shams, 2011). Content analysis of the websites and other relevant publications (e.g. annual report, promotional material, commercial partnership templates and so forth) of the ECB are utilised to collect data. The case analysis and synthesis approach has been adapted from the guidelines of Hartley (1994, 2004), Dey (1995), Stake (1995, 2000, 2003), Creswell (1998), Gomm, Hammersley and Foster (2001), Gomm (2006), Stavros (2005) and Yin (2003, 2009), which helps to analyse the relevant issues, concepts and variables (value innovating RM indicator centred mutually beneficial stakeholder relationship value) identified from the ECB's business-to-business value innovation have been analysed through insight, intuition and impression for comprehending whether the identified issues, concepts and variables are pertinent to the major areas of inquiry (the significance of the RM indicators for mutually beneficial stakeholder relationship value in order to flourish further value for customers through product/service innovation) by direct interpretation and or naturalistic generalisation. Such a case analysis approach helps to synthesis the ECB and its business partners' mutually beneficial stakeholder relationship value on further value proliferation through product/service innovation for customers, while they work interdependently, with the intention to share that proliferated value among themselves in a business-to business context.

MUTUALLY BENEFICIAL RELATIONAL VALUE AND BUSINESS-TO-BUSINESS INNOVATION

Centred on the evaluative viewpoint, the chosen case analysis approach identifies the following perspectives to analyse in this section in order to demonstrate the findings, relevant to the aim of the study:

- analyse any prospective mutually beneficial stakeholder (ECB and its business partners) relationship value;
- impact of that mutually beneficial stakeholder relationship value on further value proliferation through product/service innovation for customers;
- Significance of the value innovating RM indicators in the prospective mutually beneficial relationship value and the product/service innovation.

Building Partnership as a Stakeholder Relationship Value driven Initiative

The Chief Executive Officer of ECB clarified the goals of the Building Partnership (2009), which is a five year strategic plan framework as: ECB needs to acclimatise as a customer/stakeholder-focused organisation by promoting relationship and service values, while reducing bureaucracy (Collier, 2009). The Building Partnership gives a clear, focused and assessable target for ECB and its business partners to meet that goal. ECB had set out the following area, where they need improvements in order to adapt with the transforming business requirements (Building Partnership, 2009):

- improve Accountability;
- streamline management;
- slash paperwork and bureaucracy;
- performance management;
- efficiency;
- commercial awareness.

ECB wanted to promote trust with stakeholders by efficient communication, service and reduced bureaucracy in order to establish long-term stakeholder commitment and subsequent relationship bond. Therefore, ECB endeavours to let their stakeholders to know what they can expect from ECB and be sure that ECB will deliver. At the beginning of 2008, ECB established a communication system by which 80% of their communication can be done online to reduce paperwork and bureaucracy (Building Partnership, 2009). To achieve the Building Partnership goals, ECB has adapted a more customer and other stakeholder value driven culture by implementing relationship and service values instead of bureaucratic legal values.

ECB's initiative towards professional change through the Building Partnership (2009) including the stakeholder management helps ECB to adapt with the contemporary business challenges, focusing on promoting mutually beneficial stakeholder relationship value with their key stakeholders. Since, ECB prioritises the type of stakeholders and the relevance of individual stakeholder's significance towards their financial and other operational goals, with the aim of a value innovating win-win outcome for all associated stakeholders (Building Partnership, 2009). Such an adaptation and relationship and service value centred RM initiative offers ECB to put into practice the competitive product or service innovation opportunities for their target markets in association with their key stakeholders. ECB's

initiative to create a customer/stakeholder-driven organisation, reducing bureaucracy, and defining roles and responsibilities clearly across their business as a whole (Building Partnership, 2009), offers the opportunity to innovate new and more dynamic services for ECB's stakeholders. Moreover, ECB's initiatives (Building Partnership, 2009) of improving the way the game is led, through effectual leadership and governance, building a vibrant domestic game, enthusing participation and following, especially among young people, developing successful England teams, ECB's continuous innovative effort on developing partnerships across various industries as per the needs of the ECB and the potential partners and ECB's Focus Club and Clubmark approach of partnership with the cricket clubs across England and Wales are nothing but the modification of ECB's existing services with new and different characteristics that innovates additional benefits/value for the target markets of ECB and their commercial and operational partners. As a result, such an initiative to modify the existing service with more value innovating stakeholder relationship and interaction helps these key stakeholders to realise the latent mutually beneficial relational value that may be originated and utilised through the cause and consequence of business relationships and interactions with ECB focusing to create value for their target market and share that value among themselves (Shams, 2011; 2012a).

To serving and delighting sponsors and business partners, ECB categorises their sponsors and partners into seven different business requirements and opportunities, which helps them analyse to serve the partners most, as well as, to bring out the most value from the partners aiming to foster the certain business requirement and subsequent relational value (Commercial Partners, 2010). Moreover, such a further segmentation of a segmented market or niche marketing (the different categories and sub-categories of sponsorship and partnership requirements and opportunities) helps ECB to realise the different needs of their businesses and creatively niche those needs by identifying and offering innovative mutually beneficial relational value to the sponsors and business partners towards a further value innovation process for their (ECB and its partners) markets.

Broadcasting Partners

Sky Sports (2010) have exclusive live broadcast rights to all international cricket played under the auspices of the ECB. They also have exclusive live broadcast rights to all domestic competitions. Sky Sports sponsors ECB's Coach Education Programme too. Channel Five (2010), BBC Radio (2010) and talkSPORT (2010) radio are ECB's other co-broadcast partners. Therefore, ECB is able to innovate further services to develop their coaches as another key

stakeholder through the joint power and effort of their broadcasting partner. Moreover, ECB sub-segments their broadcasting partnership segment of the total partnership market into television and radio broadcasting sub-segments, where the partners realise the significance of mutually beneficial relational value by associating with ECB's business (Shams, 2011).

Team Sponsors

Brit Insurance (2010) is the official team sponsor of ECB. Brit Insurance's logo appears on England teams' shirts. Brit Insurance (2010) demonstrates the significance of mutually beneficial relational value with the ECB as, "our association with cricket is an excellent way to increase the profile of Brit Insurance with those that purchase and advise on business insurance" (np). More discussion on ECB's insurance partnership has been presented in the Other Partners sub-section of this section. Since, ECB sub-segments their team sponsorships with other partnership opportunities as well.

Competition Sponsors

Leading energy supplier Npower (2010) has been sponsoring all domestic international test cricket since 2001 and their existing agreement is up to 2013. Npower will continue to enjoy significant commercial access to the England team, as well as an extensive package of rights including ticketing at test matches and image rights. The deal will also provide Npower with the opportunity to build a greater brand presence at test match venues through advertising, branding and sampling. Npower will also continue its successful grassroots initiative to spread up cricket around the UK, Npower Urban Cricket, which it runs in partnership with the ECB. These initiatives provide a permanent and safe space for children to learn the basics of cricket, aim to increase participation and leave a long-term, sustainable legacy for the sport. Kevin Miles, Chief Executive of Npower retail described:

We're delighted to announce our continued sponsorship: to be at the heart of the game for eleven years is something we can be extremely proud of. Our Urban Cricket initiative continues to go from strength to strength. Renewing our contract ensures future investment in this scheme, which is vital for the development of cricket from playground to test arena. From a brand perspective, not only has our cricket sponsorship provided us with great visibility, it has also provided a strong marketing platform for our other products and services like our gas boiler installation service, Npower home team. We're already looking forward to the next two seasons (Shams, 2012b, p. 253; Npower 2010, np).

ECB chief executive David Collier added “its (Npower) Urban Cricket initiative has helped give thousands of children across the country a chance to play cricket for the first time” (Npower 2010, np). ‘LV=’ (2010), the insurance and investment group has been sponsoring English county cricket since 2002; they renewed the contract with ECB and announced that they will continue their sponsorship. ECB Chief Executive, David Collier described about the renewal of the sponsorship contract:

This renewal underlines the benefits that sponsorship can bring to commercial partners. This announcement is fantastic news for domestic cricket, and LV’s continued support will play a key role in the future success of our national summer sport (‘LV=’, 2010, np).

‘LV=’ chief executive Mike Rogers added:

Our sponsorship of the LV County Championship has proved very successful in getting our message across to cricket fans far and wide. We look forward to strengthening our partnership with the ECB (LV=, 2010, np).

Friends Provident (2010), the life and pensions company, is proud to be a long term domestic competition sponsor of ECB. Following three successful years as the title sponsor of the domestic fifty-over competition, the sponsorship of the ECB’s new enhanced Twenty20 competition provides a natural evolution for Friends Provident and its involvement in domestic cricket. Friends Provident also supports ‘Chance to Shine’ (a cricket development programme of ECB), the Cricket Foundation’s campaign to regenerate competitive cricket in state schools, and the Professional Cricketer’s Association (PCA).

NatWest (2010) part of the Royal Bank of Scotland Group, has been a major sponsor of English cricket for more than twenty five years. Over the last two decades more than £35 million has been invested into the game both at international and grassroots levels. This includes the highly successful NatWest Interactive Road show and NatWest Speed Stars competition, the Interactive Cricket programme taking cricket into secondary schools, the Volunteers in Cricket initiative, as well as, the innovative ‘Sun Safety-Don’t get caught out’ campaign to raise awareness of skin cancer in the UK.

Clydesdale Bank and Yorkshire Bank’s (2010) sponsor the Twenty20 Cup, which is hosted by ECB. The partnership continues to support cricket at all levels of the game. Gareth Johnson, promotions executive for Clydesdale Bank and Yorkshire Bank, explains:

Our support for Twenty20 continues to generate great feedback from our customers and our employees—the pace and energy of this form of the game is something that we can all identify with. (Clydesdale Bank and Yorkshire Bank 2010, np).

Other Partners

Buxton (2010) Natural Mineral Water is the Official Water Supplier to the England Cricket Team. As part of the agreement Buxton provides the England Cricket Team with bottled mineral water to be used during all home international matches and training sessions. ECB commercial director John Perera described:

We feel there is an excellent brand fit between Buxton and the England Cricket Team and are confident this partnership will further demonstrate that cricket can have a positive impact in a business environment (Buxton 2010, np).

Paolo Sangiorgi, Nestlé Waters UK Managing Director, commented:

Buxton and the ECB share several important mutual characteristics, a rich heritage and a strong sense of Britishness – and this is why we believe our new sponsorship deal will work so well. Buxton has always used strong sports associations to increase its awareness and promote healthy and active lifestyles, and we are confident that the new partnership will benefit everyone (Buxton 2010, np).

Hewitt Associates (2010), a global human resources services company with offices in thirty five countries, is proud to be an Official Human Resource Management Partner of the ECB. Maximising human resources is what Hewitt is all about. Cricket, while a team sport thrives on the importance of specialist skills and individual strengths as key elements of success—just as ECB does at Hewitt. Through this partnership, Hewitt can reach out to employees, clients, associates and a wide range of ECB's stakeholders and audiences. As one of the commercial partners of the ECB, the Hewitt name will be a fixture at some of the world's most famous grounds.

Marshall Wooldridge Ltd, a general and financial services insurance company is the insurance partner of ECB (ECB Extra Cover Insurance, nd). In the partnership with Marshall Wooldridge Ltd, ECB provides discounted Extra Cover (2010) to its affiliated Focus Clubs and Clubmark clubs as official insurance scheme. The ECB recommends strongly to all affiliated

clubs to consider the Extra Cover scheme to protect their assets and overcome liabilities. Extra Cover is the ideal way for cricket clubs to insure against a wide range of risks-all in one simple policy. It provides a flexible and customised range of cover designed solely for cricket clubs around the UK, who are one of the target markets of the Marshall Wooldridge, as well as the key stakeholders of the ECB in order to spread up cricket.

Suppliers

Maximuscle, the UK leader in sports nutrition was the official partner of ECB for sports nutritional products up to the end of 2010 (Cricket World, 2010). Maximuscle and the ECB worked at new methods to improve performance with Maximuscle providing proven products like Viper and Recovermax, offering expert advice from their team of nutritionists and creating new sports nutrition solutions to the rigorous demands of international cricket. James O'Shea, Marketing Director for Maximuscle described (Cricket World, 2010, np) as: "this is an exciting opportunity for Maximuscle to showcase the virtues of sports nutrition to anyone looking to improve their performance".

Grassroots and Recreational Partners

ASDA (2010), the leading European conglomerate corporate house is ECB grassroots level's development partner. More discussion has been made on this in the ECB Focus Club, ECB Clubmark and Partnership with Schools sub-section. On the other hand, Npower (2010) and NatWest (2010) extended their partnership with the ECB into ECB's grassroots levels development and recreational activities along with their competition sponsorship. Again, as being a broadcast partner of ECB, Sky Sports (2010) extended their support to ECB into ECB's recreational activities.

ECB Focus Club, ECB Clubmark and Partnership with Schools

ECB develops school and junior cricket and other local cricket through ECB affiliated Focus Clubs around the UK.

Affiliation to the ECB allows clubs and, where appropriate, leagues to access a range of tangible benefits. Affiliation is via the County Board within whose area the club or League is based. We provide those benefits centrally by the ECB—individual County Boards will provide additional benefits and may charge

additional affiliation fees for these benefits (Play Cricket Making A Difference, 2006, p. 10).

Centrally and regionally through the regional County Boards, ECB provides enormous supports, guidance, resources, development planning and initiatives, technical and expertise supports for business and game development to these affiliated Focus Clubs in association with their sponsors and commercial partners (Shams, 2011; Play Cricket Making A Difference 2006). Furthermore, in return of these huge endorsements, ECB's regional County Boards charge a nominal affiliation fee to the clubs. ECB provides these supports to the clubs through their prolific relationship with their sponsors and partners, which helps to develop cricket country-wide, as well as helps sponsors and commercial partners to meet their business targets. Simultaneously, ECB and its regional bodies earn additional revenue from the club affiliation fees. It shows that only through the cause and consequence of stakeholder relationships development and maintenance initiatives and subsequent interactions, ECB has been increasing their revenue and innovating the routes for their growth.

There are in excess of 1,400 Focus Clubs which have been strategically identified across England and Wales. On average each Focus Club will work in partnership with four schools and one community group. This equates to over 5,600 schools and 1,400 community groups. On the other hand, the ECB Clubmark is a motivational program for the Focus Clubs, which boosts the competition among the Focus Clubs to achieve and compliance as many supports as possible from ECB and set an example for other Focus Clubs. These Focus Clubs are currently registered and actively working towards ECB Clubmark. More than 850 Focus Clubs have achieved the prestigious ECB Clubmark accreditation putting in place and maintaining the required minimum operating standards for community club cricket (Play Cricket Making A Difference, 2006). Under the Clubmark (2010) scheme, in the partnership of UK's government department 'Sport England', ECB and Cricket clubs can play a key role in the successful delivery of building partnerships with the key stakeholders by supporting the delivery and implementation of various business, promotional and operational activities. A Focus Club has to meet the criteria of seven steps to obtain and maintain the prestigious ECB Clubmark status (ECB Clubmark Process, 2010).

ECB always encourages the Affiliated Focus Clubs and Clubmark clubs to have their own sponsors and commercial partners from local and national businesses to get sufficient funds to run the clubs. For this, ECB helps the clubs through their expertise sponsorship marketing

guidelines, as well as the clubs to get grant and aid through their Sources of Grant Aid and Funding for Cricket Clubs (2009) publication.

ECB is concerned to develop and nurture cricket talents from grass root level for which, they established and maintain partnerships with country-wide schools through country-wide local ECB Focus Clubs and Clubmark Clubs. ECB introduced cricket activities for primary and secondary schools' boys and girls (Cricket in Partnership with Education, 2010) in the partnership with their grass root partner ASDA (2009; 2010), and the local ECB affiliated clubs. ASDA works in partnership with the ECB to develop and implement two major campaigns designed to use ASDA Kwik Cricket as a vehicle to educate children about the benefits of healthy living and also raise the profile of the sport within communities. A core element of these campaigns will involve the ECB, in conjunction with the eighteen first-class counties, and ASDA establishing a series of recreational junior cricket festivals across the country. This will also include new girl's tournaments aimed at increasing levels of participation. These festivals will be attended by high-profile professional cricketers who, in addition to passing on coaching tips, will also talk to kids about the benefits of healthy eating (ASDA, 2010). ASDA Kwik Cricket is played in 8,000 primary schools and over 4,500 of the 6,000 ECB affiliated clubs. It is designed to provide children, between the ages of 7 and 11, with an introduction to cricket and can be played through various flexible and adaptable ways (ASDA, 2010).

Deborah Whitehead, Local Marketing & ASDA in the Community general manager, said: ASDA Kwik Cricket is proving to be very popular with the number of primary schools participating increasing each year. It's perfectly aligned to our strategy to focus on Kids within local communities. In 2008 we added to the program by educating children around the benefits of healthy eating and doing more to support cricket within the local communities (ASDA, 2010, np).

Significance of Value Innovating RM Indicators on Mutually Beneficial Relational Value and Business-to Business Value Innovation

The delighting remarks of the ECB's partners and sponsors clearly demonstrates the significance of the mutually beneficial relational value of these stakeholders' and ECB through their joint value innovating initiatives for their different target markets. Since, the partners are able to meaningfully innovate/promote their offerings to their own target markets, as well as

ECB is able to nurture and innovate further value for their own target markets through such initial mutually beneficial relational value of their partners.

In order to achieve the Building Partnership goals by prolifically utilising the mutually beneficial stakeholder relationship value with the aim of innovating further value for all of the involved stakeholders' target markets, ECB has adapted a more stakeholder focused culture by implementing relationship and service values instead of bureaucratic legal values. ECB started funding its regional bodies, Focus Club and Clubmarks Clubs based on their annual performance (Shams, 2011), which indicates that ECB promotes the quality is the concern of all in their intra-organisation practice. Moreover, the overall stance towards an organisational change from a traditional practice to more customer/stakeholder driven practice of ECB indicates that high stakeholder service, stakeholder commitment and stakeholder contact would be a key of ECB's success through their reformed customer/stakeholder driven organisational practice.

As per their business requirements, ECB categories and sub-categories their sponsors and partners into seven different segments and underlying sub-segments of the sponsorship and partnership opportunities. Such a further segmentation of a segmented market or niche marketing (the different categories and sub-categories of sponsorship and partnership requirements) helps ECB to realise the different needs of their businesses and creatively niche those needs by identifying and proffering innovative offerings to the sponsors and commercial partners towards a win-win outcome. Moreover, ECB has been developing them and cricket throughout the UK through the resources and opportunities gained by the joint power of their sponsors and business partners. Simultaneously, in general, share of dependency, risk and uncertainty is always involved among the business partners, based on the partnership contract. Another RM indicator, orientation on benefits or knowledgeable customers and/or other stakeholders is involved in ECB's RM practice too. Since, ECB tries to enlighten potential sponsors or business partners about the potential benefits for sponsoring or partnering ECB, as ECB ensures to let their stakeholders know what ECB can offer them and be sure ECB will deliver that (Building Partnership, 2009).

In the partnership with the sponsors and business partners, ECB provides grassroots cricketing facilities to the ECB affiliated clubs. By which, the affiliated clubs continue the cricketing activities among the country-wide schools' kids. Through such ventures, all involved stakeholders are benefiting and breeding further value towards their future interest. Commercial partners and sponsors are gaining their promotional advantage by partnering

and/or sponsoring ECB, which exhilarates their potential sales. Again, affiliated clubs are gaining cricketing facilities from ECB and County Boards because of ECB's partnership with their business partners and sponsors, which exhilarate affiliated club's growth too. Simultaneously, country-wide schools are gaining the opportunity to involve their students in the sports activities, which helps young students to gain sustainable physical structure since their childhood, as well as helps the school to socialise their extra-curricular activities. On the other hand, ECB and its regional bodies are gaining club affiliation fees from such ventures too. As a result, the Value-Breeding Bond (VBB) is found in ECB's venture. Since, all of the involved stakeholders are gaining their individual interests through the venture, which breeds further value among the VBB network.

ECB introduces the Clubmark status for the Focus Clubs, where the 'Focus Clubs' only can gain the 'Clubmark' status after fulfilling ECB's standard. That means quality is the concern of all is involved from this perspective too. Again, ECB and their insurance partner customise various insurance services for ECB's Focus Clubs.

IMPLICATION AND CONCLUSION

Existing literature shows that the implications of the RM indicators have a favourable impact on nurturing mutually beneficial stakeholder relationship value, and innovating further value for customers through product/service innovation in order to share that innovated/enhanced value among the associated stakeholders. Accordingly, ECB has been proving that what value they can deliver to their business/operational partners in order to foster mutually relational value and subsequent innovated/enhanced value for customers through a strategic stakeholder relationship and interaction. Moreover, underlying such value innovating RM indicators in a business-to-business setting, ECB ensures an interdependency among the business/operational partners that helps them to transform their value network into a Value-Breeding Bond network, where value is innovating/generating through the re-productiveness of the existing value, while each stakeholder plays some value added role, by way of stakeholders working interdependently towards mutually beneficial, multifarious goals. Correspondingly, the Building Partnership approach of ECB keeps a keen eye on flourishing latent market (all associated stakeholders, including customers) needs in a way that the target market expect and accept, where the value innovating RM indicators help ECB to enrich their relational influence in order to meet and exceed that expectation, which is tailored based on

their stakeholders' needs. As a result, the mutually beneficial stakeholder relationship value derived from the value innovating RM indicators is utilised as an antecedent of business-to-business innovation in ECB's value network. The key implication of such a RM indicator centred value innovation initiative in a business-to-business context is it can be utilised to innovate value in any setting (market, culture, industry and so forth); however the relationship portfolio should pursue only the given situation of the targeted setting (Gummesson, 2002).

CAN A SOCIAL NETWORK MARKETING STRATEGY BENEFIT SMALL AND MEDIUM ENTERPRISES?

Silva, Daniela¹; Nobre, Helena²; Becker, Kip³

ABSTRACT

The study explored what benefits to small or medium sized firms could be derived from the development of a social media marketing strategy. Results indicated that Facebook can facilitate communications between (SME) companies and customers, and can also be an important tool in creating brand recognition and broadening awareness. The importance of developing a thoughtfully designed strategy was cited as SME's often lack sophisticated marketing or business plans. The positive study results suggest that SMEs can derive benefits from a SN strategy and, in particular, Facebook was shown to be an important channel that enabled small and medium sized companies to advertise their brands without large budgets. Facebook presents itself as a unique environment that can enable businesses to increase prospective clients and also offer current consumers a closer relationship to the company. As such, the study indicated that presence on social networks can have an important role in both relationship development and increased sales/membership.

Keywords: Social networks, SME, Facebook, strategy, small medium companies

INTRODUCTION

While the need for a social network (SN) marketing strategy has been explored with large firms little exploration has been undertaken to determine their usefulness to small (< 50 employees and ten million in sales) or medium (< 250 employees and fifty million in sales) enterprises (SMEs). The intent of this study was to examine the potential benefits to an SME that could be derived from a social network strategy.

The importance of a social network strategy for a small or medium sized firm emanates from the explosion of online social networks that allow information to be disseminated in different ways and sociability to take new directions. An additional significant benefit to the SME is the relatively inexpensive cost of a relatively sophisticated SN strategy that connects the firm directly to current and potential consumers. Social networks sites provide a way to be closer to consumers with the added benefit of not needing to go through "gate keepers" to transmit information having the ability to communicate in an easy and accessible way (Hennig-Thurau, et al., 2010).

There are several important online social networks where millions of users interact daily. Facebook, Twitter and Kurkut are among the most widely used. The study focused on Facebook, with 90 million members, due to its heavy European influence as well as its importance in Portugal where the study was conducted. Currently, there are 4,644,220 Facebook users in the Portugal, which makes it #39 in the ranking of all Facebook statistics by Country. Facebook penetration in Portugal is 43% in relation to population and 85% in relation to Internet users. The largest age group is currently 25-34 with total of 1,214,920 users, followed by the users in the age of 18-24. Meanwhile, 51% of the Facebook users are male and 49% are female (Socialbakers, 2013). Perhaps one reason for Facebook's popularity is that Facebook, compared to LinkedIn and ASmallWorld, offers the most comprehensive tools for personalization and a larger management of the profile on the network (Papacharissi, 2009).

Companies recognize that social networks represent a new way to communicate with consumers allowing a company to extend its communications, develop a reputation and promote firm image (Becker, Nobre and Vijay, 2012). It would seem natural then that firms would look to this channel to promote their brands, communicate with customers and increase sales (Burson-Marsteller, 2010).

The important of SN is well stated by Facebook promotional materials which point the benefits to firms who use their platform. Stressing the importance of WOM marketing the Facebook site notes the following benefits of using Facebook in social network strategy (Facebook, 2013).

1. Customized news feed based on users' personal information and interactions, which indicates what they may like.

2. Brand recognition means that you stand on a huge public platform, where every eye can be focused on you resulting in image building of your brand or service.

3. Facebook fan box is persuasive tool through which email recipients or website visitors can easily become your fan, and follow your business page.

4. Effective brand monitoring allows the firm to counter misconceptions or negative comments or opinions about your company by directly addressing them.

5. Increase search engine rankings because all data public can be public so using major brand key words a company page can come up on top on Google or Yahoo search engines.

Social Networks appear to be an exceptional tool for companies to communicate with consumers due to the speed which information circulates and the low costs associated compared to the traditional marketing. Of particular importance to a firm is the ease of consumer feedback. Focus groups are becoming a tool of the past as firms with solid consumer recognition can solicit information directly from hundreds of interested Facebook fans. The power of social media lays in its viral nature so it is a consumer relating to another that quickly spreads the marketing message throughout the internet. While WOM can work against the brand in a negative way a carefully monitored SN strategy is amply justified (Becker, Nobre and Vijay, 2012).

While the nature of SNs is dramatic the preponderance of research still focuses on the more traditional marketing concepts. Gil-Or (2010) points that in the area of online social networks and particularly in Facebook, there is little academic research related to marketing and business. In this sense, to study how companies work their image, communication and relationship management, specifically in the context of Facebook, provides an important contribution. This is even truer in the case of small and medium sized firms. It is also important to recognize how social network strategy can be used in small nations as most research tends to focus on North America or the more industrialized nations of Europe such

as the UK and Germany. The purpose of the study was to explore how SMEs are using social networks in a small lesser developed nation (Portugal) to determine what lessons could be ascertained for other similar nations and sized firms. To this end the study addressed three questions of:

1. Do social networks have an impact in management strategy for Small Medium Portuguese Enterprises?

2. Does a company's presence on a social network help improve communication with the firms current and/or potential consumers?

3. Will a presence have a positive impact on the relationship that the consumer establishes with the firm/brand?

In the process of online communication WOM plays a central role in the dissemination of new products and services where their intangibility makes sharing the experience is even more important to consumers (Gil-Or, 2010). Brown and Reingen (1987) further reinforce the crucial role WOM plays in consumer attitudes and behaviors.

WOM is a very prominent communication tool on the Internet, this presents itself as a privileged way means for consumers to share their opinions, as well as preferences and experiences (Trusov, et al., 2009). Havlena and Graham (2007) contend that the interest in the power of WOM can be traced to the advent of the Internet, which facilitated the sharing of information from consumer to consumer regardless of time or location. They argue, the online opinions of consumers can be long lasting and far-reaching demonstrating effects on purchase choice. Hyllegard, et al. (2011) also emphasize that consumers seem to rely more on the opinions expressed in social media than in the information generated and shared by companies themselves. Based on these ideas the following hypothesis was formulated.

H1: Small Medium Enterprises will benefit from the impact of WOM on social networks

It is clear that Facebook provides a company with a unique opportunity to communicate with a collection of consumers who have a personal interest in the company's products and brand. With this knowledge Facebook can contribute to better understanding of the product and the sharing of experiences related to satisfaction or dissatisfaction to the product (Hyllegard, et al., 2011). Facebook also allows for a greater social activity between users and, simultaneously, helps businesses, through direct dialogue, to interact, with the existing and/or potential customers (Deloitte, 2012). Through social networking WOM consumers can

share their experiences with the products in a unique way (Soares, et al., 2012). The importance of SN in discussing products and services led to the following hypothesis:

H2: Social networks are an important means of enabling consumers to share information about a product/service

Soares, et al. (2012) state that for consumers to decide communicate with companies feel comfortable to share personal information and free to provide direct company/product comments. Kaplan and Haenlein (2010) also corroborate this idea arguing that companies must deliver their message in a coherent and consistent way. Reinartz, Krafft and Hoyer (2004) conceptualize CRM at the client level and believe there are three stages of relationship developed with the customer (initiation, maintenance and end). It is important that a firm recognize, in their communication, which stage the customer represents.

Gil-Or (2010, p. 22) states that "in order to build the level of trust and transparency that is needed for the consumers to feel comfortable with companies participating in what is considered a not commercial environment (such as Facebook), companies should invest in doing Relationship marketing right". When this is accomplished McKeefery (2008) states that social networks such as Facebook can provide a powerful presence for the firm which can, according to Zang (2010) can serve to build strong relationship between potential and current consumers. Based on this assumption a third hypothesis was formulated:

H3: The level of communication in social networks reflects the quality of the relationship that companies have with consumers.

In a study conducted by Deloitte (2012) Facebook was found to enable companies to focus advertising toward a specific group of user once the site visitors had become fans of the firm. Through monitoring the communication between consumers and engaging visitors companies are able to promote the brand where it is most effective and meaningful in order to generate awareness and new sales. According to Urde (1999) a brand is inseparable from the company so the effective use of brand sites can create an environment where personal interactions, about a product/service, can result in increased brand value. Social network sites can be effective in developing a personal relationships with the firm/brand which can serve to assist consumers to identify with the brand making it different from others and, at the same time, help the company to differentiate itself from the competition (Grönroos, 2001).

Familiarity with the brand happens when the consumer formulates favorable, strong and unique brand associations (Keller, 1993, p.2). These build brand image and, simultaneously, the construction of value. Social networks are an important channel in the management of the company's reputation which for this discussion could be equated to brand value (Becker, et al., 2012). This leads to the following hypothesis:

H4: The presence of Small Medium Enterprises in social networks will have a direct impact on the brand familiarity of these firms to the consumer

If the consumer is satisfied there are more chances to be loyal, or engage with the brand and buy it whenever you need (Bloemer and Kasper, 1994).

A study by Deloitte (2012) determined that a company's Facebook page can increase knowledge about the brand and about their activities enabling companies to interact through direct dialogue with existing or potential consumers and can promote the firm's links to their websites. By increasing traffic on the company website Facebook has been responsible for helping increase sales. Facebook offers a firm the ability to advertise to a particular consumer group focusing messages that meet their specific needs and tastes (Deloitte, 2012). In addition, the less formal communication format allows the company to connecting with consumers and "tell a story" about the identity of the brand or product helping to convert customers into loyal advocates of the company (Burson-Marsteller, 2010). This led to the final hypothesis:

H5: The direct contact with consumers through social networks generate greater involvement resulting in a direct impact on brand loyalty intentions

Virtual brand communities in social network sites have received increasing attention from both academia and industry. A study of 333 virtual brand community members in Korean social network sites suggests that members of brand communities have six primary social and psychological motives for engaging in virtual community activities: interpersonal utility, brand loyalty, entertainment seeking, information seeking, incentive seeking, and convenience seeking. Among them, brand loyalty acts like the facilitator who set up an essential connection between real world and the intangible cyber network. It was noted that members of consumer versus marketer-generated brand communities had both similarities as well as differences in terms of the extent of community participation and the levels of community commitment, satisfaction, and future intention (Sunga, et al., 2010).

METHODOLOGY

A qualitative approach was chosen as the best method since this methodology appears when there is a "need to get meaning and in depth" (Carson, et al., 2001, p. 69). According to Neale, Thapa and Boyce (2006) one of the main advantages of studying the case is that this method enables access to more detailed information compared to other methods providing thus "a more complete picture" of what happened in that particular "context and why".

The use of social networks as a management tool, particularly for Small Medium Enterprises, is a recent development and scientific literature remains scarce (Gil-Or, 2010). Yin (1994) states that the exploratory multiple-case study is an appropriate, and perhaps the best method, when under taking this type of investigation. The multi-case analysis has several advantages as multiple firms can indicate trends and offers insights that a single case study is not capable of. Herriott and Firestone add that "evidence from multiple cases are considered more compelling and comprehensive...being more robust" (Herriott and Firestone, 1983 cited in Yin, 2001, p. 68).the study offered greater support for generalization as he four companies represented different business sectors.

Yin (1994) notes that the case study fits in the investigation when a "'how' or 'why' question is being asked about a contemporary set of events over which the investigator has little or no control" (Yin, 1994, p. 9). Building on this the researchers believe that the multi-case method, is well suited for and can be applied to, investigations that have an initial exploratory hypotheses that can be studied and developed to provide future insights into broader research activities. The research was designed to investigate how social networks impact the strategy of Small Medium Portuguese Enterprises. The format was to analyze four cases using semi-structured interviews, and later on elaborating a "cross company case" where each company was analyzed and compared to ascertain the expectation of patterns relating to either social network strategic designs or outcomes.

Four Small Medium Portuguese Enterprises were selected based on four specific criteria:

- Companies had to be present on Facebook
- Companies had more than 250 "likes" on their pages
- Were selected companies that operated in different areas, two of which offer products and the rest falls in the services area

- The geographical location of firms, which are all located in the northern region of the country, in order to give facility and access to company managers to be interviewed.

Consistent with the exploratory nature of the study the collection of data was made by semi-structured management interviews.

A detailed script was divided in three parts: 1) The reasons that led the company to be present on Facebook; 2) The way management is implemented in Facebook and 3) The advantages that the company derived from its presence on Facebook. In addition, secondary data was obtained from the company managers / directors.

THE EMPIRICAL STUDY

Four SME Portuguese Enterprises were selected for the multi-case study: ACIAB, Braga Pop Hostel; Brb. Artesanato Urbano (Brb. Urban Craft) and MARKA – Vinhos do Douro (Table 1).

The ACIAB is a business association, founded in 1911, and its goal is to promote business development in the region providing assistance to firms to adapt in the current market as well as providing tools to compete and innovate. ACIAB has more than 1000 associates (companies) in different branches of business, from trade, industry and services.

Braga POP Hostel is the first hostel in the city of Braga, in an early differentiating aspect of the brand, and desires to position itself as a local informal housing alternative that is close to the customer and youth culture.

Brb. Urban Craft produces an urban crafts adapted to constantly changing consumer habits and their search for something unique. Creativity and innovation are the hallmarks of the company as well as environmental concerns, having a clear careful selection of materials used in the various manufactured parts.

Durham Agrellos Wines S.A. was founded in 1991 but the name “MARKA” appeared only in 2004. This was at the time of the introduction of the wine “Doc Reserva 2002”. MARKA markets an extensive range of wines, red, white, classic blends and has received several medals in European competitions.

All the selected cases are from the north of Portugal, for the data collection facility. Companies have a philosophy of proactive, that is, despite being very small and not having extensive resources, they adapted themselves to the circumstances and got into the market with a clear vision of what they represent and how they intend to place towards the competition. These companies are concerned about their brands

All firms are active Facebook sites which allows them to communicate to a large number of individuals in a where it simple to be a membership, requiring only user registration and an Internet connection.

The cases of the research are summarized in Table 1.

Table 1. Description of companies studied

	ACIAB	Braga Pop Hostel	Brb. Artesanato Urbano	MARKA – Vinhos do Douro
Location	Arcos de Valdevez/ Ponte da Barca	Braga	Viana do Castelo	Porto
Business Activity	Economic Organization	Local hosting of short duration	Manufacture and sale of jewelry (craft)	Production of wines
Product Type	Intangible, durable	Intangible, not durable	Tangible, durable	Tangible, perishable
Beginning of Activity	1911	2011	2006	1991
Initial Presence on Facebook	May 2010	July 2011	May 2010	April 2010
Number of fans on Facebook page : March 2012	256	714	1.308	5.721
Number of friends on Facebook profile page: March 2012	4.899	1.259	610	It has not profile page

RESULTS

Managers had different aspirations for their Facebook page (Table 2). Only one desired to have the site expand the number of interested viewers (ACIAB). This is an understandable goal for them being an association membership based company. Two firms of the four expressed a desire to mitigate the effects of negative WOM comments on the site. While the international aspects of the internet and Facebook are widely discussed it is interesting that all firms desired viewers to share information about their company and to obtain a greater fan base from the local area.

The first aspect is reflected in how WOM appears in Facebook, once that in the four cases, the site seems to present itself as a means of fostering the sharing of information about the company and a wider range of consumers territorial level as well, because the companies have visitors from various parts of the world.

The purpose of the company Facebook page varied among the firms. The firm ACIAB had a different outcome objective than the others being a not for profit organization whose goal was not revenue based but was to assist firms in the region through seminars and consulting. As such, it was the only firm with the objective of creating a viral environment to spread information among members about organization operations. All firms shared the objectives of sharing information about the company and gaining local customers. Only Urban Craft and Douro Wines felt that the Facebook page should management the effects of negative WOM responses (Table 2).

Table 2. Purpose of company Facebook page

	ACIAB	Braga Pop Hostel	Brb. Urban Craft	Douro Wines
Expand awareness by WOM	X			
Share information about the company	X	X	X	X
Greater coverage of consumers at territorial level	X	X	X	X
Manage negative WOM impacts			X	X

The objectives of the Facebook site also varied among the different firms but each firm appeared to have a developed strategy based on the type of firm and desired outcome of Facebook interaction (Table 3).

X

CONCLUSIONS

When the objectives of the different company Facebook pages were analyzed it was determined that only ACIAB had the objective of organizing member events which is consistent with its mission. All firms reported that the site should engage consumers in dialog and be part of the company communication strategy. Braga Hostel, Urban Craft and Douro Wines stated that the site should act to find ways to understand the consumer profile and only Braga Hostel desired the site to further the consumer relationship. It is worthwhile to note that while two firms wanted to use the Facebook site to better understand the profile and desires of the consumer. When Urban Craft asked consumers about a product preference consumers responded they liked the color of a product that had the least sales. While only a single case this highlights drawbacks of taking consumer responses at face value. Such contradictions are frequent and recalls the famous Coke survey where thousands of consumers reported a preference for "new Coke" but when the firm introduced the product found that consumers rebelled demanding the reinstatement of their Coke Classic (Table 3).

The Facebook strategy of the different firms, as well as their different objectives, was reflected in the varied reported benefits of the company Facebook page. Three firms (excluding Braga Hostel) noted increased knowledge about the company which indicates the "Facebook effect" of Braga Pop Hostel may not be as effective as the others but Braga Hostel found the site increased traffic. The only common benefit of four companies in the case research is the increased traffic on the company's Facebook page. Only in one case (Braga Pop Hostel) Facebook was selected as a channel of choice for establishing relationships with customers because this media allowed the company to interact with the client in a unique way of immediacy and interactivity that no another channel provided. This was consistent with ACIAB's object to increase membership and awareness of their offerings and the site did increase the number of clients. As a membership organization they would not be involved in sales, however, the significant traffic on ACIAB's website seemed to successfully lead to the

wider customer basis, as well as the better company acknowledgement. Determined by ACIAB's business model, which targets directly at customers, the number of clients is much more essential than sales volume.

Braga Hostel did increase brand loyalty and traffic but this did not translate into increased sales. Both Urban Craft and Douro Wines increased knowledge, traffic and sales. What appears to be the case with these two firms was that the increased sales came from different customer sources. In the case of Urban Craft, who saw increased client number, sales came from existing and new consumers. Actually, injecting energy in either reaching out for new or keeping existing clients can be extremely acceptable and help a small or middle-size company to expand. In the case of Douro Wines, however, there was not an increase in new clients pointing to the increase in sales to come from existing consumers buying more products (Table 4).

For the first formulated hypothesis - *H1: Small Medium Enterprises will benefit from the impact of WOM on social networks*- the results suggest these firms can benefit with the impact of WOM on social networks. WOM presents itself as a prominent factor for the Facebook users to learn about companies and their products through the sharing of information and the interaction that the site enables. It must also be taken into consideration that the sites may generate negative communications about a firm that has to be taken into account making it necessary for firms to monitor the sites carefully. It was suggested that when WOM is negative it can be minimized if the content was taken from pages quickly and/or responded to effectively.

In consideration of *H2: Social networks are an important means of enabling consumers to share information about a product/service* the results suggest that Facebook is a privilege channel for consumers to talk about brands and their products and services. Companies can accentuate this trend by promoting interaction between consumers and the firm through such activities as contests and sweepstakes on its pages. Such actions would have as their objective to increase the number of visitors interacting with the site.

Results concerning the third hypothesis, "*networks reflects the quality of the relationship that companies have with consumers*" indicate that each of the selected companies communicated on Facebook in a structured way in order to convey the brand values clearly.

In regard to *H4: The presence of Small Medium Enterprises in social networks will have a direct impact on the brand familiarity of these firms to the consumer* the results indicated

that Facebook plays a crucial role to promote the brand in online environments and were responsible for the increased knowledge about the firm and its products/offerings.

An analysis of the final hypothesis - *H5: The direct contact with consumers through social networks generate greater involvement resulting in a direct impact on brand loyalty intentions* suggests that Facebook leads to greater involvement with the brand and increases loyalty as evidenced through increased sales and increased customers.

Thus, and given the above, on the main research question "**How do social networks have impact in the management of Small Medium Enterprises?**", the results indicate that, in particular Facebook, is an important channel that enables small and medium sized companies to advertise their brands easily and accessible without having to have large budgets. Similarly, this tool allows companies to communicate with consumers and establish a relationship with them that will prove crucial for a greater involvement with the brand and increased loyalty.

The study demonstrated that Facebook is a medium that facilitates and expands communication with the consumer of small or medium sized firms. Working in an interactive environment and having tools that allow rapid conversation between all parties, Facebook presents itself as a unique environment that can enable businesses to increase prospective clients and also offer current consumers with a closer relationship to the company. As such, the study seemed to indicate that presence on social networks can have an important role in both relationship development and increased sales/membership. It is noted that when companies promoted the firm in a creative way that enabled consumers to interact with content (e.g. photographs, texts, contests, sweepstakes or promotions) consumers were more likely to engage with the company and promote their products through WOM. The diverse range of firms and objectives of the study demonstrated that Facebook can be a useful, inexpensive and dynamic part of a small/medium size firm's business strategy. To do so, however, requires insight, focus, a well-developed Facebook plan, an understanding of analytics and the courage to engage the consumer in a meaningful open manner.

ABSTRACT

Listening to the customer is very important to develop a marketing oriented firm. At the same time, it is a difficult, time consuming and costly exercise. As a result many of the firms have disengaged themselves from listening to their customers in larger scales. However recent technological advances in information and communication technology has allowed marketers to fundamentally alter the nature of conducting business by providing much easier and cheaper avenues to listen to their customers. This paper will discuss one such mechanism i.e. call centers. Main objective of the research will be to find out the impact of customer perceptions of voice to voice service encounters on behavioral intentions. Research was conducted as a survey where data was collected using self-administered questionnaires. The survey was conducted in Western and Southern provinces of Sri Lanka across a sample of 750 respondents. Four independent variables namely attentiveness, responsiveness, empathy and adaptiveness were used to predict behavioral intentions which was the dependent variable. Regression analysis was used to analyze data. As far as the impact is concerned, the study found out that perceived attentiveness, perceived responsiveness and perceived empathy have positive impacts on behavioral intentions while empathy has been the strongest predictor.

Keywords: Call Center, Attentiveness, Responsiveness, Empathy, Adaptiveness

INTRODUCTION:

Listening to the customer is very important to develop a marketing oriented firm. But at the same time, it is a difficult, time consuming and costly exercise. As a result many firms have disengaged themselves from listening to their customers in larger scales; firms who do engage in similar activities are more focused on balancing costs and benefits. However recent technological advances in information and communication technology has allowed marketers

to fundamentally alter the nature of conducting business by providing much easier and cheaper avenues to listen to their customers. This paper will discuss one such mechanism i.e. call centers, available to marketers to listen to their customers and will evaluate the larger consequences of performance of the call center on customer intentions.

“A call center has been defined as a physical environment dedicated for servicing and interacting with customers or potential customers, which comprise of agents whose primary dedicated function is to handle inbound and outbound traffic via the telephone and other available channels” (Contact Center Industry Benchmarking Study-2003). According to Moon et al., (2004, p. 227) call centers, are where human agents and/or automatic voice response machines handle computer assisted telephonic communications with customers. As a whole call centers are dealing with integrating technology with human component to provide unique service to the customers.

Service-based competition and the potential for significant cost reduction have resulted in a significant worldwide growth of call centers in recent years (Callaghan and Thompson, 2002). Many firms have introduced call centers to improve the responsiveness of their service and to minimize the costs (Tax and Brown, 2000). For an example number of call centers have almost doubled and expenditure on developing call centers have almost tripled during last five years (Richard et al., 2000). Moreover the total number of call center seats across the south Asian region is estimated to be over 200,000 by mid 2000.

Despite the importance and given that the use of call centers has grown over the years (Crome, 1998), the contexts have rarely been studied from the customer point of view, even though most consumers at some point in their life has contacted a call center (Keiningham et al., 2006). Further Monger et al., (2004) highlights the importance of managing the first call properly, as the first call has importance influences on customer satisfaction. Most of the available literature in the field focuses on staffing aspect of the call center. Even the available studies have focused on “evaluating call center performance, based on performance of employees in call centers using “hard data” like the number of calls handled, agent sales, productivity, and amount of errors.” (Brown and Maxwell, 2002, p. 311). There is a clear gap when it comes to studies measuring customer satisfaction elements (Jaiswal, 2008; Keiningham et al., 2006; Unzicker, 1999). Few studies which have focused on customer perceptions (e.g.: Ruyter and Martin, 2000) have failed or haven’t tried to link perceptions to any behavioral outcomes. Thus there is a clear knowledge as well as a contextual gap. Therefore the objective of this study is to find out the impact of customer perceptions of voice to voice service encounters on behavioral intentions.

LITERATURE REVIEW:

Predicting human behavior:

Explaining human behavior in all its complexity is a difficult task, since behavior is interplay between lots of different actors. Ajzen, (1988) and Sherman & Fazio, (1983) have used social attitude and personality traits, to predict and explain human behavior. Theory of Reasoned Action (TRA) which was developed by Ajzen & Fishbein, (1980) with the assumption that individuals are rational and make systematic use of information, predicts that people consider the implications of their actions before they decide to engage or not to engage in a given behavior. Ajzen and Fishbein, (1980) define attitude toward the behavior as “a person’s general feeling of favorableness or unfavorableness for that behavior” and subjective norm as “a person’s perception that most people who are important to him think he should or should not perform the behavior in question”. However TRA lacks practicality and even the original authors realized it, which made them introduce an extension to the theory (Godin & Kok, 1996). The extension which is also known as Ajzen’s (1985) Theory of Planned Behavior (TPB) is one of the most influential and well-supported social psychological theories for predicting human behavior. The central argument for the theory is that behavioral decisions are not made spontaneously but made as a result of a rational process in which behavior is influenced, both directly and indirectly, by attitudes, norms, and perceptions of control over the behavior (Ajzen, 1985). As far as the study is concerned the attribution of three components to attitudes is widely accepted: cognitive, affective, and behavioral elements (Sánchez and Iniesta, 2004).

Customer expectations and satisfaction:

According to Garbarino & Edell (1997, p. 147) “It is increasingly clear that a brand’s attributes are not the only elements, and perhaps not the most important elements, in determining consumers’ attitudes”. Pre decisional evaluation of services, due to its specific characteristics may depend on other factors as well, such as the prestige of the company, recalled attributes of the product, or prior overall judgments (Lynch et al., 1988). Customer satisfaction is interpreted as a function of the blend between customer’s expectations and actual experience of the service (Zeithaml et al., 1993). Expectations are viewed as “predictions made by customers about what is likely to happen during an impending transaction or exchange”

(Zeithaml et al., 1993, p. 2). Many researchers (Gronroos 1990; Parasuraman et al., 1988) break service into two dimensions: the outcome (what the customer receives) and the process (the manner in which the service is delivered to the customer). The services literature further suggests that the quality of the interaction is also a critical component of the service **recovery** process (Bitner et al., 1990).

Call center service encounters:

Voice-to-voice encounters are critical encounters because the telephone can be the first interaction with a company (Unzicker, 1999). Therefore one of the most important aspects of call centers is that their agents are listening to customers as well as responding to their requests. Voice-to-voice encounters provide a way to build, maintain, and manage customer relationships (Anton, 2000) and increase satisfaction (Feinberg et al., 2002). Listening as perceived by customers has been defined as “a set of interrelated activities, including apparent attentiveness, non-verbal behavior, verbal behavior, perceived attitudes, memory and behavioral responses” (Lewis and Reinsch 1988, p. 18). Moreover Rust and Oliver (1994) on the other hand discussed the service encounter with respect to two dimensions, namely, the service performance and the service environments. Moreover Boshoff (1999) in his scale instrument (RECOVSAT) identified eight elements which can be used to measure customer perception towards call centers. They are, time, communication style, empathy, reliability, perceptions of commitment to service quality and customer satisfaction, empowerment, staff attitude, and explanation.

METHODOLOGY:

Research was conducted as a survey where data was collected using self-administered questionnaires. The population for the study is all telephone subscribers in Sri Lanka. Sri Lanka was selected due to its booming economy and conducive environment to call center establishments. Sample comprised of 750 subscribers and was selected across different telephone users. Sample was selected using convenience sampling. The survey was conducted in Western and Southern provinces of Sri Lanka these two provinces were selected in this regard since those are the two provinces with highest number of telephone subscribers (These two represents 54% of all fixed access users in Sri Lanka) (www.trc.lk).

Questionnaire was divided into three main sections namely, general information about the respondent, general information about the service, and information relevant to customer

perception. In order to measure the customer perception of call center experience researcher used the scale developed by Burgers et al., (2000), which has four variables to measure the service encounter namely adaptiveness, assurance, empathy, and authority and De-Ruyter, & Wetzels (2000), which has used four items attentiveness, perceptiveness, responsiveness, and trust. This part of the questionnaire included closed ended symmetrical scale questions.

Researcher created a questionnaire carrying twenty eight questions covering these eight variables and was tested through a pilot study which comprised with 100 university students. Researcher then did an exploratory factor analysis and found out four main factors. Oblique rotation was used due to high correlation among the initial factors. Loadings above 0.4 were selected and the new factors were named and their similarity with initial factor structures was considered during the process. Here four factors were identified, namely attentiveness, responsiveness, empathy and adaptiveness. Each factor had four variables except responsiveness which had five variables.

Attitudinal statements were constructed on above dimensions and were measured on a seven point scale; which ranged from strongly agree (7) to strongly disagree (1). The midpoint of the scale will be anchored by 4 (neither agrees nor disagrees). Researcher decided to use seven point likert type scales in order to minimize the possibility of moderate answers instead of a five point scale. Questionnaire was developed in English and then was translated to Sinhala by a language expert. Moreover questionnaire was given to an industry expert for his review in order to increase the face validity.

Measures used in the study:

Attentiveness is defined as "the extent to which customers receive verbal and nonverbal cues from call center agents during the telephone service interaction" (De Ruyter and Wetzels, 2000, p. 277). Adaptability, can be identified as the level of flexibility (Zeithaml and Bitner, 2000), and observed by the customer through effectiveness exhibited by the call center agent in managing different circumstances (Bearden et al., 1998). Responsiveness can be defined as "the level of understanding or agreement between the call center agent and the customer" (De Ruyter and Wetzels, 2000, p. 277). Ramsey and Sohi (1997) identifies at least 3 components of being responsive, namely answering to the customer at the right time, using complete sentences to answer the question and doing these things in a manner that customer feels the agent is enthusiastic about solving the problem. "A caring, individualized attention" can be defined as empathy (Parasuraman et al., 1988, p. 23). With relevance to call centers it is

the ability of the call center agent to make the customer feel like he was given individualized as well as prompt service (Burgers et al., 2000).

Following hypotheses were developed by the study in order to test the potential relationships as well as to achieve the objectives.

H1: Perceived attentiveness has a positive impact on behavioral intentions.

H2: Perceived responsiveness has a positive impact on behavioral intentions.

H3: Perceived empathy has a positive impact on behavioral intentions.

H4: Perceived adaptiveness has a positive impact on behavioral intention.

Researcher conducted a reliability test to determine the reliability of the items. All the items had greater than 0.8 Cronbach's Alpha values signaling very good strength of association among the instruments according to Hair *et al.*, (2006). Table 1 provides the reliability statistics.

Table 1: Reliability statistics

Measure	Cronbach's Alpha	Cronbach's Alpha	
		standardized items	No.of items
Attentiveness	.870	.873	4
Responsiveness	.835	.839	5
Empathy	.881	.881	4
Adaptiveness	.874	.874	4
Retention	.894	.894	4

Analysis:

Sample consists of 56% females and 44% males. Majority of the respondents (47%) were belonging to the age group of 18-25 while the second largest group (32%) was belonging to age group of 26-35. Majority of the customers (33%) had contacted the call centers during 7 p.m. and 11 p.m. and the second most preferred time slot was 3 p.m. to 7 p.m. (23%) which was closely followed by 7 a.m. to 11 a.m. time slot (22%). 29% of the customers were picked up by an active agent before 5 minutes while a significantly higher (12%) set of respondents had to wait more than 10 minutes before they actually got an active agent. Researcher would

like to note that actual waiting time on hold and perceived waiting time on hold by respondents might vary quite a bit and latter generally be higher than former. But the study also wants to note that for respondents, perception is reality, thus whether it is correct or not doesn't have any impact.

Before examining the regression model a correlation matrix was conducted. All the correlations were significant at 99% confidence level. Empathy had the highest correlation with retention (0.730). The next highest correlated variable with retention was attentiveness which had a correlation of 0.711. Responsiveness and adaptiveness had correlations of 0.702 and 0.676 respectively. Both responsiveness and empathy were highly correlated with each other (0.780 and 0.781 respectively). All the independent variables exhibits significant correlations with other independent variables, this was a warning sign for the researcher. Thus the researcher decided to include multicollinearity diagnostics into the analysis.

As depicted in table 2, all three variables in the equation have VIF values less than 10 and tolerance values higher than 0.2 which signals a model with low multicollinearity.

Table 2: Coefficients and colinearity statistics

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Colinearity Statistics	
	B	Std. Error	Beta			Tolerance	VIF
1 (Constant)	.998	.148		6.748	.000		
Empathy	.793	.027	.730	29.237	.000	1.000	1.000
2 (Constant)	.366	.154		2.381	.018		
Empathy	.506	.039	.466	13.037	.000	.433	2.311
Responsiveness	.426	.043	.351	9.802	.000	.433	2.311
3 (Constant)	.146	.155		.940	.347		
Empathy	.389	.043	.358	9.025	.000	.337	2.968
Responsiveness	.296	.048	.243	6.148	.000	.338	2.956
Attentiveness	.276	.048	.242	5.794	.000	.305	3.283

a. Dependent Variable: Retention

Table 3: Regression Model Summary

Model	R	R square	Adjusted R square	Std. error of the estimate
1	.730 ^a	.533	.533	1.022
2	.766 ^b	.586	.585	.963
3	.777 ^c	.604	.603	.943

a. Predictors: (Constant), Empathy b. Predictors: (Constant), Empathy, Responsiveness c. Predictors: (Constant), Empathy, Responsiveness, Attentiveness

The final model which was selected by the study to interpret, included three predictors namely attentiveness, responsiveness and empathy, and could explain 60% of the variation of the dependent variable which is behavioral intentions. Table 3 provides more details on the three models developed by the step wise regression process. Regression equation was determined as follows.

$$\text{Retention} = 0.146 + 0.276 (\text{Attentiveness}) + 0.296 (\text{Responsiveness}) + 0.389 (\text{empathy})$$

Attentiveness ($b = 0.276$) value indicates that when attentiveness of the call center agent increases by one unit in the scale, retention increases by 0.276 units in the scale. Responsiveness ($b = 0.296$) value indicates that when the responsiveness of the call center agent increases by one point in the scale, retention increases by 0.296 units in the scale. Empathy ($b = 0.389$) value indicates that when a respondent rated one unit higher on the empathy scale, respondent retention tendency will increase by 0.389 units on the scale. Moreover t-test values can be used to see whether the predictor is making a significant contribution to the model (Field, 2006). Therefore highest contribution comes from the empathy (t-test value = 9,025) while attentiveness and responsiveness contributes respectively (t-test values 6.148 and 5.794 respectively).

First hypothesis of the study stated that perceived attentiveness has a positive impact on behavioral intentions. Attentiveness had an unstandardized Beta value of 0.271, a t- test value of 5.66 and was significant at 0.01 level. Thus research decided to accept the 1st hypothesis which stated that perceived attentiveness has a positive impact on behavioral intentions. Attentiveness signals how successful the call center agent is in creating a successful interaction (De-Ruyter & Wetzels, 2000). Therefore the study highlights the importance of creating a positive interaction with the caller.

2nd Hypothesis of the study stated that perceived responsiveness has a positive impact on behavioral intentions. Responsiveness had an unstandardized Beta value of 0.280, a t-test

value of 5.56 and was significant at 0.01 level. Thus research decided to accept the 2nd hypothesis which stated that perceived responsiveness has a positive impact on behavioral intentions. Responsiveness creates trust in the eyes of the consumer (De-Ruyter & Wetzels, 2000), thus the above findings are logically related.

3rd Hypothesis of the study stated that perceived empathy has a positive impact on behavioral intentions. Empathy had an unstandardized Beta value of 0.361, a t-test value of 7.05 and was significant at 0.01 level. Furthermore empathy had the highest ability of prediction out of all other variables in the equation. Therefore research decided to accept the 3rd hypothesis which stated that perceived responsiveness has a positive impact on behavioral intentions. The individual attention given to the customer determines how much empathy was created during the transaction (Burgers et al., 2000). The importance of empathy in employee satisfaction is well documented in the literature (Kettinger & Lee, 1994).

Final hypothesis of the study stated that perceived adaptiveness has a positive impact on behavioral intention. Adaptiveness had an unstandardized Beta value of 0.052, a t-test value of 1.01 and was not significant at 0.05 level (sig = 0.309). Thus the hypothesis which stated that perceived responsiveness has a positive impact on behavioral intentions was rejected by the study. Adaptiveness deals with the flexibility shown by the call center agent. These findings are in contradiction with the existing literature; which suggests positive impact between these two dimensions (Burgers et al., 2000). Table 4 provided summary of the hypotheses testing.

Table 4: Summary of the hypotheses tested

Hypothesis	Results
1: Impact of Attentiveness on Behavioral Intentions	Accepted
2: Impact of Responsiveness on Behavioral Intentions	Accepted
3: Impact of Empathy on Behavioral Intentions	Accepted
4: Impact of Adaptiveness on Behavioral Intentions	Rejected

FINDINGS AND CONCLUSIONS:

Study found out that demographic variables have some kind of influence in respondent's voice to voice perceptions. However at the same time it is important to note that these differences are minimal and do not impact the firm's ability to influence consumer perceptions.

However as far as call center related factors are concerned there is significant room for firms to improve. Especially when it comes to customers on hold time, even though researcher assumes that waiting times may be inflated due to the nature of the interaction, still customers are kept on hold for significant period of times. The situation becomes even worse because of the fact that some of these customers wait on paid lines. However study also wants to note the positive perceptions by customers across all areas and across all companies. This as far as the study has identified is due to proper and effective training of the call center agents. Therefore study would recommend these firms to maintain these higher standards. Study found out significant relationships as well as the impact on three perceptual antecedents on behavioral intentions. Namely attentiveness, responsiveness and empathy have significant impact on customers' willingness to be with the firm in the long run. As pointed out earlier, attentiveness, empathy and perceptiveness has also been found earlier as significant predictors of behavioral intentions (Mount and Mattila, 2002), and which supports the findings of this study. Thus a firm needs to identify and manage call center voice to voice encounters properly.

ABSTRACT

The ban on advertising for liquor and cigarette is now likely to be extended to surrogate advertising that defeats the purpose. Another problem came into focus when brand extension strategy used in response to the ban on advertisements of one product category. Although many of the consumers know the negative effects of surrogate advertising for alcohol and tobacco products but this particular study aims to quantify the ill effects caused by it, will definitely increase their responsibility

towards health. Major portion of respondents believe that surrogate advertising leaves a wrong impression on corporate reputation and corporate are losing their potential on ethical ground. The statutory warning could be more effective to increase consumer awareness if it quantifies how much it is responsible for health hazards. An amount of respondents thinks that it is a normal promotion of products and does not affect on their purchase and usage decision. The antecedents and consequences proposed by the study model designed based on the literature, appeared reasonably valid.

Keywords: Surrogate advertising, brand extension, corporate reputation, India

INTRODUCTION

Corporate communication carries the essence of a corporate identity (Balmer, 1998; Scott and Lane, 2000). As ethical concerns are an inseparable factor of business, advertising cannot ignore them. It is a communication process directed from the marketers towards the consumers. The basic objective of advertisement is to provide information and create awareness about the product and the market. According to Wells and Burnet (1998, p.13) advertising is a paid non-personal communication from an identified sponsor using mass media to persuade or influence an audience. However, many times some advertisements are accused of misleading the mass. Such accusations came in the lime light when the flashes are on the advertisements that are openly endorsing liquor and tobacco products. Consumer awareness was carried out on topics ranging from MRP to Gold Hallmarking, ISI marked products, expiry dates etc. Numbers – it really matters. This particular study aims to quantify the direct and indirect ill effects caused by this kind of advertisements and aims to increase consumers' degree of personal responsibility towards their health.

REVIEW OF LITERATURE

Surrogate advertisement: A Surrogate advertisement is one in which a different product is promoted using an already established brand name such ads helping in contribution to brand recall (ASCI – Laws Governing Ads). 'Surrogate advertising' is one of the emerging ethical issues in advertising in India (Chander & Sharma , 2007). Advertising leads to awareness. Keller (2003, p.76) defines awareness as “ the customers' ability to recall and recognize the

brand as reflected by their ability to identify the brand under different conditions and to link the brand name, logo, symbol, and so forth to certain associations in memory". Surrogate advertising is performing the same in a substitute way. Despite significant contributions in the past, there is still a growing need for answers in the area of business ethics and social responsibility of the firm (Donaldson, 2003; Harrison and Freeman, 1999; Walsh et al., 2003). Chander and Sharma (2007) found that, the attitude of the respondents towards surrogate advertisements are much on the negative side. Through surrogate advertising Tobacco and alcohol companies' left unethical impact on their corporate reputation, challenge consumes ethical consciousness, government policies, corporate strategic practices etc.

Corporate reputation and communication: Fombrun and van Riel (1997) sought to subsume corporate image and identity within reputation. Bromley (2001) defined a firm's image as 'the internal collective\state of mind that underlies its corporate communications efforts (successful or not) to present itself to others'. A corporate identity is their reputations through corporate communication (Balmer and Gray, 1998; 2000). To obtain a reputational status, a company should consider different ethical dimensions of advertising (Cunningham and Cunningham, 1977; Zanoletti and Pincus, 1983; Hunt and Vitell, 1986; Zinkhan et al., 1989; Treise et al., 1994; Miniard, 1999; Cohan, 2001; Perry and Berky, 2002). The behavior of firms and the values guided the means of achieving the goals, can be broadly extended to corporate communication. A failure to communicate ethical values and socially responsible behavior impacts on corporate identity as it depends on organizational values and behaviors (Fombrun, 1996; van Riel and Balmer, 1997). Benetton positions its corporate identity successfully with strong ethical values in its marketing communication campaigns and social initiatives (Borgerson, J.L., Schroeder, J. E., Escudero Magnusson, M. and Magnusson, F., 2009). It is desired, a responsible corporate should be participating actively in ethical social dilemmas (Löhman & Steinholz, 2003; Philipson, 2004) and proper Communication, as it is an important part in ensuring future business (Charter & Polonsky, 1999). Corporate reputation implies individual's knowledge or emotions since these indicate an awareness of the firm. Empirical evidence has supported the argument that consumers gave a positive appraisal if news media focus on ethical issues (Christians & Nordenstreng, 2004; Berkman & Shumway, 2003) and it will definitely hurt firm's reputational indicator. Once there is negative impact in a company's reputation because of ethical issues like surrogate advertising, it is nearly impossible to influence the consumers' attitude and their enduring beliefs towards the positive way.

Questionable use of Best corporate practices: Brand extensions can be defined as the stretch of the established franchise to a different product class (Aaker and Keller, 1990). The advantage of extensions compared to new brand names is it requires lower marketing and brand development costs (Smith and Park, 1992), borrow awareness and positive associations from the parent brand (Aaker & Keller 1990; Volckner & Sattler 2006; Ahluwalia 2008) and appeals to the prospects. The argument is on using brand extension strategy by the tobacco and alcohol companies to capitalize equity, based on their core business. Mehta (2003) and Sirisha and Mukund (2003) give lights on the deceptiveness of surrogate advertising and how they entering into new businesses like cassettes and CDs, mineral water, soda, giving sponsorship on holiday packages, entertainments with the same brand name, logo or symbols. Parent brand category dominance (Keller, 2003) may help the surrogate advertisers to keep hold of their actual business. There is nothing to counter as so far no universal model has been widely recognized which could offer guidelines for brand extension practices (D'Astous, Colbert, and Fournier 2007; Sood and Dreze 2006; Echambadi, Arroniz Reinartz & Lee 2006) or anything declared that brand extension is not allowed for banned products. Thus surrogate advertising leads questionable implementation of the brand extension strategy using restricted brand names.

Surrogate advertising increase consumers' advertisement involvement: The key purpose of surrogate advertising, is to motivate consumer characteristic like influencing their positive mood for their core brand (Nijssen et al., (1995), Broniarczyk and Alba (1994), Gurhan-canli and Maheshwaran (1998), Barono et al. (2000), Flaherty and Pappas (2000), and Klink and Smith (2001). Involvement is a motivational condition in which people have an impact on their decisions and actions. In the current study, involvement can be simply defined in the context of motivational properties evoked by a particular stimulus such as advertisement. This study seeks to know whether Surrogate advertising may advance the degree of involvement towards the tobacco and alcohol products. According to J. Craig Andrews, Srinivas Durvasula, Syed H. Akhter) as it carries intensity, direction and persistency towards usage, purchase decision etc. Moreover advertising involvement (e.g., Andrews 1988) facilitates message-oriented thoughts, message-argument recall. Using tobacco and alcohol brand names in ads helping in contribution to brand recall (ASCI) only. Active involvement, identification is an important motivation for, and outcome of, media exposure (e.g., Ang, 1982/1985).

Defying Government policies and socially irresponsible behavior: Keller and Aaker (1997) defines Corporate Social Responsibility as a “firm’s philosophy to improve the quality of life in local communities through various activities and programmes”. In contrary, Chander and Sharma (2006) opine that surrogate advertising promotes wrong impressions and leads to social degradation. “Business is not divorced from the rest of society. How companies behave affects many people, not just shareholders. A company should be a responsible member of the society in which it operates” (Internet, World Business Council for Sustainable Development, 1, 2006). Through surrogate advertising companies are showing their socially irresponsible behavior.

Issues of concern: This kind of indirect advertising also may increase involvement, which has an impact on consumers’ decisions and actions, original brand original product category recall, identification. All of these may lead to addictive disorder like alcoholism and tobacco addiction. A market survey in 2001 revealed that advertising has a direct influence on the consumption habits of 431 million people in India and an indirect impact on 275 million ‘aspirants’ from the lower income group (Mehta 2003).

Another problem came into focus when Companies started offering new product sharing the same brand name as it was used for tobacco and alcohol products. (Ex: Companies such as Kingfisher have several businesses with the same brand name - such as mineral water, airline and soda). The vision behind selling drinking water and apple juice packaged by alcohol companies is getting young people to start early and be life-long consumers (Raekha Prasad, 2009).

Tobacco and alcohol takes enormous lives daily. Alcohol is the leading risk factor related to the major burden of disease in low mortality developing countries and the third most prevalent risk factor for leading diseases and injuries in developed countries (WHO, 2002). To maintain the customer base the companies started attracting children, youth and women and producing a range of feminized brands associating smoking with slimness, modernity; sophistication. Some examples are Virginia slims, glamour, camel pink etc. (TAPS).

Companies are not only violating ethical issues but also abusing corporate social responsibility. “Godfrey Philips Bravery Awards” is an example of media- hyped CSR activity. The company would justify the advertisement by claiming that it is an example of

social responsibility. By using the tobacco brand, they are only, contradicting with their aim and responsibility towards society.

Research gap: Although the previous studies examined the ethicality of advertisements on controversial products like cigarettes, alcoholic beverages (pomeroy, castellano, Becker, Johnson, and Brown 1992; Zinkhan et al. 1989), but in India, there are still a number of unresolved issues in the area of surrogate advertising. The study has not been confined on the controversial use of surrogate advertising but further extended on the consequences like corporate irresponsible nature towards its surrounding by targeting segments like youth, feminism; challenge consumers' ethical concern, defying government policies, questionable use of brand extension strategy which are largely neglected issues yet.

The objective of the paper: Consumer awareness and protection has been recognized, as a major thrust area of this study. This particular study aims to quantify the direct and indirect ill effects caused by surrogate advertising.

This study has been undertaken to address the deficiency of research in the field of surrogate advertising by exploring people's perceptions towards such controversial advertising practices and related ethical issues.

The paper is offered as an information service to consumers, companies, and academicians and could play a pivotal role in creating mass awareness.

Proposed study: The research accounted in this paper is a preliminary assessment of some antecedents or previous circumstances and consequences of surrogate advertising, proposed by the study model designed based on the literature framework.

Antecedents

Consequences

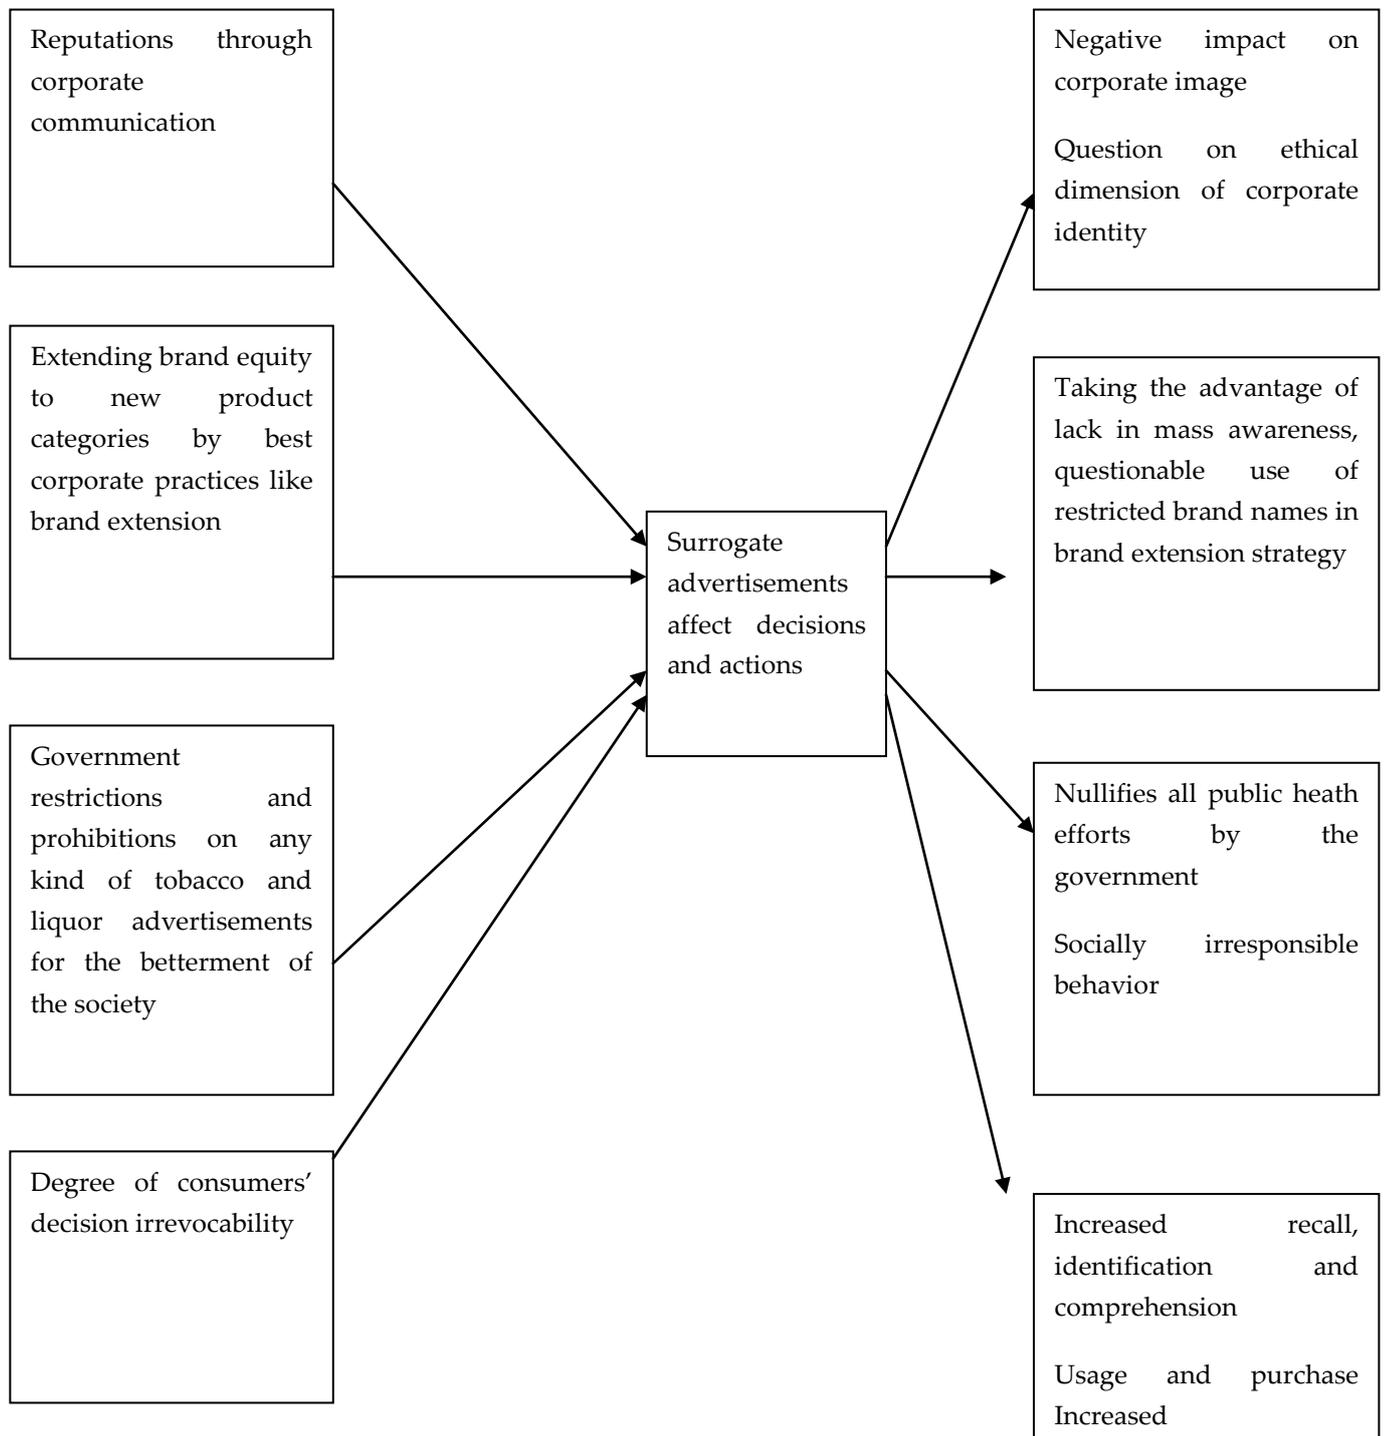

Fig. 1 Solid arrows signify direct influences

METHODOLOGY

Table 1

Descriptive research: Quantitative analysis was done based on a survey using convenience sampling in Kolkata, India. The sample comprising of two forty two respondents.

In an attempt to answer following questions of the research, which were;

1. According to you for this type of surrogate advertising,

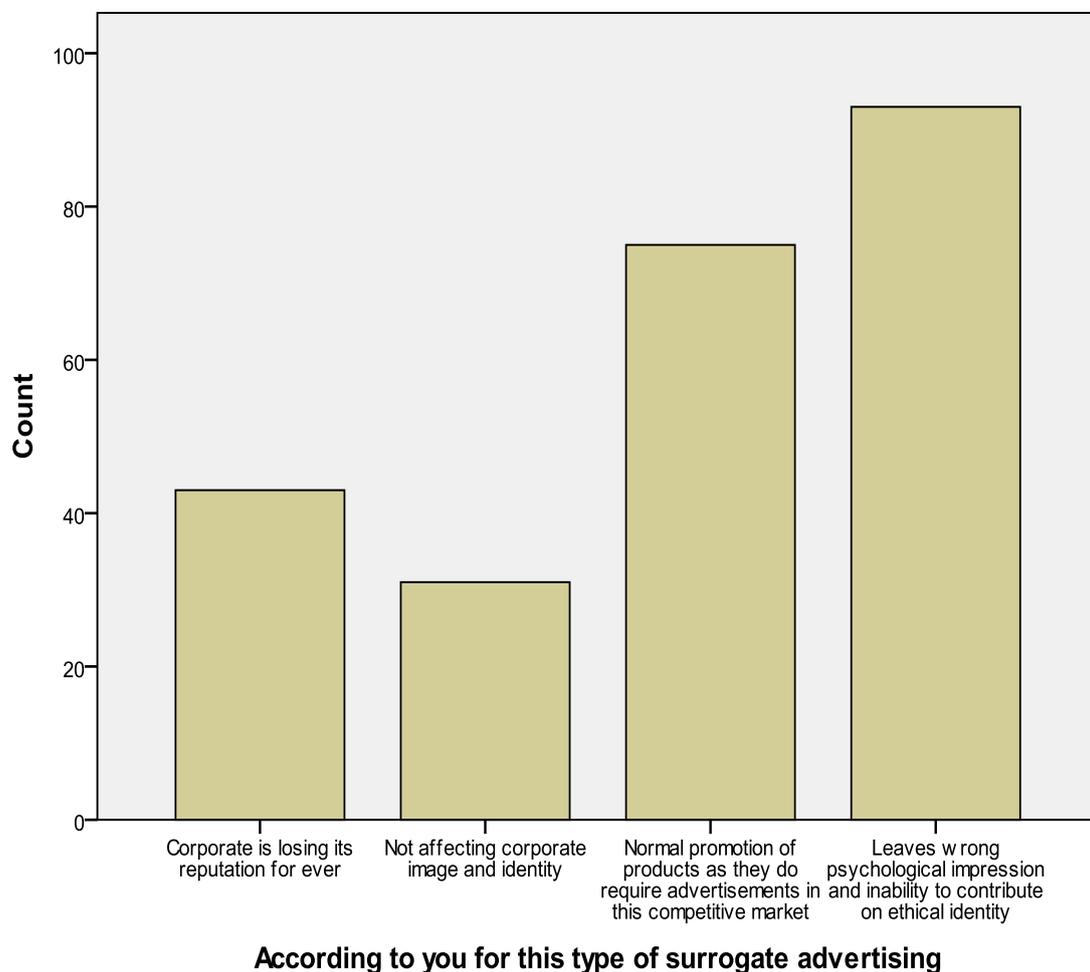

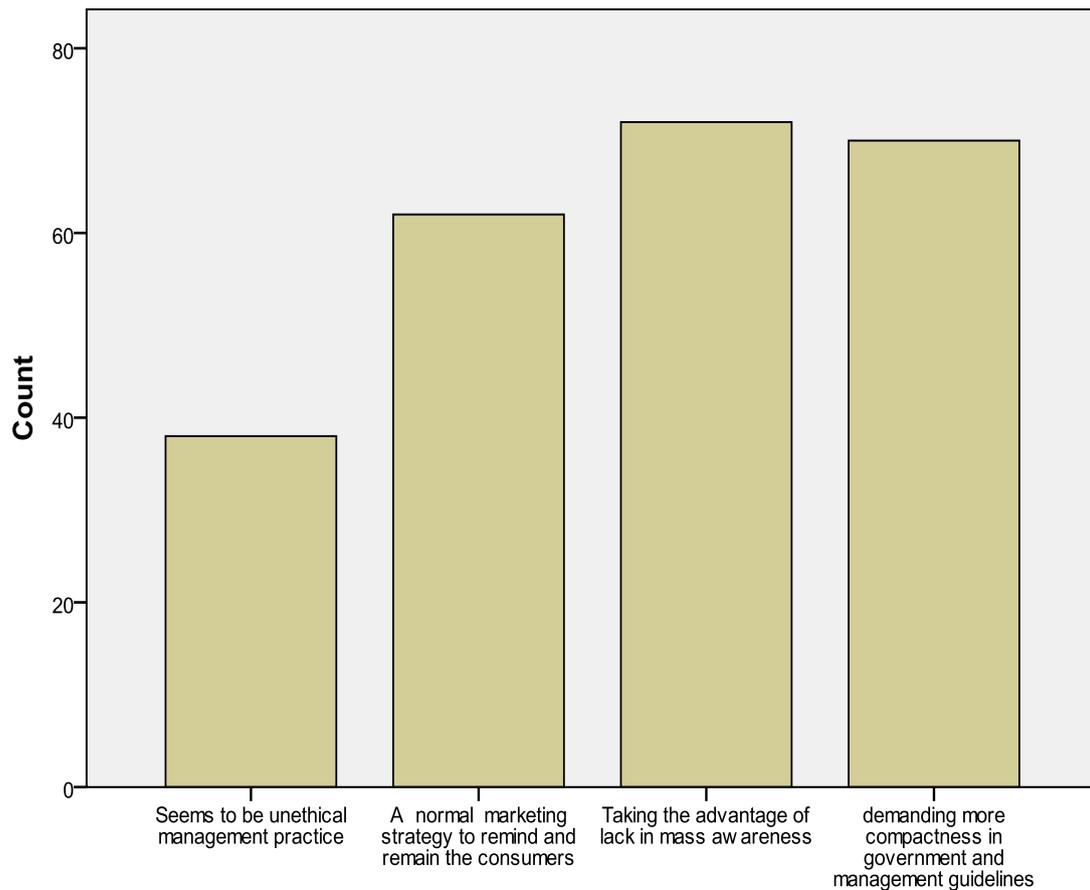

Fig. 2

The greatest amount of respondents believed it increase involvement towards tobacco and alcohol. The second highest finding it as normal promotion of products. The logic behind this

is if there is no restriction on sell then why on advertising? It is necessary to advertise in the competitive market. Few respondents found it responsible for loosing corporate reputation and few found it not effecting corporate image and identity.

2. According to you, introducing mineral water, CDs under the tobacco and alcohol brand name is

According to you, introducing mineral water ,CDs under the tobacco and alcohol brand name is

Fig.3

Common mass is unaware of the fact that brand extension is a qualified branding strategy but it is used in brand stretching of restricted products via introducing mineral water, CDS etc.

3. Can you identify the Brand of the ad campaign in which Saif Ali Khan, Yuvraj Singh and Harbhajan Singh played music on the streets?

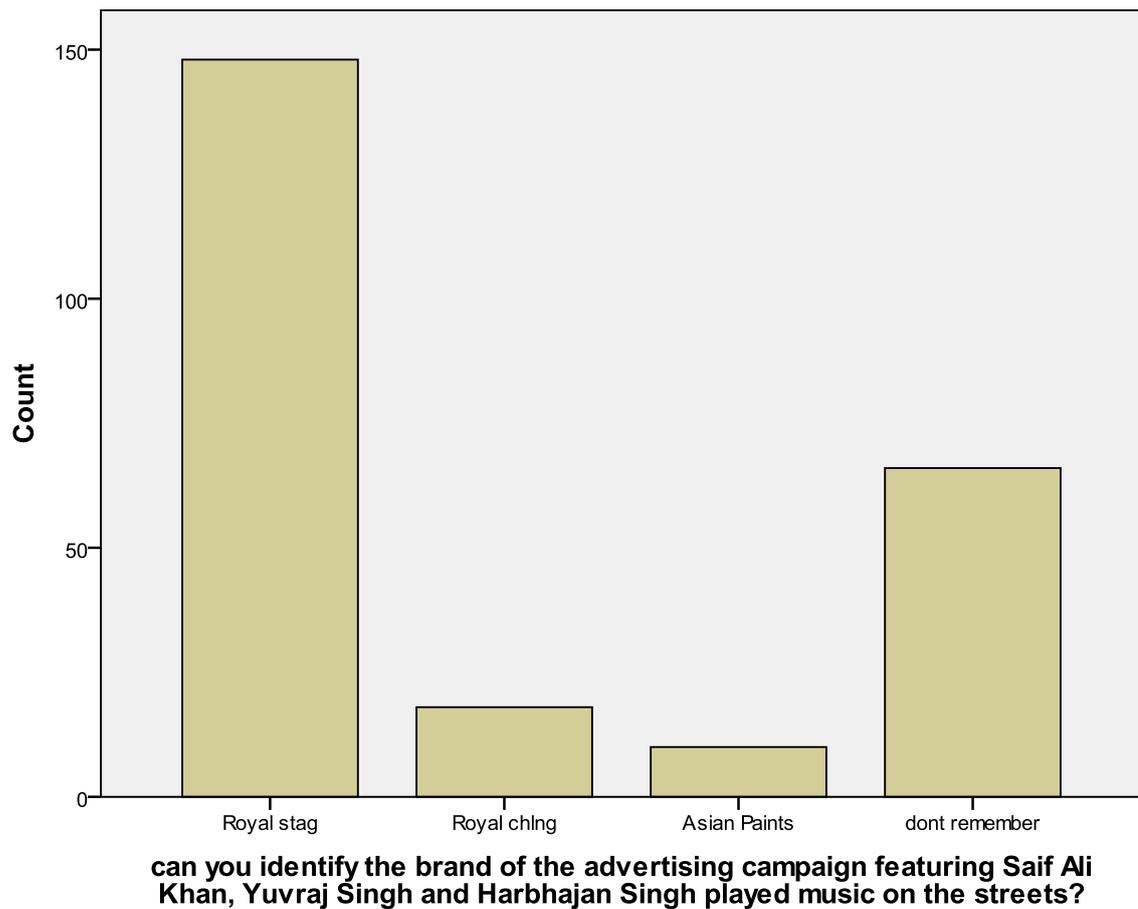

Fig. 4

The greatest amounts of respondents easily spot the brand name. It emphasizes the strong identifiable level of the original brand through surrogate Ads.

4. According to you what would be the probable approach to normalize the current problem?

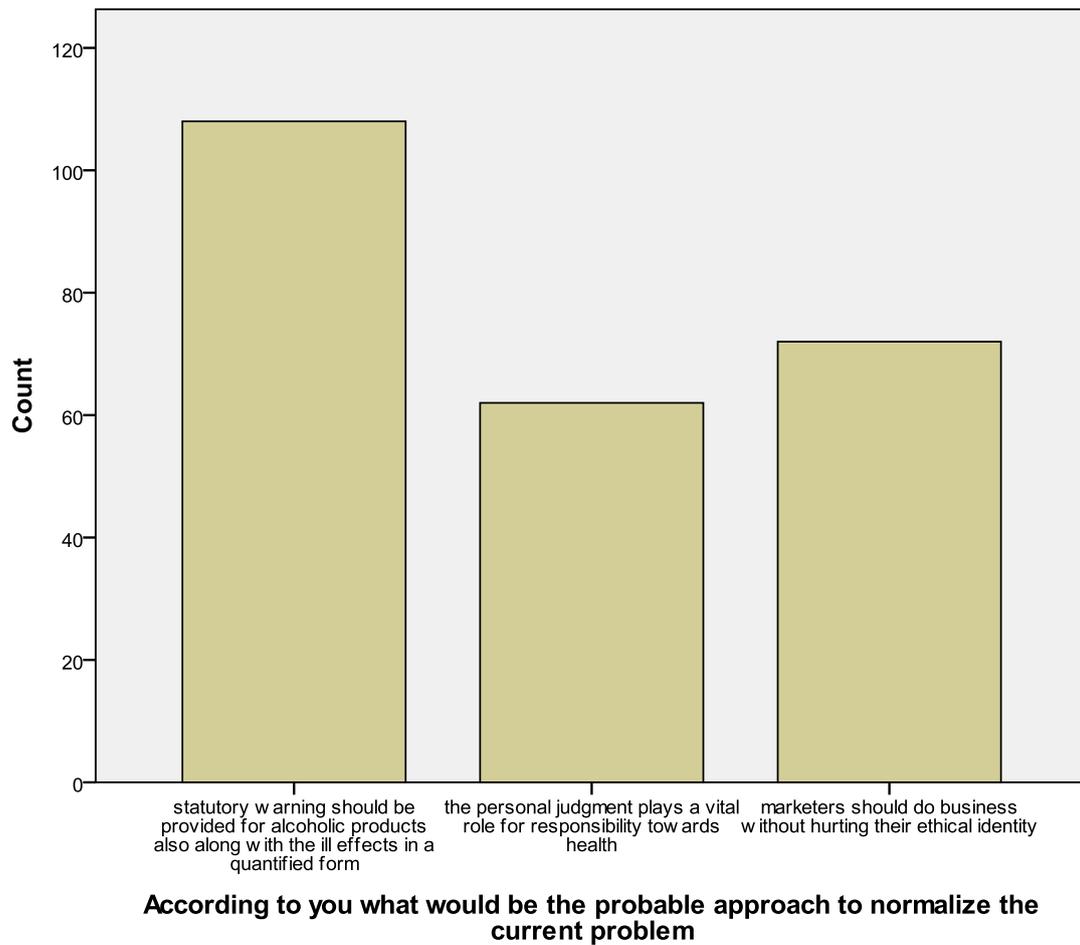

Figure - 5

4. Is there any significant relationship between number of tobacco and alcohol brand advertisement viewership and increase in usage and purchase decision?

Seen advertisements on various media * Increase usage and purchase decision Crosstabulation

			Increase usage and purchase decision		Total
			yes	no

		% of Total	57.9%	42.1%	100.0%

Table – 4

The above cross tabulation shows that the surrogate Ads helps the organization to advertise their product in a different way and make a brand original product category recall at the time of purchase.

Chi-Square Tests

	Value	df	Asymp. Sig. (2-sided)	Exact Sig. (2-sided)	Exact Sig. (1-sided)
Pearson Chi-Square	3.146a	1	.076		
Continuity Correction ^b	2.700	1	.100		
Likelihood Ratio	3.148	1	.076		
Fisher's Exact Test				.090	.050
Linear-by-Linear Association	3.133	1	.077		
N of Valid Cases	242				

a. 0 cells (.0%) have expected count less than 5. The minimum expected count is 47.21.

b. Computed only for a 2x2 table

Table – 5

According to chi-square test of association, there is no association ($p = .076 > .05$) found between original brand original product category recall at the time of purchase any of their extended product and surrogate ads.

Findings: As per descriptive analysis, major part of the group saw the Ad as an offensive corporate activity leaves wrong psychological impression and shows inability to contribute on ethical identity. Moreover it Challenges consumers ethical concern, since these behaviors are related to moral feelings about right and wrong (Clow&Baack, 2007).

In contrary, an amount of respondents supports the fact that it as a normal promotion and marketers do require advertisements of their products in this competitive market. As the sales of these, products are not banned. However, there is also a major group of respondents who are confused about questionable practice of brand extension strategy used in response to the ban on advertisements of one product category. The result reveals that the higher the number of viewers higher the identification level of brand and original products through surrogate ADs. Media effects on identification increase the association between exposure and impact (e.g., Basil, 1996). The cross tabulation result reveals that the higher the number of tobacco

and alcohol brand advertisement viewers, higher the increase of usage and purchase decision. Chi-square test there is strong association between higher the number of tobacco and alcohol brand advertisement viewers and increase of usage and purchase decision. Here we emphasize degree of personal responsibility associated with decision regarding usage and purchase of tobacco and alcohol products.

The major portion of respondents believe statutory warning should be provided for alcoholic products also and instead of general statutory warning provided for tobacco products, it should be quantified how much it is responsible for health hazards. The introduction of more graphic and bigger warnings for cigarettes has impacted on behavior (Hammond et al. 2003) and is a source of information for consumers (Hammond et al. 2006). It can be said that it will be definitely decrease the consumption rate.

Chi square test reveals there is no association between original brand original product category recall at the time of purchase any of their extended product and knowledge about tobacco and alcohol brands through surrogate ads. Emphasizing there are respondents who are unaffected by the Ad in terms of ABC (awareness, branding, and communication) and it does not affect any more on their purchase decision.

DISCUSSIONS AND RECOMMENDATIONS

Services or products sometimes go wrong. Therefore, to maintain a brand's reputation it is important to Deal with this effectively. In India, the top management, in their speeches has been resorting to social reporting but it should be more serious in nature (Bhatia, 2005 & Raman, 2006). Social responsibility of a brand broadly affects consumers' overall evaluation of the company, which in turn creates a preference of the consumers for the products inherited from the same brand. Empirical evidence has supported that argument that consumers gave a positive appraisal if news media focus on ethical issues (Christians & Nordenstreng, 2004; Berkman & Shumway, 2003). While there is a continuous tug of war between government guidelines and corporate strategies, the personal judgment plays a vital role.

Counter-advertising also can be beneficial. It involves circulating information about a product (in this context tobacco and alcoholic products), its effects, or the industry that promotes it, in

order to reduce its appeal and use. It is distinct from other types of informational campaigns in that it directly addresses the fact that the particular commodity is promoted through advertising (Stewart 1997).

Need to develop clear and comprehensive laws and Mechanisms for tobacco and alcohol control policies. Special education and awareness should be communicated to save children, youth, females to not take it up and middle aged for quitting.

The alcohol problem must be addressed in a more concerted manner by international organizations such as the World Health Organization and the United Nations Drug Control Programme, prohibition instead of restricting on advertising and sponsorships of public events, which can create an erroneous impression on consumers.

NGOs such as HRIDAY (Health Related Information Dissemination Amongst Youth)-SHAN (Student Health Action Network), created a supportive environment to enforce tobacco control measures. More and more NGOs should involve on CSR aspects because it needed external expertise.

Companies' are as responsible part of the society should respect and co-operate Government policies and laws as ethical values and social commitments can strengthen corporate identity (e.g., Bhattacharya et al. 2004).

These are the findings and recommendations that serve as guidelines for both individuals and organizations; they help make boundaries regarding what is acceptable and what is not. According to Leo Burnett "Let's gear our advertising to sell goods, but let's recognize also that advertising has a broad social responsibility."

RESEARCH LIMITATION AND INSPIRATION

The literature on surrogate advertising is very scanty as the problem is of recent origin and is confined to the countries where advertising such harmful products is banned.

In Asian context, many of our countries in Asia have not given alcohol the serious attention but Indian Government has been taking several steps to restrict and prohibit the same. Sirisha and Mukund (2003) opined that liquor surrogate advertising in India has faced a series of challenges.

INNOVATION AND SME GROWTH: THE CASE OF PALESTINE

Sultan, Suhail Sami

Birzeit University, Palestine, ssultan@birzeit.edu

ABSTRACT

The development of small and medium-sized enterprises (SMEs) has long been regarded as a seedbed for economic growth. In the case of the future State of Palestine, the importance of these enterprises as an engine of growth is even more crucial within the economy's weak and distorted supply capacity, and the limited size of local markets. This research paper presents the drivers, dimensions, and achievements of innovations carried out by SMEs in the agribusiness, furniture and stone and marble sector in Palestine. Further, it discusses the growth rates of innovative SMEs vis-à-vis non-innovative SMEs. Thereafter, it has explored and analyzed the relationship between innovation and growth with respect to innovative SMEs of the three sectors.

Results of the survey show that a substantial proportion of SMEs in all the three sectors are innovative, mostly informally. Most of the innovative SMEs attributed the origin of their innovations to a combination of internal factors such as self-motivation, technical qualification, knowledge, experience, and innovative ideas of entrepreneurs, and external factors like customer requirements and demand, information provided by suppliers of equipments and materials, market opportunities, and competition.

Innovative SMEs have primarily focused on both product and process innovations in the three sectors and a substantial majority of these innovative SMEs registered higher growth relative to non-innovative SMEs in terms of sales turnover, and employment.

Keywords: Innovation, SME, Growth, and Palestine.

INTRODUCTION

The contribution and significance of small and medium-sized enterprises (SMEs) as an important engine of growth are receiving increased attention in both developed and developing countries. These enterprises are often regarded as the "backbone" of the economy, serving as major sources of development, new jobs and a seedbed for entrepreneurship. Such a prominent role is mainly attributed to their flexibility in responding to emerging opportunities and their flexibility in the face of adverse conditions.

In the case of Palestine, the development of SMEs ranks high on the Palestinian Authority's (PA) policy agenda. However, relatively little is known about the dynamics determining their birth, expansion and closure. A solid understanding of these dynamics is extremely important at this critical stage of the development process. Enterprises are facing increasing pressures as the criteria that define best practice in production are continually evolving to reflect the constant pace of upgrading in both product and process technologies. They are also continually seeking to adhere to international standards on quality assurance, environmental standards, labor norms and social ethics, all of which are becoming critical determinants of global competitiveness.

Given the above, this research paper attempts to understand issues such as what factors drive SMEs to innovate, what is the nature of SME innovations, what are the achievements of SME innovations. As well, it discusses the growth rates of innovative SMEs vis-à-vis non-innovative SMEs. Thereafter, it has explored and analyzed the relationship between innovation and growth with respect to innovative SMEs in the agribusiness, furniture and stone and marble industries.

LITERATURE REVIEW

For over a decade of economic volatility and political instability, the Palestinian private sector has demonstrated dynamism and the ability to adapt to changes. However, the global economic landscape is very different today from what it was in the past, and with these new global realities, the Palestinian private sector will have to be very creative and efficient to catch up with the competition. SMEs are generally more flexible, adapt themselves better, and are better placed to develop and implement new ideas. The flexibility of SMEs, their simple organizational structure, their low risk and receptivity are the essential features facilitating them to be innovative (Harrison and Watson 1998). Therefore, SMEs across industries have

the unrealized innovation potential (Chaminade and Vang 2006) and these innovations are likely to be an important determinant of their success (Hoffman et al. 1998).

.However, the ability and innovative capacity of SMEs varies significantly, depending on their sector, size, focus, resources, and the business environment in which they operate (Burrone and Jaiya 2005). Particularly innovation in the manufacturing sector is a very complex process which is propelled by numerous factors (Becheikh et al. 2006). There are internal and external factors that lead firms to innovate (Porter and Stern 2001). Firms should have in-house competence in the form of technically qualified and motivated entrepreneurs or managers with innovative ideas and technically skilled employees. Similarly, there must be a market demand for the innovated products in the form of an explicit customer demand or implicit market opportunities. Of course, the relative importance of these internal as well as external factors might vary from firm to firm or from industry to industry or even from economy to economy and from time to time.

SMEs might undertake only process innovations in the form of material substitution, change in technical process of manufacturing, etc. to achieve cost reduction or quality improvement or product innovations in the form of changing product shapes/dimensions/sizes or introducing improved or new products, or both (Freeman and Soete 1997). According to Hoffman et al. (1998) SME innovations are more likely to involve product innovation than process innovation (which is important nonetheless). Reid's (1993) study ascertained that 60 percent of the surveyed firms had undertaken both product and process innovations. Martinez-Ros (1999) found that product and process innovations are interdependent and closely linked.

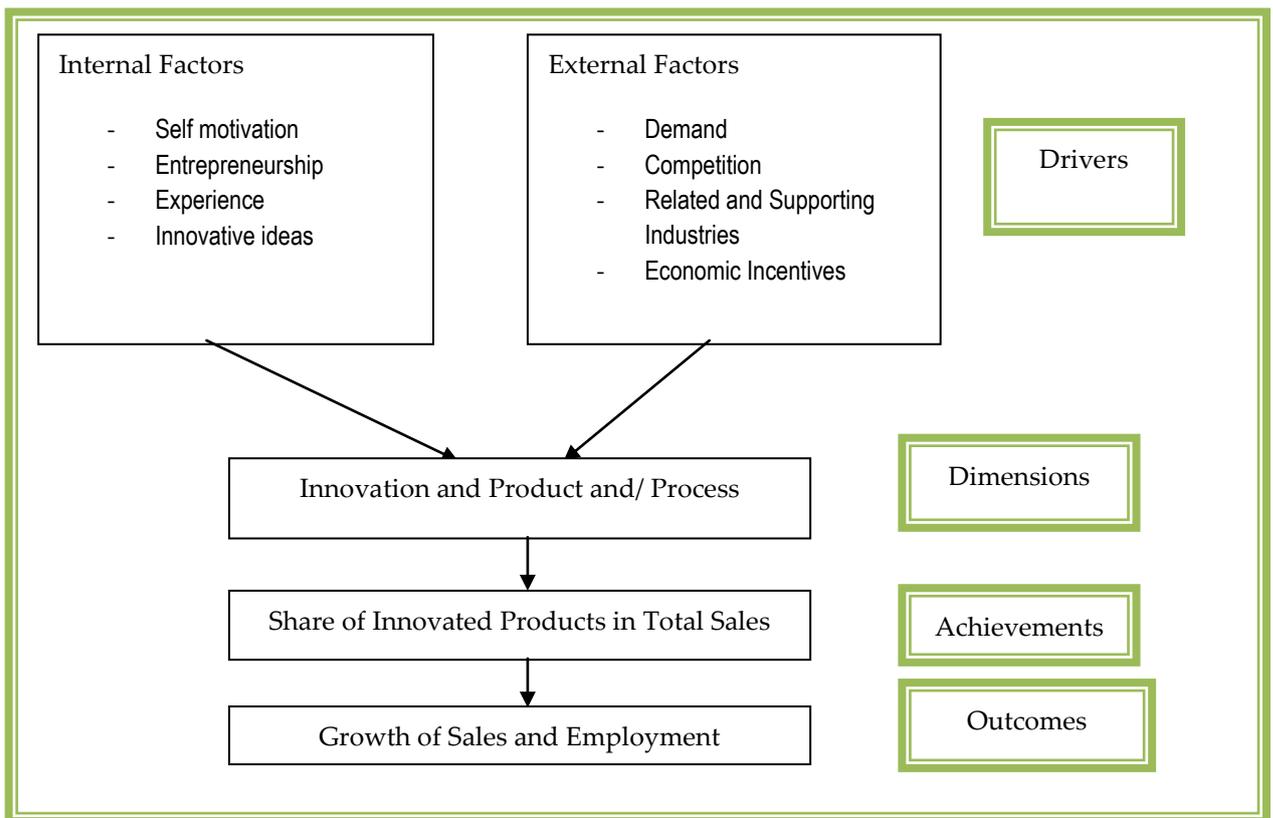

SMEs need innovative products in order to gain and maintain competitive advantages (Lee 1998). If they succeed, they will be able to realize a greater share of such innovated products in their total sales. Lehtimaki (1991) observed in the context of Finnish SMEs that on the average, the contribution of innovated new products was more to total sales than to profits. Roper (1997) whose study focused exclusively on product innovations in German, UK, and Irish SMEs, ascertained that the output of innovative SMEs grew significantly faster than that of non-innovators implying that innovated products contributed to the faster growth of the former. Engel et al. (2004) found that sales turnover of innovative firms grew faster than that of non-innovative firms. They detected a significant relationship between the share of innovative sales and sales turnover change of firms. Lumiste et al. (2004) found that innovation effects were felt in terms of both product-oriented results such as (i) improvement

in quality of goods and services, and (ii) increased range on goods and services, and process-oriented results like increased production capacity and improved production flexibility.

Roper (1997) comparing the innovation strategies of German, UK, and Irish SMEs, observed that there is a strong association between innovation and turnover growth. But Edwards et al. (2001) argued that growth is not necessarily dependent on those factors attributed to 'innovative potential'. Of course, they further stated that this does not mean that innovation does not lead to growth, rather there is a need to develop methods to assess the relationship.

Bala Subrahmanya (2001) observed that SMEs of North East England pursued radical innovations as a strategy of firm growth though he did not explicitly probe the relationship between innovation and growth. Danneels and Kleinschmidt (2001) claimed that innovative products present great opportunities for SMEs in terms of growth and expansion into new areas though they did not study the relationship between innovation and growth. Lumiste et al. (2004) found that innovation helped Estonian SMEs to improve their performance in terms of market share and diversified range of goods and services. However, they did not study whether the size of those SMEs changed over time.

However, all of these studies are related to industrialized countries and therefore their relevance to a developing country like Palestine might be questioned. USAID (2006) conducted a survey four eight industrial clusters in Palestine with a special focus on agribusiness, furniture and stone and marble sectors. These sectors managed to stand in front of the instable political and economic environment in the region. Figure (1) presents the conceptual framework of the study.

Figure 1: Innovation and SME growth

There are four primary issues concerning innovation and growth of SMEs: (i) driving forces, (ii) dimensions, (iii) achievements, and (iv) outcomes. What factors drive SMEs to innovate? Are they internal factors or external factors, or both? What kind of innovations do SMEs undertake? Are they exclusively product focused or process focused or do they necessarily have to undertake both together? What are the achievements of innovation by SMEs? If innovation is successful, whether new products or improved products emerge due to product or process innovations, the share of such innovated products is likely to increase in the total sales of the firm. If this happens, such firms would be able to achieve growth in their sales turnover and employment resulting in the growth of firm size.

RESEARCH OBJECTIVE

The research paper has the following objectives:

- Assess the drivers, dimensions and achievements of innovations carried out by SMEs
- Assess the growth rates of innovative SMEs vis-à-vis non-innovative SMEs
- Discuss the relationship between innovation and SMEs growth

RESEARCH METHODOLOGY

An academic and business literature search was conducted to capture the domain of each potential construct adequately. As part of the literature review, books, journal articles, tertiary literature such as indexes and catalogues, company minutes, internet sites, chambers of commerce surveys and professional association surveys have been used.

A combination of the quantitative and qualitative methods is used employing both quantitative and qualitative data and offering an opportunity in order not to test the hypotheses but also to explore deeply into the issues raised by the research questions (Saunders et al. 2000). The multi-method design enables triangulation to take place.

The area random sampling is used. The population is the sum of all SMEs working in the three industrial sectors (agribusiness, furniture, and stone and marble cutting firms). The population has been divided into three strata based on the type of industry. Dividing the population into a series of relevant strata means that the sample is more likely to be representative, and each of the strata is presented proportionally within the sample.

The number of SMEs working in West Bank in each industrial sector is ranging between 380 and 420. The researcher selected a random sample that represents 10% of each industrial sector (i.e. 40 SMEs). The researcher used the survey as a quantitative method and the questionnaire as a tool to collect the primary data from 120 SMEs working in the three sectors. The questionnaire consists of three parts: part one covers the characteristics of SMEs, entrepreneurial background, location and year of establishment. Part two covers the driving forces, dimensions, objectives, sources, dimensions, achievements of innovation, and part three covers the economic variables such as employment, and sales turnover. The questionnaire was discussed with university academics, industry experts and representatives of SME associations. Cronbach alpha was calculated as 0.75.

The first objective was descriptively analyzed making use of frequency tables for innovative SMEs. Innovation was measured by asking the SMEs to prove any innovative product or process it developed during the last five years. The second objective was analyzed in terms of percentage growth of economic variables for both innovative and non-innovative SMEs. The third objective was analyzed for innovative SMEs using correlation analysis, analysis of variance (ANOVA), and regression analysis. As well, the researcher conducted semi-structured interviews with representatives of chamber of commerce, industrial associations and Ministry of National Economy to discuss the results of the survey.

RESULTS AND ANALYSIS

The main results of the research study are the following:

Drivers, Dimensions and Achievements of Innovations

All of SMEs in the three sectors were started as new ventures (i.e. entrepreneurs have set-up their firms to gain self-employment by implementing their innovative ideas and/or to exploit market opportunities) in 1980s and after. Majority of the entrepreneurs are in the age group of 40 to 50 years and hold associate degree or BA degree (mainly in accounting and languages). Their size characteristics revealed that size structure of the SMEs is more towards small to medium sized enterprises (i.e. less than 50 employees).

Table (1) shows that the majority of SMEs are innovative, during the last five years, in all the three sectors. A greater proportion of SMEs in the stone and marble sector is innovative relative to agribusiness and furniture sectors. SMEs are generally known for informal innovations, without any exclusive innovation department or documentation. They carry out their innovations along with their day-to-day manufacturing operations within the same premises.

Table 1: Innovative and Non-innovative SMEs

Classification	Number of SMEs		
	Agribusiness	Furniture	Stone and Marble
Innovative	32	25	35
Non-innovative	8	15	5
Total	40	40	40

Table (2) presents that a majority of the SMEs identified both internal and external factors as the driving forces of their innovations as discussed by Porter and Stern (2001). However, a considerable number of SMEs in the stone and marble sector has identified external factors as the driving force of their innovations. Those who have attributed their innovations exclusively to internal factors are not many. It is clear that both internal factors such as self-motivation, technical education background, work experience, and innovative ideas of entrepreneurs on the one hand, and external factors such as customer requirements,

information given by suppliers of equipments and materials, and competition are responsible for a majority of SMEs to innovate.

Table 2: Internal and External Drivers of Innovation

Drivers of Innovation	Number of SMEs		
	Agribusiness	Furniture	Stone and Marble
Internal Factors	2	4	5
External Factors	5	6	10
Internal and External	25	15	20
Total	32	25	35

Innovation could be at the product level and/ or process level. Product focused innovations comprised the introduction of new products and/or the improvement of existing products through changing product designs and dimensions or quality improvement to suit customer requirements. Process-based innovations involved the introduction of new process technology for existing products, adoption of cost reduction techniques, etc. Table (3) shows that a higher proportion of SMEs in the three sectors have undertaken both product and process focused innovations.

Table 3: Dimensions of SME Innovation

Classification	Number of SMEs		
	Agribusiness	Furniture	Stone and Marble
Product Innovation	3	5	6
Process Innovation	10	5	8
Product and Process	19	15	21
Total	32	25	35

Table (4) presents the share of innovative products in total sales in innovative SMEs. A higher percentage of innovative SMEs have succeeded in converting their innovations into sales in the stone and marble sector relative to furniture and agribusiness sectors. Among those SMEs working in the stone and marble sector which have succeeded in converting their innovations into sales, the majority accounted for a share of innovated products in total sales in the range of 10 percent to 25 percent. Thus, as shown in the table, more successful innovative firms might realize a higher share of innovated products in total sales compared to less successful innovative firms.

Table 4: Percentage of Innovated Products and/ or Processes in Total Sales

Percentage Share	Number of SMEs		
	Agribusiness	Furniture	Stone and Marble
Zero	4	6	3
Up to 10%	16	11	7
10% - 15%	8	5	10
15% - 25%	4	3	15
Total	32	25	35

Innovative and Non-innovative SMEs

The growth performance of SMEs has been analyzed in terms of sales and employment. The growth performance has been analyzed for all the SMEs of each sector—for innovative and non-innovative SMEs. For measuring growth, all the SMEs have collected together in each sector and did not separately identify growing ones from the rest. The SMEs were asked to present the growth of employment and sales during the last five years.

Table (5) presents the growth of sales and employment for innovative and non-innovative SMEs. It is clear that innovative SMEs have enjoyed a higher rate of growth compared to non-innovative SMEs in terms of sales, and employment in all the three sectors. However, the growth rates of the two variables differ within as well as between sectors. In the three sectors innovative SMEs registered a higher growth of sales than by employment. In fact, employment of non-innovative SMEs was declined absolutely in the furniture sector.

Table 5: Growth (Percentage) of Innovative and Non-innovative SMEs

Variable	Agribusiness		Furniture		Stone and Marble	
	Innovative SMEs	Non-Innovative	Innovative SMEs	Non-Innovative	Innovative SMEs	Non-Innovative
Sales	18.3	12	15.5	12.1	24.5	10
Employment	6.2	1.2	4.3	-10	6.8	2

Innovation and Growth of SMEs

This section discusses the relationship between innovation and SME growth. To find out the answer, the researcher testify whether there is any statistically significant positive correlation between the average rate of growth of sales and percentage of innovated products in total sales. The results (see table 6) indicate that there is a statistically significant positive correlation (at 0.05 level) between sales growth and percentage of innovation sales in total sales.

Table 6: Correlation between Sales Growth and Innovation Sales

	Number of SMEs		
	Agribusiness	Furniture	Stone and Marble
Correlation Coefficient	0.38*	0.34*	0.40*

*Significant at 0.05

To know whether higher growth SMEs should have higher shares of innovated products in total sales compared to lower growth SMEs. The innovative SMEs of each sector were divided into two groups: high growth SMEs, and low growth SMEs. The results clearly indicate that higher growth innovative SMEs, on average, have a higher share of innovated products in total sales compared to low growth innovative SMEs in all the three sectors (see table 7).

Table 7: Share of Innovated Products in Total Sales

	Agribusiness		Furniture		Stone and Marble	
	No. of SMEs	% of IPs in Sales	No. of SMEs	% of IPs in Sales	No. of SMEs	% of IPs in Sales
High Growth	12	22.5	19	19.5	22	31
Low Growth	20	15.4	6	11.2	13	22

-
- IPs = Innovated Products

In order to testify whether there is a significant relationship between the share of innovated products in total sales and sales growth, a regression analysis was used both for innovative and non-innovative SMEs. The regression model is statistically significant as indicated by the F-value. The results clearly indicate that the percentage share of innovated products in total sales has a significant influence on the average rate of growth in innovative SMEs in all the three sectors. Thus if an innovative SME could expand the scale of production and achieve an increase in innovation sales, it will be able to experience a significant improvement in its performance. This enables us to conclude that innovation sales do contribute to firm growth.

CONCLUSION

This research paper has discussed the driving factors, dimensions, and achievements of innovations carried out by SMEs in the agribusiness, furniture and stone and marble sector in Palestine. It also discussed how far the growth rates of innovative SMEs are different from that of non-innovative SMEs. Finally, it has explored and analyzed the relationship between innovation and growth with respect to innovative SMEs of the three sectors.

The majority of SMEs in all the three sectors are innovative, mostly informally. Most of the innovative SMEs attributed the origin of their innovations to a combination of internal factors such as self-motivation, technical qualification, knowledge, experience, and innovative ideas of entrepreneurs, and external factors like customer requirements and demand, information provided by suppliers of equipments and materials, market opportunities, and competition.

Majority of innovative SMEs in the three sectors focused on both product and process innovations and managed to convert their innovative efforts into sales as they realized

varying proportions of innovated products in their total sales. This has enabled the majority of them to achieve sales growth more. Innovative SMEs registered higher growth relative to non-innovative SMEs in terms of sales turnover and employment. There was a statistically significant positive correlation between innovation sales and sales growth. Innovative SMEs, which experienced higher growth accounted for a higher share of innovated products in their total sales and employment relative to those which experienced lower sales growth.

To conclude, the overall analysis lends substantial confidence to the argument that innovation contributes to the growth of firms.

CLOUD COMPUTING AND THE WEB: THEIR POTENTIAL DISRUPTION OF THE DIGITAL AND EDUCATION DIVIDE

Sultan, Nabil

Division of Business, Management and Enterprise, School of Business, Leadership and Enterprise, University Campus Suffolk, Ipswich, UK, nabil.sultan@yahoo.co.uk

ABSTRACT

Disruptive innovations such as cloud computing and the Web are impacting many aspects of organisations' and people's lives in many parts of the world. The economic attraction of cloud computing's cost model (e.g., pay as you go) has made it particularly attractive to many organizations in the current global and gloomy economic environment and many organisations in the developed world have adopted it in one way or the other. However, it is yet to make any comparable impact in the developing world. But this situation can change and cloud computing, as will be demonstrated in this article, could potentially have a disruptive impact on people's and organizations' ability to access IT services in those countries, thanks to increasing levels of internet penetration and the proliferation of smart mobile devices. Furthermore, the development of MOOCs (Massive Open Online Courses), thanks to improvements in Web technology, could potentially have a great impact on the way we learn, both in the developed and the developing worlds. This article examines the impact of such disruptive innovations on organizations and people and their potential to bridge the digital and education divides.

Keywords: Cloud Computing, MOOCs, Online Learning, Mobile, Smart Phones, Disruptive Innovation.

THE ADVENT OF IT AS A UTILITY

Since cloud computing emerged in 2007 it attracted a great deal of attention from many quarters (e.g, authors, consultants, technology analysts, companies). The more interest it attracted the more attempts were made to define it. At one point, a study by McKinsey & Company (the global management consulting firm) found that there were 22 possible

separate definitions of cloud computing (Grossman, 2009; Voas and Zhang, 2009). However, a comprehensive and jargon-free definition of cloud computing was attempted by Sultan and Sultan (2012). They defined it as an IT (Information Technology) service delivery model that uses advances in ICT (Information and Communication Technology) such as virtualization and grid computing for delivering a range of ICT services through software, and virtual hardware (as opposed to physical) provisioned (by data centres owned and operated by cloud providers and/or end users) according to user demands and requirements and delivered remotely through public (e.g., Internet), private networks or a mix (i.e., hybrid) of the two delivery modes. The provided ICT services include:

- business-related computer programs (software as a service –SaaS);
- fast and almost unlimited processing capabilities and large and almost unlimited storage facilities (infrastructure as a service –IaaS);
- development tools and hosting options for clients preferring to create and manage their own Web applications (platform as a service –PaaS).

Cloud computing services can be provided by cloud vendors through their data centres (public clouds) and end users (i.e., client organizations) using cloud software installed on their own data centres (private clouds) or installed on their own and other cloud vendors' data centres (hybrid clouds). The authors also draw attention to “community” clouds (often touted as another possible addition to the other three models). These types of clouds can be provided (often by one organization) and consumed by groups of organizations in businesses or professions similar to that of the providing organization. However, according to these authors, there are little examples to demonstrate the viability of this approach (Sultan and Sultan, 2012).

Advantages

When it first emerged in 2007, cloud computing received a mixed reaction. While some analysts saw merits in its application, others (including highly respected IT individuals) such as Richard Stallman, creator of the GNU operating system and founder of the Free Software Foundation and Larry Ellison, founder of Oracle, regarded it as a useless business model (Hasson, 2008; Johnson, 2008). In spite of this, cloud computing continued to attract many followers and increasing numbers of IT companies embraced it and began to offer many of their services in the cloud.

Having passed the fad stage, few people now doubt the economic attractions of this new computing service paradigm. Cloud computing delivers a variety of essential software and hardware services (e.g., applications, storage, processing power, virtual servers) over the medium of the Web (i.e., the cloud) on a pay-as-you-go price structure, thus offering scalability and obviating the need to make large investments in expensive hardware and software licenses and offering organizations significant cost advantages (Leavitt, 2009; Lin *et al.*, 2009). Continuous upgrades of software and hardware are common (and expensive) practices in many organizations. Tighter cost control in organizations is increasingly prevalent following the near collapse of the world's financial systems and is a condition which is likely to worsen over time. Cloud computing can provide many of those organizations with the opportunity to continue to take advantage of new developments in IT technologies at affordable costs.

While cloud computing seems to make economic sense, some people think this can only be achieved in the long run. Reflecting on his company's successful implementation of a SaaS solution, Doug Menafee, CTO of the Schumacher Group, a leading US emergency and hospital medicine management company, admitted that a cloud solution could be more expensive to run in the short term due to the heavy connectivity demands that require the installation of expensive high speed cables such as fibre optics. He explained that it takes a three year ROI (Return On Investment) period to break even and over five years to realize the economic benefits (Brooks, 2010).

Concerns

Despite, the economic and flexibility attractions of cloud computing there are still many issues that it needs to overcome: security, vendor-lock and outages are the most problematic (Sultan and Sultan, 2012). Security is no doubt one of the main concerns for organizations contemplating the adoption of this IT service modality. A survey of 244 chief information officers and IT executives conducted in 2008 by IDC (International Data Corporation), the market research firm, revealed that 75 percent of the respondents rated security as their main cloud computing concern while performance and availability were the next two concerns for 63 percent of the respondents (Cisco, 2009). Moreover, various governments, such as those in the European Union (EU), have privacy regulations that prohibit the transmission of some types of personal data outside the EU. This issue, however, is no longer a problem as many cloud vendors now (such as Amazon, Microsoft and others) were able to establish some of

their cloud data centres in various locations across the EU region and elsewhere in the world and can offer their cloud clients the option of where they want their data to be stored.

Organizations are likely to adopt a careful approach to cloud computing. Another survey by EDUCAUSE, US-based non-profit organization that promotes the intelligent use of information technology in higher education (HE), involving 372 of its member institutions revealed that a great proportion of the respondents with use cases that involved cloud-based services reported that data privacy and data security risks were among their top barriers to overcome (Goldstein, 2009).

Another concern is vendor-lock and outages. Currently, many cloud providers offer their services through proprietary Application Programming Interfaces (APIs). This means that organizations that sign up for the services of cloud providers will find it difficult to change cloud providers in the same as way as, for example, changing an electricity supplier.

Furthermore, failure of a cloud provider that hosts client data in its data centres can have serious repercussions for those clients who trusted their data with that provider. This issue could force potential cloud users to go for well-established and large companies that are more likely to be around for many years to come (e.g., Microsoft, Amazon, Google, IBM, Salesforce.com).

Lastly, reliability can also be a serious problem for cloud users. Many of the big cloud providers such as Salesforce.com, Amazon, Google and Microsoft saw their systems afflicted with outages which affected large scores of their customers (Leavitt, 2009; Naughton, 2009; Clarke, 2011). One of the latest such events occurred in April 2011 when Amazon's EC2 (Elastic Compute) cloud service experienced an outage when its northern Virginia data centre site was affected. Amazon attributed the incidents to a networking glitch that caused many of its storage volumes (used to store data when an EC2 instance is created) to create new backups of themselves, thus filling up Amazon's available storage capacity and kicking off a series of connectivity problems that affected many of the cloud provider's customers (Pepitone, 2011). For more stories of similar outages see (Raphael, 2011). Outages are not limited to cloud computing platforms. Some of the online social networking sites (especially Facebook) had their fair share of this problem (Johnson, 2010). The latest outage to afflict Facebook was in February 2012, one day after its filing for IPO (initial public offering) (Brown, 2012).

Solutions

The aforementioned concerns are genuine and real. However, there are efforts to address some of those problems emanating from different quarters. Portability is likely to be increasingly important as the number of cloud providers increase. One of the solutions to this problem would be to base the APIs of cloud solutions on open source message communication standards such as SOAP (Simple Object Access Protocol) or REST (Representational State Transfer). In some situations this is already happening. For example, cloud solutions such as Amazon Web Services and Microsoft's Azure can now be accessed through the SOAP and REST protocols. The need for inter-cloud interoperability was highlighted by Vint Cerf, a co-designer of the Internet's TCP/IP, who likened the current lack of cloud communication standards to that of computer networks in the early 1970s (Krill, 2010). Moreover, there are also efforts by some organizations such as the Cloud Computing Interoperability Forum intended to address this issue (Grossman, 2009). IEEE, the Open Data Center Alliance (ODCA) and the Distributed Management Task Force (DMTF), the latter two working in partnership. The issue of security is, nevertheless, a controversial one. Many analysts believe that security is likely to be more robust in a cloud environment, given the massive resources of cloud providers, than one maintained in-house (Ashford, 2009; Linthicum, 2009; Financial Times, 2009). Nevertheless, many cloud providers are now offering hybrid solutions where clients are given some level of control over the security of their data (Taneja Group, 2011).

THE DISRUPTIVE FORCE OF CLOUD COMPUTING

New technologies, especially those of a radical nature, are often looked upon, initially, with cynicism or dismissed as useless inventions. William Orton, the President of Western Union (once a major US communications company specializing in telegraphy), described Alexander Graham Bell's telephone invention as "an electric toy" when his company declined to buy the inventor's patent for US\$ 100,000. The telephone eventually killed telegraphy and led to the demise of Western Union.

The concept of disruptive innovations was first raised by Christensen and his colleagues and developed into a theory known as the "theory of disruptive innovation". According to this theory, there are mainly two types of disruptive innovations: new market and low-end disruptions. New market disruption occurs when an innovative product attracts customers

who were prevented from acquiring similar products due to cost and/or complexity issues. Examples of such innovative products include Sony's first battery-powered transistor pocket radio, Canon's desk photocopier, etc. Low end disruption affects the low end of the original business or mainstream value network by attracting customers who are served by this level of the business. One example of this type of disruption was the Korean automakers' entry into the US market. The Korean automakers did not create a new market; they simply attracted the "least attractive" customers of the targeted businesses.

A hybrid of the two types of disruption can also be found. The American low cost Southwest Airlines is one example of a hybrid disruption. It initially targeted people who were not flying (those who used cars or buses) but later pulled customers out of the low end of the major airlines' value network as well. In addition to the simplicity and the affordability they bring, disruptive innovations, according to this theory, occur less frequently and tend, initially, to have performance problems (Christensen *et al.*, 2004).

From this brief description, it is evident that cloud computing has many of the attributes of a disruptive innovation (Sultan and Sultan, 2012). For example, it has the potential to destabilize existing IT markets (e.g., those that rely on providing traditional on-premises IT solutions) and create other business opportunities that did not exist before (e.g., consuming IT, both as software and hardware) when needed, according to demand and with less requirements for infrastructural expenses (e.g., hardware, staff). Disruptive innovations that create new markets, according to this theory, can occur when characteristics of existing products and services (e.g., size, price, complexity) limit the number of potential consumers or force consumption to take place in inconvenient or centralized settings. Bell's telephone, Sony's transistor radios, Apple's personal computers and eBay (among others) are examples of new-market disruptive innovations. They were able to create growth by making it easier for people to do something that historically required a great deal of expertise or great wealth.

The theory also suggests that disruptive innovations often tend to initially have performance problems. The aforementioned concerns of cloud computing and the infrequent loss of service experienced by cloud customers are clear examples of the initial performance issues that often characterize disruptive innovations.

THE CLOUD IN DEVELOPING COUNTRIES

Given the compelling economic attractions of this computing service delivery model, many organizations are likely to embrace it despite its current problems. Gartner (the global IT research and advisory company) anticipates a massive cloud computing explosion, fuelled largely by the economic turmoil of the last few years. In a recently published report, Gartner expects the global cloud services revenue to reach nearly US\$150 billion by 2014. This level of spending, according to Gartner's Vice President, Ben Pring, is directly related to increased economic pressures which made organizations scrutinize every expenditure (Hickey, 2010).

Small to medium enterprises (SMEs) are likely to be among the main beneficiaries of this computing service due to their limited resources which constrain their ability to make large IT investments (Sultan, 2010a, 2010b, Sultan, 2011). However, an increasing number of major companies are also embracing the cloud (Sultan, 2010a).

What is interesting is that cloud computing is making an impact in many developing countries. For example, a number of African educational establishments have adopted cloud computing, largely due to the inadequate IT infrastructures that exist in their countries and their inability to cope with the endless cycle of hardware and software upgrades. Google, in particular, has been very successful in targeting the East African educational market. For example, the giant cloud provider has partnered with a number of East African educational establishments (e.g., the National University of Rwanda, the Kigali Institute for Education, the Kigali Institute for Science and Technology, the University of Nairobi, the United States International University, the Kenyan Methodist University and the University of Mauritius) in order to provide their students with some of its cloud services (e.g., Gmail, Google Calendar, Google Talk and Google Docs and Spreadsheets). These universities were also helped by an a World Bank grant that supports bandwidth subsidy in universities (Wanjiku, 2009).

In Ethiopia, Microsoft has rolled out 250,000 laptops to the country's teachers, all running on Microsoft's Azure cloud platform. The laptops were intended to enable teachers to download curriculum, keep track of academic records and securely transfer student data throughout the education system, without the extra cost of having to build a support system of hardware and software to connect them (Chan, 2009).

The ability of cloud computing to help African education, not only by reducing IT costs but also by making education more efficient than before, is likely to be a very powerful (and

empowering) tool for the advancement of education in this under-developed continent. Indeed, many of the large cloud providers see lucrative opportunities in some of the developing and emerging economies. For example, IBM has established a number of computing centres in China, India, Vietnam and Brazil. Other cloud players such as Microsoft, VMware, Salesforce.com and Parallels are also active in the developing world (Kshetri, 2010).

There are increasing speculations from some industry observers that cloud computing will be a great help to developing countries which generally suffer from poor IT infrastructures. Given that cloud computing reduces reliance on physical infrastructure this, on the surface, seems to make sense. However, the reality is different in some developing countries that suffer from continuing power cuts and poor broadband infrastructures (essential necessities for a proper use of the internet). Such environments are unlikely to be conducive to any meaningful use of cloud computing. However, during the last few years the penetration of the internet in many of these countries has been dramatic.

Egypt, for example, has been one of those countries that have experienced high Internet penetration rates during the last few years. A report by its Ministry of Communications and Information Technology (MCIT) indicated that there were 23.51 million Internet users in January 2011 growing at an annual rate of 39.61 percent while the proportion of households using the Internet was 32.76 percent and growing at an annual rate of 7.25 percent (MCIT, 2011). Tunisia also has one of the highest Internet penetration rates in the African continent with 3.6 million users, half of the population (Ryan, 2011). Such high rates of Internet usage (which enabled access to online social media) in these two countries have played an important role in topping the dictatorial regimes in these two countries during what came to be known as the Arab Spring. This issue is echoed by Janardhan (2011) who argues that the growing use of new media (in reference to online social networking and Internet-enabled mobile devices) to advance political reforms is a natural consequence of the fast-rising number of Internet users in the Arab World, estimated at 46 millions in 2008 which represents an impressive Internet-usage growth rate of about 13 folds between 2000 and 2008.

Broadband speeds in emerging markets may not be great (e.g., 1,691 kbps) with average upload speed of 795 kbps. They are however adequate for basic cloud services. Some countries such as Egypt, South Africa, and the UAE have developed their networks sufficiently to support intermediate cloud applications such as CRM, ERP, and basic video conferencing. Large enterprises in emerging markets are likely to find the model of cloud

computing appealing as it addresses three of the most important challenges: 1) limited availability of IT skills, 2) capital constraints, and 3) security risks (Ford and Belmans, 2012). A Cisco survey suggests that small businesses in developed countries will rely extensively on cloud applications to manage their communications and business processes over the next five years with nearly 50 percent of them spending more than one third of their IT budgets on cloud services in 2013. The cloud impact, according to Ford and Belmans (2012) will be much greater in emerging markets where small businesses do not have capital or the skills to use IT and will put such companies onto the first step of the technology ladder.

A MOBILE-BASED CLOUD INFRASTRUCTURE

Indeed, if there is any real future for a massive uptake of cloud computing in the developing world it is likely to be through mobile devices. And there is rationale for this suggestion. In 2011 worldwide shipments of smart phones were estimated at 487.7 million gadgets, overtaking client PCs (e.g., pads, netbooks, notebooks, desktops). This was a 63 percent increase on the 299.7 million smart phones shipped throughout 2010. The increase of the demand for smart phones was driven partly by their availability at low prices and partly by a driving trend of increasing consumer appetite for Internet browsing, content consumption and engaging with apps and services on mobile devices (Canalys, 2012). According to Dikaiakos et al., (2009) one of the visions of the 21st century computing is that users will need to access Internet services over lightweight portable devices rather than through some descendant of the traditional desktop PC. And since users who have access to such devices are unlikely to have (or be interested in having) powerful machines, it is likely that cloud computing will be the source of that computing power.

The comfort level of mobile phone usage in these countries – combined with the lack of power and broadband infrastructure – offers a unique opening that cloud computing can fill. Providing SaaS through mobile devices can give businesses in the developing world a free or low cost alternative to traditional desktop-based productivity applications. These businesses now have the option to use business software (e.g., CRM applications) that is prohibitively expensive in the traditional software world. By moving their data to the clouds, these businesses are not held hostage to frequent power failures and broadband disruptions that are common in many third world countries (Goundar, 2010).

With the advent of low cost smart phones and netbooks with mobile data capabilities, they can now have IT infrastructures that can parallel even those of developed countries (Subramanian, 2008; Greengard, 2010; Harris and Nunn, 2010, cited in Goundar, 2010). Cloud computing provides an opportunity for individuals and businesses in developing countries to compete with those in advanced nations on an equal footing. Such an opportunity has the potential to create tremendous growth in these countries and help in their fight against global poverty (Subramanian, 2008, cited in Goundar, 2010). Such a scenario will no doubt have a disruptive impact on the world's ability to access IT resources and will potentially bridge the digital divide that currently exists between the developed and the developing worlds. It will also make the world more globalized than ever before.

THE DISRUPTIVE FORCE OF THE WEB

The Web has had a profound (and disruptive) impact on our lives (both as individuals and organizations). It created a new market opportunity, epitomised in online trading or e-commerce, and disrupted many traditional businesses such as those involved in music, books, stocks, etc. Increasingly, the Web is having a disruptive impact on learning and teaching. Since the early 2000s, online learning was often being provided by institutes (e.g., colleges, universities) as an additional learning tool (to other existing traditional learning tools, e.g., class room lectures) or provided by institutes (mostly commercial) as a tool for programmes fully accessed using this mode of delivery. In either case, users of this service had to pay for it through fees. Increasingly, online learning has become a Knowledge Management (KM) tool and organizations are using this technology to provide their workers with free access to online resources as part of their KM efforts (Sultan, 2013). It is evident here that online learning (enabled by the Web) is an example of a new market created in education by the disruptive Web. Degree courses delivered fully through online learning are relatively inexpensive when compared with traditional college or university degrees (Clark, 2009). This is especially true in many Western countries. In the UK, for example, a university home student can pay a total of up to £ 27,000 in fees for a three year undergraduate degree. Online learning is enabling people to gain access to education at far less cost. It also removes many of the inconveniences associated with a traditional education, e.g., registering at certain times of the year, commuting, attending classes, finding a seat in a class (especially if the class is crowded).

In a new book, Christensen and his colleagues (well before the advent of MOOCs) have predicted the disruptive impact that “computer-based” learning will do to education (particularly secondary US education). They estimate that by 2019 about 50 percent of high school courses in the USA will be delivered online as the world begins “flipping rapidly to student-centric online technology” (Christensen *et al.*, 2008). The authors see online learning as a classic example of a new market disrupting or substituting an existing business model (i.e., class-based education). They argue:

“This substitution is happening because of the technological and economic advantages of computer-based learning, compared to the monolithic school model. Online technology provides accessibility for those who previously would not have been able to take the course. It provides convenience for a student to fit the course into his or her schedule at the time and place that is most desirable. To varying degrees, it is simpler because it offers comparatively greater flexibility in the pace and learning path. And when it is software-based, it can scale with ease” (Christensen *et al.*, 2008).

The Web has also ushered in a new era of communication and interaction. The emergence of new media, define as the use of Web-enabled digital mobile technology (e.g., smart phones, iPads) is adding a new dimension to online learning: mobility. No longer is online learning constrained to a desk in your bedroom or office. Thanks to Web-enabled digital mobile devices you can now learn while on the move.

The emergence of MOOCs

During the last few years a new online learning trend has emerged known as Massive Open Online Course (MOOC). There is no common definition of a MOOC. However, it would probably be safe to describe it as a life-long learning initiative aimed at delivering free courses through online platforms to an unlimited number of students without any entry requirements for registration.

The history of MOOCs is traced back to early efforts by two Canadians: George Siemens (an educator Professor at the Center for Distance Education) and Stephen Downes (an online learning designer and researcher). In 2008, Siemens and Downes offered a free online learning course entitled “Connectivism and Connective Knowledge 2008 (CCK08)”. The course was offered formally through the University of Manitoba and informally through open enrolment (at no cost) to anybody in the world (Fini, 2009). Some initiatives aimed at

providing free university education have emerged since. One such is the University of the People (UoPeople). UoPeople was founded in 2009 by educational entrepreneur Shai Reshef and is affiliated with the United Nations GAID, the Clinton Global Initiative, and Yale Law School ISP. Courses provided by UoPeople are free but students are required to pay a one-time application processing fee of US\$50 and subsequent examination processing fee of US\$100 levied per course. The free university has signed collaborative partnership agreements with New York University (NYU) to accept students; and with Hewlett-Packard (HP) - through the Catalyst Initiative - to provide student internship opportunities. It offers undergraduate programs in business administration and computer science and has more than 1,500 students from 135 countries. However, what is very interesting about new developments in free online learning is a surge of interest in MOOCs by leading US universities which seemed keen to deliver their own "free" online courses. Since 2011, MOOCs began to attract a great deal of interest, especially from highly prestigious US universities. Examples include Harvard, Stanford, Michigan, Pennsylvania, Princeton and MIT (to name but a few). Several start-up companies since then have developed partnerships with universities and professors to offer MOOC's. These include companies such as Coursera, Udacity, edX, Udemy and Khan Academy.

In an interesting and extended blog article hailing the potential merits of MOOCs, Shirky (a keen advocate of MOOCs) argues that MOOCs are unlikely to replace traditional education. He comments:

"...anything that could replace the traditional college experience would have to work like one, and the institutions best at working like a college are already colleges. The possibility MOOCs hold out is that the educational parts of education can be unbundled. MOOCs expand the audience for education to people ill-served or completely shut out from the current system, in the same way phonographs expanded the audience for symphonies to people who couldn't get to a concert hall, and PCs expanded the users of computing power to people who didn't work in big companies" (Shirky, 2012).

Aware of the new online educational developments across the Atlantic and their potential threat to the UK's educational market, a new company by the name of "FutureLearn" has been set up by the Open University to offer similar services (starting in 2013) to those offered by MOOC companies in the USA and their university partners. FutureLearn is majority owned by the Open University (which has decades of experience in distant learning) and

includes a number of leading UK universities such as King's College London, Bristol, Exeter, Warwick, East Anglia, Leeds, Lancaster, Southampton, Cardiff, Birmingham and St Andrews. More universities are expected to join this alliance in the near future. The enthusiasm for this venture by UK universities is matched by their fear of being left behind.

The UK government, represented by David Willetts, Minister of State for Universities and Science, is supportive of this initiative. He was quoted as saying "MOOCs present an opportunity for us to widen access to, and meet the global demand for, higher education" (Bateman, 2012). In 2012, the UK government (under the current coalition of the Conservative and Liberal Democrats parties) almost trebled university tuition fees for its national students. UK national students entering HE in 2012 were required to pay a tuition fee of up to £ 9,000 (as opposed to £3,375 for the previous year). Making UK HE expensive could prevent many people from gaining academic qualification, thus potentially creating an education divide between those who can afford it and those who cannot. The decision to increase fees at such levels was widely criticised by large numbers of the UK population and huge student demonstrations were organised to protest against it. In that year the total number of applicants to all British universities fell 7.7 percent, with applications to some subjects (e.g., English) witnessing a much higher drop (Vasagar, 2012). It is logical therefore for government officials to be seen supportive of initiatives (such as that of FutureLearn) that aim at widening access to education.

EDUCATION AS A SERVICE (EAAS)

It is not clear at this stage of their development how MOOC providers will make their money. They can afford, for now, to provide their registered students with free access to courses. For example, MIT and Harvard have together committed US\$ 60 million to edX, Coursera has raised US\$16 million in venture funding, and Udacity is sitting on an undisclosed infusion from Charles River Ventures. The MOOC providers are in strange territory, according to Kolowich (2012), in that they have staked their future on a vision that makes HE more accessible than ever before. However, eventually they will have to figure out how to pay for the costs of these services and also how to make money. It should be noted that a number of these MOOC providers (e.g., Coursera, Udacity) are businesses and making money will be one way to stay in business.

Some analysts such as Moody (the international financial research company) suggest that advertising (copying the Google model) could be one option to make money out of MOOCs. Another possibility is to pay a fee to license MOOC material from other institutions, similar to paying for a textbook (Marklein, 2012). So far, the only revenue stream that the major new MOOC providers (e.g., Coursera) have indicated they will pursue is charging a small fee (e.g., US\$ 30 or US\$ 80) for issuing certificates of completion to those who register and successfully complete their exams. However, the extent to which revenue from issuing such certificate can support a MOOC business is still unclear, given that only a small fraction (between 10 and 20 percent) of the students who have registered (so far) for MOOCs actually made it to the final exam. Other MOOC providers (such as Udacity) are contemplating the prospect of making money from recruitment by headhunting for companies that might like to hire some of its more impressive students. By doing so, Udacity will be able to charge a commission for each successful match. There are also suggestions that MOOC providers might try to make money by matching the large number of students who do not complete their courses with traditional online programs where they might have a better chance of gaining acceptance (Kolowich, 2012). While credit-bearing MOOCs are not yet available, this might change in the future. There are suggestions that MOOC providers could use some of the global testing networks to enable their MOOC students to sit fee-based invigilated exams to recognise their achievement in some way. MOOC providers such as edX and Udacity have signed deals with the education company "Pearson" so that their learners can take exams via the company's network of test centres (Parr, 2012).

Whatever business model or models that might eventually emerge from this endeavour it will no doubt involve an element of cost that will have to be borne by somebody (whether registrants, advertisers or employers). Indeed, MOOCs have the potential to commoditise education in a manner that has not been experienced before by providing education as service (EaaS) similar to the way cloud providers provide their IT services (e.g., SaaS, IaaS and PaaS). Registered students could end up paying for their education on a pay-as-you-go basis, similar to what many companies now pay for their cloud services. MOOC providers could end becoming the new cloud providers of education.

MOOCs are likely to be attractive to those people who cannot gain access to HE (due to cost or lack of sufficient secondary education entry requirements) and who might see MOOCs as a potential avenue towards achieving that objective. It could also be potentially attractive to people who are already in employment and cannot afford the time and/or completion

commitment required by campus-based (or even other traditional online-based) education but who aspire to achieve career progression, at their own pace, by having MOOC certificates from some of the most respectable universities in the world. Most interestingly, MOOCs could be hugely popular with learners from poor third world countries who aspire to acquire certification from respected Western universities but cannot afford the cost implications associated with a Western education (e.g., travel, fees, subsistence) or do not have the required academic or pre academic certification that is often required by most Western HE establishments. Indeed, if online learning, as Christensen and his colleagues have suggested, is a new market disruption to the established class room-based education, MOOCs are an example of a “sustaining innovation”, one that is geared towards making improvements to the online learning product. Sustaining innovations, according to Christensen, are often innovations that occur frequently and are implemented by established large companies in order to improve the performance of some of their products that have strong market shares. Some sustaining innovations, according to this theory, can also be breakthroughs that can leapfrog beyond the competition products (Christensen and Raynor, 2003). MOOCs have the potential to belong to this category of sustaining innovations. But can MOOCs disrupt campus-based HE by replacing it or by becoming a good alternative to it? One respondent to Shirky’s interesting blog article wrote:

The push for MOOCs is not coming primarily from students who want to take classes in their pajamas. Instead it is coming from administrators and investors who see a big opportunity to make a big pile of money... What you don’t cite is the number of students who learned enough to have passed the course. My recollection is that it was something like 2% of the students enrolled. And the percentage is probably smaller given that many of them may have cheated their way to that result. Is that what the future narrative of education looks like? If so, I will be checking, very carefully, the credentials of my doctors and nurses before I count backwards from 100 inhaling the anaesthetic (See Shirky, 2012).

MOOCs are unlikely, in the view of this author, to replace or be a good alternative to campus-based HE, as we know it. But they could end up becoming an acceptable element of HE. However, if the cost of campus-based HE continues to rise and restrict access (except to those students who can afford it) then the future situation for MOOCs could be different. Competing for students will require innovative solutions to reduce costs and MOOCs could be one of those solutions.

There are massive IT infrastructural problems in many developing countries; many of which are the consequences of decades of neglect and corrupt regimes. And if there is any real future of taking advantage of the knowledge and learning that is being made available by Web and new online learning developments such as MOOCs, it is likely to be through Web-enabled mobile devices. In 2011 worldwide shipments of smart phones were estimated at 487.7 million gadgets, overtaking client PCs (e.g., tablets, netbooks, notebooks, desktops). This was a 63 percent increase on the 299.7 million smart phones shipped throughout 2010. The increase in demand for smart phones was driven partly by their availability at low prices and also by a growing consumer appetite for Internet browsing, content consumption and engaging with apps and services on mobile devices (Canalys, 2012). According to Dikaiakos *et al* (2009) one of the visions of the 21st century computing is that users will need to access Internet services over lightweight portable devices rather than through some descendant of the traditional desktop PC. And since users who have access to such devices are unlikely to have (or be interested in having) powerful machines, it is likely that cloud computing will be the source of that computing power. This scenario will bode well for the development of MOOCs. Free learning offerings made through this new learning model could have a huge transformational impact on education in many parts of the world and could potentially improve the lives of many millions of people by reducing poverty which is often caused by lack of access to proper education according UNESCO (Van der Berg, 2008).

CONCLUSION

Cloud computing has made a great impact on the world's IT landscape since its emergence in 2007. Many analysts doubted its viability as a sound IT service model. But cloud computing proved to be more enduring and seems to have the potential to be a more disruptive force than initially envisaged. This IT service model has already made a great impact on organizations in the developed countries. Many small and large organizations in those countries saw merit in what it had to offer and chose to use it. Well established and adequate IT infrastructures in those countries (especially broadband connections and reliable power supply) have been useful in facilitating this process. Lack of similar infrastructures in developing countries might have hindered a more widespread uptake of this service in that part of the world. However, this position, as argued in this article, could change thanks to high levels of new media penetration. Furthermore, the disruptive force of the Web is having a great impact on education. Online learning has made education affordable to many people.

With the emergence of MOOCs, as contended in this article, access to education, especially HE, could become far more widespread and affordable, both in developed and developing countries. Indeed, cloud computing and Web-based education have the potential to disrupt (by bridging) the digital and education divides that currently exist in countries and between countries.

EXPLORING ORGANIZATION'S CHANGE CAPABILITY

Swetlik, Ralf¹; Sanchez Bengoa, Dolores²

¹Cheltenham University, Germany, r.swetlik@citykom.net

²International Business School at Vilnius University, Lithuania, sanchezl@cytanet.com.cy

ABSTRACT

In the speed of how business are operating currently, key terms like transformation and change are not a new phenomena. The elements of change and change management are widespread and multifaceted. Change management is a well established concept in academic literature but in order to implement it, suitable measuring instruments have to be in placed.

An organization's capability to change is very closely linked to the capability to change of its employees. The behaviour of people is in turn closely dependent amongst others on their motivation, leading to issues like how does motivation influence change?. Here aspect like a) communication, b) leadership: emotional intelligence and factual intelligence, c) change management as an on-going and lasting challenge and d) Focus on processes play a remarkable role.

This is a work on process paper, where the researchers explore several measuring models in order to answer those questions, being the EFQM model one of them. The objective of this paper is to explore the organizational change capability and identified strengths and weakness of current existing models. This paper will be used as a stepping stone for the final research which aim is to create an extension of the EFQM model by adding a new component which is suitable to measure the change capability.

The research will apply a qualitative methodology using a combination of methods for an optimal possibility to answer the research question. The action research gives the framework with the intention of helping to develop practice, and in this case specifically to create an extension of the EFQM Model. The case study will provide a detail understanding of what is happening at the work place by conducting in-depth interviews in the real situation.

Keywords: Change management, change capability, EFQM model and measurement

INTRODUCTION

Change management has a long tradition in literature; it was already in 1951 when Lewin exploring this phenomenon divided the change process into three phases: “unfreezing”, “moving” and “re-freezing”. This journey through time will be undertaken against this background to find out to what extent these basic assumptions can be found in the newer models. In particular because this view is based on fundamental assumptions about the world: stability, certainty, homogeneity and centralized sources of power and authority. From this it can be deduced that change can be made in steps. This assumes that change it is a planned and controlled process. In addition this perception has a strong inwards focus. (Wimmer, 2011).

Modern change management is however marked by the increasing dynamics of the change processes and their concurrency. As Appelbaum et.al., (2012, p.764) stress “changes are an inevitable part of the current market. These changes can be seen and triggered by the pressure from the national and international markets, customers, competitors and the overall internationalization process, demanding “ a higher degree of willingness to change along with an increasing pace in the implementation of the change management” (Weismann, 2010, p. 19).

The problem could be that the capability to deal with change is not built into organizations. Kotter (2001) states that it is not built into either the skills, nor in the brains of the people who run the organizations. The big question for the future is: how can organizations be helped to build those capabilities?. Kotter (2001) can be quoted here as a well-known author representing authors who have developed the so-called phase models of emerge change.

Another important aspect in change management is the involvement of the employees. If it is assumed that the necessary inclusion of the employees involvement is one of the major challenges, then the factors affected by emotions have a particular influence on a company’s capability to change, (Roth, 2010). As explained by Scherer (2005) because, emotions are the key element for employees’ adaptiveness to new behavior. As employees cannot be adjusted as machines can, models are necessary which make measurable the so-called emotional intelligence of a company (Weismann, 2010). The emotional intelligence’s perception of those involved in the change process plays an important part here. Therefore, Burch and Ghoshal,

(2003) suggest to explore if all the members involved in the change process really have the same perception of the issues. Additionally, not only the perception should be explored, also the willingness to change is crucial. Hofstede and Hofstede, (2005), explained that members coming from societies characterized by high levels of risk's acceptance are more willing to accept change than member of a society with high levels on uncertainty.

When exploring change management in projects, it is almost impossible to implement in organizations without a suitable measuring instrument (Krüger 2002, Capgemini, 2010). According to Raisch (2007) only where change can be measured is it possible to attribute clear areas of responsibility and to monitor whether the aspired goals are reached or not. Based on these statements, the paper aims to examine suitable measuring instruments for change management. In order to conduct this examination a selection of measuring instruments are introduced, for example the EFQM model (later explained) investigating if it can be extended with a change component which is suitable to measure the change capability.

The paper is structured in four parts, the first one review topics on measurability of change capability, introduces some measurability models and examines to what extent potential measuring tools are at all suitable for measuring this complexity, and finally the EFQM model is introduced. The second part, explain the planned methodology to be applied to answer the research questions. The third part, presents some initial findings based on the literature review. Finally, some conclusions and an anticipation of potential limitation in the research are addressed.

MEASURABILITY OF CHANGE CAPABILITY

According to Capgemini (2010, p.33ff) the capability to change consists of the dimensions of the willingness to change, capacity to change and possibility to change. With these three dimensions it is expressed that the organization wants to (willingness to change), that it is able to (capacity to change) and that it is possible to (possibility to change) change. Based on this definition, the strating point to measure change capability is provided.

Nevertheless, the measuring tools must be able to cover a wide spectrum in order to be used flexibly and universally. In addition, it must be possible to decide on courses of actions in the light of the measured results. Under the presumption that the success of change processes depends on whether the chosen approach suits the company's starting situation, the effective monitoring of change processes requires independent and differentiated instruments

(Charbonnier-Voirin 2011). Those various independent and differentiated instruments or capabilities which emerge in the literature refer to: organizational agility (Charbonnier-Voirin 2011), organizational energy (Bruch and Ghoshal 2003), organizational fitness (Voepel and Leibold 2004), organizational change capacity (Soparnot 2011).

It can be observed that the company often prioritizes the improvement of product characteristics, the production processes or also the structure and process flow triggered through the change process. During this prioritization process, companies often overlook the point that they are not only affected by their structure, but also, in particular by the attitudes, interaction and behavior of their employees. The change in ways of thinking and behavior, however, is often at the bottom of the list, although this is where the source of sustainable competitive advantages lies, as the Expert Circle "Zukunftsstrategien" has found out (Expertenkreis 2009). In the same line of thought, Ansari and Bell, (2009, p.139) highlight the more holistic approach towards the implementation of change. They suggest that "implementing change requires thinking as a designer and employing the logic of conjecture rather than scientific deductive or inductive reasoning. Successful implementation requires conjuring an image of a future reality that does not currently exist and making that image persuasive by connecting it with the values of the organizational participants"

Reflecting on those statements, questions arise as to does such a „wonder tool“ exist? Or are there still similarities in the various approaches which also help simplify the measuring and the evaluation?. In mainstream literature key factors regarding these issues are discussed. The factors relate to a) Communication, b) Leadership: emotional intelligence and factual intelligence, c) Change management as an on-going and lasting challenge and d) Focus on processes, (Vermeulen, Puranam and Gulati 2010; Doppler and Lauterburg, 2005; Kostka and Mönch 2009; Weismann, 2010; Krüger 2002)

Communication is a process which runs parallel to the change process. Through focused corporate communication cultural and structural conditions along with states of mind must be created so that employees, despite or possibly due to the changing structures in the organization, are taken along with the flow and can subsequently develop their optimal performance ability (Kostka and Mönch 2009). At the same time, the employees involved with their questions, worries and emotions must be gathered up and won over for the changes. This is where leadership is required, because the success of a change process depends considerably on the communication capabilities of the managers (Weismann 2010).

Very often projects are schemes with a defined beginning and a defined end, which are marked by the characteristics of time restrictions, uniqueness, complexity and novelty (Krüger 2002). With these specific characteristics and requirements **change management** can be spelt out. If an organization does not only want to keep up with competitors, but also, to achieve sustainable competitive advantages, then changes in organizations must be considered as an on-going and lasting task in the future. Accordingly Appelbaum et.al., (2012, p.765) stress that “successfully implementing changes can be a major determinant of its short- and long-term company success”

A core competency of successful organizations lies in the capability to change. Most organizations are built around one single aspect, be it function, product, customer or the market. The focus is on this single aspect, and this is seen, as being the most important one. To optimize this aspect all existing resources are deployed on it. However the organization unit in its entirety is disregarded. There is a danger that the optimization of the individual aspects can lead to the separation of the individual areas, and due to this, it is impossible to achieve the optimal results for the organization as a whole (Weismann, 2010). As a consequence of this the problem arises that communication and cooperation are limited to one of these separated areas. So it can be concluded, that a modern and versatile organization ought to be geared up to functional **processes** and a meaningful process chain (Doppler and Lauterburg 2005). Keeping this in mind, the challenge faced by many companies remains the creation of an organization capable of changing, and not only the specific structuring of change in one particular situation. If the issue concerning how the organizational capability to change is considered as essential, it is a logical reflex, from a scientific point of view along with from a practical point of view, to examine the measurability or scalability aspects.

Conclusively, the explanation derived from the literature review reveals the complexity of change management. Focusing on this complexity, is where the researchers identify the main challenge and reach the conclusion that this complex system cannot be described with a simple and practical model.

MEASURING TOOLS

Measuring tools must be able to cover a wide spectrum in order to be used flexibly and universally. In addition, it must be possible to decide on courses of actions in the light of the

measured results. Under the presumption that the success of change processes depends on whether the chosen approach suits the company's starting situation, the effective monitoring of change processes requires independent and differentiated instruments (Charbonnier-Voirin 2011).

There are already various approaches and models which examine the measurability of the capability to change of an organization. A selection of models based on the studies of Judge and Douglas (2009) and Charbonnier-Voirin (2011) are examined, and the strengths and weaknesses of the models are introduced.

Table 1: Summary of models "Measurability of the capability to change"

Authors	Model	Advantages	Disadvantages
Palanisamy and Sushil (2003)	Organizational flexibility: "The capacity to respond to environmental change."	Simple model with only 4 factors	Too broad and general to be meaningful Not rooted in a theoretical framework
Hatum and Pettigrew (2004)	Organizational flexibility: "A combination of a repertoire of organizational and managerial capabilities that allow organizations to adapt quickly under environmental shift."	Two-dimensional model - degree of internationalization - degree of product-market Diversification	Tried and tested in only two organizations and these organizations belong to the same industrial sector
Butler (2003)	Organizational receptivity: "An emerging, but undeveloped notation which attempts to reveal the factors which contribute to organizations being either low-change, non-receptive contexts, or high-change, receptive contexts."	Good results were achieved in the study	Tried and tested in only two organizations in the public sector
Moilanen (2005)	Organizational learning: "A consciously managed organization with learning as a vital component in its values, visions and goals, as well as in its everyday operations and assessment."	Five-interrelated dimensions	"There is no agreement on the concept itself or its measurement."
Holt et al. (2007)	Employee readiness for change: "The extent to which an individual or individuals are cognitively and emotionally inclined to accept, embrace, and adopt a particular plan to purposefully alter the status quo."	Well-regarded scale development approach, reliable and valid 25-item, four dimensional measures.	This model was only examined in two organizations
Judge and Douglas (2009)	Organizational Capacity of Change (OCC): "A combination of managerial and organizational capabilities that allows an enterprise to adapt more quickly and effectively than its competition to changing situations."	Examines the success factors of change management.	The use of complicated mathematical formulas implies accuracy to the last decimal point. The measure does not consider the specific nature of the organizational change.

Source: based on Judge and Douglas (2009) and Charbonnier-Voirin (2011).

It can be summed up that all the models do indeed have advantages individually in their own rights. However, it cannot be overlooked that the disadvantages or drawbacks are in some cases serious (Voepel and Leibold 2004).

In particular, many of these tools involve a very mathematical or statistical approach. It is often overlooked that these tools are to be used mainly in the human resources departments, and in most human resources and organization departments the employees do not have a mathematical background. In addition to this, the literature review has also shown that it appears that the change process very much depends on the motivation of those involved. It also indicates that the emotional factors and the company culture also play a significant role. The process and the emotions are connected inseparably. Each new phase within a change process reveals its own emotional issue and with this, the phase's specific function for the handling of the change process tasks (Roth 2000). Therefore, dealing with these emotional climate curve is a particular challenge in the change process, because such emotions can support the process as bringing joy and excitement, but they can also hamper it with negative emotions of fear and grief (Liu and Perrewe, 2005)

If those responsible are aware of the importance of these fluctuations they will find it easier to recognize the signs of issues threatening the process early on and so be able to intervene early enough (Weismann 2010). Change produces extreme emotional pressure which must be released. The emotional handling of the situation follows in these cases in the same and natural sequence, regardless of the reason for change (Schmidt-Tanger,1998). In view of this, it can therefore be stated that the existing models for measuring the capability to change more or less ignore these emotional factors (Bruch and Ghoshal 2003). Finally, measuring instruments are flawed with weaknesses on account of which their practical use can be questioned.

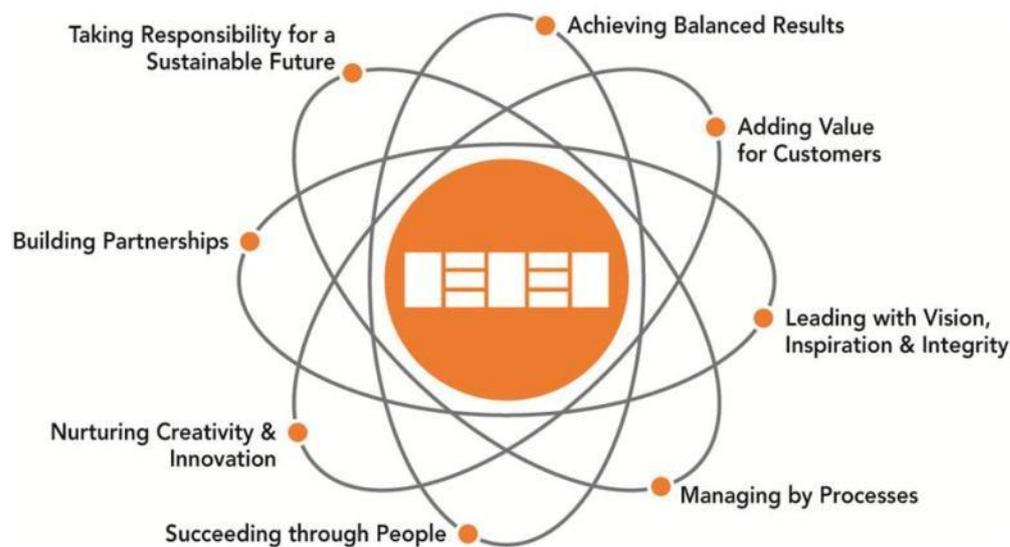

EFQM AT A GLANCE

The „European Foundation for Quality Management“ EFQM is a global non-profit membership foundation. The EFQM model provides organizations with assistance in the setting up of and the continual further development of extensive management systems. The organizations use it as a tool to determine its strengths and the potential for improvement based on self-assessment, to encourage and increase business success.

Excellent organizations distinguish themselves through similar characteristics and ways of thinking, regardless of the environment in which they operate. These characteristics which make successful organizations excel in comparison to other competitors are identified in the EFQM model as basic concepts. These basic concepts have been identified through global

benchmarks, observation of emerging trends and interviews with senior managers throughout Europe. Each basic concept is important in its own right, but the highest gain can be achieved if they can be interlinked with each other. There is no particular order or importance of these basic concepts. Each organization itself must recognize which basic concepts are the most important for them.

Figure 1: EFQM – The basic concept

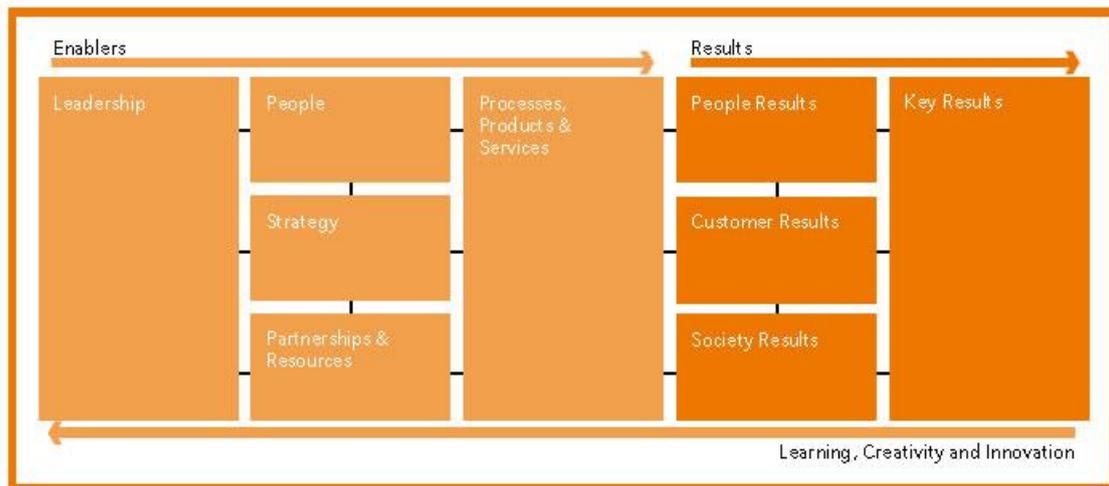

Source: (EFQ 2012)

This approach sets out that the employees are involved in the processes in such a way that the company can improve its results.

The EFQM Excellence model is based on eight basic concepts and nine essential criteria with a total of 32 sub-criteria, divided into “enablers” and “results.” (EFQM 2012). The wording was chosen so that the model can be used similarly for differing sectors, large/small companies, or simple/sophisticated organizations.

Figure 2: EFQM – The main criteria

Source: (EFQ 2012)

The three main pillars in the vertical boxes clearly form the fundamental components of the model. The corresponding horizontal boxes in between form a further sub-division and they indicate with which measures the implementation of the model can be achieved and which intermediate results are necessary for this. Basically, the model explains that customer and employee satisfaction and the influence on the society can be achieved through leadership with the support of policies and strategies, employee orientation and management of resources, which subsequently, with the help of appropriate business processes, leads to excellence in the organization's results.

The second issue to be seen is that the model is divided into two large parts, in **enablers** and **results**, both of which make up half of the whole model in the evaluation. This is one of the fundamental points of the TQM model, that it is not sufficient to manage the results but that it is essential to include the ways of approach (the enablers). This is the reason why half the weighting falls on the ways of approach although at the end it is the results which have to be achieved. With the results, *what* the organization has achieved it is defined and with the enablers *how* the organization wants to approach the issue it is defined along with which resources and methods they want to achieve the results.

So far the research questions as to whether it is possible to adapt the EFQM model with specific change requirements until here is still unanswered. This model was chosen because on first sight it analyses the above mentioned key factors, along with the internal and external view. Whether or not the model can fulfill the expectations is under examination and the

question cannot be answered directly at this stage, but model extensions do already exist as indicated by (Schat, 2011) as it can be seen with the following concepts (extensions).

ROWE Concept: the first additional module is the ROWE concept (Results Only Work Environment). The aim of this concept is a strict focus on employee results. The employees decide themselves when and where they work. The managers and the employees agree on specific goals and outline the framework of conditions which support them in reaching these goals (working materials and equipment, resources, courses and seminars etc.).

OED Concept: the second additional module is the OED concept (Overall Employment Deals). In the light of demographic developments the importance of employability is growing. For this reason, in addition to salary payment, fringe benefits and perks, the following aspects are also gaining in importance: workplace health promotion, workplace design, flexible working hours, work-life balance, lifelong learning, career planning until 67, and the transfer of knowledge. OED offers an integrative approach which combines these components into a convincing and logical company-specific strategy.

There are already the first studies in which companies, which have used the EFQM model, have shown certain factors of success, for example by obtaining higher profits and an improvement in employee's retention. Although, two extensions to the current model have already been developed (ROWE and OED) concepts as explained above the emotional part involved in change management is still missing. Therefore, the researchers are convinced that the EFQM model can further be extended by focusing on the emotional part involved in change management. Being the aim of this research the extension of the EFQM-model by a change component which does not exist at present.

CHANGE MANAGEMENT

In literature, there is no one unambiguous, clear and conform definition of change management (Weismann 2010). The following three definitions are the most wide-spread (Capgemini 2010):

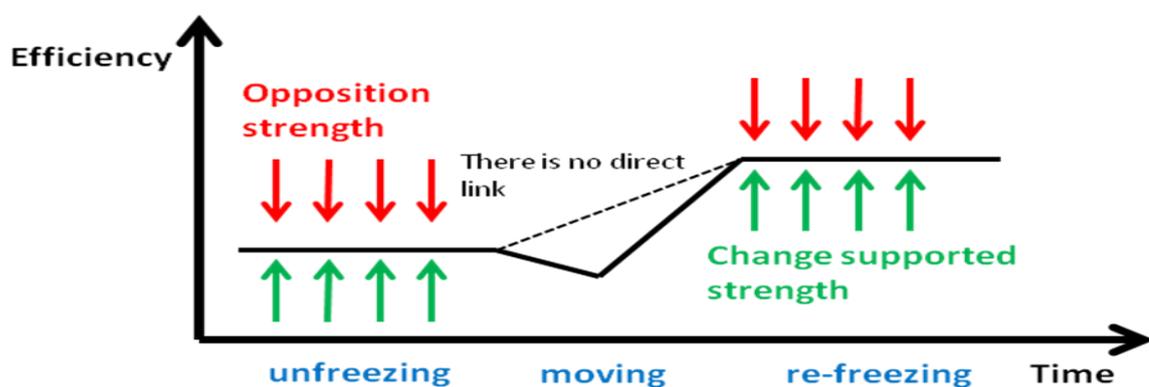

Planning-oriented definition: the aim of change management puts the increase in efficiency above a focussed change in culture, systems and behaviour within an organisation.

Stakeholder definition: here change management is understood as the organized and systematic approach dealing with changes from the point of view of company managers and employees.

Result-oriented definition: the aim of change management is the improvement of business objectives and results via the change process.

Deeping further into change management, Lewin's (1952) three basic approaches are described with the intention to work out which starting points from the various approaches offer in the way of making an organization's capability to change measurable. Lewin is regarded as one of the main protagonists of Organizational Learning. Lewin's model is based on three phases in the change process (Burnes, 2009, p.364).

Figure 3: Lewin's model

Unfreezing: "The starting situation is marked by a balance of the competing powers of stability and change. In this phase the employees involved are to be prepared for the changes. They should be sensitized to the demands of a transformation. Through this forming of awareness the necessary willingness for change in the employees involved is established and built up and the powers for change strengthened. At the same time the powers of resistance are reduced due to which the balance of the organization is out of equilibrium for a while.

Movement: As soon as the necessary willingness to change and the main aim of the first phase has been achieved the actual change takes place. Solutions are compiled and new patterns of behavior are tried out, in order to be able to cope with the challenges of the change process. This phase runs for as long as it takes to achieve the change strived for and until the new balance is reached.

Re-Freezing: The new behavior patterns are lived out consistently in order to stabilize the new balance. The problem solving strategies applied in the second phase are integrated into the company's workflows. By doing this the organization can prevent itself falling back into its old ways".

Changes at all levels, individual or company level always means to abandon one's comfort zone for something perhaps unsure or unknown. At the stage, is when leadership needs to

combine the skill identified previously of communication, emotional and factual intelligence, change abilities and attention to processes have to come to the fore.

METHODOLOGY

The research applies a qualitative approach on the basis of interpretivism. Creswell (2009) describes the research design as an overall plan for connecting the conceptual research problems to the pertinent and achievable empirical research. It remains important that the design frame is suitable to answer the research question (Salkind 2003). Therefore, to achieve effective improvements, a combination of action research and case study will be chosen. The researchers regard this combination of the two approaches the optimal possibility to answer the research question. This is confirmed by Mumford (2006) stressing that often a mix of methods produces the best results.

The action research gives the framework with the intention of helping to develop practice (Coghlan and Brannick, 2010). Through the case study the understanding of the details of what is happening can be established. Yin (2009) describes this circumstance that the researcher would use the case study method because he wanted to understand a real-life phenomenon in depth.

The researchers have planned 6 steps for data collection (in-depth interviews, focus groups and company's reports) which will be conducted in one of the researcher's company. The sample will be employees and members of middle management and top management. The selection of the participants will be made on the ground that middle and top management play a particularly important role in the change process. With this type of data collection the personal interaction between the researchers and the participants would be very important. Once the data is gathered, content analysis will be used to conduct the analysis.

LITERATURE FINDINGS' DISCUSSION

At this early stage, as the research is part of doctoral work only findings based on literature review can be presented.

Kotter, (2001) has been researching change management for a few decades and he says, that the fundamentals on how organizations change are quite clear. He has found out how

organizations change and what people need to do to make them change. Changes and changing processes are part and parcel of today's business environment. Which challenges are waiting on the road towards change? Do we really know how a company has to be structured and which capabilities are necessary for it to be able to cope with continuous change? In general business literature is often pointed out that many companies fail during the change process. But what exactly does it mean, to fail? Or, what makes some change processes successful and others not? The problem could be that the capability to deal with change is not built into organizations. Kotter states that it is not built into both the skills and the brains of the people who run them. The big question for the future is: How can organizations be helped to build those capabilities? How can managers and staff be helped to incorporate usefully a way of thinking that enables corporate change? How can it be ensured that everyone has the capability to play their appropriate role in any change process? In other words the capability of change is a question of company culture within which managers see the process of change as one of the most important management tasks.

Capability of change is made up of change readiness, change competence and the scope of possible change. In this case the main challenges, especially for managers, are to support the willingness to change of those involved, to encourage change competence and to outline the scope of change possibilities.

If a company doesn't only want to keep up with competition but also gain a cutting edge it must be in a position to tackle these challenges of change. That means the establishment of an organization which is capable of changing, but not only for one specific forming of change in one specific situation, is the main challenge for companies. In other words the main job of corporate change will be to build the specific capabilities into the organizations allowing them to deal with extreme turbulence. This requires getting enough people and all kinds of people in the organization involved in the right way to handle change. When a topic such as organizational capability of change is considered as being essential the next logical step is to ask about measurability and scalability.

Related to the three steps of change management, the basic approach of this model is to bring about the willingness to change in the employees involved. All in all, this model is very general and conclusions based on only three phases are hardly possible for the real world. Furthermore this approach is based on the assumption that the organizations can always work under consistent conditions. It is also assumed that the organizations can develop from

a stable starting point to the next stable state. A further important point of criticism is also that this approach does not take into account possible crisis situations at all. Finally, it is also assumed that all the people involved work together, all pulling in the same direction and that they fully support the change process. With this assumption organizational and political conflicts are equally ignored. Or in other words, it is assumed that conflicts can be easily identified and solved (Todnem, 2005, p.374).

It was indicated before that without a suitable system for measuring it is almost impossible to implement the changes within an organization. Raisch 's statement that only where change can be measured is it possible to attribute clear areas of responsibility and to monitor whether the aspired goals are reached or not, found several supporters in literature.

The overriding opinion emerging from the literature review related to the models of measurement is that the model has not been able to be operationalized. This leads to the dilemma that on the one hand the measurability of the capability to change is considered as being important as stressed by Todnem (2005), and that on the other hand, suitable measuring instruments do not exist. Could the reason for this possibly be found in that the authors of the existing measuring instruments wanted to develop basic new models? Did they fail due to the complexity of change processes? Might it be possible to add on a so-called change component to existing models which have already been proved useful in practice? .

CONCLUSION

As an interim conclusion of the literature review, these models of measurement have not been able to implement neither in practice nor in sciences or teaching. This is, at least, the overriding opinion emerging from the corresponding literature. This leads to the dilemma that, on the one hand, the measurability of the capability to change is considered important and on the other hand, suitable measuring instruments do not exist.

The question as to why this is the case inevitably crops up. Is it possible that the assumptions made for the models for measuring a company's capability to change are wrong? Wrong, in the sense of the methods used?

It looks as though change is a function of external dynamics and internal capabilities and significantly success or failure is often determined by the interaction between the two as stressed by (Jarret, 2008).

The extension of the EFQM should be able to support management to find out the level of the current capability to change and also to identify the specific possibilities for action to improve capability to change. In this model the main focus of attention should be on the interaction between the external events and the internal capabilities. Therefore, the existing additions discussed above show that the EFQM model can be extended for specific needs. So what can be said against the idea that by using a so-called EFQM change component a pragmatic instrument for measuring the capability to change can be developed? To be able to examine this in depth though, firstly, further intensive research and secondly a trial experiment are necessary to confirm the suitability.

LIMITATIONS

What is important here is that the researchers examine the potential sources carefully and then bundles optimally for the specific case. So, even if the researchers consider various techniques for the analysis phase, according to Yin (2009), for example pattern matching, explanation building, time-series analysis, logic models and cross case synthesis and the researchers embed the case studies in an action research, not all the weak points can be compensated for. This is particularly the case, because the collection of data and information is restricted to the researchers' company and so, a generalization of the knowledge gained is not really possible.

This preliminary decision is also influenced by the central topic concerning company culture. From the researchers' point of view today it can hardly be expected that other companies in the industry will be willing to give away such sensitive and company-internal information, as all the companies in the lacquers market are in direct competition to one another.

FACTORS INFLUENCING FUND RAISING: AN EMPIRICAL STUDY ON ITALIAN STARTUPS

Talaia, Marco¹; Pisoni, Alessia²; Onetti, Alberto³

ABSTRACT

This paper aims at identifying the factors that influence fund raising in new ventures. We analyzed a sample of 108 Italian startups. The research is aimed at identifying the characteristics of the entrepreneurial team that have a bigger influence on equity acquisition. We focused the research on the lead person in the founders' team (we identified with the person who assumes the CEO position) and we carried out a Tobit regression to test hypotheses developed on a list of variables extracted from the literature analysis. The analysis shows a significant relationship between the ability of a startup in fund raising and the level of education of the CEO. This causal relation is even stronger if the CEO has a managerial education acquired through an MBA. Moreover, previous work experience seems not to have a key role in fund raising, while company's size and legal form may affect it. Future research lines conclude the paper.

Keywords: Entrepreneurship, Startups, CEO, Fund Raising, New Technology-based Firms.

1. INTRODUCTION

Entrepreneurial activity fosters the innovation and technological change of a nation (Schumpeter, 1943). Shane (1995) demonstrates how key is entrepreneurship for the economic growth of the country providing data about the contribution of entrepreneurial firms to the US real economic growth in the period 1947-1990. Moreover, new ventures are responsible for job creation (Vesper, 1996). Recent studies (see inter alia, Stangler and Kedrosky, 2010; Kane, 2010) show that startups are accountable for almost all the new jobs created in the United States (about 63%), net of jobs lost.

For all these reasons, entrepreneurship has attracted the interest of scholars since many decades. Entrepreneurship is a multifaceted phenomenon that can be defined in different

ways (Gartner, 1990; Bull and Willardt, 1993; Lumpkin and Dess, 1996). The interdisciplinary nature of entrepreneurship research reflects aspects related to individuals and groups (team), enterprise, culture, geographic distance/location, industry, country's policy.

In this paper we refer to entrepreneurship as a process whereby firms and individuals (entrepreneurs) explore and exploit opportunities (Stevenson and Jarillo, 1990; March 1991), leveraging their ability to manage uncertainty in a pro-active way. Moreover, this process impacts (and is impacted by) the company's strategy and business model (Onetti *et al.*, 2010b) as well as the fund raising process (Eckhardt and Shane, 2003).

This paper focuses on equity capital acquisition since it is one of the most critical factors in the growth/development for a startup/new venture (Hustedde and Pulver, 1992). Stated the importance of startups for the economic growth of countries and job creation, we decided to focus the research on the factors that favor fund raising. We decided to analyze factors that refer to the startup as a whole ("company specific factors") as well as the single individuals composing the entrepreneurial team ("human capital").

The way entrepreneurs mobilize resources (in terms of quantity and quality) to exploit opportunities is a crucial research issue in the field of studies related to entrepreneurship. Insofar studies have focused on network ties between entrepreneurs and investors (Shane and Cable, 2002; Zheng *et al.*, 2009) and entrepreneurs' characteristics (Watson *et al.*, 2003; Burton *et al.*, 2002) to explain financial capital mobilization/acquisition. Moreover, Cooper, Gimeno-Gascon and Woo (1994) linked initial human and equity capital to new venture performance. While the above-mentioned issues have been deeply investigated, access to equity capital for startups at an early stage and the existing linkages with human capital and firm characteristics still remain an open research problem.

Our analysis aims at filling this gap linking the founders' background (education, working and entrepreneurial experiences) to the ability in acquiring new equity capital. This study aims at contributing to the literature on entrepreneurship and provide important implications for researcher and practitioners who are more and more interested in startup companies and (qualitative and quantitative) criteria to be used during the investment process (Startup Genome, 2012).

The paper is structured in six main sections. The first is an introduction to the topic of entrepreneurship and capital raising. The second section contains a comprehensive literature review on human capital - new venture characteristics and relationship between them and the capital raising process. In this section we also provide a brief description of the conceptual framework we adopted to run the analysis. Then, the methodology is discussed and the main

features of the sample are presented. In last section, results are described and discussed. Some managerial and research implications complete the paper.

2. THEORY AND HYPOTHESES

2.1 *Human capital*

Several studies on entrepreneurship have focused on the person of the entrepreneur (human capital). According to this stream of research, several variables have been studied: education, past experience (both working and entrepreneurial), knowledge acquired by individuals (industry and market specific), family background and so on. According to Becker (1964), human capital relates also to the general knowledge (overall working knowledge or leadership experience) acquired by individuals through education and previous experience both as employee and employer.

The main variables related to human capital adopted in empirical studies referring to entrepreneurship focus mainly on basic demographic factors (such as age, gender, country of origin) (Roberts, 1991; Bates, 2002; Levesque and Minniti, 2006). A recent field of study is the so-called “young entrepreneurship” (Lewis and Massey, 2003; Schoof, 2006). In fact, as stated by Stevenson (1987), young entrepreneurs face major challenges by trying to raise financial assets capital to start up their business, first because they typically had no time to accumulate a lot of personal assets which that can be used as a collateral security for a bank loan and second because they lack of credibility from banks and financial actors. Other studies on cognitive aspects and social capital (Baron, 2004; Davidsson and Honig, 2003) and on motivational drivers, such as high need of achievement (Roberts, 1991) are helpful to understand entrepreneurship. Another relevant aspect of analysis that studies on entrepreneurship take into consideration is related to previous entrepreneurial and work experience. As regards previous entrepreneurial experience studies often refer to “serial entrepreneurship” (Delmar and Shane, 2006; Presutti *et al.*, 2008; Onetti *et al.*, 2010a). Empirical evidence supports that entrepreneurial startup experience increases the odds of venture success (Dyke *et al.*, 1992; Doutriaux and Simyar, 1987). Regarding previous entrepreneurs’ work experience (Brüderl *et al.*, 1992; Blanchflower and Oswald, 1998; Sorensen, 2007) previous researchers have found a positive association between previous experience in management and business success/performance (Gimeno *et al.*, 1997). Number and variety of prior work experiences (Lazear, 2004; Dahl and Reichstein, 2007) is also an important aspects.

Moreover, entrepreneurs' high educational levels/years of schooling (Bates, 1990; Roberts, 1991) is also related to superior startups' performance (Cooper and Gimeno-Gascon, 1992): in particular, Brinckmann, Salomo and Gemuenden (2009) show that startups, whose team members have strategic financial management competences, are often related to faster firms levels of growth. Another deeply analyzed field of study refers to indirect experience or passive experience of entrepreneurs, i.e. family and friends' entrepreneurial attitude (Roberts, 1991; Sorensen, 2007) that, in particular, can positively affect entrepreneurs' attitudes toward risks.

Table 15. Human capital: variables studied

Variable	Description	Authors
Basic Demographic Factors	Basic demographic factors (age, gender, country of origin)	Roberts, 1991; Bates, 2002; Levesque and Minniti, 2006
	Family and friends (entrepreneurial attitude)	Robert, 1991; Sorensen, 2007; Duchesneau and Gartner, 1990
	Personality traits	Glancey <i>et al.</i> , 1998; Steward Jr <i>et al.</i> , 1998
	High need of achievement	Roberts, 1991
	Cognitive aspects and social capital	Baron, 2004; Davidsson and Honig, 2003
Education	General knowledge acquired through education	Becker, 1975
	High education levels/years of schooling	Bates, 1990; Roberts, 1991
Experience	Work experience	Brüderl <i>et al.</i> , 1992; Blanchflower and Oswald, 1998; Sorensen, 2007
	Variety of jobs	Shane, 2001; Lazear, 2004; Dahl and Reichstein, 2007
	Specific capabilities (industry specific and entrepreneur specific, i.e. career and leadership experience)	Becker, 1964
	Entrepreneurial experience	Bates, 1990; Brüderl <i>et al.</i> , 1992; Delmar and Shane, 2006; Presutti <i>et al.</i> , 2008; Onetti <i>et al.</i> , 2010a

Some scholars have pointed out that individual characteristics may help the wanna-be entrepreneur in exploring and exploiting opportunities (Shane, 2000) or in accessing to the resources required to develop the business (Brush *et al.*, 2001). It is thus generally accepted in literature that human capital is a crucial resource to succeed in business (Bosma *et al.*, 1994; Brüderl *et al.*, 1992; Cooper *et al.*, 1994). Therefore we expect that entrepreneurs who have broader business experience, higher skills in business and management and are older should have more chance of succeeding in their business ventures. Actually, they could leverage

their prior experience and network and develop more sounding business plans and be more effective in raising capital (Hustedde and Pulver, 1992). In summary, we hypothesize that:

H1a: Entrepreneurs with higher academic education are more successful in fund raising

H1b: Entrepreneurs with business education are more successful in fund raising

H2: The older and more experienced is the entrepreneur, the bigger is his/her ability to raise capital

H3: The previous working experience positively influence the entrepreneur's ability to raise capital

2.2 Company specific factors

Company specific characteristics refer to the size of the company and group of promoters (entrepreneurial team), the country of origin and the legal status. McMahon (2001) found that the size of the company - measured in terms of headcount - positively impact its performance. Other studies show that the probability of success of a company depends also on the magnitude of the entrepreneurial team - measured in terms of number of founders - and the diversity of the competence base (Bates, 1990; Brüderl *et al.*, 1992) - startups benefit from the presence of founders with heterogeneous skills and competences (Cooper and Bruno, 1977; Eisehardt and Schoonhoven, 1990; Cooper *et al.*, 1994). Moreover, previous studies also support that firms founded by teams are more successful than those founded by individuals (Cooper and Bruno, 1977; Mayer *et al.*, 1989; Timmons, 1990; Kamm *et al.*, 1990).

Although many studies focus on the impact of country of origin on consumers' choices (Schooler, 1965; Lampert and Jaffe, 1996; Roth and Romeo, 1992), some authors have studied the relationship between the country of origin and the financial performance, although limited to companies targeting an IPO (Bell *et al.*, 2008). Startup companies begin their operations and sometimes the funding process also before being formally incorporated. This specific issue creates problem to scholars since they often need to include in their research samples companies that are not formally established as legal entities (Foo *et al.*, 2005). Reports show that venture capital funds prefer to invest in companies already established instead in companies not yet incorporated (Kauffman, 2008).

Assuming that the amount of capital raised is a good proxy of entrepreneurial performance (Lee and Zhang, 2011; Watson *et al.*, 2003), we thus formulate the following hypotheses:

H4: The size of the company - in terms of number of employees - facilitate the fund raising

H5: The larger the founding team, the higher is the ability of the company to get funded

H6: Already incorporated companies are preferred target of investment than companies not yet incorporated

Scholars argue that access to financial capital provides the necessary resources to foster exploration, to pursue new opportunities (March and Simon, 1958; Bourgeois, 1981; Zahra, 1991; Stevenson and Jarillo, 1990) and to sustain the new venture over the long term. The amount of capital raised is therefore an important resource (Cooper *et al.*, 1994) and can be considered a good proxy of entrepreneurial performance (Lee and Zhang, 2011; Watson *et al.*, 2003). The issue to address, then, is how to best capture the variables that support new ventures in accessing to financial resources. A first stream of research takes into consideration the influence of human capital on fund raising. Cressy (1996) suggests that human capital determines the ability of a company to access to financial resources, while others affirm that capital raised by a startup is positively related to the entrepreneurs' level of education (Bates, 1990). On the other side, some authors (Storey and Wyncarczyk, 1996) find that company specific factors have greater explanatory power than human capital as fund raising is involved.

As a consequence, in our research we decided to consider both company specific factors and individual specific factors (human capital) to understand their impact on the startup's ability to raise capital from investors.

3. DATA AND METHODOLOGY

To shed light on the proposed issue we used a dataset composed of 108 Italian innovative new ventures that in 2011 voluntarily submitted their business plan to the Business Plan Competition organized by Mind the Bridge Foundation, a non-profit (501 c3) corporation based in San Francisco. As stated by Foo, Wong and Ong (2005), using data of participants of a business plan competition can be quite useful and relevant. In addition, drawing the sample from this source has several advantages, i.e.: identify teams engaged in the early stages of the entrepreneurial process; scout firms and founders characteristics and perform longitudinal studies, monitoring the phenomenon in a specific area or region; such competitions are a chance for students, those from industry, and potential investors to network with one another, and thus for teams to reshape ideas and strategies.

As regards sample representativeness of population, it is difficult to assess whether this sample would be representative or not of the Italian population of startup. Different studies report a magnitude of 800/1.000 new startup initiatives each year (see among the others, Onetti *et al.*, 2012). A recent law enacted by Monti Government (Law n. 221/2012, the so-called

“Decreto Legge Sviluppo bis”) establishes a register to survey innovative startup. This would help future research by “officially” identifying the Italian population.

Data gathered contains information about the new venture, such as the year of incorporation and place of establishment, sector, number of founders, business description and available market data, company investment profile (capital raised and investors typology), financials. Moreover, demographic information on the founders and management’s team are collected, such as date and place of birth, gender, education path, role played in the new venture, prior working experiences (detailed information on the prior positions in companies / universities / research centers) and prior entrepreneurial experience (detailed information for each previous startup the founders have been involved).

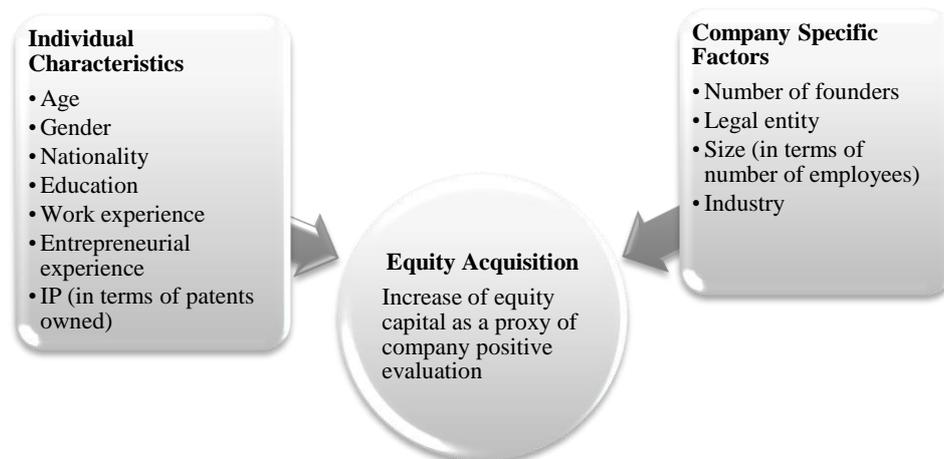

As a proxy of the individual specific factors we decided to concentrate the analysis on the Chief Executive Officer (CEO) of the new company who usually is a founder of the new venture and, in the early stages, the key figure for the company and for its strategic choices (Papadakis and Barwise, 2002). We thus take into deeply analyzed the 108 CEOs of the above-mentioned new ventures. The other people composing the founder team are considered among the company specific variables.

Below are described the main explanatory characteristics of the 108 companies we analyzed.

As regards the CEOs, they are on average 32 years old (ranging from a minimum of 21 to a maximum of 56); 87% are male and 13% female. As regards the field of activity of the companies, web and ICT represent the more prevalent business (85%). A minor role is played by companies operating in the Clean Technology industry (10%) and in Biotech/Life Sciences sector (5%). Companies are recently founded (on average 1 year); 39% are not yet formally incorporated. Bootstrapping is the most common source of funding (62%) for the 108 new ventures, 26% companies were able to raise seed capital, while 7% were funded by business angels and 5% by venture capital firms. Moreover, 14% of the companies had access to research grants.

3.1 Research design

In our research, we decided to correlate the characteristics both of the CEOs and new ventures with the ability of a startup to fund raising (measured as the amount of the capital raised up-to-date), as shown in the following figure.

Figure 26. Research Model and Variables.

In doing so, we adopted a Tobit model. Tobit models are used when the dependent variable is non-negative and represents a corner solution. The variable is therefore zero for a part of the sample and is continuously distributed over positive values (Wooldridge, 2009). In fact, capital raised is zero for about 46% of our sample, while for the remaining 54% it assumes values ranging between 750 euros and 950k euros. This model has been used by different authors to accommodate censored dependent variables as sales/expected sales (Siegel and Wessner, 2012) or efficiency and technological progress (Foltz *et al.*, 2012). The explanatory variables we adopted are listed in the following table.

Table 16. The explanatory variables of the model.

Variable	Description	Type
CEO_ACADEMIC_EDU_Y_N	The CEO has an academic education (Bachelor or Master)	Dummy
CEO_AGE	CEO's age	Continuous
CEO_BORN_ABROAD_Y_N	The CEO is born abroad	Dummy
CEO_EXP_ABR_Y_N	The CEO has international experience	Dummy
CEO_GENDER_MOD	CEO's gender (male or female)	Qualitative
CEO_MBA_Y_N	The CEO has an MBA	Dummy
CEO_PATENTS_Y_N	The CEO has submitted at least one patent	Dummy
CEO_PHD_Y_N	The CEO has a Ph.D.	Dummy
CEO_PREV_EXP_COMPANY_Y_N	The CEO has previous experience in a company	Dummy
CEO_PREV_EXP_UNIV_Y_N	The CEO has previous academic experience	Dummy
CEO_SERIAL_Y_N	The CEO is a serial entrepreneur	Dummy
INCORPORATED_Y_N	The company has been incorporated	Dummy
NO_EMPLOYEES	Number of employees of the company	Continuous
NO_FOUNDERS	Number of founders of the company	Continuous
SECTOR_WEB_NM	The company operates in the web-based	Dummy

Variable	Description	Type
	industry	
SECTOR_CLEAN	The company operates in the clean-tech industry	Dummy
SECTOR_ICT	The company operates in the ICT industry	Dummy
TEAM_MULTINATIONAL_Y_N	The team is multinational	Dummy

We carried out a Tobit model using EViews, testing the relationship between the amount of capital raised and the variables of the above table.

Model 1 takes into consideration the variables summarized in Table 3. The Tobit model includes 99 valid observations.

3.2 Testing the explanatory magnitude of the model

Before discussing the results, it was important to test the explanatory magnitude of the model. In doing so, we compared the Log likelihood of the two models, comparing them to the Chi Square with a number of degrees of freedom equal to the restrictions applied to the model.

The Chi Square test is useful to test the similarity between model No. 2 and model No. 1: in this way we can test rigorously that the general model and the restricted one are identical.

We need to test the null hypothesis, that Model 1 is equivalent to Model 2:

$$H_0: \text{Mod 1} = \text{Mod 2}$$

$$L1 \text{ Log likelihood} = -719.1430$$

$$L2 \text{ Log likelihood} = -720.8349$$

To accept the H_0 hypothesis the following relationship must be satisfied:

$$2 * (L1 - L2) < \text{Chi Square (7)}$$

$$\text{With Chi Square (7)}_{0,050} = 14.0671$$

$$[-719.1430 - (-720.8349)] = 1.6919$$

$$2 * 1.6919 = 3.3838$$

And

$$3.3838 < 14.0671$$

This confirms that the restricted model (Model 2) is definitely able to explain the influence of independent variables on the dependent one in a parsimonious way.

4. DISCUSSION OF THE RESULTS

We tested the hypotheses arisen from the literature review on the sample composed of 108 new ventures. Our results demonstrate that education positively affects the fund raising

process. In particular, our regression model strictly correlates with the attendance of an MBA program with the amount of capital raised.

The hypothesis H1a:

Entrepreneurs with higher academic education are more successful in fund raising

is then supported by our analysis. The above-mentioned result supports the idea that entrepreneurs with a higher education are better able to present and communicate a business plan and likely benefit of higher reputation vis-a vis potential investors.

Also our H1b hypothesis:

Entrepreneurs with business education are more successful in fund raising

is strongly verified, with a z-Statistic of 4.10 and a p-value<0.01.

Such results could be explained by the fact that the key competences necessary to convince third part investors are more related to managerial aspects rather than a generic level of education. Actually, the ability to effectively explain the value proposition, strategy and business model of the new venture as well as the target market and customers requires specific managerial competences and skills.

Another important factor that usually authors take into consideration to explain new companies' performance is the previous experience of the entrepreneurial team. In our study, as described, we limited our analysis to the CEO of the new ventures. As pointed out by Kisfalvi (2002), strategies in general - and strategic orientations in particular - are strictly linked to the mindset and individual-related characteristics of the CEO, that represent often the more important and charismatic person of the founders' team (Miller and Toulouse, 1986). The age of an entrepreneur can be considered a good proxy of the experience accrued along years. In fact, we expect that more experienced individuals are more successful in fund raising, doing the experience nurtured during their working life and the larger network of contacts they can leverage (Hustedde and Pulver, 1992; Eesley and Roberts, 2012).

Therefore we formulated the following hypotheses:

The older and more experienced is the entrepreneur, the bigger is his/her ability to raise capital

and

The previous working experience positively influence the entrepreneur's ability to raise capital

Both these hypotheses are not confirmed by our analysis inasmuch as the p-value is not significant. As a consequence from our data the amount of capital raised does not look significantly correlated with the age/experience of the CEO as well as his/her working

experience. This result could be biased by the specificities of the geography of our sample. As known, entrepreneurship in innovative fields is a more recent phenomena compared to other countries such as the US. As a consequence serial entrepreneurship plays a minor role in this stage of development of the startup.

Company factors are also important to explain the ability of new ventures to secure investments. Dimensional factors - measured in terms of number of employees - can be considered a proxy of the stage of development of the company and the associated risk (Lee and Zhang, 2011). Therefore, we formulated the hypothesis that

The size of the company - in terms of number of employees - facilitate the fund raising.

Our data confirm that the dimension of the company facilitates the acquisition of investments ($p\text{-value} < 0.01$). Data support that investors prefer to invest in companies that are more structured since the risk perceived results lower than in very early stage projects. The same applies to H6:

Already incorporated companies are preferred target of investment than companies not yet incorporated

where data show that already established ventures are preferred investment targets than not yet established companies.

Moreover, our data do not confirm the benefits on fund raising from a larger founders' team and in a certain way deemphasize the role played by the network in fund raising. The hypothesis:

The larger the founding team, the higher is the ability of the company to get funded

is therefore not confirmed.

It is worth to single out that our analysis only focused on the size of team and not on the diversity of the skills and competences associated to the team. Further research should also better investigate this topic.

5. CONCLUSION AND LIMITATIONS

Our analysis focus on the correlation between performance of a new venture (measured in terms of amount of capital raised) and characteristics of the company and the founders' team (human capital). The majority of studies use sales/year - sales/growth as a measure of new ventures' performance (Lechler, 2001). The innovativeness of this study lies therefore in the choice of the dependent variable. According to Lee and Zhang (2001) and Watson, Stewart and BarNir (2003) capital raised can be considered a good proxy of entrepreneurial

performance. Nevertheless, from our literature review arises a lack of empirical studies dealing with factors affecting new ventures' fund raising ability.

In particular our findings, based on data analysis through the Tobit model, show a significant link between fund raising and academic education (z-Statistic = 2.07, $p < 0.05$) and - more specifically - business/management education (z-Statistic = 4.10, $p < 0.01$). Consistently with previous studies carried out on the topic (Colombo and Grilli, 2005; Hustedde and Pulver, 1992), we found that MBAs and - in general - post-graduate education on management/business topics enhance the ability of entrepreneurs to attract third parties investments that are key for the success and survival of new venture companies. Conversely data do not support the role played by prior CEO's entrepreneurial/work experience. As regards firm specific characteristics, the model revealed a significant relation between company size, legal form and the ability in fund raising.

Concluding, the results of our empirical study provide further insights about the characteristics of the entrepreneurial team and startup that impact the success of new ventures. Moreover, we provided insights on the aspects seed and venture capital firms as well as business angels consider while evaluating an investment in a startup company.

The focus on startups founded by Italian entrepreneurs (though some of them result to be incorporated abroad) represents the major limitation that may impact on the generalization of the results. Therefore, a cross-country study will represent the natural prosecution of our research.

ABSTRACT

The purpose of this research is to evaluate the influence of two strategic service encounter dimensions on consumer beliefs and service loyalty. A conceptual model was generated with the aim of seeking to reveal the contribution of the physical environment and social interactions with front line employees on customer's evaluation of the service provider. An empirical study is conducted based on a sample of 400 customers of fitness centers. Collected data was analyzed using a structural modeling that highlight the contribution of each predictors.

The results revealed that physical and social cues differently influence customer trust and loyalty to the service provider. Overall, the joint effect of servicescape and social interactions positively influence customer trust and lead to service loyalty. This paper provides empirical evidence on the contribution of two service encounter cues: servicescape and social interaction on customer trust and service loyalty. The survey is limited to just one context, fitness centers and Tunisian customers. However, it offers a conceptual framework that can be tested in a variety of services. Managerial recommendations focus on improving relational aptitudes of frontline employees, particularly in personal services such as fitness centers

Keywords: servicescape, social interactions, front line employees, trust, loyalty, structural modeling

INTRODUCTION

There have been several attempts in service marketing literature to discuss the issue of service encounter dimensions and their effects on service outcomes. Shostack (1985, p. 243) defines a service encounter as *“a period of time during which a customer directly interacts with a service”*. This definition implies that in the service industry, customer interactions with physical and human elements may be necessary for service delivery. Some authors have suggested that service encounters have more impact on customer evaluation than the service outcome (Bitner, 1990; Grönroos, 1990). This statement has been illustrated by the Nordic approach of service quality which distinguishes between the technical (service outcome) and functional (service interactions) dimensions. It might seem that customer perception of tangible clues such as the establishment's decor, furniture and front line employees' behavior are greatly significant in service evaluation and future intentions (Nguyen and Leblanc, 2002; Mari and Poggesi, 2013).

Many of the researchers on this issue have underlined the relevance of the physical environment and customer-contact personnel in service performance. While Eiglier and Langeard (1987) have classified those elements as key factors in service delivery (« servuction theory »), Booms and Bitner (1981) emphasize their strategic relevance by integrating them in the service mix marketing.

A review of the existing literature on this subject reveals that prior research has employed different methods to understand the role of the physical environment and/or customer-contact personnel on customer evaluation. Although qualitative research has focused on service experience, quantitative studies have tried to examine these two elements (separately) as predictors of service quality, satisfaction and patronage intentions (Baker et al., 2002). Scant empirical studies have combined the role of physical environment and customer-contact employees' relationship (e.g. Baker et al., 2002; Eileen and Berry, 2007; Musriha, 2012) in customer's beliefs, in particular, trust in the service provider. This research attempts to address this gap by (1) jointly investigating the effect of physical environment and customer-contact personnel relationship on trust and loyalty and (2) comparing their influence on customer evaluation of the service provider.

After reviewing the literature, the paper describes the study designed to test the conceptual model. This is followed by a discussion of structural modeling results, managerial implications and finally a suggestion of future research.

PHYSICAL ENVIRONMENT IN SERVICE ENCOUNTER

Previous physical environment research in marketing has attempted to define and illustrate the influence of the physical setting in retailing and service organizations. Kotler (1974) used the terminology of atmospherics to describe « *the effort to design buying environments to produce specific emotional effects in the buyer that enhance his purchase probability* ». This definition points out the managerially controllable dimension of environmental stimuli and explains the internal mechanisms leading to consumer's emotional and behavioral reactions.

The Kotler (1974) framework is anchored in the environmental psychology paradigm (Mehrabian and Russell, 1974). Models were developed in this area to examine the direct physical environment influence on affect and the mediating role of emotion in understanding consumer behavior.

Based in this research tradition, the seminal study of Bitner (1992), illustrated the cognitive, affective, physiological and behavioral reactions of both customers and employees to the physical environment. This conceptual framework has encouraged many scholars to investigate the influence of physical cues in the service context by taking into account the frontline employee's behavior and the social interaction between customers and employees (Turley and Milliman, 2000; Baker et al., 2002; Eileen and Berry, 2007; Skandrani et al., 2011).

Referring to Bitner (1992), we consider that the physical environment or what the author named servicescape is the "*manmade, physical surrounding as opposed to the natural or social environment*". This conceptualization only focuses on "objective", "measureable" and "managerially controllable" environmental cues (Rosenbaum and Massiah, 2011).

SOCIAL INFLUENCE IN THE SERVICE ENCOUNTER

Interactions between the customer and contact personnel derive from the nature of services and the customer involvement in the service delivery process. In the majority of service encounters, customers interact with front-line employees as coworkers and share conversations that go beyond the core service. This social aspect of service encounters is viewed as a key concept in service literature because it reveals that several service encounters are closer to friendship than to economic transactions (Price and Arnould, 1999).

To support this idea, Rémy and Kopel (2002) proposed the concept of "linking services" to address the customer need of social interaction and communitarian links. They suggested that

the physical setting, the customer involvement in service delivery and interactions with contact-personnel are fundamental cues in creating social bonds.

Many authors draw on the exchange theory to illustrate the nature of service relationships (Goodwin and Gremler, 1996). In this research, there is consistent evidence that the boundaries between transactional and social relationships are unclear. This statement supports the idea that service relationships vary on a continuum from transactional to social. Somewhat similar inferences can be found in the framework of Goodwin and Gremler (1996). The authors identify two types of social behavior in service delivery, functional aspects (that refers to “provider personalization”; “friendliness”; “empathy” and “Appreciation”) and communal aspects that reflect friendship behaviors.

In the same way, Butcher et al. (2001) emphasize interpersonal relationships in the service process and distinguishes relational outcomes from service partner’s characteristics or behaviors. Relational outcomes refer to “*the feelings, thoughts, and perceived relationships arising from the social interaction with the service employee*”.

In this issue, the research of Bove and Johnson (2000) offers a literature review on consumer-service provider relationships that end in a conceptual framework showing the influence of interpersonal relationships on loyalty to frontline employees and service firms.

A CONCEPTUAL FRAMEWORK OF THE INFLUENCE OF PHYSICAL AND SOCIAL ASPECTS OF SERVICE ENCOUNTER ON CONSUMER’S TRUST AND LOYALTY

Empirical studies on this issue are relatively scant, particularly regarding the investigation of the joint impact of servicescape and social interactions with front-line employees. In the following sections, the influence of the two aforementioned constructs will be discussed in order to propose a model that explains how consumers form beliefs and behaviors in service encounters.

Physical and social aspects of the service encounter as predictors of loyalty

In service marketing literature, the loyalty phenomenon is mainly conceptualized as a tri-component construct that encapsulates behavioral, attitudinal and cognitive dimensions

(Oliver, 1999). Thus, service loyalty is depicted as customer commitment to a particular service provider, which led to a repetitive purchasing behavior, an advocacy of the service to others and a strong belief that this service provider is a first choice among a set of competitors. In service, it is argued that loyalty is linked to interpersonal relationships and tangible cues of the service encounter. For this research, it is assumed that the physical setting and social interactions with the contact-personnel are salient in explaining service loyalty. Further support can be found in the works of some researchers. In her conceptual framework, Bitner (1992) suggests that behavioral outcomes such as spending money and returning to the service provider are influenced by the servicescape. However, this influence reflects an indirect causal relationship that can be mediated by "internal responses" (cognitive, emotional and physiological responses). Numerous studies have also been inspired by the SOR paradigm and have illustrated that the perceived servicescape can predict behavioral outcomes through the customer's beliefs and emotions. Investigating on this issue, research in retailing stores has demonstrated the direct impact of environmental stimuli on returning, advocacy behavior and spending money (Turley and Milliman, 2000; Skandrani et al., 2011). Hui et al. (1997) have found a positive influence between ambient conditions and advocacy behavior in service area. In the same way, Keillor et al. (2007) confirm the same results in an intercultural study in the hotel industry. In a recent study, Musriha (2012) supported the impact of servicescape on customer loyalty in bank industry. In order to thoroughly understand this influence it is useful to examine the following hypothesis:

H1: Perceived servicescape has a positive and direct influence on service loyalty.

Regarding the social aspect of the service encounter, researchers tend to support the vital role of front-line employees on loyalty to the service provider. It's often argued that loyalty is a relational construct (Bowen and Shoemaker, 1998; Pitchard et al., 1999) that could be predicted by social interactions. On the basis of this assumption, many researchers have found a positive and direct impact of customer-service employee relationships on repurchasing behavior, advocacy and positive word-of-mouth. In his study, Barnes (1997) found that a strong relationship between the customer and the contact-personnel lead to repurchasing intentions and advocacy of the service provider. Similarly, Butcher et al. (2002) illustrated the positive impact of relational outcomes on loyalty. The authors specifically demonstrated that friendship was a strong predictor of service loyalty. Using SEM method Musriha (2012) demonstrated the influence of personal, communication quality on customer

loyalty. Similar results were found by Goodwin and Gremler (1996) and Price and Arnould (1999). Therefore, the following hypothesis is advanced:

H2: The relationship with front line employees has a positive and direct influence on service loyalty

Physical and social aspects of the service encounter as predictors of trust

Physical and social aspects of service encounters are also linked to the customer's beliefs. In Bitner's (1992) framework, the physical setting may reduce cognitive reactions as beliefs, categorization or symbolic meanings. In service literature, the customer's beliefs toward the service organization are also considered as an outcome of interpersonal bonds with frontline employees.

In this research, trust in the service organization will be investigated as an outcome variable reflecting the customer's beliefs. Trust will be incorporated in the conceptual model as a central relationship-building construct.

Researchers have yielded a variety of terms such as confidence, reliability, integrity, expertise, to define trust. Relationship marketing theory has suggested that trust could be defined as the customer's confidence or willingness to rely on the exchange partner's competence, reliability and integrity (Moorman et al., 1993; Morgan and Hunt, 1994). It would seem that customer trust arises from the perceived intentionality of the service provider to fulfill their promises.

The service encounters present to the customers an opportunity to test the service provider's intentionality. Any interactions with the servicescape or the frontline employees act as an indicator of the trustworthiness of the service provider. Insufficient inferences exist on this issue, so this investigation attempts to fill this gap in the research.

The study of Julien and Dao (2006) has suggested an influence of frontline employees' behavior on customer trust. The findings indicate that perceptions of employees' expertise have a positive impact on customer trust. Similar inferences can be drawn from Berry (1999). However, the authors didn't find a link between benevolence behavior and customer trust. Regarding retail banking services, Shainesh (2012) highlights the role of consumers' beliefs of trustworthiness arising from the competence, benevolence and problem solving orientation of

front line employees in building trust in the service provider. In line with these theories and some empirical results we expect that:

H3: The customer-front line employees' relationship has a positive and direct influence on trust in the service provider.

While there are many studies supporting these results, little published work aims to investigate the link between the physical environment and trust in the service context. In their study, Guenzi et al. (2009) generated some interesting results about the influence of the store environment on customer trust in the supermarket retailer. Somewhat similar inferences can be drawn from the study of Bitner (1990), showing the influence of travel agency decor on customer attribution for the agent behavior. Bitner (1992) supports the idea that "*The perceived servicescape may elicit cognitive responses...influencing people's beliefs about a place and their beliefs about the people and products found in that place*". By logical extension, it can be argued that:

H4: The physical environment has a positive and direct influence on trust in the service provider.

The physical environment's effect on customer-frontline employees' socialization

The conceptual framework of Bitner (1992) has addressed the question of the influence of the physical environment on social interactions. This idea underlines the role of environment clues in shaping individual behaviors in the service encounter. Thus, in the words of Bennett and Bennett (1970) "*all social interaction is affected by the physical container in which it occurs*" (in Bitner, 1992). Equipment and furniture arrangement in the service could enhance or limit social interactions between customers and front line employees. This implies that the physical environment affects the nature and the quality of social interactions. This is consistent with Varlander and Yakhlef's (2006) results. The authors have performed interviews and observation in the travel, banking and book-selling industries in order to examine the effects of the implementation of the Internet on spatial designs. The results show that furniture and artifacts model social interactions in terms of spatial orientation (proximal or distant), temporal orientation (accelerated or decelerated), behavioural outcome (approach or avoidance) and service outcome (suboptimal or optimal). Further support can be found in the quantitative study of Temessek-Behi (2008), which highlights the positive impact of customer

perception of a hotel's physical environment on the nature of the relationship between customers and front line employees.

H5: The physical environment has a positive and direct influence on the customer-front line employees' relationship

Service loyalty and trust

Extensive literature in social psychology and relationship marketing has emphasized the role of trust in creating long lasting relationships. Doney and Cannon (1997) suggest that customer trust refers to a psychological state, an expectation or a belief. Whereas Moorman et al. (1993) associate trust with the willingness to rely on the exchange partner and trustworthy behavior. Trust seems to be an implicit condition leading to loyalty and a key factor in long-term customer orientation toward the service firm (Gwinner et al., 1998; Julien and Dao, 2006). The link between trust and service loyalty has been supported by numerous empirical research (Gwinner et al., 1998; Julien and Dao, 2006).

H6: Customer trust has a positive and direct influence on service loyalty.

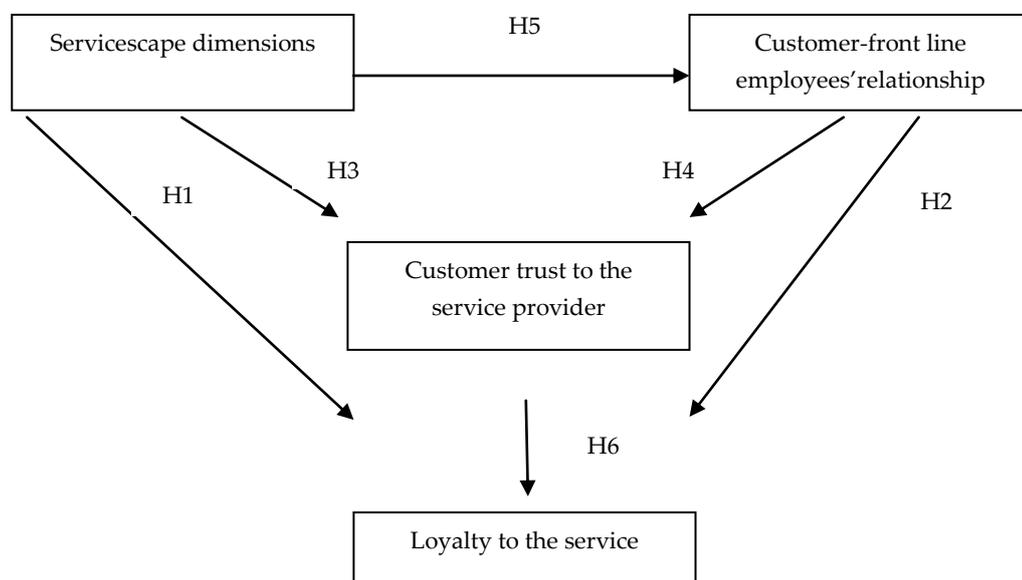

Figure 1: The conceptual framework of service encounter

RESEARCH SETTING AND SAMPLE

To test the hypothesized relationships a survey was conducted in fitness centers. This choice is advantageous since it offers a setting where customers spend a lot of time observing, experimenting with the physical environment and developing interactions with frontline employees. Fitness centers also represent a hedonic service with a high linking value (Rémy and Kopel, 2002) yet it remains rarely investigated.

A total of 400 customers of fitness centers were interviewed face to face. The sample was proportionally distributed with regard to gender (52 percent women and 48 percent men). Interviewed customers were predominately young (45 percent aged between 20 and 30 years). The majority of the respondents had an occupation (53.8 percent).

MEASURES

To measure customer loyalty, four items were selected from the behavioural consequences of service quality scale developed by Zeithaml et al. (1996). This scale has been used in several researches to determine customer loyalty (Price and Arnould, 1999). In order to measure the servicescape, scales proposed by recent research have been also considered (Capelli and Sabadie, 2007, Temessek-Behi (2008). The customer-contact personnel relationship was measured by Butcher et al. (2002)'s relational factors. Customer trust in the service provider was measured by a three-dimensional indicator (benevolence, integrity and competence) developed by Bartikowski and Chandon (2008). All the indicators were measured by a 5 points Likert scale ("strongly disagree" to "strongly agree").

RESULTS

An exploratory factor analysis was carried out to examine the construct structure. Then, the two-step approach recommended by Anderson and Gerbing (1988) was used with LISREL 8.3. Firstly, a confirmatory factor analysis was performed to ensure the validity of the measurement model. Secondly, a path analysis revealed the hypothetical causal relations of the research model. The scale of the perceived physical environment showed a bi-dimensional structure with "space design" as a first dimension and "ambient conditions" as a second dimension. All the other scales had a one-dimensional structure. It was found that the Cronbach's alpha ranged from 0.72 and 0.82 and the Joreskog's Rho ranged from 0.68 and

0.87. Therefore, all measurement scales were considered reliable. However, there was a less satisfactory reliability and validity score for "ambient conditions" dimension (Table 1).

	Scales structure	Cronbach's Alpha	Joreskog's Rhô	Rho of convergent validity
Perceived environment	physical Bi-dimensional			
Design	7 items	0.82	0.82	0.56
Ambient conditions	3 items	0.72	0.68	0.48
Social interactions	one-dimensional 6 items	0.84	0.81	0.54
Customer trust	One-dimensional 7 items	0.75	0.87	0.52
Loyalty	One-dimensional 4 items	0.79	0.79	0.51

Table 1: Scales' Reliability and validity

The factor contributions are significant (p value =.05) and the Rho of convergent validity exceeds the recommended threshold by 0.50 except for the "ambient conditions" dimension.

After verifying measurement model fit we tested the structural model. The values of the indices show an acceptable fit between the empirical and theoretical model (RMSEA = 0.059, SRMR=0.054, $\chi^2 / dl=2.39$, GFI=0.88, CFI = 0.91). The predictors of the model satisfactorily explain the dependent variables. Thereby, the SMC relative to "customer trust" and "loyalty" is 0.40 and 0.52. The physical environment dimensions only explain a small part of the social interactions between the customer and the service employees (SMC=0.08). The results of the path analysis support the hypotheses (Table 2). The examination of the standardized

estimates and the significance of the relationships highlight the influence of social interactions and the physical environment on customer trust and loyalty towards the service provider.

As assumed, the interaction between the customer and the service employees acts positively on consumer's beliefs in the service provider's integrity (H4) and increases their loyalty intention (H2). The physical environment dimensions do not act directly and significantly on loyalty to the service provider (H1). The results (Table 2) similarly validate hypothesis H6. It thereby appears that consumers who trust the service provider are more likely to develop repatronage and advocacy behaviors. The results do not totally support the relation between the physical environment dimensions and the social interaction between the customer and the service employees. Only the ambient conditions seem to positively influence the customer-frontline employees' relationship (H1a).

Hypothesis	Structural path	Path Coefficients	Hypothesis testing and t test
H1a	Space design → Loyalty	0.09 (t=1.33)	Not supported
H1b	Ambient factors → Loyalty	0.10 (t=1.21)	Not supported
H2	Relationship factors → Loyalty	0.38 (t=4.60)	Supported
H3a	Space design → Trust	0.17 (t=2.34)	Supported
H3b	Ambient factors → Trust	0.28 (t=2.09)	Supported
H4	Relationship factors → Trust	0.44 (t=6.00)	Supported
H5a	Space design → Relationship factors	0.00 (t=0.03)	Not supported
H5b	Ambient factors → Relationship factors	0.25 (t=3.00)	Supported
H6	Trust → Loyalty	0.35 (t=4.27)	Supported

Table 2: Results

DISCUSSION AND MANAGERIAL IMPLICATIONS

The purpose of this research was to examine the influence of physical environment dimensions and social interaction on trust and loyalty towards the service provider. The results provide some important insights that could enhance theoretical and managerial understanding of the role of servicescape and customer-frontline employees' relationship on behavioral outcomes. The social interaction between the customer and the contact personnel appears to be an effective factor that reveals the customer loyalty level to the service provider. This result confirms previous research, which insists on the strategic role of service employees in customer trust (Moorman *et al.*, 1993) and loyalty (Butcher *et al.*, 2002). From a managerial point of view, this result suggests developing the relationship between the customer and frontline employees by promoting interactions based on respect and even friendship. Coaching sessions should be considered to improve service employees' awareness of the importance of their role in the formation of consumers' beliefs.

Trust is also an outcome of physical environment dimensions. It seems in this framework that the ambient conditions have a more significant effect on customer trust than the design. Thus, the service providers should focus on ambient clues such as local cleanliness, temperature or even lighting which seems indispensable to the creation of an atmosphere inspiring confidence and denoting the service provider integrity and professionalism. Furthermore, the design relative to the aesthetic level, the architecture, and the furniture of the fitness centers act slightly positively on customer trust. These factors would be probably more associated with evaluative judgment variables like service quality, perceived value and satisfaction.

However, the two dimensions of the service encounter explain 40 percent of the scores for variation of customer trust. This result consolidates the choice of the explanatory variables and enables emphasis on their importance in the formation of the consumer's beliefs towards the service provider. The relationship between the dimensions of the servicescape and loyalty did not find any empirical support. No significant relationship has been found between loyalty and ambient conditions, on the one hand and between loyalty and design, on the other hand. This result points to the possibility of an indirect relationship between physical environment dimensions and loyalty. It is possible to consider a mediating effect of customer trust. This option confirms the theoretical Bitner's framework (1992) and Temessek-Behi's results (2008), which suggest an indirect effect induced by servicescape components on loyalty and behavioral outcomes. However, the results indicate that loyalty is positively influenced by social interactions between frontline employees and customers. This finding

converges with other research (Butcher et al., 2001, 2002; Price and Arnould, 1999). The relationship with contact personnel is an important dimension in the formation of the consumer's behavioral intentions.

Indeed, it seems that the influence of social interactions on the consumer's loyalty is stronger in the case of services with high spatial and psychological proximity like fitness centers (Butcher et al., 2002). Within this context, service providers would benefit from focusing their attention on the nature of the interactions between their customers and the service employees. This attention should begin with the implementation of hiring procedures in order to choose candidates with undeniable relational qualities. Training seminars are also necessary to anchor the customer orientation in the mind of the employees. The valorization of friendly and respectful interactions also passes through an effective reward system. The loyalty is also affected by the degree of customer trust which the consumer grants to the service provider. Thus, as it has been confirmed by a variety of research in different domains, the intention of consumer loyalty depends on the consumer's perception of the benevolence and the integrity of the partner exchange (Gwinner et al., 1998). Trust and social interaction seem to be effective predictors of service loyalty. However, the physical environment dimensions seem to indirectly contribute to service loyalty. This study validates the combined role of servicescape, customer-frontline employees' relationship and trust as drivers of service loyalty. They explain 52% of the variation in loyalty scores. Thus, loyalty is a process determined by consumer beliefs regarding their level of interaction with service employees and their perception of the physical environment dimensions. Service providers could develop sensory and relational stimuli that would engender positive beliefs and would denote their good intentions towards the customer. The ambient conditions and space design should first reassure customers in regards to the competence and integrity of the service provider. Social interactions would then play an essential role in the development of customer trust and the demonstration of loyalty intention. By verifying the relationship between the two dimensions of the service encounter, it has been possible to highlight a significant impact between environmental factors and social interaction. Thus, social interaction is directly affected by lighting, temperature and cleanliness in the servicescape. Pleasant ambient conditions will generate more positive social interactions between the consumer and service employees. However, the predictive power of the physical environment on the social interaction remains marginal ($R^2 = 0.08$). This result suggests that an adapted physical environment is essential but not a sufficient element to direct the interaction between the customer and the service employees.

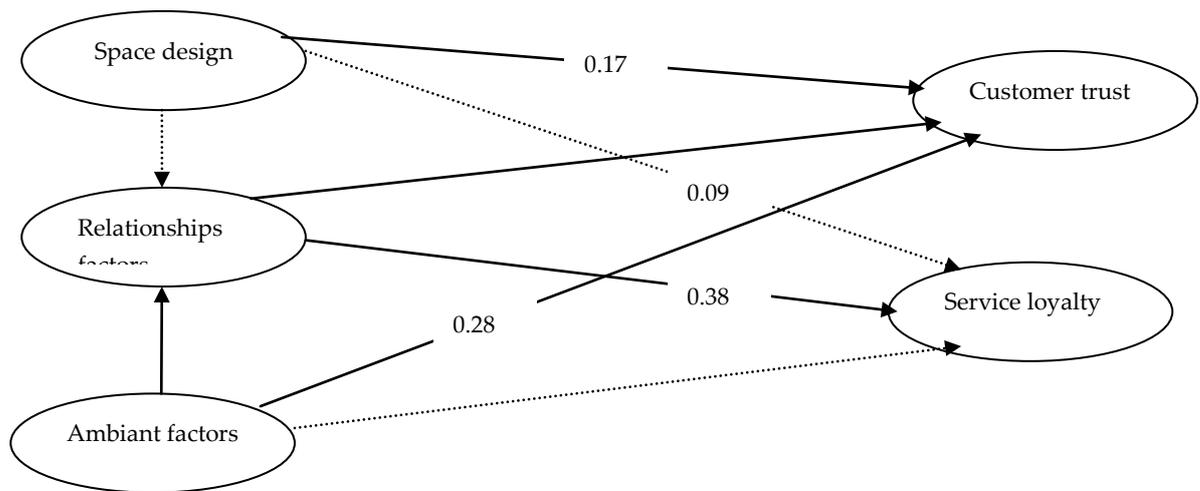

Figure2: path model

LIMITATIONS AND FUTURE RESEARCH

The findings of the current study should be interpreted with caution due to several limitations.

This research raises new interrogations and several points which should be improved in future research. A test of the proposed conceptual model, with other measurement scales of the research variables, would improve the internal validity of the study. In spite of the significant size of the sample (400 people), generalization of results always remains raised up and other applications of the model with larger samples would be desirable. Another limitation is in the choice of studying a single survey context. An empirical test of the conceptual framework in a variety of services could provide a better understanding of the variation of variable's scores between service settings. Future researches should investigate this conceptual model in utilitarian (financial services) and hedonic services (hotels, restaurants, etc.).

Service encounter literature offers directions for other important dimensions such as customer to-customer interactions that could enhance the explained variance of behavioral outcomes in the service setting. Furthermore, the integration of mediating and moderating factors could improve this framework. The absence of direct relationships between loyalty and the two dimensions of the physical environment questions the trust mediating role. It

would then be promising to widen the potential track of the possible moderating effects of situational factors (temporal perspective, objectives of the visit) or individual (familiarity with the service, customer personality) between the dimensions of service encounter (physical environment and social interactions) and the consumer's reactions (trust and loyalty).

ABSTRACT

Purpose: The aim of this paper is to study the validity of the Global Leadership and Organizational Behavior Effectiveness (GLOBE) cultural dimensions “As is” and its “Bands” as defined by House et al. (2004) in the prediction of leadership practices, measured by the Leadership Practices Inventory created by Kouzes and Posner (2003).

Design/methodology/approach: In this paper we selected a quantitative approach. The data was collected from 1359 master students in management area in thirteen countries. We conducted correlation tests and comparison of means tests to analyze the data.

Findings: The results of our study support the scientific perspective that transformational leadership is both a universal and a culturally contingent phenomenon. We found empirical evidence that In-Group Collectivism, Assertiveness and Uncertainty Avoidance are important contextual moderator factors for Encourage the Heart, Model the Way and Challenge the Process leadership practices. Our study also indicates that GLOBE’s Bands are a valid tool to predict leadership practices.

Practical Implications: This study provides evidence for external validation of GLOBE model, supports the idea that GLOBE model is a valid framework to predict leadership practices and suggests a new line for cross-cultural leadership research based on GLOBE’s.

Originality/Value: This paper tries to fulfill a gap in the literature related to the validation of GLOBE’s Bands and provide information about countries that normally do not appear in the literature. It is also one of the biggest studies using GLOBE’s

cultural dimensions to predict leadership practices measured by the Leadership Practices Inventory.

Keywords: GLOBE; Leadership; Culture; Cross-cultural leadership; Leadership Practices Inventory.

INTRODUCTION

In this paper we tried to explore a gap in the literature. There are a wide range of studies using GLOBE model to study leadership behaviors across cultures (Mittal and Dorfman, 2012; Kono *et al.*, 2012) however, few researchers have been used this model in the prediction of leadership practices measured by the LPI (e.g. Teodósio and Robalo, 2011; Raskovic and Krzisnik, 2010). Specifically we could not find, in our literature review based on databases PsycINFO, ISI Web of Knowledge and ProQuest, studies that focus on the validity of GLOBE's bands. Our study has also the purpose to answer to Hofstede (2010) that claims for external validity of GLOBE model and to contribute with new ways of research for the debate of universality versus culturally contingent leadership behaviors.

Cultural Models

The Cross-cultural research is an ancient phenomenon (Gelfand *et al.*, 2007). In the modern sense, the first models of cultural dimensions were designed in the 50s and 60s (Parsons and Shils, 1951; Kluckhohn, 1951; Hall, 1959; Kluckhohn and Strodtbeck, 1961). Despite these first attempts, it is only within the past three decades that cross-cultural research and theories become prominent on the research agenda. Beyond others models that have been developed since then, Hofstede's model (Hofstede, 1980) was perhaps the major contribution to the development of modern comparative research (Leung *et al.*, 2005). In his seminal work, based on work-related values, he presented four cultural dimensions: Uncertainty Avoidance; Power Distance; Masculinity versus Femininity and Individualism versus Collectivism. Since then, Hofstede has upgraded his model with two more dimensions: Long-Term Orientation versus Short-Term Orientation (Hofstede, 2001) and Indulgence versus Restraint (Hofstede *et al.*, (2010).

One of the alternative models to Hofstede was presented by (House *et al.*, 2004). In this model the authors identified nine dimensions: Uncertainty Avoidance; Power Distance; Institutional Collectivism; In-Group Collectivism; Gender Egalitarianism; Assertiveness; Future Orientation; Performance Orientation and Humane Orientation. Related to each of the dimensions, GLOBE distinguishes between normative cultural values “Should be” and actual cultural practices “As is” at two levels: organizational culture and societal culture.

For this study we choose the GLOBE model because we found a gap in the literature related to external validation of Bands and it presents scores of cultural practices for cultural dimensions that is the focus of our research. The cultural dimensions that we used in this study were: Uncertainty Avoidance; Collectivism II and Assertiveness. House and Javidan (2004, pp. 11-12) presented the following definitions of these dimensions: “*Uncertainty Avoidance (UA)* – The extent to which members of an organization or society strive to avoid uncertainty by relying on established social norms, rituals, and bureaucratic practices; *Collectivism II (IGC)* – The degree to which individuals express pride, loyalty, and cohesiveness in their organizations or families; *Assertiveness (ASS)* – The degree to which individuals in societies and organizations are assertive, confrontational and aggressive in social relationships.”

The cultural scores for these dimensions and the aggregation of countries in bands are presented in Table 1. The cultural dimensions are divided in practices (“As is”) and values (“Should be”). According to House e Javidan (2004, p. 21) “Responses to *As is* questions reveal the perceptions of middle managers concerning current practices in their societies and their organizations”. Since this study concerns to leadership practices, we choose the “As is” scores. A Band means that all societies that fall within it are considered to be equivalent, that is, the societies that fall within the same band cannot be reliability differentiated (Hanges *et al.*, 2004).

Table 1. Cultural Scores “As is” and Bands per Cultural Dimension

Countries	IGC	Bands	ASS	Bands	UA	Bands
Argentina	5.51	A	4.22	A	3.65	C
Brazil	5.18	A	4.2	A	3.6	C
China	5.8	B	3.76	B	4.94	A
Germany	4.02	C	4.55	A	5.16	A
India	5.92	A	3.73	B	4.15	B

Countries	IGC	Bands	ASS	Bands	UA	Bands
Indonesia	5.68	A	3.86	B	4.17	B
Mexico	5.71	A	4.45	A	4.18	B
Portugal	5.51	A	3.65	B	3.91	C
Russian Federation	5.63	A	3.68	B	2.88	D
Thailand	5.7	A	3.64	B	3.93	C
Turkey	5.88	A	4.53	A	3.63	C
USA	4.25	C	4.55	A	4.15	B
Venezuela	5.53	A	4.33	A	3.44	D

Transformational Leadership

The study of leadership, especially during the last century, has generated a large number of theories. The focus of our study is in the Transformational Leadership Theory. The first model of transformational leadership was created by Bass (1985) which was based on Burns' (1978) concepts of "transformational leader" and "transactional leader". In 1987, an alternative model of transformational leadership was created by Kouzes and Posner.

As a result of case studies and in-depth interviews they identified five leadership practices: Model the Way; Inspire a Shared Vision; Challenge the Process; Enable Others to Act and Encourage the Heart. Based on their analysis they created a questionnaire (Leadership Practices Inventory) to measure the leadership practices. Kouzes and Posner (2007) presented the following definitions for the leadership practices (factors) that we used in our study: (1) *Model the Way (MTW)* - Leaders clarify values by finding their voice and affirming shared ideals and set the example by aligning actions with shared values; (2) *Encourage the Heart (ETH)* - Leaders recognize contributions by showing appreciation for individual excellence and celebrate the values and victories by creating a spirit of community; (3) *Challenge the Process (CTP)* - Leaders search for opportunities by seizing the initiative and by looking outward for innovative ways to improve. They experiment and take risks by constantly generating small wins and learning from experience.

LITERATURE REVIEW AND HYPOTHESIS

An important line of research in cross-cultural leadership has been the search for universal and contingent leadership behaviors. The Transformational Leadership Theory and the Hofstede's model of cultural dimensions have been the main models used by researchers to find these answers. The research has presented mixed results. Some researchers support that transformational leadership is seen to have a universal tendency (Bass and Avolio, 1993) due to the increasing of globalization (Zagorsek, 2004) and it is universal and effective across cultures (Bass, 1997). Others support that at least some of the transformational leadership behaviors are culturally contingent (Teodósio and Robalo, 2011; Ergeneli *et al.*, 2007). Teodósio and Robalo (2011) using the GLOBE model of cultural dimensions and the Leadership Practices Inventory with a sample of eight countries found that the leadership practices Model the Way and Encourage the Heart were universal and the remaining leadership practices (Inspired a Shared Vision, Enable others to Act and Challenge the Process) were culturally contingent. Ergeneli *et al.*, (2007) using the same questionnaire and the Hofstede's model in three countries found different results. The leadership practices Challenge the Process and Enable others to Act were not related to any cultural dimension. The results of these two studies based on the same questionnaire but with different cultural models and national samples support the researchers that suggest that leadership is both a universal and a culturally contingent phenomenon (Dorfman, Hanges and Brodbeck, 2004). In this study we have analyzed this phenomenon in an innovative way. First, we studied cross-cultural leadership behaviors using a cultural model that very few researchers have used in this research topic (e.g. Teodósio and Robalo, 2011; Raskovic and Krzisnik, 2010; Tang, Yin and Nelson, 2010). Second, our focus was not only in general cultural dimensions scores, we expanded our analyses to the Bands that GLOBE presented for each cultural dimension.

In-Group Collectivism

The collectivism of a society can be generally described as the degree to which people prefer to act as a member of a group rather than as individuals. According to Gelfand *et al.*, (2004) leadership behaviors associated with the guidance of teams (loyalty, cooperation and inclusion) and charisma (inspiring and visionary) are seen as promoters of effective leadership in societies with higher collectivism. Jung *et al.*, (1995) reported that members of collectivist societies tend to identify more easily with the objectives of the leader and with a shared vision of the group and organization. They are able to sacrifice their personal goals in favour of the

group (Gomez *et al.*, 2000) and they prefer an integrating style of leadership (Casimir and Waldan, 2007). Teodósio and Robalo (2011) comparing eight countries found a positive and significant correlation between In-Group Collectivism and the leadership practices Encourage the Heart ($r = .643$). In a recent study Teodósio and Robalo (2013) comparing thirteen countries found similar results ($r = .60$). The results also showed that this cultural dimension explains, by itself, 30% of this leadership practices variation in the sample. In the LPI, the Encourage the Heart factor describes practices such as: the leader supports his team members; values the collaborators that share the team values; expresses trust in his team members and praises his collaborators for the job well done.

Hypothesis 1 - There will be a positive correlation between In-Group Collectivism and Encourage de Heart.

Hypothesis 1a - There will be differences in Encourage de Heart practices between the master students from Band A, B and C.

Hypothesis 1b - The master students from Band A will have the highest score in Encourage the Heart practices and the master students from Band C will have the lowest.

Assertiveness

According to Den Hartog (2004, p.395) the “cultural assertiveness reflects beliefs as to whether people are or should be encourage to be assertive, aggressive, and tough, or non-assertive, nonaggressive, and tender in social relationships”. The same author refers that GLOBE was the first study that considered assertiveness as a cultural dimension. In his literature review he presents some characteristics for the societies with higher scores in Assertiveness that could be important to our study. He refers that the societies that score higher in Assertiveness tend to value competition and performance, tend to value taking initiative and tend to expect demanding and challenge targets. Assertiveness is accomplished by being explicit and direct in communications, by using unambiguous language (Holtgraves, 1997). Non-assertiveness (i.e., being non-dominant) can be linked to agreeableness. Agreeable people are cooperative (trusting, caring) and likable (good natured, gentle), they are softhearted and tolerant. Non-assertiveness is related to the use of high-context language, which is less direct, often more ambiguous, and more subtle (Schneider and Barsoux, 1997). Teodósio and Robalo (2011) found a positive and significant correlation between

Assertiveness and the leadership practices Model the Way ($r = .643$). Teodósio and Robalo (2013) found similar results ($r = .61$). The results also showed that this cultural dimension explains, by itself, 32% of this leadership practices variation in the sample. In the LPI, the Model the Way factor describes practices such as: the leader sets the example; his clear in his philosophy of leadership and makes sure that collaborators follow the principles and the standards agreed.

Hypothesis 2 - There will be a positive correlation between Assertiveness and Model the Way.

Hypothesis 2a - There will be differences in Model the Way practices between the master students from Band A and B.

Hypothesis 2b - The master students from Band A will score higher in Model the Way practices than the master students from Band B.

Uncertainty Avoidance

Uncertainty Avoidance is related with the variable needs that societies have to reduce the degree of unpredictability in the future. Luque and Javidan (2004) reported that members of cultures with higher uncertainty avoidance tend to prefer leadership styles that are oriented to teams (integrators and collaborative), to relations (modest and concern with others) and to self-protection (normative and procedural). The members of these cultures tend to formalize their interaction with others, show greater resistance to change and tend to accept moderated and calculated risks. Koopman *et al.* (1999) describe a greater emphasis on rules and procedures and a lower focus on innovation in managers from cultures that score higher in uncertainty avoidance. Raskovic and Krzisnik (2010) comparing Portuguese and Slovenian leadership practices found that Slovenian sample score higher in Challenge the Process than the Portuguese sample. According to GLOBE, Portugal score higher in Uncertainty Avoidance than Slovenia. However, the difference was not significant due the proximity of the scores in this GLOBE dimension. Tang, Yin and Nelson (2010) found similar results comparing USA and Taiwan. Teodósio and Robalo (2011) found a negative but not significant correlation between Uncertainty Avoidance and the leadership practices Challenge the Process ($r = -.255$). Teodósio and Robalo (2013) found similar results but with a stronger correlation ($r = -.50$). In the LPI, the Challenge the Process factor describes practices such as:

the leader takes risks even without guarantee of success; challenges the people to look for innovative ways to do their job and to test their skills and looks for benchmarking.

Hypothesis 3 - There will be a negative relationship between Uncertainty Avoidance and Challenge the Process.

Hypothesis 3a - There will be differences in Challenge the Process practices between the master students from Band A, B C and D.

Hypothesis 3b - The master students from Band A will have the lowest score in Challenge the Process practices and the master students from Band D will have the highest.

METHODOLOGY

Sample

As a sample we choose masters students in the field of management. Some authors have chosen similar samples for their studies (e.g. Zagorsek *et al.*, 2004; Aimar and Stough, 2007). Our sample (Table 2) consists of 1359 master students in thirteen countries: Argentina (n = 46); Brazil (n = 95); China (n = 241); Germany (n = 87); India (n = 96); Indonesia (n = 78); Mexico (n = 108); Portugal (n = 175); Russian Federation (n = 62); Thailand (n = 86); Turkey (n = 54); United States of America (n = 169) and Venezuela (n = 62).

Measures

To measure the leadership practices we used the Leadership Practices Inventory (LPI), Self-Instrument, 3rd Edition (Kouzes and Posner, 2003). We choose LPI because it focuses on observable behaviors rather than personality traits, is not specific to American values (Tsend, 2000) and can be easily used outside the USA (McNeese-Smith, *et al.*, 2000). This instrument contains five leadership practices: Model the Way (MTW); Inspire a Shared Vision (ISV); Challenge the Process (CTP); Enable Others to Act (EOA) and Encourage the Heart (ETH). Each practice is composed of 6 statements on a 10-point Likert scale that range from 1 (almost never) to 10 (almost always). Posner (2010) reports a good internal reliability for the LPI, Self-Instrument, based in a sample of 282.867 responses. The Cronbach's alpha coefficients reported by Posner (2010) for the leadership practices were: MTW (0.84); ISV (0.91); CTP (0.86); EOA (0.86) and ETH (0.91). The construct validity of this instrument has been reported by different researchers (Kouzes and Posner, 1993; Fields and Herold, 1997; Zagorsek *et al.*,

2006). LPI was available in English and Spanish, thus the instrument was translated to the other official languages of the countries in the study, by a consulting firm with the help of local representatives before being disseminated.

Data Analysis

For the statistical analysis we used SPSS (version 19). First we used the Cronbach's alpha test to analyze the internal reliability of the LPI factors. For the correlation analysis we used the R Pearson test. To compare means we used Kruskal-Wallis and Mann-Whitney tests (Marôco, 2011).

RESULTS

In Table 2 we present the sample per country and the means and standard deviations for the leadership practices Model the Way, Challenge the Process and Encourage the Heart.

Table 2. Means and Standard Deviations for Leadership Practices

Countries	N	MTW		CTP		ETH	
		Mean	SD	Mean	SD	Mean	SD
Argentina	46	7.80	0.86	7.75	0.92	7.94	0.72
Brasil	95	8.08	0.87	7.82	0.94	8.24	1.05
China	241	7.40	1.21	7.05	1.36	7.72	1.21
Germany	87	7.61	0.99	7.08	1.24	7.51	1.10
India	96	7.67	1.06	7.25	1.33	8.27	1.11
Indonesia	78	7.60	0.89	7.54	0.99	8.29	0.74
Mexico	108	7.82	1.06	7.58	1.38	8.10	1.09
Portugal	175	7.48	1.08	7.30	1.20	7.61	1.07
Russian Federation	62	7.27	1.26	7.14	1.39	7.66	1.10
Thailand	86	7.00	1.08	6.97	1.26	7.60	1.05

Countries	N	MTW		CTP		ETH	
		Mean	SD	Mean	SD	Mean	SD
Turkey	54	7.74	0.75	7.62	1.00	8.20	1.00
USA	169	7.31	1.06	7.27	1.07	7.16	1.18
Venezuela	62	8.08	0.91	7.91	1.02	8.36	0.90
Total	1359						

The Cronbach's alpha coefficients for the total sample in the three leadership factors used were as follows: $\alpha = 0.68$ for MTW (range between 0.41 and 0.78); $\alpha = 0.75$ for CTP (range between 0.59 and 0.83) and $\alpha = 0.77$ for ETH (range between 0.42 and 0.83). The Cronbach's alpha for the LPI factors in the study present considerable differences per country. Zagorsek *et al.*, (2004) reported similar results. The Pearson correlations (Table 3) show that Hypothesis H1 was confirmed and Hypotheses H2 and H3 were partially confirmed. The results show a positive and significant correlation between In-Group Collectivism and Encourage the Heart ($r = 0.60$, $p < 0.05$). The results show a positive correlation ($r = 0.50$) between Assertiveness and Model the Way (H2) and a negative correlation ($r = -0.45$) between Uncertainty Avoidance and Challenge the Process (H3) as we expected. However, the correlations were not statistically confirmed. The Pearson correlations also indicate that the leadership factors Model the Way, Encourage the Heart and Challenge the Process are positive correlated. Similar results were reported by Vito and Higgins (2010).

Table 3. Pearson Correlations

Variables	MTW	CTP	ETH	IGC	ASS	UA
MTW	1					
CTP	.87***	1				
ETH	.73**	.70**	1			
IGC	.05	.17	.60*	1		
ASS	.50	.46	.02	-.55	1	
UA	-.15	-.45	-.29	-.39	.15	1

***Significant at $p < 0.001$ (two-tailed) **Significant at $p < 0.01$ (two-tailed) *Significant at $p < 0.05$ (two-tailed)

To analyze Hypothesis H1a, H1b, H2a, H2b, H3a and H3b we conducted nonparametric tests because the assumptions of parametric tests (homogeneity of the variances and normality) were violated in some subsamples (Marôco, 2011).

Table 4. Comparison of Bands' means per Leadership Factor

Leadership Practices	Kruskal - Wallis Test			
	N	Mean Rank	χ^2	Sig
Encourage the Heart				
Band A	1008	710.34 ^a		
Band B	95	827.11 ^b		
Band C	255	502.62		
	1358		71.72	.000
Model the Way				
Band A	621	735.10 ^c		
Band B	737	633.64		
	1358		22.59	.000
Challenge the Process				
Band A	327	594.80 ^d		
Band B	451	694.76		
Band C	456	706.18		
Band D	124	749.24		
	1358		22.01	.000

Note: The differences between Bands were calculated using Mann-Whitney tests. ^a Significantly different from Band B ($p < 0.001$) and Band C ($p < 0.001$); ^b Significantly different from Band C ($p < 0.001$); ^c Significantly different from Band B ($p < 0.001$); ^d Significantly different from Band B ($p < 0.001$), Band C ($p < 0.001$) and Band D ($p < 0.001$).

First we conducted the Kruskal – Wallis tests to found differences between Bands in the three leadership practices in study: Encourage the Heart; Model the Way and Challenge the Process (Table 4). The results confirmed that at least two groups are statistically different in all the leadership practices: Encourage the Heart ($\chi^2 = 71.72$, $p < 0.001$); Model the Way ($\chi^2 = 22.59$, p

< 0.001) and Challenge the Process ($\chi^2 = 22.01$, $p < 0.001$). Then, we conducted pair comparisons for each Band in the different leadership practices using Mann-Whitney tests to analyze the Hypotheses. The significance of the differences between Bands are presented in Table 4. The differences found between all the Bands of the leadership practice Encourage the Heart confirmed the Hypothesis H1a: Band A versus band B ($U = 39468$, $p < 0.001$); Band A versus Band C ($U = 89026$, $p < 0.001$) and Band B versus Band C ($U = 6501.5$, $p < 0.001$). The differences found between Bands A and B in the leadership practice Model the Way confirmed the Hypothesis H2a: Band A versus Band B ($U = 194349$, $p < 0.001$). The results of Hypothesis H3a were only partially confirmed. The differences between Bands were only significant in comparison with Band A: Band A versus Band B ($U = 62905$, $p < 0.001$); Band A versus Band C ($U = 62129.5$, $p < 0.001$) and Band A versus Band D ($U = 15835.5$, $p < 0.001$). No significant differences were found in cross-comparisons between Bands B, C and D.

The results presented in Table 4 confirmed the Hypothesis H2b and partially confirmed the Hypotheses H1b and H3b. The Hypothesis H1b predicted that master students from Band A would score the highest in Encourage the Heart was not confirmed, master students from Band B score significantly higher than the master students from Band A (Mean Rank: Band A = 710.34; Band B = 827.11; Mean difference $p < 0.001$). However, the prediction that the master students from Band C would score the lowest was statistically confirmed (Mean Rank: Band A = 710.34; Band B = 827.11; Band C = 502.62). The mean differences between the Bands were significant ($p < 0.001$). As predicted in the Hypothesis H2b master students from Band A score higher in Model The Way than the master students from Band B (Mean Rank: Band A = 735.10; Band B = 633.64). The mean differences between the Bands were significant ($p < 0.001$). The Hypothesis 3b was only partially confirmed, the results show that, as predicted, the master students from Band A score the lowest in Challenge the Process and the master students from Band the D score the highest (Mean Rank: Band A = 594.80; Band B = 694.76; Band C = 706.18 and Band D = 749.24). Despite of the Mean Rank of the Bands confirms the direction of our prediction, the mean differences were only statistically significant in comparison with Band A ($p < 0.001$). As a result we can only statistically confirm that the master students from Band A score the lowest in Challenge the process (mean differences of cross-comparisons between Band B, C and D were not significant).

DISCUSSION AND CONCLUSIONS

This study was designed to examine the validity of GLOBE model in the prediction of the leadership practices measured by the Leadership Practices Inventory (Kouzes and Posner, 2003). It had also the purpose to understand if the GLOBE's Bands are important for cross-cultural researchers, specifically when they are conducting multi-country studies. In Hypothesis H1 we predicted a positive correlation between In-Group Collectivism scores and leadership practices Encourage the Heart. The results of our statistical analysis confirmed this proposition ($r = 0.60$, $p < 0.05$). This result support our prediction that the master students of more In-Group Collectivistic societies would score higher in practices such as team support, trust in team members and value of shared values. This is in line with the results presented by Teodósio and Robalo (2011; 2013) and previous studies that found that the members of Collectivistic societies prefer an integrating style of leadership (Casimir and Waldan, 2007) and leadership behaviors associated with the guidance of teams (loyalty, cooperation and inclusion) (Gelfand *et al.*, 2004). In Hypothesis H2 we predicted a positive correlation between Assertiveness scores and leadership practices Model the Way. The results of our statistical analysis were only partially confirmed ($r = .50$). Teodósio and Robalo (2011; 2013) found this correlation but with statistical significance. This difference justifies further investigation in order to understand why the significance was lost. Despite of that the presented correlation stills suggest that the master students of more Assertiveness societies score higher in practices such as set the example, clarity in speech about their philosophy of leadership and assertive in the respect of principles and standards agreed. These findings are consistent with Holtgraves (1997) and Schneider and Barsoux (1997) that found that members of societies with high Assertiveness are more explicit, direct and unambiguous. In Hypothesis H3 we predicted a negative correlation between Uncertainty Avoidance scores and leadership practices Model the Way. The results of our statistical analysis partially confirmed this proposition. They show that the correlation presents the expected signal ($r = -.45$), however this correlation was not statistically supported. Similar results were found by Teodósio and Robalo (2013).

The remaining hypotheses (H1a, H1b, H2a, H2b, H3a and H3b) had the specific purpose to study how valid the GLOBE's bands were for research. The results of our predictions were confirmed for hypotheses (H1a, H2a, and H2b). That is, the answers of our respondents confirmed that there are significant differences in Encourage the Heart leadership practices between the members from Bands A, B and C in relation to In-Goup Collectivism (H1a). In

the same way, the results confirmed that there are significant differences in Model the Way leadership practices between the members from Bands A and B, in relation to Assertiveness (H2a). It was also confirmed that the master students from Band A score significantly higher in Model the Way than the master students from Band B (H2b). The results of our predictions were partially confirmed for hypothesis (H1b, H3a and H3b). In the Hypothesis H1b we predicted that master students from Band A would score higher in Encourage the Heart than the master students from Band B, and the master students from Band B would score higher than the master students from Band C. Results confirmed that master students from Band B score higher than master students from Band C, however, master students from Band B score higher than master students from Band A. The results of our predictions in Hypotheses H3a and H3b were partially confirmed. In Hypothesis H3a we predicted that master students from Bands A, B, C and D would score differently in Challenge the Process. The results show that only the master students from Band A score significantly different from the master students of the other Bands. In the Hypothesis H3b we predicted that master students from Band A would score lower in Challenge the Process than the master students from Bands B, C and D. This proposition was statistically confirmed, however the prediction that master students from Band D would score higher than master students from Bands A, B and C was only partially supported. The mean ranks present the expected direction, however only statistical significance was found between the master students from Band A.

As limitations of our study we would like to highlight that according to Kirkman *et al.*, (2006) we choose to present a study Type I, that means that we considered culture has the main factor to explain the variation of leadership practices. However some authors have reported the necessity to introduce other variables beyond culture in the explanation of the results and relations between individuals and cultures, once the variance explained by cultural scores is generally low (Kirkman *et al.*, 2006; Gelfand *et al.*, 2007; Gibson *et al.*, 2009). We intentionally do not considered any control variable in order to understand the strength of the GLOBE model by itself.

In this study we tried to contribute for the validation of cultural dimensions and bands from GLOBE model. The results presented go in the right direction, every hypotheses were confirmed or partially confirmed. They also confirmed the vast majority of the results that we have been presenting since 2011. In sum, for this sample and questionnaire the GLOBE model is an important source to explain the differences in leadership practices found. GLOBE's bands showed to be an important tool for cross-cultural researchers. The results of our study

based on this innovative approach to analyse the impact of culture in transformational behaviors also support the scientific perspective that transformational leadership is both a universal and a culturally contingent phenomenon. We hope that these findings contribute to open a new line of research related to GLOBE's bands using different instruments of data collection from different areas of knowledge.

EMERGING IMPLICATIONS OF THE DEREGULATION OF THE PHARMACY RETAIL SECTOR IN GREECE: THE PHARMACISTS' PERSPECTIVE

Theodoridis, Constantinos¹; Priporas, Costantinos-Vasilios²

ABSTRACT

This paper seeks to provide an initial account of the changes that happen in the Greek pharmacy sector since the enforced by the government deregulation of the sector. It further looks at the response of the independent pharmacists to the changes that are in line to take place. Pharmacy retailing is defined by set of characteristics; scientific, vocational, and entrepreneurial; that makes it a very intriguing sector to research. The entrepreneurial shift of the pharmacists is identified as necessary and priorities for the transformation have been addressed. A qualitative research project was devised in order to collect data on the perceptions of the pharmacists on the deregulation of the sector and their response to the emerging landscape. The major finding of the project was the reported lack of entrepreneurial culture which stems from the absolute un-entrepreneurial business environment pharmacist developed and operated in the past and has a result the lack of confidence to make business decisions as they do not know how to analyse the environment and take advantage of the potential opportunities that emerge.

Keywords: Pharmacy retail, entrepreneurship, retail change, retail strategy

INTRODUCTION

Pharmacy retailing in Greece will soon be deregulated by the state, among the massive structural changes that the Greek government will implement in order to satisfy the terms that are set by the foreign creditors in order to negotiate the bail-out of the Greek economy. The example of the last massive deregulation of the Greek retail sector in 1990, which involved among others the deregulation of the opening hours, and the removal of price

restrictions led to an overnight change of the whole image of the traditional retail to a more westernised version of it (Bennison and Boutsouki, 1995). The character of the competition then changed and price became the focal point since retailers could adjust their prices to the supply and demand of the products. The pharmacy retailing sector accounts about 10,000 independent stores across the country (Symphony IRI Group, 2010). About 75% of the total transactions in medicines take place in the pharmacies, whilst 75% of the transactions that take place in pharmacies are prescribed and non-prescribed medicines and the remaining 25% are cosmetics, toiletries, and other paramedical products (Imerisia, 2010). An average pharmacy in an urban area generates sales of about €40,000/month, but there are cases where a single pharmacy can generate sales higher than €100,000/month.

Table 19: Pharmacies in Greece

Area	No of Pharmacies	Percentage
Attica	4,178	37.69%
Central Greece	1,470	13.26%
Northern Greece	1,443	13.02%
Thessaloniki	1,264	11.40%
Peloponnesus	824	7.43%
Crete	507	4.57%
Rest of Greece (approx)	1,400	12.63%
Total	11,086	100.00%

Opening a new pharmacy is a long and complicated process which usually involves either the acquisition of the licence of an older pharmacist who will be retiring soon or waiting government to issue licences under the law 1963/91. Under that law Greece is divided in zones and the licences are given depending on the density of the population of each zone.

The changes that are proposed to happen in the pharmacy retail sector share a lot of common characteristics to those happened in 1990. Among the changes proposed one can finds the deregulation of the opening hours, and the easing of the geographical restrictions.

Therefore, the competition in the market will intensify and the pharmacists will be asked to develop market skills, like the entrepreneurship in order to keep up with the challenges that will emerge in the market. In order to become a pharmacist in Greece it is essential requirement to obtain the Higher Education pharmacy degree. Approximately 300 new students per year choose the Pharmacy programme of one of the three Greek Universities that offer it; however Pharmacist's training is also a popular choice for Greek students that opt to study abroad. The pharmacists training consists of approximately thirty different modules, however pharmacist only have an optional module on marketing and that is all the business training they get during their studies. Being a pharmacist is a reputable profession in Greece, and pharmacists are well respected and appreciated in the Greek society.

On the top of the market oriented changes a number of cost-containment measures were introduced by the Greek government. Vandoros and Stargardt (2013) summarised them to four general categories:

- a. Price cuts,
- b. The re-introduction of a positive list
- c. Changes in profit margins both for pharmacies and wholesalers, and
- d. Tenders for hospital medicines

It is expected that the adoption of the fore-mentioned fiscal measures will result to the reduction of the pharmaceutical cost by €1Bn, basically through the increased use of the generic medicines (Anastassakou, 2012). However, it must be stressed that pharmacies that are the major retail distribution channel of medicines, are not particularly active sellers of generic drugs. Anastassakou (2012) pointed that only 20% of the medicines sold through the traditional pharmacy format are generics. This may be an indicator of the resistance of the pharmacists to adapt to the changing operational framework, or else a message to the government that they need further support to comprehend the changing context. The liberalisation of the market had another major impact on the pharmacists, namely the profit margin of the pharmacies was capped to 20% (Kaitelidou and Kouli, 2012). This was another blow for the pharmacists who saw their both their sales and profit margins to decrease.

This research looks at how the pharmacists understand the deregulation process and what are the challenges that consider being vital for their future. It is part of a bigger cross-cultural research project that investigates the retail practices that independent pharmacists apply and searches for common patterns among the pharmacy professionals in different places around the world. The research aims to collect data that will offer insight on how pharmacists

understand the challenge of transition, how they will deal with the change, and finally what are their concerns about the change. A conceptual framework will be developed and it will form the basis for further deductive research.

LITERATURE REVIEW

Pharmacists as entrepreneurs

There are numerous definitions of the entrepreneurial activity. Some focus on the process of managing resources (Tice, 2005), some other focus on a human behaviour that aims to mobilise the market process (Davidsson, 2004). Interestingly, the definitions of entrepreneurship suggest that it involves all the determining factors of the strategic management (internal and external). Apparently, pharmacists are asked to act as trained managers which is a paradox, given that the Higher Education curriculum includes only one elective business related module. Therefore, the understanding of the resource based advantage, the adaptation on the changing environment, and the development and introduction of innovative products and services that can satisfy the needs of niche markets can happen only under the guidance of a trained consultant or they are driven by the intuition of the pharmacist. Another factor that should be taken into account is that the trained pharmacists tend to underrate the role of the retailer that they need to play in the competitive arena as they believe that their scientific background defines their occupation and the retail aspect is the *necessary evil* (Schmidt and Pioch, 2004). More recent research from the U.S.A. shows that local pharmacists have been trained to the entrepreneurial activities, noting among others that pharmacists organise themselves to interest groups utilising the facilities that are offered via networking and social media (Martin, 2011). Martin (2011) also stressed the importance of the community networking, that is seriously exploited by the local pharmacists, as this provides them with the opportunity to link to independent communities, geriatric care managers, and private-pay patients.

Szeinbach *et al.* (1995) suggested that market conditions challenge the one-sided professional identity of pharmacist and push them to behave, consciously or not, as an entrepreneur. They identified four qualities that the entrepreneurial pharmacist must possess that include: a. cost effectiveness, b. customer service, c. political structure, and d. business orientation. Given that pharmacists do not have the background knowledge to act like managers-entrepreneurs formalised methods of management are not expected to be used and this is a challenge for

them, especially during the process of change that require innovative responses. Reijonen and Komppula (2007) researching the understanding of success from the entrepreneurs perspective concluded that obviously there are non-quantifiable measures that the entrepreneurs themselves employ to assess their success. Among them they highlight the autonomy and the ability to balance work and family life that can be undoubtedly affected by the evolution of the market structure, the competition, and the lack of up-to-date knowledge and training.

Dealing with change

Changing, particularly when this change involves a forced and unwanted event, is a major and stressful challenge for entrepreneurs. Kotter and Schlesinger (2008) suggested that change that is implemented through participation and involvement – which is the type of change an independent entrepreneur is going through – depends on time and commitment however they noted that time is an asset that costs, in that case the pharmacist invest their own time on the enhancement of the change, and a misunderstanding of the context may lead to a failure – which is likely given that pharmacists lack managerial training that will equip them with the knowledge to scan the business environment. Lancaster and Brierley (2000) highlighted the need for a holistic transformation during the change process. This change involves acquiring new knowledge, upgrading skills and roles, and also it requires changes on the values, behaviours, and attitudes.

The research on the change management in entrepreneurial organisations shows that change is generally treated with aversion by the entrepreneurs. Gray (2002) stated that change is subjected to numerous entrepreneurial traits, citing among them issues like the mode of earning and the lifestyle of the entrepreneur. For example, a major barrier for change is the fear to lose the existing status or income. Entrepreneurs that have an established position within their community and their income is enough to pay for the expenses of them and their family are reluctant to proceed to any kind of change. Gray (2002) adds that successful entrepreneurs are willing to risk and pursue the environmental opportunities, suggesting that the strategic view of the entrepreneur may be a strong predictor for the successful integration of the business to the emerging business landscape.

Change in retail

Retail change theories are based on the concept that retail enterprises are the key motivators of it, when it is not motivated by socio-environmental factors. Chronologically presented the first theory that evolved is the environmental. Hollander (1966) suggests that socio-economic environments impose limitations on the development of retailing and retail institutions. Brown (1987) notes that changes in the economic, demographic, social, cultural, legal and technological conditions of the marketplace are reflected in the structure of the retail system. Environmental theory is very popular, especially among practitioners, is that it has similarities with auditing frameworks like PEST and SWOT (Roberto and Levesque, 2005). McGoldrick (2002, p.24) indicates that the main strength of environmental theory is its flexibility, focus upon the “uncontrollables” and its applicability in a variety of contexts. The change under scrutiny in this research is initiated by the government changes, namely the deregulation of the sector.

Research in the retail SMEs has shown that the reluctance to embrace or deal with change is a major factor that can lead to the failure of the company. Coca-Stefaniak *et al.* (2005) have found that change that originates from EU/government law or policies that are not positively digested by the entrepreneurs is a major factor that can dictate the future of a small company. This research came to confirm the earlier findings of the research of Joyce *et al.* (1990) who found that there are certain barriers to the change of the smaller retail organisations pointing that the market conditions and the lack of capital are making the entrepreneurs to be reluctant to proceed with any kind of change.

METHODOLOGY

The qualitative paradigm is seen as the appropriate when exploratory research takes place (Ruyter and Scholl, 1998) and it is particularly popular in the entrepreneurship research (Bygrave, 1989; Carson and Coviello, 1996) as it allows the researcher to empathise with the research objects and have a view of the bigger picture of the research context. A snowball sampling technique was employed for this research. An initial contact was made with pharmacists that the authors knew from the past and through them more pharmacists were recruited. Finally, the authors interviewed 16 pharmacists from Thessaloniki (for the purposes of the report of the research they are anonymised and capital letter are used to identify them) in an attempt to understand how the massive changes that will soon take place will influence them. Twelve out of the sixteen pharmacies are based in the centre city of Thessaloniki while the remaining four are based in the suburbs. Other organisational

researchers in similar fields employed a range of interviewees varying from four (Le and Nhu, 2009) to thirty (Beaver and Ross, 2000). Unfortunately no other research has been conducted in the Greek context that can be used for comparison.

Each one of the interviews lasted from 90 minutes to 3 hours. The authors used an abstract interview plan but they were open to follow up the leads that were given by the pharmacists. The major thematic areas that were discussed were the challenges of the deregulation for the pharmacists and the changes that they believe they need to make in order to stay competitive in the emerging sector. Guba and Lincoln (1994) criteria for the assessment of the qualitative research were followed in this research. Table 1 summarises the application of the criteria:

Table 1: Assessment of the quality of the research, adapted from Guba and Lincoln (1994)

Trustworthiness	Credibility	The notes from each interview were return to the respondents for approval.
	Transferability	Pharmacists were invited to discuss the entrepreneurial characteristics of their job in addition to the specific characteristics of the pharmacist's job.
	Dependability	The data was analysed separately by each one of the authors of the research and their ideas were then combined for the development of the data analysis section.
	Confirmability	The findings of the research were discussed with another pharmacist that did not participate to the data collection in order to establish that the personal views of the researchers do not skew the data analysis.
Authenticity	Fairness	Pharmacists were allowed time to respond and they had the opportunity to review their responses.
	Ontological authenticity	By reviewing the data the respondents had the opportunity to revisit their own coping strategies as they were presented with an alternative account of their reality.
	Educative authenticity	The respondents had the opportunity to get feedback on the evolution of their business by retail specialists and understand the implication of their choice to implement change or not.
	Catalytic	Some of the respondents pointed that they became clearer regarding the future of the sector and

authenticity	suggested that they will get training on running their pharmacy as a retail premise.
Tactical authenticity	N/A. Up to this point the researchers have not followed up the progress of the majority of the pharmacies. In a single case of a pharmacist that is a social acquaintance of one of the researchers it is reported that he is in the process of moving to a multi-channel distribution strategy that demonstrates that the research influenced him to change.

Thematic analysis was employed and themes were identified. The data analysis was manual as the data set was relatively small and a software package would have made data coding, input and analysis more time consuming (Bryman, 2012).

FINDINGS

The challenges of deregulation

Even though the interviewees were not asked to provide a definition of deregulation they provided a number of insightful suggestions on what is the content of deregulation. The dominant view was that deregulation refers to a new way of operating, with less restriction but a lot more threats. Interviewee E said for example:

We will have to operate as the other retail shops. Licensing will ease, there will be no opening hours restrictions, and honestly I am waiting for the big foreign pharmacies to invade and take over! But for me there will still be space for the independents. We have the personal contact with the customers that make us hard to replace.

Among the other challenges that pharmacists highlighted were the government cuts on health expenditure, which may exceed the €2B per year. This means that on average each pharmacy may lose sales of approximately €100,000 per year or under moderate estimations about €3,000 of net profits. Also, pharmacists suggested that competition will become fiercer. More licensed pharmacies, in addition to the potential introduction of the distribution of generic medicines from super markets increase the players in the market and the market share would need to be split to more companies. Another issue that was mentioned was the potential need – or opportunity – for mergers and acquisitions. Smaller pharmacists suggested that they think that merging with another pharmacy of similar size would be a reasonable

way to keep the costs low and work longer hours. Pharmacist A, who owns a small pharmacy in the suburbs, pointed that:

“If I, Yannis, and Charra (first names of pharmacists located nearby) could merge, we would be able to move to a bigger store, split the costs, and most importantly work 24/7 as we would probably afford to pay the salary of an early career pharmacist”

Bigger pharmacists on the other hand suggested that they may be attracted by smaller pharmacies located in remote or rural areas. The demand there is predictable, and a single provider is only based there. Pharmacist C suggested that:

“A small pharmacy in a place like Dorkada or Pente Vryses (villages about 20km away from Thessaloniki) services about 1,000 people and can easily make €60,000 per year. However, if you centrally manage them, I reckon this may increase by 25%-30%.”

It was also quite obvious that all the pharmacists were severely concerned about their future as entrepreneurs and what negative impact the shrink of their sales it would have to their families. It was obvious that they felt that their family income is under a serious threat, and they used a number of words to describe that varied from ‘serious’ to ‘vital’. Especially, pharmacists of younger age that only recently started their business commented that the liberalisation of the sector had as an immediate result them to ‘lose all the money they spent only a few years ago to buy a licence from a retiring pharmacist’. Considering that a licence for a pharmacy based in a premium location, next to doctors’ practices or hospitals, may have cost as much as €500,000 this indicates their anger as they point that if they had not paid for the licence they could have afforded to invest not to the modernisation of their stores.

Another issue that was addressed was the lack of understanding of the actual business challenges. Their lack of any business training makes them vulnerable as they do not know how to do even the basic entrepreneurial planning. One of the pharmacists that is married to a business consultant said:

“You cannot believe how privileged I am. My husband can take care of the book keeping, contact my suppliers (the pharmacists meant suppliers of cosmetics)”

and negotiate payments, he even make changes to the layout of the shop!"

(Pharmacist B)

Finally, the vast majority of the respondents suggested that customers will become of outmost importance. Personalised service will become essential. The pharmacist will take the role of the "personal shopper" for the customer. He will provide advice on medicine, basic level treatment, information on cosmetics and toiletries, and also the pharmacy will work long hours and it will be the centre of social interaction for the neighbourhood. Some of the pharmacists suggested that they would be open to offer roof to a doctor that will offer in house advice. In fact, one of the suburban pharmacists already does that offering consultation space to the local doctor.

The necessary changes

The deregulation itself poses a major change. However the pharmacists highlighted three areas that they believe changes will become absolutely essential. The first one will be the development of Customer Relationship Management programmes, and in specific methods that will enable them to keep customer satisfied and loyal. For example, pharmacist K said that he may introduce a loyalty card, pharmacist A suggested that he may do home deliveries, while pharmacist C said that he may start an own label, handmade cosmetic range of products. However, when they were presented with the rough estimation of the associated costs that may incur from such a change they directly admitted that they had a completely wrong idea about the resources that are necessary for that.

Retail considerations have also become apparent. Space management was discussed by some pharmacists. It was raised as a concern from some pharmacists that own or lease big stores or it was described as a potential opportunity for pharmacist that own or lease small stores. The product mix becomes an important decision as the profit margins in medicines will remain the same – if not reduce – while for cosmetics and toiletries the margins will be uncapped and regulated by the supply and demand. In addition to the home delivery that was earlier mentioned some pharmacists suggested that internet sale will be researched and potentially exploited. Only two of the sixteen pharmacists had a retail sale functional website during the period of the interviews, and she reported very positive experience:

About 10% of my sales are through the internet now but... this is vital for me as I only sell cosmetics where the profit margins are very high! Yes, I definitely feel happy...(Pharmacist H).

DISCUSSION

The purpose of this research was to explore how the pharmacists understand the deregulation process and what are the challenges that consider being vital for their future. The literature shows that the pharmacists struggle to adapt to the identity of the businessman and the findings of this research are consistent to that. Schmidt and Pioch (2004) research revealed that they do not find their entrepreneurial identity as attractive as the professional and scientific identity of the pharmacists and that was also found in this research. The findings show that the entrepreneurial side of the pharmacy operation will become pivotal for the long-term success of the pharmacy. There is a major area of concern for the pharmacists as they believe that the immediate result of the deregulation will be that retail chains will dominate the sector. The companies that will emerge from the mergers and acquisitions will become particularly strong and competing against them will be impossible as they will have both the resources and the market insight to dominate the sector.

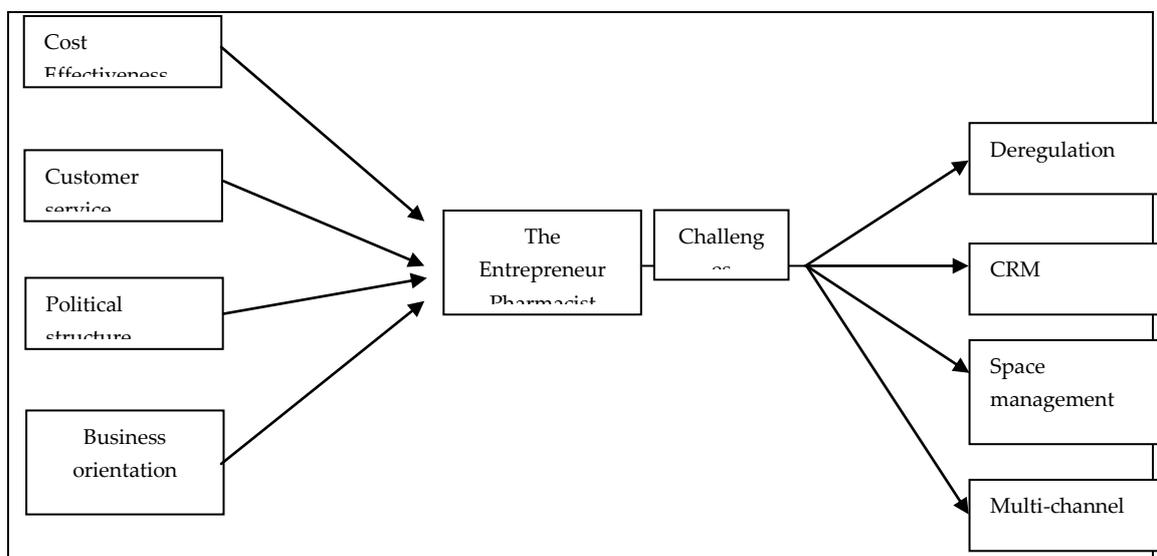

The pharmacists suggested that the deregulation of the sector is unplanned and they do not seem to understand how this will benefit the consumer. Past examples of deregulation show that it takes long time to understand the new landscape and the emerging competitive position in the sector. Evidence from similar change that happened in UK showed that even though pharmacists had a lot of time to prepare themselves to a new, government oriented, environment they lacked the necessary background and experience to deal with and adapt to the new environment (Schmidt and Pioch, 2004). Findings from research that took place in Austria also suggest that the independent pharmacists there struggled to position themselves in the competitive map (Foscht, 2006).

Another area of importance is the negotiation with the competitors. Pharmacists reported that they sense the threat of the competition but they do not have a clear strategy to defend against, or even more retaliate, them. Entrepreneurial strategy development is by definition problematic as it is based on limited information, lack of resources, and massive personal biases. In that case it must be added the lack of business training that makes understanding the environment and the competition an impossible task. Mitchellette (2008)

stressed that entrepreneurs try to take full advantage of their competencies and fully exploit the available resources however they become myopic and focus on this internal to external process. Probably this explains why 90% of the small and small-medium companies fail within 3 years of their start up.

This research reveals a major threat for pharmacists; this is their inherent lack of business training. In an environment where small independent pharmacists will be called to compete against bigger multinational companies it is essential, or even fair, to expect them to be benefited by seminars or workshops that will be organised from the Government or their union particularly for them. Pharmacists need to learn the basics of organising a retail space, managing relationships with customers, understanding the supply chain, and foremost analysing competition and identifying compatible to their resources niches for their products. Figure 1, encapsulates the concerns of the pharmacists and illustrates the reported connections between the causes of the entrepreneurial concerns and the emerging challenges.

Figure 27: The pharmacists' entrepreneurial concerns

LIMITATIONS AND FUTURE RESEARCH

As stated earlier in this paper this is the first output of a bigger project that aims to understand how independent pharmacists across the world understand their retailer role and how they operate under the advantages and disadvantages of their size and capabilities. The

data that was collected for this part of the project comes from Thessaloniki only, so this research will be further benefited from more data that will come from urban, suburban, and rural areas. Obviously, this limited geographic representation reduces the credibility and replicability of the research; however the purpose of this part of the research is exploratory and aims to pilot research techniques and test concepts.

Regardless the unavoidable limitations, the findings of the present study could be a first step towards a better understanding of the deregulation of the pharmacy retail sector and the subsequent changes, where very little research has been done. Considering the gap in the literature as well as the potential managerial interest in the deeper understanding of the topic, future research can build on these results to extent this picture at an international level especially nowadays because of the global economy's unstable shape. Furthermore, it will be beneficial future studies to look into the suggested conceptual framework and to develop it more.

ACKNOWLEDGEMENTS

The authors would like to thank the ICCMI 2012 conference reviewers for their insightful feedback. An earlier version of this paper can be found in the ICCMI 2012 conference proceedings.

ORGANISATIONAL SEQUESTERING OF WORKPLACE BULLYING: ADDING INSULT TO INJURY

Thirlwall, Alison

University of Wollongong in Dubai, alisonthirlwall@uowdubai.ac.ae

ABSTRACT

This paper defines and labels some of the ways that human resource workers, managers, and union representatives respond to complaints about workplace bullying. Using thematic analysis of empirical data from semi-structured interviews with human resources practitioners and targets of bullying, this study found that organisations routinely sequester, or set aside, targets' complaints. Organisational sequestering occurs in three main ways: reframing, rejigging, and rebuffering, as shown in a range of examples. The sequestering of complaints produces an additional source of anxiety and distress for targets of bullying. The examples show how organisations routinely employ a range of tactics to avoid taking responsibility for managing complaints or simply misunderstand the nature of bullying. Some explanations for sequestering are proposed, including the absence of anti-workplace bullying legislation and national cultural attitudes. However, despite special features of the sample, it does appear to link to a broader global phenomenon, as similar behaviours have been noted in India, Canada, and the UK (D'Cruz, 2012; Ferris, 2004; Harrington *et al.*, 2012). The study provides a useful contribution to knowledge by identifying, explicating, and providing terminology for specific behaviours that exacerbate the problems caused by workplace bullying. It concludes with practical recommendations for using organisational sequestering in a more constructive fashion.

Keywords: Workplace Bullying, HRM, Unions, Organisational Sequestering, Reframing, Rejigging, Rebuffering, Zealand.

INTRODUCTION

This paper explores empirical data from human resources workers (HR) and other employees to identify and define the ways in which organisations respond to complaints about workplace bullying in New Zealand. Despite recommendations that organisations take workplace bullying seriously (Lewis, 2001) and a proliferation of research in this area in recent years, little evidence of any improvements in the management of this problem exists (Harrington *et al.*, 2012). Indeed this study adds to the gloom by providing an account of the ways in which organisations--line managers, HR, and union representatives--fail to take responsibility for the welfare of their employees and members. This paper provides a selection of responses to requests for help from targets of bullying and some possible explanations for these responses. Crucially, it introduces a set of terms for identifying HR, management, and union inaction towards those attempting to resolve workplace bullying situations. This terminology provides a pattern that has not previously been identified and it may ultimately assist with the resolution of previously unnamed behaviours.

CONCEPTUALISATION

Workplace bullying has no single, agreed, definition. Although the area is still in a state of denotative hesitancy (Lutgen-Sandvik and Tracy, 2012), some key themes have emerged (Einarsen *et al.*, 2011). Therefore, in this study, workplace bullying is defined as repeated, hostile acts that are harmful to the recipient. A diverse range of behaviours may constitute bullying, and examples include shouting and rudeness, belittling and aggressive gestures, through to ostracism and exclusion (Keashly, 1998). Harm is a vital feature of bullying because recipients may interpret the same behaviours in quite different ways, so without harm bullying cannot exist (Lee, 2000; Namie and Namie, 2000; Quine, 1999; Randall, 1997). Harm may be both psychological and physical, and typically targets experience symptoms associated with stress, such as distress, headaches, and nausea (Davenport *et al.*, 1999; Field, 1996; Namie and Namie, 2000; Needham, 2003), insomnia, inability to concentrate, and in some cases Post Traumatic Stress Disorder (Lee, 2000; Leymann, 1990). Persistence is also a defining feature of bullying, so behaviours need to be recurrent and on-going (Einarsen, 1999; Field, 1996; Keashly, 1998; Lee, 2000; Namie and Namie, 2000).

Organisational responses to allegations of workplace bullying have received limited attention from academics. A study in Finland, where there is a legislative requirement to remedy workplace bullying, indicated a diverse range of outcomes for both the perpetrator and the target, including discussions with both parties, dismissal or other sanctions for the bully if allegations are serious and founded, counselling of the target and the bully, and occasionally taking no action at all (Salin, 2009). Conversely, in the UK, where there is no specific legal requirement to manage bullying, a recent study noted that HR practitioners viewed themselves as strategic organisational partners rather than welfare workers, resulting in complaints being treated as outside their remit (Harrington *et al.*, 2012); whilst in India, organisations encouraged employees to view complaining about bullying as unprofessional behaviour (D’Cruz, 2012), with the result that problems were not resolved. Organisational responses are important because they influence the degree of harm experienced by the target and the wider organisation (Ferris, 2004), so in order to identify responses to workplace bullying in New Zealand, this paper addresses the research question:

How do organisations respond to requests for help with workplace bullying?

METHODS

Using semi-structured interviews ($n=40$), data was collected from 27 volunteers—including academics, managers, technicians, administrators—and 13 HR workers from Institutes of Technology and Polytechnics (ITPs) in New Zealand. The semi-structured approach was chosen because it allowed relevant, emergent themes to be further explored and gave breadth to the interviews, whilst keeping a focus on the subject area. Interviews lasted 2 hours on average. Interviewees volunteered to participate via a website and they were a purposive group that had experiences of workplace bullying (Nielsen and Einarsen, 2008; O’Leary, 2005). The selection criteria included working, or having worked at an ITP, and wanting to contribute experiences or views of bullying at work; however, it transpired that all volunteers had been targets of bullying according to the conceptualisation used in this study. HR workers were nominated by organisations participating in the study. They were asked to explain their organisations’ approach to managing bullying, but four HR workers also described being targets of bullying at work, so their experiences were added to the volunteers’ responses, which resulted in 31 sets of bullying experiences.

The digitally recorded interviews were transcribed verbatim then thematically analysed to explore, amongst other things, the ways organisations responded to reports of bullying. Thematic analysis is a qualitative approach used for “identifying, analysing and reporting patterns (themes) in data” (Braun and Clarke, 2006: 79) and by using sections of data incorporating multiple occurrences of the same thread of meaning, a theme developed. Targets who sought help or raised concerns about workplace bullying received a range of responses that suggested that their issues were being set aside; whilst HR workers described the ways in which this occurred. These responses were grouped and this theme is labelled Organisational Sequestering.

What is sequestering? It means to seclude, isolate, or set apart. Previously, the term was used to describe how targets of sexual harassment avoided taking action to resolve their situations, thereby contributing to its continuation (Clair, 1993). The term *Organisational Sequestering* describes ways in which managers, HR workers, and union officials set aside or avoided problems rather than addressing them. The identification of organisational sequestering of workplace bullying complaints is important because problems remain unresolved and difficulties experienced by targets are compounded by its use.

RESULTS

Interviewees and some HR staff reported the persistent use of various types of aggression, unfair work conditions, dishonesty, and ostracism against them. Several interviewees provided documentary evidence to support their claims, despite this not being requested, and it transpired that their complaints were routinely sequestered by the organisations concerned. Organisational sequestering manifested itself in three key ways: (1) *reframing* the issue, (2) *rejigging* the workplace, and (3) *rebuffing* the target’s complaints, with reframing being the most frequent and complex form.

Reframing

Whilst frames provide patterns for understanding social relations (Fisher 1997), reframing is a way of viewing situations and people from alternative perspectives (Clair, 1993). In this study, reframing comprises the ways in which managers and HR used different perspectives to move the responsibility for bullying outside the organisation or to make the issues appear unworthy of consideration. Reframing occurred when organisations viewed targets’

complaints of bullying as being linked to their private lives or personal views, being easy to resolve or of no importance, denying the existence of issues, and, finally, claiming the target complained to deflect from other issues, such as disciplinary-type action. Both targets and HR workers provided examples of workplace bullying being reframed. These examples are further grouped into (1) reframing as a personal issue, (2) reframing as trivial, (3) reframing through denial, and (4) reframing as defence, as explained below.

(1) Reframing as a personal issue. HR workers and interviewees provided examples of ways in which complaints about workplace bullying were reframed as personal issues. Some HR staff accepted that employees felt bullied but said that this was not due to organisational matters. For example, Kristy remarked “There is very rarely just bullying; there’s usually other things, if they’ve got health issues, if there’s been a death in the family, if their workload is particularly high. It tends to put them in a vulnerable place”. This comment appears to blame the complainant’s vulnerability and implies that other issues are at the root of the complaint. Reframing in this way sequesters the issues as personal matters rather than organisational problems, which removes the need for action by HR.

Another way of reframing as a personal issue emerged when several staff complained about a manager’s behaviour and HR worker Evelyn reframed their concerns by saying: “If you know the person and you know their background, you can see that it’s not deliberate, it’s kind of in their make-up, the background of that person. The intention is not to bully at all”. This comment suggests that the manager’s negative behaviour was excused as a matter of personal style by HR, rather than being something that the organisation should address, and the staff were at fault for interpreting it incorrectly. Similarly, when manager Rona tried to get help, HR told her: “There’s no bullying [here], there’s just misunderstandings and what you need to do is understand people’s personalities and some people do lose their temper before others. It’s a personality difference rather than bullying”. These examples suggest that HR reframed complaints of workplace bullying as the personal traits of targets and perpetrators rather than organisational issues. Reframing in this way removes any imperative for action from the organisation and places it back with the target.

(2) Reframing as trivial. Some interviewees reported that when they aired their concerns with their managers, the responses suggested that the manager did not grasp the seriousness of the problem and did not understand why the target was upset. For example, Tiffany stated “My boss wanted me to resolve it over a coffee and directed me to go out with [the perpetrator] for a coffee”. Tiffany said this instruction distressed her greatly because her colleague had been

aggressive and she was frightened of him, so it would take more than a simple chat over coffee to correct matters. Similarly, Harry, an HR manager, reported that one of his managers had told two staff members to “Go and have a beer and sort it out”, rather than addressing the issue. Reframing removes the need for any official work by managers and HR, so it may appear to be an attractive option. In the short-term, the organisation reduces the risk of mishandling the bullying case by deflecting in this way; however, in the long term this approach may backfire, as cases may become more complex and serious over time.

Trivialisation occurred in a slightly different way for two female interviewees who spoke of their experiences of bullying by female staff. In separate interviews about unrelated incidents, they both remarked that their managers appeared to reframe their problems as “women’s issues”, which took them out of the range of their male senior managers’ concern. For example, manager Sophia said she was being bullied by a subordinate but when she tried to tell her manager, she was unable to communicate, Sophia explained, “I did speak to my manager. When I outlined it to him, I could tell he wasn’t interested. He saw it as a sort of women’s thing, I think”. Rona reported a similar experience; she said, “The CEO knew that [my manager] was a bully but I think he thought it was just a catfight between two women”. Trivialising the issues meant interviewees were denied support and their negative experiences appeared to have been viewed as minor, easy to resolve, or women’s issues and thus unworthy of consideration.

(3) *Reframing through denial.* Denying the existence of bullying emerged as a further form of reframing. For example, after HR told Rona there was no bullying at her ITP, she tried to get help elsewhere within the organisation. Rona said when she spoke with her manager, a member of the executive team, his response shocked her, she explained “I said ‘I’m starting to feel bullied’ and he said, ‘Don’t use that word’ and started screaming at me and he said, ‘Don’t say bullying; we’re not using that term at this institution’”. By refusing to use the term bullying, the senior manager made it much more difficult for Rona to communicate her issues. A different take on denial emerged through the comments of HR worker Freda, who said:

I just wonder whether a lot of what gets reported is really bullying. Quite honestly the people that they’ve described as bullies, I don’t think that they’re that kind of person, and I’m not usually a judge of character, but I’ve never met a manager who I would describe as really grumpy or highly strung.

In this example, Freda appeared to deny that bullying exists because she has not witnessed or experienced behaviour that she considered to be bullying. Indeed, she also framed it as if only grumpy or highly-strung people are bullies. People who lack knowledge or experience of bullying are unlikely to understand its impact and consequently, invisibility occurs, that is, observers are unable to understand problems as individuals are experiencing them (Gilbert and Malone, 1995). These examples suggest that invisibility may have been a factor in the responses, but also there may have been a deliberate effort to deny the existence of bullying.

(4) *Reframing as a defence.* A final form of reframing is claiming that bullying is a defence mechanism or a way of deflecting attention from professional short-comings. For example, Freda believed people claimed to be targets to deflect attention from their poor performance; she stated "People who had known there was something coming up in the future, where their performance was to be questioned, have seen the approach as bullying". By treating complaints about bullying as a response to being performance managed, Freda reframes bullying as being a defence mechanism. However, none of the interviewees referred to the performance management process in their stories, despite them providing many personal details during the confidential interviews, which suggests this might be reframing to provide HR and managers with a way of avoiding action and ignoring difficulties. However, not all problems were ignored and sometimes attempts were made to rectify situations. The next section discusses the ways in which organisations tried to address bullying.

Rejigging

The second key way in which organisational sequestering occurred was by rejigging. Rejigging refers to the implementation of temporary or partial solutions that enabled interviewees to continue to work with perpetrators but that did not resolve the underlying problems. In this type of sequestering, organisations took some action but this was insufficient to resolve the problems. The label reflects the idea that these actions were relatively minor adjustments to the workplace to partially accommodate targets' concerns. Rejigging usually dealt with the surface problem, for example, providing support for a distressed target, but did not manage the perpetrator's behaviour. Overall, this approach resulted in the problems being partially addressed, rather than completely resolved.

Targets talked about the ways in which they were encouraged to work around abusive managers, either by avoiding direct contact or by taking witnesses into meetings. For example, Ken explained that, after he had complained to the HR manager about his dean's

behaviour, an arrangement was implemented to ensure that anything that was required of Ken by his dean would be requested through the HR manager. He said, “We just circumvented the dean and the management relationship because relating to [the dean] was just too difficult; it was too painful”. Despite accepting that a problem existed, HR rejigged the communication lines to protect the target from direct interactions but did nothing to improve the aggressive behaviour of the dean, so the problems continued.

Similarly, Wiremu reported that HR workers were aware of his difficulties with his supervisor, but they only provided minimal support, he explained, “On my last two appraisals I asked [HR] to be present as a witness and it's been all nice and lovely conversations as a result of that”. However, Wiremu received no other support, nor was any action taken to improve the situation, so his other difficulties with his supervisor continued. These are examples of rejigging because HR supplied interim, surface-level solutions to the problems but in each case they did not manage the root cause.

Some targets received counselling or other forms of personal support to address their immediate problems; however, without action to improve the behaviour of the perpetrator, this approach only provided only a partial solution to the situation. For example, Olga said she had complained about her manager's behaviour and accepted an offer of in-house counselling. She also requested help to resolve the underlying issues, but her requests went unheeded; Olga explained, “[HR] sent me to counselling, which is fair enough, and that was the last I heard of it. I said [my manager's] behaviour needs to be modified, she needs to be supervised but nothing happened”. In this case, Olga's difficulties were effectively rejigged as a health-issue, and beyond providing a partial solution to help her to cope, the organisation took no other action to resolve the situation.

The examples in this section indicate some of the ways in which HR use partial solutions to rejig problems. By treating the immediate difficulties but failing to address the underlying problem, HR sequestered the bullying, effectively supporting the continued use of abusive behaviours in their organisations.

Rebuffing

The third and final form of organisational sequestering is rebuffing. Rebuffing highlights the different ways in which interviewees said they felt pushed away when they requested help to address bullying. Rebuffs were both active and passive.

Active rebuffs involved specific comments or behaviours that appeared to be made deliberately to deter targets from pursuing their concerns. Several targets talked of how they had expected support and guidance from HR staff but instead they felt pushed away. For example, when he was trying to complain about his manager, Gerry felt that HR was trying to deter him, he explained:

HR said that this would be on my record, this complaint; they went down that road first. They said, "This makes it official" with quotation marks. "This will be recorded and will involve a lot of people. Walls are thin."

Gerry said that this response worried him and he was reluctant to take the matter further. Similarly, Rona explained how the HR manager rebuffed her when she tried to complain about her manager, "[She] said, 'You can try to do something, you can [complain] then your life will get worse and you will have a black mark against you forever for complaining'". Finally, manager Perry said he received support from HR initially, but he found that their attitude towards him changed when he decided to make a formal complaint against his executive manager; he explained: "The opinions of HR, as an informal discussion, were 'Sorry this is going on, don't agree with it, feel corrupted morally for the comments that they're making', this was informal, but formally they would take a very different [unhelpful] tack". Perry could not understand why HR would provide him with personal support whilst allowing abusive behaviour to continue. These examples illustrate ways in which HR actively rebuffed targets and appeared to have little interest in defending and supporting bullied employees, even when the complainants were managers. This approach had the effect of deterring the targets from pursuing their complaints and increasing their distress.

Rebuffs were not always so obvious and sometimes passive rebuffs were used. Passive rebuffs usually occurred when interviewees were unable to get responses to their complaints from their manager or HR. For example, Felix explained how difficult it was to contact his HR manager, stating, "We send e-mails to make appointments and there's no way you can see the Human Resource Manager". HR's failure to respond to meeting requests resulted in Felix feeling pushed away and ignored, which compounded his sense of abuse. Similarly, Uma's attempts to resolve problems with her line manager were unsuccessful because he did not respond, she said:

I sent very strong letters, but they just didn't seem to really go anywhere. He'd fob it off [and say] "Oh I'll think about it." You know, that kind of thing, "I'll get back to you later" but he didn't.

In these examples, the interviewees felt rebuffed by the lack of communication, which made it very difficult for them to take action and pursue their concerns.

Passive rebuffs sometimes occurred owing to an absence of knowledge, or perhaps ability, of how to support targets. Typically, targets received generalised support but it lacked any action or advice about reaching a resolution. For example, after complaining about repeated verbal abuse from her dean, Ngaire stated, "Probably if I'd had better HR advice I think I would have moved to the next level. I think those young women in HR, they were lovely, but they were quite inexperienced as well". Wiremu, who worked at the same organisation, supported Ngaire's view; he described his experience as follows:

I went earlier this year to HR and spoke to one of the girls there a few times. They were okay, but I really found them a little bit ineffective; they sit there and nod, you know, and that's all.

This inaction resulted in Ngaire and Wiremu using alternative, less professional, approaches to manage their negative experiences.

A few interviewees received passive rebuffs from unions. Tiffany explained how her union representative sent her on an unnecessarily circuitous route to get help; she said, "I had people along the way going 'we can't be involved in this', because the union delegates are actually members of staff, and they didn't want to be involved. It was horrendous". In this case, multiple rebuffs occurred from people who should have been supporting the target, which caused her considerable and lasting distress.

Sometimes union representatives appeared to lack skills to deal with more complex situations. Rona explained what happened when she took a union representative with her to see the HR manager, "He was completely floored by [the HR manager's response], and he said he didn't know what to do. He said, "I don't know what to advise you"". Rona said the representative's response meant she was denied the help that she had could reasonably have expected to receive. Both of these targets were left feeling helpless by their union representatives' passive rebuffs.

In summary, the results identified many ways in which organisations sequester concerns and complaints about workplace bullying. Some reasons for the use of organisational sequestering are proposed in the next section.

DISCUSSION

Despite recommendations that bullying is stopped promptly (Vartia and Leka, 2011), the results of this study suggest managers, HR workers, and unions prolonged bullying by using organisational sequestering. In contrast to the range of active organisational responses proposed by Salin (2009), it appears that organisations did little to rectify workplace bullying. The use of organisational sequestering prevented bullying from being resolved and consequently this approach created additional problems for targets. Both HR and targets explained, and sometimes agreed, on the different ways that complaints about bullying were sequestered. The examples in this study suggest that HR staff did not work in the interests of employees but instead acted in ways that minimised their own input, for example, reframing issues as the fault of the target or creating temporary solutions to work around perpetrators. A lack of personal experience of bullying may have made it invisible to HR, and this may explain the less effective responses (Branch *et al.*, 2006; Gilbert and Malone, 1995).

Skills and resources to resolve workplace bullying complaints sometimes appeared to be lacking in HR and union representatives. One HR worker acknowledged the difficulties that targets faced. Jenny explained that sometimes managers simply “refused to manage bullying” and they ignored her attempts to implement her organisation’s anti-harassment policy. This suggests that, even if they do have the necessary knowledge, skills, and motivation, without direction from organisational leaders, HR and union representatives may fail to implement processes that reduce and rectify bullying,

Furthermore, as union representatives are often workers at the same organisation, they may be fearful for their own jobs if they try to manage bullying, providing another reason why they might be willing to sequester issues. More broadly, New Zealand unions have seen their membership reduce dramatically from 55% in the 1970s, (Blanchflower, 2007; Visser, 2003) to the rate of around 30% more recently (Statistics New Zealand, 2005). This reduced powerbase might provide a systemic explanation for the examples of representatives’ reluctance to support union members.

A more culturally specific explanation for the lack of action may be associated with the *She'll be right* approach that is prevalent in New Zealand. This phrase is a frequently used to express the belief that problems will right themselves without intervention (BurrIDGE and Mulder 1999). Typically, this approach has been considered either an optimistic or apathetic outlook, but more recently has been associated with the acceptance of low quality and its use suggests a casual lack of action (Bayer, 2012; Ewing, 2012). The use of the *She'll be right* approach may partially explain the prevalence of organisational sequestering in this context.

Another special feature of New Zealand is the proximity of its population. Much of the country is sparsely populated and consequently settlements are often relatively small or located remotely. This could be a particular problem when HR workers, managers, and union representatives are close to the perpetrator, either as a friend or neighbour, or simply by virtue of working at the same organisation. Close-knit communities, and multiple roles in them, may lead to workers being unwilling to take action, as they have competing priorities; whilst, as previously noted, invisibility may reduce appreciation of the situation from the target's perspective (Gilbert and Malone, 1995).

Typically, the HR workers interviewed for this study were uncertain about how to manage bullying. In the absence of specific anti-bullying legislation in New Zealand there is no requirement for organisational policies; however, as several researchers have noted, even where policies exist they can be ignored (D'Cruz, 2012; Harrington *et al.*, 2012; Vartia and Leka, 2011) and this study suggests that organisations will usually find ways to avoid dealing with the underlying issues and thus, possibly inadvertently, perpetuate problems for targets. However, as commitment to addressing workplace bullying may improve with increased knowledge and awareness (Vartia and Leka, 2011), continuing research and publication in this area provides some hope for its eventual resolution.

CONTRIBUTION

This study provides an overview of the unhelpful approaches that may be adopted by organisations when dealing with workplace bullying. Denotative hesitancy, (i.e., a lack of clear definitions) is still an issue in this field (Lutgen-Sandvik and Tracy, 2012), so the identification of terminology for organisational responses makes an important contribution to workplace bullying research. Specifically, providing names for elements of the bullying process can help people to see a pattern where they did not see anything before (Rheingold,

2000). The use of the term organisational sequestering and the three ways in which this can manifest itself (i.e., through reframing, rejigging, and rebuffering) should draw attention to the negative role of HR, managers, and unions in the overall process of bullying and lead to the development of approaches remedy it.

RECOMMENDATIONS

Gaining legal recognition of bullying in New Zealand might provide an important step towards addressing the problem because legal protection would offer incentives to organisations to prevent bullying and provide compensation for targets (Yamada, 2010). Any legislation would need to take into account the ways in which organisations sequester issues and address the *She'll be right* culture, otherwise it is unlikely to be helpful. However, treating bullying as an extension of sexual and racial harassment, which both have legal remedies in New Zealand, might provide a useful starting-point for policy development and training in organisations.

A more practical alternative might be to sequester complaints away from the organisation by using a separate, disinterested, but knowledgeable body to investigate and implement solutions. As previously noted, New Zealand's small population results in problems associated with employees having multiple roles in the workplace and in the wider local community; so sequestering may provide a pragmatic solution when HR and union representatives are too close to the problems. Furthermore, development of a human resources partnership approach with the management team, both in New Zealand and overseas, is likely to present a conflict of interest, especially when HR workers are required to investigate and resolve bullying by their management colleagues (Harrington *et al.*, 2012). Therefore removing the responsibility from the workplace to an independent investigator/consultant might provide organisations with an opportunity to legitimately sequester workplace bullying and result in a greater likelihood of a permanent resolution. This suggestion may also provide opportunities for additional research.

LIMITATIONS

Like all research, some aspects of the present study limit its findings. Confidential interviews preclude checks of the veracity of the experiences reported and using mainly self-selecting respondents means the sample is not representative of the general population. However, the self-selecting approach may be appropriate when studying groups that have the most severe experience of a phenomenon (Nielsen and Einarsen, 2008) or are affected by invisibility (Gilbert and Malone, 1995), and it may explain the rich vein of experience that the findings reveal. The narrow industry focus and relatively homogeneous sample may limit generalisations and a broader cross section of workers might have produced different outcomes.

CONCLUSION

Organisational responses to requests for help to resolve workplace bullying are usually disappointing and various forms of sequestering are used that do not address the underlying issues. Organisational unwillingness to address the causes of bullying compounds targets' negative experiences, adding insult to the injuries or harm they have already experienced. Whilst it is tempting to simply link these findings to New Zealanders' optimism or apathy, or other special features of the country, the existence of avoidance behaviours in Indian (D'Cruz, 2012), Canadian (Ferris, 2004) and UK human resources practitioners (Harrington *et al.*, 2012), suggests that organisational sequestering might be part of a global phenomenon. By naming and defining the sequestering behaviours of managers, HR workers, and union representatives, it is possible to understand the role these workers play in the continuation of workplace bullying. Those with responsibility for providing a motivated and engaged workforce may consider how they can reduce their negative impact on this phenomenon. A helpful start might comprise taking responsibility for developing and implementing policies, and arranging training programmes to help managers and employees understand more about workplace bullying, especially if these approaches make the problem more visible. Similarly, the senior management team may find ways to provide fair and decisive leadership that leads to an environment where bullying does not have a chance to thrive. Alternatively, removing conflicts of interest from more strategic HR workers or those with multiple roles, by seeking the support of external, independent practitioners, may provide longer lasting solutions.

MUTUAL RELATIONSHIP OF WINE INDUSTRY VS. WINE TOURISM; THE ISRAELI PERSPECTIVE

Tirosh, Nathan

Department of Tourism and Hotel Management, The Kinneret College on the Sea of Galilee,
Emek Hayarden, Israel, ntirosh@galilcol.ac.il ;www.swotclock.com

ABSTRACT

Wine tourism is identified as a symbolic partner of the wine industry. The wine industry in Israel has been experiencing a rapid development from a small wine producer for the Jewish community to a substantial wine industry which exports a wide variety of top-quality wines, which is followed by wine tourism activities. The objective of the research is to determine the perceived strategy of wine stakeholders in relation to the wine tourism, and to indicate future implications. The research applies the Tourism Area Life Cycle (TALC) model and the SWOTCLOCK™ approach. Results show that the 'Leading Strategy' of big commercial wineries is GROWTH compared to the RESPONSE strategy of Small & Family wineries and SURVIVAL of Mid wineries. Government ministries and the Vine & Wine Board (VWB) perceive LEVERAGE to be the 'Leading Strategy'. Findings of empirical data analysis position the current Leading Strategy as RESPONSE and prove validation between the TALC and SWOTCLOCK™ models. The key conclusion and recommendation is that government ministries, VWB and local authorities should take a leading role in leading the wine industry and tourism sector towards the rejuvenation and growth stage.

Keywords: Wineries; SWOTCLOCK™; Tourism Area Life Cycle (TALC); GROWTH; RESPONSE; SURVIVAL; LEVERAGE; Leading Strategy;

INTRODUCTION

Wine was mentioned in the Bible when Moses sent two Israelite spies to explore the land of Israel who "cut down from thence a branch with one cluster of grapes and they bare it between two upon a staff" (Numbers XIII, 23), followed by the prophet Micha with his vision

that "they shall sit every man under his vine ..." (Micha IV, 4). Producing wine in Israel reached its peak during the Second Temple, but later on was stopped when the Romans destroyed the Temple and the Jews were sent into exile. The wine industry was totally wiped out during the period of the Ottoman until the WW I. In the 19th century there a few and small isolated wineries operated in Israel, and in 1848 the first commercial winery was established by the Baron Edmond de Rothschild who gave sponsorship and financial support for wine production, and imported varieties of vines from Bordeaux in southern France, as well as technical support of professional wine-makers. The development of the wine industry received a significant boost in the 1980s, when Professor Cornelius of the University of California, claimed that the Golan Heights area was suited for growing grapes of excellent quality. Robinson (2006) noted that according to the World Council Vine (OIV), the area covered by vineyards in Israel in 2003 was approximately 17,000 acres, producing some 57,000 hectoliters of a large selection of high quality wines, part of which were exported. Subsequently Israeli wineries began to participate in international competitions and have won numerous awards and accolades for quality wines. A commitment to high quality and presentation of a variety of new wines have changed the culture and consumption, brought the establishment of new vineyards and professionalism in producing wine and led to the construction of about 200 new wineries mostly small and family (boutique) wineries. There are 5 official wine zones: Galilee & Golan Heights, the Shomron (Carmel Mountain), Samson, the Judean Hills and the Jerusalem mountains and the Negev. There is no formal system of wineries registration in Israel and the general estimate is that approx. 250-300 wineries are currently operating in the wine sector. Although accurate and viable data is difficult to gather (Shor and Mansfeld, 2009), according to Vine & Wine Board (VWB) and the Ministry of Agriculture, planted vineyard area by 2012 covered about 55,000 dunams (1 acre=10 dunams) yielding approx. 55,000 tons of grapes (Harkabi, 2012), and enabling the production of close to 45 million bottles. The implementation of the PARETO rule groups wineries into 3 major groups: 7 Big wineries with clear commercial orientation (above 2.5 million bottles and about 80% market share), 15-20 Mid wineries, producing 120,000–1,000,000 bottles (about 12% market share), and the Small & Family (boutique) wineries (production of up to 100,000 bottles a year). The establishment of new vineyards and planting new types of grapes at an increased rate was followed by a growing a wine culture and changing consumption habits in relation to wine. Visitor centers, cellar doors, and quality restaurants started offering wine as part of the gastronomic experience, wine tasting competitions started appearing, as well as festivals and early initiatives of 'wine route'.

Although the Israeli wine sector has experienced an impressive development over the last two decades, the wine consumptions per person is estimated to stand steadily at 5.5 liters per person per year, far behind 65-70 liters per person per year in France. This, together with the growth in wine supply beyond the demand of the local current market, import competition and the beginning of wine export, sets tremendous challenge to the wine sector.

LITERATURE REVIEW

For thousands of years wine accompanied by the development of human society as one of the components which compliments to the food served and has been used to inspire joy and pleasure. Wine as a consumer product begins its supply chain at the initial step of growing grapes as raw material, continues to the second stage of wine production and finishing as one of the vertebrae in the distribution and marketing to leverage the product to the end consumer. For many years the traditional wine center both production and tourism was located mainly in European countries such as Italy, France, Spain and Portugal ('old wine world'). Substantial development in wine tourism, which accompanies the development of new and attracts young people, can be seen in the U.S., Australia and New Zealand ('new wine world'). South Africa's famous wine culture and industry developed at a slower pace, mainly for political reasons. Over the last two decades, there has been more and more research activities related to the wine industry, combined with wine tourism, as the conspicuous phenomenon of focusing on specific areas. Getz (2000), Hall (2000) were among the first who contributed to a deeper understanding of the characteristics of wine tourism. Hall et al. (2000) defined wine tourism as : "visitation to vineyards, wineries, wine festivals and wine shows for which grape tasting and/or experiencing the attributes of a grape wine region are the prime motivating factors for visitors". In order to enrich the visit in the region, the visit has to include some unique quality as defined by the Wine makers Federation of Australia (1998): "visitation to wineries and wine regions to experience the unique qualities of contemporary Australian lifestyle associated with enjoyment of wine at its source-including wine and food, landscape and cultural activities". In line with this definition Getz et al. (1999), Getz (2002), Getz et al. (2004), Sparks and Malady (2004) and Sanders (2004) undertook some more studies on the characteristics of wine tourism. Carlsen and Charters (2006) suggest that wine tourism is based upon 6 major areas: wine tourism setting, regional development, wine marketing and tourism, cellar doors, wine festivals and events and wine tours and trails. In spite of the fact that wine tourism contributes to the increase in wine consumption and that

both of them complement one another, Carlsen (2004) suggested that it is important to recognize that the wine industry and wine tourism are positioned opposite each other in the industrial micro-cosmos spectrum. The conclusion is that much more work should be done in order to understand how wine industry and wine tourism both diverge and also converge through the application of a wide range of economic, culture, geographic and other related factors. This is a fundamental issue for further research and investigation. Shor and Mansfeld (2009) investigated the characteristics of Israeli wine tourists in terms of their lifestyle attributes and wine-related behavior. The findings of the research show that wine tasting is the main motivation for visiting wine tourism sites, especially wineries, where the level of interest was higher than knowledge about wine and its production process. Getz (2000) indicated that wine tourism consists of three major components: wine producers, tourism operators and consumers. As a consequence, wine tourism provides marketing opportunity for wineries to teach and educate wine and potential customers and at the same time to their products, particularly to wine lovers or those who are interested in visiting preferred destinations (Getz and Brown, 2006a; Charters and Knight, 2002). Getz et al. (2007) indicated that "wine tourism is a special interest travel based on the desire to visit wine producing regions...", and extended the connection between wine industry and wine tourism. Understanding the life style of wine tourists and wine tourism experience, can also improve wine marketability and profitability for wineries and other partners in the wine production area. Dowling and Getz (2000) indicated that both the supply of wineries and consumer behavior demand should be taken into account. The concept of synergy of wine manufacturers and wine tourism elements can led to economic growth, particularly at 'new world' wine destinations, such as Napa Valley (USA) and Margaret Valley (Australia). To achieve this, the wine tourism council, in collaboration with wine industry and political stakeholders, should be the leading bodies in the development and marketing of wine tourism through the provision of the necessary infrastructure throughout the wine region. Cambourne et al. (2002) indicated that wine tourism is an emerging broad scope of interest associated with future potential of the wine tourism and industry at regional, national and international level. In that line they indicated that some wineries in Napa Valley have already started meeting the demand by supplementing wine tasting with wine education. Issues influencing future wine tourism and wine industry development are mainly, securing initial funding and regional financial commitments to development wine routes (Europe); loss of agricultural land to urbanization development (Canada) and access to land (South Africa); a lack of constant relevant information and data about impact of wine tourism associated with

wine industry (Canada/UK); ensuring that wineries see a tangible Return On Investment (ROI), which affects wine industry and tourism willingness to invest in product development initiatives (Australia); the unwillingness of the wine industry to commit resources to tourism participation (USA); difficulties in establishing a joint network for the wine and tourism sectors. Skinner (2002) indicated that there are some limits to wine tourism development, which requires detailed studies of elements within and around a wine region. This calls for a careful planning which incorporates all interested parties including local, regional authorities and government, vintners, wineries and wine tourism operators and most especially the local residents. It is recommended that smaller wineries should be regulated as closely as any large corporation. A good example of this is the wine route development in the Bairrada region of Portugal. Correira and Ascencao (2006) indicated the necessary steps of the process in the process of developing a wine route, which enables visitors to meet wine producers. Bras, Costa and Buhalis (2010) emphasized that after some previous failures to promote the development of the Bairrada Wine Route (BWR), it is important to involve a large number of economic partners and to gather public and political support, by organizing first-step actions and increasing network trust and communication. A dichotomous situation was highlighted by Fraser and Alonso (2006), who clearly indicated that wine tourism may present significant downside aspects to the business of making and marketing wine. In their research, it was very clearly indicated by some winery owners that the alleged benefits of wine tourism were insufficient to encourage them to engage in this operation. It clearly appeared that not every grower is willing to commit himself and to get deeply involved in wine tourism. The literature review highlights the fact that wine tourism research concentrates mainly on the characteristics of the wine tourist and on wine travel behavior rather than the wine manufacturer's perspective in relation to his business environment characteristics. Currently, the Israeli wine industry and tourism sector is faced with the dilemma of how to move forward. This emphasizes the need to further study and investigate wineries policy, wine tourism and official and regulator's, concerning the future steps and strategy which will lead the sector towards growth and prosperity.

RESEARCH METHODOLOGY AND APPROACH

In light of the literature review, it is clear that the wine sector embeds both wine production and wine tourism. Intense development has taken place in Israel in the last decade that may lead the sector to reappraise its strategy, with the overall objective of increasing wine

consumption. This has yielded the following research question: 'What is the leading strategy of the wine sector, given the relationship between the wine industry and wine tourism, and what are the implications for the future?'. The hypothesis assumes there is a difference in the 'leading strategy' of various stakeholders groups which reflects their perception as to the strategic position of the wine sector. The study applies the SWOTCLOCK™ (Tirosh, 2010, 2013) and the TALC (Butler, 2006a, b) models. The research operated visits to wineries in all winery zones, as well as in-depth interviews with wineries owners, people at the Ministry of Tourism, at the Ministry of Agriculture, VWB and other stakeholders who are involved in the wine sector. Questionnaires were processed using the SPSS program for significance (OneWay ANOVA, 't-test'). Stakeholders were segmented into 5 groups: government ministries and VWB, big, mid, small & family wineries and independent stakeholders (wine consultants etc.). The sample size of 58 valid questionnaires as to the wineries groups' segmentation proportion is shown in Table 1:

Sample group	size
government ministries, VOB	6
big-size wineries (>1,000,000 bottles)	6
mid-size wineries (100,000-1,000,000 bottles)	9
small & family size wineries (10,000-100,000 bottles)	31
Other (independent consultants etc.)	4
Total	56

Table 1:

Segmentation of research sample groups

Some wineries which were approached, did not participate in the research, stating personal reasons and reservations, resistance to exposing business data and general suspicious. Empirical data concerning trends of vineyards' new plantation had been collected. A regression analysis was applied to test validity and compliance significance between the 'Leading Strategy' determined by the SWOTCLOCK™ model and related characteristics of the TALC model.

RESEARCH FINDINGS AND DISCUSSION

Determination of the mutual 'Leading Strategy' of wine stakeholder groups

The research methodology operates the SWOTCLOCK™ approach (Tirosh, 2010, 2013). The Leading Strategy derived from the SWOTCLOCK™ model reflects an 'equivalent vector'

determined by the relative 'power intensity' of four vectors: Strengths (S), Weaknesses (W) as internal vectors and Opportunities (O) and Threats (T) as external vectors. Bernroider (2002) indicated that the list of the external and internal factors is subjectively determined with reference and prior review. Factors in the questionnaire (Bernroider, 2002) are partly derived from components indicated in the literature review, while others came from the preliminary visits and interviews held at the wineries. 'Level of importance' (Weighted Factor) and 'strategic position' operate as two independent variables in the calculation procedure of each of the 'power intensity' of the four strategic vectors (S), (W), (O), (T).

The 'Level of importance' scores for each group factors should be 100%. Results of the average 'level of importance' (Weighted factors) are shown in Table 2: For the internal factors group, scores for the 'wine sector' show that 'wine know-how & technology' (12.9%) and 'wine culture' (12.9%) are highly important for the sector, followed by 'visitor center facilities' (12.2%), whereas the 'availability of database' factor is the least importance (4.4%). Results of the ANOVA analysis show significant results ($p < 0.05$) for the 'wine equipment & facilities' factor, between Government & VWB and Big and Small & Family wineries, for the 'wine know-how & technology' factor between Government & VWB and Big wineries and Small & Family wineries, and for 'wine pricing' factor between Government & VWB and all wineries. Big wineries group rates the 'wine culture' factor at a lower level than other wineries groups. On the other hand, the 'winery equipment & facilities' and 'wine know-how & technology' factors are more important to Big wineries than to the other groups.

		Gov. & VWB	Big wineries	Mid Wineries	Small & Family wineries	Other	Wine sector
Internal Factors	Winery equipment & facilities	4.3	12.0	8.0	11.1	8.3	9.8
	Wine Know-how & technology	7.0	14.6	11.1	14.5	10.0	12.9

	Regulations & standards	12.8	5.4	7.4	8.8	11.7	8.7
	Total (%)	100.0	100.0	100.0	100.0	100.0	100.0

Table 2 Internal and External Weighted Factors (%) by stakeholders groups

For the external factors group, scores for the 'wine sector' show that the 'wine market demand' factor (13.6%) is the main concern of all groups, followed by 'wine trail & tourism development' (12.7%) and 'economy, security & ecology' factor (10.9%). Least important is the 'HR availability' (4.7%) factor. Regarding the 'regulations & standards' factor, the Government & VWB (12.8%) and Other group (11.7%), rate this factor higher than the winery groups. The 'strategic position' (currently) is determined along a Likert type scale. Calculated results of the current strategic position (average) are listed in Table 3:

Strength score scale: 4, 5, 6 Weakness score scale: 0, 1, 2		Gov. & VWB	Big wineries	Mid wineries	Small & Family wineries	Other	Wine sector
Internal Factors	Winery equipment & facilities	5.8	5.5	4.8	5.1	5.7	5.1
	Wine Know-how & technology	5.5	5.5	4.9	4.5	5.0	4.8

	Regulations & standards	1.3	2.4	2.5	2.6	0.7	2.3

Table 3 Strategic position by stakeholders groups

For the internal factors group, all stakeholders groups perceive 'winery equipment & facilities' (5.1) and 'wine know-how & technology' (4.8) as very strong areas of the sector, as opposed to 'wine standard' (1.5), 'availability of database' (1.0), 'wine culture' (2.1) and 'wine region & terroir' (2.2) as weak areas of the sector. Significance in difference of opinions among the groups ($p < 0.05$) is found regarding the 'wine pricing' factor, between Government & VWB

and Big and Mid wineries groups. In addition to that, Big wineries consider the 'wine pricing' factor as very strong (5.0) but it drops to 3.7 score for Mid wineries and to 2.5 score for Small & Family wineries. This means that Big wineries perceive current pricing level as a point of 'strength', but that it is perceived as a 'threat' to the Small & Family wineries. For the 'availability of database' factor, a significant difference was found between Government & VWB opinion and Mid wineries. Significant different exists regarding the 'wine culture' factor, between Government & VWB and all wineries groups. For Big wineries group, the 'wine culture' factor score is 3.2 (slightly strong) but drops to 2.6 (slightly weak) for Mid-size wineries and 2.1 (quite weak) for Small & Family wineries. This means that Small & Family wineries seek to increase wine culture, which is important issue for them, more than for Mid and Big wineries. Regarding the external factors, 'development of wine trail and tourism' factor (4.7) is perceived by all stakeholders group as the biggest opportunity for growth, followed by 'HR availability' (3.9). All other external factors' scores are at the break-even position (around 3.0) or below on the Threats side (3.0<). An Interesting result is the significant difference ($p < 0.01$) between the Government & VWB, Ministry opinion as to their perception of their own policy in relation to the wine sector. They rank the 'Ministry of Tourism policy' (4.0), 'Ministry of Agriculture policy' (5.5) and 'VWB policy' (6.0) as big opportunity for the wine sector; however, Big and Mid wineries perceive their attitude as a kind of a 'threat' to them and the Small & Family wineries are indifferent to them (3.0). A significant difference was found concerning 'wine market demand' where the Government & VWB perception was that currently this factor threatens the sector, compared to the other groups which feel that the current wine demand is neither a threat nor an opportunity to the sector.

The intensity value of each of the SWOTCLOCK™ vectors (S), (W), and (O), (T) is calculated as the multiplication of the level of importance score by the current strategic position. The product of the relative weight (100%) in formation of the indifferent '3' score position is:-300. When the vector value of the internal factors is greater than 300 (positive value), it means that the 'organization' is 'stronger' than 'weaker' and vice versa when it is less than 300 (negative value). When the vector value of the external environment is greater than 300 (positive value), it means that there are more 'opportunities' than 'threats' and vice versa. Results of the intensity vectors are presented in Table 4:

No.	Internal Factor	Gov. &	Big	Mid	Small &	Other	Total	Sig. between groups
		VWB	wineries	wineries	Family		sector	
1	Wineries equipment & facilities	24.25	66.00	36.80	54.36	48.33	48.91	0.047
2	Wine know-how & technology	38.25	80.40	53.90	66.88	51.67	62.10	0.171
3	Wines basket variety	8.75	39.00	18.00	19.52	21.00	20.45	0.052

Table 4 Internal and External Vector Intensity of various groups

Regarding the internal vector intensity, 'wineries equipment & facilities' (48.91) and 'wine know-how & technology' (62.10) are the core contributors to the strength of the sector, particularly the Big wineries position (66.00 and 80.40, respectively) but significantly ($p=0.047$) opposed to the Government & VWB position (24.25, 38.25). 'Visitors center facilities' (29.19), 'visitor center quality of service' (35.83) are the second most contributors, particularly

for Big wineries (38.60, 47.80 respectively) which operate established visitor centers. Mid and Small & Family wineries score these factors lower and feel that much more should be done to strengthen current facilities and service provided at the wineries (facilities, training etc.). 'Wine region & terroir' (28.19) and 'wine culture' (27.55) are ranked the third important factors contributing to the strength of the wine sector. A significant difference ($p=0.052$) was found between Government & VWB position and other groups regarding the 'wine culture' factor. It was indicated by all stakeholders that a big emphasize should be put on developing a 'wine region' (terroir) and 'wine trails', as well as wine culture awareness program. This will differentiate and enhance wine regions and wine tourism, the domestic market and even more for export purposes. This is followed by 'wine tourism product variety' (17.29 score) with no significant difference among the groups. The overall view is that currently, this factor does not contribute much and therefore there is a need to extend the variety of wine tourism products such as festivals and events, restaurants, B&B and other complementary tourism activities in the wine region. The groups feel that 'availability of database' (4.55) is the least significant contributing factor to the strength of the sector and that at the moment it is not top priority. Contribution of the 'wine basket variety' factor (20.45) is ranked moderately: for Big wineries (39.00), the basket contributes more strength than for Mid and Small & Family wineries (18.00, 19.52), with significant difference from the Government & VWB position (8.75, $p=0.052$). Concerning external vector intensity, 'wine trail & tourism development' factor provides the biggest opportunity (61.70) with no significant difference between the groups. Small & Family wineries perceive it higher (61.44) than Mid wineries (59.50) and Big wineries (46.40) mainly because they rely and depend much more on cellar door sales and the wine tourism system. Next comes the 'wine market demand' factor (39.47) headed by the Big wineries group (61.60) but with significant difference ($p=0.057$) from the Government & VWB (1.00) and 'Other' (30.00). An interesting finding is that Government & VWB group members perceive their own policy contribution as high 'opportunity' (38.85, 63.25 and 55.05 respectively) for the sector, contrary to all other wineries group which rate this significantly below 30 score ($p=0.073$, $p=0.02$, $p=0.084$). The 'investors willingness' (30.00) and 'availability of financial support' factors (19.44) reflect low opportunity level for wine tourism development. Government & VWB as well as Big wineries and 'Other' groups rank willingness higher than Mid and Small & Family wineries, while all are of the opinion that current financial support is not much sufficiently available, particularly Government & VWB (7.75), compared to Big wineries (35.20) which can get financial support easier than Mid and Small & Family wineries. 'Regulations and standards' (18.19), 'economy & security' (17.89),

'HR availability' (16.64) and 'ministry of Trade & Industry' are the factors that provide the least opportunity to the wine sector. The 'Leading Strategy' is determined as the equivalent vector of the calculated relative intensity vector of the internal vectors (S) and (W), and the external factors (O) and (T), and summarized for the various groups as shown in Table 5:

	Gov. & VWB	Big wineries	Mid wineries	Small & Family	Other	Total sector	Sig. between groups
Internal vector intensity	-125.50	91.80	-5.80	14.02	-2.98	5.06	0.047
External vector intensity	12.40	41.20	-11.30	-11.52	-27.30	-7.50	0.073
Leading Strategy	LEVERAGE	GROWTH	SURVIVAL	RESPONSE	SURVIVAL	RESPONSE	

Table 5 'Leading Strategy' position for wine stakeholder groups

The 'leading strategy' of the wine sector is perceived as RESPONSE. The Big winery group determines GROWTH as the 'leading strategy', compared to RESPONSE of the Small & Family wineries group, LEVERAGE by the Government & VWB group and SURVIVAL for Mid wineries and the 'Other' group. Resulted leading strategy position of each group is shown in Figure 1.

The small population size of about 250-300 Israeli wineries in total, and the reluctance of some wineries to participate, affect the sample size of valid questionnaires (56) and partly the significance in difference of strategy factors between some groups. The recommended sample size for significance ($p < 0.05$) was calculated by the G*Power3 model software, based on the results of the 't'-test, and the difference between the average amount of internal and external factors that determines the 'leading strategy'. In the case where the sample size of Big, Mid and Small & Family wineries will be equal ($n_1 = n_2 = n_3$), the required calculated sample size ($p < 0.05, 0.95$) is 95 for each population group. Practically this is not achievable since to such because the number of Big and Mid wineries is smaller than the recommended sample size.

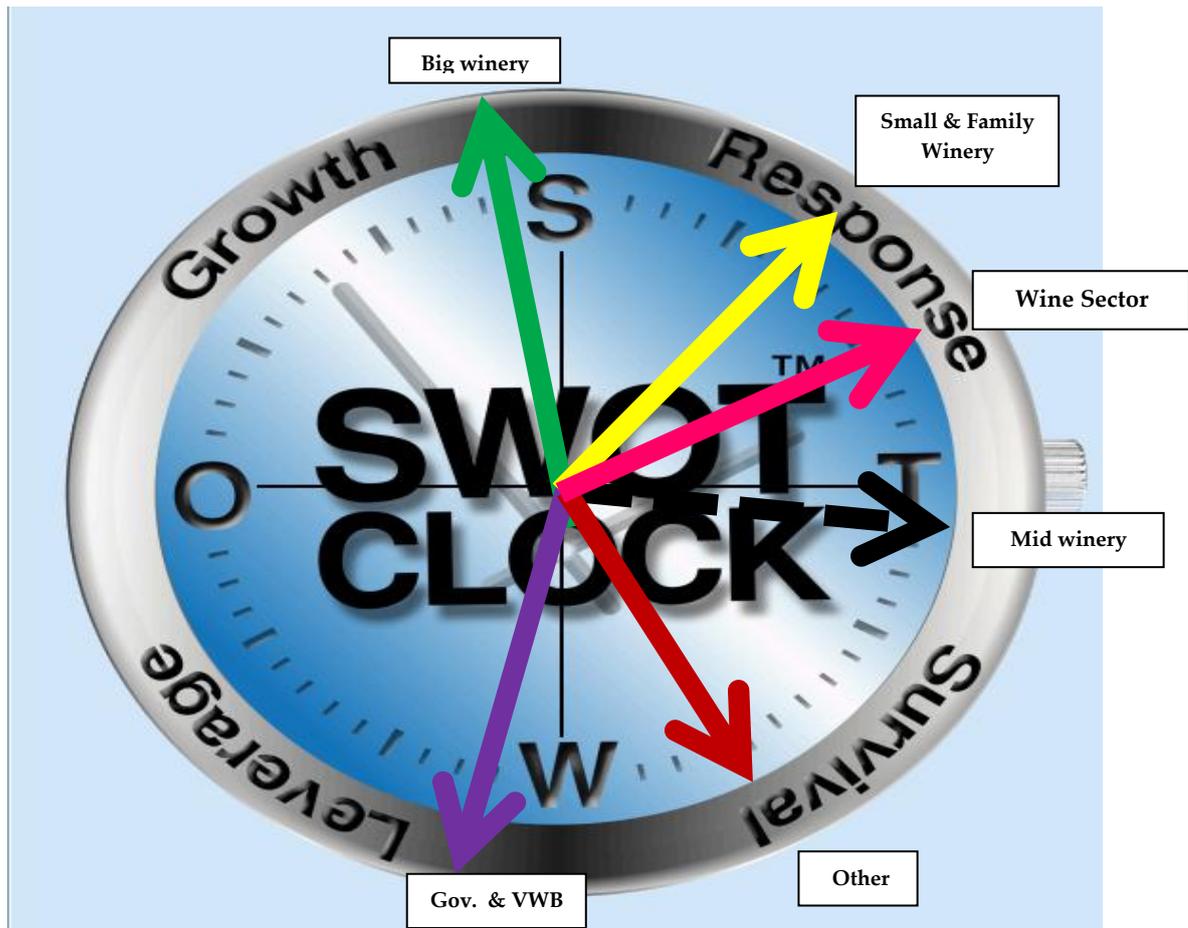

Figure 1 'Leading Strategy' of wine sector stakeholders groups

ANALYSIS OF EMPIRICAL DATA

The SWOTCLOCK™ model (Tirosh 2010, 2013) assumes a validation and compatibility between the developmental stages of the TALC model (Butler 2006a, b) and therefore the second research question concerns the compliance between the models. An official database for the wine industry and tourism is almost nonexistence, so the analysis is based on VWB empirical database which tracks vine plantation and it can be used as a yardstick which reflecting the development trend of the sector. Results of the empirical analysis correspond to the characteristics of the TALC model and thus support, confirm and validate the basic assumptions of compatibility to the SWOTCLOCK™ model, as shown in Figure 2:

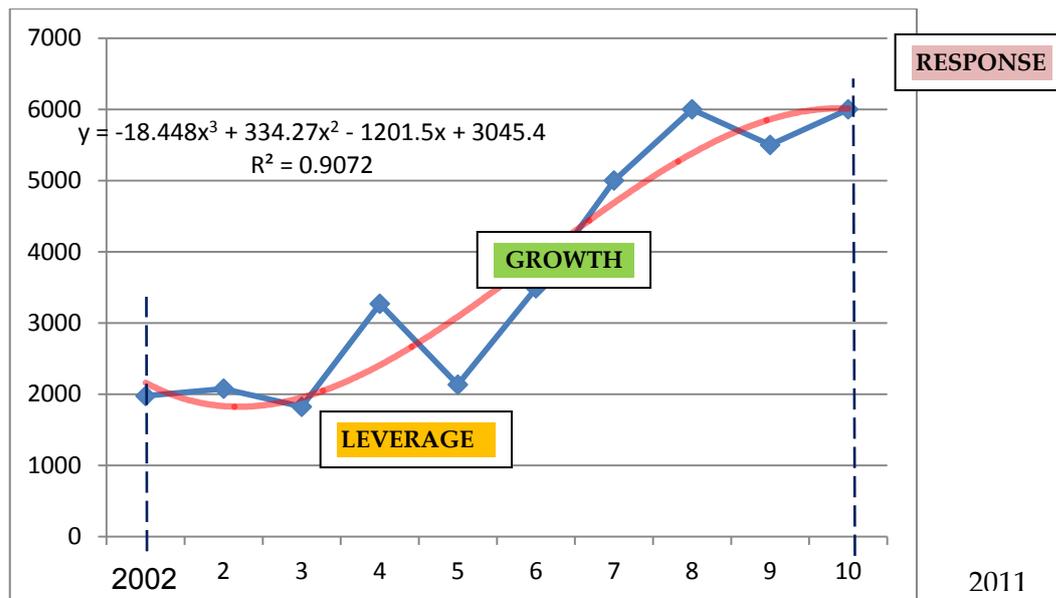

Figure 2 New vineyard plantations ('000 m²)

The actual new vine plantation has high matching polynomials ($r^2=0.9072$) fit. This behavior shows a trend change in the leading strategy since 2002, from LEVERAGE in 2002 to GROWTH in the period 2004-2009 and turning to RESPONSE from 2010 until today. That is very similar to the sequence of behavior stages of the TALC model, where the 'exploration' stage is followed by 'growth' and then by 'stagnation'. Results of the empirical analysis correspond to the characteristics of the TALC model and thus support and confirm the basic assumptions of compatibility to the SWOTCLOCK™ model.

Big wineries distribute most of their production through wholesale networks. Therefore, the assumption is that direct wine sales in Small & Family wineries are proportionally higher than in Mid and Big wineries. Empirical data of the proportion (%) of direct wine sales at the winery was collated from the questionnaires and the interviews. A regression analysis shows the between the direct Volume of Sales (VOS) (%) at the cellar door and visitors center out of the total VOS of the winery, as shown in Figure 3:

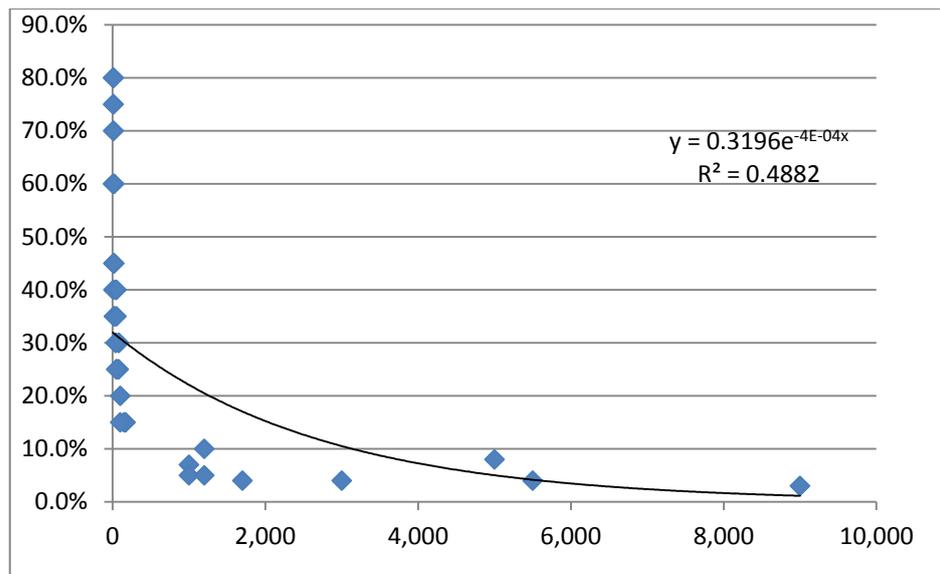

Figure 3: Direct VOS (%) at wineries

From the resulting calculated formula and the correlation coefficient ($r^2=0.4882$), it is clear that Small & Family wineries sell most of their wine production on site (VOS > 35%) compared to the Mid wineries (VOS < 15%) and Big wineries, where this take place at the visitors center (VOS < 8%). The conclusion is that Small & Family wineries are much more directly related to wine visitors and that therefore, wine culture and wine tourism are key issues for them more than for Mid and Big wineries. This correlates also to the 'level of importance' perception of the 'wine culture' factor (12.8%) compared to the Big wineries group (8.8%).

SUMMARY AND CONCLUSIONS

Over the last two decades, the wine and wine tourism in Israel are experiencing rapid growth, regarding production and marketing. That is characteristically the behavior of a fast growing and emerging young industry which is facing the strategic dilemma of 'how to determine the best way to move to sustain and expand growth'. The research questions focus on identifying the strategic positions of various stakeholder groups in the wine sector. Two typologies, SWOTCLOK™ and the TALC models, approached the dilemma different angles and the results of the study show a compatibility and validity between them. Stakeholder groups indicate a different 'leading strategy' for the wine industry and tourism. Big wineries feel that currently the sector operates a GROWTH strategy, compared to the RESPONSE strategy indicated by Small & Family wineries and to the Government & VWB LEVERAGE

strategy and the SURVIVAL strategy of Mid wineries and the 'Other' group. The overall equivalent 'leading strategy' of the sector is RESPONSE. Particularly, a significant difference and gaps were found between the Government & VWB position and the other groups. Currently most wineries operate visitors centers, 'cellar door' and wine tasting activities, but other components of wine tourism such as wine trail, terroir & region tourism network (Bras, Costa, Buhalis, 2010) are only at the early stage of development. This pattern of behavior indicates that the wine sector is reaching a deflection period from 'stability and stagnation' to 'rejuvenation, involvement and development according to the TALC model, and from 'response' to 'leverage', according to the SWOTCLOCK™ model. All groups indicate that the development of wine regions and wine trail is the appropriate step to boost wine culture and wine tourism, which can bring an increase in wine consumption. Gaps found among the groups could be closed if Government & VWB were to play a **bigger and leading role** in promoting wine awareness, culture and education, through intensive advertising schemes, developing wine routes & trails and wine region (terroir), in collaboration with local authorities and wineries. Findings ranked 'wine culture' and 'wine trail & tourism development' as major factors together with the 'winery equipment & facilities' and 'wine know-how' factors, reflecting the strengths of the sector. Since Mid and Small & Family wineries do not have enough marketing and economic power for developing wine regions (terroir) and trails, Government & VWB and local and regional authorities should take the lead role in this area. Although Big wineries market is not directly related to wine tourism activities, as it is for Mid and particularly Small & Family wineries, they should participate given the benefit they can gain from the enhancement of wine culture, education and exposure to wine consumption. Wine tourism in Israel is facing two major regulatory barriers: the restriction on constructing and operating winery (industrial entity) at a vineyard site (agricultural entity); and the Jewish religious restriction stipulating that 'Kosher' winery must be closed on Saturdays and Jewish holy days. The negative affect is that wine visitors and tourists cannot maximize their vineyard and winery visit experience and that some potential wine marketing segments do not have access to wineries visit during the peak time of weekends and holidays. The research findings and recommendations set a big challenge to the wine industry and wine tourism in Israel in order for it to meet overall objectives of increasing wine consumption, attracting more domestic and incoming wine and other tourists, but also enhancing and expanding the export of Israeli wines through the establishment and differentiation of wine regions (terroir), branding and producing top quality unique wines.

WORK-FAMILY BALANCE IN CHILDCARE CENTERS: IS SUPPORT RELATED TO PARTICIPATORY MANAGEMENT?

Tremblay, Diane-Gabrielle

Téluq-University of Québec, Canada, dgtrembl@teluq.ca

ABSTRACT

This article analyses organisational support to work-life balance measures and policies in the childcare centers in the social economy (i.e., excluding the private childcare centers). It shows that the social economy sector is more supportive, and also shows that the mission and management approach (participatory decision-making process) influences organizational support to work-family (WFB) or work-life balance (WLB) and the perception of WLB-related issues. The quantitative data show that this subsector is more supportive than others which we studied. The qualitative part of the research shows that the specificity of the social economy sector, i.e., mission and participatory management, explain the stronger support of WLB in that subsector.

Keywords: organizational support, work-family conflict, work-life balance, childcare, early childhood centre, daycare, social economy.

INTRODUCTION

Work-family balance has been the object of much research over the last three decades. Historically, research has centered on the difficulties facing parents of young children (Guérin *et al.*, 1997), but it now examines the measures and policies developed by organisations to support work-family articulation (Fusulier *et al.*, 2006). Certain studies (Haas *et al.* 2002; Lewis 2001) also analyse the organisational culture and the attitudes and behaviour of colleagues and managers, and highlight their role as key determinants in work-life balance.

Some research has shown that large firms and public organizations might be more favourable to work-life balance, yet Guerin *et al.* (1997) observed that organisational culture

does influence the degree or extent of work-family conflict. It appears that organisations can play a favourable role in the development and implementation of family-friendly practices and policies (Fusulier *et al.*, 2008). However, while comparisons have been made between various types of organisations, we have seen no attempt to test the idea that a participatory management style (as in the social economy) could have an influence on the management of work-family balance. We therefore decided to analyse some organizations of the social economy. Our research is based on Québec early childhood centers in the social economy sector. These are called *Centres à la petite enfance* (CPE), to distinguish them from private daycare centers, known as *garderies* (daycare). When speaking of childcare centers, we will refer only to these social economy organisations (CPE).

We will investigate the incidence of organisational culture on the perceptions of work-life articulation in organisations with a social mission and more democratic management style. We focus on the study of social economy early childhood centers to determine if their social mission and management style has an influence on the organisational support and the perceptions related to work-family balance. Before discussing the findings, we present the research methodology and a review of the literature on organisational support and work-life balance.

1. WORK-LIFE BALANCE AND ORGANISATIONAL SUPPORT

Research has identified various work environment that influence the degree or scope of work-family conflict. Family-friendly practices as well as the support of colleagues and management have been found to have a significant impact to reduce work-family conflict. Some research stresses the importance of organisational culture as well as the attitudes and behaviour of colleagues and managers in the analysis of work-family conflict (Haas *et al.*, 2002; Lewis, 2001). An American survey carried out by the Families and Work Institute (1998) has shown that a demanding job and lack of organisational support tend to stress employees, make them less resilient in the face of difficulties, ill-tempered and less energetic after work, all of which may contribute to reduce personal and family wellbeing. This can generate the transfer of family problems to the work environment, which could reduce employees' productivity. Organisational support to work-family balance thus appears as a key element to increase both organisational productivity and employees' wellbeing.

The survey carried out by the Families and Work Institute (1998) indicates that the most important determinants of the availability of programs and policies, but also, by order of importance: the sector of activity, the size of the organisation, and the proportion of women holding executive positions. This led us to pay particular attention to specific sectors and to retain male and female working environments since the proportion of women in the workforce and the proportion of women in management are generally concurrent. In previous work (Tremblay, 2012) we compared male and female sectors, but did not confirm this observation of female sectors being more supportive. We thus decided to investigate management styles as research has not yet differentiated organisations according to their management mode. We thus investigate a sector with participative or more democratic organisations to see if they differentiate themselves from the traditional hierarchical organisations studied earlier (Tremblay, 2012). Our research thus dealt with large public organisations and social economy organisations, but we concentrate here on the latter. First, we present the social economy sector and early childhood centers.

2. THE SOCIAL ECONOMY SECTOR AND EARLY CHILDHOOD CENTRES

Social economy enterprises display unique characteristics. Originally created to cater to the needs of individuals and local communities, these community-based organisations are involved in economic development based on human values. In these organisations, rules and operational processes are designed to recognise and take into account the social dimension that should permeate economic development. The rules and principles that guide the social economy are as follows (from the *Chantier de l'économie sociale* online):

- The purpose of a social economy organisation is to serve its members or the community rather than simply generating profit or securing return on investment (ROI)
- Management is independent from the State
- Statutes and the operations include *democratic and participatory decision-making* processes that involve both users and workers
- In the distribution of its surpluses and revenues, the firm promotes the primacy of persons and of work over capital
- Activities are based on participatory principles, self-empowerment, and on individual and collective responsibility.

The social economy is thus a sector in which social values are strongly conveyed within the mission statement and objectives. We investigated the social economy sector in order to determine whether a democratically managed work environment is more receptive to work-family concerns.

3. METHODOLOGY

Our investigation is based on qualitative and quantitative methods (Creswell & Plano Clark 2006; Patton 1990). We first conducted a quantitative survey requesting participants to answer an online questionnaire, followed by a qualitative investigation using semi structured interviews.³¹ The online questionnaire consisted of questions on existing measures or policies within the organisation and on measures that respondents expected from the organisation. We wanted to capture the respondents' perception of the support available from both management and colleagues in the workplace regarding family responsibilities. Participants were also surveyed on different aspects of leave for family reasons and on parental leave. Finally, we asked our respondents whether they were satisfied with the way they could balance their professional and family responsibilities.

Respondents' profile

To qualify as respondents in our survey, participants had to be employees responsible for at least one child under the age of 18. In the social economy sector, 423 persons completed the survey—28 men and 395 women. Among the respondents, 69% work in early childhood centres, 14% in cooperatives and 17% in not-for-profit enterprises (NPO). This article is concerned with the childcare sector, which counts 293 respondents: 289 women and 4 men.

In CPEs, 68% of respondents are employees while 32% are managers. Overall, 94% are employed on a regular basis. Further, more than 80% of our respondents are 45 years old or younger and more than a third (36,2%) have at least one (1) child 6 years old or younger, 52% have at least one (1) child between the ages of 6 and 12, and 50% have at least one (1) child between the ages of 12 and 17. A majority of employees enjoy occupational seniority with

³¹ At the conclusion of the online questionnaire, participants interested in meeting with us were invited to provide their contact information; we were then able to proceed with the second phase of the research in face-to-face interviews.

their current employer: 30% have more than 10 years, 32% between 6 and 10 years, and 37% have 5 years or less. Further, 87% of respondents live with a partner and 53% of the partners have a higher income of up to \$10,000 more for 42% among them, which may have an impact of WLB and the division of duties. Approximately 74% of CPE work environments are in an urban setting and 26% in rural areas (see Appendix for detailed CPE respondent profiles).

4. RESULTS

The quantitative data collected indicate that respondents' perception of and overall satisfaction with work-life articulation is rather positive within their work environment.

4.1 An organisational culture generally open to work-life issues

First, the data clearly indicates our respondents' satisfaction with the organisational support they have for work-family issues. In the online questionnaire, five questions covered organisational culture, the support provided by the supervisor, and the respondents' ability to manage family and professional responsibilities. To the statement "Your organisation is a work environment that supports work-family balance", approximately 10% of participants replied "rather disagree" and "disagree totally", while 80% replied "rather agree" and "agree totally"; 10% of respondents remained neutral.

Statistical analyses were conducted to determine whether differences existed among the types of organisations (CPE, cooperatives, NPO) with respect to work-life articulation. No significant difference exists in this respect: the three social economy sectors concerned equally support work-life articulation. However, when comparing the social economy sector with the social work, nursing and public safety (police) subsectors (presented in Tremblay, 2012), important differences appear among all the groups and the effect size is important ($p < 0,05$ — large effect size, $r^2 = 0,285$). Therefore, definite differences exist between large public sector work environments and the social economy sector, the latter being more supportive of work-family balance. CPEs are the outstanding subgroup within the social economy sector herein studied and the statistical analysis identifies them as a work environment more conducive to work-family balance.

To the question "Overall, do you encounter difficulties in balancing your family and professional responsibilities?", only 5,6% indicated frequent problems while more than 55%

have no such problems and 30% only occasionally. Likewise, to the statement “I have the feeling that I’m successful in balancing my professional life and my family life”, more than 73% of respondents replied they were rather in agreement or in full agreement with the statement, while 11% remained neutral. We have seen, in the statistical analyses, that the social economy sector is different from the police subsector in this regard among others, but the difference is small here ($p < 0,05$ – weak size effect, $r^2 = 0,050$) and we were not able to establish significant differences with the other groups under study.

Some 98 % of respondents in CPEs stated that they are satisfied with their job. And only 9% of participants believe that it is not within the culture of their work environment to take leave for family reasons, and less than 5% say the same for parental leave. The CPE work environment is therefore open to work-family issues and work leave for family reasons.

Statistical analyses show that respondents are more satisfied in the CPE subsector and there is a significant difference with the two other social economy sub-sectors (although the size effect is very weak : $p < 0,05$ – very weak size effect, $r^2 = 0,026$); it is difficult to conclude with certainty since there are few subjects in the “unsatisfied” groups. We were not able to observe any significant difference either among job designations (employer-director, employee), according to the presence of a partner (few do not have a partner) or the presence of a child or children between 0 and 5 years of age.

A large majority of respondents think that their work environment is very supportive as concerns work-family issues and that they succeed quite well in balancing their professional and family responsibilities. Nothing is perfect and a number of issues were mentioned during the face-to-face interviews although not to such extent as was observed in other work environments. Here, in CPEs belonging to the social economy sector, support provided by management and colleagues is definitely higher. In order to better understand such positive perception among our respondents, we asked them to explain or provide examples of how their work environment in the SES (social economy sector) actually supports work-family balance.

4.2 Selecting a social economy job for its work-family measures

We know that work-life measures are important incentives that attract new employees (Tremblay, 2008). In this sense, social economy enterprises and CPEs in particular seem to

have a very positive reputation concerning their approach to work-life; it would seem that this top-notch reputation is known beyond the social economy sector itself.

Certain persons among our respondents stated that they left a job in the private sector to work in a CPE precisely because work-family balancing would be easier there. For them, the workload and work schedule in their former job did not take into consideration a working parent's family responsibilities. For example, two mothers formerly had a very stimulating career in another sector of activity with a private company but did not find any support regarding their family responsibilities. They decided to change jobs and found what they were looking for in social economy organisations: "When I left my last job, honestly, I gave it up precisely because family and career were at odds [...]. Then, in any case I waited and applied [...] and I was very lucky because it's... it is really a dream come true." Another said: "I was even ready to sacrifice the kind of job, you know, just to have this balance [...] Therefore, I wanted to find balance and I think, for me at least, for our family, we found it and it is working out real well for us."

Other respondents who are thinking of reorienting their career will wait until the children are older in order to take advantage of work-life measures in the CPEs: "No, I will not stay in this job forever. I like it here, it's good for my family. I have young children, 13 and 10 years old, and things are OK for now in my life. But in 5 years, I think I'd rather look for something else. [...] maybe take up a job that is less flexible... For now, however, I need flexibility, that's the critical requirement."

For others, working in a social economy organisation such as a CPE means lower wages than what they could earn or were actually earning elsewhere, but the loss is largely offset by all the possibilities not otherwise available to better attend to one's family. One respondent did not hesitate to leave a well-paid and prestigious job in favour of a position as director of a social economy organisation: "So they told me outright: 'We can't offer you that kind of money. So, what is the rock bottom salary you would accept if you were to help us?' I realized that the job would earn me much less money but I would have comparative advantages, access to work-family measures especially."

4.3. A sector with a human touch for lone-parent families and fathers

Our data show no difference in satisfaction between lone-parent families and others with regard to one's capacity to balance work-life issues and organisational support in these organisations. For certain lone mothers, the social economy sector is particularly open to their situation. For example, a young lone mother recounts having lost her job repeatedly because of her status until she found employment in a cooperative, where she encounters understanding and support from her supervisor. Other testimonies gathered in the CPE sector support this vision.

One last type of comment shows the openness of CPEs toward work-family balance; according to our respondents, male employees are also concerned with the work-family issue. The participation of fathers in paternity leave following birth or adoption has risen in Québec and almost 80% take leave in one form or another. On average, men in Québec take seven (7) weeks off (Doucet and Tremblay, 2009). Many managers note that when it is necessary to leave work for family reasons (sick child), male employees who live with a partner will take leave more often than their spouse when the latter does not work in a CPE. From management's point of view, the measures available in the specific sector foster leave take up by employees regardless of gender: "For example when we had men working here at the CPE and their wife worked in another field, the man would take time off." Observations by management are substantiated by male employees who estimate that they indeed take leave for family reasons more often than their partners because the latter's work environments are not as flexible. While they recognize that nothing is perfect and that holding a full-time or part-time job involves different constraints, many respondents believe that work-family articulation measures designed for them by their employers are a definite step toward an explicit ideal. In CPEs, the service offered to the community is self-promoting by definition, i.e., it supports the very idea of work-life balance. This in turn leads CPE directors to a more sensible outlook on such issues in their own work environments and to take them into consideration in their management practices.

4.4 CPEs' outlook on work-life balance

Our respondents identify several factors which can explain CPEs' support to work-family balance, and relate them to the organizational culture. As mentioned above, doing things differently is the social economy's *modus vivendi*. Social economy organisations are indeed different; their history, and above all their social mission contribute to their unique

organisational culture and openness. Further, it should be noted that despite the social mission inherent to the social work sector, which we also studied (Fusulier, Tremblay & di Loreto, 2008), that sector does not provide as much organisational work-family support. Many respondents will spontaneously amalgamate the values of social economy businesses - especially CPEs - and work-family concerns; they consider that their work environment is more receptive to work-family balance. We mentioned earlier that the social economy and the CPE's childcare approach stem from citizens' common concern for needs that are overlooked or ill-served by the state, and respond to individuals' needs as opposed to corporations' needs and profit-making. For our respondents, it is only natural that these organizations support their employees. It is clear that the tradition of advocacy and the non-hierarchical character of the organisation extend the social mission into organisational support to employees, and this is what differentiates CPEs from social work (Tremblay, 2012). For example, according to our respondents, unionist and cooperative values at the root of many community organisations explain why work-family measures are included in the working conditions of employees in the CPEs. Community organisation coordinators respect the social values advocated by the founders of the CPEs in supporting their employees. Another respondent relates work-family issues to community issues and feminism. For him, the employer's openness to family values and fathers' responsibilities are an extension of the values that are at the origin of community-based organisations in the first place.

4.5. Mission, activities and operating rules

Operational rules and principles that govern social economy enterprises including CPEs promote the well-being of individuals and communities. In addition, according to a most prominent organisation in the field (*Chantier de l'économie sociale*), the main distinguishing characteristic of social economy organisations is to blend economic activity and social mission. The persons we interviewed believe that if social mission is intrinsically part of the organisations' activities and operations, it is only natural that the employer would be sensitive to work-family issues and that the organisation's management would reflect that mind-set.

When we asked a CPE educator if she believed that the availability of work-family measures put forth by her employer had anything to do with the mission of the enterprise, she replied without hesitation: "Yes, yes. It is all included in the childhood centre's policies. It is clearly stated in the organisation's mission that work and family concerns be addressed. [...] Indeed,

yes. Everybody working here naturally considers that family comes first.” For a CPE director, work-family balance and CPEs, the mission is based on a clear rationale: “In our CPEs, our mandate is to take care of children, we spend all our time doing that. And when they are sick, we call the parents to inform them and ask them to pick them up [...] I, for one, ask them: ‘please come and pick up your child immediately.’ So then in similar circumstances, how can I tell one of my own employees ‘no, you can’t leave, forget about your child.”

Many respondents indicated that in their organisations the decision-making process was generally based on team work. As well, we have seen that the social economy organisations integrate within their organisational rules and principles “a democratic decision process involving both users and workers”. While a large majority of persons interviewed work in organisations headed by a management team or coordinating office responsible for the decision process, most of them, whether managers or employees, have indicated that the decision-making process is often done with the employees or at least discussed among colleagues. For example, managers will often submit proposals or ask the employees for their opinion on matters of concern to them. This method takes into account the needs of the employees. We can see that participation, team work and better working conditions are often linked.

4.6. Organisational support and management’s shared values

The values inherent to the social economy movement appear to be among the founding elements that explain the openness of CPEs to work-family issues and solutions. As well it seems that CPE managers, as in other social economy organizations, adhere to the same values, which results in a significant impact on work-life balance. It is understood that work-life measures deliver little results when managers do not support them with an open mind (Duxbury et al. 1994, 1993; Behson, 2005) and therefore management’s attitude and values are crucial.

In addition to general statements on organisational support as we have seen above, we also studied the offer of specific measures and their use. This confirms that organisational support toward different measures is a reality—whether included in policies or otherwise implemented, and shows that supervisors and colleagues are responsive to work-family needs of employees.

The issue of organisational support was included in the online survey with this statement: “I have the feeling that my supervisor is responsive to the work-family articulation issue”. Among the respondents, only 11% of CPE participants disagreed with the statement against 70% who agreed or were in total agreement; 18% remained neutral. During the interviews, CPE managers regardless of gender spoke of the values that nourish their actions; employees also mentioned the values they perceive in their supervisors. The statistical analyses conducted on all the social economy subgroups studied indicate that there are no differences amongst the groups according to the status of employment (manager, employee), or the type of organisation (CPE, cooperative and other NPO or social economy activities).

CONCLUSION

Our data show how CPEs offer adequate organisational support toward work-family balance: management support, colleagues’ support, and offer of work-family measures. The situation is to a certain extent similar in other sectors of the social economy (NPOs, cooperatives). Our data pertaining to other sectors that we might have expected to be more supportive (social work, nursing; see Tremblay, 2012) reveal more significant differences and it is clear that social economy work environments and CPEs in particular are open to work-family articulation and offer adequate and relevant organisational support. It may appear difficult to explain why this subsector in the social economy would provide such strong support to work-family articulation while several other sectors offer so little, including work environments with a social mission and mostly managed by women (i.e., social work; cf. Fusulier, Tremblay & di Loreto, 2008). It seems that the values inherent to the social economy sector explain the situation: offering people-oriented services or performing some form of social work cannot in itself explain why work-family articulation is supported. Indeed, such support is not found to the same extent in social work or nursing (Fusulier, Tremblay & di Loreto 2008; Tremblay and Larivière 2010).

One factor that can explain the scope of organisational support in social economy enterprises appears to be managers’ familiarity with the benefits of work-family articulation in their own work environment. The benefits were widely documented (Tremblay 2008; Barrère-Maurisson and Tremblay 2009) and the relevant studies show without doubt that employers may benefit as well in terms of problem reduction (and savings thereof) related to absenteeism, attendance problems including coming in late at work, to personnel turnover,

diminishing allegiance and risks involved in employees' dwindling dependability for lack of organisational support toward their parental role. CPEs are relatively small-sized workplaces and this allows managers to better observe how work-family related measures actually benefit the organisation.

Our research thus shows that the social economy sector is more supportive, and also that its participatory management approach influences organizational support to work-family balance (WFB) and the perception of WLB-related issues. The quantitative data show that this subsector is more supportive than others previously studied. The qualitative part of the research shows that the specificity of the social economy sector, i.e., mission and participatory management, explain the stronger support of WLB in that subsector.

ABSTRACT

Rangelands constitute major natural resources that contribute to regional development, by offering significant goods and services. The economic value of rangelands includes both their value in use and non-use, which is hard to quantify in certain cases. The contribution of rangelands is particularly important in developing countries, where the rural sector plays a decisive role in economic and regional development.

The use and exploitation of rangelands should be carried out in the framework of a rational management process, in order to avoid the emergence of numerous problems regarding the sustainability of this kind of ecosystems.

Keywords: rangelands, regional development, economic value

INTRODUCTION

The term rangelands is used to describe natural ecosystems with or without native vegetation, which are covered by herbaceous vegetation or shrubs and are a production source of various goods and services (Papanastasis and Noitsakis 1992, Homewood et al. 2001, Ispikoudis 2010). The extent of rangelands worldwide is estimated to cover 47% of the total surface of the planet (Papachristou and Ispikoudis, 2003).

Rangelands are multi-functional ecosystems that offer a number of goods and services (Arabatzis and Kyriazopoulos, 2010). The forage production found there is an important source of food for farm animals and game. They also provide drinking water, suitable

habitats for wild fauna and fish and are a supply source for raw materials, i.e. various minerals and metal ores. In addition, a large number of remarkable archaeological and historical sites, along with particular cultural assets, are often located on rangelands. Finally, through the application of appropriate interventions, they can also contribute to the development of recreation and tourism-related activities (Solomon *et al.*, 2007; Ispikoudis, 2010).

Rangelands comprise a variety of diverse types of vegetation, such as annual reed beds with or without shrubs; land covered in bushes or trees, or even forested savannah-type areas. More specifically, this term divides areas with the above-mentioned characteristics into rangelands, shrubland, forest areas and arable land, based on biophysical parameters, such as the climate, fires, grazing, directed pressure and succession stages, as well as man-made factors, such as changes to land use and population density (Homewood and Brockington, 1999).

ECONOMIC SIGNIFICANCE OF RANGELAND RESOURCES

The total economic value of rangeland resources includes values in use, which are divided into direct and indirect values. Direct values refer to extensive livestock farming, direct economic benefits, and income. Indirect values include tourism development, services, future values which arise from livestock farming and the valorisation of rangeland resources, with a potential future yield and existence or bequest values stemming from livestock farming which, if maintained, will also benefit future generations (Dovie *et al.*, 2006; Hesse and MacGregor 2006; Gombakomba 2008; Kroeger *et al.*, 2009).

More specifically use values of rangeland resources consist of direct value like extensive livestock farming, conservation, input of commercial and raw materials, employment, skills improvement and other prosperity factors, indirect value such as tourism, ecological and livestock farming services, local knowledge and future value referring to future opportunities that will benefit livestock farming. On the other side non-use values refers to existence or bequest value an attribute that deals with substantial benefits for all society and personal benefits through the preservation and continuation of livestock farming (Dovie *et al.*, 2006; Hesse and MacGregor, 2006; Kroeger *et al.*, 2010; Gombakomba 2008; Kroeger *et al.*, 2009).

Stakeholders in a rural area can benefit from rangeland resources directly or indirectly. Direct benefits of rangeland resources consist of required factors for prosperity like production for

domestic and social consumption, input of livestock products (milk, meat, skin), forest resources (fuelwood) and non-wood forest resources (honey, fruit, plants with medicinal properties); Service provision: security, saving and risk management; Other factors: socio-political values, valorization and improvement of cultural assets; economic activity (commercial: sale of animal and plant products. Raw material production: input also affecting other economic sectors, e.g. slaughterhouses, traders, transporters) (Dovie *et al.*, 2006; Hesse and MacGregor, 2006; Kroeger *et al.* 2009).

Indirect benefits of rangeland resources consist of economic activity which comprise agricultural production and tourism) and environmental benefits like ecological and livestock farming services, conservation of balance and stability of rangeland ecosystems, regeneration, conservation of water sources and drinking water production sources (Hesse and MacGregor, 2006; Kroeger *et al.*, 2009).

RANGELANDS AND REGIONAL DEVELOPMENT

It is not easy to assess the contribution of rangeland resources and livestock farming to a country's economic development, and more specifically to the development of a rural area, since a whole range of obstacles and difficulties may exist that prohibit the collection of data by those who will carry out the relevant assessment. More specifically, in several African countries, where there is no highly developed system for recording the various economic data that is used by the productive sectors of each country, various activities such as livestock present grave deficiencies as regards the accuracy and recording of economic data, and thus the official data collected do not represent the size and economic significance of livestock farming and its participation in economic development (Lusigi and Acquay, 1999).

A large percentage of the economic flows stemming from livestock farming and the use of rangeland resources do not go through the country's official markets, but remain within each local community, where livestock farming is one of the main productive activities, since the majority of livestock farmers do not declare a specific annual income from their work and are therefore not taxed upon it. The use of the shadow price method can also not be used to assess the value of livestock farming products, like milk and butter; since it is quite complex and the relative rarity of these products on the local markets can inflate their purchasing value. Even if one used the usual methods of recording the economic input of livestock

farming on a national level, it is still extremely difficult to estimate its value and contribution to the economic development of the countryside (Hesse and MacGregor, 2006).

At the same time, the practice of extensive livestock farming in numerous parts of Africa, gives the opportunity to men and women livestock farmers alike, to collect and process various wood and non-wood forest products (fruit, honey, aromatic plants and herbs with healing attributes), in order to use them domestically (as a nutritional supplement or in making household objects and local, folk, or traditional art objects) or supply them to the local market, thus creating an additional source of income for their household. This practice for example is particularly beneficial for the prosperity and sustainability of rural families, living in the most arid parts of Africa and in certain Mediterranean countries (Shackleton *et al.*, 2001; Papachristou and Ispikoudis 2003; Shackleton and Shackleton 2004; Bugalho and Abreu, 2008).

In their research, Harp *et al.* (2000) attempted to identify the impact on the local economy from grazing on public rangelands in seven communities of Idaho, USA. Through a study conducted at 160 livestock farming units using a semi-structured questionnaire, they observed that in areas where livestock farming is the main economic activity, the economy is quite diversified, since a series of economic activities (pluriactivity) develop, which are related to and depend on livestock farming. This however is not the case in areas where the primary economic activity is not livestock farming, but minerals, wood harvesting and recreation activities.

In a study carried out in rural parts of Spain and specifically in areas where livestock farming plays the main role in agricultural production along with rangeland management, Plieninger and Wilbrand (2001) aimed to examine the prospects for improving the techniques and practices used, so that livestock farming could attract a larger part of the population and contribute to the economic recovery of the areas in question. The areas where the study was conducted are better known in international literature with the term "*dehesas*". *Dehesas* are "agrosylvopastoral areas with a combination of sparse stands consisting of various types of oak (*Quercus ilex* and *Quercus suber*) with open flat areas suitable for animal nutrition, such as cattle, sheep and goats", which are primarily found on the Iberian Peninsula. These areas are characterized by intense variety as regards their structure and also in relation to the biodiversity they offer. From an economic perspective, the "*dehesas*" support a major part of the population living off agricultural activities, such as livestock farming. The study showed that livestock breeding in the region of Cuatro Lugares in Spain has proven to be quite a

profitable practice, compared to the wages earned by local people working in other production sectors, and also given the prevailing situation regarding the livestock farming sector in other similar (but less favoured) regions in other countries. As regards their rational management, Plieninger and Wilbrand (2001) propose the establishment of a biological reserve in these regions, aiming at their protection and future valorization and conservation, both for economic purposes, and for the preservation of biodiversity.

In Greece, no extensive studies have been carried out in order to assess the value of rangeland resources and the economic benefits offered to livestock farmers (Papaspypopoulos *et al.*, 2010). The first studies related to the economic evaluation of rangeland resources were carried out by Papanastasis and Pittas (1984), whose research estimated that about a third of the total production of milk and meat from farm ruminants is produced on rangelands. Nastis (1984) estimated that the contribution of rangelands to livestock production is equal to 3% of the GDP. More recently, Papaspypopoulos *et al.* (2010) attempted to calculate part of the total value (in particular, the direct value in use) of rangelands used by bovine breeders in the prefecture of Fthiotida, along with the value they attribute to the same rangelands in order to be able to continue using them in future. This study highlighted the difficulties of assessing the value and contribution of rangeland resources to the overall development of the countryside.

Within the framework of the sustainable management of rangeland resources, the increased needs which arise due to the population expansion also require an augmented livestock production. Such a step, however, could lead to a grazing intensity that would exceed the grazing capacity of rangelands and thus result in their downgrading due to overgrazing (Gadamu 1990). Based on the above, their use for livestock farming purposes constitutes a supervisory expression of the interaction between the various dimensions of the matter, and as such, could function as an indicator for assessing the total health and sustainability of a natural ecosystem (MAF 2000). In order to be able to assess the impact of each dimension on the concept of sustainable rangeland management, so as to determine the extent to which it is applicable or not, it is necessary for local rural communities to work together with scientists of various specializations, so that new methods, practices and collaborations are formulated among the organizations interested in the sustainable management of rangeland resources (CSIRO 2003). To achieve this cooperation, there needs to be a balance between science and social values, economic viability, institutional traditions and political will and interest. From the above conclusions, we can observe the multi-variability and complexity of the term

sustainable rangeland management (Azadi et al. 2007). In more recent descriptions, this concept is defined as the science of managing rangeland ecosystems in such a way, that the disasters of the past are avoided, social needs and values are promoted and prospects of future growth are handed to future generations (Box 2002). For all these views to be applied, the basic issues and challenges of sustainable rangeland management need to be understood.

The most controversial and sensitive issue regarding the use of rangeland resources today and in the near future is how to achieve a balance between individual rights and the public interest. This conflict, in most cases, is reduced to the level of clashing local interests which are represented by various social groups, and also involves land use by individuals (overgrazing) and its availability for public use (sustainability) (Box 1995). This situation is better known as the "tragedy of the commons" (Deadman 1999; Zilberman and Alix, 2005). The dispute regarding the issue of overgrazing on public rangelands is related to the ownership status of public land and the rights that livestock farmers can claim over this public land and, in general, over a public natural resource (Box 2002). Each time livestock farmers focus on their individual rights and forget their collective rights and interests, then unavoidably a downgrading of rangeland resources results, which has a direct negative impact on future generations (Azadi et al. 2003). Most rangelands in Greece are downgraded mainly due to their irrational use (Nastis and Tsiouvaras 2009). Uncontrolled grazing is primarily related to the communal land grazing system, which gives access to free grazing to any farmer for a price, with no overall planning being in place. This situation is sustained by the insistence of livestock farmers on unconditional, free grazing, and also by the lack of political will to address this problem (Papanastasis, 1994).

One consequence of this uncontrolled grazing is overgrazing and the reduction of native vegetation (Box 1995). A visible reduction in the density of rangeland vegetation, land cover and encroaching on native vegetation, are leading to a decreased biodiversity and available food for herds on large rangelands, particularly in developing countries like Iran (Mesdaghi 1995). In cases where this phenomenon is observed, the downgrading of rangelands is transformed into an economic threat which reduces the income of livestock farmers, into a social threat which boosts internal migration from rural areas to large urban centres and into an environmental threat, since it can gradually lead to a desertification of large areas of land. As a means of reacting to this situation, numerous livestock farmers attempt to increase the number of their animals and overexploit the available rangelands in an effort – which is linked to the economic and political pressure they are subjected to – to produce more meat,

which they supply to urban centers aiming to maximize their income. In some cases, even governments themselves offer incentives which encourage overgrazing, through their implemented policies (Lusigi and Acquay 1999; Zilberman and Alix 2005). Moreover, without the adoption of relevant decisions for the protection and rational management of rangelands, it is impossible to regulate the intensity of grazing, in line with the existing grazing capacity (Taghi and Jandaghi 1998; Walker and Hodgkinson, 2000).

CONCLUSIONS

Rangelands bear a great ecological and economic significance for the development of rural areas. Nevertheless, essential resources and suitable strategies are required that will aim at their conservation and management, at the sustainability of their economic benefits and at the strengthening of the social, aesthetic, cultural and traditional values they embody.

Furthermore, rangeland management must also take into account the relation between the former and other natural resources, like forests, agricultural crops and protected areas, aiming at the sustainable development of the areas in which the above-mentioned natural resources are located. The valorization of various financial incentives, which are primarily provided at a European Union level, will further contribute to the rational management and exploitation of rangelands.

As far as the conflicts that arise in some countries for rangeland resources, governments must center their efforts in support and promote livelihood strategies and ways to preserve and enhance them as well as the natural assets of rangelands on which local people depend on to make their living. Additionally, must involve local people and especially stakeholders in the planning and establishment of these strategies from the initial stages of this process to reduce potential conflicts (Kirk et al. 1998a, Ngaido and Kirk 2000).

Such attempts could succeed only if local authorities and institutions secure the socioeconomic welfare of their members, namely the local people. Finally, an integrated approach for the sustainable management of rangeland resources considering all the potential attributes that affect and shape the sustainable use of rangeland resources could be very helpful and profitable in order to reduce conflicts among livestock farmers in remote rural areas.

Partnership among scientists, ecologists, economists, policy and legal experts, private and public rangeland managers and authorities is important in order to allow for multiple uses and sustainable rangeland management.

ABSTRACT

IFRS conceptual framework deals with the objectives of financial statements, the underlying assumptions and qualitative characteristics. In Slovakia, the basic concepts, the accounting methods and accounting principles are contained in the Act on Accounting and the Measures of accounting procedures.

The major differences are in the measurement of assets, in the recognition of the assets, in the method of assets depreciation, and in the identification of an impairment of assets. The important issue is recognition of investment property, recognition of assets held for sale and recognition of the biological assets. The Statement of Financial Position according to IFRS reflects the mentioned principles compared to Balance Sheet used by the Slovak Accounting Regulations.

The papers contain the comparison which describes the differences between IFRS and the Slovak Accounting Regulations on accounting and disclosure of noncurrent assets of the entity.

Keywords: International Financial Reporting Standards, noncurrent assets, depreciation, valuation, impairment

INTRODUCTION

A financial statement should reflect true and fair view of the business activities of the organization. As these statements are used by various constituents of the society or regulators, they need to reflect true view of the financial position of the organization, and it is very helpful in checking the financial position of the business for a specific period.

The stated goal of the IFRS Foundation and International Accounting Standards Board (IASB) is to develop, in the public interest, a single set of high-quality, understandable, enforceable and globally accepted financial reporting standards based upon clearly defined principles. The year 2005 marked the beginning of a new era in global conduct of business, and the fulfillment of a thirty-year effort of creating the financial reporting rules for a worldwide capital market. During that year's financial reporting cycle, the 27 European Union member states, plus many other countries (Australia, New Zealand, Russia, South Africa) adopted IFRS.

The objective of general-purpose financial reporting is to provide financial information about the reporting entity that is useful to existing and potential investors, lenders, and other creditors in making decisions about providing resources to the entity. General-purpose financial statements provide information about the financial position of an entity, its resources, and claims against the resources.

The qualitative characteristics identify the information that is most useful in financial reporting. The qualitative characteristics of financial statements include:

1. Relevance (Materiality).
2. Faithful representation.
3. Comparability.
4. Verifiability.
5. Timeliness.
6. Understandability.

The aim of the paper is to describe the IFRS approach to recognition of noncurrent assets, measurement of noncurrent assets, depreciation and impairment of noncurrent assets, and comparing this area with the national accounting regulation.

HISTORY OF IAS AND IFRS

International accounting standards are accounting standards issued by the International Accounting Standards Board (IASB) and its predecessor, the International Accounting Standards Committee (IASC). Listed companies, and sometimes unlisted companies, are required to use the standards in their financial statements in those countries, which have adopted them. The history of international accounting standards really began in 1966, with the proposal to establish an International Study Group comprising the Institute of Chartered Accountants of England & Wales (ICAEW), American Institute of Certified Public Accountants (AICPA) and Canadian Institute of Chartered Accountants (CICA).

The International Accounting Standards Committee (IASC) was founded in 1973, with the stated intent to release new international standards which must "be capable of rapid acceptance and implementation world-wide". The IASC survived until 2001, when the organization was restructured and the IASC was replaced by the International Accounting Standards Board (IASB). Between those years the International Accounting Standards Committee released a series of standards called 'International Accounting Standards' in a numerical sequence that began with IAS 1 and ended with IAS 41. Some IAS standards were superseded by IFRS standards.

The IASB stated that they would adopt the body of standards issued by the Board of the International Accounting Standards Committee, but any new standards would be published in a series called International Financial Reporting Standards (IFRS). The former Standard Interpretations Committee (SIC) was reconstituted in 2001 as the International Financial Reporting Interpretations Committee (IFRIC).

The first IFRS 1 First-time Adoption of International Financial Reporting Standards was published in June 2003.

The Regulation (E.C.) No 1606/2002 of the European Parliament and of the Council on the application of international accounting standards was adopted on 19th July 2002, requiring listed companies to use International Accounting Standards by 2005. As a result of the Regulation, all EU listed companies were required to prepare their financial statements following IFRS from 2005.

LITERATURE REVIEW

In present, good and useful information have the most important role, based on which their users can make decisions correctly (Andrejovská, 2012). The major sources of economic information are financial statements and accounting of companies, which must meet certain requirements (Andrejovská, 2012). According to Cohen, *et al.* (2012) internal users of financial information include, among others, politicians, public managers, employees, while external users include citizens, voters, taxpayers, suppliers, banks, rating agencies. These users should be able to base their decisions on reliable and relevant information about the financial position, financial performance and cash flow of the government (Cohen, *et al.* 2012). An entity is required to present in the Statement of Financial Position (Balance Sheet) short-term and long-term assets and short-term and long-term liabilities as a separate classification (Hakalová, 2010). In accordance with IAS 1, long-term asset is such asset that does not meet the definition of short-term assets. Long-term assets include: intangible assets, property, plant, equipment, investment property, financial leasing, and financial assets if their settlement remains more than one accounting period (Strouhal, 2009). Relevant IAS and IFRS to noncurrent assets are cited in the papers (IAS 16 Property, Plant and Equipment, IAS 36 Impairment of Assets, IAS 40 Investment Property, IAS 41 Agriculture, IFRS 5 Non-current Assets Held for Sale and Discontinued Operations, IFRS 6 Exploration for and Evaluation of Mineral Resources).

EXISTING IFRS REPORTING FRAMEWORK

Noncurrent assets include property, plant, equipment, intangible assets, investments in associates, and available-for-sale-investments. Noncurrent assets are held to obtain the economic benefits by an entity for a period greater than one year. Measurement and presentation of noncurrent assets involves systematic allocation of cost to accounting periods, and possible write-downs. Components approach to depreciation means that significant elements of an asset are amortized over their various appropriate useful lives.

IAS 16 PROPERTY, PLANT AND EQUIPMENT

This standard outlines the accounting treatment for most types of property, plant and equipment. Property, plant and equipment are used in the production or supply of goods or services, for rental to others, or for administrative purposes. These fixed assets will benefit the entity during more than one accounting period. Property, plant and equipment do not include biological assets related to agricultural activity or mineral sources.

Items of property, plant, and equipment should be recognized as assets when it is probable that: (1) the future economic benefits associated with the asset will flow to the entity, and (2) the cost of the asset can be measured reliably.

This recognition principle is applied to all property, plant, and equipment costs at the time when they incurred. These costs include costs incurred initially to acquire or construct an item of property, plant and equipment and costs incurred subsequently to add to, replace part of, or service it. IAS 16 recognizes that parts of some items of property, plant, and equipment may require replacement at regular intervals. An item of property, plant and equipment should initially be recorded as cost. Cost includes all costs necessary to bring the asset to working condition for its intended use. This would include not only its original purchase price but also costs of site preparation, delivery and handling, installation, related professional fees for architects and engineers, and the estimated cost of dismantling and removing the asset and restoring the site.

IAS 16 permits two accounting models: (1) Cost model: the asset is carried at cost less accumulated depreciation and impairment. (2) Revaluation model: the asset is carried at a revalued amount, being its fair value at the date of revaluation less subsequent depreciation and impairment, provided that fair value can be measured reliably.

Under the revaluation model, revaluations should be carried out regularly, so that the carrying amount of an asset does not differ materially from its fair value at the balance sheet date. The increase in the carrying amount is accounted for in equity as „revaluation fund“ (credit). Reduction in the carrying amount should be recognized as an expense.

Depreciation of a depreciable asset begins when the asset is available for use and continues until the asset is derecognized, even if it is idle. The depreciable amount (cost less residual value) should be allocated on a systematic basis over the asset's useful life. The residual value and the useful life of an asset should be reviewed at least each financial year-end and, if

expectations differ from previous estimates, any change is accounted for prospectively as a change in estimate under IAS 8. An item of property, plant, or equipment shall not be carried at more than recoverable amount. Recoverable amount is the higher of an asset's fair value less costs to sell and its value in use. Value in use is the present value of estimated future cash flows expected to be realized from the continuing use of an asset and from its disposal at the end of its useful life. An asset should be removed from the balance sheet to disposal or when it is withdrawn from use and no future economic benefits are expected from its disposal. The gain or loss on disposal is the difference between the proceeds and the carrying amount and should be recognized in the income statement.

DEPRECIATION OF PROPERTY, PLANT AND EQUIPMENT

According to Mackenzie *et al.* (2012) the costs of property, plant and equipment are allocated through depreciation to the periods that will benefit from the use of the assets. Method of depreciation results in the systematic and rational allocation of the depreciable amount of the assets (less residual value) over the whole expected useful life of the asset. IAS 16 sets the choice of method of depreciation to the entity: to use the straight-line method, accelerated method, and units of production method.

Straight-line method – depreciation expense is incurred evenly over the useful life of the asset. The periodic charge for depreciation is given as:

$$\frac{\text{Cost amount less residual value}}{\text{Estimated useful life of asset}}$$

Accelerated method – depreciation expense is higher in the early years of the asset's useful life and lower in the later years. Two methods of this type of accelerated methods are often used: diminishing balance method and sum-of-the-years' digits method.

- a) Diminishing balance method: using diminishing balance method, entity can calculate the straight-line rate times the net carrying amount at the beginning of the year. The formula is as:

$$\text{Straight – line rate} = \frac{1}{\text{Estimated useful life}}$$

Double-declining balance depreciation is stopped when carrying amount equals to estimated salvage value.

Depreciation = 2 × Straight-line rate × Book value at the beginning of the year

- b) Sum-of-the-years' digit method: another method to calculate a diminishing charge for depreciation is the sum-of-the-years' digit method (SYD).

Depreciation = (Cost less salvage value) × Applicable fraction

$$\text{Applicable fraction} = \frac{\text{Numbers of years of estimated life remaining}}{\text{SYD}}$$

$$\text{SYD} = \frac{n(n+1)}{2}$$

n = estimated useful life

IAS 36 IMPAIRMENT OF ASSETS

This standard seeks to ensure that an entity's assets are not carried at more than their recoverable amount (i.e. the higher of fair value less costs to sell and value in use). With the exception of goodwill and certain intangible assets for which an annual impairment test is required, entities are required to conduct impairment tests where there is an indication of impairment of an asset, and the test may be conducted for a "cash-generating unit" where an asset does not generate cash inflows that are largely independent of those from other assets. IAS 36 applies to: land, buildings, machinery and equipment, investment property carried at cost, intangible assets, goodwill, investments in subsidiaries, associates, and joint ventures carried at cost, assets carried at revalued amounts under IAS 16 and IAS 38. An asset is impaired when its carrying amount exceeds its recoverable amount.

Carrying amount is the amount at which an asset is recognized in the balance sheet after deducting accumulated depreciation and accumulated impairment losses. Recoverable amount is the higher of an asset's fair value less costs to sell (net selling price) and its value in use. Fair value is the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date (IFRS 13).

Value in use is the discounted present value of the future cash flows expected to arise from: (1) the continuing use of an asset, and from (2) its disposal at the end of its useful life.

Indications of impairment are external and internal. External are: market value declines; negative changes in technology, markets, economy, or laws; increases in market interest rates; company stock price is below book value. Internal are: obsolescence or physical damage, asset is part of a restructuring or held for disposal, worse economic performance than expected.

An impairment loss should be recognized whenever recoverable amount is below carrying amount. The impairment loss is an expense in the income statement (unless it relates to a revalued asset where the value changes are recognized directly in equity).

IAS 40 INVESTMENT PROPERTY

Investment property is property (land or a building or part of a building or both) held by the owner or by the lessee to earn rentals or for capital appreciation or both. Investment property should be recognized as an asset when it is probable that the future economic benefits that are associated with the property will flow to the entity, and the cost of the property can be reliably measured.

IAS 41 AGRICULTURE

This standard sets out the accounting for agricultural activity – the transformation of biological assets (living plants and animals) into agricultural produce (harvested product of the entity's biological assets). The standard generally requires biological assets to be measured at fair value less costs to sell. Costs to sell are incremental costs directly attributable to the disposal of an asset, excluding finance costs and income taxes. An entity should recognize a biological asset or agriculture produce only when the entity controls the asset as a result of past events, it is probable that future economic benefits will flow to the entity, and the fair value or cost of the asset can be measured reliably. Biological assets should be measured on initial recognition and at subsequent reporting dates at fair value less estimated costs to sell, unless fair value cannot be reliably measured. Agricultural produce should be measured at fair value less estimated costs to sell at the point of harvest.

IFRS 5 NONCURRENT ASSETS HELD FOR SALE AND DISCONTINUED OPERATIONS

Assets (or disposal groups) held for sale are not depreciated, are measured at the lower of carrying amount and fair value less costs to sell, and are presented separately in the balance

sheet. In general, the following conditions must be met for an asset (or “disposal group”) to be classified as held for sale:

- Management is committed to a plan to sell an asset,
- The asset is available for immediate sale,
- An active program to locate a buyer is initiated,
- The sale is highly probable, within 12 months of classification as held for sale,
- The asset is being actively marketed for sale at a sales price reasonable in relation to its fair value,
- Actions required to complete the plan indicate that it is unlikely that plan will be significantly changed or withdrawn.

A “disposal group” is a group of assets, possibly with some associated liabilities, which an entity intends to dispose of in a single transaction. Non-current assets or disposal groups that are classified as held for sale shall not be depreciated.

CALCULATION OF DEPRECIATION

An entity acquired a machine that cost 145 000 € with an estimated useful life of six years and a 5 000 € salvage value. The calculation of three mentioned methods of depreciation is shown in the table:

	Straight-line		Double-declining balance		Sum-of-years' digits	
Year 1	140 000/6	23 333 €	33,33%×145 000	48 329 €	6/21×140 000	40 000 €
Year 2	140 000/6	23 333 €	33,33%×96 672	32 221 €	5/21×140 000	33 333 €
Year 3	140 000/6	23 333 €	33,33%×64 451	21 481 €	4/21×140 000	26 667 €
Year 4	140 000/6	23 333 €	33,33%×42 969	14 322 €	3/21×140 000	20 000 €
Year 5	140 000/6	23 333 €	33,33%×28 648	9 548 €	2/21×140 000	13 333 €
Year 6	140 000/6	23 333 €	33,33%×19 099	6 366 €	1/21×140 000	6 667 €

Table 1. Calculation of depreciation of asset

Source: own elaboration based on Mackenzie et al. 2012

CALCULATION OF IMPAIRMENT AND ITS ACCOUNTING

An entity has a group of machines that constitutes a cash-generating unit for purposes of applying of IAS 36. A group of machines have an aggregate carrying amount at the end of the accounting period which ends at December 21st, 2012 totaling 145 000 €. Future revenues and costs are apparent and they predict the diminishing productivity of the group of machines. The fair value of the machines after deducting estimated disposal costs is calculated as 100 000 €. Value in use is calculated with reference to the expected revenues and costs, discounted at a rate of 5%. The calculation of net present value of cash flows is shown in the table:

Year	Revenues	Costs, excluding depreciation	Cash flows	PV factors	Net PV of cash flows
2013	95 000	45 000	50 000	0,95238	47 619,05
2014	92 000	50 000	42 000	0,90703	38 095,24
2015	73 000	58 000	15 000	0,86384	12 957,56
2016	25 000	17 000	8 000	0,82270	6 581,62
Total	285 000	170 000			105 253,47

Table 2. Calculation of value in use of asset

Source: own elaboration based on Mackenzie et al. 2012

In this case, value in use exceeds fair value less costs to sell and thus value in use is selected to represent the recoverable amount of this cash-generating unit. This is lower than the carrying amount of the group of the machines. The impairment must be recognized as of the end of 2012, in the amount of 145 000 € - 105 253 € = 39 747 €. This amount will be included in operating expenses for 2012 (either depreciation or a separate caption in the statement of comprehensive income or in the statement of profit or loss).

CURRENT NATIONAL ACCOUNTING FRAMEWORK

Accounting in the Slovak Republic is based on the same accounting principles as in other countries, and also uses the same accounting methods. Current national accounting framework consists of two pillars:

- Act on Accounting No. 431/2002 Corpus Iuris, and
- Measure of the Ministry of Finance of the Slovak Republic on stipulation of details of accounting procedures and framework chart of accounts for entrepreneurs keeping double-entry accounting from 11th December 2003 No. 25167/2003-92.

Act on Accounting governs the scope, methodology and verifiability of accounting and the financial statements. Accounting principles and methods are contained in the accounting legislation (Measure of the Ministry of Finance of the Slovak Republic of accounting procedures), which is resulting from all legal acts of the European Union in the field of accounting (The Fourth Council Directive 78/660/EEC on the annual accounts of certain types of companies, and The Seventh Council Directive 83/349/EEC on national laws on consolidated accounts).

The Slovak Republic became a part of the Euro zone from the 1st of January. After Slovakia's accession to the European Union, there was a need of comparability of accounting information flows between countries, without additional costs to adapt them to the same base.

DEFINITION AND RECOGNITION OF ASSETS ACCORDING TO NATIONAL REGULATION

According to national regulation, assets mean those of an accounting entity's total on- and off-balance sheet assets which result from past events and which virtually increase the accounting entity's future economic benefits, may be reliably valued, and are presented in the financial statements (Act on Accounting). Assets of accounting unit are classified from the timely point of view to long-term and short-term assets. National regulation (Measure of the Ministry of Finance of the Slovak Republic of accounting procedures) has set two criteria: time and value. Firstly, long-term assets include assets whose useful life, agreed maturity or other settlement deadline from the date of origin of the respective accounting case is longer than one year (time criterion). Secondly, tangible long-term assets are considered to be those whose costs are higher than 1 700 €, and intangible long-term assets with costs higher than 2 400 € (value criterion). Unlike IFRS, national regulation is missing the expression "controls of assets". Long-term assets of which the accounting entity has ownership or rights are accounted and recognized. Measurement of assets after their recognition is reduced only on

cost model. According to national regulation, part of long-term assets covers some types of assets, which are regulated by individual IAS and IFRS. These assets are as follow: noncurrent assets held for sale (IFRS 5), biological assets (IAS 41), investment property (IAS 40), exploration for and evaluation of mineral resources (IFRS 6).

Unlike IFRS, according to national regulation, the estimated costs of dismantling and putting assets into the original state do not enter into the valuation of assets.

DEPRECIATION AND IMPAIRMENT OF ASSETS ACCORDING TO NATIONAL REGULATION

An accounting entity depreciates both tangible and intangible assets in accordance with accounting principles and accounting policies. Land, objects made of precious metals, and objects of art are not depreciated. The accounting entity is obliged to prepare a depreciation schedule and to depreciate assets following such schedule. Depreciation schedule shall take into consideration useful life, number of products or similar units to be acquired with the help of the depreciated asset. The assets shall only be depreciated to the level of their book values. Depreciable amount (IAS 16) is not defined in national regulation. Tangible assets shall be depreciated by the accounting entity over their expected period of use corresponding to the consumption of future economic benefits. Methods of depreciation are based on time and on physical usage. Methods based on time are permitted as follows: linear method, progressive accelerated and regressive accelerated methods. Sum-of-the-years' digit method is not allowed. Depreciation of asset begins when the asset is put into use, and not when it is available or capable to work.

Slovak accounting regulation does not address the specific regulations of impairment of assets like IAS 36: recoverable amount, net selling price, value in use, cash-generating unit. The accounting entity is obliged to adjust valuation of the assets value, to create provisions and to deduct the assets in accordance with the accounting principles and accounting methods to the balance sheet date. The valuation of assets shall be adjusted by adjusting entries if there is a justified assumption of a reduction of assets value under their book value. Adjusting entries shall be cancelled or their value shall be changed if a change of an assumption of value reduction occurs.

RESULTS AND DISCUSSION

Body of regulation of accounting in the Slovak Republic is the Ministry of Finance of the Slovak Republic. Hierarchical structure of the laws of accounting and preparation of financial statements is as follows: Commercial Code, Act on Accounting, and Measures of accounting procedures and framework chart of accounts for entrepreneurs keeping double-entry accounting. The essential requirement of the Accounting Act is that the financial statements provide a true and fair view of the facts that are subject of accounting, and financial condition of the entity. Unlike IFRS, in Slovakia there is not a document called Conceptual Framework with its mission. Basic concepts such as the definition of assets, liabilities, revenues and expenses, and accounting methods and principles are contained in the Act on Accounting. Definition of fair value is different in national regulation. According to Act on Accounting, a fair value shall be understood as:

- a) Market price,
- b) A valuation by a qualified estimate or an expert opinion if the market price is not available or does not accurately express the fair value,
- c) A valuation laid down by a separate regulation, if it is not possible to proceed according to previous paragraphs,
- d) The value of the works provided by a concessionaire to the contracting authority in exchange for which the concessionaire acquires the intangible assets.

Using fair value valuation after initial recognition may be valued only to selected types of assets and liabilities: securities, derivatives, financial allocations, enterprises or cooperatives being wound up without liquidation, hedging derivatives, real properties in a special interest fund, commodities at market price, and precious metals being in the possession of fund at market price.

The following table shows an overview of the most significant differences between IFRS approach and national treatment.

IFRS	Slovak Accounting Regulation
Conceptual Framework (IASB)	In Slovakia there is no such document with that mission
Controls of assets (IAS 16)	Ownership or rights to noncurrent assets
Definition of assets:	Assets mean those of an accounting entity's total on- and off-balance sheet assets which
Items of property, plant, and equipment	

should be recognized as assets when it is probable that: (1) the future economic benefits associated with the asset will flow to the entity, and (2) the cost of the asset can be measured reliably (IAS 16)	result from past events and which virtually increase the accounting entity's future economic benefits, may be reliably valued, and are presented in the financial statements.
Two accounting models: (1) Cost model, (2) Revaluation model (IAS 16)	Two criteria for asset recognition: time and value. Only Cost model is permitted
Depreciable amount (IAS 16)	Depreciable amount (IAS 16) is not defined
Depreciation of a depreciable asset begins when the asset is available for use and continues until the asset is derecognized, even if it is idle (IAS 16)	Depreciation of asset begins when the asset is put into use, and not when it is available or capable to work
Carrying amount (IAS 16)	Carrying amount is booked value of asset
Methods of depreciation: Straight-line method, accelerated method, and units of production method (IAS 16)	Linear method, progressive accelerated and regressive accelerated method and method based on physical usage are allowed. Sum-of-the-years' digit method is not allowed
Components approach to depreciation (IAS 36)	Components approach to depreciation is permitted
Value in use (IAS 36)	No recognition of value in use
Recoverable amount (IAS 36)	No recognition of recoverable amount
Cash generating unit (IAS 36)	No recognition of cash generating unit
Investment property (IAS 40)	Investment property is a part of noncurrent assets
Biological assets (IAS 41)	Biological assets are part of noncurrent assets
Assets (or disposal groups) held for sale (IFRS 5)	Assets held for sale are not separately reported
Definition of fair value: Fair value is the price that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants at the measurement date (IFRS 13)	Fair value (the term) is defined in the Act of Accounting: a. Market price, b. A valuation by a qualified estimate or an expert opinion if the market price is not available, c. A valuation laid down by a separate

- regulation,
- d. The value of the works provided by a concessionaire to the contracting authority in exchange for which the concessionaire acquires the intangible assets.

Table 3: An overview of the most significant differences between IFRS approach and national regulation

CONCLUSION

Although both reporting frameworks, IFRS and Slovak Accounting Regulations recognize the assets in the Statement of Financial Position or Balance Sheet, their approaches are different. National regulation is missing the expression “controls of assets”. According to that, long-term assets are those of which the accounting entity has ownership or rights. National regulation framework has set two criteria for assets recognition: time and value. Firstly, long-term assets include assets whose useful life, agreed maturity or other settlement deadline from the date of origin of the respective accounting case is longer than one year (time criterion). Secondly, tangible long-term assets are considered to be those whose costs are higher than 1 700 €, and intangible long-term assets with costs higher than 2 400 € (value criterion). Measurement of assets after their recognition is realized only under the cost model. Fair value valuation is used after initial recognition only to selected types of assets and liabilities. According to national regulation, part of long term assets generally covers some types of assets, which are individually regulated by IAS and IFRS. Methods of depreciation of assets are based on time (linear method, progressive accelerated and regressive accelerated methods) and based on physical usage. Sum-of-the-years’ digit method is not allowed. Depreciation of asset begins when the asset is put into use, and not when it is available or capable to work, unlike the IFRS. According to national regulation, impairment of assets is realized only through adjusting entries, without the recognition of recoverable amount.

ACKNOWLEDGEMENT

ABSTRACT

Tourism is one of the fastest growing economic sectors. Growing competitive pressure increases the demands on service quality as the requirements and attitudes of customers are constantly evolving and changing. Due to the specific nature of tourism services, the offer may be copied easily and in some sectors, it can differ only in the quality of the services provided. The quality of services is assessed from technical and functional points of view, while individual factors may be evaluated according to customer satisfaction. The objective of this article is to identify the factors affecting quality in the sector of the providers of tourism services (travel agencies) and determine their significance for the selected segments of customers. These factors reflect the dimensions of the service quality that a customer is able to assess without any experience with the service provided (responsiveness, assurance, empathy and tangibles). The output of the study will be the determination of the significance of individual factors from the perspective of a potential customer when selecting a service provider. The factors will be determined based on an analysis of previous scientific research in the context of functional and technical quality of services. The necessary data will be obtained through primary research (1-10 scale of factor importance) among potential customers and travel agencies chosen by random selection.

Keywords: tourism service quality, dimension of quality, competitiveness factors, travel agency

INTRODUCTION

The Czech Republic after 1989 became a popular destination for tourists from all over the world - it was something new, exotic and yet not expensive. This specific competitive advantage increased the tolerance to relatively low quality of services on the Czech market. This trend, however, has ceased and the Czech Republic is currently perceived as a normal tourist destination. Tourism is a very prospective industry, however, its potential has not been fully exploited in the Czech Republic. As tourism, despite temporary fluctuations, has been showing globally long-term sustainable growth, great attention should be paid to quality in order to gain competitive advantage. The Czech Republic is currently going through a stage, when national standards are being formulated in some selected sectors within the National Quality System in Tourism Services. The quality standards, however, focus only on the technical aspects of quality, not the functional ones, and they are not related to the external environment. The functional quality system has not been implemented.

This paper presents the results of the initial partial analytical phase of a research project aimed at defining the best practices and designing a model of comprehensive evaluation of the quality of tourism services in the context of increasing the competitiveness of the Czech Republic in the highly competitive European market. The objective of this paper is to identify the key factors affecting quality in the sector of the providers of tourism services, namely travel agencies, and determine their significance for the selected segments of customers. The article includes classification of various factors into the elementary quality dimensions based on empirical and theoretical support (conceptual support), in literature specifically the initial models developed by Grönroos (1984), Parasuraman et al (1990), and subsequent determination of the importance of these dimensions in selecting a service provider in view of a potential client.

MATERIAL AND METHODS

Due to the specific nature of the services, the approaches to the assessment and understanding of the service quality are very different. Quality can be seen as a component of customer satisfaction, which is closely connected mainly to their expectations and eventually to customer loyalty. The quality of tourism services from the customer perspective is very subjective. Customers form their ideas, their desired ideals on the basis of recommendations and advertisements and then compare them with reality. Customers have a certain idea about the level of quality before consuming the service and therefore its consumption may affect their prejudices and ideas about the service (Cetlová, 2007).

The perception of the service quality may vary between individual customers, but it can also change in a single customer in time. (Vašítková, 2008). One of the most reliable methods of quality evaluation, according to Bartl, Schmidt (1998) and Müller (1995), is a direct contact with a customer and quality evaluation on the part of the customer. The area of service quality management was influenced significantly by Grönroos, Zeithaml, Parasuraman and Berry (e.g. 1988, 1990, 1991, 2007). Their work focused on customer expectations, service quality and customer satisfaction represent major theoretical approaches to service quality evaluation.

Parasuraman et al (1990) draw upon the assumption that the first and most important step in providing quality services is correct identification of customer expectations, which tend to grow and change depending on the current trends. These authors define five dimensions of service quality which have been quantified based on an extensive research and which affect the customer's perception of service quality. These attributes are listed in the order of their importance and their validity is expected theoretically in all types of services:

- Reliability - availability and ability to provide services accurately and reliably;
- Responsiveness - helpfulness, sensitive approach to customers, prompt service delivery;
- Assurance - staff competence, knowledge, courtesy and ability to create in the customer a sense of confidence;
- Empathy - understanding of individual wishes, care and attention paid to the customer, sensitive approach;
- Tangibles - service materialization and influence of environment.

The aforementioned dimensions represent the service functional quality, i.e. subjective perception of the way the service provided to the customer. Kang, James (2004) on the other hand, in their model of quality according Grönroos (1990), takes into account not only the subjective functional quality but also the technical quality, which is represented by objective measurable indicators as well as a factor representing the company image.

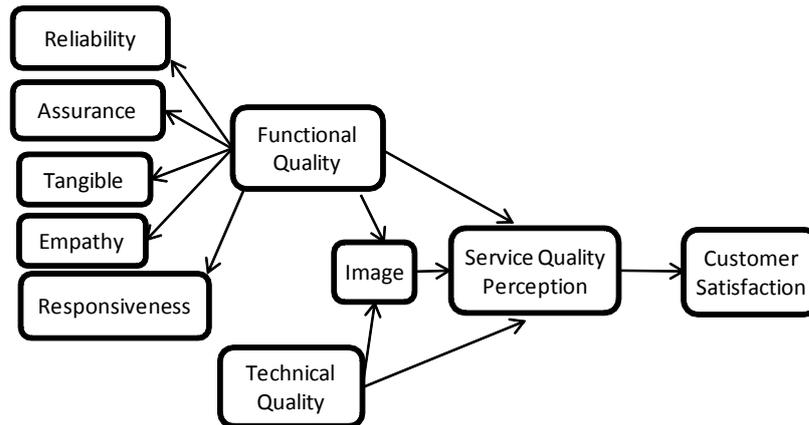

Figure 1: Model of service quality according to Grönroos, Source: Kang, James, 2004

Zeithaml et al (2006) in their publication state that although in practice the terms of satisfaction and quality are mutually interchangeable, experts claim that satisfaction is generally perceived as a broad concept while the quality of services concentrates especially on the dimensions of services. Parasuraman et al (1988) clarify the differences between service quality and satisfaction: perceived quality should be regarded as a global state, close to an attitude, while satisfaction refers to a specific transaction. Also, when consumers judge quality levels, they can base their assessment on their opinions and brand image, without any necessary prior experience of the product. However satisfaction relates to a specific transaction and, for it to be assessed, consumer must acquire/use the product or service. According to Zeithaml et al (2006) and their model presented in Figure 2 the customer satisfaction is an outcome of product quality. However, mutual relations between satisfaction and perceived quality induce more controversies. Admittedly, Petrick et al (2004), verified models of relations between perceived quality, customer value, satisfaction, and market behaviour of customers, does not assume such a possibility that satisfaction has influence on quality, in all analysed variants assuming the opposite relation. However, Lee et al. (2004), on the basis of broad studies on the literature, has noticed that research cannot agree on which of the two terms has a wider scope and which of them is the prerequisite of the other. Getz et al (2001) notice that properly defining relations between quality and satisfaction depends mainly on the way quality is defined. The problem might be even more complicated if additionally customer value is taken into consideration as another term strictly connected with customer satisfaction and product quality (Chen, Chen, 2010; Yuskel et al, 2010; Żemła, 2012).

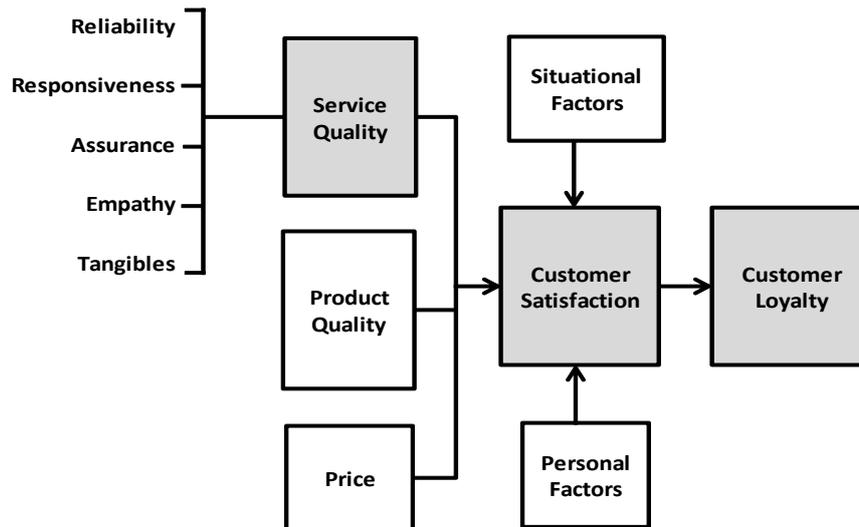

Figure 2: Relations between customer satisfaction and service quality, source: Zeithaml et al, 2006

Baker, Crompton (2000) examined the relationship among quality, satisfaction, and behavioural intentions and they confirm the hypothesis that perceived quality has a major influence on subsequent customer behaviour than customer satisfaction; the measurement of the quality is therefore for managers more valuable than examining customer satisfaction. Examples of further research is the relationship among perceived value, satisfaction, and subsequent customer recommendations (Lee et al, 2007).

For evaluating customer satisfaction we can use not only tools that will provide rather a basic picture of satisfaction to a service provider (e.g. the systems of complaints, mystery shopping, satisfaction survey, simple questionnaire surveys)³² but also more sophisticated methods (Gap³³, Kano³⁴, PFI³⁵, ECSI³⁶) that are based on models the aims of which is to operationalize service quality a customer satisfaction in such a way that they become better traceable and measurable.

³⁶ Fornell, 1992; Mateides, Ďaďo, 2002; Ryglová, Vajčnerová, 2005; Ryglová, 2007, 2011

A primary research was conducted in the form of a questionnaire survey in order to fulfil the goal of identifying the quality factors important for clients of travel agencies. The survey was conducted in autumn 2012 and the sample consisted of 230 respondents who make use of the services of travel agencies. The sample was obtained by random selection. The decisive factors were selected based on the arithmetic average of the scores that each factor was given by the respondents. The factors were then divided according to Grönroos' model into groups expressing technical quality, functional quality and image. The functional quality was further divided into sub-dimensions: responsiveness, assurance, empathy and tangibles. As each quality dimension contains a different number of factors, two most important factors had to be chosen from each dimension for comparison. Dimensions with the highest rating also included decisive factors. These dimensions were then tested in relation to sex, age and education of the respondents. The testing was performed in Statistica programme according to ANOVA analysis of variance. In addition, the homogeneity of variance was tested using the Brown-Forsythe test at a significance level of 5 %. Having rejected the null hypothesis, the HSD method for unequal N was applied to determine the pairs of mean values which differ from each other.

RESULTS AND DISCUSSION

The Table 1 below shows the order of the key factors ranked to relevant dimension perceived by the client when evaluating the quality of travel agencies.

Order	Factors	Ø value	Dimension of functional quality				Technical quality	Image
			1	2	3	4		
1.	Qualification and knowledge of service personnel	9,27		X				
2.	Helpfulness of service personnel	9,16	X					
3.	Credibility of service personnel	9,14		X				
4.	Kindness of service personnel	9,09				X		
5.	Respect to customer	9,03	X					
6.	Provision of detailed information about accommodation	8,84		X				
7.	Provision of detailed information about transport	8,53		X				
8.	Provision of detailed information about destination	8,53		X				
9.	Provision of detailed information about catering	8,47		X				
10.	Timely provision of services	8,43			X			
11.	Possibility to book holidays via the Internet	7,93				X		
12.	Appearance of service personnel	7,85				X		
13.	Website quality	7,68				X		
14.	Image of travel agency	7,51						X
15.	Provision of catalogues and promotional materials	7,20				X		
16.	Recommendation of relatives and friends	7,19						X
17.	Possibility to pay by card	7,01					X	
18.	Reservation of seats in means of transportation	6,97					X	
19.	Sufficiently long opening hours	6,53			X			
20.	Catalogue appearance	6,51				X		
21.	Good accessibility of travel agency	6,16				X		
22.	Furnishing	6,14				X		
23.	Building appearance	4,98				X		

Table 1: Factors in descending order according to their importance in the context of quality dimensions Source: authors.

Dimension of functional quality: 1. responsiveness, 2. assurance, 3. empathy, 4. tangibles.

The importance of the examined factors ranges from 4.98 to 9.27 on a ten-point rating scale. The most important quality factor, according to the respondents, is the competence and knowledge of the service personnel, as it was assigned grade 8 or higher by more than 90 % of respondents. All the key quality factors were given rating higher than 8.5 points, the most frequent value being the highest score 10; more than 75 % of respondents rated them with scores 8 to 10. The first three factors (qualification and knowledge, helpfulness and

credibility of the service personnel) were rated with scores 9 and 10 by 75 % of the respondents. On the other hand, the least important factors with a value of 6.16 and lower are the accessibility of the travel agency, furnishing and building appearance.

Subsequently, the most important factors were distributed among the relevant dimensions and Figure 3: below shows them in the order of their importance.

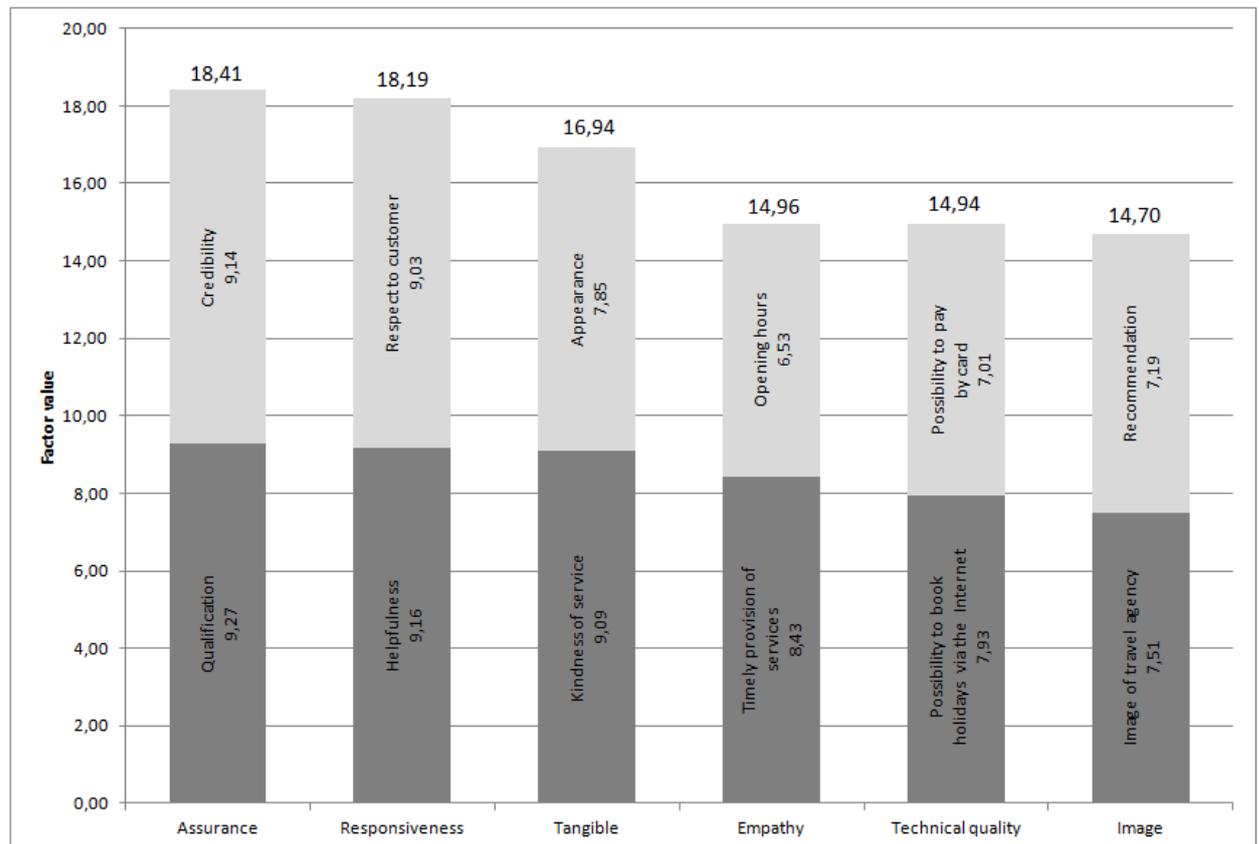

Figure 3: The most important factors distributed among the relevant dimensions. Source: Pířová, 2013

The most important dimension was assurance, followed by the dimensions responsiveness, tangibles, empathy, technical quality, and the least important according to the results seems to be the dimension of image. Hypotheses in the context of the variation of market segments were tested for the three dimensions identified as most important ones after the Brown-Forsythe test by means of ANOVA. The dimension of competence is seen differently by women and men; the factors of the dimension are more important for women, age and the level of education have no influence on this service dimension and the factors of this dimension can be used to improve the service quality for any target group, regardless of age or level of education. The dimension of sensitive approach has distinctly different importance for

women and men; for women the factors of the dimension are more important than for men; on the other hand the dimension independent of age and education. The dimension of the influence of environment on the customer does not depend on sex, age or education.

Figure 4 shows a potential connection between evaluation and a particular chosen market segment. It is a segment of women with secondary education under 25 years of age and a segment of men aged 26-45. The same key quality factors were identified for the selected segments, identical with the results of the entire sample. Only the segment of women under 25 years of age with secondary education showed different order of importance.

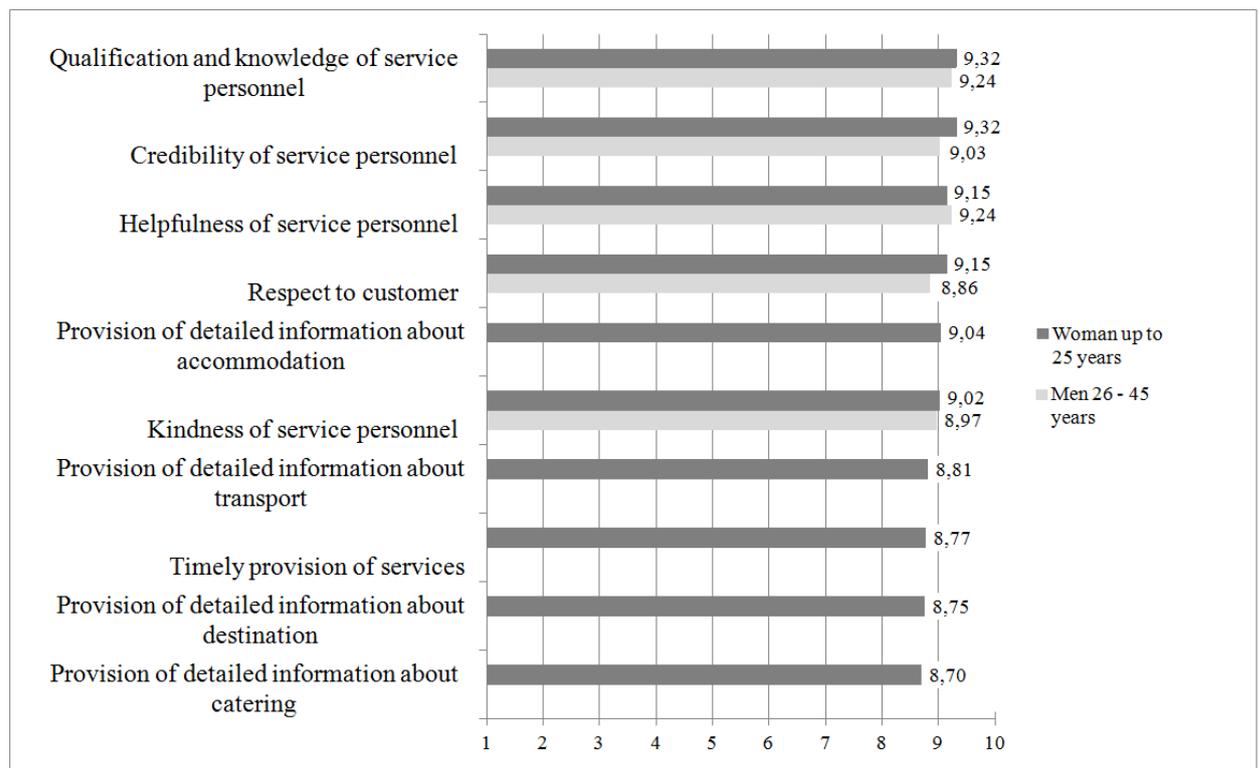

Figure 4: Connection between evaluation and a particular chosen market segment. Source: adapted according Pířová 2013

CONCLUSIONS

The objective of this paper is to present the results of the partial analytical research aimed at identifying the key factors that the customer sees as crucial in assessing the quality of a travel agency. Partial objectives included: determination of the importance of individual factors, distribution of factors into quality dimensions, determination of the importance of dimensions and subsequent statistical verification of the hypotheses in the context of the variance of the results within market segments. A primary questionnaire survey was applied

to achieve the stated objectives. The crucial factors for the customers of travel agencies are those related to the service personnel. The most important factor is the factor of competence and knowledge of the service personnel, followed by helpfulness, credibility, kindness of the service personnel, respect to the customer and provision of information about transport, destination and accommodation. The key factors were also distributed in the dimensions of functional quality, where the dimension of competence has the highest weight of importance for customers assessing the service quality. On the other hand, the factors related to technical quality and image of a service provider are of the lowest importance for potential customers. The quality of human resources in the field of services, especially of the front-line workers in contact with customers, is the crucial factor in the competitive environment of travel agencies that is decisive for the purchase of services and must be paid utmost attention.

The authors intend to expand the research with prospective target segments of travel agencies (e.g. segments of senior citizens and families with children); the research activities of the authors should also be expanded with investigation on the key factors in other sectors of tourism (hospitality services, attractions, information centres, etc.).

The published results are included in the initial analytical phase of an extensive research project of the authors aimed at defining the best practices and designing a model of comprehensive evaluation of the quality of tourism services.

The results presented in this paper are part of the University research project No. VZ: 62156 48904 „Czech Economy in a Process of Integration and Globalisation...“, which is conducted with support of Ministry of Education of the Czech Republic.

ABSTRACT

Objective:

The objective of this study was to cross validate the applicability of the SERVQUAL (proposed by Parasuraman, Zeithaml & Berry, 1985, 1988, 1991, 1994), SERVPERF (proposed by Cronin and Taylor, 1992, 1994), BSQ (proposed by Bahia and Nantel, 2000) and BANKQUAL (proposed by Tsoukatos and Mastrogianni, 2010) for measuring service quality of public and private bank in India.

Design/methodology/approach: The data was collected at bank and store for period of six months during the evenings and weekends from the customer of bank who have at least six month old account with particular bank and who buy and was willing to respond. Researcher has used instrument SERVQUAL, SERVPERF, BSQ and BANKQUAL for measuring service quality in bank. The research instrument was administered through personal interviews conducted outside the bank and store. The sample size was 1373 and data was analyzed through SPSS 19.0 and AMOS 18.0.

Findings:

Based on the finding of bank study, it is evident that different models of service quality have different psychometric properties of measurement model. This reiterates our initial notion that measures developed internationally are of little use in determining service quality of Indian bank. Finding of banks study revealed that SERVQUAL scale has highest reliability followed by BANKQUAL, SERVPERF and BSQ. Different kinds of validity were demonstrated by factor loadings and correlations between factors in CFA model. Research found that Content validity was high in SERVQUAL model because of its popularity and one of the founder models in service quality measurement, but according to Predictive and convergent validity, and Cross validation approach BANKQUAL has high validity than the other models.

Practical Implication: View and posit that the cultural differences between countries are likely to have varying effects on the definition of service quality. International

player planning a foray into India would require careful re-thinking before applying their existing perspectives on service quality gained in other countries to Indian store.

Originality/value: With respect to its academic value, the study accumulates knowledge that will eventually outgrow the boundaries of academia and pervade management.

Keywords: Service Quality, SERVQUAL, BANQAUL, CFA

I. INTRODUCTION: SERVICE IN 21ST CENTURY

In this 21st century the digital revolution has transformed the economy into a new economy which permitted the customer with new set of skills such as; 1. Contact to greater amount of facts, 2. Broader variety of accessible goods and services, 3. Bigger ease of networking with the service provider. The services sector accounts for around 50 per cent of GDP and is presently the fastest-growing sector of the economy. The sector has the unique opportunity to cultivate due to its labor cost benefit shiny one of the lowest salary and wage levels in the world. The 11th Plan must, therefore, put special focus on this sector so that its potential to create employment and growth is fully realized.

The Retail Banking environment today is changing fast. The changing customer demographics demands to create a differentiated application based on scalable technology, improved service and banking convenience. Higher penetration of technology and increase in global literacy levels has set up the expectations of the customer higher than never before. Increasing use of modern technology has further enhanced reach and accessibility. More amusingly services have also been described as something that can “be bought and sold, but which cannot be dropped on your foot”.

Lovelock (1983) believes that in order to have effective managers in the service sector, they must improve marketing and development skills. Schmenner (1986) warned that service businesses should not consider themselves to be drastically different and remain cut off from each other, because this could increase their fatality rate. As an alternative, businesses in the service sector should consider themselves to be similar, instead of exclusive businesses on their own (Schmenner, 1986).

Stuart and Tax (1996) ensured costs associated with poor service quality include:

- low customer satisfaction, high customer defection rates, lost sales and loss of customer loyalty;
- low employee morale leading to high turnover and absenteeism; and

- excessive costs associated with attracting new customers and overcoming a damaged image.

According to the US news and world report market research on lost customers by major companies shows that 14% for better product, 9% for cheaper product, 68% left because of poor service (service provider's attitude) which can be easily avoided by designing effective customer service process which enables the company to respond. The study clearly demonstrates the significance of soft service quality in relation to product quality.

It is in this context we need to stress on the service quality part as 68% of the customers desert the service provider. The behavioral/attitude component of service is major determining factor on the growth of the company which complements the performance for complete customer satisfaction.

Background of the Study:

Defining the dimensions of service quality is a more daunting task. A number of scholars have developed lists of service quality model. These consist of 5 to 10 dimensions and are general lists which serve as good starting points. But, current research indicates that in terms of service quality, the models and the relative emphases on each are different for different industries. So dimensions developed in one or a group of service industries may not be directly applicable to another group of service industries.

The specific problems relating to the measurement of performance, even though a number of methods have been developed (e.g. SERVQUAL, Parasuraman *et al.* (1988)). These problems include:

- Quality measures are very subjective (i.e. quality and its delivery is in the eye of the customer),
- Quality measurement is heavily dependent upon questionnaires and interviews,
- The application of statistics to process control is difficult because every customer is different.

One of the emerging themes from the growing body of literature is that, as is the case with other marketing and management constructs and measures (Benkhoff, 1997; Hofstede, 1990; Yavas, 1997), quality constructs/measures in general (Yavas and Konyar, 2002), and service quality constructs/measures in particular (Mattila, 1999a) that are developed in one culture (notably a western culture) may not be applicable in a different cultural setting.

Even as researchers continue to debate the determinants of service quality a few important issues remain unanswered. Is there a universal set of determinants that determine the service quality across a section of services? Does the service characteristic gets reflected in what customers expect out of delivery of a particular service? Is there an inherent difference in services because they must be delivered in a particular way and does that have a bearing on what becomes important for the customer? Practitioners continue to look for advice and suggestion as to what constitute service quality for their offers and furthermore, if they tend to reposition their offers by varying some characteristics of their offers, for example, by increasing or reducing tangibility or customer contact, etc. What are the operating characteristics of determinants as they together constitute the service quality?

Yavas (2002) argued that despite the recent trend of globalization, the foreign markets are still different from each other. She notes that there are four dimensions of distance-cultural, administrative, geographic, and economic. Cultural distances are the differences in religions, social norms, and languages among countries. Administrative distances are the differences in historical and political aspects, such as the government's actions towards foreign investors. Geographic distances are related to physical differences. For example, the size of the country is definitely a factor affecting the transportation costs of the company. And for the last one, economic distances are determined by the wealth and the income of residents of the countries. Also, the cost of products will affect pricing and may lead to economic distances, too. Hence, because of these four distances, a big global market and standardized products are not possible and adjustments and changes must be made from country to country. If local factors such as cultural background and geographical issues are important factors affecting people's decisions, distances between national markets still exist. In other words, the markets are not converting into one big market and hence people in the East and the West make their consumption choices with different bases. This debate highlights the importance of empirical studies of consumer behavior and service quality across cultures.

Overlooking differences between cultures has recently been shown to limit the ability of service multinationals to expand their activities internationally. Fureret *al.* (2002) argue that the importance and perception of service quality are highly dependent on customers' values and beliefs that might change from one culture to another. This dependence has led to increased concern about the relationship between national culture and service quality.

The literature review proves that Service Quality measurement varies from country to country and culture to culture. Till today all the measurement of service quality were developed and tested in different countries and different cultures. So this is required to test

service quality measurement model in an Indian culture context. Since service quality is a theoretical construct, researchers have defined its dimensions based on the setting used to explore the construct.

II. REASONING OF RESEARCH:

Fretise and Costa (2012), In spite of the numerous considerable published works on the service quality field all over the world, there is still a lack of consensus between the managers and marketing researches concerning about its measurement.

Bhattacharjee, P. K. (2010), found that researchers have explained the importance of quality to service firms and have demonstrated its positive relationship with profits, increased market share, return on investment, customer satisfaction and future purchase intentions or market, rate of customer retention etc. Quality measurement and improvement of service industries has been perceived differently. It is based on different conceptualizations. Various models have been investigated for service quality measurement. Since one of the models is not so accurate enough for measuring and comparing service quality value. Empirical efforts are not well diagnosed for corrective actions in case of quality shortfalls. Moreover, practical implementation to the applicability of these models is very much limited to the service industries in developing as well as developed countries.

Despite its popularity, the concept of service quality in the marketing literature is still ambiguously and vaguely defined. Several measurement models have been proposed, but some of these take into account only the method of measurement and ignore the idea that the same model may not be able to be automatically applied in different industries or in different cultures. Several research projects concerning the relationship between perceived quality and customer satisfaction and loyalty have been conducted, although the majority has been implemented in developed economies, especially the us (Yavas, Benkenstein, and Stuhldreider, 2007).

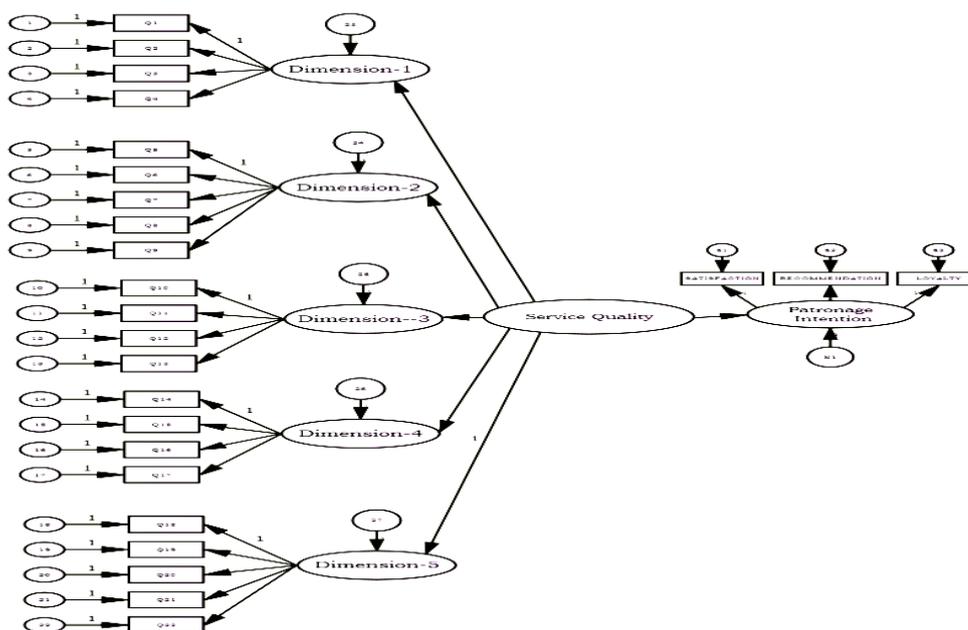

Research Objective:

So, the purpose of this study is to prove better understanding of which Service Quality Measurement Model is effective to measure service quality of Bank sector in Indian context and how managers increase patronage intension among customers. To achieve the stated purpose above and research questions mentioned at the end of literature review, following research objectives will be further investigated. Based on research Gaps and research problems mentioned at the end of literature review following objectives will be studied in this

study. To analyze service quality formulation and its measurement and to assess applicability of service quality constructs to be used for diagnostic purposes in bank.

- To cross validate the applicability of the (proposed by Parasuraman, Zeithaml & Berry, 1985 1988, 1991,1994), SERVPERF (proposed by Cronin and Taylor, 1992, 1994), BSQ (proposed by Bahia and Nantel, 2000) and BANKQUAL (proposed by Tsoukatos and Mastrojianni, 2010) for measuring service quality of Bank in India. This was achieved by examining the reliability, validity and component structures of the Scale.

Figure No. 1: Structural Model of Service Quality

Research Hypothesis:

H1: Initial first order factor model of SERVQUAL, SERVPERF, BSQ and BANKQUAL is reliable and valid in India. In other words, all the dimensions model are reliable and valid.

H2: Second order factor measurement model of SERVQUAL, SERVPERF, BSQ and BANKQUAL is reliable and valid in India. In other words, all the dimensions of model are adequate to measure service quality of Bank.

H3: SERVQUAL, SERVPERF, BSQ and BANKQUAL are adequate to predict patronage intension of customer. In other words, Service Quality Model is effective to establish relationship with theoretical construct of bank.

III. SUMMARY OF LITERATURE REVIEW:

Table No.1 Summary of Literature Review

Study	Sample characteristics	Sample size	Country	Data procedure assessing structure	analysis for factor- Findings.....
Carman -1990	Customers of a dental clinic, a business school placement center, a hospital, and a tire store	Ranged from 74 to 600 p across settings	USA	Exploratory factor analysis	Between six and nine dimensions depending on setting with "reliability", "tangibles", and "security" appearing in all settings
Parasuraman et al. (1991)	Customers of telephone company, insurance company, and bank	Ranged from 290 to 487 across companies	USA	Exploratory factor analysis	Five dimensions (six if "tangibles" is split into two dimensions)
Finn and Lamb (1991)	Customers of four different types of retail stores: stores like K-Mart, Sears, Dillard, and Neiman Marcus	Ranged from 58 to 69 across settings	USA	Confirmatory factor analysis	Model fit for a five-dimension structure was poor; no alternative factor structure was examined
Babakus and Boller (1992)	Customers of an electric and gas utility company	689	USA	Exploratory factor analysis; confirmatory factor analysis	(1) Five-factor model not supported; (2) two-factor structure supported
Cronin and Taylor (1992)	Customers of fast food restaurant, banking, pest control, and dry cleaning	Ranged from 175 to 189	USA	Exploratory factor analysis; onfirmatory factor Analysis	(1) Five-factor model not supported; (2) one-dimensional structure supported
Headley and Miller (1993)	Customers of medical Services	159 usable pre- and post-encounter responses	USA	Exploratory factor Analysis	Six dimensions: dependability, empathy, reliability, responsiveness, tangibles, and presentation
Taylor and Cronin (1994)	Individuals in shopping malls who had used	116 (study 1)	USA	Exploratory factor	Six factors (expectations/study1),four factors (perceptions/study1) Seven factors

Study	Sample characteristics	Sample size	Country	Data procedure assessing structure	analysis for factor-	Findings.....
	hospital services within 45 days	227 (study 2)		analysis; confirmatory factor Analysis		(expectations/study2),three factors (perceptions/study 2)
Kettinger and Lee -1994	Undergraduate and graduate students in several courses	342	USA	Confirmatory factor analysis		Four dimensions: reliability, responsiveness, assurance, and empathy
Pitt et al. -1995	Users of online production systems (financial institution); internal users of information system department (accounting and consulting firm, information services business)	237 -181- 267	UK, USA, and South Africa	Exploratory factor analysis		(financial institution); five dimensions (consulting firm); three dimensions (information services business)
Durvasula et al. (1999)	Shipping managers of various organizations (B2B)	114	Singapore	Confirmatory factor analysis		The fit of the SERVQUAL model was acceptable but the one-factor model provides the best representation of the data
Morales Espinoza -1999	Customers of supermarkets	149 (Canada) 169 (Peru)	Canada and Peru	Exploratory factor analysis; confirmatory factor analysis		The SERVQUAL's dimensional structure was confirmed by the Data
Engelland et al. (2000)	Undergraduate college students and career services administrators at campus career services centers	267	USA	Exploratory factor analysis;		The fit of the SERVQUAL model was Poor

Study	Sample characteristics	Sample size	Country	Data procedure assessing structure	analysis for factor-	Findings.....
				confirmatory factor analysis		
Gefen (2002)	Students who had previously bought at Amazon.com	211	USA	Exploratory factor analysis Confirmatory factor analysis		Three factor structure: tangibles, empathy, and a combination of reliability, responsiveness and assurance
Zhou et al. -2002	Bank customers	373	China	Exploratory factor analysis		Six dimensions for expectation scores. Three dimensions for perception and gap scores
Baldwin and Sohal (2003)	Dental care services patients (patients who held private health insurance that provides cover for dental treatment)	354	Australia	Exploratory factor analysis		Four dimensions for expectation and perception scores: skill and ability, punctuality, personal attention, tangibles Four dimensions for gap scores: responsiveness, empathic assurance, reliability, tangibles
Chi Cui et al. -2003	Bank customers	153	South Korea	Exploratory factor analysis; confirmatory factor Analyses		The fit of the SERVQUAL model was Adequate Three dimensions of service quality: tangible, empathy, reliability/responsiveness
O'Neill and Palmer -2003	Visitors to theme parks	135-103	Australia	Exploratory factor analysis		Four dimensions
Kilbourne et al. (2004)	Nursing home residents from ten long-term care facilities in the USA and 15 long-term facilities in the UK	195 (USA) 99 (UK)	USA and UK	Confirmatory factor Analysis		Four factors model for US and UK samples: tangibles, reliability, responsiveness, and empathy

Study	Sample characteristics	Sample size	Country	Data procedure assessing structure	analysis for factor-	Findings.....
Arasli et al. -2005	Bank customers	260	Greek Cypriot	Exploratory Analysis	factor	Three factors: tangibles, reliability, responsiveness, and Empathy
Landrum et al. (2007)	Customers of two army corps of engineers research centers	385	USA	Structural Modeling	equation	Structural equation model fit the data
Sunayna Khurana (2008)	Customer of Retail Store	200	India	GAP Analysis and Reliability		Modern-looking equipment's and fixtures, physical facilities, the ambience and store layout are up to the mark.
Sanjaraspor (2009)	Customer of hotel industry	265	Croatia	Exploratory Analysis	factor	'reliability,' 'empathy and competence of staff,' 'accessibility,' and 'tangibles'
Gilmore, Audrey; McMullan, Rosalind (2010)	Customer perception on tourist destination	100	Spain	EFA, Regression		SERVQUAL is reliable and valid ,making it adequate t o measure the quality of a tourist destination.
Theodorakis Al. (2011)	Professional Football	415	USA	CFA		Overall Service Quality was shown to mediate the relationship between the five dimensions of service quality and fans' satisfaction.
Mubarak Ali (2011)	Customer of Bank	117	India	Regression and EFA		.Exploratory factor analysis was conducted to validate the instrument for the Indian situation.
Swar (2012)	Customer of Bib major Bank of India	600	India	Regression Analysis		Human element of service delivery and Systemization element of service delivery of bank

IV. RESEARCH METHODOLOGY

Data Collection:

The purpose of this research is mainly descriptive and exploratory. In this study, survey methods have been preferred. Researcher adopts well-known service quality measurement. SERVQUAL, SERVPERF, BSQ and BANKQUAL model for measuring service quality have been used for measuring service quality in bank. Researcher preferred to use a probabilistic systematic random sample method of data collection. Data have been collected from three private bank and three public bank of India. The study has been conducted among six banks of India, viz., State Bank of India (SBI), Bank of Baroda (BOB) and Syndicate Bank in public sector banks being the largest and oldest banks in India, HDFC Bank, ICICI Bank and Axis Bank in the private sector banks being the one of the second largest bank and most successful bank in India. The instrument was administered by a researcher himself and the investigators trained by the researcher till they were familiar with the instrument. The data was collected from the respondents at outside bank. The data was collected at bank period of three months during the evenings and weekends from the customer of bank who has at least three month old account with particular bank and was willing to respond.

Data were collected by means of a structured questionnaire. The questionnaire consisted of three sections A, B and C. Sections A and B required respondents to evaluate the service components of their regular bank. Section C contained questions pertaining to respondent profile. The perception statements were measured on a seven-point Likert type scale with "1" being "strongly disagree" and "7" being "strongly agree". All perception statements were randomly arranged and together made up the dimensions of service quality.

In this study, the research instrument was administered through personal interviews conducted outside the bank. To minimize bias, caused by poor service, prospective respondents were approached and interviewed prior to conducting their intended transactions. The method of personal interviews is superior to self-administered questionnaires in perceptual or attitudinal surveys while face-to-face administration maximizes response rates and field researchers' availability to answer respondents' questions.

Sample Profile:

According to guideline provided by Nunnally(1978) that ten times of total number of items, so sample size for SERVQUAL is 293 and SERVPERF, BSQ and BANKQUAL was 360 respectively, means total sample size was 1373. However, Hair et al. (1992, 1995) cautioned that, if the sample size exceeds 400, the goodness of fit is poor because almost any difference

is detected. Therefore, by considering the constraints of the research setting and theoretical aspect of this study, the targeted sample size was set at 360 ($n=360$) for each service quality model.

Data Analysis and Tool

For analyzing the data researcher used various test like Preliminary Analysis, Correlation coefficient Analysis, Chi-square test, Multiple regressions Analysis, Structural Equation Model (SEM), Confirmatory Factor Analysis (CFA) through SPSS 19.0 and AMOS 18.0.

V. RESULT AND DISCUSSION:

Every analysis has some basic assumption for further analysis. Below table shows the some test for fulfillment of advance analysis.

Table No.2 Normality, Multicollinearity, Collinearity and Independence of residual

		Recomm. Value	SERVQUAL	SERVPERF (Bank)	BSQ	BANKQUAL
<u>Normality</u>	Skewness	-3 to 3	-0.170 to -0.755	-1.014 to -0.226	-1.083 to -0.137	-1.083 to -0.137
	Kurtosis	-10 to 10	1.118 to 0.002.	1.24 to -.272	2.081 to -.032	2.081 to -.032
<u>Multicollinearity</u>	Tolerance	>0.10	0.324 to 0.670	0.317 to 0.583	0.322 to 0.511	0.317 to 0.658
	VIF	< 10	1.19 to 3.01	1.714 to 3.151	1.96 to 3.107	1.52 to 3.25
<u>Collinearity Statistics</u>	Correlation between independent variables	< 0.90	0.413 to 0.753	0.393 to 0.736	0.393 to 0.736	0.459 to .800
<u>Independence of Residual</u>	Cook's Distance for Residuals	< 1.0	0.437	0.153	0.109	0.168

Kline (1998) suggested that all variables in the analysis for univariate skewness and kurtosis were satisfactory within conventional criteria for normality i.e. *-3 to 3 for skewness and -10 to 10 for kurtosis*. Multivariate normality (the combination of two or more variables) means that the individual variable is normal in a univariate sense and that their combinations are also normal (Hair *et al.* 2010). The correlations between the variables in your model are provided in the table labeled *Correlations*. Check that your independent variables show at least some relationship with your dependent variable (above .3 preferably). (Pallant, 2005). According to Juie Pallant (2005) have quoted commonly used cut-off points for determining the presence of multicollinearity (tolerance value of less than .10, or a VIF value of above 10). These values,

however, still allow for quite high correlations between independent variables (above .9), so we should take them only as a warning sign, and check the correlation matrix. One of the ways that these assumptions can be checked is by inspecting the residuals scatterplot and the Normal Probability Plot of the regression standardized residuals that were requested as part of the analysis. To check whether this strange case is having any undue influence on the results for this model as a whole, researcher can check the value for Cook's Distance given towards the bottom of the Residuals Statistics table.

Reliability Analysis:

Tabke No.3 Reliability Statistics

	SERVQUAL	SERVPERF	BSQ	BANKQUAL
Split-Half Reliability				
Part 1	0.921	0.89	0.846	0.884
Part 2	0.932	0.894	0.896	0.908
<i>Correlation Between Forms</i>	<i>0.784</i>	<i>0.752</i>	<i>0.73</i>	<i>0.755</i>
Strictly Parallel Model	0.955	0.933	0.92	0.933
Cronbach Reliability	0.955	0.935	0.924	0.937
N of Items	22	22	31	27
Rank	1	3	4	2

In above table, the items on the scale for service quality measurement in bank are divided into two halves and the resulting half score are correlated. High correlations between the halves indicate high internal consistency. Correlation Between Forms are high in all scale i.e. 0.789 in SERVQUAL, 0.752 in SERVPERF, 0.730 in BSQ and 0.755 in BANKQUAL Scale. According to Malhotra & Dash (2011), the Service Quality scale has good internal consistency, with a Cronbach's alpha coefficient reported of more than 0.60. In the current study the Cronbach's alpha coefficient were >.90. So all the scales can be considered reliable for measuring service quality of Bank.

Table No.4 Reliability of Respective Dimensions of SERVQUAL, SERVPERF, BSQ and BANKQUAL in Retail Bank context

SERVQUAL		SERVPERF		BSQ		BANKQUAL	
Dim.	α	Dim.	α	Dim.	α	Dim.	α
Tangibles	0.91	Tangibles	0.82	Effectiveness and Assurance	0.83	Assurance and empathy	0.88
Reliability	0.92	Reliability	0.81	Access	0.76	Effectiveness	0.86
Responsiveness	0.88	Responsiveness	0.84	Price	0.72	Reliability	0.82

Assurance	0.86	Assurance	0.79	Tangibles	0.78	Confidence	0.83
Empathy	0.88	Empathy	0.82	Service Portfolio	0.68		
				Reliability	0.75		
Overall	0.92	0.94		0.924		0.94	

For SERVQUAL scale, the alpha score was comparable to 0.955, which is consistent with previous replication studies. In selected SERVQUAL application like Parasuraman et al. (1991) in their study they found Cronbach's alpha coefficient were ranged from 0.83 to 0.91 in Customers of telephone company, insurance company, and bank. Babakus and Boller (1992) found Ranged from 0.67 to 0.83 in Customers of an electric and gas utility company. Cronin and Taylor (1992) found reliability of 0.89 in banks, 0.90 in Pest control, 0.90 in Dry cleaning, and 0.85 in Fast food. In this study, it is much higher than previous study.

For SERVPERF scale, the alpha score was comparable to 0.935, which is consistent with previous replication studies (Babakus and Boller, 1991; Carmen, 1990; Finn and Lamb, 1991) which had alphas ranging from 0.59 to 0.93.

For BSQ Scale, the alpha score was comparable 0.924, which is consistent with the scale developer (Bahia & Nantel, 2000) which had alphas ranging from 0.78 to 0.96.

For BANKQUAL Scale, the alpha score was comparable .937, which is consistent with the scale developer (Tsoukatos & Mastrojianni, 2010) which had alpha value 0.966.

Table No.5 Psychometric Properties of Models

Table No. 5 describe the factor loadings of observed variables are reliability estimates of individual construct. In BANKQUAL, SERVQUAL and BSQ model, all the factor loadings are above suggested limit of .50 by Kline (1998) while in SERVPERF item no. 09 is below .5. All the models of SQ are indicating reliability.

In addition to table no. 06, In BSQ model, the R^2 corresponding to all observed variable indicate that the respective factors not explains respectable portions of the variance (between .18 to .59 i.e. 18% to 59%). It means that item does not tap the same values dimension. We could also say that the estimated reliability of all items of BSQ is very poor. In BANKQUAL model, the R^2 corresponding to all observed variable indicate that the respective factors explains respectable portions of the variance (between .41 to .61 i.e. 41% to 61%). It means that item taps the same values dimension. We could also say that the estimated reliability of all items of BANKQUAL is reasonable except item no. P6, P8, P17 and P19. In SERVQUAL, the R^2 corresponding to all observed variable indicate that the respective factors explains respectable portions of the variance (between .517 to .79 i.e. 51% to 79%). It means that item taps the same values dimension. We could also say that the estimated reliability of all items of SERVQUAL is reasonable except item no. Q4 and Q9. In BANKQUAL model, R^2 corresponding to all observed variable indicate that the respective factors explains respectable portions of the variance except item no. 04, 09, 15 and 21. It means that item taps the same values dimension. We could also say that the estimated reliability of 18 items of SERVPERF is reasonable except item no. 04, 09, 15 and 21.

Table No.7 Comparative analysis of Models

	Psychometric Analysis	Squared Multiple Correlations-R2	Composite Reliability	Convergent Validity (AVE)
Recommended Value	Above .50	Higher the batter	Above .70	Cutoff level of 0.70
SERVQUAL	.725 to .862	.517 to .79 i.e. 51% to 79%	.75 to .81	.43 to .50
	0 item below .50			21 - $\geq .70$, 1- <.70
SERVPERF-B	.354 to .833	.132 to .771 i.e. 13% to 77%	.77 to .82	.35 to .41
	1 item below .50			14- $\geq .70$, 8 <.70
BSQ	.424 to .771	.18 to .59 i.e. 18% to 59%	.47 to .79	.43 to .52
	2 item below .50			29 - <.70
BANKQUAL	.577 to .781	.41 to .61 i.e. 41% to 61%	.71 to .78	.50 to .53
	0 item below .50			12 - $\geq .70$, 15- <.70
SERVPERF-R	.474 to .723	.22 to .52 i.e. 22% to 52%	.61 to .68	.46 to .51
	1 item below .50			22- <.70
RSQS	.438 to .818	.38 to .67 i.e. 38% to 67%).	.40 to .60	.43 to .52
	1 item below .50			26- >.70

Based on the result obtained, it is evident that that the BANKQUAL and SERVQUAL model are well supported than BSQ and SERVPERF, thus it can be concluded that all r dimensions of BANKQUAL and SERVQUAL scale tested appear to be suited for measuring service quality, particularly in Bank.

Hypothesis Testing:

- Hypothesis-1(H1): Initial first order factor model is reliable and valid.

Researcher estimated the structural models yield the following model fit results:

Table No.8 Goodness-of-fit Statistics (Measurement Model)

Goodness-of-fit model index	Recommended Value*	BSQ	BANKQUAL	SERVQUAL	SERVPERF
Chi-square/degree of freedom**	≤ 5.00	3.020	2.73	2.16	3.644
GFI	$\geq .90$.822	.89	.90	.86
AGFI	$\geq .80$.776	.89	.86	.80
NFI	$\geq .90$.792	.83	.91	.84
TLI/NNFI	$\geq .90$.718	.90	.94	.86
CFI/RNI	$\geq .90$.766	.90	.95	.88
RMSEA	$\leq .08$.789	.06	.06	.08
Standardized RMR	$\leq .08$.075	.06	.43	.064

* These criterias are according to Hair et al. (1998) and Arbuckle and Wothke (1995)

** Ullman (1996) recommended chi-square/degree of freedom value of < 5.00

From the above table, we can summarize the fitness of structural model in service quality of bank. Collectively, these fit indices indicate that the measurement model is acceptable. That is, perceived service quality model BANKQUAL and SERVQUAL have all fit indices with the values recommended by Hair et al.(2010) than the BSQ and SERVPERF. It also suggested that SERVPERF and BSQ are not found satisfactory in first order, so Model-II and Model-III are not supposed to be tested.

- H2: Second order factor measurement model is reliable and valid.

For SERVQUAL, overall fit measures (CFI,NNFI,RMSEA and χ^2 difference) were used iteratively to determine whether the CFA model fitted data well. Result from running this second-order model showed that all fit indices suggested good fit of data, $\chi^2=468.55$, $df=204$, $\chi^2/df=2.29$, NNFI/TLI=.93, CFI=.94, RMSEA=.067 and For BANKQUAL, all fit indices suggested good fit of data, $\chi^2=1069.31$, $df=400$, $\chi^2/df=2.67$, NNFI/TLI=.90, CFI=.90, RMSEA=.07. According to χ^2 difference test, the improvement in fit between the initial first-order and second order five factor model was not statistically significant($\Delta \chi^2 (5)=38.510$, $p > 0.05$). The result suggest that the first-order and second order SERVQUAL and BNAKQUAL models provide the best representation of data in this study.

- H3: Hypothesis-3(H3): Service Quality model is adequate to predict patronage intension of customer.

Table No.9 Second Order Measurement Model

Goodness-of-fit model index	Recommended Value*	SRVQAUL	BANQUAL
Chi-square/degree of freedom**	≤ 5.00	2.264	2.67
Goodness-of-fit index(GFI)	$\geq .90$.88	.90
Adjusted goodness-of-fit index (AGFI)	$\geq .80$.84	.85
Normalized fit index (NFI)	$\geq .90$.89	.91
Tucker-Lewis index (TLI/NNFI)	$\geq .90$.93	.90
Comparative fit index (CFI/RNI)	$\geq .90$.94	.90
Root mean square error of approximation (RMSEA)	$\leq .08$.07	.07
Standardized root mean square residual (standardized RMR)	$\leq .08$.05	.07

Collectively, these fit indices indicate that the structural model is acceptable. That is, the third-order perceived service quality model SERVQUAL and BANKQUAL are robust and theoretically explains the patronage intentions.

Table No. 10: Structural Model Coefficient

SERVQUAL			BANKQUAL		
Dimensions of Service Quality	Second-order Loading Estimates	t-Values	Dimensions of Service Quality	Second-order Loading Estimates	t-Values
Tangible	0.68	9.041**	Assurance & Empathy	0.61	7.915**
Reliability	0.88	10.855**	Effectiveness	0.96	11.533**
Responsiveness	0.94	11.114**	Reliability	0.97	12.43**
Assurance	0.89	11.216**	Confidence	0.91	Λ fixed 1
Empathy	0.89	Λ fixed 1**			

** significant at the 0.001 level (2-tailed).

The structure coefficients linking the five dimensions with second-order service quality (i.e. the second-order loading) are all significant and in the expected directions. Table no. 70 contains the structure coefficient with corresponding *t* values.

The main aim of this study was to assess effectiveness of alternatives service quality measurement model which suit in Indian context. So practitioner and business man can utilized right instrument to measure their service quality and do necessary changes in different aspect of business and its related services.

Number of models and instrument are available in the literature to determine the service quality. Different authors were demonstrated different dimensions and determinants of service quality through empirical as well as conceptual research. All the models somehow appropriate and may be not appropriate due to number of factors like different culture, service setting and socio-cultural aspect of society.

Literature review chapter describe number of arguments regarding service quality formulation, its determinants and dimension. There is no general consensus regarding service quality formulation due to various factors like culture, service setting etc..

Table No. 11: Comparison of overall indices for three model of Service Quality-BANKQUAL

Model	χ^2	df	χ^2 / df	NN FI	CF I	RMS EA	$\Delta \chi^2$
Model-I: An initial first-order five factor measurement model, which was developed by Parasuraman <i>et.al.</i> (1991)	869.15	318	2.73	.90	.90	.06	---
Model-II-Second-order five factor measurement model.	887.30	320	2.77	.90	.90	.07	18.15
Model-I-Structural Model Validity	1069.31	400	2.67	.90	.90	.07	182.01

According to χ^2 difference test, the improvement in fit between the initial first-order and second order five factor model was not statistically significant ($\Delta \chi^2 (2)=18.15$, $p > 0.05$). The result suggest that the first-order and second order BANKQUAL model provide the best representation of data in this study. χ^2 difference between in second-order and third model were also not statistically significant ($\Delta \chi^2 (80)=182.01$, $p>0.05$). It means that BANKQUAL model is overall fit for measure service quality of Bank in India.

VI. CONCLUSION AND IMPLICATION

For this research, three conclusions and recommendation may be drawn. First, based on the finding, it is evident that different models of service quality have different psychometric properties of measurement model. This reiterates our initial notion that measures developed internationally are of little use in determining service quality of Indian bank. All kinds of reliability test suggested following sequence of models for service quality measurement in banking sectors.

Table no. 12: Effectiveness of Model: According to Reliability

	Split-Half Reliability	Strictly Parallel Model	Cronbach Reliability	Composite Reliability	OVERALL RANK
SERVQUAL	1	1	1	1	1
SERVPERF	3	3	3	3	3
BSQ	4	4	4	4	4
BANKQUAL	2	2	2	2	2
1= Most Reliable and descending order					

Finding of banks study revealed that BANKQUAL scale has highest reliability followed by BSQ.

Second, the study provide evidence that initial notion BSQ was not applicable in measuring service quality of Bank in Indian Context. First-order factor model suggested the goodness-of-fit of initial model; second-order factor model suggested that all the dimensions of model

were adequate to measure service quality of Bank. And third order model suggested the overall fit of model with theoretical construct. The study found only BANKQUAL has better fit.

Table No.13 Comparison of overall indices for all three-order models of SERVQUAL and BANKQUAL in Bank Study

	SERVQUAL			BANKQUAL		
	Model-I	Model-II	Model-III	Model-I	Model-II	Model-III
χ^2	430.51	468.44	611.4	869.15	887.3	1069.31
df	199	204	270	318	320	400
χ^2/df	2.16	2.29	2.264	2.73	2.77	2.67
NNFI	0.939	0.93	0.93	0.9	0.9	0.9
CFI	0.947	0.94	0.936	0.9	0.9	0.9
RMSEA	0.063	0.067	0.066	0.06	0.07	0.07
$\Delta \chi^2$	---	38.04	142.96	---	18.15	182.01

Table no. 14: Overall Model Soundness:

	Model-I	Model-II	Model-III
SERVQUAL	Satisfactory	Satisfactory	Satisfactory
SERVPERF-B	Not-Satisfactory	Not- Satisfactory	Not- Satisfactory
BSQ	Not-Satisfactory	Not- Satisfactory	Not- Satisfactory
BANKQUAL	Satisfactory	Satisfactory	Satisfactory

The BANKQUAL validity and reliability in the Indian banking setting indicate that the BANKQUAL can be used to assess the overall service levels provided by the bank and for tracking changes in overall service levels over a period of time.

Third, this study provides evidence that the service quality is multi-dimensional and therefore hierarchical in nature.

This provides usefulness of the scale as a diagnostic tool for providing strategic direction. Bank and researchers applying multi-dimensional service quality scales developed internationally such as the SERVQUAL and BANKQUAL to the Indian context are advised to pay special attention to scale adaptation to ensure that the scale has reliable diagnostic ability. International financial institution like bank planning a foray into India would require careful re-thinking before applying their existing perspectives on service quality gained in other countries to Indian bank.

Due to the cultural differences, global banks and retailers need to be responsive in developing customer service. In this regard, a thoughtful customer research should be conducted to advance an understanding of local customers' behavior and their experience. Bank should

develop a customized service quality measurement instrument because all available tools have some limitation.

However, the issues of “service quality formulation and its measurement” are extensively researched; present study provides original findings that contribute to both academia and practice. It builds on prior research concerning service quality dimension in retail banking.

The BANKQUAL scale also has some limitations with respect to measurement of Service quality. In BANKQUAL model, tangibility dimension is not covered as a part of service quality evaluation. In addition to that, BANKQUAL has also not bothered with electronic service quality measurement like ATM, Internet Banking and Phone Banking, which are extensively used by customer in this cutting edge technology era.

The developments in information and communications technology have provided a platform by which companies can design, develop and deliver services that can be perceived by customers as superior (Surjadjaja *et al.* 2003).

Automated service quality has tended to lag behind because practitioners have focused mainly on issues of usability and measurement of use, with little or no consideration to the issues of service quality (Buckley 2003).

There is a strong requirement to proposed holistic model for service quality measurement which may be tested in further study. On the bases of the literature available on service quality measurement and models, present study would like to propose following research model for service quality for the future study in Indian Context.

1. Tangible
2. Reliability
3. Empathy and Assurance
4. Responsiveness
5. Confidence
6. Automated Service/E-Services

Automated service quality is defined as the customer’s overall evaluation of the excellence of the provision of services through electronic networks such as the internet, Automated Teller Machine (ATM), and telephone banking (Santos 2003).Ruyter et al. (2001, p186) define automated service as *‘interactive, content-centered and internet-based customer service, driven by the customer and integrated with related organizational customer support process and technologies with the goal of strengthening the customer-service provider relationship’*. An automated service

quality dimension covers the electronic service quality aspect of bank. All most all the Private and Public Bank of India, provide ATM facility, Internet Banking and Phone Banking service as a core part of its product portfolio.

ATM service should measures by Sufficient number of ATM , Secure locations, ATM has a user, friendly system,- Conveniently located, ATM functions. Phone Banking should measure by Pleasant musical background, Reasonable number of voice prompts, Short waiting time, Clear instructions, Reliability, Telephone banking options. Internet banking should measure by Availability of information, Easy to use, Secure, Error free transactions, Attractive web site, Website interface accuracy.

GREEK BANKS' INTERNATIONAL BEHAVIOUR IN S.E.E. COUNTRIES: BUSINESS COMMITMENT AND POLITICAL DIMENSIONS

Vasiliadis, Labros¹; Panta, Maria²

¹T.E.I. of Chalkida, Greece, labvas@yahoo.gr

²T.E.I. of Chalkida, Greece, panta@teihal.gr

ABSTRACT

Purpose – This research aims to examine (continuing previous study – Vasiliadis, 2013) how Greek banks internationally behave, focusing in South Eastern European countries, in relation of aspects as business commitment and political dimensions.

Methodology – Empirical data were collected by using primary data sources. Primary data sources included semi-structured interviews with managers from the banks' headquarters as well as managers of their activities in the region. A total of twelve interviews were undertaken.

Findings – The theoretical view relies on the firms' internationalisation and business network theories and the varieties in the behaviour are explained by the degree of business commitment and knowledge. The analysis of the Greek banks' international behaviour, concerning their penetration and expansion in the region, reveals that commitment and knowledge also have political dimensions, which complement business commitment and knowledge.

Limitations – The main shortcoming is that the empirical study contains only two cases, which naturally raises the problem of generalisation.

Conclusions – Based on the findings, the outcomes of this paper add new knowledge to the Greek banks' internationalisation, for the better understanding of market entry and expansion, offering managerial implications for management of political relationships.

Keywords: business commitment; political dimensions; Greek banks; internationalisation process.

1. INTRODUCTION

The global financial system is facing a very difficult time. A large number of American and European banks have already gone into bankruptcy. Some of them have had significant cross-border activities, while others have been acquired or rescued at the last moment, following state interventions and liquidity injections of billions. This is a crisis which began, in essence, on the other side of the Atlantic and has spread throughout almost the entire world. The starting point of its evolution has been the bankruptcy of Lehman Brothers, the American investment bank, in September 2008 (Georgikopoulos, 2009). The collapse of Lehman Brothers has brought out, on a global scale, the issue of capital adequacy of financial institutions, the quality of their capital structure and the failure of the global financial system in terms of assessing the risks that had been undertaken.

This exogenous crisis and the adverse global developments in the money and capital markets had a relatively limited impact on the stability of the Greek financial system, compared to the systems in other countries that have been severely affected by this crisis. One of the main factors of strengthening of the Greek banking system is the satisfactory liquidity in the system, which is attributed to the strong growth of the Greek economy during the last few years and the expansion of Greek banks to the rapidly developing countries of south-eastern Europe (Vasiliadis, 2009; Kosmidou et al., 2007; Karafolas, 2006; Mamatzakis et al., 2005; Stubos and Tsikripis, 2005).

The region under consideration includes: the countries of Bulgaria and Romania where the first recently joined the European Union, Croatia is a new EU member since 1st July 2013, and the rest of the Balkan countries (Serbia and Montenegro, Slovenia, Bosnia – Herzegovina, Albania, FYROM, Kosovo) still remain basic candidates. All these countries became corporate “targets” for a number of multinational companies which attempted to explore new market segments. The increase of the international capital flows into the emerging markets of South Eastern European countries has been accompanied by the active development of foreign banking occurred at the same time. In all these emerging economies the appearance of foreign banking occurred only after a considerable restructuring of the political environment and the liberalisation of the financial sector (Uiboupin and Sörg, 2006).

Researchers in the field of banking have given their attention to aspects like contestability in Eastern European banking and competition in bank services (Yildirim and Philippatos, 2007). Regarding internationalisation of bank services, aspects like entry mode choices (Álvarez-Gil et al., 2003), FDI motives and growth (Tschoegl, 2002) and trends and obstacles have been the concern of researchers. Further, researchers have described motives and

activities of banks in emerging markets, like the transition markets in Eastern Europe (Miani and Sagan, 2006).

The main contribution aiming this study is to provide an analytical view on the internationalisation of Greek banks in these changing contexts (continuing and strengthening the conclusions of previous study – Vasiliadis, 2013). Thus, it is studied how two Greek banks penetrate and expand into new emerging markets in SEE countries. It is discussed how the penetration and expansion of these two Greek banks into these transition markets evolve, how the internationalisation of the firm affect the evolution of business networks at both levels and how they impact knowledge levels and behaviour. Then this process is investigated empirically. Comparing the two firms' penetration and expansion processes allows studying how their behaviour can be explained, given the different business environment they were confronted with from their first entry in the region. The results reveal the need to add another dimension to the model: commitment to and knowledge of management of political relationships.

2. LITERATURE REVIEW

In emerging markets like SEE countries, business networks had to be developed more or less from scratch after the fall of the Comecon network and the Soviet Union. Following Johanson and Mattsson (1988), this study distinguishes four theoretical situations dependent on the degrees of internationalisation of the firm and the market (see Figure 1).

Figure 1. A two-dimensional topology of entry strategy and internationalisation.

		Degree of Internationalisation of the Market	
		Low	High
Degree of Internationalisation of the firm	Low	(1) The Early Starter	(2) The Later Starter
	High	(3) The Lonely International	(4) The International Among Others

The degree of internationalisation of the firm is determined by the bank's degree of commitment and knowledge about the market of entry (Johanson and Vahlne, 1977; Johanson

and Mattsson, 1988). The degree of internationalisation of the market, however, refers to the position of the bank in relation to other firms in the market of entry, here the emerging markets in SEE. Next it will be discussed each of the four resulting situations separately (The early starter, the lonely international, the later starter, the international among others).

The early starter (1)

The degree of internationalisation of the focal firm as well as the market in general is low, in this situation (1). This means that the firm and also its competitors have little knowledge about foreign markets. As the level of uncertainty is high, the firm refrains from entering into a new market with large commitments but instead builds up knowledge through an incremental entry process. Firms in this situation can, for instance, manage their uncertainty by cooperation with local firms that have market knowledge. For a bank that would like to be close to its customers, but with a lack of sufficient knowledge to make the large commitment of developing a local network itself, cooperative strategies with agents can be a solution. The counterpart in the local market increases the firm's capability to solve different known and unknown problems related to the specific market circumstances. When the counterpart has a good market position, for example through strong distribution or financial connections to others in the local market, the early starter firm can gain an opportunity in filling the market holes (Ghuri et al., 2006). In doing so, it also raises obstacles for competitors wishing to follow the early starter into the market.

The lonely international (2)

The firm, in that situation (2), is highly internationalised but its market environment is not. The firm has built a large market commitment and has extended its market activities, but its competitors are far from this stage. The focal firm has knowledge and experience of where and in what they have to invest. More important for international banks is the relationship experience with different market actors. They have to understand different local institutions and cultural differences and to act directly with the foreign market actors. Their position of being alone depends on how they can manage the financial network in the local market. The timing of building and maintaining its relationships in the local network is of vital importance for the firm's penetration and expansion. This is particularly so because of the nature of the product exchanged in the bank industry: the low level of product complexity can easily open the doors for competitors and push the firm to Situation 4. However, highly internationalised firms have access to more resources, partly through their more extensive

network of partners and customers, and have also acquired capabilities for the development of new services in several countries. These advantages will strengthen the ties between the lonely international and its local partners, which can allow the firm to maintain its lonely position at the market.

The later starter (3)

In that Situation (3), the market is highly internationalised but the focal firm is not. For entering, late starter firms may observe and copy how other banks have penetrated and expanded or they can be pulled by their network partners. The decision to penetrate and expand requires the firm to undertake risk and commit resource to build new 'second-hand' relationships. The market share of the later starter cannot be high, as the market is already occupied by competitors with a tightly structured network. A very tight local network structure forces the late starter into the development of specialised products to avoid high levels of competition.

International among others (4)

In that Situation (4), both the firm and the market are highly internationalised and are predominantly confronted with high levels of competition. Because of the fact that banking networks across borders are highly related in that Situation, a highly internationalised bank can easily move from one country to another: using its knowledge and experience in one market to gain a position in another. For example, the knowledge and experience from other markets can speed up the agency phase and result in further market commitment (Blomstermo et al., 2006). Because of the nature of their products, banks can increase their commitments internationally more easily than industrial firms: coordination between different international units and diffusion of new and specific service happens at a higher speed. On the other hand, internationalisation in banks consists of other aspects that can hinder this speed: economic or political risks or crises, for example, can rapidly affect the financial assets of the firm globally. Banks can spread their risk in different countries with different conditions: issues like size of the bank and the specificity of its service products are of vital importance for strengthening its market position. In order to reach such a major position, banks often join actions with others: mainly through mergers and acquisitions.

3. METHODOLOGY

In order to understand of how Greek banks penetrate and expand into SEE countries and how the environment influences the entry and expansion behaviour of those enterprises, it was conducted an in-depth study of two Greek banks' entry processes in these emerging markets. They were selected two large-sized Greek banks that are both confronted with a saturated home market and have started to internationalise more extensively during the 2000s. The case banks did not want to disclose their names in this study, and therefore, their anonymity was guaranteed by using fictitious names in presenting them. Both banks were selected because they have started activities in SEE as part of their increased internationalisation strategy. This will allow to research whether developments in the environment influence the banks' entry and expansion strategies. The banks, that have been called 'Ipsilon' and 'Omega', started to invest in the region shortly after these markets opened up for foreign investment. Data was collected through interviews with managers from the banks' headquarters as well as managers of their activities in the region.

Primary Data - Interviews

The most common form of primary research is based on interviews, especially when the researcher is searching for in-depth information about a special phenomenon. Merriam (1998) has identified three types of interview styles that have different characteristics and structures. The interview structure ranges from highly structured, questionnaire driven interviews, to unstructured, informal interviews. From these styles, the interviewer can choose which style to use to get a desired answer from the interviewee.

- The highly structured interviews are more or less an oral survey. The wording and order of the interview questions are predetermined. This can be used to gather social-demographic data from the respondents. It can also be used if the researcher wants the interviewee to answer a statement or define a concept. The problem with the highly structured interview is that it does not allow the interviewee to speak freely about the subject. This can lead to misunderstandings, because an interviewee can wrongfully answer questions due to interpretations mistakes.
- The semi-structured interviews are conducted with some flexibility towards the interviewee. However, the interviewer has a framework of questions that s/he wants answered, but the flexibility will also allow the researcher the opportunity to elaborate on certain topics, as the interview proceeds.

- The unstructured interview style is essentially exploratory and is used when the researcher wants to learn about a topic.

Qualitative research using a semi-structured interview guide (Easterby-Smith *et al*, 1991) as the collection method seems best suited to this study.

Face-to-Face Interviews

A face-to-face interpersonal role situation, usually associated with qualitative research, was seen as a feasible approach and was adopted in this research, because of the significance to gain meaningful insight to the subject, as well as to obtain extensive information from informants, which are particularly important for the research (Patton, 1990).

In conducting face-to-face interviews were considered to be more suitable than telephone interviews, mainly because of the greater flexibility they are able to offer in exploring issues as they arise, and due to the fact that the population to be interviewed was not spread (Janesick, 1998; Sarantakos, 1998). A core tenet of the data collection strategy was to target, and face-to-face interview, key individuals involved in each stage of the bank's foreign entry process. With that in mind, a 'hit list' was drawn up in the early stages of the research, listing some individuals by generic descriptor – e.g. level of responsibility. The list was drawn up by the researcher's own personal knowledge of the Greek banking sector and the people involved in it, and by taking advice from sector commentators. The interviewees fell into five generic categories, as shown in table 1.

Table 1: Generic Categorisation of Interviewees

Generic category	Number of interviewees
International Marketing Director	2
Marketing Manager for international affairs	4
Senior Executive involved with international process	2
Director of foreign subsidiaries sector	2
Consultant for international affairs	2
Total	12

A total of twelve interviews were undertaken. This meant that a total of twelve people were interviewed. The success rate with approaching people for interview was very high at over 90 percent. In almost all cases where the request was declined, it was possible to gain an alternative perspective on particular events from another interviewee and there were no significant gaps in the scope of the interview material generated. The interviews were conducted in the interviewees' offices. An important facet of the interview programme was anonymity. Hence any opinions that were expressed by interviewees would be presented in any published material in such a way that the contributor remained anonymous. Without exception, all interviewees were happy with this arrangement.

The cases were separately analysed comparing the results in a cross-case analysis:

Findings (in table)

Table 2: Case summaries

	Ipsilon bank	Omega bank
Exploration stage	<ul style="list-style-type: none"> • Greenfield entries (branches) • Opportunistic entry in general; expand if successful • Local personnel for links with local institutions. 	<ul style="list-style-type: none"> • Greenfield entry preferred but not possible in general • Local personnel for links with local institutions.
Penetration stage	<ul style="list-style-type: none"> • Banking licences granted smoothly because of the successful integration in institutional network • <i>Products</i>: simple package • <i>Clients</i>: large multinationals. 	<ul style="list-style-type: none"> • Difficulties in obtaining banking licences in general for branches because of the less immediate success with integration in institutional network: need to acquire local bank in a market; adapted business concept in another market • <i>Products</i>: simple package • <i>Clients</i>: local companies and multinationals in some industries.
Expansion stage	<ul style="list-style-type: none"> • Expansion also to serve local companies; preferably, acquisition of local company or otherwise expand offices • Expansion of product package when market is "ready" • Expansion to retail banking 	<ul style="list-style-type: none"> • Expansion to serve more client companies in some industries; growth mainly through local clients • Expansion of product offering on demand of and in cooperation with clients • Expansion to retail banking

	for private households eventually.	only for private persons in some industries.
Result	Respectable market shares in general.	Small market shares in general, but higher in some industries.

4. ANALYSIS

Considering the firms' degree of internationalisation, two case banks of this study represent an Early Starter (Ipsilon) and a Late Starter strategy (Omega), respectively. Ipsilon's entry strategy shows that it invested widely in developing relationships with government and other institutions. This is in accordance with the Early Starter pattern. Because Ipsilon lacks experiential knowledge of the SEE markets and cannot use existing network relational paths, it hires local people to develop such network relations. From a country's experiences it seems that hiring the person with the right connections at the Central Bank smoothes the entry process. In other country, the early investment in developing network connections results in bank's strong position in several institutions. Ipsilon also achieved a strong position in the developing business networks in the markets it entered. The bank's managers relate that their early positioning in the market resulted in attracting clients like large multinational companies, whose 'own' banks were not yet present in the region.

Although Ipsilon internationalised in other regions before entering SEE, it adopted a gradual and risk-avoiding approach to enter these markets. It preferred to enter through a branch, i.e., avoiding the control of the local Central Bank and only established subsidiaries when forced by local government. In congruence to Johanson and Mattsson's Early Starter, Ipsilon offered only simple and standard products in the new markets. The bank expanded its product offerings only after increased its local market knowledge and the market showed a certain level of development. Also, Ipsilon extended its focus to other target groups, including groups that are more difficult to reach and that demand a higher level of local commitment, such as private households.

Johanson and Mattsson suggest that Early Starters attempt to solve their lack of market knowledge and uncertainty in foreign markets through cooperations with local companies. In contrast, Ipsilon has not established such cooperations in its first stage of penetration, but instead acquired local knowledge through hiring local managers in important positions. In a next stage, expansion was eventually furthered through acquiring a local bank. This acquisition offered to the bank the network of offices that it needed to expand to target

groups like private households. Ipsilon's Early Starter strategy has proven to bring the bank success because it has provided the bank with a strong position in networks of customers and regulators. Ipsilon has followed a gradual expansion pattern with extensive investments in building a network position, but like Johanson and Mattsson reasoned, this has given it a beneficial position in facing the competition of later entrants.

Omega bank (the second case) has been one of those later entrants. Omega set its first steps in the region, when banks like Ipsilon had already been present and had already built their network of relationships. This is like the highly developed international context that confronts the Late Starter according to Johanson and Mattsson's model. In a country of the region, Omega in order to receive a banking licence is required, against its preferred entry strategy, to make an acquisition. In other country, its withdrawal is partly the result of the market already being taken by competitors and not allowing enough space for another player. Finally in other country, it is the bank's uncertainty about the high level of political risks that stalls further expansion. To build network relations, Omega joins the lobbies of united international banks and also, like Ipsilon, hires local managers with extended networks. To build profitable banks in the region, Omega further cannot rely on its client network of foreign investors alone. In contrast to Ipsilon, Omega is forced to reach out to local companies, also small- and medium-sized companies, to start up their business.

Omega's entry strategy is in accordance with the gradual approach predicted by the theories (Johanson and Mattsson, 1988; Johanson and Vahlne, 1977). Before entering SEE, Omega collected information about these markets from several areas, including competitors that already had entered them. Further, Omega's preferred entry strategy is through a Greenfield office, i.e., an entry mode that demands fewer immediate investments than an acquisition. Like Ipsilon, Omega started with simple banking products first, adding products and developing new ones in cooperation with clients over time.

Besides the heterogeneity in the commitment of these firms because of their degree of internationalisation, it was also found an interesting homogeneous behaviour towards actors. This aspect considers the type of commitments. As the cases manifest, the firms' resource commitment and organisation can be divided into two types. These two types are business commitments, which were related to the business relationships, and the other was the political commitments, which considered the political actors and bureaucrats. As the cases and also the figures illustrate, there was a clear difference between these two types of the firms' commitments. Both firms, specifically in the penetration stage, were faced with the

problem of, for example, having to obtain a licence. These two different commitments developed hand-in-hand, but demonstrated different degrees of internationalisation.

The two banks had two types of commitments, as illustrated in Figure 2, which varied depending on the degree of internationalisation. In the first stage of internationalisation, for example, both firms were in cell 3 as the first commitment was to solve the political and bureaucratic problems. But, as the case of Omega manifested, the firm in the expansion stage considered the business commitment to be high and the political commitment was less. If a firm like Omega conducts a high investment in the political arena for penetration and is not able to move from cell 3 to cell 2, then the only option is exit. Besides the fact that firms hold commitment towards two different political and business markets, the degree of commitments in these two types does not follow similar development. While one is high in one stage, the other can be low and vice versa. In severe conditions, like mergers and acquisitions, both types may stand in cell 4, as the firms require a high level of investment for the businesses and at the same time resolve the political and bureaucratic demands.

Figure 2: Types and degree of commitments

		Internationalisation and Business Commitment	
		Low	High
Internationalisation and Political Commitment	Low	1	2
	High	3	4

5. CONCLUSIONS

The analysis (continuing and strengthening the conclusions of previous study – Vasiliadis, 2013) contains several interesting conclusions:

1. The first one concerns the internationalisation process model's ability to analyse the firms' entry strategies and expansion in new emerging markets. The empirical study contains facts showing the slow progress in their internationalisation. It is true that firms entered into these markets at different times but their expansion followed the

same slow progress in the increasing knowledge and commitments. Ipsilon's Early Starter has benefited from being one of the first movers: it has gained a very strong position in the local business networks. These strong network relations have been shown to support the success of the bank. Omega, in contrast, has been much less successful in reaching its targets: it has been confronted with higher levels of competition from local business networks resulting in lower chances of starting with a portfolio of foreign investors. This conclusion supports those believing in internationalisation process model and business network.

2. The second conclusion raises questions on definition of the market in the theoretical sense. Specifically, it relates to new emerging markets like SEE countries, as these markets change drastically in their political and business fields. The internationalisation model emphasises on commitment and knowledge for managing the business markets. Actors like customers, competitors and suppliers define a relationship network of a market. These actors are limited by relationship commitments and knowledge. The employment of the business network for these two firms shows new facts besides these explanations. As the cases manifested, the firms' network contained two different types of actors: Business and Institutional. This conclusion verifies the results from other studies (Welch and Wilkinson, 2004), which express the decisive role of the institutional political actors in business network. This conclusion resides on the presumption that political actors belong to a different market because their function is different. Therefore, it can be stated that business firms, specifically those acting in new emerging markets like SEE countries, are functioning in two interrelated markets: the business and the political. The entry and expansion behaviour of the firms relies on how these firms can manage these two markets.
3. The third conclusion relies on the rule of incrementality in the commitment and knowledge. Based on the cases, it can be concluded that there are differences between the two types of business and political commitment and knowledge of the firms. Besides that, the degree of commitment in these two types can vary at different stages of internationalisation. A deeper understanding of the types of commitments at different stages of internationalisation may provide a better understanding of why some firms do not succeed: this is not because of the degree of internationalisation of

the businesses, but because of the hindrances created by political actors in entry or expansion stages of internationalisation. This is an extremely important issue since the political and institutional systems in new emerging markets are not so stable.

CHINESE ACQUISITIONS AND THEIR IMPACT ON THE MADE IN ITALY LUXURY SECTOR –

Vecchi, Alessandra

Department of Management, University of Bologna, Bologna, Italy, London College of Fashion,
University of London Arts, London, UK, alessandra.vecchi@unibo.it

ABSTRACT

The competitiveness of the Made in Italy luxury industry is in question. Traditionally Foreign Direct Investment (FDI) has flowed from the advanced developed economies into developed and developing countries. More recently a new trend has emerged in the pattern of FDI. Outward bound FDI from emerging economies has begun to increase significantly and has been growing at a faster pace than FDI from the advanced developed world. The proposed project seeks to study the impact of Chinese acquisitions and their impact on the Made in Italy luxury sector and its stakeholders. The proposed project has been funded by Marie Curie CIG grant and just started in June. The overall goal of the project is to establish and implement a substantial research agenda that will assist policy makers in responding to this trend and will be of value to all stakeholders in the Italian luxury industry as they face this facet that inevitably globalization entails.

Key Words: Made in Italy, luxury, FDI, Chinese acquisitions

1. INTRODUCTION

While traditionally Foreign Direct Investment (FDI) has flowed from the advanced developed economies into developed and developing countries, more recently, a new trend has emerged in the pattern of FDI. Outward bound FDI from emerging economies has begun to increase significantly and has been growing at a faster pace than FDI from the advanced developed world. Increasingly nowadays Multinational Corporations (MNCs) from Newly Industrialised Countries (NICs) are buying business assets and capabilities in the luxury sector all over Europe.

According to a recent EC report (CEC, 2012), skills shortages, mismatches and gaps may lead to the disappearance of certain activities and knowhow from Europe. Existing trade and investment barriers in third countries make it more difficult for European products to reach new markets and establish distribution networks. The efforts European luxury companies make in creativity and innovation may be hampered by illegal activities, such as intellectual property rights infringements. In the current economic situation, access to finance, which is a key determinant for the start-up, development and growth of businesses in the fashion industry, remains a major difficulty. At this stage, therefore, it is crucial that the European industry be given the conditions and support it needs to take advantage of the existing opportunities.

Italy has a traditional competitive advantage in the production of luxury products and services (Vecchi, 2008). The Italian luxury market has long been regarded as the origin of the mainstream luxury goods and services, including brands like Giorgio Armani, Prada, Gucci, etc. With its rich cultural heritage embedded within these brands, these firms have captured loyal customers and remarkable profits from all over the world. In Italy, luxury brands are deeply rooted in their design, quality, craftsmanship and service and it often has taken decades to build their reputation. These features often appeal to those who want to instantly build a luxury brand and during the recent economic downturn, the main players of the sector have caught the opportunity to reshuffle the cards. For example, recently De Tomaso, a maker of luxury sporty cars has been acquired by Hotyork Investment, a Chinese group. Earlier this year, Shandong Heavy Industry Group of China bought 75% of Ferretti, a builder of luxury yachts that had previously bounced between banks and private-equity funds. In December Eland World, a South Korean retailer, bought 49% of Coccinelle, a firm that makes handbags, for €15.5m; Coccinelle's parent firm, Mariella Burani Fashion Group, went bust in 2010 (The Economist, 17/3/2012). Other examples include Trinity Limited.'s purchase of Italy's Cerruti and and Hong Kong businessman Peter Woo's 8% stake in Salvatore Ferragamo. Overall, an increasing number of the acquiring companies are from China or other emerging economies. A number of major fashion houses have indicated their intent to sell part or all of their stakes in various well known brands—House of Galliano, Roberto Cavalli, Pierre Cardin. The sellers of these brands have made no secret of the fact that they are indeed courting NICs' investors.

The project seeks to assess the broader implications that acquisitions from Chinese MNCs might have for the Italian luxury sector. The ultimate aim is to conduct an inter-disciplinary

project which seeks to develop a framework (relevant both to the Chinese MNCs and the luxury Italian firms targeted) that could lead to a “win-win situation” for all the stakeholders in the luxury sector. In particular, there is the need to develop a framework that would be beneficial to both the interests of the acquired firms and the investors. So instead of the outcome being a win-lose one with the all of the benefits going to the investor the outcome would be one in which the complementarities of both firms would be leveraged in a synergistic mode so that the benefits would be maximized for both to generate a win-win set of outcomes.

2. PURPOSE

The main aim of this project is to assess the broader implications that the acquisitions from Chinese MNCs might have for the Italian luxury sector with the goal of ascertaining their impact on the “Made in Italy”. The aim will be achieved by meeting the following project objectives:

Table 1.1: Project objectives

Project Objectives	
1. Clarify and quantify the nature of Chinese acquisitions in terms of the sources of such investment	
2. Gain an in-depth understanding of the expanding international activities of Chinese MNCs	a) The influences and motives driving these firms to invest beyond their borders and in particular into the luxury Made in Italy
	b) The patterns and modes of Chinese acquisitions affecting the different sub-sectors of the luxury Made in Italy
	c) The unique competitive strategies for expanding overseas and the particular challenges that Chinese MNCs
3. Gain an in-depth understanding of the impact of these Chinese acquisitions	
4. Estimate the future nature, pace and magnitude of this emerging phenomenon in relation to the broader Made in Italy and make forecasts for the future	

As the result of the multidisciplinary project, the contribution to knowledge in a variety of functional disciplines will greatly enhance the existing sparse body of knowledge around this topic. The socio-economic reasons for undertaking such a multidisciplinary project are also significant. The European Commission has already recognized the importance of the Luxury sector for growth and employment in Europe. Antonio Tajani, Commissioner for Industry and Entrepreneurship has stated that *“The European Luxury goods sector is a key component of sustainable growth in Europe and on-going Creativity and Innovation. Luxury exports have continued to grow through the financial crisis and the sector is an example of European Cultural Excellence at its best”* (Altagamma, 2010). The luxury goods industry as a whole is of major importance to the European economy. It employs approximately 800,000 people (directly and indirectly) in Europe with an annual turnover of approximately €170 billion. Indeed, the competitiveness not only of Italy but of the entire European luxury industry is in question. While some Chinese investors have acquired stakes in Italian local brands, the focus has been also on acquiring stakes in European brands.

3. RESEARCH METHODOLOGY

From a research methodology viewpoint, in line with the multidisciplinary ethos of the research a variety of methods will be employed. These will include desk research, case studies, surveys, forecasting techniques to include the Delphi method for theory development and extension. Since the ultimate aim of the project is to stimulate ideas around both national level policy responses as to develop a framework that would be beneficial to both the interests of the acquired firms and the Chinese investors, the Delphi method has been deemed as particularly suitable for the task at hand. Desk research will form a major part of the means of seeking to describe and quantify the emerging phenomenon. This research will draw on many of the major international data sources such as UNCTAD, and Eurostat. National databases such as ISTAT will also be accessed and a particular emphasis will be given to the local national sources of data from China. In addition a variety of other sources including company reports and business news media will be utilised to gain as complete a picture as possible of these Chinese acquisitions in the luxury Made in Italy. Similar approaches will be employed to ascertain the nature of acquisitions from China in terms of the sources of such investment and the sectors from which it is emanating. In terms of gaining an understanding of the expanding international activities of investors from China, a number of approaches will be involved. Firm level case studies will be a central element of the

approach. These case studies will be centred on Chinese MNCs who have already invested in the luxury Made in Italy. While the focus of such case studies will be around local brands, operations and facilities in Italy; gaining a complete understanding of the strategic and competitive positioning of these will also involve interviews with key actors within these firms in China at headquarters' level. The selected firms will be representative of different sub-sectors of the luxury Made in Italy (fashion, boats and cars, hospitality etc.). Interviews will also be conducted with key-informants and managers of local firms in the same sectors to assess the competitive impact for local firms of this emerging trend. An evaluation will be made of current policies which promote, attract and facilitate inward investment to Italy to gauge the degree to which they are taking cognisance of this emerging trend. Discussions with local and national policy makers will assist in this evaluation process. In seeking to estimate the future nature, pace and magnitude of this emerging phenomenon, reliance will be placed on surveys of key actors from China and the involvement of experts in a Delphi forecasting process. Finally, in attempting to add to the body of knowledge around the internationalisation process and the extension of existing theory and likely the development of new theory, an integrative process will be deployed. Cross-case analysis will be conducted in different sectors of the Made in Italy and cross-sectoral comparisons will be made. The outcome of these analyses and comparisons will be synthesized and its implications for International Business theory established. In particular, one of the ambitions is to stimulate ideas around national level policy responses as to develop a framework that would be beneficial to both the interests of the acquired firms and the investors.

4. RELATIONSHIP TO THE 'STATE OF THE ART' OF RESEARCH IN THE FIELD

4.1 OFDI and Internationalisation theories

The Chinese acquisitions affecting the luxury Made in Italy sector are emblematic of a wider trend. Many emerging economies have benefited from a massive infusion of capital, technology and managerial expertise from the traditional industrialized countries. As a result of this and other factors, companies in some of these countries have amassed sufficient capital, knowledge and know-how to invest abroad on their own. The proportion of FDI accounted for by emerging economies is increasing. According to the UNCTAD (2010), the rate of outward FDI growth by companies from emerging markets has outpaced that by

companies from the industrialized countries. The participation of emerging countries in FDI flows has varied considerably during the past 30 years. In relative terms, emerging markets have increased their share of FDI outflows from 1.29 percent in the 1970s to 11.10 percent during the 1990s, while FDI outflows from developed countries had decreased in proportion from 98.69 percent during the 1970 to 88.61 percent during the 1990s. There is strong connection between the growth of FDI into Europe with the increased economic integration in the European Union (Dunning, 2006).

More recently the global picture of FDI flows belies a more varied regional reality. Most FDI in developing and transition economies has flowed to a small number of countries, mainly large emerging markets (UNCTAD, 2010). In the context of MNCs from NICs, China represents one of the leading player ranked 5th among all economies in terms of OFDI flows (UNCTAD, 2011). While China's dominant position as recipient of global FDI flows has been well documented, the overseas investment activities of Chinese companies have received considerably less attention. However, a recent wave of cross-border M&A deals by Chinese firms has brought increased interest in this topic. China's investments abroad registered a significant increase despite an overall decline in foreign direct investment following the 2008 financial crisis (UNCTAD, 2011). This remarkable growth is likely to continue since China's substantial foreign exchange reserves and as a consequence of its monetary policy. Furthermore, UNCTAD (2010) indicates that recovery of FDI in 2012 is likely to be led by cross-border M&As.

Restructuring in a number of industries, as well as the privatization of companies rescued during the global turmoil, will further create cross-border M&A opportunities for Chinese MNCs. Traditionally, much of the FDI from emerging markets has been directed to emerging markets with geographical proximity and similar economic and cultural backgrounds. In recent years, however, MNCs from emerging markets have moved towards other markets outside their regions. In this age of financial crisis and austerity, an increasing number of luxury companies are seeking financial support and alliances with wealthy companies. Meanwhile Chinese MNCs are willing to engage in new investments for gaining market and strategic asset-seeking often at bargain prices. The result is that Europe is experiencing a structural wave of Chinese MNCs acquisitions where annual inflows tripled from 2006 to 2009, and tripled again by 2011 to €10 billion for the current year (Rhodium Group, 2012).

A variety of reasons have been offered for the emergence of FDI from emerging economies (Rios-Morales and Brennan, 2010). These include the support of exports, the expansion of

market presence, the acquisition of established brands and foreign skills and the establishment and strengthening of local distribution networks. The increasing financial strength and the growing international exposure of companies from emerging economies together with greater domestic competition have also been suggested as explanations. Finally, the goals of building international brands, accessing advanced technologies and establishing R&D centres in developed countries help to explain the growing trend.

The surge of FDI in recent years has generated a growing body of literature on FDI with the theory of internationalisation and the Eclectic Paradigm widely utilized. While the theory of internationalisation focuses on entry modes and competitive advantages of a firm, the eclectic theory incorporates a holistic explanation of why a firm moves abroad, suggesting that location-specific advantages arise from using endowments that are tied to a particular location (Dunning, 2006). The theory affirms that the extent and pattern of international production undertaken by MNCs is determined by the interaction of three sets of interdependent variables: Ownership, Localization and Internalization advantages, resulting in the abbreviation and alternative name of the eclectic paradigm, namely the OLI paradigm (Dunning, 2006).

The first competitive advantage represents the ownership (O) of specific resources to be exploited externally. These advantages can be endogenous or exogenous to the company. The first refer to a company's access to income generating assets such as technology, knowledge or managerial and organizational skills. The latter are related to the privileged access to input factors such as raw materials, funding and labor allocation. Penrose (1966) defines the ownership advantage as an asset competitors cannot imitate, copy or otherwise access over the short run, securing the company monopolistic rents. Rugman (1981) calls this advantage as Firm Specific Advantage (FSA) defining it as a unique capability proprietary to the organization and they can be technology based, knowledge based or they can reflect managerial skills. FSAs are property rights and intangible assets advantages such as new process or products and strong brand names. According to Dunning (2006), the O-advantage has to be identified, nurtured and fostered, accessed and capitalized upon by the company. The greater the competitive advantage of the investing firms relative to those of other firms, the more they are likely to be able to engage in foreign production (Dunning, 2006).

The second element of the OLI paradigm regard the host country location attractions (L). In particular, the model refers to the immobile, natural or created endowments which the more they favor a presence in the foreign country, the more they encourage firms to exploit their

ownership advantage by serving market through FDI rather than export. Rugman (1981) defines the L-advantage as the Country Specific Advantage (CSA) that are unique to the business in each country. The author asserts that building on CSAs, the firm makes decisions about the efficient global configuration and coordination between segments of its value chain such as operations, R&D and logistics.

With regard to the last variable of the paradigm, the internalization (I) advantages involve the opportunity to keep firm specific resources within the company rather than exploit them in the market through arm's length transactions (Amighini & Rabellotti, 2010). Dunning (2006) asserts that the greater the net benefit of internalizing, the more likely the company prefers to engage to foreign production itself, rather than license the right to do so to a foreign firm. In his later works, Dunning affirms that the significance and configuration of the above mentioned parameters is strongly contextual and it is likely to vary across industries. The OLI variables explain why internationalization occurs but do not identify the process of internationalization. Thus, the eclectic paradigm has been extended to include the theory of the Investment Development Path (IDP) that was first put forward in 1975 and since then it has gone through various iterations (Dunning, 1981,1988; Dunning and Narula, 1996).

The IDP explains how a country's outward and inward direct investment position change as a result of the economic development of the country (Dunning and Narula, 1996). The basic hypothesis of the model is that as a country develops, the pattern of the OLI advantages change and that is possible to identify both the reasons underlying the changes as well as the effect on the country's development cycle (Dunning, 2006). The IDP recognizes five stages of development a country might pass through, based on its ability to be outward or inward direct investors (Dunning and Narula,1996). In the first stage, a country is in a period of pre-industrialization and a country's inward as well as outward direct investments are almost nonexistent (Dunning, 2006). Dunning and Narula (1996) explains that in the first case the country has insufficient location advantages and in the second case its firms have few ownership advantages, which is the result of the country suffering from an insufficient economic systems or government policies and poor infrastructure. Depending on its resources, government policies and strategy of the firms, the OLI parameters change so as to attract inward investments, leading to the second stage of development. According to Dunning (2006), a country's L-advantages increase as the country increases its efforts to create an improved legal system, infrastructure and human resources. Therefore, in this early stage the role of the government is especially important. The third phase registers a decline in growth of inward FDI and an increase of outward FDI directed to countries in a lower stage

of the IDP (Dunning and Narula,1996). The O-advantage is less based on domestic natural resources and more on organizational and managerial competences. Countries in stage four are referred to as post-industrial economies with outward FDI growing faster than inward FDI. Companies increasingly internalize to protect their owner-specific advantages by reaching other markets through FDI rather than exports. The final stage of the IDP occurs when there is a balance between inward and outward FDI as a result of some degree of convergence of the level of development and the economic structure of countries (Dunning, 2006).

Dunning and Narula (1996) highlight the critical importance of the government at this stage too, to influence the quality of L-advantages and to set the suitable competitive advantage that allows its firms to exploit the opportunities offered by the global economy. As a result to the internationalization of companies, national boundaries become less significant and the world is increasingly interconnected. Therefore, companies engage in FDI not only to exploit their existing O-advantage in a host location, but also to augment the advantages by acquiring complementary assets or new markets (Dunning, 2006). The theories reviewed so far identify the institutional environment as one key factor of influence on the decision-taking. However, the focus is generally on the recipient country's framework. The OLI paradigm takes into consideration the foreign institutional environment as a potential driver of location advantages, yet, the role of home country institutions and particularly government is key to shaping the process of internationalization of domestic firms (Ramamurti, 2008).

According to Sim and Pandian (2007), the impact of the domestic institutional framework is acknowledged in terms of push-factors triggering the internationalization of a company. North (1990) defines institutions as the 'set of rules', formal and informal, which organizations in pursuit of their own learning and resource allocation goals must follow. This concept includes a wide range of elements such as the legislature and bureaucracy, government structure and customs and beliefs. In accordance to (Williamson, 2000) all of them are interlinked and influence each other. Furthermore, Redding (2002) asserts that the institutional configuration determines the pace and scope of a country's macro and micro level economic development as consequence of the policy provided by government to local and foreign firms. In this respect, Murtha and Lenway (1994) argue that the constraints given by an institutional environment affect the decision-making of a firm by contributing to or underpinning a firm's capability.

In response to the previous criticism to the OLI paradigm, Mathews (2002) has developed a new theoretical framework called Linkage, Leverage and Learning (LLL) to analyze the phenomenon of the MNEs from Asia-Pacific that he calls "Dragon multinationals". The model captures the idea that latecomers use their overseas investments and global linkages to leverage cost leads and learn about new sources of competitive gains. Differently from the OLI perspective, Mathews sees the first phase of MNEs formation as most likely to begin with asset-exploring purpose rather than asset-exploiting motives. He argues that linking with mature market MNCs, a latecomer firm may leverage knowledge, technology and market access with the result of entering in a learning process which can be exploited for further growth (Mathews,2002). In the pursuit of resources and capabilities not otherwise available, the emerging MNC seeks advantages that can be acquired externally. Therefore, a global orientation represent a source of competitive advantage since the global market increase the possibilities to access to new and complementary assets (Mathews, 2006). Partnerships and joint ventures are seen as vehicles to connect with proprietary assets and knowledge and reduce the risks and uncertainties related to international expansions. Chen and Chen (1988: p.446) asserts that resource access may be interpreted as *"an attempt to access external resources in order to offset the weaknesses of the investor"*. According to the LLL model, the degree of international success is related to the extent to which links can be established and resources can be leveraged. The leverage potential is related to the accessibility to these resources in terms of their inimitability, transferability or substitutability. So, one of the main focus of the latecomers is how to overcome such barriers to access to initially lack resources in foreign countries. By repeating the process of linkage and leverage, emerging MNCs benefit from learning to perform such operations more effectively entering in a path of organizational learning. Thus, the latecomer companies are able to take maximum advantage of the new opportunities presented by inter-linkages of the global economy (Mathews, 2006). Moreover, Li (2007) shows how this internationalization process is often interlinked to inward FDI at home that provides to the local firm the unique chance to enter into established global networks and thus enhancing their capabilities. This allows companies to develop their own capabilities and to become more competitive abroad through experiential learning process. The benefits are related to the ability of the firms to leverage external resources and its 'absorptive capacity' meaning the ability to identify, assimilate and exploit external knowledge (Cohen and Levinthal, 1990).

Overall, while the conventional theories of internationalisation such as the Eclectic Paradigm, IDP as well as LLL offer some insights into the changing trends in FDI, they provide an

incomplete understanding of the drivers of this new phenomenon. This suggests that theories of internationalisation need to be developed so that are reflective of the new global context in which the attainment of economic goals are underpinned by cultural and political fundamentals.

4.2 OFDI and their impact on the Made in Italy

While we have extensive evidence of FDI flows from the Italian fashion sector into developed (Vecchi, 2008) and developing countries such as the UK Romania (Crestanello & Tattara, 2011), we are very little evidence of the opposite trend and to a bigger extent in relation to the luxury industry (Rabellotti & Sanfilippo, 2008; Pietrobelli et.al., 2010). The issue of the Chinese acquisitions and their impact on the luxury Made in Italy is particularly relevant for the competitiveness of the national industry and the rationale for conducting further research in this field is twofold.

First, the production of luxury Made in Italy mostly relies on industrial districts that are characterised by the active presence of both a community of people and a populations of firms (Becattini, 1989). Within this context the presence of foreign investors (Vecchi, 2008) as the Chinese in the Prato district (Dei Ottati, 2009) can significantly affect the district internal dynamic by compromising their future viability (Dunford, 2006; Vecchi, 2008; Dei Ottati, 2009). In essence, when radical changes in the competitive context such as those that Globalisation entails (Vecchi, 2008) it becomes likely that external competitive pressures will cause destructive forms of competition by ultimately undermining the districts equilibrium and the propagation of its competitive advantage (Dei Ottati, 2009). In these instances, districts revival development would require profound changes which cannot merely rely on familiar experience and behavioural models that were previously deemed as strategic (Dunford, 2006). On the contrary, it requires the deliberate construction of a new equilibrium which inevitably see the involvement of some global actors (Vecchi, 2008; Dei Ottati, 2009; Rabellotti & Sanfilippo, 2008). Assessing the role of Chinese acquisitions within this context thus becomes crucial for the viability of the luxury Made in Italy.

Second, the mixed expectations related to China's overseas expansion calls for a better understanding and knowledge of the strategies of Chinese companies entering overseas markets to inform what is becoming an increasingly relevant debate. Although this topic is becoming fashionable in international business studies, the empirical evidence on Chinese FDI in European countries is quite limited and relates mainly to the UK (Burghart and Rossi,

2009; Cross and Voss, 2008; Liu and Tian, 2008) and Germany (Schüller and Turner, 2005). This evidence is even scarcer if we consider Italy and more specifically the luxury sector.

4.3 Originality and innovative nature of the project

As such, there is a valuable opportunity to conduct further research. The project is original and innovative in a number of ways:

- There is no research seeking to assess the broader implications that Chinese acquisitions might have for the luxury Made in Italy currently underway in the EU research programmes and other European fora.
- It will provide a novel perspective on one of the recently emerged unanticipated effects of the process of globalisation.
- It will develop the space around a new field of enquiry. It will also provide valuable insights for a variety of stakeholders in the luxury sector.
- The project will deliver contribution to knowledge around the areas of internationalisation and Foreign Direct Investment in the luxury Made in Italy sector.
- By providing understanding and insights, it will inform and benefit the various stakeholders in the sector.
- Luxury firms and their managers will gain an appreciation of the competitive strategies of these new entrants and will thus be better placed to develop both competitive and collaborative responses.
- As the result of the research project, the contribution to knowledge in a variety of functional disciplines will greatly enhance the existing sparse body of knowledge around this topic.
- Finally, the project may also have benefits for firms from NICs in better understanding the challenges that they face in expanding into the luxury Made in Italy.

5. CONCLUSION

Due to the increasing intensification of Chinese M&A activities and of the related fears and expectations regarding Chinese MNCs expansion a fuller understanding of the phenomenon is not only desirable but also indeed necessary. As such there is a valuable opportunity to conduct multi-disciplinary research. Overall, there is a widespread fear that by being acquired by NIC's investors the interests of local stakeholders will be subordinated to those of non-local stakeholders with adverse consequences for local firms, employment levels and standards and the overall welfare of citizens by ultimately eroding the competitiveness of the

Italian luxury sector. By researching and analysing the Chinese acquisitions and their implications for the luxury Made in Italy, the proposed project is a timely response to addressing a key part of the manifold issues that are currently arising in Italy as a result of the ongoing process of globalisation. The project will provide quantification and insights around an emerging phenomenon. The project will deliver contribution to knowledge around the areas of internationalisation and Foreign Direct Investment in the Italian luxury sector. By providing understanding and insights, it will inform and benefit the various stakeholders in Italy. This is critically important given the degree of anxiety that stems from the sensitivity of this novel topic. In many European countries, politicians, business leaders, employees and their representatives have in varying degrees expressed alarm about this new phenomenon. The provision of concrete research results can assist governments in supporting the sector with responding to this phenomenon by adjusting their policies so that local economies are able to capitalise on the advantages to be derived while minimising the negative impacts. In this sense, the project will contribute to enhance EU scientific excellence and will support Italian luxury firms and their managers to gain an appreciation of the competitive strategies of these new entrants and will thus be better placed to develop both competitive and collaborative responses. Finally, the project may also have benefits for MNCs from China in better understanding the challenges that they face in expanding into the luxury Made in Italy. A number of conclusions can be drawn at this preliminary stage. There has already been interest in this sector and its players from non-traditional investors. Such interest is likely to continue and grow given the attractiveness of the industry and the prestige associated with it. Non-traditional investors are likely to encompass both firms from the fast growing emerging economies and Sovereign Wealth Funds. Interest in the topic of investment from non-traditional sources has already attracted the attention of scholars (Brennan, 2011). However it is likely that such attention will need to be more sector focused into the future. In that respect, the research plan presented in this paper can serve as a template for other researchers addressing other sectors. Finally it can be noted that the topic of this research lends itself well to interdisciplinary exploration. Indeed such exploration is likely to be essential if the goal of developing win-win responses to this phenomenon is to be realized.

ABSTRACT

The ascent of knowledge economy and the advance of information and communication technology (ICT) have placed e-learning as mainstream application by providing knowledge workers with learning experiences that are accessible, timely and affordable. In the business world, accountants are amongst the professional groups whose work has been affected significantly by ICT developments. However, existing literature has not investigated in depth user's requirements of an e-learning accounting platform yet. The scope of the present study is to record how potential users evaluate the usefulness of a web-based platform operating as an accounting educational platform and at the same time as a job-seeking environment in the field of accounting. Moreover, it aims at examining the characteristics that an educational platform and job seeking mechanism should include. Finally, the study aims at exploring differences existing between user groups in relation to an e-learning accounting platform. More specifically, it explores four target groups' opinions on e-learning accounting platform, that is, students, academics, employers and people interested on vocational training. The analysis is based on 451 answers on a structured questionnaire. The analysis is conducted in Greece that is a country with specific peculiarities in terms of accounting, the most significant of which is the strong financial accounting conformity.

Keywords: e-learning, accounting education, user needs, accounting educational platform, accounting job-seeker

INTRODUCTION

The ascent of knowledge economy and the advance of information and communication technology (ICT) have placed e-learning as mainstream application by providing knowledge workers with learning experiences that are accessible, timely and affordable. E-learning is the use of electronic media for teaching and learning anywhere and anytime (Engelbrecht, 2005). E-learning has been viewed as synonymous of terms such as web-based learning, internet-based training, advanced distributed learning, web-based instruction, on-line learning (Khan, 2001; Selim, 2007). Despite the positive trends of e-learning, e-learning poses a challenge for both schools and industry, since e-learning requires the integration of information technology into teaching and learning process (Akour, 2012). For this reason, a number of research initiatives have emerged to explore the conditions that enable an e-learning system to deliver the desired learning outcome.

In the business world, accountants are amongst the professional groups whose work has been affected significantly by ICT developments (Engelbrecht, 2005). The internet has become a powerful tool for governments; legal, financial and accountancy firms to empower accountants with distributed modern information processing capabilities. Besides accounting profession, the importance of ICT has been recognized for the education of accounting (Meade, 2002; O'Neil and Rowe, 2000; Rubin, 1999).

However, existing literature has not investigated in depth user's requirements of an e-learning accounting platform yet. The scope of the present study is to record how potential users evaluate the usefulness of a web-based platform operating as an accounting educational platform and at the same time as a job-seeking environment in the field of accounting. Moreover, it aims at examining the characteristics that an educational platform and job seeking mechanism should possess. Finally, the study aims at exploring differences existing between user groups in relation to an e-learning accounting platform. More specifically, it explores four target groups' opinions on an e-learning accounting platform, that is, students, academics, employers and people interested in vocational training. The analysis is based on 451 answers to a structured questionnaire. Finally, the analysis is conducted in Greece that is

a country with specific peculiarities in terms of accounting, the most significant of which is the strong financial accounting conformity (Dimitracopoulos and Asteriou, 2008)

The structure of the paper is the following: The next section is devoted to the literature review. Section three presents the methodological approach followed in this study. The fourth section is devoted to the results of the analysis while the last section of the paper discusses the conclusions of the study.

LITERATURE REVIEW

There are several studies that have analysed the critical success factors (CSFs) for e-learning systems. Papp (2000) diagnosed as e-learning CSFs intellectual property, suitability of the course for e-learning environment, building the e-learning course, e-learning course content, e-learning course maintenance, e-learning platform and measuring the success of an e-learning course. Volery and Lord (2000) indentified three e-learning CSFs: technology, instructor and previous use of technology. Soong et al. (2001) found that human factors, technical competency of both instructor and student, e-learning mindset of both instructor and student, level of collaboration and perceived information technology infrastructure are the CSFs for e-learning systems. Dillon and Guawardena (1995) and Leidner and Jarvenpaa (1993) indentified technology, instructor characteristics and student characteristics as variables that affect the effectiveness of the e-learning environment. Finally, Selim (2007) proposed the following university e-learning CSFs: instructor, student, information technology and university support.

However, existing literature has not investigated user's requirements of an e-learning accounting platform yet. For instance, Emgelbrecht (2005) reports students' experience of an e-learning tax program by focusing on three factors: the use of technology, the learning design, and flexibility of the tax program. Students reacted positively to the use of technology, but expressed concern about the lack of interaction between students, and between students and teachers. This study had been implemented within the context of an existing e-learning tax program and focused on students' opinions. Yet, various other target groups' opinion for e-learning accounting program is important. Individuals and firms that employ accounts pose requirements for both their ICT skills and accounting knowledge level. Academics can recognize aspects of the educational process that can be improved by new

technology. People interested in vocational training may have different views than undergraduate students for the context of an e-learning accounting platform.

Moreover, the Greek accounting environment is an interesting setting for the scope of our study. Dimitracopoulos and Asteriou (2008) comment that one of the main characteristics of the Greek accounting setting is the strong financial accounting conformity. The Greek accounting profile is generally characterized as conservative and driven by legal and tax requirements (Ballas, 1994). This tax orientation is considered as being a key difficulty during the transition to IFRS (Street and Larson, 2004).

The formality of accounting knowledge within the Greek accounting environment provides opportunities and challenges for the development of an e-learning accounting environment. Firstly, it affects different users towards shaping uniform requirements for an e-learning accounting platform. Secondly, it provides greater opportunities for associating an e-learning educational with a job seeking environment. As a result, an explanatory study for e-learning accounting systems within the context of the Greek accounting environment will provide valuable findings for the link between electronic education and labour market and the differences between different groups' requirements for an e-learning environment.

METHODOLOGICAL APPROACH

For the purposes of the survey a questionnaire was developed addressing different types of potential users: undergraduate and postgraduate students of accounting, academics in the field of accounting, professional accountants and persons interested in vocational training in accounting. The questions are structured under a 1-5 Likert scale. The questionnaire has been produced in two forms. A hard copy form that has been distributed to the students on the Athens University of Economics and Business and an electronic form that has been sent to academics, professional accountants and persons interested in vocational training.

The sample

Eventually, 451 completed questionnaires were received. More specifically, the sample that participated in the survey is analyzed as follows:

- 354 students, 300 of which are undergraduate and 54 postgraduate students,
- 33 academics, 28 of which have also professional experience in the field of accounting,
- 24 professional accountants working as auditors, head of accounting departments, CEOs, etc., and
- 40 persons interested in vocational training, 37 of which are at the same time practicing the accounting profession.

RESULTS

All potential users were asked to rate the significance of the existence of an online platform that would operate in two parallel levels: firstly as an accounting educational platform providing theoretical courses in accounting and practical accounting applications, and secondly as a job seeking environment in the field of accounting. From the responses (Table 1) it appears that all groups perceive the existence of both dimensions of such a platform as being “very important”. The only difference worth mentioning was recorded in the group of Students where the existence of the job seeking environment (mean value: 4.27) was rated as more important compared to the educational platform (mean value: 3.87). All other groups rated almost equally the importance of both dimensions, highlighting the necessity of such an on-line platform in the field of accounting. This could be explained by the fact that students are more interested in finding a job after their graduation, while the other groups are already under an employment scheme.

Table 1: Significance of the existence of a web-based platform (mean values)

	Students N=354	Academics N=33	Accountants N=24	Vocational training N=40
	<i>Mean value</i>	<i>Mean value</i>	<i>Mean value</i>	<i>Mean value</i>
Educational platform	3.87	4.39	4.33	4.03
Job seeking environment	4.27	4.27	4.33	4.20

Scale is 1-5 where 1: not important – 5: very important

Apart from a general assessment of the usefulness of the basic components of the platform, an in-depth analysis of platform's characteristics was sought. Therefore, the respondents were asked to rate their perceptions regarding the usefulness of a set of predefined characteristics.

Educational platform characteristics

At first, the potential users were given eleven proposed characteristics of an accounting educational platform and were asked to rate the significance of each one. These characteristics were the following (in parentheses their short names used in Table 2) :

- A concise presentation of the theory in the form of text (Theory)
- A concise presentation of the material in the form of slides (Slides)
- Examples – practical applications in various accounting subjects (Examples)
- Self assessment multiple choice questions (Multiple choice)
- Self assessment true/false questions (True/false)
- Links to electronic accounting databases (Databases)
- Links to national and international accounting sites (Sites)
- Proposed further reading for various accounting subjects (Further reading)
- Links to accounting journals (Journals)
- Links to E.U. and national regulations and legislations (Legislation)
- A glossary of accounting terminology in Greek and in English (Glossary)

Table 2 presents the overall ranking of the characteristics' significance, the individual ranking provided by each group and the mean values that was derived from the ratings. All groups agreed that the provision of "Examples – practical applications in various accounting subjects" (total mean value: 4.55) would be the most important feature of such an educational platform. At the overall level, "A glossary of accounting terminology in Greek and in English" (total mean value: 4.06) was ranked as the second most significant characteristic. On the contrary, "A concise presentation of the theory in the form of text" (total mean value: 3.34) was rated as the least significant characteristic. From these results, it appears that users are more in favour of more practical applications on accounting compared to the traditional theoretical approach.

Table 2: Proposed characteristics of the educational platform

Overall ranking		Featured characteristics	Students		Academics		Accountants		Vocational training	
Rank	Mean value		Rank	Mean value	Rank	Mean value	Rank	Mean value	Rank	Mean value
1	4.55	Examples	1	4.50	1	4.73	1	4.79	1	4.68
2	4.06	Glossary	2	3.99	2	4.39	6	4.13	4	4.20
3	3.80	Data bases	5	3.59	3	4.36	3	4.46	2	4.39
4	3.79	Multiple choice	3	3.76	4	4.30	8	3.63	8	3.65
5	3.72	Sites	6	3.57	5	4.24	5	4.21	5	4.02
6	3.71	Slides	4	3.73	8	4.06	8	3.63	11	3.28
7	3.61	Legislation	9	3.39	6	4.21	6	4.13	3	4.33
8	3.60	True/false	7	3.49	9	3.91	2	4.50	10	3.55
9	3.53	Further reading	8	3.40	8	4.06	7	3.83	6	3.87
10	3.44	Journals	10	3.26	7	4.18	4	4.25	9	3.63
11	3.34	Theory	11	3.21	10	3.82	8	3.63	7	3.69

Scale is 1-5 where 1: not important – 5: very important

The potential users were also asked to propose any additional characteristics they would like to find in an educational platform. Only Students and Accountants provided additional ideas. Students suggested the inclusion of “Frequently Asked Questions-FAQ” and “feedback to the user”, of a “search machine” and “online communication between users in form of a forum”, of “Step by step solution of the exercises” and “Email-alerts, news for changes on accounting environment and updates”. Accountants on the other hand expressed the importance of providing a feature were “questions could be submitted and answered via email”.

Job-seeking environment characteristics

Following the assessment of the characteristics of the accounting educational platform, potential users were asked to rate several applications incorporated in a job-seeking environment. These applications were the following ((in parentheses their short names used in Table 3) :

- Users can upload their CV (Upload CV)
- Users can complete a predefined CV template with several fields (Predefined CV template)
- Users can upload a job seeking ad (Job seeking ad)
- Firms in Greece can upload announcements of job offers (Firms in Greece)
- Firms from abroad can upload announcements of job offers (Firms abroad)
- Users can have direct communication with employers (Direct communication)
- Interviews can be arranged (Interviews)

All user groups indicated the ability given to firms operating in Greece and abroad to upload job offers as the most important feature of job seeker. More specifically, the application “Firms in Greece can upload announcements of job offers” was rated as most important (total mean value: 4.44), followed by the application “Firms from abroad can upload announcements of job offers” (total mean value: 4.29). As least important, although it received a relatively high score, turned out to be the feature “Users can upload a job seeking ad” (total mean value: 3.78). Through these findings it is evident that there is need for creating a stronger bond between studying accounting and seeking jobs on the field.

Table 3: Proposed characteristics of the job-seeking mechanism

Overall ranking		Featured characteristics	Students		Academics		Accountants		Vocational training	
Rank	Mean value		Rank	Mean value	Rank	Mean value	Rank	Mean value	Rank	Mean value
1	4.44	Firms in Greece	1	4.43	1	4.48	1	4.54	1	4.37
2	4.29	Firms abroad	2	4.29	2	4.24	2	4.38	5	4.27

3	4.18	Direct communication	3	4.17	5	4.03	3	4.33	3	4.32
4	4.12	Upload CV	5	4.08	3	4.12	4	4.08	2	4.35
5	4.08	Interviews	4	4.09	6	3.94	6	3.88	4	4.28
6	3.79	Predefined CV template	6	3.77	4	4.09	7	3.83	7	3.67
7	3.78	Job seeking ad	7	3.72	7	3.88	5	3.96	6	3.95

Scale is 1-5 where 1: not important – 5: very important

Again, the potential users were asked to propose any additional features. Students suggested that such a tool should also contain “advices and guidelines for successful interviews”, “guidelines for CV formation” and “information about relevant seminars”, while Academics proposed the existence of “announcements from public institutions” and “information on vocational training and master programs”.

Differences between user groups

In an attempt to group the needs of the users, the study proceeded with the conduction of factor analysis. Eventually, three factors were revealed regarding the accounting educational platform and were given the names: “Further reading”, “Self-assessment” and “Theory” (Table 4). The reliability of these factors was verified from the results of Reliability analysis (Cronbach a: 0.856, 0.807 and 0.517 respectively). Regarding the characteristics of the job-seeking environment, no factors were revealed.

Table 4: Factor analysis outcomes

Factors	Characteristics (Factor loadings)	Name	Cumulative % explained	Cronbach a
1	<ul style="list-style-type: none"> • Databases (0.760) • Journals (0.760) • Further reading (0.755) • Sites (0.749) • Legislation (0.716) • Glossary (0.643) 	Further reading	31.890	0.856

	<ul style="list-style-type: none"> • Examples (0.532) 			
2	<ul style="list-style-type: none"> • Multiple choice (0.643) • True/false (0.604) 	Self-assessment	48.372	0.807
3	<ul style="list-style-type: none"> • Slides (0.539) • Theory (0.522) 	Theory	64.141	0.517

After formatting the three factors, the survey proceeded by examining the differences in the responses of the different groups. In order to have a better view of the differences between the needs of the users and due to the inequality of the user groups' sizes, the sample was split into two main groups: Students (n=354) and non-Students (n=97; academics, accountants and persons interested in vocational training). By conducting a t-test significant differences between the two groups were revealed in all three cases: "Further reading", "Self-assessment" and "Theory" (Table 5). These differences were also confirmed by conducting non-parametric tests (Mann-Whitney U test). From the results it is apparent that non-Students consider as more important the three groups of characteristics compared to Students, with most noticeable the case of "Theory". Regarding, the characteristics embodied in a job-seeking environment, no significant differences were revealed between the groups (results not tabulated).

Table 5: Differences between Students and non-Students

Factors	Name	Students N=354	non-Students N=97	Mean difference	p-value
		<i>Mean value</i>	<i>Mean value</i>		
Factor 1	Further reading	3.46	3.68	0.216	0.015*
Factor 2	Self-assessment	3.59	3.89	0.298	0.004**
Factor 3	Theory	3.65	4.21	0.564	0.000**

*Scale is 1-5 where 1: not important – 5: very important, *Significant at 5% significance level, ** Significant at 1% significance level*

CONCLUSIONS

The scope of the present study is to record how potential users evaluate the usefulness of a web-based platform operating as an accounting educational platform and at the same time as a job-seeking environment in the field of accounting in Greece.

Our results confirm that there is actually a need in the Greek market for an on-line educational platform in accounting. Moreover this platform should possess all the characteristics that are found in literature as relevant as they are all considered to be useful at a level that is above average (e.g. Emgelbrecht, 2005; Selim, 2007). Nevertheless, different user groups seem to prioritize in a different way the elements included in such a tool indicating that the needs of groups interested in e-learning in accounting is not unanimous.

Also, students have ranked the existence of a job seeking environment as more important compared to the educational platform. Probably this is because this user group is more interested in finding a job after their graduation, while the other groups (i.e. academics, accountants, people interested in vocational learning) are already under an employment scheme.

Finally, non-students seem to appreciate in a higher degree the existence of an on-line platform incorporating features that could fall in the categorization of "Further reading", "Self-assessment exercises" and "Theory" compared to students. Probably, as students are already in the learning environment they do not feel the same need as those that are out of a university educational setting.

ACKNOWLEDGMENT

The present study is part of the project FASTER (contract number 518894) funded by the European Commission Lifelong Learning Programme. The FASTER platform that has been informed by the results of this study can be found in <http://www.fasterproject.eu>

ABSTRACT

The topics of wine sector and regional competitiveness are widely debated at international level and their measure is of extreme interest in the academic community. This paper aims at investigating the existence of a relationship between these two dimensions, providing a measure of it with an application to the Italian regions. Despite a large literature on the measurement of the relation between regional and wine sector competitiveness, scarce contributions test the existence of a correlation between them. This paper bridges this gap by supplying a measurement of these factors and of their relation, proposing development strategies. The analysis consists in testing the correlation between the Regional Competitiveness Index (RCI) and the Wine Sector Competitiveness Index (WSCCI) – both built throughout the Delphi method, by involving 40 stakeholders of different provenience throughout semi-structured interviews. The research findings show how RCI is affected by ten dimensions (economic, demographic, entrepreneurial, innovation, internationalisation, infrastructural, urban green areas, agriculture, craft, tourist) while WSCCI by four dimensions (quality, distinctive characteristics, fame and reputation, OCM investments); furthermore, the levels of the two indices depend on few attractive regions, confirming the existence of a positive correlation between them. Despite the importance of the results, this paper must be viewed at the light of several limits relating to the level of exhaustiveness of drivers/indices, chosen throughout subjective criteria; furthermore it is applied to one single specific context. However, it represents a starting point for further applications to other levels of analysis or to other sectors.

* Despite this paper is a collaborative effort between the Authors, Prof. Vrontis is responsible for the sections: 'Introduction' and 'Conclusions remarks' while Prof. Viassone is responsible for the sections: 'Literature Review on Competitiveness Measures for Regions and Wine Sector', 'Research Model and 'Analysis and Discussion of Results'.

Keywords: wine business; regional competitiveness; Delphi methodology; measure of competitiveness. Track number: 2

INTRODUCTION

Although the topics of wine sector and regional competitiveness are widely debated at international level and their measure is of extreme interest in the academic community (Tardivo *et al.*, 2011; Vrontis *et al.*, 2011; Jaffe and Nebenzahl, 2008; Zanni, 2004) no research supplies a measure of the relation among them. In 2011-2012, despite the not favourable economic trend, the wine tourism has grown by 12% but it is difficult to think that this trend can continue without a national strategy.

In fact in the wine sector as much as in wine tourism, environmental and cultural proprieties assume a very important role and, when realized, can return a not repeatable result making wine an identity good, able to pick out cultural meanings of a territory (Tardivo *et al.*, 2011).

For this motivation it is extremely important to deeply analyze the wine sector and regional competitiveness and their drivers, in addition to the correlation among them; only in this way it will be possible to support the positive action they can exercise one toward the other. This interest is even higher in a scenario like Italy, the major European wine producer, that counts in 2011 about 42 millions of hl of wine production.

This paper tries to bridge this gap in the literature, by supplying – throughout the Delphi methodology and statistical analysis - an exhaustive measure model both for regional and wine sector competitiveness and by verifying the existence of a correlation between the two global indices.

In the first paper a review of attempts to measure regional and wine sector competitiveness is proposed; after this research model is described and results are analyzed and discussed.

Finally conclusions, paths of action, limits and possibility of application of the model are developed.

LITERATURE REVIEW ON COMPETITIVENESS MEASURES FOR REGIONS AND WINE SECTOR

Despite numerous attempts to define regional competitiveness (EC, 1999; Storper, 1997) it has been recently defined by Dijkstra *et al.* (2011) as “*the ability to offer an attractive and sustainable environment for firms and residents to live and work*”.

In particular it is affected by 10 drivers: economic variables (Porter, 2003) –very important is business density-, innovative and entrepreneurial factors (Cepollaro *et al.*, 2006), demographic elements (Poot, 2007) - resulting in population size, composition, distribution and growth , internationalization variables (Cotta Ramusino and Onetti, 2006) –i.e. import, export, FDI-, infrastructural variables (Rohm *et al.*, 2004); green areas, agricultural, craft and tourist variables (Viassone and Casalegno, 2011; Franch *et al.*, 2008) able to contribute to the economic growth and to local employment.

Main existent indices used for the measure of its competitiveness are (Viassone, 2009): the World Knowledge Competitiveness Index and the creativity index, Massachusetts Technology Collaborative’s, Science, Technology and Industrial Scoreboard, the Community Support Framework (CSF) 2000-2006 for Southern Italian Regions, the Regional Competitiveness Index Croatia, the UK competitiveness Index and the competitiveness Index for Turkish Regions, Regional Attractiveness Index, the Regional competitiveness framework in Hungary, the Global Provincial Competitiveness Index (Viassone, 2009) and the EU Regional Competitiveness Index (RCI) (Dijkstra *et al.*, 2011).

On the other side, in the wine sector industries and firms are considered competitive when they are able to continue to grow their trade in today’s global environment, through product offers – qualities, prices and services - that are as good as (or better than) those of their competitors (Van Rooyen *et al.*, 2011).

According to Zanni (2004) main drivers affecting wine competitiveness are: quality (Bailet *et al.*, 2010)- expressed through Doc and Docg denominations (Viassone, 2012)- at the base of wine reputation, distinctive characteristics (i.e. the total area planted with grapes, the total regional wine production, etc) (Viassone, 2012), fame and reputation (Gergaud and Livat, 2004), a dynamic signal of quality for the collective denomination of origin and expressed by the awards received by a particular firm or territory (Bailet *et al.*, 2010), technological innovation (Vrontis and Thrassou, 2011); investments that PMI receive from OMC, able to support this sector with the necessary resources to develop itself.

Sporadic attempts of measure of the wine sector competitiveness have been provided by Balassa (1977), Vollrath (1991), Castiglione (1999), Van Rooyen *et al.* (2000), Valentine and

Krasnik (2000), Pitts *et al.* (2001), Esterhuizen (2005), who developed the RTA- Revealed Trade Advantage, used to measure quantitatively to what extent the different wine industries compete internationally; Esterhuizen and Van Rooyen (2006) who applied their Wine Competitiveness Index (WCI) to the South African wine industry; Notta and Vlachvei (2011) and Fischer's (2007) who calculate a composite measure for relative and multidimensional economic performance as measured by profitability, productivity, as well as output growth.

Furthermore Remaud (2006) demonstrated how four items influence the company in the wine industry to be more competitive in its export markets: export staff with good knowledge, expertise and skills, good level of expertise and skills accumulated through its own export experience, the entrepreneurial attitude of the CEO and the aggressiveness of the firm to search for new export opportunities. Several researches have studied the impact of wine tourism on the economic growth of the region, for wine industry and for increasing the profitability and sustainability of tourism in the area; in particular Hall and Sharples (2008) maintained that food and wine events have assumed a key role in international, national, regional and firm tourism and food and wine marketing and promotion strategies. They identified some important advantages created by these events for the region, like increased visitation, retaining travelers within a region.

In fact, food and wine competitiveness have increased their importance in the academic debate and, in particular, researchers are interested in understanding how wine tourism contribute to tourism marketing strategies at the level of both the destination and the firm (Hall, 2003). Wine events can contribute to maintain the profile of a wine region in key markets and assist in differentiating wine regions in a competitive market scenario. For all these assumptions, many wine regions and tourism destinations have realized that the benefits of wine tourism extend well beyond the cellar door to virtually all areas of the regional economy and into the urban areas that generate the majority of wine tourists (Carlsen and Charters, 2006; Carlsen, 1999).

RESEARCH MODEL

This paper aims at testing the existence of a correlation between the Regional Competitiveness Index (RCI) and the Wine Sector Competitiveness Index (WSCCI) – both built throughout the Delphi method (Dalkey, 1969), by involving in their validation and weighing 40 stakeholders of different provenience (bodies, academics, entrepreneurs, builders of indices) throughout semi-structured interviews.

The RCI is built by ten dimensions (economic, demographic, entrepreneurial, innovation, internationalisation, infrastructural, urban green areas, agriculture, craft, tourist) while WSCI by four dimensions (quality, distinctive characteristics, fame and reputation, OCM investments); drivers and sub-drivers are segmented throughout SPSS in 4 different classes of the same size, assigning a different score according to whether they belong to class 1 (the lowest level), 2, 3 or 4 (the highest level). By adding the scores of each sub-driver, it is possible to get 10 different partial indices; their sum generates the Regional Competitiveness Index ^{Ⓢ1}.

$$\text{RCI} = \text{ES} + \text{DS} + \text{ENS} + \text{INN} + \text{IS} + \text{INS} + \text{GAS} + \text{AGS} + \text{CS} + \text{TS}$$

where:

ES = economical scores

DS = demographic scores

ENS = entrepreneurial scores

INN = innovation scores

IS = internationalization scores

INS = infrastructural scores

GAS = green areas scores

AGS = agricultural scores

CS = craft scores

TS = tourist scores

With the same process it has been computed the Wine Sector Competitiveness Index (WSCSI), composed of 4 macro-variables (2).

$$(2) \quad \text{WSCSI} = \text{QS} + \text{DCS} + \text{FRS} + \text{OCMIS}$$

where:

QS = quality scores

DCS = distinctive characteristics scores

FRS = fame and reputation scores

OCMIS = OCM investment scores

Finally the correlation between RCI and WSCI has been calculated always by means of SPSS.

RCI	WSCSI scores	Level of wine sector competitiveness
0-25	0-25	Low
26-50	26-50	Discrete
51-75	51-75	Good
76-100	76-100	Excellent

Table 1. Classification of the RCI and WSCI

Source: personal elaboration.

ANALYSIS AND DISCUSSION OF RESULTS

This research shows how stakeholders confirm those variables affecting regional (Passeri et al., 2012; Viassone and Casalegno, 2011) and wine sector competitiveness (Zanni, 2004) supported by literature.

The model describing regional competitiveness is characterized by ten dimensions: economics (Porter, 2003), demography (Poot, 2007), tourism, entrepreneurship (Cepollaro *et al.*, 2006), innovation, infrastructures (Rohm *et al.*, 2004), internationalization (Cotta Ramusino and Onetti, 2006), urban green areas (Franch *et al.*, 2008; Pilotti *et al.*, 2011), agriculture and craft, while the model describing wine sector competitiveness is constituted by four variables (Zanni, 2004): quality, distinctive characteristic, fame and reputation and OCM investment scores.

All the dimensions are composed of different sub-variables. Scores of different dimensions have been attributed in an equal way to each variable.

With reference to regional competitiveness it is possible to notice the presence of a single region with a high competitiveness (Lombardy, that instead is in 7th position with reference to the wine sector competitiveness), only one region with a good competitiveness (Lazio) and 4 regions with a discrete level of competitiveness: Piedmont, Veneto, Emilia Romagna, Tuscany. Finally the other 14 regions are placed in a low position (Table 2).

RCI	Level of regional competitiveness	Regions
0-25	Low	Campania, Puglia, Marche, Liguria, Sicilia, Friuli Venezia Giulia, Abruzzo, Trentino Alto Adige, Calabria, Umbria, Sardegna, Basilicata, Molise, Valle d'Aosta
26-50	Discrete	Piemonte, Veneto, Emilia Romagna, Toscana
51-75	Good	Lazio
76-100	Excellent	Lombardy

Table 2. Classification of the RCI

Source: personal elaboration.

This emphasizes the difficulty of Italian regions in offering an attractive and sustainable environment for firms and residents to live and work, that is to be competitive (Dijkstra *et al.*, 2011).

The datum concerning wine sector competitiveness (Table 3) turns out to be non homogenous and it shows 5 regions with a good competitiveness: Piedmont and Tuscany, in the first positions, followed by Veneto, Sicily and Puglia while the most of them (10) are placed in a discrete position while Calabria, Basilicata, Liguria, Molise and Valle d'Aosta are not competitive in the wine sector.

Both Piedmont and Tuscany are famous for the quality (16 D.O.C.G. and 42 D.O.C. for Piedmont and 11 D.O.C.G. and 39 D.O.C. for Tuscany) and reputation (with respectively 72 and 62 "Tre Bicchieri" awards in 2011) of its wines. This confirms the extreme importance attributed by Viassone (2012) and Bailet *et al.*(2010) to these two variables in the composition of the wine sector competitiveness.

WSCI	Level of wine sector competitiveness	Regions
0-25	Low	Calabria, Basilicata, Liguria, Molise, Valle d'Aosta
26-50	Discrete	Emilia Romagna, Lombardy, Marche, Campania, Lazio, Trentino Alto Adige, Friuli Venezia Giulia, Abruzzo, Sardegna, Umbria
51-75	Good	Piedmont, Tuscany, Veneto, Sicily, Puglia
76-100	Excellent	-

Table 3. Classification of the WSCI

Source: personal elaboration.

As shown in Figure 1 this paper emphasizes the existence of a positive correlation between regional and wine sector competitiveness, in particular in terms of tourist flows and investments and vice versa. This is a further demonstration of how wine competitiveness can contribute to maintain the profile of a wine region, increasing its competitiveness and vice versa (Carlsen, 1999, Hall, 2003). The relationship is linear, with a positive direction, and an entity by 0,301: so there is a meaningful correlation at level 0,05 (2-tails) between regional and wine sector competitiveness.

While Emilia Romagna, Calabria, Basilicata, Liguria, Molise and Valle d'Aosta are examples of regions where regional and wine sector competitiveness proceed in the same way, the most

of Italian regions is characterized by a low level of competitiveness (14) and by a discrete level of wine sector competitiveness (10), symptom of a Country that, thanks also to its grape varieties and its wine/food reputation, is famous at world level for its valuable wines but that it is not able enough to attract tourists, investments, resources (Passeri *et al.*, 2012).

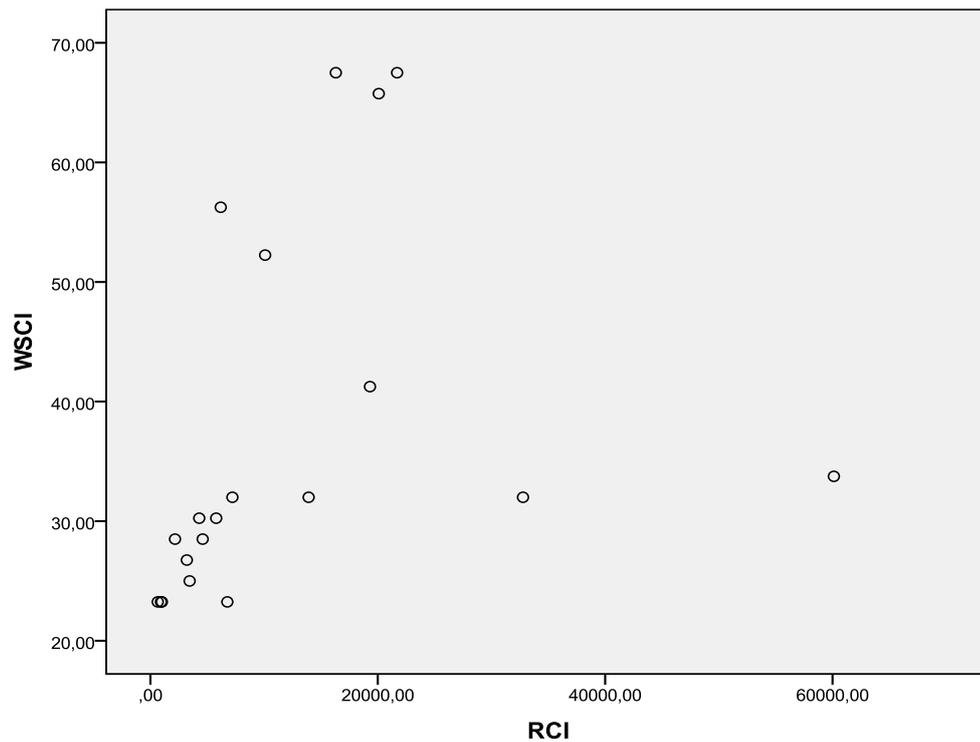

Figure 1. Correlation between RCI and WSCI

Source: personal elaboration.

CONCLUSIVE REMARKS

The research shows how the level of RCI and WSCI depends on a few variables, confirming the existence of a positive correlation between the two indices; in this way it is evident how a high regional competitiveness can affect the wine sector competitiveness and vice versa. In particular, with reference to regional competitiveness, there are many regions with a low level of competitiveness in different Italian areas while only one (Lazio) with a good degree of competitiveness and one with a high competitiveness (Lombardy). The research shows that, when it comes to wine, consumers' choice increasingly relies on reputation, quality and association with strong territorial socio-cultural aspects. Possible strategies proposed in order to develop the virtuous circle between regional and wine sector competitiveness consist in:

- supporting a strong culture of collaboration in order to strengthen wine sector research capability to better address wine sector issues;
- adopting proper strategic marketing processes;
- increasing the firm dimensions through mergers and acquisitions;
- selling premium wine to market niches or to rich people of developing Countries;
- developing the ability to communicate and improve regional brand in order to increase regional competitiveness;

Despite this paper offers an important contribute to the literature, it shows several limits, in particular with reference to exhaustiveness of drivers and indices and to its application only to the Italian context. With some changes, it could be extended to other levels of analysis (urban, national) and to other sectors (food, tourism, etc.).

ACKNOWLEDGEMENT

An acknowledgement goes to Stefano Gripiolo for his help in the collection of the data.

THE INTERNATIONALISATION OF CHINESE FIRMS: BRAND, ENTRY MODE, AND COUNTRY OF ORIGIN OPTIONS

Wilson, Ian

Staffordshire University Business School, Stoke-on-Trent, England, I.A.Wilson@staffs.ac.uk

ABSTRACT

This conceptual paper proposes a model to guide the internationalisation options and pathways of Chinese firms with respect to the choices of OEM (contract manufacturer to Western brand owners)-OBM (build own consumer brands); country market (home or foreign); foreign market entry mode (passive export, active export, or foreign direct investment); and production location (home or foreign country market).

Whilst these options are alternatives with their own advantages and disadvantages, underlying this model is the idea that the above dimensions are also inter-related. These linkages are posited to take the following forms. Firstly, some OEM-OBM brand strategies imply certain entry mode strategies. Secondly, some entry mode strategies imply certain production location strategies. Thirdly, some production location strategies imply certain brand positioning strategies and have implications for international competitiveness, resulting from a country of origin linkage.

The paper discusses some literature in these areas and builds towards a model which integrates the options. Finally the paper suggests that the development pathways facing Chinese firms may constitute a form of brand, entry mode, market and sourcing internationalisation cycle.

Keywords: OEM, OBM, Internationalisation, brand, foreign market entry mode, country of origin

INTRODUCTION

This conceptual paper follows on from the research based article 'The OEM-OBM Debate: Factors Influencing Chinese Firms' Branding Decisions in their Internationalisation Process' (Wilson, 2012). That paper developed a model of the factors influencing the internationalisation strategies of Chinese firms in terms of building their own consumer brands (OBM strategy) or to be international players by acting as contract manufacturers for foreign brand owners (OEM strategy). The present paper proposes a model to guide the development decisions of Chinese firms which incorporates additional options to the OEM-OBM choice, namely country market (home or foreign); foreign market entry mode (passive export, active export, or foreign direct investment); and production location (home or foreign country market).

Whilst these options are alternatives with their own advantages and disadvantages, underlying this model is the idea that the above dimensions are also inter-related. These linkages are posited to take the following forms. Firstly, some OEM-OBM brand strategies imply certain entry mode strategies. Secondly, some entry mode strategies imply certain production location strategies. Thirdly, some production location strategies imply certain brand positioning strategies and have implications for international competitiveness, resulting from a country of origin linkage. The paper discusses some literature in these areas and builds towards a model which integrates the options. Finally the paper proposes that the potential development pathways facing Chinese firms suggests a form of brand, entry mode, market and sourcing internationalisation cycle.

INTERNATIONALISATION AND OEM-OBM BRAND STRATEGY

The interpretations of the term 'internationalisation' vary from attitudinal factors through a generally increasing exposure to foreign markets, sources and competitors to the much more specific growth of a firm into more foreign markets and to the progressive use of more and more 'committed' forms of market entry mode strategy. In this paper, the term is mainly concerned with market entry mode strategy decisions and their relationship with branding strategies, a topic which has rarely been discussed in the marketing text literature since it was mentioned briefly by Kotler et al (1996, p.566), but also discusses their interface with country sourcing options.

Wilson (2006) and Fan (2008) have argued that there are close inter-relationships between international market entry mode strategy and branding strategy and country of origin (COO).

Although it may not be seen as a branding decision by the firms themselves, the choice of an OEM business model is a decision not to brand products and which will also largely determine its initial foreign market entry mode strategy. In the first instance, this is likely to be through passive exporting (Clarke and Wilson, 2009) i.e. Foreign Brand Owners seeking OEM suppliers may contract Chinese suppliers to manufacture products for them.

A firm with an unknown brand name, perhaps based in a country with negative country of origin cues, will find it difficult to market to foreign countries. OEM branding is one strategy which by-passes these hurdles. It reduces the costs of marketing dramatically and endorses the product with the customer's brand name. Very importantly, the product is sold through the customer's already established marketing channels. There may be further advantages for the contract manufacturer if the customer provides assistance with technology or perhaps insists on quality controls which improve the manufacturer's quality standards. Large volume orders with programmed delivery schedules may also result in the manufacturer being able to hone their processes so as to further reduce costs and become even more competitive.

Relationships built will increase the manufacturer's learning about its customer and their markets. This may encourage the OEM to then engage in active exporting. Ultimately all this learning, together with the credibility and references resulting from having already sold in the market should make it easier for the contract manufacturer to later supply the market on an OBM basis should it wish to. The (implicit) brand strategy is thus both a stimulus to internationalisation and a determinant of the initial entry mode strategy. A discussion of the advantages and disadvantages of OEM and OBM can be found in Wilson (2012). Figure 1 below summarises into a '14Cs' model the factors mentioned by the research participants as influencing their decisions.

Cost: small firms, particularly, perceive the costs of R&D and brand building communications to be a major barrier to brand building

Competencies: a lack of skills in terms of creating brands and implementing brand strategies

Connaissance: a lack of knowledge, particularly of international market entry mode strategies and foreign marketing channels, can inhibit OBM

Culture: a lack of understanding of foreign cultures leading to a fear that suitably adapted OBM products could not be developed

COO: a product seen to be made in China by a Chinese brand owner was expected to have a negative impact on foreign final consumers

<p>Customer value: the need to build innovation into products in order to persuade consumers to change brand preference</p> <p>Conflict: the fear that existing OEM customers would respond by cancelling contracts was a major inhibitor of moving to or adding OBM</p> <p>Counterfeiting: such is the threat from Chinese counterfeiters that it was seen as a reason not to expend resources to develop brands</p> <p>Competitive advantage: some firms had made the positive decision to specialise in manufacturing rather than try to build the marketing skills necessary for OBM</p> <p>Character: the ambitions and personalities of founders and senior executives played a role in determining the value of the esteem perceived to result from brand ownership</p> <p>Corporate Social Responsibility: although OEMs were expected to adopt CSR policies, there was more pressure on OBMs to do so</p> <p>Co-operation: joint New Product Development with Global Brand Owners may permit some OEMs to gain the benefits of a collaborative relationship without the risks of moving to OBM strategies</p> <p>Control – Risk: some firms saw OBM as the mechanism for increasing control over their destiny and reducing the risk of price-based customer defection; others saw control arising from careful management of OEM business without the risks and costs of brand building</p> <p>Cash flow-profit: some firms saw OBM as offering higher profits through bigger margins and others felt careful management of OEM produced high volumes with adequate margins and improved cash flow.</p>
--

Figure 1: Factors influencing the OEM-OBM decision

BRAND INTERNATIONALISATION OPTIONS

For those firms which are ready to take the OBM route, the ultimate objective of an international brand portfolio can be developed in a variety of ways. The discussion below also identifies further links between entry mode and branding strategies.

For some firms, the principal route to brand internationalisation has been to take an existing brand to foreign countries, perhaps with some degree of adaptation. According to Barwise and Robertson (1992) this method of *organic geographical extension* is slow, requires a medium

level of investment but offers high control. Well documented Chinese white goods manufacturer Haier has predominantly used this approach but, arguably, not exhibiting the characteristics implied above. Thus, despite failures in some countries (mainly as a result of political unrest), Haier's progress has been widespread and comparatively rapid and a summary of some of its development illustrates some of the options discussed in this paper.

Qingdao Refrigerator was renamed Haier, partly to give itself a Germanic, rather than Chinese, sounding name. Using technology from German Liebherr, it produced several brands for China and then made for Liebherr for the German market (Liu and Li, 2002). This first OEM contract manufacturer based foreign market entry in 1984 was followed by entry into a number of Asian markets, including FDI in Indonesia) and entry into the USA in 1999, where it invested in design, manufacturing and marketing facilities. Success in the USA has been helpful in subsequent moves into additional developed and developing markets with an OBM strategy.

A second associated route is to develop new brands with a world market in mind and then expand in the same way. Electronic products manufacturer Asus began as an OBM in Taiwan but because Taiwan is a relatively small market Asus accepted orders on an OEM basis from famous brand owners in the West and Japan such as Dell, HP, Apple and Sony and this became the major portion of its business. In 2007, however, Asus launched the Asus Eee Pc which was designed for global markets beginning with the USA, followed by China and Japan. Asus thus entered international markets on an OEM basis but has now begun to export some product types under its own brand.

A third route is by forming *foreign brand alliances* which offer a combination of moderately speedy expansion, low investment but also low control. When used primarily for foreign market entry, this type of strategic alliance can also be seen as a form of foreign market entry mode strategy.

A fourth route is *foreign brand licensing* whereby a firm can pay a fee to use an available brand name on particular products for sale in eligible markets for a specified period. In recent years some Asian brands have used this strategy to allow them to use recognised, but often redundant, Western brand names to help their sales in Europe and the USA. In 2004, in a type of hybrid of routes three and four, French firm Thomson set up a joint venture (TTE) with China's TCL, giving to TCL all manufacturing of RCA and Thomson television brands thus

making TCL the global leader in TV manufacturing. Thomson still controls the brands themselves but licenses them to TTE.

A fifth route is the *acquisition of foreign brands*, by which we mean all the assets of the business rather than just the brand name itself. According to Barwise and Robertson (1992) acquisition has the advantage of speed but requires high investment costs and offers only medium control since it is usually difficult to fully integrate acquisitions in terms of values, culture and systems. Again, when used to enter a foreign country this equates to an FDI form of market entry mode strategy.

BenQ tried this strategy in October 2005 by acquiring the loss making mobile phone division of Siemens. As well as obtaining instant manufacturing scale in Germany and marketing presence in Europe and Latin America, BenQ also acquired permanent rights to some 600 technology patents and the rights to use the Siemens brand name for 5 years. Initially a dual branding strategy was used on the new products introduced with the presumed intention to gradually phase out the Siemens brand name. However, the new enterprise produced massive losses and filed for bankruptcy after only 1 year. It also caused BenQ's largest OEM customer, Motorola, to defect. Today, BenQ only markets branded mobiles in Taiwan and continues to operate on an OEM basis elsewhere. However, it is now selling branded mobile internet devices in Italy through Telecom Italian Mobile and is continuing its push to market a broader range of BenQ branded products in foreign markets.

In summary, while probably for most Chinese firms, OBM means developing their own brand organically, there are other options, several of which imply a particular form of market entry mode when used to market to foreign countries. Several of these options may also mitigate the Chinese COO 'problem' but they may also have other implications in terms of competitiveness and sourcing strategy. These advantages and disadvantages are outlined in the next sections.

COUNTRY OF ORIGIN, BRAND STRATEGY AND INTERNATIONAL MARKET ENTRY MODE STRATEGY

A large amount of research has been undertaken in relation to COO (Al-Sulaiti and Baker, 1998), mainly in terms of its impact on consumer perception and product purchase behaviour. COO was originally defined by the 'made in' label but is now more complex, particularly in electronic products, which may be designed in one country, assembled in another from

components sourced in yet other countries. On top of this, COO in terms of brand could be seen as the country where the product brand is conceived or the country with which the brand may be associated.

COO is irrelevant for some product categories but is product specific in others Okechuku (1994). In many situations, where a brand is unknown, consumers use COO (where known) as one means of brand evaluation. In particular, COO has been found to influence consumer evaluation of quality (Khachaturian and Morganosky, 1990) and value (Ahmed and d'Astou, 1993). Despite Western acceptance of some Chinese brands (such as Tsingtao beer) and recognition of China's competence as the 'factory of the world', Chinese COO is still perceived, notwithstanding that the image of China itself is improving over time, by Chinese and non-Chinese consumers to have a generally negative impact on brand image, based on assumptions about quality (Liu and Li, 2006; Tan and Wang, 2010)

. Six out of the eight Chinese firms interviewed by Wilson (2012) cited their expectation, that Chinese COO would be viewed negatively, as one of the several factors inhibiting the development of their own consumer brands (see Figure 1). One firm, for example, was investigating the possibility of achieving a foreign COO brand by either licensing foreign brand names or manufacturing in foreign markets, as a means of addressing the issue. Chinese consumers often also have a preference for Western brands which is rooted in their wish to appear modern and affluent. On the other hand, there is a growing trend amongst Chinese consumers to buy some Chinese brands out of pride and patriotism.

Although it is a contestable assumption that consumers can accurately identify COO (Balabanis and Diamantopoulos, 2008), in the model in Table 1, the brand aspects of COO (COOb) are posited to emanate from the brand name itself and also from any 'made in' labelling. This combination recognises the impact on consumers of 'culture-of-brand-origin' in addition to country of manufacture (Lim and O'Cass, 2001). The COOB associations are illustrative only (market research should reveal 'real' multi-dimensional dimensions peculiar to specific product categories and brands) and solely to convey perceptions which consumers might be expected to have in response to different COO cues. Thus, Chinese brand names may be seen as "routine" to Chinese consumers whereas foreign brands in China often have more positive associations and are seen by Chinese consumers to provide clearer "positioning". Conversely, Chinese brand names may not be "trusted" in some foreign markets whereas local brands will be seen as the "routine" purchase. Purchasing products made in China may appear "patriotic" to the Chinese whereas purchasing foreign products

may be the “pragmatic” response to acquiring the perceived functional and emotional benefits implied by the foreign positioning in China.

Made in China may have perceptions of “value” in a foreign market when marketed under an FBO’s name but negative “quality” perceptions along with the positive value perceptions when marketed as a Chinese brand. When made in a foreign (to China) country both Chinese and foreign brands may have positive “quality” images whereas in the foreign market, made in that market will be “routine” if the brand is local. If the Chinese acquire a foreign brand and make it in the original country, then the made-in label will confer “authenticity”.

COUNTRY OF ORIGIN, PRODUCTION LOCATION AND FOREIGN MARKET ENTRY MODE STRATEGY

Our interest in COO also lies in the fact that COO not only has significant implications for branding but also, in its original manufacturing manifestation as ‘made in’, for foreign market entry mode strategy and for export competitiveness. Figure 2 models these relationships. Thus, by definition, in export entry modes, manufacture takes place in the ‘home’ country while in contractual modes such as licensing and FDI modes such as equity joint-ventures or wholly foreign owned enterprises (whether arising from acquisition or organic investment) production takes place in the foreign destination country.

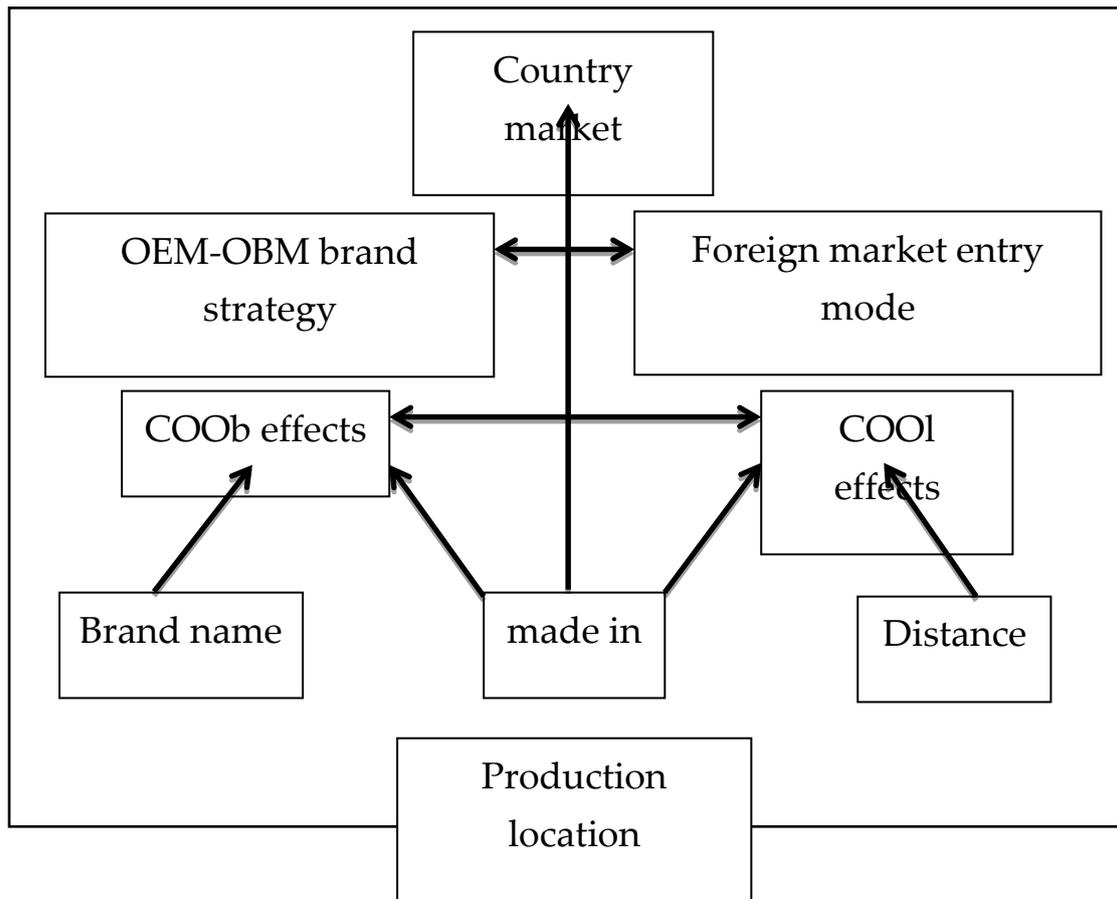

Figure 2: COO, brand and entry mode

THE (COMBINED) INTERNATIONALISATIONAL OPTION MODEL

Table 1 shows the main options facing Chinese firms on their internationalisation and domestic growth pathways. It indicates the implications of different strategies for consumer perceptions of brand image and for advantages and disadvantages of location of production for Chinese manufacturers.

Option	Made in	Brand Strategy	Client	Country Market	FMEMS	COOb		COOl	
						Brand name	Made in label	Production Cost	Distance barriers

1	China	OEM	FBO	China	-	Positioning+	Pragmatic	neutral	None
2	China	OEM	FBO	Foreign	Passive/ Active export	Routine	Value +	+	AG
3	China	OEM	Self	China	-	Routine	Patriotic	neutral	None
4	China	OEM	Self	Foreign	Passive/ Active export	Trust -	Quality -	+	CAGE
5	China	FB name Buy or License	Self	China	-	Positioning+	Pragmatic	neutral	None
6	China	FB name Buy or License	Self	Foreign	Export	Routine	Value +	+	AG
7	Abroad	OEM	FBO	Foreign	FDI organic	Routine	Routine	neutral	None
8	Abroad	AOBM	Self	Foreign	FDI Acquisition	Routine	Authentic	neutral	None
9	Abroad	AOBM	Self	China	FDI Acquisition	Positioning+	Quality +	-	AG
10	Abroad	OEM	Self	Foreign	FDI organic	Trust -	Quality +	neutral	None
11	Abroad	OEM	Self	China	-	Routine	Quality +	neutral	AG

Table 1: Brand, Entry Mode and COO internationalisation options

COOI	Country of Origin - Impact of production location	FB name	Foreign Brand name
COOb	Country of Origin - Brand Image associations	FBO	Foreign Brand Owner
EM	Original Equipment Manufacturer (Chinese contract manufacturer)	FMEMS	Foreign Marketing Entry Mode Strategy
OEM	Original Brand Manufacturer (Chinese brand manufacturer)	AOBM	Chinese acquisition of marketing manufacturing assets of Original Foreign Brand Manufacturer

In the model in Table 1, the production location implications of COO are posited to be production cost and 'distance' between production location and destination market. Production cost assumes that China is a lower cost location than Western countries (though there is increasing evidence that the cost advantage of sourcing in China is eroding as a result of wage inflation and if the full costs of overseas procurement are included).

Distance is a holistic concept which, here, is based on CAGE (Ghemawat, 2001), an acronym for cultural, administrative, geographic and economic barriers. Economic distance includes differences in incomes and costs and quality of resources. Geographic distance refers not only to mileage but also to presence or absence of common borders. Administrative distance includes such things as political hostility, presence or absence of political, colonial and economic ties. The premise is that the larger the distance between two countries, the more difficult it will be to trade. While this is broadly true, individual firms can reduce some of these barriers.

Thus, the model assumes that an OEM branding (with manufacture based in China) strategy will circumvent some of the cultural and administrative distances and perhaps turn economic distance into an advantage while an OEM strategy with manufacture based in the foreign market will not suffer from geographical distance nor any of the other CAGE factors provided it has an associated Marketing operation which engages with customers at a local level. Likewise, OBM strategies will have different distance impacts depending on whether manufacture and marketing take place in China or in the foreign market. Thus, for example, all the CAGE factors will probably be negative when manufacture for foreign markets is undertaken in China while cultural and administrative factors may be positive if manufacture occurs in the foreign market.

As stated previously, it should be noted that – for the sake of completeness of development directions - the model includes options in the Chinese market as well as foreign market options. An illustrative explication of one of the foreign market options facing Chinese firms is given in relation to Option 2. The foreign customer sees the brand as "routine" in that the name suggests Western origin whilst the "made in " label suggests "value –for–money" given its low cost production location endorsed by an FBO. The Chinese contract manufacturer gains from the low cost location but suffers from partial distance problems i.e. geographical

and administrative distances are high but cultural and economic distance are reduced because of the OEM brand strategy.

As yet, few Chinese brands have established themselves as major players on a global basis but firms such as Haier, Galanz, HTC, Huawei and others have become significant forces in some product sectors and market segments in some country markets. Their resources will permit any and several of the above options to be employed. Smaller Chinese firms will, however, need to make choices about their options and subsequent pathways.

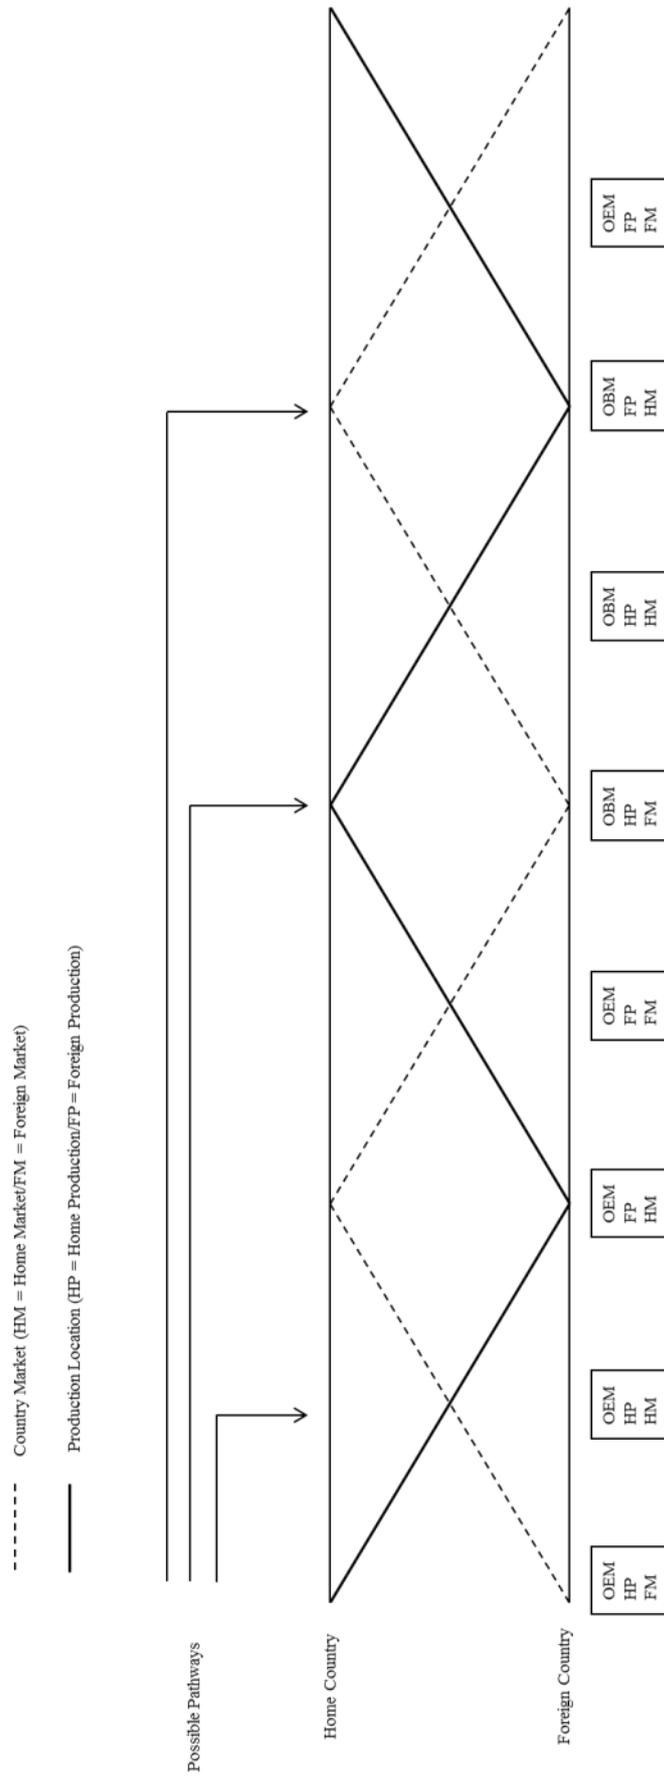

Figure 3: Brand, COO and country market pathways

DISCUSSION: ACADEMIC IMPLICATIONS – SIGNS OF A BRAND, ENTRY MODE, COO CYCLE ?

In a study of the pathways taken by Singaporean garment manufacturers during the 1980s and 1990s, Van Grunsven and Smakman (2005) identified 7 development trajectories among which OEM strategies inevitably resulted in internationalisation as foreign buyers seek sourcing opportunities. Figure 3 illustrates a set of potential pathways in terms of the brand, COO and entry mode options. Of course, any individual firm could omit any of these stages and end the process at any point. Equally, any individual firm could build a portfolio which included many – or even all – of these strategic options.

Nevertheless the patterns of internationalisation of Chinese manufacturers suggest a developmental process in the way that Vernon (1966) postulated for US firms in his model of an international trade and product cycle. Vernon's cycle was stimulated by factors such as the changing incomes of consumers in different countries, costs of production, ease of access to foreign markets amongst others. The 'cycle' proposed here is also prompted by similar forces but also by changing perspectives on branding, COO, sourcing and market destination strategies. One potential pathway for Chinese firms can be summarised as shifting from OEM branded home production for foreign markets (Option 2) to OBM branded foreign production for the home market (Option 11). In between these extremes, the Chinese firm may pass through stages such as OBM export, licensed foreign brand export, acquired foreign brand export, OEM FDI, OBM FDI by acquisition and OBM organic FDI.

Clearly, the precise pathway will be different for each firm but there is a sense of a cycle albeit with an increasing number of spin-offs en route. For example, Chinese internationalisation often begins as the response to FBO sourcing strategy but then widens into a multitude of options. As the attractiveness of the Chinese market increases relative to Western markets, so will Chinese focus shift from abroad to home; as Chinese brands grow in stature, so will there be a general shift from OEM to OBM; and as China becomes relatively more expensive as a production location, so will foreign production increase. (This paper assumes foreign production located in the destination country market. In practice, much production will be re-located to lower cost third countries.

There is a corollary 'cycle' for foreign (Western) brand owners whose involvement in China has often started as an import sourcing strategy for the West and then widened to add

resource seeking FDI in China for Western markets and then market seeking FDI in China for the Chinese and other Asian markets.

It is also possible to see a cycle in the changing relationships of Chinese and Western firms. For example from a Chinese perspective, typically, the Western brand owners begin as customers. As relationships deepen and dependencies increase, the arrangement becomes more of one of collaboration. For those Chinese firms which take or add the OBM route, erstwhile customers and collaborators may well become competitors.

CONCLUSION

In reality, Chinese firms will also need to take into account more factors than those shown in Table 1 (which focus on the inter-related items of brand, entry mode and country of origin). For example, there is increasing recognition that some Chinese firms are actually internationalising in order to obtain competitive advantages, rather than to exploit existing advantages as in the traditional Western model (Goldstein et al, 2006). Motivation for internationalisation will obviously affect the options chosen. However, whilst the above options model and cycle are clearly slices and simplifications of complex decision making phenomena they may help to highlight and structure some of the key factors. The importance of the issue for Chinese and Western firms suggests that extensive research into the topic would be more than justified.

COLLABORATION COMPETENCE DEVELOPMENT: THE CASE OF BIONIC, LTD

Yeromenko, Galyna

Ukrainian Mediation Centre at Kyiv-Mohyla Business School, Ukraine,
eremenko@kmbs.com.ua

ABSTRACT

This pedagogical case draws attention to the role of a HR manager as a facilitator / mediator in negotiations inside an organization, aimed not only at conflict resolution, but at dealing with rising of company competitiveness and effectiveness from HR perspective.

Highly structured environment with clearly defined goals of every department in an MNC often provokes 'competition for a client' inside a company. This case allows for deep study of a conflict of employees' interests, and proposes to look for the ways of its resolution with help of the soft management approaches (e.g. using Harvard negotiation project methodology). It also highlights the importance of collaboration competence development in modern business organization.

This case, written in Ukraine, is based on several prominent multinational companies in IT sector and was prepared under the research framework of the SCOPES project (Swiss-Russian-Ukrainian institutional partnership 2011-2013).

Keywords: Collaboration competence; conflict resolution; win-win approach; interest; one enterprise approach; negotiation.

CASE DESCRIPTION

Competition between employees of the two departments in Ukrainian branch of multinational IT company results in a loss of income, and resources are needed to resolve the conflict. The company decides to develop "cooperation" competence among staff and appoints HR manager to be the leader of this process.

Increasing competition on the IT services market creates the challenges of improving competitiveness and efficiency of Bionic LTD. Creation of additional resources for improving competitiveness of the company is connected to the development of *one enterprise* approach. This approach means that the priority for the employees is to get the *collaboration* competence. That is why Bionic LTD considers as one of its main tasks to create the corporate culture in which employees connect company's success to their own success. Great possibilities might be provided here by accepting *win-win* approach, concerning solving management tasks as well as difficult challenges, connected to the conflict of employees' interests from different departments in the company.

So the company aims its efforts on development of the *collaboration* competence among employees. The expected result of the development of this competence is that all the employees are motivated to act in the interests of the company, and different departments of the company are trying to sell to clients the services of other departments. At the same time employees consider success of the company as their own.

The development of the new competence, according to company's management, should lead to creation of transparent trusting relations between employees of different departments. This in turn should help creating the environment that encourages the development of creative and innovative thinking among employees and motivates them to look for and to implement the new solutions. This hypothesis is confirmed by the results of new research, conducted within the Harvard negotiation project.

There is hope that the cooperation between the employees of the company, which is based on collaborative relationships, would allow to implement *one enterprise* approach. This move would help:

- To increase cross-selling of the products of the company (from software to consulting),
- To strengthen the company's reputation as the one that provides high-quality and complex services,
- To create conditions that would motivate customers to use legal software,
- To improve the quality of the customer base of Bionic LTD by better information sharing within the company about customers and their needs,
- To provide long sales that would not be limited by selling of software and would allow to develop new services related to customer service;

- To develop new innovative product offerings that would allow being one step ahead of the competition.

Development of *collaboration* competence is especially important for the two departments of the company. The first one is Enterprise group, which works in three directions:

- 1) Major customers,
- 2) Small and middle-sized business customers,
- 3) Government.

The main task of Enterprise group is selling software to the customers of Bionic LTD. In addition Enterprise group is also responsible for coordination of the work with partners of Bionic LTD. These partners are small IT companies that have signed the partnership deal. They provide services to the customers of Bionic LTD (mostly to small and middle-sized business) after delivery of the software.

The second department is the Service group, which provides customers with the services concerning software that was sold to them. The tasks of the specialists of this department are the post-sale services provided to the customers. Mostly these services are consulting services to the major customers concerning implementation and using of the new software. Their services are partly the same as services of Bionic LTD partners.

Thereby Enterprise group has wide access to customers, knows their needs and interests, and trying to satisfy them in a best possible way. Usually representatives of this group keep their hand on the pulse of the customer. And Service group provides consulting services mostly to the clients of Enterprise group.

Until recently Bionic LTD worked mostly with major customers, who are able to appreciate all the benefits of cooperation that is based on *one enterprise* approach. Middle-sized or small companies are mostly the clients of partners of Bionic LTD. Relations with the partners of Bionic LTD are built on the principles of transparency, integrity and mutual aid.

Supply of software is an exclusive service provided by Enterprise group. At the same time, regardless of size and financial capacity, customers of Bionic LTD care about optimization of all their costs including the costs of post-sales support by Bionic LTD. Thus, partners of Bionic LTD potentially become a competition for Service group of Bionic LTD by

“price for services” criteria, even for major clients. Demand for the services of Service group decreases. The company starts to lose profits, and that is why the issue of cooperation between Service group (consulting services) and Enterprise group becomes especially topical.

The situation is complicated by the fact that at Ukrainian market of IT services software users have the possibility to use unlicensed software. Disagreements within the company may lead to increased use of unlicensed software, and thus reduce the demand for Bionic LTD services in general. If the situation in Ukraine is not resolved soon, there is a risk of decrease in sales as well as the risk of financial losses within the company because of the cost of resolving the conflict between the two departments.

The company management placed the responsibility on HR for urgent development of collaborative culture and its implementation inside the company. The company tried to make changes, but presentations by HR manager for the representatives of two departments on how things might be different, did not work.

Unsolved problem leaves all the departments of Ukrainian office without any chance of winning the "Bionic LTD Contribution" competition. This is very sad, because representatives of more than 20 countries take part in this competition. "Bionic LTD Contribution" is a prestigious annual award for those who made the greatest contribution to the company. For winners it is not just a real chance to become well-known in the international branches of the company. Often, even the fact of being nominated have a positive effect on the further career development.

TASKS:

1. Identify the participants of the negotiations and the role of HR manager in this process. Design the negotiations process between two departments (who contacts whom, when and with what kind of issue).
2. Analyze the situation from the point of view of the *interests* and possible options for cooperation development between Enterprise group and Service group.
3. Negotiate with the help of HR manager. HR manager is supposed to play the role of mediator at the meeting of groups' leaders. The main task of this meeting is to find possible solutions and to prepare the common meeting of employees from two departments. In the process of negotiation, make hypotheses about feasible solution

options for this problem. Being HR manager, try to give the parties as much autonomy in looking for possible solutions to address the situation as you can.

4. Discuss the issue of necessary managerial decisions that would contribute to the implementation of achieved agreements and development of "cooperation" competence among staff.

CONFIDENTIAL INSTRUCTIONS FOR ENTERPRISE GROUP (ON A SEPARATE PAGE):

Our Enterprise group has access to customers, knows their needs and interests, and tries to satisfy them in a best possible way. It is difficult to combine the interests of the company, customers, partners, other units and your own interests, including personal. This is understandable. You are rewarded for the performance of your unit, and everything else is not your problem. A client will be able to buy services of Service Group if he still has funds in his budget; if not, then a client has an alternative to buy services from the partners of the company.

In a whole, things are going well in the department. Some inexplicable failures of the software don't influence much on level of clients' satisfaction. However, there is a risk to lose the company's face, because your managers' knowledge is not deep enough to discuss the failures in the software issues with the client. You have to get deep understanding on how to work systematically with clients on the software shortcomings; otherwise it can lead to loss of time and the deterioration of relations with clients.

One enterprise approach is being implemented in the company. But it's not that easy, because your account managers do not have competences to offer services of Service Group and Service Group consultants are not always available to take part in meetings with clients. Consultants of Service Group often refuse your invitations to take part in meetings with clients at the stage of product sales because of the work pressure.

And in general, who talks about this problem? For now everything goes as it goes: everyone on his own tries to act in the best possible way. But for whom this way is the best? Orientation on the general success of the company is still important, but we will think about it later, right?

Interesting, who will win the *Bionic LTD Contribution* contest this year? This is a prestigious annual award for those who made the biggest contribution to the development of the company.

CONFIDENTIAL INSTRUCTIONS FOR SERVICE GROUP (ON A SEPARATE PAGE):

Service group provides clients of Enterprise group with post-sale consulting services. If there are some technical difficulties in using the software, then your consultants are always ready to help. This is why the cooperation with representatives of Enterprise group would give substantial additional possibilities for selling services and products of your department as well as other departments of the company. As a result, everyone would earn more. And now the clients' money goes outside of the company, to the partners.

Clearly, it is difficult to sell consulting services without special knowledge that account managers of Enterprise group do not have and therefore poorly explain the benefits of your services comparing to the services of partners. You could more actively provide account managers with expert information and support them during meetings with clients while giving them the initial offer. At the same time, we all are allowed to participate in first meetings with clients while working on the initial offer. However, it is unknown whether it makes sense to do so. Our consultants spend a lot of time on these meetings, but the result is poor. Invitations to meetings with clients often look like a generous gift from a rich uncle and depend on the specific manager's will. Maybe it is better not to go to meetings at all, but then everyone, including the company, loses.

Generally there is a belief that the group plays a minor role in the plans of the company. It is not really clear why your fate is to work only with big clients. Working with representatives of small and medium business should mean opportunities for all, not just partners.

Everyone feels lesser importance of a Service Group in the company's success, and the attitude in the Enterprise group towards you reflects that. But they also have problems! Clients are clearly tired to harass account manager concerning every error in the software, especially since they're still not getting professional help. Your consultants have creative ideas for new services that would allow everyone to save time, nerves and face.

We could think together what to do in order to make time for preparing quality offers more effectively. Perhaps we should prepare a project offer for a client together? But nobody knows if it is really possible. And nobody in the department can understand how to find the proper information about customer needs on time; in what terms an offer should be done; who should make the first step; who is there in Enterprise group that makes a decision on a final offer to the client, and so on.

If everybody could gather and talk to each other as experts, then it could turn out that consultant may improve the image of Enterprise group on meetings with clients. But no one dares to speak first. It is not very comfortable to talk about all these issues. What it would sound like a complaint? No one wants to spoil the relationship. It is hardly possible to implement changes and keep the good relationships between departments at the same time.

No one knows whether there is any positive experience in solving similar problems in other countries. There is feeling that they demand the impossible from Ukraine. The company tried to make some changes, but general meetings of the two departments with the presentations of HR manager on how things could have been different, did not work. After all, sometimes the best intentions are so far from reality!

TEACHING NOTES

Case target audience

Top and middle level managers (executive level), who are responsible for effective employees' interaction, high-quality managerial decisions and implementation of these decisions in their companies.

The recommended course to include this case study into is: Organizational Culture.

The case aims

1. Development of the skill of non-conflict resolution of complicated managerial tasks
2. Development of mediator competences that include such skills:
 - Management of negotiations process: group members should gain knowledge about effective negotiations with the participation of facilitator (mediator), its six stages (meeting preparation, meeting opening, exploration of interests, finding a solution,

agreement formulation, and organization of negotiation working space). Furthermore, managers should learn to build an effective negotiation process: to define right goals and right participants for a meeting, determine who to meet while preparing negotiations and why, complete negotiations in a right manner (evaluate results and implement agreements).

- **Work with content:** to have an idea of what the interests are, to be able to detect them via asking questions, to analyze, to assist in looking for mutually acceptable solutions through questions, to evaluate them using objective criteria, to deliver SMART solutions (specific, measurable, achievable, realistic, timely), to be able to check actuality of their solutions.
- **Management of relations:** ability to manage emotions, to talk positive language, to have an idea of active listening and to work out skills of active listening while working on the case (silence, summarizing, paraphrasing, etc.), to be able to check the judgments and assumptions about the motives of other people, to form trusty relations.
- **Ability to implement the agreements:**
- Developing of a plan of implementation of the agreement; to understand the barriers within the company that prevent the implementation. To be able to "sell" to top managers the agreements achieved in negotiations process. In particular, they should be able to explain to the company's top management why the implementation of the agreements is important for the company as a whole
- to look for creative managerial decisions.

Case delivery recommendations

Number of participants in the group: up to 30 people.

Learning activities in this case study:

- Discussions in small groups
- Simulation (role play)
- Discussions in large group (debrief)

Recommended time for preparations:

- Preliminary studies aimed at developing the skills of a mediator among managers (24 astronomical hours).

- Familiarization with the case right before study (20 minutes). Please note that the case study contains general information and confidential instructions to participants. This means that prior to the training participants should be divided into groups (HR manager, representative of Enterprise group, and representative of Service group) and familiar with the general instructions and only with their specific confidential instructions.

Duration of work on the case study in lecture room: 140 minutes

Specific requirements for the teacher: mediator competences.

Case study work organization

Warning: Samples of steps and possible solutions are listed below. If participants would have other solutions, this should not be counted a mistake.

Step 1. Presentation of the case study (15 minutes)

The teacher introduces the general plot and purpose of the case study. It is also necessary to remind participants that during a role play they will have to demonstrate the mediator skills.

Step 2. Work in small groups on the first two questions of the case study (40 minutes)

- Determine the participants of the negotiations and HR manager in this process; design the negotiation process between two departments (who addresses whom, when and with what kind of issue).
- Analyze the situation in terms of interests and possible cooperation between Enterprise group and Service group.

Here you have to divide the participants into three groups: HR managers, representatives of Enterprise group, and representatives of Service group. Discussion on the performance of small groups is to be held at the final stage after the role play (step 4).

Possible answers to the question "What is an optimal design of the negotiation process?"

1. Preparation stage:

- HR manager should hold meetings with the group leaders to exchange thoughts on the vision of the problem.
- After that it would be appropriate to have separate meetings with each group to share information about the causes of negotiations and another testing of hypotheses concerning interests of the parties, which were voiced at a joint meeting of leaders.
- Meeting with leaders of groups to find possible solutions and preparation of the joint meeting. Ability to work in a wider focus group.

2. Negotiations stage (mediation):

- General meeting of representatives of two departments in order to find possible solutions that would be based on the interests of the parties
- Development of the plan on implementation of agreements
- Deciding on what agreements should be agreed with the company's management

If no agreement is reached, you may need to hold several separate meetings of HR manager with representatives of each department.

Possible answers to the question "Analysis of the situation, preparation for the negotiations":

Answering the following questions will help you to analyze the situation and parties' interests:

- What is important for the participants in this situation?
- Why is it important for them?
- What does it mean for them?
- Which interests are the most important for every party (priorities)?
- What are their common interests?

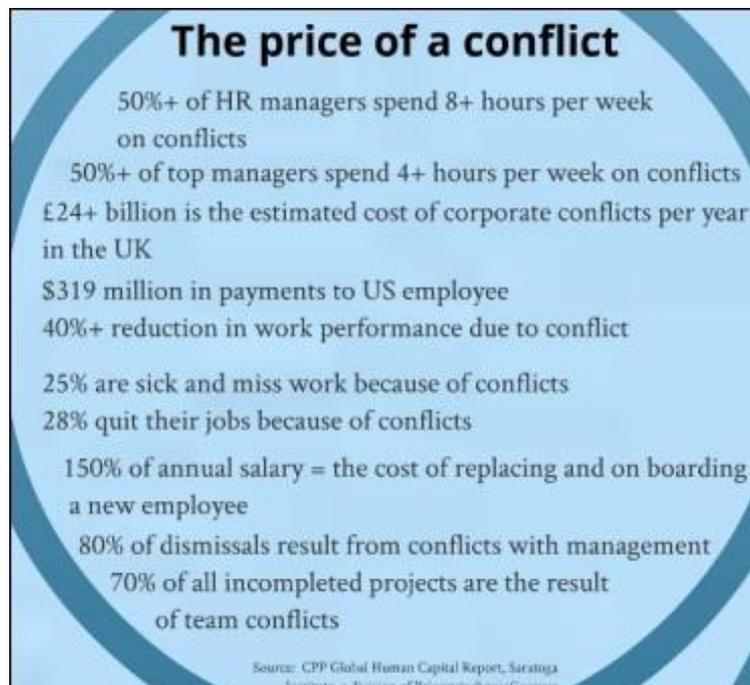

Below are listed just some of the interests appropriate for the participants of the situation. You can also add the interests of clients, HR manager, partners and others to the table. It should be noted that the interests of the company should be one of the criteria for assessing the acceptability of agreement options between the two departments.

Bionic LTD (Ukraine) interests. Interests bearer: top management of the company	Enterprise group interests	Service group interests
Increase in sales	General stability of company's work	<ul style="list-style-type: none"> • To make more money. • Closer cooperation with Enterprise group

Reduce the cost of conflict resolution and competition within the company	Getting compensation for the sales of additional services provided by Service group	Get more information about the Enterprise group, the needs of potential customers, experience in implementing similar processes in branches of company in other countries
Image and reputation in the faces of the parent company, partners, customers	Improving the image of department within the company, which is achievable if you get prestigious award <i>Bionic LTD Contribution</i>	Upgrading the status of the department within the company
Rapid implementation of the new approach (time)	Saving the face in front of customers in case there is a complaint on the technical failure of the software	The most effective use of the time of consultants
	Retention of old clients and attraction of new ones	General stability of company's work
	Quality and quick preparation of complex offers to clients (including services of Service group)	

Interests of the key parties of the case study

Additionally, you may notify participants about the cost of the conflicts in a company:

The costs of the conflicts in a company

Step 3. Role play in small groups: negotiations (40 minutes)

Participants should be divided into groups with three people in every group (playing the roles of HR manager, Enterprise group representative, Service group representative).

Participants should have negotiations with the participation of HR manager, giving him the role of mediator in negotiations process between Enterprise group and Service group. The purpose of the negotiations is to find possible ways out of the situation. Encourage participants who play roles of HR managers to focus on conducting of the effective process, and representatives of the departments should be provided with more freedom and autonomy in finding optimal solutions in the development of the culture of trust and collaboration within the company.

Remind HR manager about the stages of mediation and the need to keep to them during the negotiations (opening of the meeting, work with interests, creating of the possible ways out of the situation, formalization of the agreement).

HR manager's role in solving the situation:

- Expert. He may express his vision of the situation, including vision concerning the interests of the company
- Mediator in negotiations process between two departments
- Mediator in negotiations between departments and top management of the company

Step 4. General discussion (45 minutes)

1. Discuss the question whether the HR manager's role as a mediator in this process was helpful or not? Could the parties agree on their own without an agent? Was the process comfortable for the parties and for the mediator? What mediator's actions contributed to the effectiveness of negotiation process?
2. Sum up the discussions in small groups concerning the optimal design of negotiations process (step 1)
3. Gather the information about identified interests of the parties, priority interests, and common interests into the groups. Put the results of discussion to the following table:

Bionic LTD (Ukraine) interests. Interests bearer: top management of the company	Enterprise group interests	Service group interests

4. Discuss the possible solutions that participants came up with in groups. Compare them to specific experience of the prototype company. Identify solutions that require approval from the top management of the company to be implemented. Discuss the reasons why top management should be willing to make the necessary changes (in terms of its interest).
5. Discuss the skills of mediation that participants used successfully; what should be improved, and what should never be done.

	Negotiations management	Work with content	Organiza tion of relations
Well done			
Needs improvements			
Should never be done			

Background information for the faculty

Find below the useful information on a prototype of Bionic LTD and real steps and changes that occurred in the company in connection with the introduction of *one enterprise* approach, and *collaboration* competence development:

- When making changes directed to introducing *one enterprise* approach, negotiations in the form of facilitation proved to be effective, and the role of facilitator and mediator was taken over by HR manager.

- The negotiation process is organized as follows: focus groups within departments were conducted, and then representatives from the two groups were voluntarily selected. Together with the HR manager they started the process of preparing a joint meeting of the two departments. During the preparations questions for the discussion were carefully chosen, their importance was prioritized.
- In order to motivate Service group to implement *one enterprise* approach, the RACI model (responsible, accountable, consulted, and informed) was introduced. Service group received a more active role in making WIN-plans of Enterprise group in terms of services sales. Also Service group is now involved in the preparation of complex proposals for clients of Enterprise groups in the part which refers services. Preparation of proposals concerning WIN-plan takes much less time than participation in regular (together with account managers) meetings with clients.
- Clients are offered a new service, which is called quality insurance. It allows customers of Bionic LTD to make realistic assessment of the added value of Service group's consultants' work. The service is to guarantee the quality of new software products and so-called "after-sales service" for customers long after the sale of the software. This approach allows extending the life cycle of services provided by Service group, and actually creating a new service that cannot be provided by partners of Bionic LTD.
- Consultants of Service group within the quality insurance service collect information on the weaknesses of the software, and develop proposals for its improvement and creation of new services. This is extremely beneficial for managers of Enterprise Group.
- Regular weekly meetings to exchange information on the implementation of the sales plans were introduced. Through shared responsibility for the result (execution plans by RACI model), the leaders of the two units were motivated to participate in joint meetings on the process analysis and sales plans.
- Rewards for the leaders of two groups for the successful operation depend not only on the performance of their unit, but also on the overall result of cooperation between two units and the company as a whole.
- The need to develop soft skills in the conduct of win-win negotiations was revealed. Development of skills of effective feedback was initiated.
- Joint virtual meeting (business calls) with Bionic LTD representatives in Eastern Europe were introduced. Representatives of the two departments take part in these

meetings, which help them to develop team spirit and a habit of thinking based on common goals and shared responsibility. Employees were informed about the positive experience in solving similar problems in the Russian branch of Bionic LTD. The problem of competition within the company has been successfully solved by the joint efforts of all employees of the company and its partners. In particular, due to the introduction of *one enterprise* approach the company's sales growth doubled in two years.

- The company has the possibility of raising the motivation to implement *one enterprise* approach through monthly compensations, Bionic LTD Contribution Award and more.
- The first six months of implementation of the new approach have proved the appropriateness of the chosen direction of development for the company. The bidding volume of new contracts increased at 30%.
- The company has plans for wider involvement of the Service group in the services for SME sector. That might occur through greater direct cooperation of Service group with partners of Bionic LTD.

A COMPARISON BETWEEN THE PERCEPTIONS OF THE IDEAL LEADER FOR COLOMBIANS AND CHILEANS USING THE LEADERSHIP PRACTICES INVENTORY OF KOUZES AND POSNER

Zárate, Rodrigo¹; Matviuk, Sergio²

¹Universidad EAN, Colombia, razarate@ean.edu.co

²Regent University, USA, sergmat@regent.edu

ABSTRACT

Some experts in the study of leadership like Kouzes and Posner (1995) state that leadership can be defined from observable behaviors, this implies that people identify their leaders as they show this behavior, therefore, the effectiveness of a leader will depend in how much the behavior of the leader resembles the behavior expectations people have of what they think an ideal leader is (Haslam, 2004). The objective of this investigation is to determine the behaviors the ideal Colombian and Chilean leaders should show, compare the results and analyze them. Very few studies in leadership have been done in Latin America about the behavior of effective leaders. To develop these studies, an adaptation of the Leadership Practices Inventory of Kouzes and Posner was made, and the samples for the survey were determined, previously establishing the characteristics of the leaders to survey.

The results provides important information for both countries, they suggest that the expectation of behavior of the ideal leader for Chile and Colombia is centered in his or her ability to enable others to act followed by modeling the way. The results also suggest that leaders must be conservative and traditionalist.

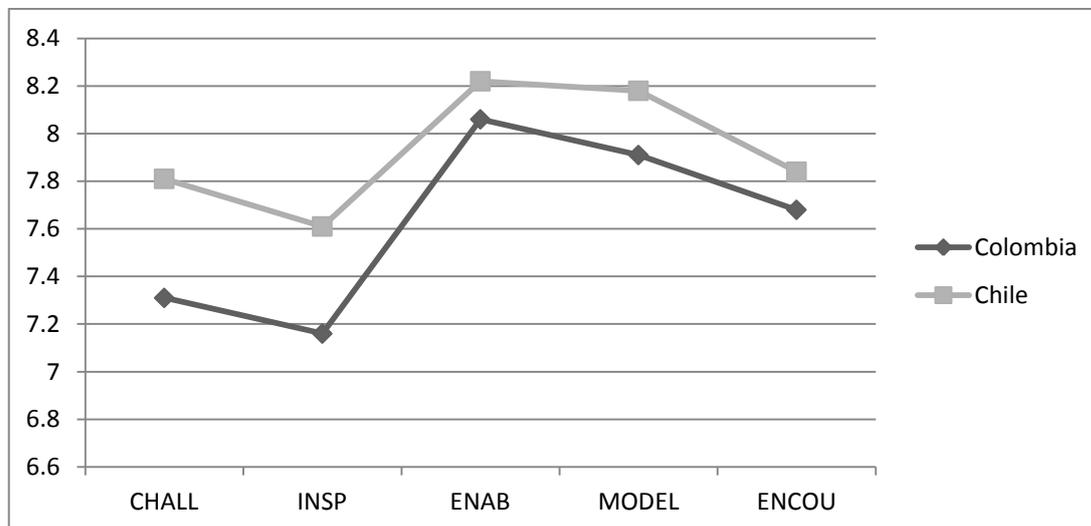

Key words: Leadership, Colombia, Chile, Leadership Practices Inventory

Experts in the field of leadership studies, such as Kouzes and Posner (1995) propose that leadership can be defined from observable behaviors; this implies that followers identify and define their leaders through those leaders' behavior. Moreover, since all followers have expectations on right and wrong behavior, the effectiveness of a leader could well depend on how much the behavior of the leader resembles the behavior expectations that followers have (Haslam, 2004). Very few studies in leadership have been done in Latin America about the

behavior of effective leaders. This investigation pretends to determine the 'ideal' behavior that is expected of Colombian and Chilean leaders in order to be considered effective leaders. This investigation also compares the results and analyzes them to see the relation between expectation of followers and actual leadership effectiveness. To develop these studies, an adaptation of the Leadership Practices Inventory of Kouzes and Posner was made, and the samples for the survey were determined to previously establish the characteristics of the leaders needed to survey.

Initial analysis was made to assure the reliability of the data concluding that the alpha of Cronbach result was over 0,70 which according to Nunally (1978) it can be concluded that it is reliable.

Figure 1. General results

Source: Authors

A total of 439 surveys were made, 339 in Colombia and a 100 in Chile. Figure 1 shows the comparison of the general results per country. Each practice is abbreviated as follows: challenging the process (CHALL), inspiring a shared vision (INSP), enabling others to act (ENAB), modeling the way (MODEL) and encouraging the heart (ENCOU).

Table 1 shows the results for each of the variable per country. The results show that there are some differences between the two countries. Chilean's followers seem to have higher expectations from their leaders' behavior. Even though the curves, when the graphs were made (See graphic 1), are similar, the behavior expectation of the ideal Chilean leader, in the 'modeling the way' (MODEL) practice, is much higher than Colombians expectation.

Table 1. Description of the results for each variable per country

CONCLUSIONS

The results provide important information for both countries, they suggest that the expectation of behavior of the ideal leader for Chile and Colombia is centered on his or her ability to enable others to act followed by modeling the way. The results also suggest that leaders must be conservative and traditionalist in their behavior.

Each country's human resources departments can use the results of this study to define the characteristics of each country's leaders and in that way determine selection and hiring

policies. They also contribute to the preparation of transnational leaders of organizations that want to operate in Colombia and Chile.

EXPLORING THE ROLE OF TRUST IN BUSINESS RELATIONSHIP WITHIN THE CHINESE SHIPBUILDING INDUSTRY

Zhou, Jiangfan¹; Sanchez Bengoa, Dolores²

¹Cheltenham University, UK, jiangfanchow@me.com

²International Business School at Vilnius University, Lithuania, sanchezl@cytanet.com.cy

ABSTRACT

China's rising shipbuilding industry offers an extensive market opportunity to the world's shipbuilding industry. The Chinese shipbuilding industry is characterised by being mainly state-owned enterprises (SOE) and has a legacy of a previous planned economy. These state-owned enterprises operate under governmental control as well as, receive governmental support. European co-operations with Chinese state-owned enterprises face major roadblocks in terms of pattern of agreements, understanding with shippers, or coping with government's policies and requirements.

The research will discuss the role and influence of trust affecting the business relationship between European suppliers and Chinese SOE shipbuilding industry. It will provide suggestions on how to build up trust for a solid business partnership. The interest's trilogy (government, relationship and trust) should be taken into account in order to avoid tension between the supplier's interest, state's interest and SOE's interest.

The methodology applied in this research will be of qualitative nature using a case study with in-depth interviews. It conducts exploratory and descriptive methods to get a deep understanding of how trust and relationship are developed in a market entry strategy with Chinese SOE.

The outcome of the qualitative research will reveal the role that trust plays in Chinese SOE shipbuilding industry, leading to the development of a new model which is based on trust and relationships being regarded as the success factors for European shipbuilding industry when entering in the Chinese market being under governmental supervision.

Keywords: Trust and relationship, market entry strategy China, culture, China's shipbuilding market, shipbuilding Industry

INTRODUCTION

Over the past years, China has drawn attention of the world shipbuilding industry because of its rapid development. According to Salles (2013) China, hold the 45% of market share in 2012, and it was in the first position ahead of the rest of the world.

China's rising shipbuilding industry offers an extensive market opportunity to the world shipbuilding industry. After having conducted a preliminary investigation of the Chinese shipbuilding market, the researchers found out that the Chinese shipbuilding industry is predominantly state-owned enterprises (SOE). This finding is confirmed by Mattlin (2009) who explains that this situation occurs as a legacy of the planned economy in China. After 1978, economic reforms in the People's Republic of China lead to dramatic performance improvements in Chinese SOEs (Groves, et al. (1994); Xu and Wang (1999); Li (1997); Cao, Qian, and Weingast (1999). In spite of that, Mattlin (2007) highlights the dual role of big Chinese state-owned enterprises as both corporations and arms of the state machinery. This could be the case as he further explained, because China has never embraced privatisation of state-owned enterprises as a central policy goal. Instead, it has been China's ambition to build a national team in several key industries including automotive, pharmaceutical, electronics and petrochemical in which SOEs have a dominant presence (Nolan, 2001).

Due to these SEO characteristics, shipbuilding industry concerned with international trade face inevitably complicated pattern of agreements and understandings with shippers and in this case with Chinese government policies like governmental protection or governmental support (Karakaya, 2002, Stopford, 2009). The Chinese government can make corresponding preferential policies like preferential tax or financing convenience, moreover, the government subsidies, promote and support its developments. Needless to say, that the Chinese government has enough influence on the state-owned shipbuilding companies with products, technology and even with the prices. (Li, 2011)

Conclusively, it can be seen the remarkable role that the government plays in the shipbuilding market, suggesting that for European companies entering into the Chinese shipbuilding market will have no other chance that getting in contact with the Chinese government.

In this context, the researchers will explore the role of trust and relationship building with Chinese government to provide important insights to European suppliers who want to enter in the shipbuilding industry and share the significant Chinese market. The researchers will discuss theoretical and practical implications on trust and relationship building for a successful business relationship in Chinese SEOs.

RESEARCH QUESTIONS AND OBJECTIVES

Considering these idiosyncrasies with the government, relationship and trust in the shipbuilding market, call the researchers to focus the research on exploring how the three issues are influencing each other and try to find a solution of how to smooth the business relationship (Figure 1). The main questions under consideration are what role does trust play in the business relationship? and how to build up trust in the Chinese shipbuilding market?

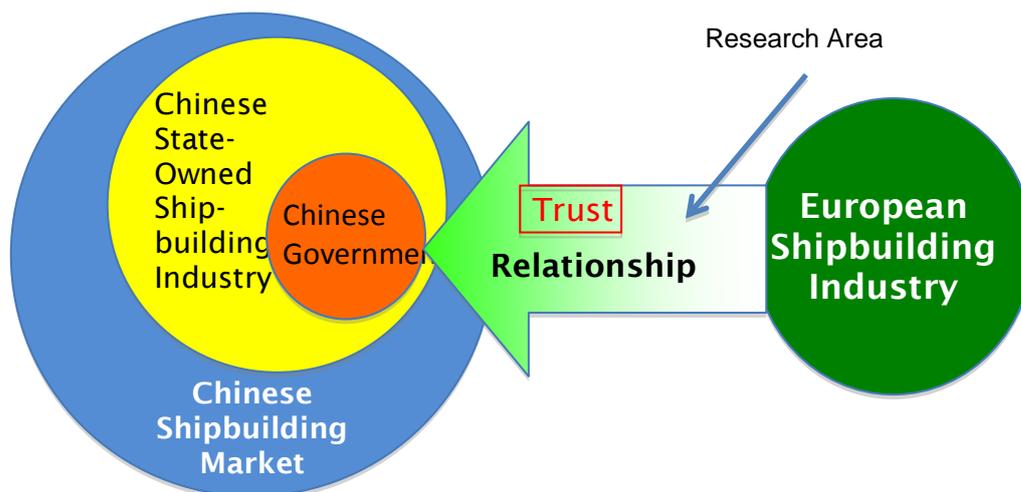

Figure1: Research Core Area (Source: developed by the researchers)

To answer the research questions, the main objective of this paper is to study the role of trust in the governmental relational context in Chinese shipbuilding industry. Following the detailed objectives are provided:

RO1: Explore the different understanding on trust and relationship building between European and Chinese shipbuilding companies;

RO2: Instigate the roles and influences of trust in the interrelationships among the European suppliers and Chinese SOE shipbuilding industry;

RO2: explore how business behaviours can influence trust building and develop the best practice by providing a set of tactics and recommendations on how to build up trust with Chinese SOE for a successful business relationship.

TRUST'S DEFINITIONS

The trust phenomenon has been studied within a long history. According to Rotter (1967, p.651) trust can be defined as “a generalised expectancy held by an individual or group that the word, promise, verbal or written statement of another individual or group can be trusted”. In addition, Morgan and Hunt (1994) identified three attitudes on what trust is based upon: reliability, integrity, and competence. In the same line, Mayer, Davis, and Schoorman (1995), confirmed attitudes of integrity and add benevolence and ability. Whereas, Sharkie (2009) focuses more on interpersonal trust highlighting as well as confidence in the ability, character, integrity and truth of a person, being a vital element in all social interactions.

Though the importance of trust is has been emphasized in the business field, however, there is few literature related to how people in different cultures trust each other (Chua, Morris and Ingram, 2009). The researchers find out, that the understanding and the importance of trust in the business world is different between Europe and China. Confucian philosophy, the basis of Chinese culture, argues that the most important thing to be successful in management is to get the trust from others, that one only gets business done, if he can get the trust from others, and one without trust cannot stand in the society (人无信不立). More and more Chinese scholars emphasize the role of the trust. Tong and Yong (1998) and Xu (1999) argue that Chinese are dependent more upon “xinyong” (personal trust) rather than trust to conduct businesses. Leung et. (2005) point out that trust is an important governance mechanism in the Peoples Republic of China (PRC). Jiang et. al. (2011) value the interpersonal trust between executives especially critical in China, and argue that when doing business in China, trust-building should be seen as a strategic dimension for foreign companies; Kriz and Keating (2010) also analyses the role of trust in Chinese business at a significant strategic level that trust “may seem at odds with the military doctrine of stratagem where victory requires tactics of deceit that can actually promote distrust” (Kriz and Keating, 2010, p.7).

In this context of Chinese trust relationship, Jiang et.al (2011) studied the cognition and affect-based trust which were categorized by McAllister (1995) and found out that the

different cultural ethnicity and different firm size (which cause different institutional endowment like government support) have different influence on building trust. Therefore, when dealing with firms with these different characteristics trust-building, culture and commitment should become key priorities.

TRUST AND BUSINESS RELATIONSHIPS

It has been already acknowledge that in doing business with Chinese partners, relationships play an important role. When European companies need to interact with Chinese government, the development of trust in business relationship should be carefully taken care for and nurture. Fukuyama (1995) points out the significance of trust and its critical meaning as one of the components of relationships in international business markets. Furthermore, Pearce and Robinson (2000), Kriza and Keating (2010) underline that trust is critical and may actually be the most important step to develop in business relationships with China. Leung et. al. (2005) find out that in China, relationship has a strong influence on personal trust and suppliers should use relationship to generate buyer's perception on personal trust whilst maintaining a reasonable level of buyer satisfaction with their products and services. Additionally, Sanchez-Bengoia and Neuhauser, (2013) identified that the creation and development of trust as an executive function can effectively save time, money, nerves and improve personal and company relationships being beneficial for the Chinese and European business cooperation. Finally, Kriza and Keating, (2010, p.22) stress that an in-depth understanding of trust "appears pivotal to the future of Sino-Western interrelationships".

METHODOLOGY

Choosing the research methodology depends on several factors including: the researcher's beliefs and understanding about the real world (ontology), and how he/she distinguishes true (adequate) knowledge from false (inadequate) knowledge (epistemology), the purpose and goals of the research, the founders of the research and the position and environment of the researchers themselves (Crotty,1998).

In this case, the researchers have adopted an interpretivist approach. The reason for that is because in the interpretive approach "the researcher does not stand above or outside, but, is a participant observer, who engages in the activities and discerns the meanings of actions"

(Carr and Kemmis, 1986, p.88). In this case, the researchers search for an understanding and explanation of the phenomenon through systematic association of variables, and by the identification of individual meanings will provide a picture of the research's reality (Szmigin and Foxall, 2000). As a result, as explained by Hammersley, Mackenzie and Knipe, (2006) the researcher will interpret his/her own experience to the research area and remain open to incorporate the attitudes and values of the participants.

The qualitative method is associated with an interpretative philosophy (Saunders et al., 2012). As interpretivist gathers highly specific qualitative information and data to analyze phenomena which are deduced from general models (Remenyi, 1998). This research conducts exploratory and descriptive method to get an understanding of how trust and relationship are developed in a market entry strategy in Chinese SOE.

The researchers consider the topic under research as a complex issue, involving various global, societal and cultural factors. For this reason, to support the exploratory and descriptive nature of this research, the researchers conduct in-depth interviews based on a case study with the intention to develop a model for cooperation between China and European Shipbuilding companies. According to Yin (1989, p.48) "a single case study is warranted or appropriate in the basis that the case is revelatory". In this research, the researchers have chosen the case with CSIC, a state-owned company which covers 46 industrial subsidiaries, 28 R&D institutes, owes total asset for a value of 28 billion US\$ in 2010, and has a workforce of 140,000 employees. It has been transformed from a defence-focused, socialist monolith into a thriving commercial enterprise, which still gets strong support from the Chinese government, and plays an important role in Chinese shipbuilding market. With this case study, the researchers will identify the potential problems which European supplier encounter with Chinese SOEs during the market entry, and to describe the implications and influence of trust during this process.

SAMPLE AND CONTENT ANALYSIS

Within an interpretivist framework, Travers (2001, p.37) advises that researchers will simply need "enough data to explore and document a range of themes". In order to answer the research questions, twenty in-depth interviews are to be conducted with representative staff from different segments acting in the case study, CSIC Management (8), Chinese Officials (4) and European Supplier (8). The CSIC Managers are the directors of products and production

department, purchasing department and R&D department who have strategic responsibility; The Chinese officials are coming from the government, they have been selected because they could explain the policies and strategies of the government; the European suppliers are those with an operational experience, usually the international marketing manager. The three interviewees' backgrounds are chosen with the aim of providing a substantial and varied range of viewpoints within the cooperation between European and Chinese shipbuilding industry.

To analyse the results of the interviews, content analysis will be adopted. The reason why to choose this method is that, content analysis can describe phenomena and analyse documents systematically and objectively with the purpose of providing knowledge, new insights, and a practical guide to action (Krippendorff, 1980). It suits to the research objects and allows the researcher to test theoretical issues to enhance understanding of the data (Elo and Kyngäs, 2007). The content to analyse is determined by the research questions and objectives (Robson, 1993).

In the analysing process, the researchers choose inductive content analysis. This process includes open coding, creating categories and abstraction (Elo and Kyngäs, 2007). The researchers will make notes and headings while reading the data, to describe all aspects of the content (Hsieh and Shannon 2005). Then the notes and headings will be grouped to several categories according to the similarity. The purpose of creating categories is to provide descriptions of the phenomenon, to understand and generate knowledge (Cavanagh, 1997).

FUTURE FINDINGS

As the current research is part of a DBA program, the empirical part is still on an on-going process. Nevertheless, to gain new knowledge throughout the research, in this case, market opportunities and risks on the basis of building up trust and relationship for European suppliers, the researchers seeks for a holistic framework to explore consisting of three steps (Figure 2):

The first step in the framework tries to develop an understanding on a macro level of the market dynamics of the state-owned shipbuilding industry in China with the single case study by CSIC. The critical areas to be analyzed are: Economic - rate of growth of GNP, level of inflation, incomes; Social - people, demographics, culture, sub-culture; Political - risk, instability, attitudes to "foreigners"; Technology - current, rate of change, infrastructure;

Resources - money, manpower, materials, acquisitions, joint ventures; Fiscal - taxes, exchange rates; Institutions - money markets.

The second step of the framework tries to conduct an analysis of the existing cooperation with the Chinese state-owned shipbuilding industry, like the market entry modes, cooperation methods, in different segments like product, service, technology, finance, to analyze the role of trust and relationship in governance, such as any shifts in regulatory policies that might have a marked impact on the industry structure.

Finally, the third step of the framework is a competitive analysis (Aspnes and James, 1998) of strategy identifying: building up of trust and relationship in market entry strategy for European suppliers and the development of core benefit proposition.

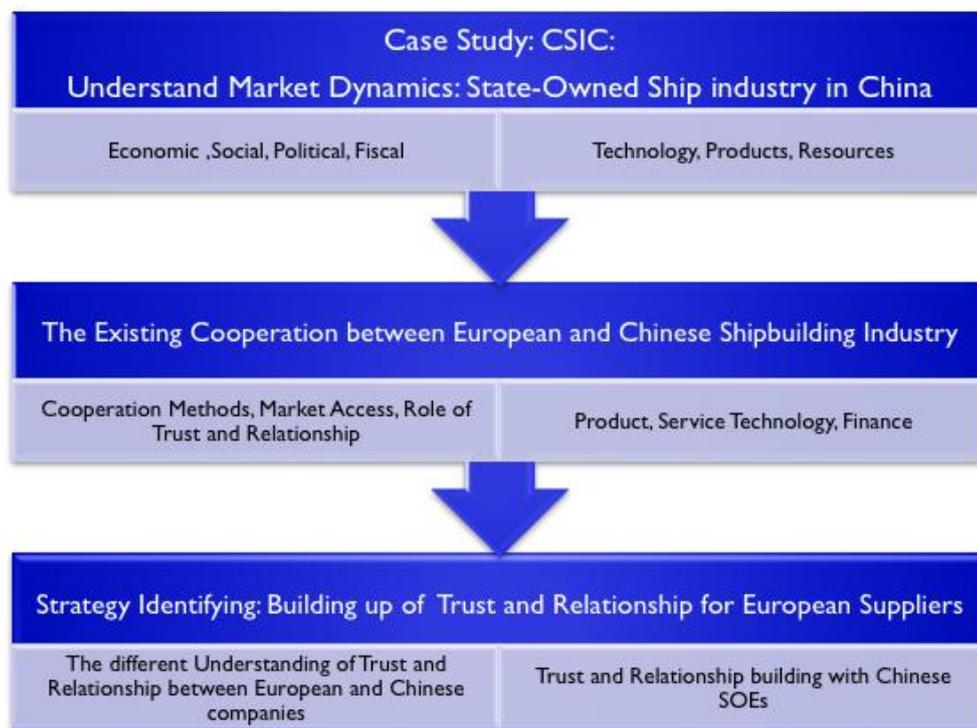

Figure 2: Holistic framework to enhance trust in the shipbuilding industry

(Source: developed by the researchers)

CONCLUSION

The literature review has provided an awareness of the potential difficulty for European shipbuilding industry in the Chinese market. These difficulties can be found on the nature of the Chinese state-owned enterprises being somehow under governmental control.

The importance of trust and relationship building indicates the path to follow for European companies wishing to enter in the Chinese market, although this is still pending to confirm. In order to find out the answer, the above holistic model needs to be tested and see whether trust will affect the business relationship with Chinese SOE in shipbuilding industry or not; explore how trust can influence political relationships which affect business decisions and to forward some suggestions on how to build up trust for a further solid business relationship on the process of market entry.

To sum up, this research explores the role and the importance of trust in a kind of trilogy relationship compound of Chinese government, Chinese shipbuilding SOEs and European suppliers (Figure 3), in order to avoid tension between the supplier's interest, state's interest and SOE's interest, and to provide a set of tactics and recommendations on how to build up trust with Chinese for a successful bilateral business relationship.

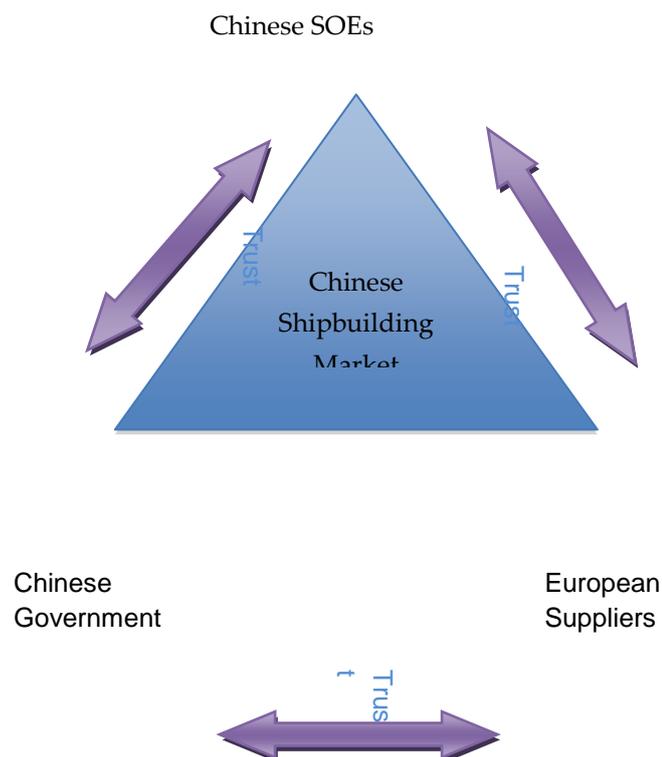

Figure 3: The interest's trilogy (Source: developed by the researchers)

LIMITATIONS

The researchers have used the case study of the (CSIC) Chinese company. Although a very big

and important company in the sector, the results obtained cannot be generalized. Nevertheless, an initial conceptualization will be the result of the research which can be taken further by testing the model with more Chinese and European companies involved.

The data collection would also be a challenge because as identified by Marschan and Welch, 2004, p.17) "qualitative data is very context specific and harder to bring into conformity with universalist assumptions of scientific rigour and make internationally appealing and publishable than quantitative data". In many situations, qualitative researchers can seldom specify exactly what their data collection methods entailed (Zalan and Lewis, 2004), what adjustments they made as a result of the location in which they conducted the research (especially in international business research), or how they validated their findings (Andersen and Skaates, 2004).

Another key point is how to ensure the credibility and validity of the interpretation of the qualitative case analysis as foreign researchers. It embraces different cultures, complex background knowledge and even language skills, being these issues potential barriers for proper interpretation.

WEB TECHNOLOGY AND BUYERS' PROFILES

Zurawicki, Leon

University of Massachusetts-Boston, USA, leon.zurawicki@umb.edu

ABSTRACT

The idea of segmenting buyers according to their decision making profiles which stem from personality characteristics is not entirely new. In practice however, quite some problems emerge in terms of testing consumers' psychological inclinations. Following what people do with and on the internet makes it possible to ascertain their buying styles in an unobtrusive and ever more accurate way. The paper discusses various approaches and methodologies used. With the technology continuously evolving and the available data getting more comprehensive, marketers are well advised to better identify the correlates of the buying styles as a useful tool to cluster the consumers.

Keywords: Neuromarketing, Buying Styles, Consumers, Web Data, Profiling

INTRODUCTION

The neural correlates of personality affect how consumers select what they buy. Apart from determining different objects of desire fitting the personality, two other important connections play a role. Namely, different personality types might focus on different attributes (benefits) of the offerings and deploy different mental evaluation processes. Accordingly, mapping out different styles of responding to environmental stimuli, sensitivity to various emotions and the patterns of executive functioning can hint at some universal patterns displayed by an individual regardless of whether s/he is contemplating to purchase a new car, a vacation package or health insurance. The processes applied by individuals to cope with buying situations indicate new dimensions along which to segment the consumers.

Whereas practitioners have for quite some time developed "shopping styles" based on behavioral observations and survey data, the theory seems to lag behind. It is only recently that advances in neuroscience brought us closer to viewing and codifying buying profiles as a direct consequence of the shopper's combination of personality traits (Zurawicki 2010, Venkatraman et al. 2012).

Connecting personality with consumer behavior has never been an easy task. The more so, that the focus on the ultimate buying results is misleading – the outcome (e.g. purchase of something)

may be the same, yet the underlying individual selection criteria and processes different. In terms of applicability to segmentation, two non- mutually exclusive novel approaches emerge. The first suggests modeling buying styles as connected to the specific mixes of personality traits.

As an illustration, we quote below the most apparent associations corresponding with the “Big Five” categorization of personality. This should not exclude other classifications, though, which can be useful in pointing at such characteristics as “competitiveness”, “family orientation”, the dedication to fitness and a host more.

The personality trait of openness is suggests a person’s high interest in novelty, exploratory tendencies, and curiosity about other cultures and aesthetics. In terms of who the innovators and the early adopters in the product diffusion process are, the “open” demonstrate stronger explorative tendencies and are clearly in the avant-guard of newness. Consumers at the lower end are deemed to be conservative and slower to embrace innovations.

Conscientious people tend to be responsible, methodical and plan ahead. They are more frugal and they pay more attention to value rather than fashion. People on the low end are more prone to impulse buying. They might be attracted to high precision and more complex products. Some more speculations may imply that a conscientious person is more interested in checking on the energy bill the monthly usage and be happy to see the decrease. Equally so, s/he would be more concerned about the sustainability, or be a disciplined car driver.

Extroversion as contrasted with introversion is a critical attribute to influence social encounters including networks, participation in the live events, team sports and seeking recognition from peers. In turn, introverts require less outside stimulation; tend to be more contemplative and individualistic. On a practical note, extroverts and introverts differ substantially in their eagerness to establish and to cultivate frequent interactions as stipulated by the proponents of the relationship marketing. Hence, spending effort to force a relationship with the less prone customers is counterproductive as by their nature they prefer to remain detached and, perhaps, independent. Consequently, the extra/introversion in interacting with the companies, their brands, salespeople and other product users becomes a relevant dimension for segmenting the clients.

Agreeableness is a measure of kindness, empathy, concern for others but also reflective of conformism and social opportunism. This trait stimulates philanthropy and a general tendency to avoid confrontation (like in bargaining).

Deficit of the emotional stability is labeled neuroticism and synonymous with variability, hence lower predictability of behavior. Lack of assertiveness leads to limited self-confidence and uncertainty about one's decisions as well as higher than average risk aversion.

Obviously, it is not single traits viewed in isolation which impact consumers' mental processes. Those separate predispositions are actually strengthened when some combinations of traits are present. For example, people with higher "g" – a measure of intelligence--who are also more conscientious and open, might be willing to adopt a more rigorous and relaxed evaluation process. When contrasting the diligent, analytic and logical method of reviewing offerings with the holistic and associative glancing over the information, the first approach tends to correspond with high ratings on Openness and Conscientiousness and a positive self-concept. In turn, the experiential processors are extrovert, rate high on Agreeableness, and underperform in categorical thinking. Such individuals, however, display higher than average creativity. Hence, depending on the requirements of the situation, the puzzle-solvers are better equipped to calculate which solution is more economical whereas the experientially inclined consumers can prove imaginative in finding multiple uses for the product or ways to improve it (Novak and Hoffman, 2009)

High scores on Extraversion and Agreeableness suggest a potentially strong impact of the individual's social networks upon evaluation and choice (higher "g" may, all other traits kept constant, further account for a higher number of individual's connections to the networks). Low conscientiousness can translate into impatience and impulsivity and high neuroticism adds anxiety and unpredictability and indulgence in "comfort" product and services. Neuroticism alone may stimulate feeling of guilt for decisions deemed unsound.

Brand choices appear to be linked to the attachment styles which theoretically stem from the early childhood bond with the caregiver. The type of connection shows along two dimensions which at the negative end reach their peak expressions in anxiety and the avoidance of others. These phenomena impact upon the adult life of a consumer. People with a negative view of self, i.e. anxious, are more sensitive to "brand personalities" – they use them for the purpose of signaling to the important others. The paradigm of "I am what I buy" should in that case be substituted by "I buy what fits my dream profile." As for the combination of anxiety with

avoidance, consumers who are anxious and more avoidant of interpersonal relationships showed preference for the brands deemed “exciting” and more flamboyant. In contrast, people who are anxious but amenable to a close liaison opt for a solid “sincere” label (Swaminathan et al. 2009).

Overcoming boredom appears a natural response when the consumption reaches satiation level. However, focusing on fresh uniqueness as a coping strategy by novelty seekers sets them apart from those consumers who just look for variety within the set of familiar brands (Helm and Landschulze 2009). Neuroticism tends to promote the latter without affecting the former tendency.

The second approach—a micro orientation—points to the specific emotional responses to involving stimuli, for example such as a sensation of surprise upon exposure to a humorous joke. In that way, the researchers can learn about the prospects’ susceptibility to various marketing ploys. To study such detailed reactions requires systematic monitoring and, beyond simple observation of general response patterns, resorting to custom crafted experiments which manipulate the stimuli of interest. For example, they may examine which customers are/are not more influenced by the rich communication format of “sight, sound and motion”.

WHAT METRICS CAN BE PROPOSED

How to label distinct buying styles is a big question, the more so that we are dealing with continuous rather than discrete variables. A helpful idea is to start with a general perspective and move on to specific relations consistent with the active conceptualization of traits which emphasizes how traits explain why and how people buy and what they prefer.

Beyond just previous history of shopping, the researchers are well advised to focus on consumers’

- Degree of the emotional component in envisioning one’s needs and desires.
- Susceptibility to impulse buying, self-indulgence
- Inclination to seek information and interact with peers.
- Individual level of self-dependence in the decision making.

- Information-processing skills and the approach to problem solving: simplicity seeking vs. comprehensive solution. Also, their willingness and ability to establish benchmarks (reference points) for considered buys. The negativity/positivity bias in interpreting the data.
- Level of intentional self-control/involvement
- Curiosity factor and the degree of risk proneness/aversion in making decisions.
- Proneness to feelings of guilt or regret in connection with purchases planned/ made or foregone.

Figure 1 shows a preliminary model to address the relevant interactions along the above lines.

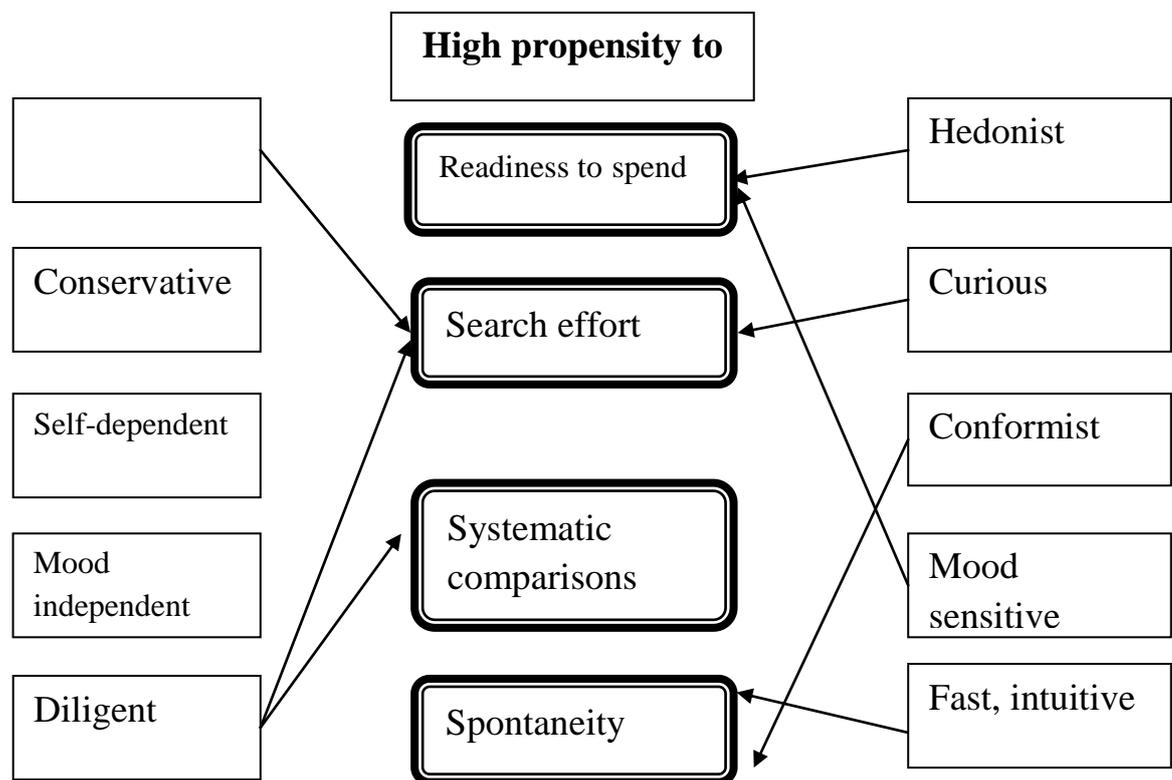

Fig. 1 Select personal characteristics and linkages to the variables of the buying style

WHAT DOES WEB HAVE TO DO WITH IT?

In using internet to detect the users' buying styles, two converging avenues can be pursued:

- Assumptions about users' personalities help infer their buying styles
- Buying styles can be inferred from the actual browsing patterns and completed/abandoned transactions.

Practical success in segmenting consumers according to their neuropsychological predispositions hinges upon the marketers' ability to gather the personal (and personality) data on the consumers or making inferences about them. In that respect, web technology can prove useful. Firstly, it appears that personality can be reliably and efficiently measured by the tests administered via the internet (Buchanan 2009), and, in certain contexts (the dating services, travel services, job search, not to mention the social networking websites) a substantial amount of such data is voluntarily provided. For example, proliferation of sites offering to rate the personality traits for the benefit of the consumer (among others, by suggesting the suitable vacation destination) is a step in that direction.

A lot can be learned from the comments/reviews posted on various sites (for example, tripadvisor.com specifically dedicated to travel and hotels). Accordingly, YouTube or Vimeo are top websites where people "rant" their opinions on many subjects. Their videos are frequently produced using a simple webcam at the person's face while s/he comments on specific issue (for example, product experiences). As such, the video comments allow for using the emotional recognition software based upon the facial expressions. This in turn tells marketers a lot about the character of the person and her affective (often subconscious) attitude to the items consumed or communications received.

Word mining and even sheer statistics shed an interesting light on the reviewers' expertise, activism, preferences, demands and rigor. Linguistic analysis of the comments can reveal the emotionality of the person, ability to organize thoughts, affinity for specific words (e.g. "smart" as a correspondence to one's own self confidence) and even a hint as to whether the reviewer is an expert or novice in the subject matter. In turn, the users of reviews reveal quite a bit about themselves through the selection of comments (e.g. positive v. negative), attention to various attributes covered and the demonstrated (dis)trust in the opinions consulted.

It is certainly helpful that some personality traits can be assessed without a need to resort to personal quizzing. Individuals who see themselves as generally independent from other

people are more attracted to angular shapes, and people who feel they are more impacted by others find rounded shapes more pleasing. Similarly, dominant individuals favor the vertical dimension of space more than individuals low in dominance. They are more capable of shifting attention vertically and are quicker at processing information that appears in the vertical dimension of space (Zhang et al. 2006; Moeller et al. 2008). So it is just a question of time that the visual approach methodology to measure the implicit personality will be perfected for the Web use. First attempts of showing the optical icons via internet and collecting the responses without asking intimate questions do seem promising (Scheffer and Manke 2009).

Monitoring the surfer's navigating style on the web page especially in the interactive context can tell a lot not only about the personal interests but also about this individual's personality (Ho 2005). Especially, when the records are pulled together from various sites visited, the total amount of data obtained gives a good approximation of the web user individuality. It may suggest whether s/he is systematic in retrieving information or rather fast-forwarding as a function of emotional associations with the content, be it when shopping or knowledge seeking.

When shopping for flights, for instance, consumers often reveal whether price or more hedonic concerns related to comfort (e.g. number of stops, departure/arrival times, and type of seat) are a priority. The amount of time and effort spent on a particular problem attests to perseverance, and the interest in and the subsequent consideration of the reviews published by other users, points to conformity seeking, to name just some implications. A special case in point is computer gaming on the internet – to a skilled observer supported by advanced software the pattern of playing can reveal the participant's approach and avoidance tendencies, individualistic vs. group strategies, the choice of characters in the game, affinity for violence or the pace of learning. In doing all that, players have luxury to act differently than they do in everyday life without experiencing negative consequences—thus showing a bit of the darker side of their true nature.

In sum, a vast amount of data generated on the internet makes it possible nowadays to speculate not only about consumers' buying interests based on the past history. More importantly, we can learn what kind of decision makers those individuals are without a need to ask a single question. This in turn should help marketers develop the nuanced strategies to successfully communicate to different profiles.

BOOK OF CONFERENCE ABSTRACTS

FACTORS AFFECTING INNOVATION IN THE HOTEL INDUSTRY

Afonso, Victor¹; Carvalh, Luísa²

¹ Escola Superior de Hotelaria e Turismo do Estoril (ESHTE), Estoril, Portugal, victor.afonso@eshte.pt

²Escola Superior de Ciências Empresariais, Instituto Politécnico de Setúbal, Setúbal, Portugal, luisa.carvalho@esce.ips.pt

ABSTRACT

Services have a key role in the hospitality industry with the growing concern of hotels to satisfy guest's needs through innovative services. Competition is based on providing similar products and substitutes and service innovation aims to achieve gains in efficiency in the processes but also to achieve competitive advantages in terms of business strategy.

This paper is a literature review on the state-of-art of innovation in the hotel industry and aims to organize the theories and concepts according to: theoretical approaches, chronology, empirical studies done by researchers, and other criteria.

Our intention is to provide a framework that, on the one hand provides a basis for future research, and on the other hand, allows practitioners to choose the most suitable model according to the type of business and its goals.

The study also identifies the different drivers of innovation and the factors affecting innovation in hotel services, including innovation culture, organizational leadership, human resources and information technology.

Keywords: innovation, services, hotel industry

A REVIEW OF BOYCOTTS AND BRAND LOYALTY IN INTERNATIONAL MARKETING

Al Serhan, Omar¹; Sirkeci, Ibrahim²

¹ Cardiff Metropolitan University, UK, Omar.alserhan@yahoo.com

ABSTRACT

Boycotting consumer behaviour has been damaging for several business in recent past. This abstract provides a critical review of the boycotting literature from 1900 onward. The review seeks to answer the following questions: What are the gaps and omissions in the boycotting consumer behaviour research? How may they be overcome?

To answer these questions, the review scrutinizes blind spots in the treatment of boycotting behavior, role of religious, cultural and political influences in boycotting behavior research in both positivist and critical scholarships. We reviewed systematically 115 academic articles published in 25 top marketing journals ranked in the ABS (Association of Business Journal Schools) Review covered publications from 1990 -2013. Focus was on journals ranked from 1 – 4 and we used the EBSCO and ProQuest search engines using the keyword Boycott as it represent a precise and specific meaning in marketing journals and.

The theoretical contribution is threefold: first, the review demonstrates that contemporary framing of boycotting behaviour literature should be expanded to cover aspects of boycotting behaviour beyond its external influences i.e. organisers – promoters- and the boycott target and put the focus once again on individual consumers. Second, the review explains why and how other strands of boycotting behaviour than religion also manifest as salient causes of difference in boycotting consumers. Third, the review reveals that political and religious context has explanatory power in boycotting behaviour. Boycotting literature should capture the intertwining influences of religion, politics and consumer culture. The paper also provides a set of useful recommendations to capture and operationalize methodological and theoretical changes required in the consumer boycotting behaviour literature.

LITERARY PORTRAITS OF LISBON: IMAGE AND PROMOTION OF A TOURIST DESTINATION

Ambrósio, Vitor¹; Matos, Graça²

¹Escola Superior de Hotelaria e Turismo do Estoril, Portugal, vitor.ambrosio@eshte.pt

ABSTRACT

This paper looks at the role played by literature in the formation process of Tourist Destination Image (TDI). The research reported in the article analyzed the content of three books written by German-speaking authors - Thomas Mann, Erich Maria Remarque, Pascal Mercier - in which Lisbon is the setting of a part of the story. German-speaking tourists, who visited Lisbon, were surveyed to determine if they had perceived identically the city. In the end, the survey results are compared with the items focused on the official Lisbon promotional video and suggestions are given in order to include or strengthen items to attract more German speaking tourists to this tourist destination.

Key words: Tourist Destination Images, German Written Literature, Lisbon.

INTRODUCTION

Based on the review of published literature on TDI, the first part of the article presents some definitions of the concept and underlines its importance for the tourism industry. It also presents the main theories about its formation process, underlining the role played by literature. The second part presents the objectives and the research methodology used. The third part presents and discusses the results of the research. The closing remarks point out the limitations of the study and suggest concrete actions in order to achieve a more effective promotion of Lisbon in the German speaking market.

LITERATURE REVIEW

Most authors agree that TDI originates and evolves through a formation process in which two main kinds of information sources play an important role: organic (present in daily life of individuals, who don't need to look for it) and induced (produced by the official promoters of the destination).

The media, movies and songs, as well as literature, provide the potential tourists information about places, contributing to a more detailed and complex image of those places. It is the value that the receiver of those contents awards the place, together with his curiosity and interest, that makes him travel to that destination (or not).

OBJECTIVES AND RESEARCH METHODOLOGY

Objectives

The research aimed to verify the following hypothesis:

- 1-Information about Lisbon, allowing readers to anticipate their experience of the city, can be found in each of the three books.
- 2-German speaking tourists (who answered the survey) perceived the attributes of the city mentioned by the writers in a similar manner.
- 3-The official promotional video of Lisbon highlights the most valued attributes of the city pointed out by the writers and the enquired German speaking tourists.

Methodology

After reading the three books, a content analysis was undertaken. The passages containing references to Lisbon became the analysis corpus; they were encoded having in mind the attributes of the city reported by the writers.

A survey, made out of citations from the three books, using a Likert scale 1-10, was answered by around 400 German speaking tourists who spent at least three days in the city.

Afterwards the official promotional video of Lisbon was analyzed in terms of the importance given to those attributes.

RESULTS DISCUSSION

Hypothesis 1 – All three books contain numerous and detailed references to attributes and districts of the city, allowing the readers to anticipate their experience of the destination, provided that they do not spill their experience beyond the mentioned territory/areas.

Hypothesis 2 – The results show that tourists almost or fully agree with the descriptions of two attributes (heritage sites and public means of transport, like the old trams). The results also show a gap between the description of other attributes (weather/light and smells) and the tourists' experience.

Hypothesis 3 – There are several attributes that are overly highlighted in the video, whereas different ones have been emphasized by the writers and the tourists (showing they have strong potential) and cannot be seen in the video.

CONCLUSIONS AND SUGGESTIONS

The research carried out allowed, on one hand, to establish the attributes highlighted in the literature (organic information) and, on the other hand, to know if tourists perceived the attributes identically.

Comparing the above results with the official Lisbon Tourism Association's promotional video (induced information), the following was found:

- Several emblematic places of Lisbon, tropical flora, funiculars and the harbor/estuary, which are perceived by writers and tourists do not appear in the promotional video, or appear in a fleeting way;
- Light and sunshine are little or not perceived by tourists and appear explicitly in the promotional video, creating possible dashed expectations;
- Ferry trips, theatrical scenic views, vegetation in blossom, smelly food (sardines and chestnuts) are perceived by the authors (although not identically perceived by tourists) do not appear in the promotional video but have potential for Lisbon's tourism promotion.

With the results of the present article, the Lisbon Tourism Association agents (or agents from any other tourism destination) are challenged to make a content analysis of their promotional materials (induced information) and to compare them with the content of organic sources of information (such as literature). It will allow them to evaluate the dissonance/consonance between both and to introduce corrections whenever necessary.

MOBILE MARKETING AND SO-LO-MO CONVERGENCE: THE NEW TRENDS IN MARKETING

Amirkhanpour, Monaliz

Faculty of Business, Education & Professional Studies (BEPS), University of Gloucestershire, UK,
monaliza1983@yahoo.com

ABSTRACT

The main purpose of this research is to introduce and highlight the importance of marketing through the mobile channel. Mobile marketing is one of the latest direct marketing promotional channels and is getting quite popular among marketers and business owners owing to an array of benefits that it offers to the potential customers as well as to businesses. The definition of mobile marketing emphasizes the fact that it connects businesses and each of their customers through their mobile devices at the right time and at the right place with the right message and requires the customer's explicit permission and/or active interaction. Mobile marketing and mobile advertising are the next big challenges in the marketing community. This is mainly because of the latest technological advancements which brought about a totally new era in the mobile world. Furthermore, marketers are always searching for innovative, cost-effective, and highly influential methods in order to increase revenue; however, considering today's shrinking economy small businesses as well as marketers look for ways to increase customer response rates by designing targeted marketing campaigns. Mobile marketing is the most appropriate medium to achieve these goals particularly because of the several benefits that it offers such as guaranteed distribution of marketing messages, simplified and flexible marketing campaigns, marketing campaign integration, quantifiable outcomes, and the viral potential of the marketing messages. In other terms, mobile marketing is helping to make ubiquitous computing a more realistic and everyday technology.

Structurally, the paper investigates the value of incorporating mobile marketing into the marketing mix, and especially direct marketing practices of business enterprises. It subsequently, identifies the benefits that the mobile channel offers, particularly by using a multi-channel marketing strategy known as the Social, Local, and Mobile (SoLoMo) marketing. SoLoMo marketing is a novel concept of providing smartphone/tablet PC users access to locally-focused promotions and store offerings through mobile search based on their current location. Furthermore, mobile-enabled social networking platforms are quickly

becoming the conduit for not only peer-to-peer interactions about interests and intent, but also consumer-to-marketer conversations. Additionally, SoLoMo marketing requires the businesses to simultaneously embrace adaptive planning in order to make real-time decisions based on social, local, and mobile responses from the target customers. As its name indicates, the social part of SoLoMo marketing is related to the various social networking platforms like Facebook, Twitter, Pinterest, etc. that enable potential customers to have a dialogue with a specific business of their interest and to share their opinions and comments with others. The local part of SoLoMo marketing is based on geo-targeting which allows businesses to target their marketing messages to potential customers in a specific geographic location. Geo-targeting can be accomplished when customers provide their address or more commonly, when they let companies know their location based on their smartphone/tablet PC use of different Location-Based Services (LBS) like Foursquare, Where, etc. The LBSs enable users to take full advantage of spatial information using technologies such as GPS, Bluetooth, and Near-Field Communications (NFC) which provide, update, and monitor users' location-based information. Finally, the mobile part of SoLoMo marketing highlights the fact that the social networking and location-based services can be easily used on the smartphones/tablet PCs by downloading their relevant mobile application.

The paper successively discusses the utilization of various mobile marketing communication tools and ultimately develops a conceptual contemporary mobile strategic marketing preliminary model in the context of contemporary consumer behavior.

Methodologically, the research is theory-based and enhanced by secondary data. The theoretical findings are further conceptually developed to construct a mobile marketing provisional framework towards empirical validation. Both the framework and its underlying theoretical foundation have been preliminarily validated through interviews with specialists. The interviewees consisted of academics specializing on the subjects of electronic marketing and/or strategic marketing; and executive practitioners with experience in the subject. The interviewees acted as controls and enhancers of the theoretical development of the framework. Nonetheless, the latter are empirically untested and therefore de facto provisional. The research findings do however add to the growing knowledge on mobile marketing and set the basis for a more refined understanding through a more comprehensive perspective on the topic.

PERCEIVED JUSTICE OF LOYALTY PROGRAM AND CUSTOMER RETENTION: QUANTITATIVE STUDY IN THE CASE OF TUNISIAN MOBILE PHONE SECTOR

Bahri-Ammari, Nedra¹; Ben Amor, Senda²

¹IHEC of Carthage, Tunisia, nedrabahri@yahoo.fr

²ESC of Manouba, Tunisia

ABSTRACT

Loyalty programs have been the subject of many previous studies (Meyer-Waarden, 2002; Mimouni and Volle, 2003; Pez, 2009) because they form a strategic issue for loyalty and retain customers especially in a competitive environment. But with technological developments and the emergence of ICT, the relational paradigm has undergone profound changes that encourage researchers to choose to study the effectiveness of these programs and their impact on customer behavior. However, the majority of research has deducted that loyalty programs have a tangible impact on satisfaction (Mimouni and Volle, 2003; Gilad et al., 2010). Others have found that these programs have a significant effect on satisfaction and retention (Lewis, 2004). According to others, the impact of such programs on behavioral loyalty is only low and transient (Sharp and Sharp, 1997; Dowling and Uncles, 1997). Hence, the purpose of this study seeks to identify the attitudinal and behavioral variables that influence the consumer behavior to become faithful and retained to its operator. And to better understand the effects of loyalty programs.

The present study was designed to investigate the effect of perceived justice programs on the relationship between the satisfaction with the program and relationship satisfaction and its consequence on customer loyalty and retention. In the first step, we developed a preliminary chapter that describes the evolution of relationship marketing, and we explained the concept of loyalty based on the presentation of various tools and loyalty reward mechanism. Secondly, we have built our conceptual model and our research hypotheses (direct and indirect effects) and especially the moderating effect of perceived justice on the relationship between satisfaction toward the program and relationship satisfaction, and the consequences on loyalty by commitment and retention. In the third step and to answer to our research question we opted for a confirmatory analysis: the multiple regression method (calculating equations of determination R^2 , ANOVA) to highlight the moderating role of perceived justice and to analyze our hypothesis. This empirical study has been carried out in the Tunisian

mobile phone sector and surveys were conducted with 220 people receiving at least one loyalty program with its operator.

The results show that these programs can generate behaviors and attitudinal reactions. In others worlds, more a satisfied customer of loyalty programs, the more he is satisfied with his experience with the operator. The analysis showed also that perceived justice is not a moderating variable. This result can be explained by the new structure of the perceived justice in the Tunisian context (bidimensional construct). The lack of communication on different parts of the loyalty program has affected the customer's perception. Therefore, the client is really unable to compare its investment compared to its winnings or rewards through the loyalty program. These last are also not yet well developed in Tunisia. The results gave us that the customer's satisfaction through the experience with his operator has a positive effect on the loyalty by commitment. It gives a strong sense of allegiance to the brand.

However, this satisfaction does not directly affect customer retention; but the satisfaction with program was able to improve the customer's retention. In conclusion, we can say that the perceived justice program does not moderate the relationship between the two satisfactions; however the satisfaction with program significantly affects retention and loyalty. So, these results encourage us to conclude that the operators need to pay more attention to the main elements of the programs, and encourage them to develop and communicate more clearly their conditions and their characteristics.

For future research, we suggest that it be possible to apply loyalty programs in other sectors (retail, service ...), it is also suggested to study dimensions of perceived justice (distributive, procedural, interactional) and the behavioral dimension of commitment (commitment calculated).

Keywords: Perceived justice, satisfaction (with the program & relationship), loyalty/engagement, retention, loyalty programs.

COMPREHENSIVE APPROACH TO CRISES MANAGEMENT

Balta, Corneliu¹; Bica, Gheorghe²; Rosioru, Nicoleta Diana³

¹Wales University, Romania, corneliubalta@yahoo.com

³Wales University, Romania, diana_rosioru@yahoo.com

ABSTRACT

The complexity of the contemporary crises appears as a direct consequence of globalization, with factors such as the diffusion of information, market interconnectivity, political ambitions and military actions acting as catalysts.

The economic disorganization characteristic to state and local administrations, along with the public security disturbances has weakened the international markets. As the latest crises demonstrate, one ought to find the multidimensional responses to economic downturns, themselves being multidimensional. Thus, the exit from the crisis must be centred on three independently connected pillars that ensure a country's stable state, namely: political security and stability, economic growth and social development.

The nature of these pillars underlines the necessity of an inter-ministerial approach, included in a multinational frame, which would enable to effectively and efficiently resolve the crisis. Under these conditions, the stake for the international community is to know how to answer with proper means to the threats regarding security, and to find a lasting solution for economic crises.

Keywords: economic crisis, political stability, efficiency and effectiveness, multidimensional approach

INTRODUCTION

Maintaining the peace offered by the United Nations (UN) is an essential goal, but not a universal ambition. The implementation of the mandate regarding "operations of maintaining multidimensional peace" is enlisted in a more ample temporal frame and targets the sustainability of state structures by identifying lasting solutions for terminating the existing conflicts and building a solid peace.

The incorporation principle, validated in 2008 by the General Secretary of UN, is applied in a different manner through 19 missions, of which 9 are conducted by the political

affairs departments (in which there is no military or police component). Firstly, this principle is applied in an internal plan by the UN, depending on the type of mission, the local environment and the personality of the main actors. It only partially responds to the challenges of managing the complex relations between the authorities and the local or regional actors.

The comprehensive approach is an intercession which targets the lasting and rapid regulation of a crisis, by coordinating the actions of all actors concerning governance, security and economic and social development. It links the collaboration between the actors who share the same final vision and the coordination, with the other actors present in the theatre. It requires, as much as possible, an approach through the host nation or the local representatives. It has as main point of application the population. Finally, it tries to associate the regional actors with this effort. As a consequence, the comprehensive approach is a strategy of resolving the crises, particularly in states with limited institutional effectiveness.

COMPREHENSIVE APPROACH: APPLICABILITY IN THE CRISES MANAGEMENT.

There is a debate over the historical fundamentals of the expression “comprehensive approach” (Frunzeti, 2012). Some place the origin of the term in the elaboration of the UN documentation at the end of the 90’s and present Kofi Annan (Wendling, 2007) as one of its first promoters. Others invoke a Danish influence near NATO, which is presented as the organization which defined the expression, especially during the Bucharest Summit in 2008.

For certain militaries, as well as for certain humanitarian actors, the bonds between civilians and militaries have existed at all times. There are, for example, historical references for the “together action” or the “global manoeuvre”, as source of the global approach concept.

Regularly, NATO and UN have acted accordingly to their visions of crises management. Thus, NATO has used the concept of “comprehensive approach” and the UN has adopted the concept of “integrated approach”. The European Union (EU) has used both military and civil instruments, without structuring its external action, in order to resolve the crises on the European continent.

The comprehensive approach of the crises management is demanded by a series of motives, as following:

- achieving a bigger efficiency in the missions of resolving the crises in the conditions of budget restrictions;
- obtaining a bigger coherence in the actions made by the actors involved in the various operations theatres;
- finding a better legitimacy of the action for certain actors (for example, NATO);
- the will to reduce the number of inefficient states which represent a security threat in today's world;
- the political emergency of regulating the conflicts, bound by the fact that the citizens are increasingly less willing to accept the long term military losses.

Hence, the necessity of comprehensive approach is to cover the entire continuum of the crisis management, from prevention to normalization. The comprehensive approach can be analysed through three stages, namely: prevention of the crisis, control of the crisis and international engagement³⁷.

Another important element is represented by the specificity of the cooperation between civilians and militaries, in the management of crises. Currently, in the operations theatres, where states take action under UN mandates in order to resolve a complex crisis, both military actors and civil actors are present. In this context, the interaction between civilians and militaries must be an efficient, continuous and concerted process, as much as possible. Thus, four degrees of interactions can be defined between actors of the comprehensive approach:

- *reciprocal knowledge of different actors who intervene in the theatre* - enables them to have a greater objective visibility. It allows them to limit the discrepancies between their activities;
- *accession* - is the information exchange between the actors who intervene for certain actions, in order to avoid their interferences in the theatre.
- *coordination* - results from the acknowledgement of sharing the objectives by the actors who intervene in the theatre. It is translated through an increased exchange of information and through the following of synergy in their activities;
- *collaboration* - must lead to a veritable effort to unify for a common purpose. It relies on the share of: evaluating the situation; long term vision, and also on the intermediary target objectives; identifying the discrepancies; target approach and allocated means; evaluation criterion of the intervention progress;

³⁷ Approche(s) globale(s) - actes table ronde, http://www.ihedn.fr/userfiles/file/debats_fond/approche-globale/Approche_globale-actes_table_ronde_06mai2010.pdf, p.11

These different levels target the appearance of national coordination needs (inter-ministerial crises management), international coordination needs (role of different international organizations, international relations between different countries present in the theatres) and theatre needs (joint interaction of the actors on field).

CONCLUSIONS

Through the comprehensive approach, the resolution of conflicts and the management of crises can be achieved, by integrating civil and military elements. Government and non-government instruments should be incorporated with full respect of each other's responsibilities. In this complex and dynamic frame, the armed forces must highlight, in all echelons, the determinants of military efficiency in a joint project. In parallel, they must entirely understand the other actors in the purpose of insuring the global coherence and the targeted results.

POLITICAL AND MILITARY ACTION FRAME OF THE EUROPEAN UNION WITHIN THE CRISES MANAGEMENT

Balta, Corneliu¹; Bica, Gheorghe²; Stanca, Costel³

¹Wales University, Romania, corneliubalta@yahoo.com

²Spiru Haret University, Romania, prorector_bica@spiruharet.ro

³Maritime University, Constanta, Romania, costel.stanca@cmu-edu.eu

ABSTRACT

The European Union is one of the active non-state actors on the world scene concerning the crises and conflicts management. Therefore, it operates by voluntarily assuming a large variety of political and military roles for preventing and resolving the crises and conflicts, which can occur in the European space and its strategic vicinity.

Continuing the process of enlargement of the Union has permitted the development of a systematic political dialogue concerning the security issues on a larger scale between Brussels and the candidate countries. In this context, the combination of the "civil" power instruments, which result from the first pile of the Union's activities, in the External Policy and of Common Security, and in the project of Europe's defence, as is built now, that EU could, in time, gain an international political dimension to match its economic state.

In order to appropriately assume its roles, EU has developed its societal structure and networks with institutions, civil and military capacities, able to significantly enhance the crises and conflict processes management no matter the place in the world. The European Union also disposes of other resources to achieve its objectives - such as policies and programs to handle the crises from both civil and military areas.

EU political-military role in its internal and external plan

The European Union, acting in its capacity of regional organization, has a highly recognized status, additionally assuming a large variety of political and military roles. The political roles are assumed by the EU both internally and externally.

Internally, it insures the social peace through specific guarantees and insurances for all its citizens – from the right to life to freedom of speech. The social protection and assistance within the Union generate a beneficial climate for all citizens. The reunification of the

continent is another major political role assumed by the Union and the member states. With the disappearance of the ideological barriers, the destruction of communism on the continent and the dissolution of the USSR, the European Union has started a new, long and complex process of enlargement. By receiving new members, from the ex-communist states, new challenges have emerged. One of the main preoccupations of the European institutions consists in guaranteeing and insuring the security of its citizens. "The 21st century Europe continues to deal with security issues"³⁸. In order to guarantee an efficient process that ensures the member states' security the EU must adopt a constructive attitude in the relations with its neighbouring regions. These neighbouring regions are: the Southern Mediterranean, the Balkans, the Caucasus and the Middle East. On the other side, it must protect its military and strategic interest through its alliances, especially NATO, and the emergence of consistent European security and common defence policies.

The military roles are exercised both by preventing the internal and external crises and conflicts and by their adequate management. In this purpose, the EU and the member states are actively, voluntarily and responsibly committed to insuring the security of the European citizens.

In the external scene, in accordance with its charter, the EU has various roles on the European continent as well as in other regions. In principle, the EU can exercise its influence both within its borders and abroad.

The political roles of the EU outside its borders consist of its different external politics, through which relations maintained with numerous partners form all around the world. To this end, different instruments are utilized, such as cooperation agreements and financial programs.

The principal domains where the political roles of the EU manifest themselves are:

humanitarian help – the EU tries to help the victims of the natural or human catastrophes, by offering financial and material help;

cooperation development - the EU has a cooperation development policy for eradicating poverty in emerging countries, in order to sustain a sustainable growth model. Through this policy, the EU encourages good government and searches to protect human rights throughout the world;

³⁸ L'Union Européenne: pourquoi?, http://europa.eu/abc/12lessons/lesson_1/index_fr.htm, p.2

human rights promotion policy - the respect for democracy and human rights is a fundamental principle of the EU, which is promoted in its relations with third parties. The adherence to these principles is a condition sine-qua-non for the initiation and continuation of cooperation agreements. The EU can punish their violation, by suspending its agreements or by imposing restrictive measures (embargos or circulation interdictions) for a country or a group of persons;

Diplomatic relations - the European Union has good diplomatic relations with most states. It has concluded strategic partnerships with the main international actors (especially with USA, China, Russia, Japan and India), and cooperates with most emerging economies. Outside its frontiers, the Union is represented by a network of 136 delegates, which fulfil a role which is similar to that of European Embassies.

In order to ameliorate the relations with its neighbours, the EU has elaborated and applied the European Neighbourhood Policy³⁹ (ENP). Through this document, the EU offers its neighbours a privileged relation, based on mutual engagement and common values – sustainable democracy, the rule of law, good government, principles of market economy and sustainable development. The European Neighbourhood Policy is applied to the direct terrestrial or maritime neighbours: Algeria, Armenia, Azerbaijan, Belarus, Egypt, Georgia, Israel, Jordan, Lebanon, Moldova, Morocco, Palestinian National Authority, Tunis and Ukraine. The EU relations with Russia are founded on a strategic⁴⁰ partnership which covers four common areas. The ENP targets the security of the external EU frontiers, creating a “circle of friends” which shares its peace, stability and prosperity objectives. These countries participate in various activities, through political, security, economical or cultural cooperation. By applying these policies, the EU tries to promote peace in the world, being involved more frequently in crises management operations, prevention of conflicts as well as police and military operations abroad.

The military roles of the European Union are accomplished through its external and security policy. Acting in its quality of international actor, the EU uses diplomacy, commerce, international aid to resolve conflicts and to contribute to the international agreements. Thus, the EU is actively and responsibly committed to preventing crises and conflicts by executing peace maintenance and stability missions. The EU has sent peace mission in various regions

³⁹ La politique: Qu'est-ce que la politique européenne de voisinage?, http://ec.europa.eu/world/enp/policy_fr.htm

⁴⁰Haukkala, Hiski. *The EU-Russia strategic partnership: the limits of post-sovereignty in international relations*. Routledge, 2010, p. 48-55.

on the brink of conflicts. Thus, in 2008, it has negotiated a cease fire between Georgia and Russia and proposed observers for the surveillance of the situation. Additionally, the EU has played a decisive role in the Balkans, where it has helped the project for stabilizing the situation in seven countries. In December 2008, it developed a Kosovo mission consisting in 1900 police officers and jurists, with the objective to help the maintenance of public order.

The Lisbon Treaty and the security aspects linked to crises management

By establishing the Lisbon Treaty, the European powers have followed the introduction of a series of new security aspects. In this sense, we can mention:

increasing the decisional efficiency concerning the liberty, security and justice areas. In this domain, the Council of Ministers will vote with a qualified majority and the European Parliament will dispose a co-decision power;

providing a system of frontier management and enforcing the Frontex powers - the surveillance agency of the Union's frontiers;

supporting the prevention and control of illegal immigration and human trafficking;

generating uniform rules, which define the penalties for a certain number of trans-border crimes (terrorism, drug trafficking, arms trafficking, money laundering, sexual exploitation of females, informatics criminality);

acknowledging the existence of the European Police Office (Europol), designed to support the actions of the national police in obtaining data and analyzing information.

The military roles assumed by EU were obtained by a series of provisions of the Lisbon Treaty⁴¹. In this sense, we can mention:

the mutual defence clause - it stipulates that if one of the member states of the EU is the object of an aggression, the others have the duty to assist it;

the solidarity clause - invites the Union and each member state to offer assistance, by all its means, to each member state which suffered human tragedies, natural catastrophes or terrorist attacks;

⁴¹ Thierry CHOPIN, *Le Traité de Lisbonne et l'action extérieure de L'union Européenne*, www.robert-schuman.eu/doc/divers/lisbonne/fr/fiche10.pdf

the extension of the action possibilities of the Union in the fight against terrorism;

the permanent structured cooperation;

The existence of the European Defence Agency, in the perspective of developing a real institution which will coordinate European policy;

CONCLUSIONS

The realities of the European security environment, as well as that of its vicinity, demonstrate the necessity of developing political and military instruments for security reasons. These can also be called upon for crises management actions. Documents like the Action plan for civil management of crises⁴² and the documentation linked to the Global civil objective from 2008⁴³ clearly show the will of the EU Council, to actively contribute to long-term stability and development. A better understanding and assessment of the necessities are required in order to support adequate policies.

MANAGING THE CRISIS IN THE EUROPEAN UNION

Balta, Corneliu¹; Stanca, Costel²

¹Wales University, Romania, corneliubalta@yahoo.com

²Maritime University, Constanta, Romania, costel.stanca@cmu-edu.eu

ABSTRACT

Civilian crisis management has become an important part of the EU security policy. However, the provision of civilian capabilities is a challenge for the European Union. The effectiveness of numerous missions is limited, reflecting, on the one hand, the current crisis of resources to conduct “state-building”missions and explains, on the other hand, the EU deficits as the absence of strategic interventions. A level of differentiated ambition at regional EU level is thus required, given the increasingly critical commitment of weak states.

The civilian dimension of the EU Common Security Defence Policy (CSDP) has evolved dynamically in recent years. As such, specific institutions have been created to plan and implement EU civilian missions. As the military capabilities have developed, civilian capabilities have been established for civilian crisis management. The overall objective of 2008 targeted six priority areas for civilian crisis management: police, rule of law, civil administration, civil protection, observation missions and supporting EU special representatives. The overall objective of 2010 highlighted the importance of simultaneous planning of interventions, training staff and the multilateral exchange of verified practices.

THE CHALLENGES AND SHORTCOMINGS OF THE EU CRISIS MANAGEMENT

Since 2003, the EU has conducted 17 civilian CSDP missions⁴⁴. Of 14 missions in progress, 11 are civilian in nature. Even if military operations often catch the interest of the media and the political world, civilian crisis management is of paramount importance in the security policy of the EU. Its geographic range has expanded continuously. Thus, EU civilian missions have been conducted in the Western Balkans, Southern Caucasus, Africa, the Middle East and Asia. The tasks performed were diverse and also include the security sector reform. The staff for EU civilian missions increased on the one hand: so far, in Kosovo, 1,700 international experts

⁴⁴ *Gestion civile des crises de l'UE: un bilan intermédiaire*, www.css.ethz.ch/publications/pdfs/CSS-Analysen-87-FR.pdf, p. 1

are working for the police and justice missions. Missions in Georgia and Afghanistan count 300 international experts⁴⁵.

Despite these dynamic developments, the EU still faces major challenges in the field of civilian crisis management. One can distinguish spiny quantitative and qualitative deficits in providing capacity. The absence in some missions of a higher strategic framework in the sense of EU policy objectives on the manner of concrete conflict resolution and modelling of relations with the countries concerned, the public's growing scepticism to support interventions across failed states and the enormous pressure exerted on national budgets of many European countries are other challenges the potential development of EU civilian crisis management will be facing in the coming years.

Moreover, we believe that there are skill shortages related to deficiencies such as:

- *recruitment of experts for tasks in state-building proves difficult* in the EU. Police and justice officials are especially lacking. The problem is explained in part by the EU recruitment system, based primarily on national squads. Some Member States have taken steps to ensure the availability of more significant and better staff resources for international missions. The national recruitment centres as the UK Stabilisation Unit, Zentrum Berlin für Internationale Friedenseinsätze or the Crisis Management Center in Finland train experts and offer structured courses. The EU also has civilian response teams, a number of experts from Member States readily available. But bottlenecks remain and, under EU missions, hundreds of experts than initially expected are lacking;
- *involvement of many national ministries in civilian crisis management*. The Ministries of Foreign Affairs, the Interior, of Justice and of Finance have different priorities and the fact that they do not often agree with the issue of funding recruitment, training and deployment represents an additional difficulty;
- *limited effect of actions taken*. The effectiveness of EU civilian crisis management is currently not reviewed systematically. Yes, it is sufficient to take a steady look at the missions to find that balance is so far quite modest, which explains, on the one hand, that local realities are often difficult. Also, there is the need to diagnose the deficits of the EU as a security policy actor.

The "state-building" concept, developed in the '90s by Western political actors in the sense of commissioning a modern state and transforming the state and society according to

⁴⁵ *Gestion civile des crises de l'UE: un bilan intermédiaire*, www.css.ethz.ch/publications/pdfs/CSS-Analysen-87-FR.pdf, p. 1

democratic principles and the rule of law, is in crisis. It has been demonstrated not only in the great “state-building” missions in the Balkans and Afghanistan, but also in smaller and less publicized operations, such as the EUPOL mission in Congo. The resilience of local elites to external intervention in the balance of power often prevents progress in state-building.

In states where the security situation is precarious, the task is still more difficult. The trend, in particular in the U.S., to focus in more and more similar cases on simple arguments of efficiency and to neglect legitimacy in the sense of civil establishment of security forces also raises problems. In Afghanistan, the EU has had difficulty in reconciling the paramilitarization of police established by Washington with the traditional understanding of the security sector reform.

Finally, local political changes could also mine the processes of state reconstruction. The EU mission assigned to protect the borders between Gaza and Egypt (EUBAM Rafah) is suspended from the takeover of power by the Hamas in Gaza and the EUPOL COPS police mission limited to the West Bank⁴⁶.

Regarding the EU deficits, it must first be noted that some missions do not have enough staff to be more than just a political symbol. On the basis of experience gained in recent years, we should rethink the EU mission objectives, which were often far too little oriented to local realities and defined by an obscure manner. Also, coordination with international partners such as the UN, NATO and the U.S. needs to be improved and criticism to overlapping skills and capabilities such as in Afghanistan should not be reserved for the EU. However, the central deficit is the absence of the strategic framework of CSDP operations, which translates into insufficient integration of numerous missions in a global policy and vision.

LACK OF A STRATEGIC FRAMEWORK

At EU level we can appreciate a problematic situation regarding the development of global regional conflict and concrete strategies, beyond general principles. The interests and priorities of the Member States are too different. The common EU institutions are too weak for them in relation to Member States to compensate for this lack of political leadership. Therefore, field missions do not have all the necessary facilities to protect staff in their

⁴⁶ *Gestion civile des crises de l'UE: un bilan intermédiaire*, www.css.ethz.ch/publications/pdfs/CSS-Analysen-87-FR.pdf, p. 1

performance. It seems that a consensus on the final result of an intervention and an exit strategy is often lacking.

In this respect, EULEX Kosovo is a revealing example. Initially launched with the aim of demonstrating the EU's ability to protect stability in the Balkans, today the mission supports the dissension between Member States regarding the independence of Kosovo. Setting a Kosovo police, a judiciary system and an administration with no mandate to promote sovereignty is proving extremely difficult. Even if EULEX performs limited executive duties, political issues and spiny areas as the fight against organized crime are more excluded in practice.

The fact that many Member States grant the civil dimension of CSDP a rather low importance complicates further intrinsic differences. The political will to take the necessary measures and provide resources to increase the effectiveness of crisis management is not always detectable. Rhetoric and practice often diverge. Civilian-military cooperation within CSDP, concerning integrated missions, is for this reason only one of its hesitations. The harmonization of civilian crisis management with the EU development policy and election observation activities also proves difficult. Therefore, civilian CSDP missions often lack both political and operational contextualization.

AMBITION LEVEL IN TERMS OF CRISIS MANAGEMENT

As regards the EU's ambition level in terms of crisis management, we can make some estimates. Thus, given the debt crisis in Europe and the growing public scepticism toward international stabilization and "state-building" missions, challenges in EU civilian crisis management are likely to continue to grow. The need for such missions should continue to grow simultaneously, especially as the security threats on the West will emanate in the near future rather from failed and significantly affected by conflict states rather than from the new great powers. Against this background, the EU would do well to define a realistic and differentiated ambition level for crisis management.

On this topic, we should assess, on the one hand, which regions are of central strategic importance for most EU Member States. On the other hand, it should be noted that the EU may especially influence sustainably the national transformation with the tool of accession prospects and potential enlarged trade agreements. Therefore, the EU regional context results as the geographic centre of gravity for more extensive and complex state-building

missions. But, as an accession perspective should remain limited to the Balkans in the near future, we should examine further leverages to achieve a national transformation process in regions such as the Southern Caucasus or Central Asia. A closer knitting of civilian CSDP missions with other tools used in the European Neighbourhood Policy is required to be considered. Finally, in the case of civilian CSDP operations beyond the regional context, it seems preferable to limit the ambitions and to strengthen simultaneously the powers of regional actors such as the African Union and ASEAN, to speed crisis control and stabilization of states.

CONCLUSIONS

The European Union, through its economic strength, population, political will, civil and military capabilities available to the Union and the Member States, the level of ambition displayed, the attitude of Member States for crisis management in civilian and military areas, is an important actor on the international stage. Its high status recognized by other state and non-state actors in the world is highlighted by assuming a wide range of economic, political, military, social and environmental roles, materialized around the world, wherever the interests of stability, peace and security may require it.

For the purpose of highlighting the roles in security, the European Union has created and developed military and civilian capabilities. Crisis management has become an important part of the EU security policy. However, the activation of civilian and military capabilities remains a challenge for the European Union. The effectiveness of many missions is limited, which, on the one hand, reflects the current "state-building" crisis and explains, on the other hand, the deficits of an EU strategic framework for action. Given the more and more critical commitment in failed states, a regionally differentiated level of ambition must be developed for the EU.

The European Union has set-up institutions aimed at accomplishing the Common Security Defence Policy, but these institutions and the actors involved in the CSDP must find a coherent and effective operation manner in all circumstances. Thus, it appears that human resources for civilian crisis management are trained with difficulty and are time consuming. Hence, the necessity of the establishment of training centres for civilian staff - experts in the rule of law, civil administration, justice, and police - either at EU level or its Member States that is willing and can do it.

Crisis management operations led by the European Union are defined by at least two features. First, due to restrictions imposed to its ambition level and means, the EU tends not to favour recourse to its military capabilities. When it does, the EU ensures that the policy objective is perfectly defined and engages in a limited space-time for well-defined tasks. Then, through its various and numerous tools, the EU always adopts a multidisciplinary approach in crisis management, is mainly interested in the causes and conducts priority targeted interventions either within an overall treatment of a situation in time, such as in Bosnia, or for obtaining a partial effect, such as in D.R. Congo, in Aceh or in Palestine. This approach seems to enjoy less visibility, but a guaranteed success.

In addition, the involvement of civilian capabilities for crisis management seems to be more appropriate than resorting to military means. For example, using the EU Stability and Neighbourhood Policy Tools or financial support in development appear to be more effective and with lasting effects in resolving crises, because they help give hope to those affected, as they are based on the satisfaction of basic economic, social and human needs in the states where the crisis is being managed.

NEGOTIATORS' ATTITUDES TOWARD FORMAL CONTRACTS: A SEVEN-COUNTRY ANALYSIS

Banai, Moshe¹; Stefanidis, Abraham²; Schinzel, Ursula³; Shetach, Ana⁴

⁴Management of Health Systems Department, Max Stern Academic College of Emek Yezreel, Israel, shetachf@netvision.net.il

ABSTRACT

This research investigates negotiators' tendency to sign formal contracts. Drawing on a sample from Austria, France, Germany, Greece, Israel, Luxembourg and Turkey, it examines the influence of horizontal and vertical individualism-collectivism, ethical idealism and trust propensity on business people's attitudes toward negotiated formal contracts. A survey questionnaire was translated from English to French, German, Greek, Hebrew and Turkish, and two thousand one hundred and sixty-six responses were collected from employees in the seven countries. The research findings suggest that higher levels of individualism and ethical idealism increase negotiators' tendency to sign formal contracts, while higher levels of trust propensity decrease negotiators' tendency to value formal contracts. This study contributes to the literature of formal contracts offering original implications for the international negotiations theory and practice.

Keywords: Formal contracts, negotiation, horizontal-vertical individualism, horizontal-vertical collectivism, ethical idealism, trust propensity, Austria, France, Germany, Greece, Israel, Luxembourg, Turkey.

ESTABLISHING A SUSTAINABLE GROWTH FOR A SME

Bertoldi, Bernardo¹; Branca, Stefano²

¹University of Turin, Italy, bernardo.bertoldi@unito.it

²University of Turin, Italy, stefano.branca@unito.it

ABSTRACT

The European Commission estimates that more than 99% of all European businesses are SMEs, providing about 70% of the private sector jobs and more than 50% of the European GDP. They are the primarily responsible for wealth and economic growth and play a key role in innovation and R&D.

Many SMEs are led by a family, and the company represents the main source of wealth and incomes for its members. According to evolutionary theory (Emlen, 1982), the individual pursues the improvement of its disposable resources to continue its own specie. Transposing these concepts to a family (Nicholson, 2008), the family leader should set a mechanism that provides resources in order to grant to present and the future generations at least the same resource level per capita. When the company is the mean through which the family generates these for the continuation of the specie, the family goals impact the company goals. In particular, the company's growth rate should be the one that allows to a growing number of family members to have the same income and wealth level. This means the expected return of Family-led SMEs, is different by large Non-Family companies, where theories like CAPM (Fama et al., 2004) are usually applied.

The purpose of the article is to discover if the growth rate of a family SME is compatible with the need for incomes and wealth generated by the increase of family members in the long term.

In order to answer the question we developed a model connecting the family growth, which depends on the average life expectation and on the fertility index of the family, with the company growth in terms of net incomes.

The results reveal that for a SME led by a family that generates 2 new branches each generation, the annual company growth rate in real terms is far lower than the MSCI annual growth of the last 40 years.

Keywords: SME growth, Family controlled, Long term return

ABSTRACT

Faced with the pressures of a modern, open society, the traditional economic approach has become an important subject of debate among economic thinkers and business planners. The economic development leading to a globalized market, with independent commercial and financial business moving towards new social and societal models, brings forward additional arguments in support of an enhanced quality of life. Change has become the word of the day. It takes a variety of forms from a wide spectrum of options. As the economic literature presents, the implementation of change (structural change, technological changes, social and political changes) represents the basis for endogenous and sustainable growth.

Keywords: globalization, complexity dynamics, change, risk, added value, reflexive modernity, economic crises.

INTRODUCTION

Previous studies have noted the intricate relationship which exists between economic restructuring and development and the general wellbeing of the population (Vasile, Viciu and Costea, 2012).

A thorough assessment of changes at all levels, brought into discussion an element that was hardly noticed less than a decade ago. The fast development of commercial activities determined a new orientation of studies in both commercial and financial life, with significant consequences at the decision making level, with implication in the social, cultural and societal fields. The changes generated have been wisely motivated by the new distribution of power inside the society where, the "awesome global might of corporations has outstripped government control and objectivity" (Rothschild, 2001).

The free market has represented the first priority in the process of building an open and democratic world (Rothschild, 2001). The results registered by the largest multinational companies, dramatically influenced life at societal level.

The structure and performance of three important sectors represented the prerequisites for this phenomenon:

1. The stability and effectiveness of the political or executive sector - represented by the government and the public institutions;
2. The profitability of the corporate or economic sector- represented by businesses and financial authorities;
3. The general trends and directions of other parts of society - described in various ways and influenced by cultural, ethnic or ethical factors.

Solow (1986) asserted that changes in technology offer the drive for economic growth and the only possible alternative to avoiding a Malthusian trap (Hansen and Prescott, 2002). On the path to liberalism and economic freedom, the expectations met strong barriers in the form of tradition, culture and religion. The clash between the new approaches and these factors brought corruption, regional politics and personal interests which, in turn, contributed to a strong polarization of society. The phenomenon was exacerbated by the emergence of a new distribution concept that affects the general and individual consumption pattern.

Under the banner of democracy, the elites of society (comprising formal leaders and large economic entities) have “politically” empowered the decision-makers to develop and replace the views of an “ideal” society with a network of complex social structures which require organization planning and leadership. This represented the moment when the new ideology of a durable, commercial, efficient and quality-oriented transition changed the policies from the search for fast profit to a pursuit of wellbeing and sustainable development. The social and economic results are significant and may benefited society at all levels.

This outcome has been supported by previous research (Costea et al. 2010) which underlined the flows of the short-term profit maximization attitude of policymakers and business leaders. Once the sentiment matured into a general purpose and strategy, the development moved from a local to a global scale.

A society which is fundamentally grounded in freedom (Handy, 2002) and competitiveness proves capable of permanently enforcing the right policy, even in situations when political and economic entities ignore the general limits or expectations. These

situations require a complex and dynamic analysis, which takes into account the fragility of the theoretical equilibrium when the stakeholders are not sufficiently studied and the expectations are not realistically defined. Research in this direction typically abandon the course of neoclassical thinking and enters the relatively new epistemological approaches of complex studies, evolutionary economics and evolutionary game theory (Keen, 2001; Vasile, Costea and Viciu, 2012).

Therefore the purpose of this paper is to bring into discussion the concept of consumption pattern and determine its relationship with societal and corporate development, through a complex assessment that incorporates the conditions and outcomes of the globalization phenomenon.

Nowadays, the consequences of globalization are widely presented and discussed, being considered by most scholars as the long-run processes with significant implications at economic and social levels. It can be noted that the macro-indicators are analyzed and justified through different approaches which depend on the specific research or policy objectives.

To ensure a durable development, there is a need to find the best solutions for socio-economic problems. These rely on several important issues connected to a better understanding of the relationship between production, environmental protection, general wellbeing and societal soundness, with direct implication for both individuals and corporations.

The macro and microeconomic levels have become intertwined, both being affected by a very wide range of global phenomena. Since most industrial products are either totally or partially made in different parts of the world or delivered at different locations by multinational suppliers, the business studies must be complemented by research in fields such as geopolitics, international studies and regional development.

This brings into equation the new characteristic of contemporary life, consisting in a multicultural, knowledge-based and complex-networked economy. While remaining a widely disputed concept, the process of globalization generates opportunities as well as risks (or threats) for business owners and managers. With the introduction of globalization, a “revolution” emerged in the field of economics, enabling entrepreneurs and businesses to

obtain profit by using global resources and capitals. This led to the creation of a new society, which generated new rules for sustainable development.

CONCLUSIONS

Global markets offer greater opportunities for people. Expanding to larger markets around the world permits easier access to extra capital flows, technology, cheaper raw material, appropriate labor and larger distribution or consumption opportunities. Global investment and trade generate positive externalities in the form of technological spillovers (Baldwin et al. 1999; Fosfuri and Motta, 1999). However, globalization does not necessarily ensure that the benefits of increased efficiency are shared by all members of society. Markets promote efficiency through competition and the division of human resources. Specialization allows people and economies to focus on what they do best. Governments and decision-makers should also accept the increasing integration of economies around the world and act accordingly to support future development. This remains an important concern for scientists.

CHALLENGES FOR EXECUTIVE RECRUITMENT IN THE LIGHT OF THE WAR FOR TALENT IN GERMANY

Buttenberg, Katharina

University of Latvia, Latvia - University of Applied Sciences Kufstein, Austria, buttenberg@gmail.com

ABSTRACT

PURPOSE

Goal of the research shall be to identify the significant trends in the recruiting-business and their implications for skilled employees – especially executive candidates.

INTRODUCTION

In Germany, the “War for Talent” is becoming a reality for more and more organizations. Competition in identifying and hiring as well as maintaining talent has increased. “All developed economies face a strong and increasing excess demand for skilled labor, fostered by technological change, population aging and a subsequent decline in the future native European workforce. The upcoming needs cannot be satisfied sufficiently by the local labor force or the educational system in the particular countries. Europe is more and more drawn into a competition to attract international skilled labor to fill the gaps.” (Zimmermann 2004, S. 2) Additionally, in a more service- and know-how-driven industry, the general value of human capital in has grown significantly. "Human resources are strategically the most important company resource, even though it cannot be expressed in numbers form a financial point of view." (Myskova 2011, S. 101) On the candidate side, the increase in diversification of the workforce, the increase of workforce mobility and the higher flexibility in changing to a new position, make it easier for candidates – especially on a higher career level – to turn to a new employer and turn the labor market from a sellers’ market into a buyers’ market.

DESIGN/METHODOLOGY/APPROACH

The paper will contain a summary of a literature review of current popular trend-studies in HR focusing on recruiting trends and qualitative and quantitative studies conducted among Executive Search Consultants and Company Recruiters / HR-managers.

In addition to the view of the recruiting party, the requirements of job-seeking (employed and unemployed) executives and professionals in Germany will be presented as counterpart, to understand the gap between demand and supply in current recruiting.

FINDINGS

Looking at the current literature and research, the needs of the two groups for recruiting can be derived. Since the “War for Talent” has been raised as topic, not much has been done on the recruiter-side. Organizations are seeing a decline in quantity and quality of applications as well as the signing-quote of job-offers has declined while the fluctuation of existing employees has gone up. (Kienbaum 2011, S. 6–8)

The regular job posting will not be enough to get the right employees applying for open positions. Similarities can be found in the prioritization of the communication channels chosen by the recruiters and the candidates in the preference-building process. Finding the “Employer of Choice” is a complex selection- and decision-process of an employee looking for an employer. (Petkovic 2008, S. 61) To attract the “best talent”, more companies are creating initiatives targeted towards the acquisition of highly qualified specialists and managers. HR-managers (Kienbaum 2011, S. 6–8) as well as Executive Search Consultants (Experteer 2011, S. 9–10) see Employer Branding as important factor for attracting Senior Talent. “[The Employer Brand] is meant to significantly enhance the publicity of the organization as employer, to ensure that employees include the employer in their relevant set. Moreover, the perceived advantages (Brand value) should immediately reflect in the preference-decisions of the target audience and at the same time enable a sustainable differentiation to competing offers of competitors.” (Beck 2008, S. 33) Employer branding is not only a recruiting strategy, but it entails a full framework for governing the everyday experience of employees through communication and behavior (Mosley 2007, S. 132), which make it hard to extract and improve for better recruitment. However, there are clear guidelines, which can be derived for employers to successfully recruit executive talent.

LIMITATIONS / IMPLICATIONS

This study is a review of current analyses of the current recruiting situation mainly in Germany, with a focus on executive talent. It is only an assessment of the current best practice and needs for recruiting.

ORIGINALITY/VALUE

Research currently provides rather limited theories for research. This research is providing an overview on the current problems in recruiting and is giving an overview on the current theoretical solutions such as employer branding. It is a basis for deriving further research questions.

Key Words: recruiting, war for talent, human resources, jobsearch, candidates

PROFITABLE INDEX ON TOURISM PROMOTION ON MADEIRA – A FINANCIAL MODEL

Camacho, Élvio José Sousa¹; Coelho, Maria Manuela M. S Sarmento²

¹Universidade Lusíada, Portugal, elvio.camacho@me.com

²Universidade Lusíada, Portugal, manuela.sarmento@edu.ulusiada.pt

ABSTRACT

As the resources for promotion are limited, it is important to create and implement a model to valuate at priori the investments made and a continuously monitoring of the return obtained.

Concerning the valuation of the investments made, there are no evidences that, at a regional level, in Madeira, this politic actually exists as a previous valuation that can assist the decision of invest or not.

When this rule for the profitable index of the promotion is applied, based on the valuation model created, we can verify that according to the strategic targets, and in harmony with the previous agreed plans, the value obtained is for a return on investment is under the historic level obtained, that is about 47 times.

The model is created to generate a full process on establishing main objectives of political investment, fully related with the amount spend on investment.

A new matrix of profitable index is made, relating two main index; a) growth on outbound market; b) market share.

Keywords: Touristy Promotion; Return on Investment; Tourist incomes; Profitable index; Profitable index Matrix.

BUSINESS MODEL FOR ASSEMBLE IT YOURSELF FURNITURE RETAILERS –A DEVELOPING ECONOMY PERSPECTIVE

Chandrasekhar, Natarajan ¹; Ostheimer, Bernard²

¹University of Applied Sciences, Ingolstadt, natarajan.chandrasekhar@haw-ingolstadt.de

²University of Applied Sciences, Ingolstadt, Bernhard.Ostheimer@haw-ingolstadt.de

ABSTRACT

Organizations venture out of their domestic market with a view to garnering better market share and ensuring continuous growth. This method of growth is most certainly not new in business and has been the most popular route employed without much difficulty until the past decade. Business entities from a developed economy venturing into the market of another developed economy did not experience any specific barriers on one hand but on the other did not experience the anticipated rewards too. This could be attributed to a number of factors like competition, matured economy, to mention a few. On the other hand we have in the past decade and also currently witnessing the increasing propensity of businesses to venture into developing markets with a very clear objective of encash on the potential growth prospects and in their quest for growth overlook crucial aspects which are latent but nevertheless could cast the difference between success and failure.

One such business which is set for this venture is the modular assemble it yourself furniture brand leader. This paper attempts to study the current model of this business entity and discusses the issues which could impede its implementation in developing economies. One of the objectives of this paper is to suggest a workable model after careful consideration of socio-cultural and psychographic aspects in developing economies.

SOCIAL DISCOURSES TOWARD HEALTHY EATING: EVIDENCE FROM ROMANIA

Chrysochou, Polymeros; Festila, Aleksandra

Department of Business Administration, Aarhus University, Denmark, polyc@asb.dk

EXTENDED ABSTRACT

PURPOSE

Existing research on healthy eating has been criticized with regard to its emphasis on individual beliefs. This is problematic because everyday decisions about food, although being individual acts, are also deeply embedded in societal norms (Ristovski-Slijepcevic, Chapman & Beagan, 2008). Chrysochou et al. (2010) proposed a framework that builds on social food and health discourses. The framework was employed in a northern European country (Denmark) and used to identify health-related segments. This paper aims to provide further evidence of the robustness of the framework in a southern European context, and more specifically in Romania. The objectives are: (a) to identify health-related segments based on the underlying discursive subject positions of the framework, (b) to validate and further describe the segments based on their socio-demographic characteristics and attitudes towards healthy eating, and (c) to explore differences across segments in their response to food labels.

DESIGN/METHODOLOGY/APPROACH

A study was conducted in Romania during 2012 (N=428). The questionnaire included the scale measuring the social discourses toward healthy eating (Chrysochou et al., 2010), attitudes toward healthy eating, and consumers' response to food labels. More specifically, a set of the most used food labels in Romania was measured in terms of awareness, perceived knowledge, usefulness and trustworthiness.

FINDINGS

Results show that the framework can successfully be applied in a different food cultural setting than the one originally developed. Three segments were revealed and were named as the Common, the Idealists and the Pragmatists. The segment that can be categorized as the

most health-conscious one was the Idealists. The Idealists were more likely to be women, married and of higher age, tended to have higher levels of education and income, were responsible for grocery shopping in their household, had good perceived healthy eating knowledge and diet quality and reported to rely on food labels. Moreover, that segment declared to be more aware of the food labels while they showed higher levels of understanding, trust and perceived usefulness.

RESEARCH IMPLICATIONS

The proposed a framework provides a useful conceptual scheme for market segmentation purposes. The main implication of this study concerns the targeted interventions that could take into account the different discursive subject positions of the proposed framework as a basis for addressing dietary-related behaviour.

RESEARCH LIMITATIONS

Data have been collected using a web-based survey, something that has skewed the sample toward more educated consumers. Therefore, results should be interpreted in the context of the characteristics of the sample.

ORIGINALITY/VALUE

This study is the first to provide evidence on the robustness of the framework on food and health social discourses proposed by Chrysochou et al. (2010) on a different cultural setting than originally developed.

SOCIAL MEDIA, PREDICTIVE ANALYTICS, AND TOURISM

Claster, William¹; Pardo, Phillip²; Cooper, Malcolm³

ABSTRACT

Recently social media has been shown to provide information on tourism and politics. In recent studies that we have conducted, wine sales and tourism trends have been forecast using machine learning algorithms and hundreds of thousands of blogs, online news articles and Twitter tweets. Our previous research has shown that mining of social media can predict in real-time market penetration figures and can also forecast social and business trends in tourism. We extend the research further to evaluate the predictive value of Social Media in forecasting trends for the value of publicly traded Hospitality and Tourism companies.

RESEARCH BACKGROUND

In this follow up study we continue to investigate whether public mood as measured from large-scale collection of social media is correlated or even predictive of publicly traded Hospitality stock values. Our research and publications to date on this issue, as well as those mentioned above suggest that models which include text mining and sentiment mining of internet based data repositories and specifically blogs, online dailies, Twitter, and Facebook can provide predictive power for financial markets. Specifically we monitor the stock measures of publicly traded Hospitality mid-sized and large firms. To date there has not been published work of this kind on this subgroup. This research additionally augments methodologies already established and will provide tools and models which will be transferable to other quantitative research.

As found in a number of papers, sentiment mining aims at extracting features on which users express their opinions in order to determine the user's sentiment towards the query object. There has been a flourish of articles in the academic literature on

market correlations to various sentiment measures of social media starting in about 2009. Our efforts at collection of data began in that year as well and we have published several papers in this field. However no work has been published on Hospitality and Tourism companies and the possible links that their market value may have to Social Media. Our study of the same type looked at social media sentiment about tourism in Thailand amid the unrest in that country during the early part of 2010 and further whether analysis of micro-blogs can be used to discern the effect of that unrest on Phuket's tourism environment.

There is a treasure trove of hidden information in the textual and narrative data of various social media that can be deciphered by text-mining techniques. The information provided by these methods can provide a basis for artificial intelligence and help support or improve any kind of analysis but in particular the verification of market valuations. To date we have devised a buy, hold, and sell strategy with accuracy of approximately 70 percent for seven large stocks that sells on the NYSE. In this paper we develop this methodology for medium and mid-sized Hospitality and Tourism companies on the NYSE by the collection of data from blogs, and other forms of social media.

METHODOLOGY

We selected a small sample non representative portfolio of Hospitality and Tourism stocks whose companies hold a significant presence in English based social media and a global footprint. Over 800 million micro-blogs and 25,000 reviews were collected and analyzed to gain knowledge regarding Hospitality and Tourist sentiment on Hotels in various destinations such as New York, London and Tokyo. Sentiment was measured using a binary choice keyword algorithm and a multi-knowledge based approach was proposed using, Self-Organizing Maps and tourism domain knowledge in order to model sentiment. A visual model was developed to express this taxonomy of sentiment vocabulary and then this model was applied to maximums and minimums in the time sentiment data. The results showed actionable knowledge could be extracted.

We obtained a collection of public media (such as Facebook, blogs, news, Twitter) for a period of 3 years. Software was written to account for location and language and a means was designed for implementation of machine translation of text from non-English sources. Domain specific models of sentiment are developed in order to achieve robust models. We further looked for correlations between sentiment and various financial indicators such as closing stock prices on public markets.

Testing of the models included periods of substantial volatility and periods with little volatility. Data sets of varying lengths were also tested (short -3 months, medium -8 months, and long -15 months). For each stock, a minimum of 10 data sets was tested against a minimum of 12 artificial intelligence algorithms including decision trees, Bayesian methods, Neural Networks, and Regression models. Aspects of traditional times-series modeling were also employed.

RESULTS AND FUTURE WORKS

The preliminary results indicate that significant correlations exist between sentiment and various business measures. The most significant of these has been between sentiment and share price. Given these correlations our next steps will involve constructing forecasting models.

Further innovations will include the incorporation of geo-location data in order to improve the precision of the predictive analytics. We have already developed software which can match a tweeters location based on characteristics of the tweet. With the growing prevalence of Android and iPhone smart phone technology GPS data is becoming increasingly available. Further innovation will be introduced through the inclusion of language indicators. The innovative inclusion of both of these factors may help avoid geographical and cultural sampling errors.

MANAGEMENT ACCOUNTING SYSTEMS AND SMES: EXPLORING THE EFFECTS OF THE FINANCIAL CRISIS IN GREECE

Cohen, Sandra¹; Karatzimas, Sotiris²; Naoum, Vassilios-Christos³

¹Department of Business Administration, University of Economics and Business, Athens, Greece, scohen@aueb.gr

²Department of Business Administration, Athens University of Economics and Business, Athens, Greece, skaratzimas@aueb.gr

³Department of Accounting and Finance, Athens University of Economics and Business, Athens, Greece, bnaoum@aueb.gr

ABSTRACT

The role of Small and Medium Enterprises (SMEs) in all economies is crucial, since they constitute the vast majority of the firms' population. SMEs are characterized as a "vital" and "key" force for an economy's well-being (Mitchell *et al.*, 1998; Mitchell and Reid, 2000; Nandan, 2010). However, literature presents several reasons that make this business sector prone to failure (Ballantine *et al.*, 1998) leading many SMEs to struggle for survival. These include, among others, the limited management skills of the owners-managers (Kirby and King, 1997), the dependency on limited number of customers and the production of standard products (Nandan, 2010). According to Hopper *et al.* (1999) SMEs receive intense pressures to reduce their costs, and at the same time to retain high quality. Nevertheless, this sector of economy is viewed by Organization of Economic Cooperation and Development as a major driver of economic growth and adjustments (OECD, 2010). Despite several shortcomings, SMEs are considered to be more flexible, entrepreneurial and innovative, react quickly to changing markets, are less bureaucratic and "in-touch" with reality compared to large companies (Peel and Bridge, 1998).

Under normal financial conditions, the appropriate use of management accounting information is characterized as a crucial attribute for the survival and even success of a small or medium-sized enterprise (Mitchell and Reid, 2000). However, the recent financial crisis has been a major challenge for organizations of all types by revealing a plethora of shortcomings in terms of culture, structure, planning as well as accounting practices (Hopwood, 2009; van der Stede, 2011). The great pressures that the crisis is putting on management accounting are "undeniable" (van der Stede, 2011; p. 606) and the need for various readjustments more than evident (Hopwood, 2009). Within the context of a financial crisis, SMEs are considered to be more vulnerable to the intense pressures and often struggle to survive. Therefore, interesting

research questions arise regarding the impact of financial crises on SMEs as well as the defense mechanisms that SMEs have developed against the financial crisis in order to overcome the extreme pressures. After all, SMEs are considered to be less complicated compared to larger firms, and therefore offer a more accessible setting for researching management accounting issues (Mitchell and Reid, 2000).

The present study examines the reaction of Greek SMEs in terms of adjusting management accounting practices and techniques, within the context of the financial crisis that started becoming evident in Greece since the end of 2009. More specifically we explore the application of budgeting and cost accounting systems as well as other management accounting techniques by the Greek SMEs and whether these changed as a response to the pressures deriving from the financial crisis. Greece constitutes an interesting setting for the purpose of such a study as the country and the organizations operating within have faced and are still facing extremely intense pressures from the extensive financial crisis (Matsaganis and Leventi, 2013). Moreover, Greece constitutes a characteristic example of a country where the vast majority of enterprises are small and medium-sized (Eurostat, 2008).

The study adds to international literature by examining the implications on management accounting systems deriving from the financial crisis. According to Hopwood (2009) and van der Stede (2011) this is an area of research which is understudied and therefore requires further analysis. Moreover, the study contributes to literature by exploring the management accounting practices and techniques that are applied by SMEs; another field where research is not extensive (e.g. Drury and Tayles, 1993; Marriot and Marriot, 2000; Wijewardena and De Zoysa, 2001). For the purpose of the study a questionnaire has been developed and disseminated to 3.000 e-mail addresses of SMEs in Greece, retrieved by the dataset of ICAP. For the selection of the SMEs the European Commission's definition of SMEs issued in May 2003 was adopted (i.e. workforce ranging from 10 to 250 employees and turnover from 10m to 50m euro). The analysis is concentrated on comparing the characteristics of the budgeting and costing systems in SMEs in 2009 the year when the crisis started and in 2013, a period that is characterized by witnessing the severe effects of the crisis.

ABSTRACT

In the process of focusing on Schweiker's [Schweiker, W. (1993), "Accounting for Ourselves: Accounting Practice and the Discourse of Ethics", *Accounting, Organizations and Society*, Vol.18 No.2/3, pp. 231 – 252.] arguments over the essential role of the act of giving an account as to enable organizations to develop an identity as moral agents within community. This paper seeks to examine the way in which discourse acts over organizations in constructing their sense of accountability. Giving that accounting is a social practice, accountability is founded upon the moral responsibility felt by the self to account for itself to another, dependent on the active subjectivity and intersubjectivity of both parties regarding a particular social reality. The self is regarded here as a corporative agent, its identity enacted through communication. This stresses the role of the accountant in the process of the enactment of corporate identity, as it reflects on one's duty of giving an account of the organization.

By conceptualizing the act of giving an account as a narrative, interpretative and discursive act, accountability, since it is grounded upon the moral responsibility of the self to respond to the other's expectations to account, is rendered as a function of three variables, the self, the other and the community, exposing it to what constraints the act of giving an account may be liable to. This allows for the ethical relationship sustaining accountability to be studied, resulting in identity never being able to claim full authorship by the self as its accounts are not properly its own, resulting instead in a complex exertion of several forces through time. Because discourse crystallizes these forces into power, one's identity as a corporation is a discursive one. As a result, accounting, as a communicative act, is tantamount to being a constructive act of an identity, reflective of an (im)balance between different forces looming and weighing behind what discourse accounts purposively convey, as the corporate subject, through the accountant, is indeed an agent in shaping its own identity.

As is a critical examination of what discursive stance is both articulated and adopted by the practice of accounting *for* the corporate subject throughout time, this paper, by investigating the way discourse in accounting information acts and reacts to the exertion of forces

comprised within a set framework, searches to grasp a better understanding of how accounts, far from being the result of a neutral bystander, express a wide range of forces acting upon what identity is intended or allowed for the corporate subject. It takes therefore a participant's view over the social phenomenon being analysed, as it reveals the observer's perspective, thus its interpretation, about the 'specific reality' whose meaning he himself wishes to understand.

Buttressed on the current economic environment, Portugal's water sector has been increasingly pressured to open itself to privatization through a prevailing discursive stance of being the best solution to the sector's inherent problems. With its leading role in coordinating water supply, 'Águas de Portugal, S.A.' represents the central focus of such pressures, making it liable to the full exposure to discourse's enabling and constraining powers on rendering its identity as an accountable being. The shifts that have been experienced by 'Águas de Portugal, S.A.' in the discourse conveyed through its accounts, reveal to be of particular importance in understanding the process of identity construction of a corporate agent, in turn reflecting its sense of accountability.

Within the field of accountability research and the role accounting has in shaping it, case studies consist on a recurrent approach in exploring the ways distinct forces are able to mould the specific framework within which identity construction takes place. In this paper, a new strategic plan for the water sector set by the Portuguese government for the period comprising 2007 to 2013 serves as the background for conducting this study. Albeit narrowed to a sample of one, as it expresses the inevitability of conducting an analysis within a regulated, practically monopolized public sector, this case study has the potential of enabling a better understanding of how the discourse conveyed through accounts reflects/affects the deployment of forces acting upon a corporate subject's accountability within processes intending for major social change.

Key words: Accountability, discourse, identity construction, water sector.

AN INTEGRATED APPROACH TO VALUE BASED INNOVATION ENVIRONMENT CREATED BY CROSS SECTOR STAKEHOLDERS INTERACTION

Czarczyńska, Anna

Kozminski University, Poland, czarczyńska@alk.edu.pl

Keywords: innovation environment, knowledge management, stakeholders' collaboration, institutional analysis approach, integrated approach

INTRODUCTION

The research is taking into account the latest trends related to the change of paradigm in management sciences, as a consequence of the development of global network organizations, importance of intangible assets and growing role of new information and communication technologies. The field of research is based on innovative, flexible, high-value organizations, as they are able to adjust to the challenges of a changing and increasingly uncertain environment most efficiently. For transformational change in knowledge management, it is important to identify key stakeholder-related sectors that influence stakeholders' participation and the domains where the integration takes place in innovation diffusion.

Improvement of the innovation is an important challenge, especially in the post-crisis era. After the period of prosperity based on competitive advantage, countries have to face the competition based on knowledge economics. The basic cost advantage is not working anymore, so further development depends mostly on ability to create creative and sustainable economy. Increasingly apparent limitations of traditional models of economic growth based on resources and production factors show that a balanced approach, based on integrated values may be the only alternative to giving the chance to build a new variety of the welfare state model.

ACTOR INTERACTIONS

The first analytical block deals with the identification of actors (individual and institutional) relevant for the design and implementation of market-based mechanisms, understanding of their roles, responsibilities, preferences, resources and the patterns of interactions emerging among them. The set of relevant actors is delineated by the nature of the problem, although it may involve actors located outside the system if their decisions affect its management.

This block relies on the techniques of stakeholder analysis, which studies stakeholders on the basis of their attributes. Four actor attributes can be identified:

- *Resources* (actor's access to stocks of capital, labour, technology, and social influence)
- *Individual preferences* (what actors want to achieve)
- *Information-processing capabilities* (the way actors acquire, process and use information)
- *Selection process* (the selection criteria actors use in decision-making process).
- The resources that different actors or groups of actors possess determine their relative strength vis-à-vis their counterparts, and endow them with the capacity to establish or change rules, or act in accordance to the existing rules to satisfy their individual preferences. The information-processing capabilities of actors and the decision-making criteria they follow to determine the extent to which individual and group interests can be matched and opportunistic behavior can be prevented or overcome. All these attributes are particularly sensitive to the socioeconomic, political and institutional setup in which interactions occur (Polski and Ostrom 1999).

INNOVATIVE ENVIRONMENT

The main obstacle to achieve this goal is the lack of cooperation and strategic attitude towards main stakeholders of that process: inefficient public sector, society with growing but still low awareness of sustainable way of thinking, and underdeveloped education and research industry. The emerging grassroots social movements increasingly emphasize the need for sustainable development with transparency, value and trust, taking into account the common good of society, which seems to be optimistic.

This article analyses an interdependencies of main stakeholders of sustainable development process based on innovation improvement. I start from the meaning of sustainable development in the cross-sector relations, examining to what extent lack of interdisciplinary strategic thinking and innovative attitude can be the main obstacle in sustainable development of innovative economy. Technological gap in the sense of the new ways of construction, distribution and utilization of collaborative knowledge supporting sustainable development, placed the whole economy below the potential sustainable growth level.

The experience of the past years shows that there is no discretion to treat imbalances as the driving force of the economy. The sustainable development ability in cross-sector cooperation is quite substantial. However this potential is rather used in line with the institutional order on the rational behavior base, instead of mindfulness developing process. The main reason of that is the existence of systemic barriers and the lack of cooperation and strategic attitude.

However the successive generations bred in the Internet age seem to be increasingly aware of the environmental consequences of economic activities and the strength of its impact on the global level - sustainability means also balance among generations (environment, labor market, but also public debt).

The theory and practice of business management form methodological foundations of the scientific used for aiming at combining micro, macro and personal level in order to investigate and show how to increase the value through innovation. Therefore the output depends on organizational management model that have the potential to reduce barriers, and to produce sustainable outcomes for innovative performance.

INSTITUTIONAL ANALYSIS

The aim of the article is also to derive suggestions and recommendations to policy- and decision-makers concerning the creation of the pro-innovative environment and to provide insights into the most adequate design of such mechanisms. I define institutions as the rules modeling human behavior, assigning roles to different actors and structuring their relations and interactions. Other actors are the players of the game, with a limited capacity to "set the rules". Institutions can be defined as the "rules of the game" which shape human behavior by giving rise to social practices, assigning roles to different actors and structuring their relations and interactions (Young 2002). Institutions, therefore, differ from actors and organizations that are the "players" of the game, with a capacity to act upon their interests. Institutional analysis sheds light on the sources of a possible mismatch between design rules, actors' interests, and other existing policies. Enhanced understanding of their complementarities and contradictions contributes to improved design and performance of these mechanisms and helps policymakers develop successful instruments.

SYSTEMIC APPROACH

Further question is how institutional or governmental policies should supporting this movement. In the analysis I adopt an institutional analysis approach to examine questions related to ways in which public institutions and private sector are effectively working together around new ideas and technologies, creating the channels of collaboration.

Systemic change towards pro-sustainable approach can help better organize cross sector cooperation improving their strategic attitude. Limited public resources can be better located thanks to civil society involvement and active role of the R&D sector. All those can be

achieved by balancing creative sustainability approach with the interdisciplinary strategic thinking. The sustainable solutions in the macro scale can be implemented only by the cooperative and aware stakeholders. There is a growing recognition of the need for sustainable approaches to value management. While innovation has been acknowledged as a tool for growth and for creating local knowledge sharing culture, it is presumably that conflicting interests of multiple stakeholder groups can hinder innovation in achieving equally social and economical objectives. The integrated approach to innovation environment combines institutional background, company management tools, and personal attitude provide a holistic and collaborative innovation system.

AIRLINE SERVICE QUALITY IN SOUTH AFRICA AND MALAYSIA - AN INTERNATIONAL CUSTOMER EXPERIENCE APPROACH

De Jager, Johan¹; Van Zyl, D.²; Bin Dahari, Z.³

¹Tshwane University of Technology, South Africa, dejagerjw@tut.ac.za

²University of South Africa, South Africa

³International Islamic University, Malaysia

ABSTRACT

Research into airline service quality has increased rapidly since its relationship with passenger satisfaction and profitability has been established. Nowak and Newton (2006) report that there is a direct linear relationship between customer satisfaction and profitability, which implies that with increased satisfaction, comes increased profits. This point of view is supported by Park (2007) and even initiated by Park, Robertson and Wu (2004), noting that high quality service rendering to passengers is essential for the airline industry to survive. During the last decade the airline transportation industry has gone through dramatic changes that were due to ever changing customer demands and expectations as well as responding to amongst other the technological and political environmental demands and the deregulation of the airline business (Rhoades & Waguespack, 2008). It is often argued that merely satisfying customers is not enough to significantly increase behavioural outcomes such as customer retention, word of mouth and profitability. Service quality conditions are influencing companies' competitive advantage by either causing to loose or retain customer patronage depending on their experience. This influences market share and consequently profitability. The rapid increasing rate of airline passengers to developing countries like South Africa and Malaysia needs to be synergised with good planning of all necessary services and facilities, of which transport is vital, but often a neglected area (De Jager, 2010). For this reason it is important to ensure that all passengers, local and international, are satisfied with the services provided by domestic airlines. This can be achieved by managing service quality with an emphasis on customer experience management (CEM).

This study attempts to identify the various service and value factors that matter most too domestic airline passengers in South Africa and to benchmark it with the domestic airline industry in Malaysia that has similar airline services. Data collected from both countries travellers were considered. A survey methodology involving face-to-face interviews was employed to conduct interviews with 196 participants from South Africa and 189 from

Malaysia. Respondents were targeted on a convenience basis. While this is not a particularly sophisticated method of sampling, it is often used as part of exploratory studies. Despite the use of this non-probabilistic sampling method, the data that were yielded showed high levels of internal consistency. A random splitting of each of the two datasets (i.e. South Africa and Malaysia) and subsequent comparison of firstly, demographic characteristics and secondly, the average ratings of key items revealed no significant differences, thus confirming repeatability or reproducibility of measurement. Trained fieldworkers assisted with the interviews and the data collecting phase span over a six week period. The findings revealed the following. The **research objective** identifying those aspects that respondents typically consider most and least important when travelling on a domestic airline. The mean importance ratings obtained for each of the service items were calculated and ranked from highest to lowest scores. The items were ranked within the three broader service dimensions for the two samples. The first dimension is labelled 'convenience of booking' and encompass elements such as adequacy of information on airline's website, allowable weight, availability of airline website on the internet, convenience in making reservation/booking, online booking facility and pre-seating options.

The results reveal considerable similarities between the two samples, with both South African and Malaysian respondents rating online booking opportunity and convenience in making reservation/booking as the two most important aspects within these dimensions. Of the six items rated, pre-seating options and allowable weight were rated least important. The average ratings of these items were significantly ($p < 0.05$) lower than the top two rated items amongst both samples. The second service dimension investigated in the study, namely 'cabin service scapes' relates to those service elements that passengers typically encounter during flight. These service elements mostly encompass elements such as food offered (quality, variety, amount and timeliness) and cabin features (cleanliness, ventilation, seating). The three items that were rated most important by both South African and Malaysian respondents were comforts of the seats, cabin cleanliness and quality of the food served. The three items that obtained the lowest ratings were amenities in aircraft, timeliness of food and drink service and amount of the food served during flight. The third service dimension labelled 'cabin crew' relates to their ability to answer questions, ability to speak foreign languages and close attention by cabin crew. Cabin crew's credibility obtained the highest average importance rating, followed by cabin crew's ability to answer questions, and physical appearance of cabin crew rated lowest. The latter items were rated significantly less important than the other two items ($p < 0,05$). Inspection of ratings across all items show that

despite the very similar views of the two samples regarding the ranking of items from most important to least important, the South African sample showed more variation in ratings than the Malaysian respondents. Management of both countries airlines should take note of the findings and incorporate it in their respective business plans.

ABSTRACT

BACKGROUND

Tourism is one of the major economic sectors which many countries depends on. Yet, incomes attained in this important economic branch tend to be volatile due to the effects of various significant events such as natural disasters and terror attacks. Understanding the factors contributing to the intention of people to travel abroad is therefore important in an attempt to mitigate the long term negative effects of such events on tourism.

The current study examines the factors affecting the intention of students from Israel to travel to four destinations: Egypt, Turkey, Japan and India. We chose these countries so as to capture the effect of terrorism (in Egypt, Turkey), health hazards (Egypt and India) and the effect of natural disaster (Japan) on the intention to travel abroad. The model we propose includes the following mediating variables: attitudes toward destination safety and risk perceptions (regarding health, terrorism and natural disaster). These mediating variables on the one hand are affected by the individuals' travelling experience and exposure to terror events and on the other hand affect the intention to travel to risky destinations.

METHODS

The research participants were 585 undergraduate and graduate students in academic institutions in different areas in Israel, who filled out questionnaires during class time in 2011. The questionnaire consisted of the following parts: (1) items requesting socio-demographic information and regarding experience with travelling abroad (number of times travelled

abroad) (2) whether or not the individual was exposed to terror events (not via the media) (3) questions concerning risk perceptions about traveling to destinations with different types of risks, which were measured on a 5-point scale ranging from 1 ("certainly agree") to 5 ("I definitely do not agree") (e.g., "it is preferable to avoid travelling to destinations in which there were terrorist events during the current year.") (4) the preference to travel to a list of destinations (Japan, Turkey, Egypt, and India) and reasons not to travel; (5) perceptions about risk tendencies in general measured on a scale ranging from 1 (avoid risk at all costs) to 10 (involved in risky activities) (6) evaluations with respect to travelling abroad (i.e., I feel nervous about travelling right now) on a 5-point scale ranging from 1 ("I definitely do not agree") to 5 ("certainly agree").

RESULTS

Of the total sample 461 (82%) had experience with travelling abroad, 447 (78%) of the participants were exposed to missiles or terror attacks. The research results shows that only 40% of the respondents intend to travel to Egypt or Turkey, while 62% intend to travel to India and 85% to Japan.

The results of the analytical model (regression analyses) show that according to the research model previous experience with traveling abroad has a negative effect on individuals' perceived risk, travel risks and attitudes toward destination safety. In particular, more experience with previous trips abroad tends to reduce risk perceptions of the prospective traveler. In a similar vein, we found that past exposure to missile attacks has a negative effect on perceived travel risk; namely, mitigates risk perceptions.

In turn, attitudes toward destination safety and risk perceptions were significant predictors of the intention to travel to all four risky destinations. More specifically, it was found that the intention to travel to Egypt or India decreased as travel risks in general and attitudes toward health hazards increased. In addition, the intention to travel to Turkey decreased as the perceptions of terror risks and perceived travel risk increased, and the intention to travel to Japan or India decreased as the perceived destination safety increased.

The results of the study emphasize the importance of previous experience with travelling and the exposure to terror events (with no damage or injury) as mediators of risk perceptions with

respect to risky destinations. These findings can contribute to policy making and strategic planning potentially expanding tourism in risky destinations.

WHY POSITIVE FEEDBACK FOR FUTURE ORGANIZATIONS STRATEGY DESIGN?

Doval, Elena¹; Negulescu, Oriana²

¹ Faculty of Management Brasov, Spiru Haret University, Brasov, Romania, prof_ed@ymail.com

² Faculty of Management Brasov, Spiru Haret University and Doctoral School, Transylvania University of Brasov, Brasov, Romania, bellatrix360@yahoo.fr

ABSTRACT

The organizations, the same as natural systems, are complex and volatile, so that they are non-linear systems, acting in the far-from-equilibrium status.

The paper is aiming to discuss the opportunity of considering the positive feedback, characterizing the non-linear complex systems, which reinforce the organization, being in the balance with the negative feedback that brings the adjustments for organization return to predetermined equilibrium. In this research two hypotheses have been presumed: the managers usually do not give importance to weak signals from the environment when designing a strategy and the managers are relying on the organization's strategy design mainly in terms of the market demands. A questionnaire survey based on three questions with 19 answers has been conducted in order to demonstrate the hypotheses and the top managers from several (36) organizations responded. The questions relate to: the way the managers have designed their organization's strategy; the general evaluation of strategies' success or failure and the causes that have led to strategies' failure (if such be the case). The processed empirical data have demonstrated the hypotheses confirmation. The conclusions lead to the conclusion or suggest that managers need to avoid success failure by considering the weak signals from the environment and knowledge from outside the industry when designing organization's strategy. They also need to balance among the positive feedback when the long-term strategy and negative feedback when the short-term strategy are designed within equilibrium's boundaries.

Keywords: positive feedback, negative feedback, non-linear systems, equilibrium, strategy design, organization, strategic option, weak signals

METHODOLOGY, FINDINGS AND CONCLUSION

The aim of this paper is to highlight the positive feedback use by the managers when designing the organization's strategy. Natural sciences are usually models for organizations. As organizations are complex and non-linear systems in their structures and relations, having 'the capacity to rebuild themselves' (Deffuant and Gilbert, 2011), as it happens in nature, the adaptive responses to the external environment volatility are necessary. In this respect, the organizations' strategies must be flexible and organizations themselves responsive to positive feedback for "creating their own futures" (Hamel and Prahalad, 1994) to be able to amplify the direction of small change in order to reinforce themselves, because the "positive feedback denotes a self-reinforcing process" (Sterman, 2000). The positive feedback is associated with weak signals from the external environment that usually are ignored by managers when making strategies, because they lack to explore outside the known areas, but "the need for new conceptualization and design" (Esposti, 2012) is required in the strategies.

On this basis we conducted a regional survey on how the organization's strategy was designed and a fair general evaluation of the formally designed and carried out strategies success from the manager's point of view. The top managers from 36 companies in Brasov County (Romania) were questioned in March 2013 to find their opinions. The "portfolio of strategic option" model (Williamson, 1999) inspired the questionnaire, emphasising the use of the positive feedback in the strategy design. Three questions with 19 answers were developed for the identification of the general trend. The statistical data processing results have been interpreted in the light of the hypotheses presumed: the managers usually do not give importance to weak signals from the environment when designing a strategy and the managers are relying on the organization's strategy design mainly in terms of the market demands.

The results obtained show the following issues. When designing strategies managers are mainly focused on customers' preferences, competitors' behaviour and developing organization's capabilities to gain or keep the competitive advantages (over 65%). An important direction in strategy's projection is to analyse and select strategic options (56%). Less importance is given to developing internal processes and strategic resources, combining planning with the opportunities and looking to the future (34-45%). The managers do not pay much attention to suppliers' knowledge or to knowledge collected from other industries (15-25%). However, the managers mostly did not use the weak signals from external environment (only 5%), but they focused on the market demands. Nevertheless 89% of the

managers recognized that most of their strategies failed in success. The answers showed that the main causes of the strategy failure were: the competitors' success (83%), the lack of financing (78%), the customers' satisfaction unconsidered (45%) and others. The hypotheses considered have been confirmed.

The findings lead to the conclusion that the positive feedback is not really recognized when strategy is designed. The weak signals from environment act as positive feedback for the organization that becomes capable to reinforce itself by a flexible attitude, structure and culture in long-term strategy. The approach of the positive feedback does not neglect the negative feedback in the strategy projection, because the organizations usually need constant adjustments to return to their "far from the environment pressures and risks" position, gaining stability in short-term strategy to efficient control and stability. But, considering the long term strategy, the managers ought to find the balance among positive and negative feedback, 'far from equilibrium' (Peters, 1996). This approach of the strategy design using the positive feedback and based on reality is new and could be applied in the management practice.

BIO-ECONOMY AND BIOECONOMICS. WHAT HAS SOCIAL MARKETING TO DO WITH?

Epure, Manuela

The Academy of Romanian Scientists, Spiru Haret University, Romania, mepure.mk@spiruharet.ro

ABSTRACT:

The paper aims to raise awareness on two concepts related with the economic development. A new concept (bio-economy) and an older one (bioeconomics) can cohabitate together and provide deeper insight on the global social challenges that people must face it. A dramatic change of human behavioural is needed in order to achieve the ambitious goal of smart and green growth. Social marketing arises as a practical solution to generate awareness and to educate people and to persuade people to accept the change.

Keywords: bio-economy, human behavior, bioeconomics, sustainability, smart and green growth, social marketing

BIO-ECONOMY – A VIABLE ALTERNATIVE TO RESTART THE ECONOMIC GROWTH

In order to overcome the current crisis and his long term effects, Europe needs to radically change its approach to production, consumption, processing, storage, recycling and disposal of biological resources. Europe 2020 Strategy calls for a bio-economy as a key element for smart and green growth in Europe. The bio-economy concept refers to the unique opportunity to address inter-connected societal challenges while achieving sustainable economic growth.

This strategic orientation requires a consistent change of mentality and social behavior. Reshaping behavioural patterns is not an easy task to achieve; it requires outstanding strategies, good methods and a strong motivation coming from policy-makers. In this context, Social Marketing tends to be seen as a viable solution, offering a wide range of methods and techniques meant to influence social behaviours.

A strategy to address the Bio-economy was launched in February 2012 at EU level and the accompanying Action Plan was designed to pave the way to a more innovative, resource efficient and competitive society that reconciles food security with the sustainable use of

renewable resources. The Bio-economy Strategy aims to improve the knowledge base and foster innovation to achieve productivity increases while ensuring sustainable resource use and alleviating stress on the environment.

In general, strategies are designed to give a clear and well established orientation and the action plans are meant to implement these strategies using a mix of resources, in an efficient way.

But, if we neglect the human nature or human behaviour patterns, the most perfect strategy will still fail just because people involved need to understand the change and to accepted it, they must contribute collectively to make it happens. Thus an adequate communication and powerful and persuasive message are required. Using social marketing approach a consistent and persuasive message will emerge and effects will be identified in behavioural changes.

Well-informed interaction is needed between EU research and innovation and the priorities of bio-economy supporting policies (EU documents). A responsible bio-economy calls for participatory models that engage citizens and end-users in order to redesign the relationship between science, society and policy making. More informed dialogues will allow science and innovation to provide a sound basis for policy making and informed societal choices, while taking into account legitimate societal concerns and needs in the bio-economy.

LOOKING BACK – THE PAST TURNS TO BE CURRENT REALITY. TWO CONCEPTS –TWO PERSPECTIVES, SAME ISSUE- SUSTAINABILITY

Definition (1) Bioeconomics is a progressive branch of social science that seeks to integrate the disciplines of economics and biology for the sole purpose of creating theories that do a better job of explaining economic events using a biological basis and vice versa.

Definition(2) Bio-economy is an economy that is based on ecological sensitive products and services produced by the use of biotechnology and renewable energy sources.

The two concepts were selected to bring into attention semantic similarities and conceptual differences, for the unique purpose to suggest further research on how the bioeconomics theory can be used to study the evolution of the bio-economy and his specific trends. The Bio-economy concept was explained above from the perspective of EU policy, being recently introduced as a strategic option for green and smart growth.

At least one question arises: is this objective achievable? A deeper insight is required and a new innovative approach in research, also.

The concept of bioeconomics, introduced by Nicholas Georgescu-Roegen, rests on two pillars: the exo-somatic nature of human evolution and the fundamental importance of qualitative and irreversible, truly novel changes in the economic process (Mayumi, 2001). Georgescu-Roegen's bioeconomics is a new style of scientific thought: it is not a new branch of economics, but a new discipline that combines elements of evolutionary biology, institutional economics and bio physical analysis associated with energy and mineral resources (Mayumi, 2001; Miernyk, 1999).

What is really interesting is the fact that recent concerns about "sustainability" bring into attention the theory of economic development, institutional change and biophysical constraints developed by the Romanian-born economist. Georgescu-Roegen's bioeconomics emphasizes the biological origin of the economic process and all the human problems associated with, especially the scarcity of resources unequal locally or regionally distributed. He insisted that the human-mode of existence neither by biology nor by economics alone. Contemporary with Milton Friedman and being significantly influenced by Schumpeter's work, Georgescu-Roegen turns to be an inspiring source of wisdom for young economists from all over the world, but not from his homeland, Romania. Georgescu Roegen 's bioeconomics rises new challenges for researchers, especially today when the policy-makers discourses are oriented to promote the strategic objective of smart and green growth.

It is true that economic growth and advancement of science and technology through exosomatic evolution resulted in the increased material comfort typically attained by the Western World. According to Georgescu-Roegen (e.g., 1977a, 1986), the exosomatic evolution brought about three formidable predicaments to human beings: the exhaustion of fossil fuels, social conflicts, inequalities among different exosomatic "species". Today, we are "enjoying" all of them.

It is up to humankind to reflect upon, stop and restart all activities, to generate real and sustainable behavioural changes. People are need to be educated to appreciate the energy production efforts by reducing the waste, to direct their creativity into innovation, especially social innovation that make them able to cope with the pressure of social issues, as population ageing.

INSTEAD OF CONCLUSIONS

Social marketing - these two words 'Social' and 'Marketing' can appear to be antagonistic. 'Social' programmes, politics and movements are about making the world a better place; whilst commercial sector 'Marketing' is the process of developing value and wealth for people who already possess resources and capital. The potential clash of basic philosophy is

clear and raises the fundamental question: 'is it possible to apply any form of 'Marketing' thinking when attempting to tackle 'Social' issues? The answer is definitely YES (French, 2011).

In 1971, Kotler and Zaltman published, *Social Marketing: an approach to planned social change*. This paper marked the first time the phrase 'Social Marketing' was used in an academic journal, but in reality social marketing approaches were being applied from the 1960s.

Social marketing is the use of marketing principles and techniques to influence a target audience to voluntarily accept, reject, modify or abandon behaviour for the benefit of individuals, groups, or society as a whole (Kotler, Roberto & Lee, 2002).

A better communication in making bio-economy "visible" at society level can be sustain through social marketing tools and equally promoting new paths in social sciences research (as bioeconomics) means to make scientists aware of.

EXAMINING THE ROLE OF TRUST IN USER PERCEPTIONS OF QUALITY AND SATISFACTION IN THE PUBLIC SECTOR: EMPIRICAL EVIDENCE FROM THE HEALTH SECTOR

Esquerdo, Teresa Josefina¹; Macedo, Isabel Maria²; Pinho, José Carlos³

¹University of Minho, School of Economics and Management, Portugal, lopes.esquerdo@gmail.com

²University of Minho, School of Economics and Management, Portugal, imacedo@eeg.uminho.pt

³University of Minho, School of Economics and Management, Portugal, jcpinho@eeg.uminho.pt

ABSTRACT

In the last decades, public sector organizations have been on the forefront to deliver more efficient and citizen oriented services. This applies particularly to health care services in which more informed and demanding users increasingly require better quality and customized services. To face these challenges, healthcare services need to go beyond the scope of past reforms managerial changes by involving users in a more visible and effective way. Recent developments in Services Marketing reflected in the emergence of the co-creation paradigm (Prahalad and Ramaswamy, 2004; Vargo and Lusch, 2004) is particularly relevant to address such goals. Thus, in accordance with this new approach, the user is recognized as an active participant in the services provision. This contributes to more fully integrate the user in the service delivery process while reinforces trust and confidence on the healthcare providers. From an academic perspective, researchers have been focused on the potential value of trust as a way of assessing the health system performance (Gilson, 2003; Zhang *et al.*, 2006; Devadasan *et al.*, 2010). Additionally, several authors acknowledged that trust in the healthcare provider increases health prevention since patients are likely to respond more proactively by adhering to the therapies proposed by doctors (Thom *et al.*, 2004).

Considering the above, the purpose of this study is to examine the role of trust in user perceptions of quality and satisfaction in relation to two key healthcare professional groups as that of doctors and nurses. Specifically, this study aims at analyzing the predicting impact of SERVQUAL dimensions (tangibility, reliability, empathy, assurance and responsiveness) on both satisfaction and trust. The study adopts a predominately quantitative methodological design, in which a survey was applied to outpatients of healthcare services in the North of Portugal.

In light of the above considerations, the major contribution stemming from this research is to

conceive an integrative model that simultaneously incorporates the various interactions of trust (public, institutional, interpersonal), service quality and satisfaction. The current study contributes both theoretically and empirically to the body of knowledge surrounding the assessment of user satisfaction in the public health care context.

³Lusófona University, Portugal, jorge.bruno@ulusofona.pt

ABSTRACT

Consumption society, as it is experienced today, has a very significant impact in people, and its influence starts very early. From their earliest stages in life, children are influenced by the advertising they are exposed to, the consumption experiences they are subject to and the paths they take when they go shopping with their parents. This influence fosters in children the development of a vast range of brands and products. It is in this context that companies started developing marketing for children, not only due to consumptions they can make, but also the influence they can have in the family setting. Sales strategies for children are all the more powerful as brands were built in a manner that makes it simple to interpret, process and store the information they receive. This consumption learning in children has been analyzed in a wide variety of studies to try and understand how consumer socialization is done. It is the goal of the present research to understand how children organize their representation of brands. To this end, a two-part inquiry was conducted, one of quantitative nature qualified with a questionnaire, where children were characterized and their media behaviours (TV and internet) were identified by means of an open question asking them to indicate the brands they know. Six hundred and two children from 8 to 12 years old were surveyed. The other part was qualitative, involving two focus groups with parents regarding their children's consumption habits. Nineteen parents participated in these focus groups, from a middle-class area and from a working class area. The main conclusions show that the representation universe of these children is extremely vast, that they spend many hours during the week and on weekends watching television and surfing the web, with higher incidence on the male than the female gender, who apparently engage in more entertainment activities. As regards consumption representation, data were processed aggregating brands by product categories using a specific software programme, involving lexicographic analysis, which highlighted a mental representation anchored on two centres: one connected with food, which aggregates a wide range of product categories in a star; the other centre is connected with clothes and is cognitively more complex, forming stars and circles. The

gender analysis showed that girls have a clearer cognitive representation, centred on two large stars, one focused on food and the other on clothes; by contrast, boys place clothes in a much more scattered manner. This may be in accordance with the gender stereotype that girls are more concerned with what they wear than boys, while the latter are more concerned with sports and the social element. This cognitive structure is consolidated with age and education. Parents confirmed this report, expressing their opinion that advertising has a huge influence on their children, that they frequently take them shopping, and that the brand repertoire, especially regarding food, greatly influences the diet they are subject to.

THE INNOVATION BASED ON DYNAMIC CAPABILITIES

Flores, Alejandro

Universidad del Pacifico - Lima, Perú, flores_ja@up.edu.pe

ABSTRACT

The talent development has become the basis for the competitiveness, innovation and continuous. The companies, increasingly, demand that executives provide greater value to organizational results, using continuous training as a means to stimulate the development of new capabilities. Among the topics that are required today, to develop the talent in the enterprise are those that stimulate the development of soft skills, and those who generate additional element of differentiation or promote organic growth of enterprises. Thus, the training of executives on the topic of innovation has begun to awaken an interest in business, since it allows generating a synergistic effect based on a set of dynamic organizational capabilities.

This study, based in a research business executives about the challenge that must be assumed to innovation and how to address their development and implementation within companies, it was identified that support the innovation dynamic capabilities and how they contribute to a synergistic effect. It is part of the thesis that the development of soft skills is not dependent on a single component, but its attainment is achieved as a result of the interaction of a set of capabilities that dynamically interact. The results allow us to show that the innovations processes could be developed dynamically into the enterprise.

Keywords: talent, dynamic capabilities, knowledge, innovation, strategy growth, learning process, competitiveness.

ORGANIZATIONAL CHANGE AND INTERCULTURAL MANAGEMENT INTO THE MERGER AND ACQUISITIONS PROCESSES

Flores, Alejandro¹; Bremser, Kerstin²

¹Universidad del Pacifico - Lima, Perú, and

²Hochschule Pforzheim – Pforzheim, Germany

ABSTRACT

The purpose of this paper is to develop a management perspective on the influence of the organizational change (OC) and intercultural management (IM) in the processes of mergers and acquisitions (M&A), as a growth strategy. The companies, for achieve the international expansion, implement growth strategies based in mergers and acquisitions processes.

The need for business expansion based on inorganic growth strategies has increased dramatically in recent decades. However, empirical evidence shows that many of these processes end in failure by not taking into account the proper integration of the businesses. The failure rates are estimated between 45% and 82% of the mergers and acquisitions in the last forty years. Other indicators of levels of failure mention that 7 out of 10 mergers fail to deliver on the promises of the merger process. The main factors influencing the failure of growth strategies correspond, on one hand, to issues related to intercultural management, stability, order and control, and, on the other hand, to the capacity for integration, collaboration and exchange, which is generated by the growth process itself. These aspects are often ignored in the attempt to attain prompt profitability of the merger or acquisition.

It is common practice for companies to reach international expansion based on M&A strategies, where mergers and acquisitions take on a greater significance. However, the results of these processes have not been successful. This review reflects that M&A processes are influenced by elements linked to the intercultural management, organizational change and cultural. It delves into the issue of the organizational change variable describing the possible scenarios where M&A processes may have a better performance and how the intercultural management will influence in the whole process. We propose a model that connects the cross cultural management, the organizational change and the corporate culture to create a situation of positive synergy that ensures the generation of value promised to shareholders in M&A projects.

Keywords: Merger and acquisitions, strategy growth, intercultural management, organizational change, corporate culture and learning process.

EFFICIENCY AND PROFITABILITY: AN APPLICATION OF DEA TO GREEK SMES

Floros, Christos¹; Voulgaris, Fotini²; Tsoukatos, Evangelos³

²Technological Educational Institute of Crete, Greece, fvoulgari@staff.teicrete.gr

³Technological Educational Institute of Crete, Greece, tsoukat@staff.teicrete.gr

ABSTRACT

SMEs play a significant role in all economies and are the key generators of employment and income, and drivers of innovation and growth (OECD, 2009). A firm with less than 100 employees is considered as SME in Greece (Voulgaris et al., 2000). SMEs are very important in the Greek manufacturing sector (Voulgaris et al., 2004), while most of them are family businesses. They originate from a variety of different industrial sectors such as food and beverages, textile, machinery etc. Several attempts have been made on the performance of the Greek SMEs. First, Thomadakis and Droucopoulos (1996) examine the growth of Greek SMEs over the period 1983-1990 (i.e. after Greece became a full member of EC) and report a slow growth. Spanos et al. (2001) use data from 500 Greek SMEs and large firms (collected in May 1999) and show that firms place emphasis on offering high quality products/services and on lowering costs. Voulgaris et al. (2003) show that factors that influence significantly manufacturing SMEs' growth in Greece are profitability, liquidity, reliance on long-term debt, employee productivity, fixed assets turnover and restricted sales credit terms. Caloghirou et al. (2004) show that financial and marketing competencies are key factors significantly affecting the performance of Greek manufacturing SMEs. Further, Agiomirgianakis et al. (2006) examine financial factors affecting profitability of Greek manufacturing firms over the period 1995-1999, and show that firm size, age, exports, sales growth, reliance on debt on fixed assets and investment growth, as well as efficient management of assets, influence profitability. Finally, Halkos and Tzeremes (2010) show that the levels of foreign ownership have a positive effect on SMEs' performance in Greece.

Due to the fact that most European SMEs are the first victims of the 2008 financial crisis (OECD, 2009), we focus on the Greek case to see if Greek SMEs have the possibility to increase the level of their profitability. In this paper we extend previous studies on the performance of Greek SMEs by examining their efficiency and profitability. This study contributes to the existing literature in two ways: (1) this is the first study that uses data from

all Greek manufacturing SMEs and covers the period before and after the 2008 financial crisis, and (2) this is the first empirical investigation of DEA approach on the effect of efficiency on profitability. In particular, we consider a large amount of recent data (source: ICAP), and apply several DEA methods (under different inputs and outputs) to see the importance of these factors in estimating efficiency and profitability of SMEs.

We use efficiency scores as indicators of firm performance (Mok et al., 2007). The efficiency estimates in our study are obtained using the DEA, which is originated by Charnes et al. (1978). We then examine the relationship between DEA efficiency scores and profitability (ROA, ROE) by regressing the profitability level on the efficiency scores using an OLS model. We further examine to what extent the profits of Greek SMEs are influenced by internal factors (firms' characteristics) using a one-system GMM specification. We adopt a dynamic profit specification and test whether the profitability of SMEs persists over time.

Our results show that there is a positive relationship between efficiency and profitability for most firms/sectors. The results (along with policy implications) reported in this study are highly recommended to financial managers of Greek SMEs.

The paper is result of the research which is undertaken under the Arximidis III project, Υποεργο 2, of TEI of Crete. The authors are members of the research teams.

TOURIST DESTINATION IMAGE: A STUDY ON LISBON'S DESTINATION IMAGE

Fontes Falcão, Pedro ¹; Santos, Dulce²

¹ISCTE-IUL, Portugal, pfontesfalcao@iscte.pt

²ISCTE, Portugal, dulce.5santos@gmail.com

INTRODUCTION

The authors studied and analyzed the tourist destination image of Lisbon. The literature review demonstrates the considerable importance of tourism to national economies. Also, knowing the tourist destination image structure of a specific location can have a significant impact in its tourism strategy and marketing, by analyzing what are the factors that influence tourists and the composition of the image itself.

This study was based on the tourist destination image model (Baloglu and McCleary, 1999) that divides destination image in three components: cognitive image (destination physical and tangible characteristics); affective image (emotional perception of the destination) and overall image. The model presents two key points: overall image depends from cognitive image and affective image, and cognitive image influences the affective image; demographic variables, psychological variables and previous experience influence overall image, by influencing cognitive image or affective image. The study measured and analyzed the three components as well as the motivations to visit Lisbon.

METHODOLOGY

First, the authors interviewed five professionals in the tourism area using a semi-structured type of interview. The information gathered was used in the development of a survey. Then, the authors performed a quantitative research based on an online survey with twenty one questions. There were two hundred and ninety six people responses and one hundred were valid. All respondents fulfilled the requirement of having visited Lisbon at least once. The survey included questions about the respondents' demographic profile and traveler's profile (e.g., number of visits to Lisbon and number of trips per year). Cognitive image was measured by the classification of twenty one items that included physical and environmental characteristics, in a scale of one to seven. Affective image was measured by the answers to four bipolar scales. Motivations to visit Lisbon were measured by the rating of fifteen sentences, describing different motivations, in a scale of one to seven.

The authors performed a statistical analysis with SPSS to measure the relationship between the various components under analysis, as theorized in Baloglu and McCleary (1999) model. The authors also performed an importance-performance analysis to cognitive image, in order to achieve a better understanding of the current image perceived by tourists.

RESULTS ANALYSIS

According to the survey results, Lisbon's cognitive image is very positive. Most attributes that were considered by the respondents as important to a destination cognitive image were rated high (above 4) in the performance scale applied to Lisbon. Even though the sample did not include prospective new tourists, these results can help the development of future marketing strategies for Lisbon's image as a tourist destination, as they identify areas of improvement and key perceived attributes. Cognitive image was also tested in terms of its relationship with demographic factors (e.g., age and educational level). The results showed no significant relationship between them, confirming the results of previous studies.

Affective image proved to be very positive, according to the survey's results. The authors tested the relationship between affective and tourists' motivations. The results showed a weak relationship between affective image and motivations, which indicate that affective image has other determinants. However, it is still important to know which motivations are rated the highest in order to understand what tourists expect when they visit Lisbon because this information can help to develop a more appropriate tourism offer that will lead to higher levels of satisfaction. Also, knowing a specific target's motivations to travel can help to develop more targeted and efficient promotion campaigns. The three most important motivations items were those related with Relaxation, Excitement and Knowledge, pointing to the fact that Lisbon promotional campaigns could use this knowledge to better focus its targets.

Finally, overall image relationship with cognitive and affective image was tested using an ordinal regression. The results showed that overall image is composed and influenced by the perceptions on cognitive and affective image and, moreover, that it is greater than the sum of these two images. From the study results on the impact of variables on Lisbon's overall image as a tourist destination, its affective image impact on the perception of overall image was higher than its cognitive image's impact. Affective image was the variable with the highest parameter estimate (with a value of 1.444), which means that when affective image increases

by 1, overall image increases 1.444, if all other variables remain constant. Furthermore, cognitive image influenced directly the overall image and also the affective image.

In sum, both affective and cognitive image should be well managed in order to improve the overall image of Lisbon as a tourist destination.

Survey results also showed that there is a clear and positive relationship between overall image of Lisbon and likeliness to recommend it as a tourism destination to others and likeliness to revisit Lisbon within a three years period.

CONCLUSION

This study applied a theoretical model to research how the tourist image of Lisbon is structured and presented results on the assessment of the current cognitive and affective images of Lisbon.

The authors proved that there is some kind of structure in Lisbon's image as a tourist destination and that overall image is larger than the sum of cognitive and affective perceptions. Managing these perceptions will help to create a positive experience for visiting tourists that will generate a high positive word-of-mouth effect and also increase the probability of the tourists' return to Lisbon. To know the structure, what influences it and what is the current position of Lisbon's image can provide guidelines for the future strategy and marketing of Lisbon as a tourist destination.

Further research can be developed in the future including an analysis with more variables or similar analysis with a larger sample.

Also, the application of research models and studies' outputs to the standard satisfaction surveys can help understanding and managing tourism destinations.

This study is pioneer in integrating a theoretical model with an empirical research study applied to the city of Lisbon, which is a very important tourist destination for Portugal with a strong impact in its economy. Future works based on this current study may provide relevant inputs to the Portuguese tourism sector and its economy.

ABSTRACT

BACKGROUND

Facing fast changing environments especially the economic crisis, organisations have experienced significant pressures in recent years to deliver effectiveness linked to employee resourcing, pay and performance. In light of these pressures, organisations require staff to be engaged in their jobs and deliver high performance. High performance work systems (HPWS) are regularly used as a label for strategic human resource management (SHRM) (Combs et al., 2006; Datta et al., 2005; Evans and Davis, 2005; Guthrie et al., 2009; Way, 2002). As described by Datta et al. (2005), HPWS are “a system of HR practices designed to enhance employees’ skills, commitment, and productivity in such a way that employees become a source of sustainable competitive advantage” (p. 136). HPWS involve the use of selective staffing, extensive training and development, performance management, incentives, and information sharing (Fu et al., 2013; Gittell et al., 2010; Takeuchi et al., 2007).

HPWS have been found to be positively associated with organisational performance such as financial outcomes (Guthrie, 2001; Huselid, 1995), turnover (Richard and Johnson, 2001), productivity (Guthrie, 2001), efficiency and flexibility (Evans and Davis, 2005), and employee commitment (Youndt et al., 1996). Most of research on HPWS has been conducted and tested in Western countries in Europe (e.g. Guthrie et al., 2009) and South America (e.g.

Huselid, 1995). In light of the fact that China, India, Japan and the rest of the East are playing a greater and stronger role on the world stage, management research in Eastern countries is gaining increased attention. However, to date, management research in Eastern countries is still scarce. Some exceptions include studies by Takeuchi et al. (2007), Sun et al. (2007) and Gong, Law, Chang and Xin (2009). Nevertheless, these studies on HPWS studied Eastern countries solely; they did not provide a comparison between the West and the East, which is the purpose of our study. In the present paper, we compare the use of HPWS in one Western country – Ireland to the use of HPWS in one eastern country – China.

In addition, the present study addresses another research gap found in the existing research, that is, the lack of attention on the HPWS in professional service firms. Human resource is the most valuable resource in PSFs as they embed the knowledge used for meeting clients' need (Løwendahl, 2000). Therefore, PSFs are an important context for exploring the use and examining the effects of HPWS.

OUR WORK

To fill in the above research gaps on the comparison of HPWS in Eastern and Western countries as well as the systematic study of HPWS in PSFs, this paper presents the results based on a survey from 120 Irish and 112 Chinese accounting firms on using HPWS. Due to cultural differences, we anticipated the use of specific HPWS practices to differ for Irish versus Chinese accounting firms. In addition, in both contexts, we expected a positive link between HPWS and firm performance. The results from multivariate analysis of covariance (MANCOVA) indicate that there is no significant difference between overall HPWS index but that there are significant differences for staffing, performance management, remuneration and training. The results from the hierarchical regression analysis confirmed the positive relationships between the HPWS and organisational performance in both Irish and Chinese PSFs.

SCHOLARLY IMPLICATIONS

Theoretically, this study helps fill in two research gaps identified in the existing research on HPWS. First, our study helps to advance the HPWS research by a cross-cultural examination of the use of HPWS and their effect on firm performance between West and East. In this study, we compared the differences and similarities between one Western country – Ireland and one Eastern country – China on the use of HPWS. Therefore, our work

contributes to the existing HPWS research by linking West and East. It also helps the researchers and practitioners to better understand the uses of HPWS across West and East.

Second, this paper extends the HPWS research context by exploring the use of HPWS in a professional service context. HPWS research has been largely focusing on manufacturing firms. The context of professional service firms has been neglected except for two recent studies by Fu et al. (2013) and McClean and Collins (2011). As human resource is the most valuable resource in PSFs, PSFs are an important context for exploring HPWS. On the other hand, the existing studies on PSFs are limited in their systematic investigation of HRM impact. Until recently, Fu et al. (2013) explored the impact of HPWS on professional service supply chains in PSFs. Our study contributes to filling in these gaps by exploring the impact of HPWS on firm performance in both Irish and Chinese PSFs.

The comparison on the use of HPWS between Western and Eastern countries provides a clear picture on how HPWS are operated differently in both contexts. Interestingly, we found that Chinese PSFs are investing more in selection and remuneration and less in training and performance management. This finding can be explained in light of the existence of high collectivism in the Chinese culture. Chinese people place a great emphasis on groups and focus on relationships, links and networks. Therefore, in operating HPWS in a highly collective culture, Chinese firms tend to emphasize loyalty to the firm more than performance. In contrast, Ireland is a culture with strong focus on high individualism and therefore tends to have more transactional and exchange-based management. In operating HPWS in a highly individualistic culture, Irish firms place emphasis on hiring and promotion decisions based on merit or evidence of what one has done or can do.

MANAGERIAL IMPLICATIONS

Through the comparison on the use of HPWS between Irish and Chinese professional service firms, we address an important issue faced by current managers. During the economic crisis, every firm starts to look out for survival and higher performance. Both the reality and practice requires the quick link between West and East, i.e. knowing each other. As said in an old Chinese words, “know the enemy and know yourself, and you can fight a hundred Battles without defeat” (Zhi Ji Zhi Bi, Bai Zhan Bu Dai). Some differences in the use of HPWS between the West and East have been identified in this study. It will help Western practitioners to understand more about Eastern management, e.g. Chinese culture does not embrace hard performance management. It also helps Eastern practitioners to learn more

about Western management, e.g. Western culture focuses more on precise management – evidence-based management.

ACKNOWLEDGEMENTS

Sincere thanks are given to Mr Diarmuid Breathnach at Chartered Accountants Ireland and Mr Yanqi Yu at Liaoning Institute of Certified Public Accountants for their great support in conducting this cross-cultural research project. We also would like to thank the DCU Business School Research Committee at Dublin City University and Emerald/IACMR Chinese Management Research Fund for their financial support for this study. Thanks are also due to Professor Marann Byrne, Dr Barbara Flood, Dr Ruth Mattimoe, Dr Mary Canning, and Ms Orla Feeney at DCU Business School Accounting Group for their valuable advice in developing the survey. Many thanks are given to Xuan Zhao and Xiaoming Liang who facilitated the data collection and input in China. We also thank the many HR Managers and Managing Partners who completed the surveys.

FUNDING

The first author on this paper is funded by an Irish Research Council for the Humanities and Social Sciences Postdoctoral Research Fellowship. This research project proposal was the winner of Highly Recommended Award of the 2011 Emerald/IACMR Chinese Management Research Fund.

ABSTRACT

The aims of this paper are, firstly, to prove the usefulness of Principal Components Analysis (PCA) in reducing financial information expressed as ratios, and, secondly, to justify the achieved results in terms of variable selection, by the application of Canonical Correlation Analysis (CCA). In the empirical analysis where both methods are applied, it is shown that they are complementary and it can be concluded that the correlated variables to the extracted factors in PCA are also important variables in defining the canonical variates in CCA.

Keywords: Principal components analysis, canonical correlation analysis, financial information, ratios

INTRODUCTION

Advances in the information and communications technologies over the last decades have fostered the generation of huge amounts of data, whose processing involves a high cost in terms of timing and resources. In order to simplify and make the decision-making process easier data reduction statistical methods are needed and one of the most employed methods is Principal Components Analysis (PCA) when dealing with quantitative data, such as accounting information expressed as financial ratios. It allows us to reduce the number of variables to a smaller group of factors which explain a high percentage of the original variance, with the advantage of removing the redundant information (García-Ayuso, 1996). Besides, it helps to solve the problem of multicollinearity among variables, since factors are uncorrelated (Lizarraga, 2002).

In order to show the possibilities of PCA in the field of financial analysis, we will focus on the study of business insolvency or failure, which is explained by a set of financial selected on the

basis of their use and popularity in business failure prediction models (Wu, 2010). Our aim is to determine those ratios which best explain that event, as they are selected by PCA. Complementarily, a Canonical Correlation Analysis (CCA) is applied in order to study the relationship between the group of selected ratios by PCA and the group of removed ratios, which confirms the results of the former.

VARIABLE SELECTION: PRINCIPAL COMPONENTS ANALYSIS (PCA)

In order to consider those ratios which measure the key dimensions of a firm, they were selected so they belonged to the following six groups: liquidity, profitability, leverage and solvency, turnover and activity, cash-flow and economic structure. An initial list of 27 ratios was chosen, on which PCA was applied, resulting that the first six extracted factors explained 58.08% of variance of the original variables.

So as to increase this percentage, those ratios that did not correlate to any of the extracted factors or did contain redundant information were deleted in successive steps. Finally, six factors were extracted, which explained 85.02% of the original variance and were correlated to 15 ratios. According to the correlation between factors and ratios, they can be described as:

- Liquidity: correlated to the ratios of current assets and cash on current liabilities, as well as the acid test, together with the firms' ability to pay current debts with their resources, both internal (cash-flow) and external (equity).
- Liability structure: correlated to the proportions of internal and external resources and current liabilities on total assets.
- Economic profitability: correlated to ROA and assets turnover, which are the two components of profit margin.
- Turnover: correlated to two ratios on sales (financial expenses and working capital).
- Current position: correlated to the ratio of current assets and working capital on total assets.
- Cash-flow, measured on total debt and current liabilities.

RESULTS FROM CANONICAL CORRELATION ANALYSIS (CCA)

CCA was applied in order to confirm PCA results, since its objective is to analyse the relationship between two sets of variables: in this case, the group of 15 ratios selected by PCA and the group of 12 ratios removed from the analysis.

Twelve canonical variates, which are linear combinations of variables in each set that have the maximum correlation, were obtained, although only five of them were significant. The redundancy index, proposed by Stewart and Love (1968), measures the proportion of variance in each set that is explained by the other set. Specifically, the group of selected ratios explained 47% of the variance in the other set, which means those ratios contained some of the information expressed by the removed ratios. This served to justify their removal from the analysis and, therefore, the results from PCA.

Regarding the definition of the canonical variates, these are the results for the five significant ones:

- The first two canonical variates are defined by the proportion of fixed assets and total liabilities on total assets in the set of removed ratios and by the proportion of current assets, equity and current liabilities on total assets in the group of selected ratios, adding the ratio of working capital on total assets in this group in the second one.
- The proportion of equity on total assets in the first set and the ratios of fixed assets and total liabilities on total assets in the second one define the third canonical variate.
- The fourth one is defined by the ratios of working capital on sales and current assets on operating income in each set respectively.
- In the fifth variate, the ratios of cash on current liabilities and working capital on total assets are significant in the group of selected ratios, whereas in the other set, the ratio that defines the variate is the proportion of cash on total assets.

ABSTRACT

Honestly, how simple or complex is for a family-owned winery to introduce a succession? What if there are no competent successors apparent? What if, although there are talented successors, they are not interested in exercising entrepreneurship in this challenging and particular business sector? What if competent successors have other work obligations “behind the scenes” and are not “allowed” being innovative agents of change? Instead, such successors simply pursue the steps of a dominant incumbent! And what if incumbents tend to face succession as a simple and static event “whose timing is never right”. And then, how vulnerable is a sudden death of the existing leader, leaving the business to face difficulties and rivalry from competitors? These and many other complex dilemmas remain unanswered and risk the development prospects of the Cyprus wine sector as well as the versatile role of rural areas planted with vineyards for the national competitiveness in general. For all the above reasons, this research work proposes a firm and inclusive theory. This is the WineSuccess Framework (WSF) which if adequately applied and managed, provides a solid and fundamental strategy for succession effectiveness in the medium-long run.

DESIGN/METHODOLOGY/APPROACH

The research philosophy has been driven from a vision! This is the best benefit of the family wineries, wine, and rural sector development in Cyprus. The backbone of the WSF (Georgiou, 2013) is previous research works that has been achieved over the last thirty years, which provided conceptual and empirical insight into the nature and various aspects of effective succession. Hence, using a deductive approach and throughout the process of literature review (Georgiou, 2010), a certain number of factors and variables surfaced and thus are believed to foster succession effectiveness. The fruit of this generic theory that has been proliferated from reflective and reasonable associations among the reviewed studies is a Preliminary Conceptual Framework towards Succession Effectiveness, with broad

exploitation and value (Georgiou *et al.*, 2011; Georgiou and Vrontis, 2012; 2013). That draws a lot from Le Breton-Miller's *et al.* (2004) succession model. Nevertheless, the "wine factor" is missing from that preliminary theory, which is far from related specialization. Virtually, the concluding WSF which is proposed on the basis of post-positivism (Popper, 1992) and action research paradigms (Lewin, 1988; Kemmis, 1985), proposes a new concept that originally, substantially and specially contribute towards succession effectiveness in family wineries (Georgiou, 2013).

FINDINGS

The WSF is presently pointing out the merging and synthesizing endeavor of various findings and theorizes on certain elements which are commonly named as succession "process" and "context" factors. These are in brief outlined as follows: a. incumbent characteristics and qualities, b. incumbent tenure, c. successor skills and attributes, d. successor training and development, e. successor origin, f. incumbent-successor expectations, g. succession ground rules, h. family dynamics, i. board of directors, j. organizational performance, k. organizational size, l. organizational age, m. transfer of capital, and n. succession monitoring and reflective feedback. Via empirical and action based research in the family wineries of Cyprus, central and statistically significant elements of the WSF are the "expectations" of the incumbent and his or her successor(s) prior to the working together period, as well as the so called "winery specific ground rules" (Georgiou, 2013). Such vital empirical factors positively provide for particular specialization and professionalization of succession as much as possible, and safeguard family tradition as much as necessary (Poutziouris, 2001). Last but not least, the "institutional role" of national authorities is either underpinned to have a principal importance for the context of succession (Georgiou, 2013).

ORIGINALITY/VALUE/MANAGERIAL IMPLICATIONS/LIMITATIONS

In contrast to the conceptual understanding (Georgiou, 2010; Georgiou *et al.*, 2011; Georgiou and Vrontis, 2012; Georgiou and Vrontis, 2013), family wineries of Cyprus are facing succession as a situational and static event rather than a never-ending and dynamic process, which indisputably risks not only their future development but also their existence.

In addition, none of the reviewed studies has been located in the literature to deal with the topic of succession effectiveness in the arena of family wineries in Cyprus, which is the empirical research base, implying that “unlike other countries, this is an industry that is difficult to research from inside” (Vrontis et al., 2001, p.260). It was also observable that theoretical orientation of past research has been placed on the basis of strict quantitative research approaches (Boeker and Goodstein, 1993; Dalton and Kesner, 1985; Schwartz and Menon, 1985). This is in contradiction with the socio-political roots of succession (Cannella and Lubatkin, 1993) which is anthropocentric process.

Hence, this research work which for the moment is exclusive in the topic of succession effectiveness in the family wineries of Cyprus, it offers a firm and inclusive theoretical basis, for further research development and practical application, on a more particular basis. In addition, its practical application may be true for elsewhere, especially for countries in the European-Mediterranean basin, in which family wineries are practically managed with similar to Cyprus cultural norms and value system.

ABSTRACT

Within the context of the reforms implemented by the Portuguese Government following the philosophy of the New Public Management, this study examines the Portuguese National Health Service (NHS), specifically in what concerns the consolidation process regarding all the legislation issued. The specificities of this particular sector, which involves both entities belonging to the Public Administration Sector and to the Business-like Sector of the State, makes it a peculiar case in what concerns the consolidation accounts process.

This study adopts an interpretive perspective by applying the lenses of New Institutional Sociology [DiMaggio and Powell (1991), *The New Institutionalism in Organizational Analysis*. Chicago, IL: University of Chicago Press]. As Meyer et al. (1997, p. 152) [Meyer, J. W., Boli, J., Thomas, G. M. and Ramirez, F. O. (1997). "World Society and the Nation State", *American Journal of Sociology*, Vol. 103 No. 1, pp. 144-181] stated, nation-states exhibit a great deal of isomorphism in their structures and policies; they make efforts to live up to the model of rational actorhood, are marked by considerable decoupling between purposes and structures, intentions and results, and they undergo expansive structuration in largely standardized ways. As result nation states are modelled by exogenous world culture and are characterized by extensive internal decoupling and they encompass a higher level of structuration than what they would have if they were only influenced by local cultural, functional, or power processes (Meyer et al., 1997, p. 173). Therefore, decoupling refers to the situation in which an actual organizational practice is different from the formal organizational structure or practice, meaning that the adopted practice is not integrated into the organizations managerial and operational processes (Dillard *et al.*, 2004, p. 509) [Dillard, J. F., Rigsby, J. T. and Goodman, C. (2004), "The Making and Remaking of Organizational Context Duality and the Institutionalization Process", *Accounting, Auditing & Accountability Journal*, Vol. 17 No. 4, pp. 506-542]. The advantage of decoupling, as shown in this study, is that possible inconsistencies

and anomalies of technical activities are effectively hidden from public view and it is assumed that formal structure is really working as set or predetermined.

The study is based on a documental analysis, namely: the Official Plan of the Health Ministry (POCMS) and other legislation, applied to NHS; the 2008, 2009, 2010 and 2011 consolidated financial statements of the Portuguese NHS prepared by the controlling entity *Administração Central do Sistema de Saúde* (ACSS) [Central Administration of the Health System] (ACSS); and the reports issued by the Court of Auditors concerning the auditing of NHS. Particular attention is devoted to the role played by the ACSS, the accounting practices followed by ACSS in the consolidation process with particular emphasis in some issues, and the role played by the entities responsible for promulgating accounting standards for the public sector, in particular for the public health sector.

The study reveals that several problems emerge in the consolidation process due to the absence of legislation or guidelines concerning this issue in this sector. This problem is even more acute since it is recognized that “the consolidation principles of IPSAS [International Public Sector Accounting Standards] don’t cover practical issues of consolidation of general government financial statements with regard to specific features of government budget and financial management” [European Commission (2012), *Public consultation - Assessment of the suitability of the International Public Sector Accounting Standards for the Member States*, Luxembourg, p. 8]. This study highlights the urgency of the the promulgation of accounting standards concerning consolidation in Portuguese public sector accounting. The study contributes to the debate concerning the fact that public sector accounting systems implemented to satisfy government mandates are rarely used for internal decision-making and control and that the primary use of elaborate, mandated management accounting systems is legitimating the organizations activities to external constituencies by creating the impression that the agency is well-controlled and demonstrating that resources are being used rationally.

ABSTRACT

Despite being one of the main means for international expansion, Mergers and acquisitions (M&A) performance continue to be dismal with scholars reporting very high rates of failure (Gregory and McCorrison 2005; Knapp et al. 2005; Mayer-Sommer et al. 2006; Panchal and Cartwright 2001; Papadakis 2005; Schoenberg 2006; Tuch and O'Sullivan 2007; Weber, Tarba and Reichel 2011). An important M&A research strand focusing on merger integration seems to indicate that human factors are recognised as major reasons for failure (Birkinshaw, Bresman & Håkanson, 2000; Björkman, Stahl & Vaara, 2007; Calori, Lubatkin, and Very, 1994; Cartwright & Schoenberg, 2006; Gomes, Cohen and Mellahi, 2011; Gomes, Weber, Brown and Tarba, 2011; Gomes, Angwin, Weber and Tarba, 2013; Ranft and Lord, 2002; Schweiger and DeNisi, 1991; Stahl & Javidan, 2009; Teerikangas & Very, 2006; Very, Lubatkin, Calori & Veiga, 1997; Weber & Drori, 2008; Weber and Tarba, 2010; Weber, Shenkar & Raveh, 1996; Weber, Rachman-Moore and Tarba, 2012).

However, despite the significant amount of research carried out on the human side of M&A, the psychological dimension of the phenomenon has been disregarded. Whilst there is substantial literature exploring the relationship between management practices and organisational fairness, there is considerably less that researches the topic from an international perspective (Lowe and Vodanovich, 1995, Greenberg, 1987, McFarlin and Sweeney, 1992, Greenberg, 1993), particularly with regard to cross-border acquisitions (Ellis Reus and Lamont, 2009; Luo, 2008, Meyer, 2001; Klendauer and Deller, 2009). In this present study, we will therefore draw on organisational justice theory to address this gap in the literature. While Ellis, Reus and Lamont (2009: 138) refer to “justice as the activities initiated by an acquirer and aimed at the integration of a target in a fair manner”, in this study organisational justice refers to the extent to which employees perceive workplace procedures and interactions as being fair. Understanding fairness perceptions is important they can

influence employees attitudes and behaviour and subsequently on organisation's performance (Baldwin, 2006). Colquitt et al., (2001) identify four types of organisational justice: distributive, procedural, informational, and interpersonal. In this paper we consider three types of justices but, in line with (Klendauer and Deller, 2009; Luo, 2007), we combine interpersonal and informational justices, referring to it as interactional justice. This seems to be adequate because interactional justice refers to the feeling of being treated with respect and dignity during interactions with managers from the other partner in the alliance (Bies, 1986; Luo, 2005; Mikula et al., 1990), thus requiring good communication between the parties. This type of justice is important because it helps to create good relationships and enhance the interaction and integration of employees and managers from both merging entities (Ellis, et al., 2009). Procedural justice, is defined as the perception that governance structures used to manage the acquisition and the procedures and processes in decision-making are fair (Thibaut and Walker, 1975; Greenberg, 1987; Lind and Tyler, 1988; Luo, 2005; Ellis et al., 2009). This type of justice is important because employees want to be treated with respect and dignity (Lind and Tyler, 1988; Ellis et al., 2009).

Within this context, this study aims to investigate whether interactive and procedural justice perceptions exert an influence over positive attitudes such as employee affective and calculative commitment. Past research has mainly focused on the effect of organisational justice upon a firm's performance (Ellis Reus and Lamont, 2009), whilst the analysis of the impact of organisational justice on employees attitudes and, in particular, employees commitment. Analysing the impact on commitment in the context of a major organisational change situation such as M&A is critical because perceptions of fairness may help minimize employee turnover and facilitate the necessary change management to combine the merging entities. Thus, the dismal success record of M&A in general and the acknowledged importance of organisational justice in influencing employees' attitudes and subsequently merger performance, clearly justify the need for this research.

Several studies have made use of the organisational theory in the context of large scale change situations (Brockner, 2002; Konovsky, 2000; Korsgaard, Sapienza, and Schweiger, 2002), very few studies have investigated the link between organizational justice and M&A. The strategic alliance literature have made some inroads to explore the impact of organisational justice in the context of inter firm collaboration (see Arino and Ring, 2010; Gomes, Cohen and Mellahi, 2011; Luo, 2005, 2007, 2008, 2009). However, the existing M&A literature on the topic is still incipient and very few studies (see Edwards and Edwards, 2012;

Ellis Reus and Lamont, 2009; Klendauer and Deller, 2009; Lipponen et al., 2004; Meyer, 2001; Melkonian et al., 2011; Meyer and Altenborg, 2007; Steensma and van Milligen, 2003) have used the organisational justice theory in the context of M&A. While some authors have only focused on studying the role and effect of procedural justice on employees identification (Edwards and Edwards, 2012), responses (Lipponen et al., 2004) and on organisational power structures (Steensma and van Milligen, 2003), others have combined different types of justice. While Ellis Reus and Lamont (2009) have analysed the combined effect of procedural and informational on M&A value creation, Meyer (2001) and Meyer and Altenborg (2007) have investigated the effects of procedural and distributive justices on process allocation and social integration in M&A.

Contradictions and inconsistencies are not uncommon within the existing research on organisational justice. In studies that attempt to derive which dimension has the greatest impact upon outcomes such as commitment, trust and co-operation, academics differ in their findings. Klendauer and Deller (2009) for example believe interactional justice to be most important for its effect on the communication through the corporate hierarchy whereas other studies such as that by Folger and Konovsky (1989) have argued that aspects of outcome are greater predictors of commitment than those of procedure. Further to this argument, the variety of research is ambiguous. Studies cover various case companies and different methods of corporate partnering across both domestic and international markets. The ability to draw supporting conclusions between each study is difficult considering the complexity of each case. The correlation between commitment and each dimension of justice appears largely inconsistent. Furthermore, none of these studies considered the direct effects of procedural and interactional justice on employee affective and calculative commitment.

Therefore, this research expects to contribute to the limited existing literature that specifically links the extensive body of research on organisational justice to that of international acquisitions. The study will attempt to analyse how perceptions of fairness impact employee commitment within the acquired firm. This study is important for several reasons. We aim to extend the organisational justice theory, not only by investigating its applicability to different contexts but also by providing evidence for how the two types of organizational justice are interrelated in affecting post-acquisition employee affective and calculative commitment. Furthermore, we aim to expand the existing literature on organisational justice specific to international acquisitions by evaluating the perceptions of non-managerial employees as opposed to solely management personnel. It is hoped that this will create a deeper

understanding as to the how the perceptions of procedural and interactional justice change throughout the organisational hierarchy. Thirdly, we intend to determine how well the two dimensions of organisational justice (procedural and interactive) predict two types of commitment (affective and calculative) amongst employees and find out which dimension of organisational justice is the best predictor of commitment. Fourthly, we intend to investigate whether the two types of justice have an interactive and mutually reinforcing effect on employee commitment. To our knowledge, this is the first study in proceeding with such investigation in the context of M&A, Alliances and International Business in general.

This study uses a mixed-method approach to explore the acquisition of a small-medium sized Japanese firm by a global company, XYZ corp, exploring the perceptions of organisational justice amongst non-managerial employees within the acquired firm as well as the perceptions of fairness felt by management in both the acquired and acquiring company. XYZ corp is a leading information services company providing data and analytical tools to customers across the world. Due to their size and access to resources, the company acquire firms worldwide on a frequent basis. The reason behind each acquisition varies and the size and industry of each acquired company is dependent upon the motives behind each business venture. The unit of analysis for this study will be ABC corp, a recently acquired Japanese firm in the technology sector. The acquired organisation (ABC corp) as well as the acquirer (XYZ corp) are in the business of providing information services and offer data and analytical tools to customers. The rationale behind the acquisition was largely to extend geographic reach, a strategic move that would not only create presence in Japan but a decision that would also expand XYZ corp's principle activity of marketing services. The acquisition offered the opportunity for XYZ corp to capitalise on the digital marketing activities that ABC corp had already established as well as the client base that they had built. The individual success of ABC corp was considered to be a substantial advantage in the acquisition. The firm was already accomplished in the market with a strong client base that would enable XYZ corp's profile to be raised amongst the existing clients throughout Japan. The company's decisions to undertake acquisitions in unexplored markets are largely driven by a strategy to expand international presence worldwide.

This study followed a mixed-method approach. This approach was considered to enrich the case study design by offering a deeper understanding of the complex issues within the study. A tradition is apparent within social-science research that advocates the combination of several approaches, both quantitative and qualitative, for the view that each approach is complementary of one another (Jick, 1979). The merits of this convergent approach to

research are often explained in the concept of “triangulation” as explained by Denzin, (1978:291) who defines it as ‘the combination of methodologies in the study of the same phenomenon’. The greatest argument in support of triangulation is the ability to cross-check the results of the experiment. This method enabled the results of the questionnaire to be reviewed against the interviews conducted at a later date. This allows greater confidence in the results produced. Further to this it can be argued that multiple perspectives are required to gain a deeper understanding of a subject. This is particularly important through this study in the attempt to analyse perceptions of different organisational justice dimensions.

Firstly, a survey was distributed amongst non-managerial employees within the acquired firm and secondly, semi-structure interviews were conducted with management in both the acquired and acquiring firms. The data was collected almost two years after the acquisition was completed. There were about 400 employees working in ABC corp during the time of the study. The questionnaire was administered online through a popular survey software. The employees were invited to the survey through an e-mail sent out by the CEO of ABC corp. The invitation e-mail explained the purpose of the study and the consent given by the senior management for the study. The invitation e-mail also had a link to the online survey. The questionnaire was administered in Japanese. A total of 128 responses were received, out of a sample of 151 non-managerial employees within the firm. This produced a response rate of 85%, a rate considered very good for a self-completion questionnaire distribution (Mangione, 1995). Within the responses, there were only ten responses deemed to be unusable due to incomplete responses. In the sample of respondents, 74% were male and more than 80% having at least an undergraduate degree. The average age of the respondents was 34.3 years.

To help us better understand some of the aspects related to the two organisational justice dimensions, we undertook additional qualitative data collection. Following careful consideration of the different qualitative methods of research, semi-structured interviews were selected for their ability to offer a deep understanding of the subject matter and also their ability to uncover the internal aspects of the acquisition process (Bryman, 2008, Kvale, 1996). This technique offers a degree of flexibility in that it is not essential for researchers to follow an exact question path; interviewees may wish to go off at tangents, give examples and expand their experiences and feelings towards a topic (Bryman and Bell, 2007). Despite variations in responses, by and large all the questions were asked with similar wording and under a similar format. This enabled the researchers to analyse results and identify similarities across the sample. Semi-structured interviews were conducted with a sample of

five managers involved in the acquisition process (see Table 1). It is often difficult for researchers to provide valid reasoning behind why candidates are chosen for interview, as the rationale can be circumstantial and based on convenience motivations. This was the case in this research project. There were tight restrictions as to which members of management could be selected. These limitations were based on language skill and involvement within the acquisition.

Table 1: Summary of Personnel Interviewed in Qualitative Research

Name	Position in the company	Date of Interview
John Mayakovski Interviewee 1	XYZ corp Line of Business Manager	15 th August 2012
Lay Cheng Tan Interviewee 2	XYZ corp M&A Lead	23 rd August 2012
Eugene Hashimoto Interviewee 3	ABC corp Integration Manager	20 th August 2012
Hideki Yamashita Interviewee 4	ABC corp IT Manager	16 th August 2012
Koji Kohayashi Interviewee 5	ABC corp Development Manager	20 th August 2012

Interviews were conducted using a conference calling system and were recorded using a Dictaphone. There was no ability to conduct interviews face-to-face due to the geographic distance and the constraint of time within the study. Despite this, the technique used enabled each response to be closely recorded. This enabled accuracy when transcribing scripts. Language proved to be the largest barrier to the interview method. Consequently, it would only be those in senior management positions that would be suitable for the interview as they had the greatest linguistic skills. An interview structure was created based upon the themes of the pre-distributed survey. This technique was motivated by the desire to reflect upon perceptions of organisational fairness throughout the corporate hierarchy. Further to this, it was hoped that using questions that explored the characteristics and experience each candidate held, an opportunity would arise to see how these factors may impact each person's response to the study. No incentives were offered for participation in the study other

than an understanding the results of the study may be used to help the company with future acquisition processes.

The complete data collection took place over a five week period from July to August 2012. With consideration of delays in company approval of the study and the time constraints of the study it was initially anticipated those two weeks would be sufficient to collect the necessary results. This was based upon the support and distribution process via the company CEO. Despite achieving a good response rate it was decided that this would be extended to further increase participant numbers. In the final week of data collection, interviews were carried out. Time differences and management schedules meant that these were run at precise times and dates. The process was completed in five working days.

The paper will be structured as follows: firstly the extant literature surrounding organisational justice will be reviewed with subsequent review in relation to international management practice, specifically that of cross-border acquisitions. This will be followed by a methodology which will outline the case companies, research methods used and the data analysis techniques proposed. The findings will then be summarised and finally, conclusions will be drawn and suggestions made for further research.

NARCISSISM AND CREATIVITY OVER TIME: TOWARD A DYNAMIC MODEL OF GROUP CREATIVITY

Gonçalo, Jack¹; Krause, Verena²

¹ILR School, Cornell University, USA, jag97@cornell.edu

²ILR School, Cornell University, USA

ABSTRACT

The literature on group creativity is representative of most research on groups: Rather than incorporate a dynamic view of the creative process it has largely viewed creativity from a static point of view (Cronin, Weingart, & Todorova, 2011). Here, we focus on an example of this static approach: Research linking narcissism to group creativity (Gonçalo, Flynn & Kim, 2010). First, we review the evidence that narcissists can contribute to group creativity. We uncover three critical gaps: The research focuses narrowly on one stage of the creative process while neglecting other stages, it neglects the fact that events in one stage can impact subsequent stages, and it assumes a dynamic process that is not tested empirically. Second, we propose a new dynamic model that addresses these gaps and thus generates a series of novel and testable propositions. Finally, we suggest an empirical approach that might be useful for studying group creativity over time.

A creative idea is one that diverges from existing solutions in an appropriate or feasible way (Amabile, 1996). As the organizational environment becomes increasingly competitive, creative ideas are viewed as an important advantage because they may lead firms in a profitable new direction (Amabile, 1996). In order to meet the demand for creative solutions, organizations have employed a variety of strategies, including the formation of teams (Paulus & Yang, 2000) to promote idea generation. In her comprehensive review of the literature on creativity, George (2007) noted that most of the research on group creativity has been conducted in the laboratory with groups that have no history of interaction nor any expectation that they will interact again. This stream of laboratory research has yielded many important insights that are useful for managing short term interactions between people who meet for the first time to generate a wide range of ideas; a brainstorming process that is foundational to creativity in organizations (Paulus & Yang, 2000).

Yet, there has been wide agreement for many decades that the creative process unfolds in stages that may extend over a longer period of time (West, 2002). In other words, teams must not only generate new ideas but they must also decide which ideas to implement

and then undertake the process of bringing their favored idea to fruition (West, 2002). Moreover, merely generating a wide range of solutions does not guarantee that those ideas will be identified as creative nor that they will be implemented (Rietzschel, Nijstad & Stroebe, 2006). Indeed, many organizations claim to want creative solutions, but fail to pursue them when they have the opportunity to do so (Mueller, Gonçalo & Kamdar, 2011; Mueller, Melwani & Gonçalo, 2012).

Unfortunately, the literature on group creativity is therefore typical of most research on groups and teams: Rather than incorporate a dynamic view of the creative process over time it has largely viewed creativity as a static process (George, 2007). In this paper, we focus on a particular example of this static approach: Recent research linking narcissism to group creativity (Gonçalo, Flynn & Kim, 2010). We intend to use this concrete example to illustrate how time can be fruitfully incorporated into our models of group creativity and to highlight the potential insights that may emerge from a more dynamic perspective. First, we review the evidence that narcissists can contribute to group creativity (Gonçalo et al., 2010). Our critique uncovers three critical gaps in this research: It focuses narrowly on one stage of the creative process while neglecting other stages; it neglects the fact that events in one stage can impact subsequent stages, and it assumes a dynamic process that is not actually tested empirically. Second, we propose a dynamic model that, at least in part, addressed these gaps and in doing so generates novel propositions that can be tested in future research. Finally, we conclude by suggesting an empirical approach for studying group creativity over time.

Key words: Group processes; Creativity; Personality; Group Composition; Narcissism; Stage Models; Time; Innovation; Conflict; Dissent

CONSUMING THE CITY, SPACES OF CONSUMPTION: COMMODYING AND AESTHETICISING CARDIFF'S EVERYDAY LIFE

Gonçalves, Ana

Estoril Higher Institute for Tourism and Hotel Studies (ESHTE), Portugal, ana.goncalves@eshte.pt

ABSTRACT

In a world where the pace of change is increasingly staggering, contemporary urban cultures and societies are characterised by unparalleled mutability, uncertainty, and social disengagement and it is in consumption that individuals now seem to find some sort of comfort and consolation and that they mould their identities and come to resemble their peers.

Contemporary cities are the privileged loci for the ubiquity and conspicuity of consumption, which has been strengthened by the soaring aestheticisation and commodification of everyday life that have prioritised the post-modern visual spectacularisation of the urban environment to attract global investment and international tourism. This present "hyperaesthesia of late modern consumer capitalism" (Howes, 2003) has found resonance in the promotion of ephemeral hedonistic prospects, new forms of leisure and entertainment, including a plethora of possibilities of consumption and festivalised urban spaces aimed at attracting more mobile and eclectic audiences whose meanderings interweave with urban dwellers' daily routines, producing peculiar rhythms in the urban fabric.

When understanding the everyday, it is essential that the different rhythms that compose it at different times are scrutinised. The everyday in contemporary cities and societies "is increasingly being made into a resource for the economy" (Lury in Bennett and Watson, 2002: 140) and this is particularly visible in the rise of consumerism, with the proliferation of spaces of consumption that now constitute everyday venues in their own right. This never-ending summoning to consumption is influenced by and introduces profound changes in the way people relate to the urban environment, to others, and ultimately to themselves, as well as in the process of endorsement of certain lifestyles and in the formation of individual and collective identities (Allen in du Gay and Pryke, 2002: 41) that are constructed and negotiated in the urban fabric and determined by people's "spatial

practices" (de Certeau, 1984) and "experience of consumption in the city" (Miles and Miles, 2004: 3).

According to Ungersma, Cardiff, the capital city of Wales, "is a textbook example" of how the growth of consumerism has had significant physical and cultural impacts on cities (2005: 157). In the late nineteenth century, Cardiff was dubbed the world's 'coaltropolis' and the coal industry was underpinned by an increasing multiethnic working-class labour force. However, as the demand for the 'black gold' declined throughout the first half of the twentieth century, the city endured an acute process of deindustrialisation in tandem with high levels of unemployment. The need to address this reality and to diversify its economic base, as well as to lever in investment and tourism, led Cardiff's policy makers to adopt a sound re-imag(in)ing rationale that aimed at positioning the Welsh capital as a leading business and tourism destination in the UK and overseas. Driven by the buzzword triad of civic boosterism, cultural regeneration, and consumption upheaval, new attractive landscapes embodied in city centre urban regeneration and waterfront revitalisation projects have bolstered the city's economic rejuvenation and have assigned new values, meanings and symbols to Cardiff's social and cultural spheres. New ways of consuming the city and its spaces have thus emerged and leisure time is now occupied with activities as diverse as cultural entertainment, the practice of sports and the attendance of sports events, or through people's engagement in conspicuous consumption in the different venues available in the city, including arcades shops, department stores, shopping centres or drinking and dining areas.

Stemming from theoretical groundwork on how consumption has transformed and been transformed in/by contemporary cities, the methodological approach adopted in this paper privileges empirical research, namely participation observation and detailed fieldwork undertaken in the city of Cardiff in the past decade. The findings of this research show how consumption has indeed come to embody the quintessential backbone in Cardiff's cultural resurgence, which emphasises the city's powerful bond between culture and the economy. Cardiff has thus been re-ima(gin)ed "as a consumption centre whose physical and social attributes have become aesthetic commodities to be sold and consumed by a number of target audiences" (Kompotis, 2006: 168). As in many other European cities, Cardiff's cultural atmosphere has experienced the outcomes of a growing capitalist commercial culture, characterised by increasingly competitive companies and corporations in the areas of drinking and dining, shopping and entertainment.

But consumption has also created intricate paradoxes. It *“divides as much as it provides”* (Miles and Miles, 2004: 2), contributing to widening the gap between the most privileged and the most disadvantaged. The latter, Bauman’s *“collateral damage”* (2011) are those who are kept socially and economically at arm’s length from contemporary consumer spaces because they lack the disposable income that would allow them to integrate into the new and coveted social and economic order. Therefore, the commodification and aestheticisation of everyday life seem to have been contributing to establish social hierarchies and foster contradictory feelings towards the city and its consumer spaces, feelings of belonging versus alienation, and of inclusion versus exclusion, depending on how people feel addressed by and integrated in this pervasive mainstream discourse of consumption and aesthetic urban spectacularisation.

CYPRUS OPTIMAL NATURAL GAS WEALTH MANAGEMENT MODEL. GOVERNMENT PRODUCTION CONSUMPTION (GPC)

Homayoon, Morvarid

University of Nicosia

ABSTRACT

Blocks offered in the 2012 Cyprus Bid Round (green shading). Source: [PetroView®](#)

http://www.mcit.gov.cy/mcit/mcit.nsf/dmlhcarbon_en/dmlhcarbon_en?OpenDocument

Cyprus is located at the crossroads of Europe and Middle East destinations. The Country's strategic location and infrastructure makes it a reputable international business and services center. In 2004, Cyprus became a full member of the European Union (EU). In January 2011, Noble Energy announced the discovery of some of the largest offshore natural gas reservoirs in the world, 90 kilometers west of Haifa which the development of its offshore fields may take a long time but surely it would benefit Cyprus as well as Europe. The natural gas revenue can change the national economy and will have an impact on the people's livelihood. According to Cyprus government officials, the recent findings of the natural gas could strengthen the Country's financial position, wealth, and the standard of living of Cypriots in near future. The country's standard cost of living indicator, known as income per capita, is related to national accounts. Usually the wealthy countries are known as countries with high GDP (Gross Domestic Product) or GNI (Gross National Income) and factors like

housing, corporate income taxes, dividends, undistributed corporate profits, wages, consumption, investment, government, export, import, foreign & domestic income from labor and the net capital inflow, are affecting the GDP and GNI. According to Friedman's theory expected future income changes influence consumption. Modigliani's theory also claims people make consumption decisions based on resources available to them over their life time and their current stage of life. These theories have provided important predictions for the economy as a whole; they predict that the aggregate saving of country is depending on the rate of growth of national income. According to Campbell McConnell (1993) economics is "the study of the behavior of human beings in producing, distributing and consuming material goods and services in a world of scarce resources." ¹ and as mentioned in Peter Drucker's writings in his management books, management is the discipline of organizing and allocating firm's scarce resources to achieve its desired goals and objectives. These two definitions explain the relationship between economics and managerial decision making. Scarce resources such as oil and natural gas will have serious impact on a country's future economic structure. If risks and uncertainties are not taken to account, the future of a country after finding such resources might differ from what expected initially. It is interesting to observe how often countries with oil or other natural resources have failed to grow more rapidly than those without; this phenomenon is known as "Natural Resource Curse" and there are many studies trying to identify the reasons behind it. Reasons such as: Dutch disease, under-investment in human capital and macroeconomic instability. On the other hand there are also studies that show the optimal management of natural resource revenues which is often gained by consumption smoothing, inter-generational equity and other investment choices. One of the ways that most researchers used to avoid the fails and to envisage possible solutions for specific cases is to study other countries with natural resources and critically evaluate their practices and experiences. The stories of different countries show that a poorly designed fund management of natural resources can harm the economy and people's wealth but having a well-designed one, will bring a good budgetary process integrating, a sustainable fiscal policy strategy and institutions that are competent, transparent and accountable. It can build public awareness and support for a policy of wise and long-term management. Revenue management is a managing process to maximize revenues. Cyprus has now initiated the gas explorations which are likely to possess considerable natural gas revenues. The critical question is: "Are there any plans in Cyprus on how to use/distribute the revenues?" "There are no concrete plans yet" - talk given by the former Finance Minister of the Republic of Cyprus and member of the working group on

economic matters in the Cyprus reunification talks. This is also a view indicated by the former Director of the Energy Service of Cyprus. As mentioned above there isn't any natural gas revenue management model for Cyprus yet. The major issue in Cyprus economic policy is "how to use the oil and gas income?" The dilemma facing the government is whether the domestic use of oil and gas revenue could partially reduce the Cyprus political, popular and economic pressures. Therefore, it is necessary to form a wealth management model adapted to Cyprus to ensure the long-term sustainability of public finances, the highest possible return on investments, and inter-generational equity. This can be achieved by looking at what has been done in a selected range of countries, including both successful and failed practices in order to highlight pitfalls that should be avoided and using the successful proved practices. This study, therefore, mainly aims at preventing Cyprus from the "Natural Curse" and developing a model investigating in different parts such as future generation, public wealth, growth in mainland GDP, renewable energies, controlling the exchange rate and inflation, research and development, technology and management methods leading to higher productivity and higher income as well as economic expansion and growth. In order to reach these purposes the successful and unsuccessful revenue models of different countries will be studied in order to create a new model for Cyprus. According to the aim and objectives of this study, case study strategy and inductive approach is going to be applied. The structure of this research is not numerical so qualitative information and primary data focusing on depth interviews will be used, but getting help from the secondary data is also useful. For this study interviewing is particularly important; Cyprus government respondents who are mostly responsible for the wealth management of natural resources, especially natural gas will be interviewed and semi-structured interviews with open-ended questions will be conducted. In this research suitability of the study is very important so the purpose of this study is demonstration of the real result and avoiding the unethical issues.

NORMS AND NON-CLASSICAL NEGATIONS

Iliescu, Gabriel¹; Kabbara, Teo²

¹Spiru Haret University, Romania, gabi.iliescu@yahoo.com

²Spiru Haret University, Romania, kabbara_kbr@yahoo.com

This research aims to connect several components among which: a) the theory of truth functions of classical bivalent logic interpreted in natural language; b) the logic of norms (von Wright, 1968, p141-167); c) the concept of elementary event or transformation (von Wright, 1982, p39-45); d) nonclassical negations (D. Gheorghiu, 2004, pp250-255).

Thus is created a conceptual framework for the analysis of a very important theorem of the logic of norms according to which the obligation entails permission. Then, the same framework can be applied to other judgements on the logic of norms.

The part concerning the truth value functions derives from a previous research. This refers to the following idea: starting from the type of opposition that exists between the conclusions (Popa, 2000, p57-59), one can deduce the type of the opposition that exists between premises. To check this we carried out two approaches on the truth functions table:

- a) I built a tree of the immediate logical consequence relation (Iliescu, 2010, p. 172).
- b) I analyzed the opposition relations that exist between each of the sixteen pairs of truth value functions.

According to the point a), all the truth value functions are successively premises-functions and conclusion-functions except inconsistency and tautology function. Some of these functions are connected by an immediate logical consequence relation, for instance, inconsistency and conjunction. Other functions are connected by the mediate logical consequence relation such as conjunction and disjunction. It is understood that both functions that are in immediate logical consequence relation and in mediate logical consequence relation are connected by the logical consequence relation. According to point b), for every function there is a contradictory to it, noted „-“.

Thus, the symmetrically spaced truth functions from the central line are mutually contradictory. The contradiction is a type of classical opposition.

On the other hand, between the truth functions there is classical opposition: the contrariety, noted „ \neg “ (Gheorghiu, 2004, p251) and subcontrariety, noted „ \neg “ (Gheorghiu,

2004, p252). Some of the truth functions are in mutual contrariety. Other of them is in mutual subcontrariety. That means for some of them, say φ , there is such a list of functions $\{\gamma_1, \dots, \gamma_n\}$, that φ is mutual contrary to each of the functions $\{\gamma_1, \dots, \gamma_n\}$, and γ , can illustrate the succession by the n mentioned function. I used the notation $\neg(\varphi)$ equivalent to the list $\{\gamma_1, \dots, \gamma_n\}$.

By applying contradiction-negation on each function γ , I obtained a list of $\{\sim\gamma_1 \dots \sim\gamma_n\}$ functions that are conclusions of φ , noted down as $\text{Con}(\varphi)$. Which means that if we are in the possession of the list $\{\gamma_1, \dots, \gamma_n\}$ of contraries of a given function, we can find the list of its conclusions by simply applying the negation-contradiction. So, we can get conclusions without using the deduction.

It also means that there are functions, let's call them ψ , for which there is a list of functions $\{\delta_1, \dots, \delta_n\}$, so that ψ is in the mutual subcontrariety relation to each of the functions $\{\delta_1, \dots, \delta_n\}$. And δ can be exemplified, gradually, by the n functions specified in the index. On the other hand, we can use the notation $\neg(\psi)$ that will be equivalent to the list $\{\delta_1, \dots, \delta_n\}$.

By applying contradiction-negation to each function δ , we will get a list of functions $\{\sim\delta_1, \dots, \sim\delta_n\}$ as being premises of ψ , noted down as $P(\psi)$. That means that if we are in the possession of the list $\{\delta_1, \dots, \delta_n\}$ of subcontraries of a given function ψ , we can find out the list of its premises by the simple mechanical application of the contradiction-negation. So, we get premises, without using the deduction as an obtaining procedure.

We have unified the notation for the γ and δ functions. The truth functions table shows that the γ functions are conclusive in relation to φ and that the δ functions are premises in relation to ψ .

But the same functions $\{\gamma_1, \dots, \gamma_n\}$ are both conclusions of φ , $\text{Con}(\varphi)$, and subcontraries for ψ , $\neg(\psi)$. The same functions $\{\delta_1, \dots, \delta_n\}$ are, also, premises for ψ , $P(\psi)$, and contraries for φ , $\neg(\varphi)$. In fact $\{\delta_1, \dots, \delta_n\}$ is the same with $\{\sim\gamma_1, \dots, \sim\gamma_n\}$ which allows a unified notation. It means that the same functions $\{\sim\gamma_1, \dots, \sim\gamma_n\}$ are both the premises for ψ , $P(\psi)$ and the contraries for φ , $\neg(\varphi)$. From here we can deduce that there exist a mutual contradiction relation (*Ctr*): between the conclusions of φ functions, $\text{Ctr}(\text{Con}(\varphi))$ and the premises of ψ functions, $P(\psi)$; between the premises of the ψ functions, $\text{Ctr}(P(\psi))$ and the conclusions of the φ functions $\text{Con}(\varphi)$. As a result of these we obtained the chains of equivalences: $\text{Con}(\varphi) = \text{Ctr}(\neg(\varphi)) = \neg(\psi) = \text{Ctr}(P(\psi)) = \{\gamma_1, \dots, \gamma_n\}$; $P(\psi) = \text{Ctr}(\neg(\psi)) = \neg(\varphi) = \text{Ctr}(\text{Con}(\varphi)) = \{\sim\gamma_1, \dots, \sim\gamma_n\}$.

In the practical part of this article we selected the material implication from the truth functions. We compared the status of this expression with one of its particular case, that is deontic conditional: *If the authority forces an agent to make a state of things p, then the same authority allows that agent to do that state of things: $Op \supset Pp$* . What makes it not only important, but also interesting is that a variant of its negation would violate the principle of non-contradiction, and another variant violate the principle of excluded third (Gheorghiu, 2005, p114-115).

Although considered negative variants are equivalent however distinct principles are violated. Also must be said, that deontic thinking is concerned, at least, by compliance with logical principles of thinking. But the same formula is a theorem of P deontic logic axiomatic system. Its demonstration starts from some tautologies such as: $(A \vee B) \supset (\neg B \supset A)$, $Pp \vee P\neg p$, and from the definition $\neg P\neg p \equiv Op$ (Popa, 1982, p. 303).

We also compared the theorem status of this expression with the one of possible element of the truth function table on the basis of the implicative function that it contains. We have reached some conclusions: On the one hand, because it is a theorem, it is provable within the system of tautologic premises. On the other hand, from here derive theorems that are tautologic conclusions. But the truth function of material implication has only premises-functions and not also conclusion-functions. And this theorem has, as the main operator, the truth function of the material implication. As a conclusion, it should have only premises, not both premises and conclusions.

We also instantiated the previous mentioned chains of equivalences by this theorem, thus evaluating it as a particular case of function deriving from premises. Some of the inferences look simple, easy acceptable, others may appear as being strange but they are sustainable by calculation.

The deontic event and the nonclassical negation are other issues that we have approached. Starting from the events theory by von Wright and from the classical negation of the contradiction type, we built nonclassical deontic events. The event-expressions contain, both in the initial state and final state, deontic expressions. They render, states of things that are possible, at least from the logical point of view, in relation to the history of law, according to which possible norms are maintained as imperative, they start being imperative or they stop being like that. The expressions for the events by means of which something appears or disappears, or is continuously absent, typically contain classical negation. But we replaced the

classical negation by non-classical negations: contrariety and subcontrariety and thus we obtained new kind of events. For some of them we propose names such as quasi-appearance, quasi-disappearances or the conservation of absence with regard to the obligations, permissions or forbidances. In the events of which final states contains the subcontrary negation, we replace it gradually with the the set of subcontraries of the given function. The same proceeding is applicable to the other deontic operators and to the contrary negation.

So, we have reached the following conclusions:

Some truth functions that are placed in simetrically oposed positions from the center of the truth function table and that are mutually contradictory are *complementary*. While one of the two functions, mentioned above, has premise-functions and subcontrary-functions, its contradictory has conclusive-functions și contrary-functions. Other pairs of functions that are also symmetrical opposed, are each of them *complete* and *similar*. So, each of the two functions has not only premises-functions and conclusions-functions but they also have subcontrary-functions and contrary-functions.

In the presented context, classical negation and contradiction-negation has a “medium-term” role. In relation to a given function, there is a moving from the premises-functions to the subcontrary-functions or vice versa. In relation to other given functions, there is a moving from the conclusion-function to the contrary-functions or vice versa. The importance of such an organon can be see not by studying it separately from any context, but precisely by studying it within such a context and by taking into account the result that is obtain by using it and it also should be extended to the domain of the investigation that is the logic of norms.

The functions that are contrary and subcontrary-negation of some given functions within the truth functions table were obtained by applying the matrix definitions of the two non-classical negations on truth functions of the classical logic. And that comes in line with the claim of the author of these definitions, according to which the classical logic of the order 0 is extended to include contrary and subcontrary-negation. So, founding the process of expanding classical logic to express non-classical negation, one found that non-classical-negation functions of classical truth functions are other truth functions that are also classical. Non-classical aspects are dispersed in classical logic, so that we do not have a net separation between classical and non-classical logic.

It should be considered for the future: that these *chains of equivalences* can stand for what I proposed to be called *epistemic situations or contexts*; that even under the syntactic relation, there is possible to *redefine the logical consequence relation* on the basis of these chains of equivalences and that this relation stands also at the basis of the logical norms; that, *applications of the chains of equivalence* on the logic of the norms are possible; that it is also possible to use the calculation of the order 0 to approach some meta-theoretical problems of axiomatical logic of norms. Thus an ordinary conjunction can be theoretically upgraded as the conjunction of the meta-theoretical properties of completeness and inconsistency of the systems of the logic of norms, properties that no judgement can live without. Much less can miss these properties from the reasoning on the rules governing the human's condition.

BEYOND THE LIMITS OF CRISIS

Ionescu, Eduard¹; Costea, Carmen²

¹USH Bucharest, Romania, ioneleduard@yahoo.co.uk

²USH Bucharest, Romania, cecostea@yahoo.com

ABSTRACT

The recurrence of economic crises serves to illustrate the limits of neoclassical economics and the contemporary established models. The study of complex systems, evolutionary economics and interdisciplinary research offers the possibility of new developments. The concept of emergence represents an insightful argument against the well-planned and ordered nature of the social sciences universe. Complex systems research represents the viable alternative for sustainable growth in the following decades.

Keywords: systemic crisis, sound development, societal innovation

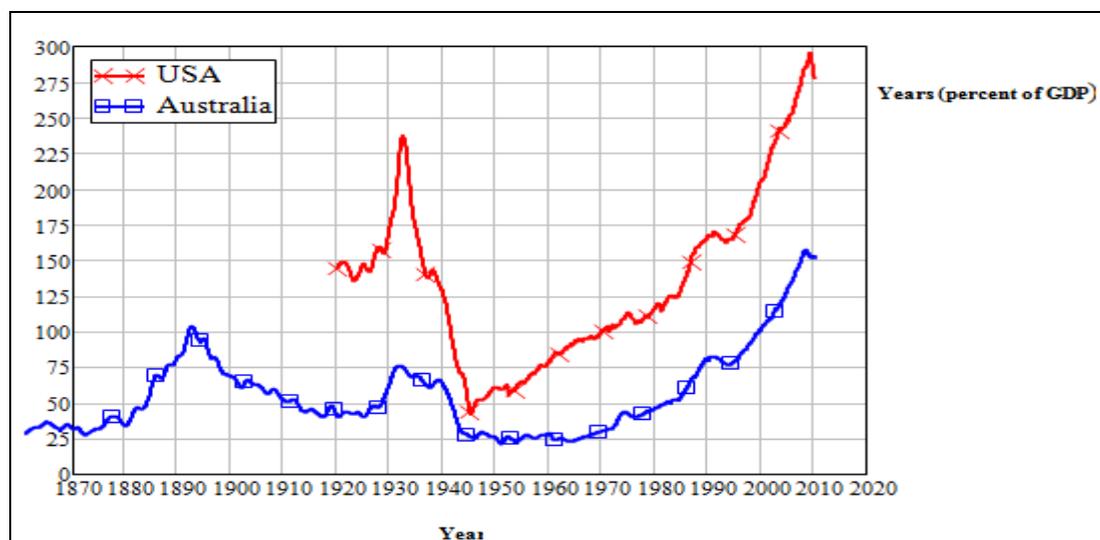

INTRODUCTION

The previous economic downturns have placed significant strains both on the real economy and the economic theory. Policymakers have been struggling to rise to the challenge, but as Stiglitz (2003) points out, in the process of shock therapy, the markets have received “too much shock and too little therapy”. Several text books analyze the crisis from different perspectives. Tantalizing insights on the economic crises are shared by Donnella et al. (1972) as a vision of the entire world in their book regarding the limits to growth. They described Planet Earth’s obvious limits and the need for growth through complex development models. Separately, the Club of Rome Report demonstrated that ignoring such approaches may bring the society and the environment into overshoot and on the edge of a total collapse. Nowadays academics and researchers have the strength and positive attitude to talk about the untold reasons of such crises development. The new philosophy has taken root, stating that what stands before us and what lies in front of us pales in comparison to what resides within us (Emerson, 1993). A majority of the 16 individuals identified by Bezemer (2009) and Fullbrook (2010) as having anticipated the Global Financial Crisis followed non-mainstream approaches to economics, with most of them identifying as Post-Keynesian (Dean Baker, Wynne Godley,

Michael Hudson, Steve Keen, Ann Pettifor) or Austrian (Kurt Richelbacher, Peter Schiff). The theoretical foundations of these authors therefore differ substantially from those of more mainstream neoclassical economists.⁴⁷ In this paper we will restrict our attention to the Post-Keynesian subset, which we will hereinafter refer to as the Bezemer-Fullbrook Group.⁴⁸

These authors made frequent references to the ratio of private debt to GDP, and the ratio of asset prices to commodity prices—both indicators of financial fragility that were emphasized by Minsky (1982) in his financial instability hypothesis, which is a common thread in the credit-oriented analysis of the Bezemer-Fullbrook Group.

Figure 1. Debt to GDP ratio for Australia and the US

Since these indicators are not commonly considered in mainstream economic analysis, key data are shown below to make the differences from Ben Bernanke analysis of the Great Depression.

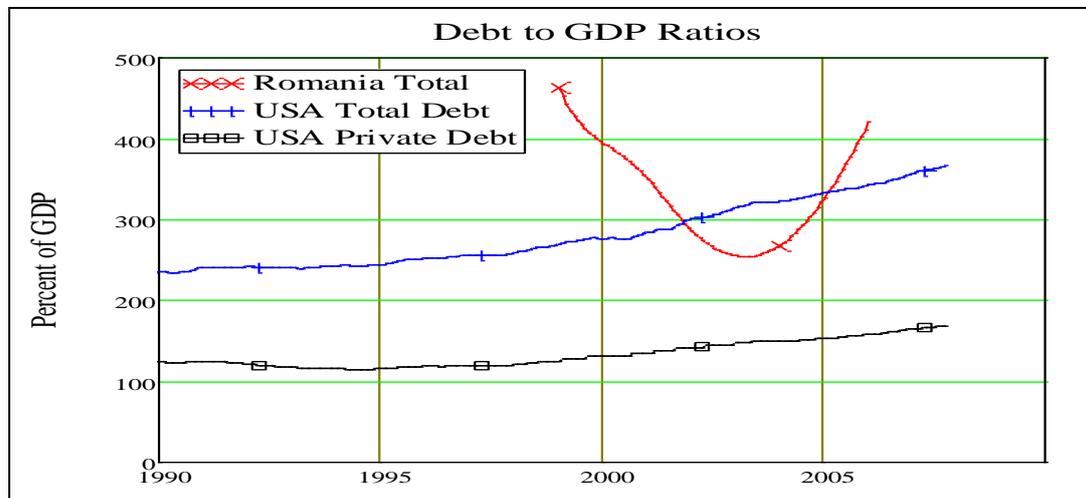

⁴⁷ Bezemer's list included four economists who could be regarded as close to the neoclassical mainstream, though all are to some degree mavericks: Nouriel Roubini, Robert Shiller and Jakob Madsen (together with his then student Jens Sørensen). The finalists for the Revere Award added two more maverick Neoclassical economists—Paul Krugman and Joseph Stiglitz. Fred Harrison applies Georgist economics.

George Soros's non-equilibrium approach of reflexivity cannot be classified in any of these more conventionally recognized schools of thought. Eric Janszen's approach blends both Austrian and Post Keynesian economics, while expressing allegiance to neither.

⁴⁸ However, though there are in turn significant theoretical differences between Post Keynesian and Austrian economists, the shared focus on the role of credit in a disequilibrium environment generates substantial empirical overlaps in their analysis.

By observing figure 1 and 2 one can notice the fact that a similar pattern starts to emerge in developing economies such as Romania.

Figure 2. Debt to GDP ratio for Romania and the US

Contemporary research can benefit from numerous developments. The availability of techniques such as computer modelling or simulation techniques as well as the understanding of specific elements as dynamics, feedbacks, behaviours and network structures, permits researchers to implement a great policy shift. This phenomenon is comparable to the moment when big government structures first became fashionable in the twentieth century.

The evolution process represents an intricate interaction between organisms, the environment and life itself in a constant stride for improvement. Transposed from biology to the field of economics and social sciences, the evolutionary process takes a societal approach and represents the dynamics of populations, behaviours or market activities based on external stimuli and repeated interactions (Vasile, Costea and Viciu, 2012). Individuals can be seen as the cells of a large super-organism which experiences evolutionary pressures. Once a critical mass has been reached in behaviours or activities, the world undergoes a stage of spontaneous evolution (Lipton, 2010).

Successful policy development requires several different perspectives. This fact was illustrated in the context of policymaking in security and infrastructure. Generating the right analysis is an essential element, asking the right question is an important starting point and getting support across the spectrum for a new research approach is the key. The right analysis

has to address the right question. An example of this statement resides in the question: 'Is this railway worth paying for?' This is a good question and it searches for the entity that will pay for it and why. This is followed by additional questions regarding the payment between passengers or property developers and the taxpayer role in getting welfare benefit.

The fundamental questions have remained without an absolute answer. This is, in fact the challenge for scientists and analysts when providing models to decision makers. As models cannot incorporate everything, decisions are to be taken with regard to their simplification. Outcomes are inherently uncertain. They need to show the appropriate range of outcomes with specific degrees of robustness. Once policy makers get answers to such pragmatic questions, their work will definitely be inspired by academic thinking, and stride for the general wellbeing of society.

HOW CAN THE DIRECTION BE FOUND IN A CLOCKWORK OR UNCERTAIN UNIVERSE?

The manner in which we regard social systems is basically rewritten in the latter years by the emergence of complex systems. Stuart Kauffman (2010) adequately describes this in his work 'Reinventing the Sacred' where he contrasted the Laplace view of a clockwork universe with one of an inherently creative and uncertain universe.

A fundamental difference between the clockwork universe and the one dictated by uncertainty is the concept of emergence. In a simplified definition this represents the property of elements to combine and generate new elements which have distinctive characteristics than those which were initially introduced. This places emphasis on complex systems research since simplified static models are no longer considered accurate and efficient in describing social phenomena. Indeed, the notion that past representations and models have begun to show signs of ineffectiveness, is already present in numerous fields of activity. In economics, the neoclassical approaches have repeatedly been placed under the critical lens.

In his assessment of mainstream economic thinking, Keen (2001) underlines the intrinsic flaws of the current establishment and proposes evolutionary and complex systems research as a possible alternative. As Witt (2008) argues, the evolutionary economics approach represents a clear shift from the concept of equilibrium and optimal solution, which are so entrenched in neoclassical thinking.

A critical approach is required in any development process, as growth is expected to take place following creative destruction processes (Aghion and Howitt, 1990). Stable endogenous growth can only be achieved on solid ground. The solid basis of any model is represented by valid and flawless theory. As numerous holes have begun to appear in neoclassical thinking when it comes to the impossibility of profit maximization, macroeconomic utility and rational behaviour, the existent scenarios have begun to seem out of touch with market activities.

The road towards a new economy starts at the realization that the current theory is not suited for future development. Furthermore, increased interest and attention should be given to branches of research that deal with:

- The rational exploitation of natural resources;
- The economic challenges which will be ushered in by climate change;
- The limits to introducing and maintaining green growth;
- The limits and basis of wealth creation in a global environment;
- Avoiding “uneconomic growth” (Daly and Bergh, 2002).

CONCLUSIONS

Important changes have to be incorporated in the path to future development. The current economic models are flawed in their interpretation of the social environment and continue to be prone to crises and inefficiency. New economic thinking requires an integration of both human beings presence and influence together with other elements such as the rational allocation and utilization of resources, the limits of current models, the challenges of climate change and the risk of uneconomic growth. The first step in this new direction is represented by developing and disseminating a greater awareness and understanding of the phenomenon.

IDEA EXPLOITATION AND VALUE APPROPRIATION: THE EXPERIMENTAL LAB

Iscaro, Valentina¹; Castaldi, Laura²

¹Second University of Naples, Capua, Italy, valentina.iscaro@unina2.it

²Second University of Naples, Capua, Italy, laura.castaldi@unina2.it

PURPOSE

The research sets out to analyze experimental labs through the adoption of a cognitive perspective and the use of Boisot's (1998) I-Space. The aim of the work is to make a contribution towards the understanding of knowledge dynamics within experimental labs, highlighting related issues of value generation and appropriation.

UNIVERSITY ECOSYSTEMS

The University Ecosystem (UE), a new way to be an entrepreneurial University as conceptualized by Curley and Formica (2012), is a community of professors, researchers, students, external professionals, etc., that interact with each other and with the external environment to generate entrepreneurial innovation. Sharing and collaboration in such an ecosystem is structured in a variety of forms: common research projects and papers, people to people and patent exchanges, cross-licensing agreements, shared copyrights. The UE identity is shaped like a "starfish", i.e., decentralized, with non-hierarchically ordered social norms, without walls to protect ideas, and built on openness and connectivity, in contrast to a "spider-like" identity, which is centralized, built on social norms, rules and power relations (Brafman and Beckstrom, 2006). As it is from knowledge flows and collaboration that "entrepreneurial innovation" can emerge, Universities have to exploit their knowledge base and collaboration opportunities to encourage and support entrepreneurial initiatives and ideas.

EXPERIMENTAL LABS

In this perspective, entrepreneurial Universities should adopt *experimental labs* in order to provide aspiring entrepreneurs with rich soil and strong network to get from an idea to a start-up. The experimental lab is a network of individuals, "federated" from Universities, research labs and firms, who become part of an innovative ecosystem rather than relying only

on their own capabilities (Andersson et al., 2009). In experimental labs high expectation entrepreneurs explain their business ideas to receive feedback from “outsiders” in a peer to peer exchange, to make the idea ready for launch in the marketplace. Labs lead an entrepreneur from “pattern recognition” of an idea, which is innate, to “pattern completion” (Curley and Formica, 2008). Through labs, aspiring entrepreneurs can access to competences, capabilities and experience of a network to explore, analyse and define their ideas. The experimental lab therefore works based on a paradigm able to react to current uncertain context, leaving the presumption to go from a business idea to a business model, to proceed by trial and error in an environment in which no failure is a failure, but rather a valuable lesson to reshape the starting idea. The new paradigm is: TECHNOLOGY/IDEA-IDEA TESTING- SIMPLEST SOLUTION- MARKETING/SALES.

VALUE CREATION AND APPROPRIATION THROUGH EXPERIMENTAL LABS

The daily work of an experimental laboratory builds upon members’ knowledge; the goal is *sharing to improve*. However, even though knowledge sharing across different individuals by means of experimental labs is deemed to be a lever for new venture creation, it can be considered a necessary but not sufficient condition for knowledge creation and exploitation. In order to analyze the characteristics, evolution and value dynamics of knowledge assets within experimental labs, we use Boisot’s (1998) I-Space theoretical framework which, absorbing and enlarging the traditional distinction between tacit and explicit knowledge (Nonaka and Takeuchi, 1995), studies knowledge assets through the joint use of three dimensions - abstraction, codification and diffusion - and highlights that knowledge assets have to be intentionally managed as they have a paradoxical character: the more useful they become, the more difficult they are to hold on to. Therefore we argue that it is important to invest in deliberate cognitive activities in order to leverage lab members’ cognitive assets. More in particular, we believe that it is necessary to find a balance between two potentially contrasting needs in order to make knowledge sharable within the network. The first is the need for externalization through the adoption of mechanisms fostering the conversion of the tacit knowledge of people involved in experimental labs into more explicit cognitive assets, thus making individual knowledge easier to get diffused within the network. The second need is for appropriation by the adoption of (isolating) mechanisms allowing members to extract value from the knowledge they contribute to generate. We are working at the

development of a virtual platform for the sharing of business ideas and knowledge flows, as a tool to sustain the activity of the experimental labs.

ROMANIAN INTERNATIONAL MIGRATION AND SUSTAINABLE DEVELOPMENT IN RURAL SENDING AREAS: MIGRANT INVESTMENTS IN HOUSES

Jacob Larionescu, Andra¹; Ciotoiu, Iuliana²

¹Faculty of Architecture, Spiru Haret University, PAVE, ENSAP, Bordeaux, Romania, usharh_jacob.andra@spiruharet.ro

² Faculty of Architecture, Spiru Haret University, Romania, usharh_ciotoiu.iuliana@spiruharet.ro

ABSTRACT

The paper discusses the impact of Romanian international migration on environmental sustainability, knowing that a great part of migrants' incomes are invested in home improvement projects or for buying/building a house in the country of origin. We use a qualitative fieldwork conducted between 2009 and 2012 in the village of Marginea, Suceava County – one of the “champion” areas of Romania's international migration. Between the many aspects that affect environmental sustainability, we focus on the transformation of the rural dwelling in migrants' homeland, a major aspect to consider when addressing the issue of sustainable development.

Keywords: Romania, international migration, environmental sustainability, houses, homeland, investments

INTRODUCTION

Sustainable development is a multi-dimensional concept, used by different disciplines, with a concern for future generations' well-being. In this paper, we focus on the interplay between environmental and social dimensions of sustainable development, observing how international migration affects environmental sustainability. The definition of environmental sustainability is drawn from the Millennium Development Goals Report: “Environmental sustainability means using natural resources wisely and protecting the complex ecosystems on which our survival depends” (United Nations, 2005:30). Nevertheless, environmental sustainability cannot be isolated from its social context. The new practices, values and beliefs acquired in the host country shape migrants' consumption patterns and the ways in which they interact with the natural and built environment. Furthermore, international migration facilitates the circulation of cultural factors, as well as the

transmission of technical, social or formal innovations. All these influence migrants' approach to traditional knowledge and culture and the way they manage renewable and non-renewable resources.

ROMANIAN MIGRATION AND INVESTMENTS IN HOUSES

Romania occupies the second position in the top 10 most mobile countries of the EU, concerning the number of foreign residents in the UE-27 member states (EUROSTAT, 2011). According to World Bank reports, in 2007, Romania was in the top 10 remittance recipients, with an inward remittance flow of \$ 6, 8 million – representing 6 % of the GDP (Anghel and Horvath, 2009). Then, after a maximum reached in 2008 (\$ 9381 million), remittances fell by almost half in 2009 (\$ 4952 million), continuing to decrease in 2010 to \$ 3.883 billion. Instead, in 2011 we see a slight increase. This decline is largely due to the crisis that affected the main destination countries of Romanian migrants: Italy and Spain.

Tracing the profile of the Romanian migrant by period of migration, area of origin and age group, Sandu (2010) observes that about half of them have rural origins, not surprising if we consider the share of rural population (45%) in Romania's total population in 2010. According to Dumitru (Dumitru et al., 2004), the majority of migrants' investments are directed toward houses, housing utilities and cars. Indeed, a survey in 2008 on «Romanian communities in Spain» revealed that, no matter their return intentions, about half of the Romanian migrants considered buying/ building a house in Romania (Sandu, 2010). In addition, the SOROS-IASCM survey in 2011 confirmed this preference for house building (Alexandru, 2012). Similarly, in another fieldwork conducted in 2001 in a rural community in Teleorman County, the researchers observe: „Building new houses (mostly large houses) / buying apartments in nearby towns [...] seems to be a constant feature of the household that includes at least one migrant” (Șerban and Grigoraș, 2000:52). Building a nice home in the country of origin is more a symbolic or an emotional investment than a financial asset (Anghel, 2008), being related to the display of migrants' new status and social identity: „Many migrants invest their earnings in large new houses, clothes and cars” (Anghel, 2011: 40). Besides, the honour of the family (Diminescu, 1999) is a must in a rural community and the house is an effective means for showing migration success in this competition between households: „The first wish of villagers from both Temeseni and Piatra who are earning money abroad is to build a new house. Not any house but a big house, if possible bigger than the neighbor's house” (Stan, 2005:11). By contrast, the old, traditional homes are „a source of

shame” for the families that „continue living in them and cannot build another `modern` house» (Moisa, 2009:3). The large and cosy houses built in the home country constitute a „Physical evidence of a migrant’s success abroad” (Uccellini, 2010:79) and, along with other signs of wealth displayed on different occasions, „provide strong incentives to other potential migrants” (Uccellini, 2010:79). Hence, a new culture of migration emerge among the community of origin, which is maintained by the new individual behaviours and consumption patterns, related to the host country: "As migration grows in prevalence within a community, it changes values and cultural perceptions in ways that increase the probability of future migration” (Massey, 1998:47).

METHODOLOGY

The paper is based on both primary and secondary sources (such as official documents, statistical databases and other derived works) related to international migration and on a fieldwork carried out between 2009 and 2011 in the village of Marginea, using the observation method and the informal and semi-structured (qualitative) interviews. The informants (near 100 people) were selected from the group of migrants as well as from the non-migrants. Several in-depth interviews were conducted with about 45 migrants and non-migrants. The majority of the respondents were gathered using local social networks (kin, friends, neighbours), a sort of a snowball sampling method, thus the sample is not statistically representative of the population of Marginea. The observed material and interviews were recorded on camera or using sketches and notes.

MARGINEA

The village of Marginea is located in the northern part of Romania (Suceava County), close to the Ukrainian border and along important national routes, in the vicinity of important churches and monasteries, some of them belonging to UNESCO patrimony. Mentioned in historical documents since 18th century, Marginea is known for its black pottery, made using traditional techniques. Between 1930 and 2011, the population of Marginea has experienced continuous increase (10 529 inhabitants in 2011), the locality being the largest village of Suceava County. According to official statistics, 2500 people were living abroad in 2009 and 2153 in 2011 (Institutul National de Statistica, Directia Judeteană de Statistica Suceava, 2012). However, according to unofficial sources, the number might be higher. In 2011, the main destinations countries are Italy and UK. Initially, migration reasons

were primarily economic. The collapse of agriculture, plant closures, lower wages, poor development of the tertiary sector, high cost of housing construction are all factors that contributed to the migration abroad. Remittances and other foreign wages constitute the main vehicles of material transformations brought by migration. The construction sector occupies an important place, concentrating migrants' investments and efforts (Cingolani, 2009). Over 16 per cent of new houses are built on former pastures, on the basis of a land lease agreement. This is largely due to an increased demand for housing and to local real estate market conditions. Another reason is that more and more villagers stopped keeping and raising cattle.

In contrast with migrants' new homes, old rural dwellings, which passed from one generation to the next, are an "instrument of memory" (Rautenberg, 2007). These traditional houses and annexes of Marginea were very well adapted to the climate, natural environment and its traditional occupations, while the new migrant's house lost all its regional features and distinctive character. In the old residential areas, the proximity of homes corresponded to extended family networks, while in the new neighbourhoods this kind of relationship is absent. The change of neighbouring relations and social relations is also materialized through the new types of gates and fences. Unlike old gates, which allowed entering the courtyard at any moment of the day, when the owner was at home, the new automatic gates are designed to «protect property and privacy» (Cingolani, 2009:157). Moreover, the symbolic repertoire was removed, along with its support: the traditional gates and fences. This tangible cultural heritage - i.e. traditional houses, annexes, gates and fences - could be a powerful contributor to environmental sustainability, through the promotion of cultural and creative industries. In a similar way, craftsmanship (like pottery making, basket weaving or textile weaving and embroidery) is a sustainable income-generating activity that may preserve Marginea's cultural heritage.

Assuring an appropriate thermal comfort remains a problem to solve for any new home project because, during the winter, the temperature might drop to -35°C . Before 1989, people had only one option: wood-burning stoves. It was also an economic solution as the forest was close to the village. Today the firewood is still used, either for wood-burning stoves or for central heating systems. Traditional dwellings had only one or two wood-burning stoves (one of them being used as cooker too), so, during the winter, the whole family was grouped inside the heated rooms. The new houses, with many rooms and wide openings, are difficult to heat and require large quantities of fuel, hindering the sustainable and efficient use of natural resources.

Public utilities (except electricity) are almost non-existent. Most of the households use wells (equipped with electrical water pumping systems) and in several cases solar panels were adopted for water heating and (eventually) electricity. The bathroom has been a rarely encountered element within the rural home of Marginea, and until 1990 the majority of households had a toilet outside the house. Migration helped villagers to gain access to improved sanitation facilities and other utilities. Indeed, the indoor bathroom rate increased from 16 per cent in 2002 to 50, 7 per cent in 2011.

CONCLUSIONS

The impacts of international migration on environmental sustainability are both positive and negative. When remittances and other foreign wages are mainly used for house construction and daily living expenses (Mara, 2012) they can foster but cannot trigger sustainable development in migrants' homeland. Indeed, migration contributed to the elevation of standards of living, in terms of sanitation facilities and an increase in the average dwelling space per capita. It also enhanced the level of human capital (Ambrosini et al., 2011), affecting individual choices and actions of the returnees, such as, for example, the use of renewable energies. International migration is closely connected with social capital (a key element for sustainable development) and one particular quality of social capital is its "convertibility – it may be translated into other forms of capital [...]" (Massey, 1998:42). Therefore, public-private partnership should enhance this social capital, and especially the link between rural sending-communities and Romanian enclaves abroad, targeting to encourage trans-national entrepreneurial initiatives without altering the well-being of future generations. In addition, any sustainable development agenda has to support good housing practices and techniques, appropriate to community needs and specifics, as well as to its natural environment. There is need for proper policies, aiming to direct migrants' investments toward a sustainable exploitation of nearby forests (e.g. for ecotourism and other recreational uses or for non-timber forest product collection and marketing) and to stop forest destruction resulting from logging. Finally, policies should promote traditional knowledge and cultural industries, bridging the gap between traditional knowledge and the new technologies and requirements, brought by migration.

ABSTRACT

During the past decades the food industry in Europe has become extensively complex and internationalized. Despite the existence of an abundant body of laws and principles governing it, the increasing scale and the intricacies of the food supply chain resulted in a variety of dysfunctional gaps. Importantly this worst case reflects that, as far as higher order values such as public health & safety, animal welfare and, especially, food quality is concerned, more concerted approaches between macro and micro decision makers are perceived paramount. Against the backdrop of an overview of EU food trade developments (Rae and Josling, 2003; Baldwin and Winters, 2004; FAO, 2012; The Manufacturers' organization, 2013), a characterization of the various actors of the European food supply chain (Chopra and Meindl, 2008; Europe Economics, 2012), a summary on European basic principles and principles of good practice (European Commission, 2011; Regulation (EU) No 1169/2011, paragraph (1); European Commission, 2013; European Union, 2013) and international management strategies applied by supply chain members (Malanoski, 1996; Malanoski, 1997; Ball, 2006), this exploratory and conceptual paper aims to provide holistic conceptual factors on how to systematically identify and remedy the current gaps combining internal supply chain factors with external ones. This paper intends to be an exploratory basis on which to develop an urgently needed comprehensive research agenda to ensure sustainable quality of food. The nub of the problem of the European horse scandal has still not been found and rather than passing the buck to national food standard agencies, food manufacturers, brokers, auctions, wholesalers, dealers and traders, primary and secondary processing plants, agents and distributors trying to blame the scapegoats, scientific research is needed to identify the roots of the problem as a basis to sustainably solve and prevent future problems.

The specific characteristics of the food supply chain relating to biological processes of production entailing variability and risks, perishability as well as concerns related to health and safety, environmental issues and animal welfare (Aramyan, 2006) render the quality focus within the food supply chain as being of central importance. Repeatedly pointing to the interdependence between macro and micro gaps, the scandal casts a murk cloud on both consumerism related topics, which, if not considered and treated carefully, lead to commercial damage inflicted on manufacturer and retail brand equity and profitability (National Geographic, 2013). Both, macro and micro decision makers' first order of the day is suggested to be the re-creation of consumer confidence and trust. Recent polls reflect reduced sales of beef related products, declining trust levels in product labeling and altered consumers' shopping and eating habits (Kantor Worldpanel, 2013; Hutchison & Baghdjian, 2013; The Economist, 2013) as well as to innovative investment schemes favoring more localized shorter supply chains to enhance food authenticity and trust. A further consumer related gap refers to low Price/Cost- Quality dichotomy. The increasing consumer demands for low end food products triggered by recession are in diametrical contrast to high production and transport costs for beef related products. This implies that achieving sustainable quality cannot be achieved without dedicating sufficient resources by all stakeholders to it, and that there is a limit to budget cutting on a macro level. Essentially, this means that there is a trade-off between reducing budgets and production costs and reducing the concerns for food safety (Rong and Grunow, 2010; Hallier in Kaufmann and Panni, 2012; Lawrence, 2013). Relating to further macro gaps, a discrepancy exists between regulating (EU) and actually implementing (national authorities) the regulations (Alemanno, 2013). Compounding this regulation gap, self-auditing of the industry (National Geographic, 2013; Lawrence, 2013) did not prove to be efficient. Summarizing, a first important research focus should be put on empirically researching this cognitive dissonance with regard to communicated quality awareness on the one side and the lack of preparedness by all players of the food supply chain to dedicate sufficient resources for quality protection on the other. Again integrating macro and micro decision makers, a further gap refers to a lack of coordinated and systematic planning and control. Based on supply chain related models (Chase et al., 2000; Duclos et al., 2003; Aramyan, 2006) this paper suggests explanatory research to elicit cause and effect relationships of the factors explaining sustainable quality in the European food supply chain. Due to the "the high level of interdependence between the elements of Supply Networks, their inherent feedback loops, non-linearities, and delays" (Remplanet project, 2010, p.6) it should be investigated to what extent simulation modeling

approaches and computational decision support systems in addition to analytical approaches (Sony and Kodali, 2013) would contribute to sustainable food quality (Van der Forst et al., 2009; Remplanet project, 2010). Relating to a control related micro gap, Fischer's (2013) view on various trust levels in the agri food supply chain might be relevant. He defines the most important trust determinants in this context as "effective communication and positive collaboration experience". At retailers' and processors' level, relationships tend to be more formalized, with larger use of contracts. The reason appears to lie in the fact that retailers deal with many and large corporations. On the other hand, processors and farmer relationships appear to rely more on trust, due to the representatives of each group tending to know each other when dealing in the local and regional markets. A solution put forward is to create exclusively formalized rather than informal trust based systems in the food supply chain. Consequently, a suggestion in order to improve the efficacy of Aramyan et al's (2006) model to measure performance in agri-food supply chains could be to validate a fifth factor called "level of formality" or "degree of formality" among the actors of the supply chain in further research. Summarizing, based on the illustrated macro and micro gaps existing in both, practice and literature, the paper will suggest a research methodology based on triangulation to better explain sustainable quality in the food supply chain.

ABSTRACT

Emerging trends such as an increasing ageing population (ec.europa.eu; www.telegraph.co.uk) and, in its wake, stressed public budgets for health care systems or a structural change in the workforce created by an increasing ageing population, calls, according to Murray (2008) for paradigmatic shifts towards more anticipatory, responsive and agile business models. Relating to the Billion Minds Foundation and Minevich (2007, in Murray, 2008) the author points to newly required traits of a social knowledge entrepreneur and perceives the social enterprise the enterprise of the future. In the context of increasingly ageing personnel, Rabl's (2010) research on German employees points to enhanced anti-discrimination efforts by leaders and HR towards the ageing workforce who, contradictory to existing stereotypes, do not fall short of achievement motives compared to their younger colleagues. In the same vein, Lu (2012) investigated factors influencing intentions to continue working in older age and calls for research informing company policies on continued employment and management of the ageing colleagues' future careers. From a more positive perspective, Easson (2013) foresees huge benefits to society and local communities when keeping older people integrated in employment or even encouraging them to become social entrepreneurs themselves. In addition to Rabl's (2010) unfailing motives for achievement, Easson (2013) regards local knowledge and expertise as potential so far being underutilized. Consequently, this paper contributes to the debate if social enterprises might be regarded as the business paradigm of the future, and, as their corporate values revolve around social responsibility, to what extent employment of ageing population could be a viable HR strategy for them.

The aims of the paper are threefold: first, to validate conceptual frameworks on elements of successful business models for social entrepreneurship and societal impact of social enterprises- the conceptualization is based in particular on the theories provided by Kaufmann, Davies and Schmidt (1994) on Identity Development of Eastern German

entrepreneurs, Grossmann (2008) on across-the-sectors- partnerships, Murray (2008) on social knowledge entrepreneurship, Rabl's (2010) research on ageing employees as outlined before and Paerenson's call (2011) for impact evaluation of social entrepreneurs; second, to investigate the conditions and perceptions for employment of the increasing ageing population in social enterprises and third, to suggest a research methodology for a comprehensive comparative cross-cultural research study to contribute to newly triangulated knowledge in the field. The previous conceptualizations (see objective 1) were derived inductively by three case studies in Eastern Europe : Ágota Foundation in Hungary, Narko-ne Association in Bosnia Herzegovina and Marijin Dvor Lužnica in Croatia (Kaufmann, Mewaldt and Sanchez, 2012). The current setting of the research method case study is Cyprus referring to two innovative social enterprises and ageing community workshops. The research techniques applied are in-depth interviews, focus groups and participant observation as to the activities of the two company social enterprise cases and in currently existing ageing community workshops. Purposive sampling with social entrepreneurs and representatives of the ageing population and employees (social enterprise cases and community workshops) will be applied. The data will be analysed applying content analysis. The two, on various occasions interacting, social enterprises are Materia Group and Second Life.

Materia Group's mission is to contribute to a healthier, happier and more empowered elderly population in Cyprus. The group responded to pressing social needs in Cyprus for a new model on elderly care services due to increasing life expectancy rates, changing family structures and lack of quantity and quality of existing services in Cyprus. The management team disposes of multidisciplinary knowledge and expertise, emphasizes care for and involvement of the human capital of the enterprise and focuses on effective ethical and socially responsible client-centred services (i.e. based on individual medical, family and psychological knowledge). Efforts are made to re-invest any profits into new services or improve existing ones. The following wide range of services should provide for a 'one-stop shop for older adults and their families: care, nursing and rehabilitation units; dementia units; programs for home care services; day care services; kids playground; pet therapy program; consultation services such as psychologists and gerontologists for older adults and their families to prepare them to deal with ageing related changes; training courses for foreign untrained employees caring for older adults at home.

Second Life, a NGO, created by the Youth Employment and Training Foundation (IEEN), collects, sorts, cleans, re-packages and re-sells items such as toys, books, clothes, shoes, push chairs, car-seats... for children aged 0-10 years old. The company aims to redress the balance of increasing waste arising by overly massive consumption of children related products i.e. on oversized birthday parties or baptisms. However, Second Life is offering a greener and cheaper alternative to recycling. As Cyprus doesn't have its recycling plant on the island, the cost and ecological footprints made the social enterprise opt for re-using rather than recycling. Compounding the matter, in a society such as Cyprus that values materialistic wealth highly, second hand is traditionally perceived negatively. Having researched the negative perceptions, the company's communication strategy is to convert negative perceptions into positive ones like looking like new, second life toys tell a story, and the consumer is part of the process. Latter aspect is reflected in the intriguing pricing strategy to let the consumer choose the value of the respective item which are distributed through various self-service Second Life stands in Schools (also supporting the collecting of items), banks or other public institutions. A further missionary aspect of Second Life is to bring generations together: at various events, teenagers get the chance to collaborate with elderly, i.e. when toys are sorted, cleaned and prepared in inter-generational workshops hosted by Maternia Group.

Summarizingly, as both companies are focusing on and co-operating with ageing people, they are regarded valid settings for this research which will provide knowledge contributions on the efficiency of business models of social enterprises and on their societal impacts in general and innovatively including the antecedents and consequences on potentially employing ageing population in particular. In addition, the paper will provide a methodology for a wider quantitative cross-cultural survey validating the qualitative findings so far. Practical contributions of the paper refer to provide social entrepreneurs and public decision makers with criteria to assess the effectiveness of Social Enterprises and social entrepreneurs with factors to adjust their HR strategies and corporate culture to the newly emerging ageing dimension.

HOW TO ACHIEVE PERFORMANCE EXCELLENCE: THE CASE OF COCOMAT, WINNER OF THE EFQM EXCELLENCE AWARD

Kriemadis, Thanos¹; Papaioannou, Alkistis²; Kourtesopoulou, Anna³

ABSTRACT

Purpose of the Study

Due to economic globalization and the increase in global trade, business organizations have implemented Total Quality Management (TQM) and establish Excellence Awards or Quality Awards in order to improve to world-class organizations and face the global competition. Business organizations measure their progress towards TQM by using the Excellence Awards criteria as a guideline. Powell (as cited in Stading & Vokurka, 2003) believes that companies that implement TQM practices have used Excellence Awards as models for benchmarking, self-assessment and improvement.

European companies recognizing the importance of quality performance to business survival and success formed the European Foundation for Quality Management (EFQM) with the endorsement of the European Commission. The main objective of the EFQM was to improve the position of European industry and commerce and achieve global competitive advantage. The EFQM Excellence Award winners are those who have excelled in the European marketplace (Ghobadian and Hong Seng Woo, 1996).

The EFQM Excellence Award is based on nine criteria which five of these are “enablers” and four are “results”. The “enabler” criteria cover what an organization does (Leadership, strategy, people, partnerships and resources, processes/products/services) and the “result” criteria refer to what an organization achieves (customer results, people results, society results, business results). Thus, the assumption is that “results” are caused by “enablers” (Wongrassamee, Gardiner, and Simmons, 2003).

The **purpose of this study** is to present and examine in depth the implementation of the EFQM Excellence Model criteria at COCOMAT, a business organization which has successfully obtained the EFQM Excellence Award. The authors will also present the methodology used by COCOMAT for meeting the EFQM Excellence criteria in order to achieve excellence in the development of an effective TQM management system.

DESIGN/METHODOLOGY/APPROACH

- (a) This is a qualitative study (case study). A case study approach is often the best methodology for addressing issues in which understanding is sought in order to improve practice. In addition, this approach focuses on a particular situation such as COCOMAT, winner of the EFQM Excellence Award, and seeks holistic description and explanation of the way which was used by COCOMAT in order to achieve Performance Excellence.
- (b) Interviews were conducted with COCOMAT managers who participated in the assessment process of the EFQM Excellence Award (General manager, Marketing Manager, Financial Manager, TQM Manager, Supplies Manager, Sales Manager, and Production Manager).
- (c) Review of COCOMAT's TQM related documents and training materials.
- (d) Observation of physical environment, people interaction and behavior in the workplace.

FINDINGS

The authors will present the COCOMAT's methodology in meeting all the criteria of EFQM Excellence Award and finally be the Winner.

"Enabler" criteria:

- Leadership: The authors will examine how leaders develop and clarify a vision statement, values-philosophy-culture and mission statement that propose TQM and organizational improvement.
- People: The authors will present how COCOMAT handles its employees and their knowledge in order to improve its business processes.
- Strategy: The authors will examine how COCOMAT formulates its strategy, communicates its strategy, evaluates and continuously improves its strategy, taken into account external environment factor such as political, economic, social, technological and competitive.
- Partnerships and Resources: The authors will examine how COCOMAT manages and utilizes external partnerships and internal resources effectively in order to develop effective business performance.

- Processes/Products/Services: The authors will present how COCOMAT's activities related to products and services are designed, managed and improved in order to satisfy its customers.

"Result" criteria:

- People results: The authors will examine how COCOMAT measures employee satisfaction.
- Customer results: The authors will present how COCOMAT measures customer satisfaction.
- Society results: The authors will present how COCOMAT satisfies the needs and expectations of local, national and international societies.
- Business result: The authors will present how COCOMAT measures its business performance.

Although only few companies are able to win the EFQM Excellence Award, managers may use these nine criteria to carry out self-assessment and benchmark data for organizational improvement.

To conclude, business organizations in order to achieve competitive advantage must give emphasis on customer satisfaction and business results and thus, TQM implementation is imperative. Winners of the EFQM Excellence Award are companies like COCOMAT which demonstrate the highest standards in operating and implementing TQM practices.

ORIGINALITY/VALUE

If a company wants to achieve excellence, the EFQM Excellence Award criteria (which are based on the TQM management system) should be met. COCOMAT a winner of the EFQM Excellence Award in Europe is presented in this study using a unique and innovative way in meeting the standards of the EFQM Excellence Award

Key words: Performance Excellence, Total Quality Management, EFQM Excellence Award.

IMAGES FROM LITERATURE AND THE ARTS IN CONSTRUCTING GASTRONOMIC CULTURAL TOURISM

Leitão, Isilda

Estoril Higher Institute for Tourism and Hotel Studies (ESHTE), Portugal, isilda.leitao@eshte.pt

ABSTRACT

Gastronomy, not only through its cultural facet (Literature, Painting, Cinema, the Decorative Arts) but also as an identity factor for a region or nation, has configured and determined the multiple *imagotypes* conveyed through Literature and the Arts.

Despite the *de-traditionalisation* of *hypermodern* «molecular» gastronomy, in serving up unprecedented combinations of flavours drawn from foods and beverages stripped from their usual regional and national contexts as a means of spurning the trend towards standardisation driven by globalisation, traditional flavours have also proven a resource for promoting tourism. Correspondingly, gastronomy proves a means of affirming the respective associated identity characteristics.

That's why the ingredients and specialities of national and regional dishes become not only a type of resource, of greater or lesser value for inclusion or exclusion by other peoples and/or cultures, but also a positive and appealing factor in the construction of the images feasible for tourism destinations.

In the Portuguese case, tourism products and services related to Literature and Gastronomy have been launched, as is the case with some literature tour routes and some foundations and or writer/artist house museums. However, we would consider they have failed to gain their due level of impact and profile both nationally and internationally.

Hence, we first set out a brief approach to the interrelationship between Gastronomy, Literature and the Arts, secondly, highlighting some of the most significant examples in terms of the range of products and/or menus based on gastronomic-literary references expressed by intellectuals whether directly in their works, in regions and/or in House-Museums.

In addition to the efforts already undertaken, we would propose far greater investment, internally and externally, in promoting Portuguese gastronomy as a tourism product associated with Literature and the Arts.

Our methodology makes recourse to literary texts, to art, cinema and geography as well as other sources deemed necessary in order to attain the objectives of this paper.

Based upon the documental research undertaken, the material resulting was subject to analysis in order to cross-reference evidence from various different sources as, in accordance with Yin (2005), the purpose of documental research is to enhance the evidence and the sources encountered. Within this framework, the documents collected were subject to analysis and interpretation with the objective of identifying their incidence, occurrence, content and characteristics as well as their mutual links and bonds.

Keywords: Gastronomy, Arts, Literature, Tourism

EMERGING MODELS OF UNIVERSITY GOVERNANCE: EMPIRICAL EVIDENCES IN THE ITALIAN CASE

Lucianelli, Giovanna¹

¹University of Rome "Tor Vergata", Italy, E-mail: lucianelli@economia.uniroma2.it

ABSTRACT

Purpose: This paper aims to explore the model of university governance that is emerging in Italy after the introduction of the law n. 240/2010. Because of the new law Italian universities have changed their by-laws in order to renew the organizational structure and the composition of their collegial bodies. The process of change has involved important choices for their future.

This topic could be studied in several dimensions. This research has firstly revealed competing trends in models of university governance across the United Kingdom (CUC, 2004), the United States (Trakman, 2008) and Australia (Carnegie, 2010). Then the different models of governance have been analysed: university governance by the academic staff, corporate governance, trustee governance, stakeholder governance, business governance.

The review provides a framework for discussing the aim of the paper and the empirical results on a sample of 56 Italian Public universities.

Design/methodology/approach: The framework presented is based on (a) an in depth literature review of governance of public and private universities, as well as literature about governance of public organizations, (b) analysis of official data collected through a Report, (c) analysis of the results of structured interviews with experts in the field.

Findings: The data collected clearly show that the majority of the sample analyzed has chosen a numerosness of 11 members (that was the maximum prescribed by Law) rather than the other possibilities. The predominant component in boards is still the academic one, but the presence of professional members is more relevant than in the past. More details about the emerging model are analysed in the paper.

Practical implication: The framework opens the door to follow-up research: data collection of best practices in Italian boards of directors, analysis and comparison with other international data sources.

Originality and value: In Italian Public Universities the presence in boards of professional members, as internal or external components trained and experienced in corporate policy and able to guide management efficiently, is considered more relevant than in the past. This may lead to innovative basic and applied research.

THE KEY SUCCESS FACTORS IN THE FIELD OF KNOWLEDGE-INTENSIVE MARKET SERVICES: EMPIRICAL EVIDENCES IN THE ITALIAN CASE

Lucianelli, Giovanna¹

¹University of Rome "Tor Vergata", Italy, E-mail: lucianelli@economia.uniroma2.it

ABSTRACT

Purpose: In the field of knowledge-intensive market services Italy turned out to be one of the European countries with the highest number of Small and Medium-sized Enterprises (SMEs) in 2011. Anyway more than 99% of all European businesses are SMEs. Nine out of ten SMEs are actually micro-enterprises with fewer than 10 employees. Hence, the mainstays of Europe's economy are micro-firms, each providing work for two people, on average. This is probably one of the EU's best kept secrets (ECORYS, 2012).

Nowadays a lot of SMEs have problems to identify the key success factors in the process of internationalization, as well as to determine their strengths and weaknesses (Kubíčková, L., Peprný, A., and Nováková, S., 2012). Some scholars underline the relevance of the effect of network competence (Torkkeli, L., Puumalainen, K., Saarenketo, S., Kuivalainen, O., 2012) and others affirm that the innovative capabilities of knowledge intensive market services do actually differ from other industries (Ferreira, J.J.M., Raposo, M.L., Fernandes, C.I., 2013).

This paper aims to explore the factors of SMEs' success in the Italian field of Legal & Accounting with reference to their capabilities to survive and compete in the market in relation to their dimension and the geographical distribution.

The literature review provides a framework for discussing the aim of the paper and the empirical results taking into account a selected sample of 20 Italian micro-firms.

Design/methodology/approach: The framework presented is based on analysis of the literature and on empirical model that summarizes structured interviews and personal conversations with experts in the field. The sample has been selected with reference to different key success factors: dimension (number of employees), juridical form, geographical area, degree of internationalization, professional capabilities.

Findings: SMEs are becoming aware of the value of cooperation and of the relevance of being part of a network in order to acquire all the competences they need in the process of internationalization.

Practical implication: The framework opens the door to follow-up research: data collection of best practices in Italian SMEs, analysis and comparison with other international data sources.

Originality and value: For all European SMEs is, in any event, very important to know which factors are the key factors for their success and this require the collaboration of interdisciplinary teams. This may lead to innovative basic and applied research.

INNOVATIVE APPROACHES IN ROMANIA EDUCATION SYSTEM - ELEARNING SOLUTION PROVIDED BY SIVECO

Luminita, Pistol¹; Ungureanu, Adrian²

¹Spiru Haret University, Bucharest, Romania, prolu2001@yahoo.com

²Spiru Haret University, Bucharest, Romania, aungureanu75@yahoo.com

ABSTRACT

The exponential development of information and communication technology in the last decade has led to the registration of a true revolution in computer assisted learning. The roadmap of eLearning development domain has different forms and approaches, many of them marking common knowledge that good practice that is taken over, multiplied and at the same time generating new theoretical guidelines. The evolution of e-learning practices in recent years is associated with a tremendous increase in complexity. By associating the concept with all situations and contexts educational nature in using new technologies to improve or complete the process, components, steps, to obtain a broad range of activities and products that are under the sign of innovation in education in the last twenty years.

Using computerized solutions for education is beneficial and generate positive effects on society - education specialists say. ELearning solutions meet the needs of the whole educational system, providing useful tools for all levels - from the makers of ministries to students, teachers, parents and even the general public. ELearning-based learning methods manage to adapt to the real needs of the educational process and gives students access to relevant and updated.

The major benefits of eLearning are considered to be: development of individual skills and team work, develop skills of analysis and synthesis of information and ability to put into practice the theoretical information learned in school. These skills are considered to be acquired due course content 91%, informal learning training 92%, training indirect 70%, and collaborative learning 84%. Summarizing, eLearning fully meet labor market demands and modern society and help create more economic and social opportunities, locally and globally.

Education specialists believe that in recent years there have been many changes in the educational system of the country they represent, most for the better. Globally, eLearning

plays an increasingly important role in education and the effects of introducing new technologies in schools without major effects, helping to develop the whole society.

E-Learning solution delivered to Romania, the SIVECO lay the groundwork for new approaches and methodologies in the development of digital content transdisciplinary integrated multi-touch interactive devices.

Multi-touch technology that supports integrated transdisciplinary education system was used for the first time in the world in high schools in Romania. Appreciated for its high degree of innovation and the significant role that it plays in access to quality education, e-Learning solution developed by SIVECO Romania for this technology, within the project initiated by the Ministry of National Education "Vision competencies educational process optimized knowledge society ", entered the finals prestigious European competitions IT & Software Excellence Awards.

The collaborative learning assisted with the most recent computer technologies, as is the multi-touch technology, is one of the most promising innovations in efforts to improve the teaching / learning. Not only does this approach encourages students to work together to solve exercises and projects that combine knowledge from multiple disciplines, but also helps to diversify and increase the attractiveness of learning activities.

The overall objective of the Ministry of National Education developed between December 2009 - November 2012 was the orientation of the educational process at the school in accordance with the competencies required by the current socio-economic and which are not addressed in traditional learning. E-Learning solution developed by a team of specialists from SIVECO was to develop and implement a new school curriculum for Mathematics, Science and Humanities disciplines and applications support multi-touch interactive devices that support collaborative learning. E-Learning solutions developed by SIVECO received two nominations in the competition: the project of computerization of education in Kazakhstan and one of the most innovative approaches to current e-Learning - project development and implementation of educational content for interactive multi-touch devices.

An important advantage of this solution is given by the methodology that is based and enables teachers to create new lessons consistent with those already developed in the curriculum.

SIVECO is the leading international provider of innovative solutions in education. The company also had the opportunity to be involved in a project of great technological

complexity and strategic importance to the modern educational system in contributing to the foundations of new approaches and methodologies for the development of transdisciplinary educational materials for the school. At this point, we can say that Romania is a concrete case study approach integrated transdisciplinary learning methods.

Key words: eLearning, innovation, education, development, opportunities

BIO-ECONOMY: TRANSITION FROM THE ECONOMIC PARADIGM TO THE NEW GLOBAL ECONOMY

Maria Ramona, Chivu¹; Dragoş Gabriel, Popescu²; Rodica, Dragomiroiu³

¹Faculty of Financial-Accounting Management, University Spiru Haret, Romania,
chivumariaramona@yahoo.com

dragosgabrielpopescu@yahoo.com

³Faculty of Financial-Accounting Management, University Spiru Haret, Romania,
rodica.dragomiroiu@yahoo.com

ABSTRACT

This paper aims to explain some important aspects of sustainability, to define what is meant by Bioeconomy and to show how sustainability can be achieved in this time of crisis. It was introduced bio-economy concept as a new paradigm based on the principles of biology and economy to replace the old economic paradigm. It was also performed a review of the old economy that promote wealth creation, but with much poverty and externalities man-looking wealth at the expense of human sacrifice.

We mention that the bioeconomy is currently in the attention of EU policy-makers and even a Bio-economy strategy and Action plan was adopted (Brussels, 13 February 2012 - COM(2012) 60 final). The European Commission "has adopted a strategy to shift the European economy towards greater and more sustainable use of renewable resources. With the world population approaching 9 billion by 2050 and natural resources finite, Europe needs renewable biological resources for secure and healthy food and feed, as well as for materials, energy, and other products. The Commission's strategy and action plan, *Innovating for Sustainable Growth: a Bioeconomy for Europe*, outlines a coherent, cross-sectoral and interdisciplinary approach to the issue. The goal is a more innovative and low-emissions economy, reconciling demands for sustainable agriculture and fisheries, food security, and the sustainable use of renewable biological resources for industrial purposes, while ensuring biodiversity and environmental protection. The plan therefore focuses on three key aspects: developing new technologies and processes for the bioeconomy; developing markets and competitiveness in bioeconomy sectors; and pushing policymakers and stakeholders to work more closely together.

The term *Bioeconomy* means an economy using biological resources from the land and sea, as well as waste, as inputs to food and feed, industrial and energy production. It also

covers the use of bio-based processes for sustainable industries. Bio-waste for example has considerable potential as an alternative to chemical fertilizers or for conversion into bio-energy, and can meet 2% of the EU renewable energy target." [www.ec.europa.eu]

"The Strategy has three main pillars:

1) Investment in research, innovation and skills for the bioeconomy. This should include EU funding, national funding, private investment and enhancing synergies with other policy initiatives.

2) Development of markets and competitiveness in bioeconomy sectors by a sustainable intensification of primary production, conversion of waste streams into value-added products, as well as mutual learning mechanisms for improved production and resource efficiency. As an example, food waste costs the European taxpayer between €55 and €90 per tonne to dispose of, and produces 170 million tonnes of CO. This waste could be transformed into bio-energy or other bio-based products, creating jobs and growth.

3) Reinforced policy coordination and stakeholder engagement, through the creation of a Bioeconomy Panel, a Bioeconomy Observatory and regular Stakeholder Conferences." [www.ec.europa.eu]

Also this paper presents the pros and cons regarding the bio-economy, this new economy that must achieve the overall objective of global sustainable development.

At the end of the speech, the reader was warned that humanity should act as a main force and is responsible for the harmful changes to the Earth and must, therefore, act as the root causes of imbalances. The authors argue that biological resource depletion, biodiversity loss, social and economic inequality, environmental degradation, contamination and lack of ethics, stresses the need for a change in thinking and action in this regard, making a proposal relating to the concepts of sustainability and development science and sustainability of the bioeconomy, establishing objective optimal balance between economic efficiency and optimal biological use.

This paper presents opportunities beyond bioeconomy crisis. It ends with a call to all to take seriously the education of persons who are related to well-being and sustainability of humanity.

Keywords: bioeconomy, sustainability, crisis, globalization.

THE MANAGEMENT OF SUSTAINABLE TOURISM DEVELOPMENT IN CYPRUS: BALANCING THE ECONOMIC, ENVIRONMENTAL, SOCIAL AND CULTURAL IMPACTS OF TOURISM

Mavris, Chris I.¹; Ambrosio, Vitor²

¹Chris Mavris & Associates, Nicosia, Cyprus And University of Nicosia, Nicosia, Cyprus, mavris.c@unic.ac.cy, mavris@ucy.ac.cy

ABSTRACT:

The objective of this paper is to determine how tourism development in Cyprus impacted its Society, economically, environmentally, socially and culturally. More specifically, this paper will examine the positive economic impacts, as well as, the negative environmental, social and cultural impacts and suggest alternative ways to balance the positive with the negative impacts, in order to achieve sustainable tourism development. The methodology employed involved primary research through selected interviews of experts in the field of tourism management in Cyprus, as well as desk research, including a literature review of journal papers and a bibliographical review. The overall analysis will attempt to reveal both the positive economic effects, as well as, that the unprecedented tourism expansion is contributing to the observed negative change in the environmental, social and cultural character of Cyprus. These effects and impacts will be related to the current tourism theories, as identified in the literature review. Hence, the need for balancing the impacts of tourism, in order to achieve sustainable development. Recommendations, conclusions and suggestions for future work are reported at the end of this paper. Lastly, an attempt will be made to demonstrate the likely contribution of the research to the tourism field, with emphasis on managerial practice in the tourism industry of Cyprus.

THE IMPORTANCE OF THE BRAND IN THE PORTUGUESE MOULD INDUSTRY

Medina, Catarina¹; Estrela, Rui²

¹Universidade Lusófona, Lisboa, Portugal, cjfmedina@gmail.com

²Universidade Lusófona, Lisboa, Portugal, restrela@ulusofona.pt

ABSTRACT

The recent creation of a collective brand to promote the Portuguese tooling cluster in international markets, as a means of appropriating value, highlights the need to understand the importance of the brand for Portuguese companies. This involves assessing the positioning brands are taking in clients' minds, as well as their level of awareness and recognition.

The present study aims to analyse the importance of the brand for the various stakeholders of this cluster, namely companies, education and R&D institutions, suppliers, associations and clients.

Since this study was carried out at an early stage of the implementation of the «Engineering & Tooling from Portugal» brand, it becomes apparent that this is seen as an important factor for Portuguese companies' competitiveness, although brand recognition is very low. The starting question was "What is the importance of the "Engineering & Tooling from Portugal" brand for the Portuguese tooling sector?", subdividing it in six hypotheses.

Considering the defined objective, and the hypotheses stated, this research, which started by a thorough literature review, was based on a quantitative methodology, resorting to the use of questionnaires designed and developed on paper and electronic versions. This enabled replies to be collected from businessmen, clients and suppliers of the Portuguese tooling industry.

The questionnaire used included open and closed questions. The choice of this type of questionnaire aimed at trying to obtain qualitative information to complement and contextualize the quantitative data.

The methodology adopted bore in mind the early stage of brand implementation, namely as regards the definition of the variables and questionnaire design. Thus, certain variables of

Keller's brand equity model were approached lightly, since it was not reasonable to expect the subjects to have much knowledge of the brand.

This study also aims to suggest guidelines which enable the cluster to maximize brand value; a reinforcement of the promotion plan is proposed, as well as the focus on the key brand attributes.

SOCIAL NETWORKING SITES: WORKPLACE IMPACT

Melanthiou, Yioula¹; Anastasiou, Nicos²

¹University of Nicosia, Cyprus, melanthiou.y@unic.ac.cy

²University of Nicosia, Cyprus

ABSTRACT

Purpose – This paper aims to research the effects and / or consequences are of using Social Networking Sites such as Facebook, Twitter, and LinkedIn on peoples' professional life and workplace environment, such as productivity and relations among colleagues.

Design / Methodology / Approach – The current literature review aims to research and identify the findings of previous studies on how Social Networking Sites affect our workplace environment and relations, as well as how we can possibly influence and impact a potential employment opportunity.

Findings – The findings of the studies are not definitive and more specific research and further studies are required. Some indicate that Social Networking Sites can promote collaboration among colleagues within different departments and countries, thus empower employees to work more and be more productive. Some studies indicated that a lot of people can express themselves easier and better through these Sites than face to face and employee interaction can increase with enhancement in knowledge sharing. A sense of "freedom" within the workplace makes employees feel "in control" and their productivity can increase.

Other findings though show that using these Social Networking Sites for personal purposes that are not related to the working environment can lose the company millions of dollars due to wasted and unproductive time, as employees instead of working are pre-occupied with these Sites. As a result a lot of companies in the US have banned access to such Sites.

Moreover, some other studies revealed that employers before hiring, they are likely to screen an individual's profile on Facebook, Twitter, LinkedIn® or any other type of Social Network Account, and according to what is posted and published pertaining to what that individual, a decision can be made that decides whether that candidate would be a suitable fit for the target position.

Originality / Value – Studies for the Social Networking Sites in the workplace are still a bit conflicting. This paper addresses the upsides and the downsides of using such Sites within

the workplace as well as the how these Sites can impact the individuals' prospects for a new employment opportunity. The paper also highlights that Social Networking Sites can enable workplace productivity by enhancing the collaboration and communication among employees, by knowledge sharing.

CORPORATE RECRUITING: E-RECRUITMENT IN CYPRUS

Melanthiou, Yioula¹; Contantinou, Eleni²

¹University of Nicosia, Cyprus, melanthiou.y@unic.ac.cy

²University of Nicosia, Cyprus

ABSTRACT

Everyday more and more companies enter the digital world by creating their own Facebook page, their LinkedIn profile and/ or a Twitter account. Social Media proved to be an effective advertising medium with a lot of advantages over traditional media but are they an effective tool to find and recruit employees as well?

E-recruiting and especially through the use of Social Media is a popular method used by many companies abroad to locate and attract young talent. The integration of Social Media Sites in almost every online system, especially recruiting software, provides easy access to vast information, fast filtration of data and better analysis of results in a shorter time period, which leads to decreased costs. Consequently, it is becoming one of the most frequently preferred methods by companies as all need to cut back their costs due to the financial crisis affecting the economy these days.

As the financial crisis expands in Europe and affects Cyprus as well, almost all Cyprus companies seek to decrease their expenditures and recruit only when it is extremely necessary for their operations and usually this means that they seek skilled employees. Even then though, companies avoid the use of social media or a web application and fail to take into advantage of the opportunities offered by their proper use, either because they do not know how or because they are afraid of losing precious time and money in a process that will “fail”. As a result, only a hand full of companies tries to implement this new method of recruitment in Cyprus. On the other hand young individuals seeking employment tend to search more online as there are more opportunities and choices available from around the world with better prospects.

In Cyprus the majority of businesses are small retail shops that offer repair services for their products, as well. Furthermore, there is another large group of companies considered as medium in size with operations spanning from production of goods, imports, exports and distribution. The owners of those shops and companies find it more difficult to recruit employees that have the skills required for the jobs as they usually need individuals with

specific knowledge and skills. For example today it is very difficult in Cyprus to locate experienced individuals that know how to assemble and repair bicycles or how to create and/or repair a shoe or how to make furniture. By accessing the internet, a larger pool of candidates is reached, hence allowing for a higher chance of finding the desirable individual. The research will attempt to provide prove that using social media as a tool could prove to be very beneficial for them. Furthermore, the study could become a guide to all type of companies, on how to exploit the functions of social networking in order to locate and attract skilled talent by using a number of tools.

Purpose Through the research an effort will be made, to assess if a company has the right tools to find employees online or through social networking. This will be attempted by investigating what the advantages and disadvantages of e-recruiting are, what legal issues exist, and which tools are required. In order to identify the reasons companies avoid e-recruitment in Cyprus and collect information regarding the key features and tools required for the online recruitment process a questionnaire will be formulated. Through the use of the collected information a general guide of the tools required so as to be able to engage in online recruitment will be formed. These tools will be in a general form that can be implemented by all organisation types and sizes.

Practical Implications By identifying the legal implications of employee screening, the advantages and disadvantages of this method and tools which can be used in order to succeed, recruiters can assess their options and make a clearer decision on whether they would like to adopt online recruitment or not.

Originality/ Value The paper reviews the available literature on online recruitment from a number of different angles in order to provide a spherical view of the subject. It will form the basis on which a methodology will be developed on the key elements required in online recruitment.

INTEREST RATES VS. INCOME TAX IN WEALTH CREATION OR WEALTH DESTRUCTION

Mihai Yiannaki, Simona

School of Business, European University Cyprus, S.Mihai@euc.ac.cy

PURPOSE

The paper aims to analyse the relationship between bank deposit interest rates and income tax in six small countries from Europe compared to the E.U. average levels. It proposes a model and a series of interconnections that lead to a special combination that shows that high interest rate environments and low corporate tax lead to an imminent future financial distress. The study looks into the data of 36 months average interest rates and income taxes in the Eurozone compared to the same type of data for the same period in other countries with relatively lower income tax level (Cyprus, Ireland, Malta, Iceland, Lichtenstein and Luxemburg). The study aims to expand the research into the impact of corporate income tax to small countries' economies by analysing the role of bank deposit interest rates in the economy.

DESIGN/METHODOLOGY/APPROACH

The paper uses RIRP, Taylor rule, monetary and fiscal policy tandem among theories to derive the main research approach. The approach opted for a set of secondary data and event methodology related to the countries experiencing so far this combination within their economic environment. The data is taken from Eurostat, Bloomberg, European Central Bank and IFM. Also, all data were complemented by literature review on the topic, documentary analysis and a test of the economic model suggested. Regression analysis and Spearman statistics are utilised as part of the methodological tools. The data analysis procedure in this study involved the use of numerical data from these countries top 3 banks' published accounts 36 months prior to their economic crisis or until end of year 2012.

FINDINGS

The paper provides several empirical insights about how the combination between a high deposit interest rate awarded to investors and a low income tax can lead to financial turmoil. It suggests that this is also associated not only with the size of the economy, country reduced diversification level, but also to the neighbouring countries (E.U.) modified disequilibrium of funds as well as their lack of a unitary fiscal policy. Additionally, the tandem monetary-fiscal policy has centred on the role and policies of the Central Banks.

RESEARCH LIMITATIONS/IMPLICATIONS

Because of the case study comparative research approach, the study results may lack generalizability. Therefore, researchers are encouraged to test the proposed propositions further in time in other environments and various size economies.

PRACTICAL IMPLICATIONS

The paper includes implications for the development of smaller economies and governments in terms of rethinking and re-balancing interest rates and taxation with country diversification and investment strategies, as well as implications for the private and public economic agents in measuring the timing of their investments in these countries.

ORIGINALITY/VALUE

This paper fulfils an identified current need to study how smaller countries' economies can be safeguarded from anticipate financial distress, by rebalancing their interest rate and income tax relative gap and how they can redress this economic balance in case of financial crisis.

Keywords: bailout, economic crisis, Eurozone, fiscal union, interest rate, tax, wealth creation

THE POLITICAL ECONOMY OF THE *PUBLIC-PRIVATE PARTNERSHIPS* ACCOUNTING

Moscariello, Nicola¹; Cinque, Ettore²

¹Dept. of Economics, University of Naples II, Italy, nicola.moscariello@unina2.it

²Dept. of Economics, University of Naples II Italy, ettore.cinque@unina2.it

ABSTRACT

The research stream concerning the Political Economy of Accounting (PEA) argues that the standard setting due process – far from being a mere technical matter – is inherently political as it exerts a significant impact on the distribution of income, wealth and power between the parties involved in the corporate reporting “supply chain” (Tinker, 1980; Cooper and Sherer, 1984; Sunder, 1988). Therefore, analyses of political factors lying behind the standard setting due process and of the intended and unintended economic consequences provoked by the accounting standards appear to be fundamental in order to deeply understand the evolution of accounting principles (Zeff, 2002; Bruggemann *et al.*, 2011).

This study analyzes the recent development of the PPP accounting under the light of the PEA. In fact, a general agreement in the scientific community has been reached on the usefulness (in terms of relevance and representation faithfulness) of a “substance over form approach” to deal with this topic. However, a strong debate is currently stirring among academics, professionals and regulators over the determinants of the economic ownership, and three different accounting criteria have been proposed: a) the “risks and rewards” approach; b) the “control” approach; c) the “rights and obligations” approach (Broadbent, Laughlin, 2002; Heald and Georgiou, 2011). Notwithstanding the high degree of insecurity concerning the best accounting treatment for PPPs, the International Public Sector Accounting Standards Board has recently issued a new accounting standard (IPSAS 32, *Service Concession Agreements: Grantor*, September 2011) requiring public sector entities to switch from a “risk and rewards” to a “control” criterion. The introduction of the “control test” introduces important changes in the accounting treatment of the PPP contracts. Indeed, quite unlike the “risks and rewards” model (generally applied to account for PPP), the “control” approach implies that most of the PPP arrangements will be considered as on-balance sheet operations by the government units, with a consequent increase in the amount of debt and deficit reported by the grantor in its financial statements (Hammami *et al.*, 2006).

The paper adopts a positive-descriptive research methodology (Watts, Zimmerman, 1986). Therefore, it aims to better understand the source of the pressures driving the accounting for

PPPs, the effects of various accounting rules about PPPs (“risks and rewards” vs. “control” vs. “rights and obligations” approaches) on different groups of individuals and lobbies and, consequently, why various groups are willing to expend resources trying to affect the standard setting process.

The paper demonstrates that the development of service concession accounting has been historically driven by political factors, rather than technical considerations. Indeed, the traditional adoption of the “risks and rewards” approach is mainly attributable to governments wishing to keep privately financed assets off public sector balance sheets and outside fiscal rules and to the influence of the neo-liberal program of privatization. The recent shift of the IPSASB towards the “control approach” – that requires an accounting treatment often leading to opposite results with respect the “risks and rewards” criterion – can also be explained as a consequence of the sovereign debt crisis and of the intent of some groups and organizations to impose austerity measures on some eurozone countries. In fact, it is important to notice that – on February 2012 – soon after the issue of the IPSAS n. 32 introducing the “control approach”, the Eurostat has issued a “Public Consultation Paper” on the suitability of the IPSAS for EU Member States. The adoption of the “control approach” for the statistical treatment of PPPs is therefore probable in the next future.

INTERACTIONS BETWEEN THE VOLATILITY OF FINANCIAL MARKETS AND INVESTORS' BEHAVIOUR

Mouzoura, Georgia

University of Gloucestershire, UK, georgiamouzoura@connect.glos.ac.uk

ABSTRACT

PURPOSE

Numerous studies of stock market volatility focus on two areas: the information side showing how the rate of news dispersion affects movements of stock prices and alternatively how human behaviour influences investment decision making.

Risk and uncertainty are pervasive in economic life, playing a role in almost every important economic decision. Understanding individuals' attitudes towards risk is intimately linked to the goal of predicting economic behaviour. There appears to be significant agreement among researchers that individuals' tolerance of financial risk is related to a number of broad demographic factors. Determinants of risk attitudes of individual investors are of great interest in a growing area of finance known as behavioural finance. Despite great interest in this area, not much research looks at the underlying factors that may lead to individual differences and play a significant role in determining people's financing and investment strategies. This study specifically deals with small rather than institutional investors' risk profiles, because of all investor groups, individual investors seem a priori a likely candidate for a group that might be subject to systematic behaviourally induced errors.

However, significant literature gaps still exist concerning: a) small investor's risk tolerance and possible interconnections of the latter to market volatility and b) the mediating/driving role of cultural factors in shaping these links. The aim of this research is to determine interrelations between market volatility and investors' risk attitudes. Antecedents such as demographics, culture and other socio-economic characteristics and their effects on small investors' attitudes toward risk will have to be identified and evaluated. To the best of our knowledge, this question has not been thoroughly tested before.

DESIGN/METHODOLOGY/APPROACH

In this research, the deductive approach is applied; foundations for the development of an adequate theoretical framework and hypotheses were provided by the literature review making the deductive approach possible in this study. In addition, all theories described in the theoretical framework will be compared to the empirical findings of the study. The research will adopt different methodological tools for its different aspects, combining quantitative with qualitative methods, as well as primary and secondary data.

Secondary data from an extensive literature review in order to construct a solid theoretical basic on which empirical research will be based and helps to access the techniques used by other researchers, to formulate appropriate testable hypotheses and built the research instrument regarding

- volatility market data publicized
- interconnections with market volatility and risk-tolerance of individuals under the perspective of behavioural finance
- culture and its consequences, with a special focus on risk-tolerance in general and investment risk-tolerance in particular
- effects of demographics on risk-tolerance

Primary data collection involving: quantitative data from a cross-sectional survey and questionnaires, on a small investors' sample; qualitative data derived from focus groups, in depth interviews with market experts who have a deep understanding of how the market interacts.

EXPECTED IMPLICATIONS

Understanding small investors' attitudes towards financial risk will be beneficial for all parties concerned; academia, financial services firms and investors. It adds considerable value to academic knowledge on the fundamental discussion on small investors' risk taking profiles, small investors' benefit of knowing their risk tolerance drivers will be in a way that will widen the array of choices according to their needs. With respect to academia it will address a wide-open literature gap and will attempt to initiate a new research stream on small-investors' risk tolerance profiles. As regards practice, financial services firms need to enhance their understanding of the antecedents of prospective investors' risk-tolerance profiles in order to appropriately segment their markets and being proactive in designing investment packages especially fit for specific market segments. On the other hand small-

investors will be given investment options designed before-hand to fit their own needs and preferences.

A number of possible future studies using the same experimental set up are apparent. Large randomized controlled trials could provide more definitive evidence. This research has thrown up many questions in need of further investigation. Various additional theoretical perspectives would also need attention on the basis of this research, in addition to widening the scope of the research.

ORIGINALITY/VALUE

Since published research on this research area is rather limited there is significant opportunity for this proposed research project to provide theoretical and practical means for considerably enhancing current understanding on the subject and initiate an investigative stream for future research. The proposed study is original in that its address the specific research subject under the light of both demographic characteristics and personal cultural values. The importance of the research relates to its focus on the culture characteristics which are largely overlooked by existing research. Also it will contribute a related framework to the existing literature. In that respect, the value of this research is expected to be significant.

LEADERSHIP FOR 21ST CENTURY: TOWARDS A TRANSCENDENT FRAMEWORK

Mukerji, Debu

Independent Leadership & Management Development Consultant, Sydney Australia,
debum@optusnet.com.au

EXTENDED ABSTRACT

BACKGROUND

In today's business world, projects and project management (PM) are the way most works are being done (Schwarber, 2005). In the heterogeneous and enormously complex construction industry, organizations are delivering products through PM systems which could have been achieved only with great difficulty if processed in traditional ways (Winch, & Kelsey, 2005; Meredith, & Mantel, 2000). Despite the growth in the PM literature, projects particularly construction projects continue to fail at an astonishing rate in the traditional measures of cost, time, and performance parameters (Winch, & Kelsey, 2005; Atkinson, 1999). However leadership in modern times has been challenged perhaps as never before, by forces of globalization, political and social dynamics, rapid technological advances, and societal upheavals over sensational examples of gross corporate misconduct (Bruns, 2013; Gardner, & Schermerhorn, 2004). This situation needs change. The paper is based on the author's ongoing post doctoral research on leadership, pragmatism, and partly on the recently completed PhD Thesis (2012) on strategy, program and project management at the SKEMA University Business School, France.

EMPIRICAL BASE OF RESEARCH FOR REDUCTION IN PROJECT FAILURES & SUSTAINED GROWTH

The construct of the paper include investigations: 1) contextualized integrated planning and DM process (Ives, 2005; Wick, & Walter, 2008) in PM; 2) experiential learning (e.g., from the team DM process) and from the facilitation process of sharing leadership with expert team members (Li, Mobley, & Kelly, 2013; Hirst, Mann L, Bain, Pirola-Merio, & Richever, 2004); 3) relationship building between organizational practitioners and key stakeholders for collaborative best performance and outcomes across domains of 'self', team members, and the

organization; 4) as a by-product, propose a structured DM framework for practitioners use at multiple levels of PM (Mota, Almeida, & Alencar, 2008). The field study was constructed by partial mixed methods (MM) research with application of pragmatism (Woolley, 2009; Johnson, & Onwuegbuzie, 2004; Moon, & Moon, 2004; Wright, 1992) which is one of the latest approach in business research, and new particularly in construction PM discipline. The empirical base included evidences gathered from successful business leaders (project managers) in global markets (Mukerji, 2012); emerging literature; and the author's pragmatism from lifelong cross cultural experiences as academic, consultant, and executive practitioner in multinational companies.

PROJECT MANAGEMENT CHALLENGES

Construction projects' are getting larger with increasing vertical integration and complexities, and exposures to global market pressures (Shenhar, & Dvir, 2007; Bennatan, 2000). The uniqueness of the construction industry makes the PM a distinct discipline as it is dealing with major challenges in various contexts (Toor, & Ofori, 2008). It encompasses industry specific challenges, general business challenges, and operating environmental challenges (socio-cultural, economic, technological, legal and regulatory, and ethical). Nevertheless, under pressure from the customer and/or competitors, the project board or the steering committee sometime succumb to timeframe or deadline that is too short for the project to be completed on time and within the budget. Moreover, the critical parameters of the project are often agreed upon during the initial phase of contract negotiations when the things are usually not fully known and thus the estimates without adequate details and provisioning of sufficient contingency allowances.

In this context, the organization specific PM operational challenges comprises under-defined projects with uncertainties in scope, dimensions and predictability of processes; underpinning relationships and coordination of external stakeholders (subcontractors, supply chain, consultants, and client) on many of whom the project manager do not have direct control (Toor, & Ofori, 2008). *The challenges are exacerbated by the acute shortage of skilled people, changing needs of clients, impossible delivery dates, and inadequate risk allocations* (Atkinson, Crawford, & Ward, 2006).

LEADERSHIP FOR SUSTAINED GROWTH IN FAST CHANGING ENVIRONMENT

Based on Douglas McGregor teachings (from his 1960 book *The Human Side of Enterprise* cited by Gardner, & Schermerhorn, 2004), the author assumed when the practitioners are well aligned with the emerging new PM knowledge and technology as well as with their innate 'self', team and the organization, properly coached, and trained for one's best capacities (e.g., in talent, creativity, and willingness to take responsibilities of personal growth); motivated and have supportive organizational culture and leadership infrastructure the practitioners would deliver thriving performance and all-round growth for *win-win* outcomes for all.

Transformational-transactional Leadership Model

For reduction of construction project failures, the paper proposed a situational blend of transformational-transactional (TT) leadership (Hermel, & Ramis-Pujol, 2003; Tannenbaum, & Schmidt, 1958) model for masterly facilitation by the project manager for collaborative teamwork for effective DM of major planning problems at multiple levels of PM. It became clear that in today's highly dynamic environment enduring business performance is really driven at a much deeper levels including leader's "self" management and a focus on 'leadership strategy' coming from strategic leadership culture of the organization and careful and continuous development of leadership at multiple levels of PM (Atkinson, Crawford, & Ward, 2006; Avolio, 2007). The scope of the paper is limited to leadership for operational accomplishments of quality planning at multiple levels of PM. The paper, project manager and junior team managers are described as practitioners or leaders.

The research is process oriented and the proposed situational TT model would promote masterly facilitation by the project manager (Gardner, Avolio, Luthans, May, & Walumbwa, 2005; Ives, 2005; Tannenbaum, & Schmidt, 1958) of the expert DM team members for sustained performance excellence (Wick, & Walter, 2008) at multiple levels of PM. The proposed strategy of integrated planning and DM in the complex construction (Wick & Walter, 2008) was validated by field studies and case examples as useful in reduction of project failures.

Leadership theories abound, but the literature is focused almost exclusively on leadership of others. It does not pay proper attention to the critical integrating component of leadership of 'self' (Odusami, 2002; Gardner, & Schermerhorn, 2004) in the leadership process. Thus, in the context of unprecedented increase in complexity (e.g., ethical meltdowns across domains) and other challenges (e.g., operational, and changes) the research explored advancing the leadership process by combining the TT model with 'transcendent' leadership for an integrated and comprehensive framework toward *total* development of the 'leader' and the 'leadership process' for one's best leadership of 'self' and others. The proposed transcendent leaders are expected to grow beyond the TT leadership for strategic leadership process within and across multilevel domains of self, others, and the organization for sustained growth with concerns for the wellbeing of all (Crossan, & Mazutis, 2008). This multilevel framework is described simply as 'transcendent leadership'.

Transcendent Leadership

Broadly, *Transcendent Leadership* is a process by which the leadership relationship promotes leader and team members raising one another to higher levels of performance and innovation for greater motivation, morality and consciousness thereby co-creating the future in the essence of "spiritual humanism". The process manifest in the core values of trust, respect, love and integrity/mindfulness. Transcendentalism is a philosophical movement which appears rooted German idealism generally and in the transcendental philosophy of Immanuel Kant (1724 -1804) a German philosopher who researched, lectured and wrote on philosophy and anthropology (and of German Idealism more generally), In this context Leadership of self include taking responsibility of self-awareness, self regulation and optimal self-growth toward self-actualization (Collins, 2001; Hermel, & Ramis-Pujol, 2003) by transcendental process (Crossan, Vera, & Nanjad, 2008) and by lifelong experiential learning which are vital in today's highly dynamic and ethically challenging environment.

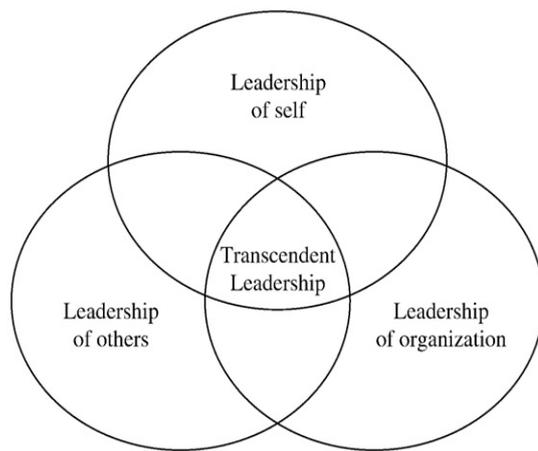

Figure: Transcendent Leadership, Source: Crossan, Vera, & Nanjad (2008)

The operational process of transcendent leadership comprises leader's behaviours and motives in making goals and values transparent and leading by setting exemplary personal examples (Avolio, & Gardner, 2005). The transcendent leader (e.g., project manager and team members) would be proactive in key aspects e.g., effective DM, in masterly facilitation of expert organizational and external diverse stakeholders for collaborative process and steering discussions across domains for his/her own as well as team best performance (Bruns, 2013). On the issue of how organizations achieve successful transformations Kotter (1980) postulated "It may be obvious that if people spend 98-99% of their work time on the job [on doing], and only 1-2% (at most) in formal training then most learning must occur on the job." The TL Collaborative process comprise helping relationships, in promoting "reflection" within (solo, sub-groups) for problem solving and in observing other members' reflections [and why, how aspects] all of which serve as valuable sources and motivations of experiential learning and in transcending to higher levels introspection, innovation and productivity (Avolio, & Gardner, 2005; Hirst, Mann, Bain, Pirola-Merio & Richever, 2004), as well as in developing colleagues and stakeholders (Crossan, Vera, & Nanjad, 2008; Crossan, & Mazutis, 2008). Thus, TL provides practical ways of valuable learning from all possible sources.

One of the most formidable PM challenges is in coordinating specialized work carried out by external stakeholders (e.g., subcontractors of trans-disciplinary disciplines, and the supply chain members) on many of whom the project manager do not have direct control. Successful cross-domain collaboration is a practical way to improve upon this situation and in promoting mutual cooperation, new knowledge-generation (Bruns, 2013). In this context, matured transcendent leaders are able and are motivated to offer game changing performance toward reduction of construction project failures and in harmony across

management domains. Thus, the transcendent leader aligns his/her values with the strategic intentions, plans and regular reviews of actions for sustained improvements and growth.

ENDNOTE

Situational transformational=transactional (TT) are processes that tend to be compared and broadly distinguished by explaining: transactional leader exchange tangible rewards for the work and loyalty of workers. However, the transformational leaders engage with followers, focus on higher order intrinsic needs, and raise consciousness about the significance of specific outcomes and new ways the outcomes might be achieved. These two modes have been experimented to diverse degrees of success particularly in highly organized organizations but the crisis in leadership (e.g., corporate corruptions in post Enron, WorldCom era continues) remains unabated rather the trend is increasing. As noted earlier, leadership in modern times has been challenged perhaps as never before by the fast changing governing market, ethical/moral forces (Gardner, & Schermerhorn, 2004) and the key aspect of effective leadership 'trust' has been blown away. Clearly a new leadership paradigm is needed to bring human efforts to higher levels of synergy for higher effectiveness involving a more diverse range of people in true shared leadership process (Crossan, & Mazutis, 2008; Dvir, Lipovetsky, Shenhar, & Tishler, 2008). Hence the TT modes were integrated with the dynamic "transcendent" approach. The metaphors of transactional, transformational, and transcendent leadership (or simply transcendent leadership) provided construct to blend the evolution of theory and practice of leader's self management and business leadership process (Avolio, & Gardner, 2005; Hirst, Mann, Bain, Pirola-Merio & Richever, 2004). The process offer a progression for the analysis of the theory and practice of shared leadership/governance across diverse participants as defined by its six major characteristics: 1) rising above selfishness, climate of trust, and ethics/moral; 2) information sharing; 3) meaningful participation and collaboration; 4) effective DM at multiple levels of PM; 5) relationship and cross-cultural exchanges; and 6) continuous experiential learning for transcending to higher levels introspection, innovation and productivity (Bruns, 2013; Collins, 2001; Li, Mobley, & Kelly, 2013; Wick, & Walter, 2008; Gardiner, 2006).

As noted earlier, the proposed transcendent leadership framework has sound philosophical underpinning, support of emerging theories e.g., authentic leadership, as well as validation by pragmatism from global experiences. The paper provides answers to leadership challenges of the day and future. Though the transactional, transformational, and transcendental modes

were tested to varying extents, further research is necessary to comprehensively study the impacts and needs of transcendent leadership for leader and leadership success.

A MATRIX OF INVESTMENTS IN SOCIAL RESPONSIBILITY AND SUSTAINABILITY

Negulescu, Oriana¹;Doval, Elena²;

¹Faculty of Management Brasov, Spiru Haret University and Doctoral School, Transylvania University of Brasov, Brasov, Romania, bellatrix360@yahoo.fr

² Faculty of Management Brasov, Spiru Haret University, Brasov, Romania, prof_ed@ymail.com

ABSTRACT

Social responsibility and sustainability are complimentary concepts.

Based on the reality and the concepts' definitions, briefly presented in the introduction, this study is aiming to underline the conceptual meaning of social responsibility and sustainability as it is understood and applied in Romanian companies and to make suggestions on how to act ethically in investments processes to support these two concepts in practice. To respond to this aim the companies' sustainable strategies have been gathered from the websites, analyzed and compared. The study is using real experiences from Romanian companies to underline the understanding of these concepts, the failures of understanding investments in social responsibility and sustainability and to provide suggestions in applying the European policies and standard in the right way.

A matrix of investments in social responsibility and sustainability has been proposed to be used by the organizations' managers.

Keywords: social responsibility, sustainability, investments, European standard and policies, Romania

FINDINGS AND DISCUSSION

The methods used in this paper are based on the real facts observation, judgment and comparison of the investments practices in terms of the social responsibility and sustainability in Romanian companies.

Even the legal framework is issued according to the European Union and United Nations principles in Romanian companies the social responsibility investments are mostly seen as a

waste, even the good practice transferred by the international corporate companies offer a fair example for the national organizations (Yves Rocher, Danone, McDonalds, Astellas Pharma Europe and many others). In this respect, in the last years, the actions towards civil society have increased and several projects have been implemented to bring “a better world” to some communities. Other companies are focused on sustainable social responsibility (Dacia Renault or Ursus Brewery), which understand their responsibility in recycling the materials, avoiding the waste of energy, keeping the jobs. The problem observed is that the most of the actions, even if they have attractive slogans, are focused on charity, for example: the internal campaign, “Santa’s knapsack”, a collection of toys, books and clothes for children living in placement centre in nine cities (GDF SUEZ Energy Romania in 2009), advertised as “the engagement is more than a value for the company, is an implication in society”, or the campaign for collecting 10,000 books for rural sites school (OTP BANK in 2012). Another way of “social responsibility” is to sponsor NGOs, because the fiscal code allows the use of up to 2% out of tax on revenue for sponsoring NGOs, for example sponsoring sports competitions, shows, concerts or scholar awards (Free scale Romania in 2011 and 2012).

The brief examples presented above emphasize that many companies are using the social responsibility concept to help disabilities, poverty and low financed activities if at all to become more visible in communities, which nevertheless is not a bad thing. In fact, it is not far from what is to invest in reputation. But, it is no doubt that a wrong policy in using the charity expenditures investments as social responsibility and sustainability has been adopted. In order to differentiate the social responsibility from sustainability and to use the investments in complimentary approach a matrix of investments on social responsibility and sustainability has been generated (figure 1) to be a useful tool for managers.

Core topics	Social responsibility	Sustainability
Investments aim	Stakeholder impacts	Social, economic and Environmental impacts
Investments means	Philanthropy; Volunteering; Engagement plan; Standard ISO 26000:2010	Equipment acquisitions; Standards ISO 14000: 2004-2012
Investments relations	Public relation; Business development	Public-private partnership
Strategy	Ethics; Fair business; Benchmarking; Relations; Communication	Total Environment Management

Core topics	Social responsibility	Sustainability
Managers' negative behaviour	Insincerity; Hypocrisy	Insincerity; Hypocrisy
Managers' positive behaviour	Employee engagement; Social and economic justice	Employees' flexi-security and health
Investments effects for companies	Shared values; Profit; Reputation	Survival; Development; Profit; Recognition
Investments effects for communities	Shared values	Added values; Living security; Resources conservation; Jobs

Figure 1. The Matrix of investments on social responsibility and sustainability

In Romanian companies the investments in social responsibility and sustainability are often wrong understood and applied. The harmonization of the two concepts in practice is approached by investments with the two targets: social responsibility and sustainability. The matrix proposed might better clarify the challenges that Romania managers have to face in order to respond to the European principles and to gain success and recognition regarding their activities' outcomes.

INFORMATION TECHNOLOGY AS AN ENABLER IN PRODUCE WASTAGE OVOIDANCE

Ostheimer, Bernhard¹; Chandrasekhar, Natarajan²

¹ Technische Hochschule Ingolstadt, Germany, bernhard.ostheimer@haw-ingolstadt.de

² Technische Hochschule Ingolstadt, Germany, natarajan.chandrasekhar @haw-ingolstadt.de

ABSTRACT

The challenge of food wastage or food loss (food material that is discarded or unable to be used) is a topic of great concern and requires urgent action on the part of all stakeholders. As of 2011, 1.3 billion tons of food, about one third of the global food production was lost or wasted. Loss and wastage occurs at all stages in the food chain.

This research-in-progress paper focuses on the IS-based prevention of food waste alongside the food supply chain, beginning with the food production, via the food transport and distribution (whole sale and retailers) up to and including the food storage and consumption in the households. Besides other loss-prevention supporting activities, state-of-the-art information systems together with current technology can provide an opportunity for reduction of this loss in different stages of the food supply chain. This research paper delivers a systematic and structured overview of contemporary IS-based concepts and solutions to reduce food waste right through the food logistics chain and also the use of systems in wastage and its elimination through education.

For this paper, fresh water is not treated as food.

³Marmara University, Istanbul, Turkey

ABSTRACT

Because of the increasing demand for energy in Turkey as well as in the world, production and distribution sectors of energy have been developing rapidly and continuously for long years. By this study, it is aimed to get a snapshot of Total Quality Management activities of Turkey's low voltage equipment producers in electromechanical sector.

In this study, research is done under the circumstances of Excellence Model developed by European Foundation for Quality Management and its self-assessment form is used as survey tool. Amongst the findings are that many companies are aware of TQM in management and national and international quality awards encourage them on their journey towards quality. It was also found that companies from this sector should improve themselves on leadership, people and partnerships & resources criteria in order to gain competitive advantage.

Keywords: TQM, EFQM Business Excellence, Turkey's electromechanical sector, self-assessment

Track Number: 10 (Total Quality Management, EFQM Excellence Model)

INTRODUCTION

Compared to western countries, the foundation of electromechanical sector in Turkey has started late and been developing slowly. Small enterprises began all their activities by producing only one kind of product without being coordinated by any nationwide organization. By the beginning of planned development period, Turkish state has started supporting investments and production of all machines and equipment attributed semi-

finished goods. Moreover; obtaining international capital and technology transfer by making license and know-how agreements with international companies has also been positively influencing continuous development of Turkey's electromechanical sector. After 1980's by the implementation of liberal economic policies, Turkish companies got more opportunities to export worldwide. Thus; Turkey's electromechanical sector has adapted itself easily for quality standards of international business environment.

This study focuses on Total Quality Management (TQM) activities of Turkey's low voltage electromechanical equipment producers. It begins by a short summary about EFQM Excellence Model and Self-Assessment. Then, it explains methodology of research and concludes with results obtained from the survey. Although Turkey's electromechanical sector exports continuously, employs thousands of employees and has important turnover rate, governmental and non-governmental associations and organizations haven't done any important and effective studies about this sector. By this study, it is aimed to point out more consideration in Turkey's low voltage electromechanical sector and it is hoped that this study will be a pioneer for further studies in this field.

EFQM EXCELLENCE MODEL AND SELF-ASSESSMENT

The EFQM Excellence Model was created in 1991 by the European Foundation for Quality Management (EFQM) as a framework for applicants for the European Quality Award. It is used as a diagnostic tool to get a holistic view that is used more than thirty thousand organizations regardless of size or sector. This model can be accepted as a tool with nine criteria that helps organizations to identify their actual strengths and areas to improve (EFQM - The EFQM Excellence Model, 2013)

These nine criteria are divided in two groups; enablers and results. The five enablers criteria help to find out what an organization does and how does it, other four results criteria help to identify what is achieved by the organization (EFQM – The 9 Criteria, 2013). Moreover, EFQM Excellence Model is a dynamic model and every three year it is reviewed by academics, EFQM Partners and Assessors. Thus, in this study the last version of 2010 is preferred to use.

In social psychology, self-assessment is described as the process of looking at oneself to assess aspects that are important to one's identity (Sedikides, 1993). The self-assessment for management is also similar with psychology's approach. It is also a way for management

teams for the availability of resources and condition of their allocation by a process of increased awareness (EFQM – Self assessment, 2013)

Although there are many self-assessment methods of EFQM Excellence model, they are generally classified into three groups; simple perception based approaches, facilitated workshop approaches and awards submission or stimulation methods (Wallmüller, 2013).

METHODOLOGY

This research is done to get a general view of low voltage electromechanical producers' situation according to TQM activities. The target is to find out companies' opinions about EFQM Excellence model and if they started practicing this model to identify their works situation.

Companies of the sample were chosen among the member lists of Electromechanical Industrialist Association of Turkey and the results obtained from internet search engines. For better research; cable producers, engineering and contracting companies etc. are not considered in our sample. The set of sample is selected from low voltage power distribution and electrical installation technology companies. Because these companies are generally international corporations which have better structured organizations and have an important role in electromechanical sector by their big turnover rates.

Design of the research is built on multiple-case studies and face-to-face interviews. The survey tool of our study is Quick Check is a MS Excel based tool. Because there is no scoring in Quick Check 2010, the scoring knowledge of the Radar is not required (Fisher, 2010).

The questionnaire considers sample companies in three dimensions. First, it asks qualitative descriptions of managerial applications to the measures. After that, the maturity and perceived strategic importance of the measures are rated on a five point scale and then they are summed up to calculate rating of each measure (Sozuer, 2011).

In Quick Check 2010 v0.2, first "Input Sheet" is completed, in which the common approaches used to implement the EFQM Excellence Model that are listed. For each approach, what is done in organization is briefly described and then from the drop down menu "Current Status" of this approach is selected. Then, the "Strategic Importance" is rated based on how the important this approach is to achieve organization's strategic objectives. The rating of status and perceived strategic importance are summed up to calculate each

measure's "Rating". Then all approaches are listed from high to low based on the measures of "Rating" so this indicates the priorities of approaches (Fisher, 2010). Measure Ratings of 8 and above are assumed as significant areas that require improvement according to the EFQM Excellence Model (Sozuer, 2011).

AN ANALYSIS OF HUMAN RESOURCE EMPOWERMENT: A CASE STUDY IN THE HEALTH CARE SECTOR

⁴Department of Nursing, University of Peloponnese, Greece, petroskolovos@yahoo.gr

⁵Department of Nursing, University of Peloponnese, Greece, marigouz@uop.gr

ABSTRACT

PURPOSE OF THE STUDY

Empowerment, teamwork and organizational commitment enhance organizational performance (through improved service quality), of frontline hospital staff (administrative and nursing staff) in the public health care sector of New Zealand (Ashill, Carruthers, & Krisjanous, 2005). Moreover, research has suggested that human resource empowerment has positive effects on organizational members and increase organizational effectiveness in the health care sector (Spence Laschinger, Finegan, and Shamian, 2001).

Human resource empowerment refers to a change strategy with the objective of improving both the individual's and the organization's ability to act and to operate more effectively in an extremely competitive environment (Papaioannou, *et al.*, 2009). The primary purposes of this study were: (a) to determine the extent to which human resource empowerment is applied to a public hospital, and (b) to examine the relationship between human resource empowerment and health care managers' gender in a public hospital.

DESIGN/METHODOLOGY/APPROACH

The particular research project is an on-going research and up to now data has been gathered from a random sample of 20 health care managers (from medical, nursing and administration services) of a public hospital in the region of Peloponnese.

The study was a quantitative design and the analysis was exploratory in nature. Descriptive statistics and T-test were used to examine the purpose of the study, using SPSS software (version 17). For the purpose of this study a 30-item questionnaire, was used

(developed by Vogt & Murrell, focused on the issue of empowerment, was modified and simplified by 1990 and modified and simplified by Kriemadis, 2011 & Papaioannou, 2011), in order to provide information on how health care managers see themselves in terms of the human resource empowerment process and demographic characteristics, using a five point Likert scale. The scales represented three different managerial styles which were: (a) the “empowering style” of management, (b) the “middle-ground style” of management and (c) the “controlling style” of management. In the first case the manager has a managerial style that reflects the manager who creates and shares power. In the second case the manager has a managerial style that combines the two styles of controlling and empowering in equal proportions, and in the third case, the manager is concerned with control or seldom shares, creates or empowers subordinates. The reliability of the scale was found to be: $\alpha = .82$.

FINDINGS

From the analysis it is shown that health care managers used 65% “empowering style”, and 35% “middle-ground style” in the six key factors of human resource empowerment (Total of all Managerial functions). Furthermore, there was a significant difference in the implementation of the human resource empowerment process between women and men health care managers, and more specifically, in the key factor of empowerment: “Total of all Managerial functions”, where women ($M=3.59$, $SD=.507$), had significantly a lower level of human resource empowerment than men ($M=4.00$, $SD=.000$) ($t(16) = 3.35$, $p=.004$). The findings of the present study are consistent with previous studies in the service sector (Hechanova, Alampay, and Franco, 2006), and show that the implementation of the human resource empowerment process is related to the managers’ gender, and propose that the policies dealing with human resource empowerment should therefore be gender sensitive (Smith, & Greyling, 2006).

RESEARCH LIMITATIONS

The study was delimited to a questionnaire designed to collect data regarding human resource empowerment according to Vogt and Murrell (1990).

The following were acknowledged as the limitations of the study:

- **The honesty, accuracy, and objectivity of the respondents when completing the questionnaire**
- The respondent's level of understanding of the empowerment vocabulary.

A useful investigation might be undertaken to research if human resource empowerment affects private hospitals' performance. Areas of further research could also include measuring the impact of human resource empowerment on the loyalty of customers.

ORIGINALITY/VALUE

This study is useful in extending the concept of human resource empowerment to the health care sector. The study will be useful in helping health care managers to their further understanding of the human resource empowerment process in their respective organization.

Keywords: Human Resource Empowerment, health care sector, public hospitals.

INNOVATIVE MARKETING STRATEGIES IN FAMILY OWNED BUSINESSES: A WORK IN PROGRESS FRAMEWORK TO INTEGRATE SOCIAL MEDIA

Pardo, Phillip¹; Tajeddini, Kayhan²

¹Ritsumeikan Asia Pacific University, Japan, pardorit@apu.ac.jp

²Lund University, Sweden, Kayhan@tajeddini.ch

ABSTRACT

The specific aim of this research is to understand: 1) how Family Owned Businesses (FOB) use new innovation and technology, in particular social media, in their business; 2) how customers evaluate the adoption of social media by FOBs; 3) how social media enhance business performance and customer loyalty 4) how the gaps can be filled by an innovative marketing strategy. A quantitative approach is employed to answer the research questions. Several modern statistical techniques are employed to analyze the data. Finally, an innovative framework on integration of social media into marketing strategy of a typical FOB is provided

BACKGROUND

Family Owned Businesses (FOB), with a long and remarkable business history, deliver a fundamental contribution to economic development and help create our quality of life as they are major vehicles for the generation of employment and income. Although there is no exact statistics about the contribution of family firms to employment and economy/GDP, most researchers agree on the high level of contribution of FOBs to national development and well-being (Astrachan and Shanker, 2003). Two thirds of all enterprises worldwide are said to be FOBs or managed by families (Gersick et al., 1997). Due to this high importance of family firms, academia has recently begun to recognize their significance as a research object (Chrisman et al., 2006; Bengtson et al., 2005).

Our literature review reveals that FOBs have been studied from different aspects, for instance, Kraus et al. (2011) has recently studied entrepreneurship orientation comprehensively. Nevertheless, despite the progress made especially in the last decade, research on family firms remains a new field which is trying to gain legitimacy within management studies (Hoy, 2003; Dyer, 2003). This topic is particularly important given the challenging economic

climate and the need to understand the distinctive characteristics of FOBs that help them to endure from one generation to another.

Social media is a great way to form closer relationships with customers. Recent development and the high-adoption level of social media among customers/people attracted academia and practitioners to probe more into the subject and propose how social media can be initialized within corporations (Keitzmann et al., 2012; Kim et al., 2010). Social media offers an opportunity to connect and interact with customers, promote brand, drive traffic to website, protect and build the digital reputation of corporations, e.g. FOBs (Evans, 2012; Kaplan and Haenlein, 2010) since whether FOBs want it or not, conversations (through word-of-mouth) occur with or without them.

METHODOLOGY

To test the model we decided to perform a cross-sectional survey. In particular we selected a sample of Japanese FOBs belonging to the most representative industries for the Japanese economy (metal products and machinery equipment; furniture; chemicals and food). In particular to identify FOBs we first of all followed the definition of FOBs of the Japanese. We will use West and East Directories (2012) to identify our target companies in Japan. To ascertain the psychometric properties of the third version of scale, a systematic random sampling method will be employed. Data will be collected by means of a mail survey questionnaire completed by owners located in different provinces in Japan. Managers and owners comprise the key informants for their participation in innovation and new service development (Tajeddini, 2010; Tajeddini and Trueman, 2012). Thus, after the process of refining and finalizing the questionnaire, a systematic random sampling procedure will be adopted to draw a sample of our target companies located in Kyushu, Osaka, Kyoto from our database.

RESULTS

A study on adoption of social media in FOBs aiming to exploit an innovative marketing strategy for FOBs is needed. Our research strives to build a bridge between FOBs and social media. In fact, we attempt to answer such research questions as: what are the attitudes of FOBs toward social media, how do they evaluate its importance, benefits, obstacles and challenges in adoption of social media, and finally what methods exist to embed social media with their (current) marketing strategies.

The specific aim of this research is to understand: 1) how FOBs use new innovation and technology, in particular social media, in their business; 2) how customers evaluate the adoption of social media by FOBs; 3) how social media enhance business performance and customer loyalty 4) how the gaps can be filled by an innovative marketing strategy.

A quantitative approach is employed to answer the research questions. Several modern statistical techniques are employed to analyze the data. Finally, an innovative framework on integration of social media into marketing strategy of a typical FOB will be provided.

GOVERNMENT - ACADEMY DIFFERENT APPROACHES TO TECHNOLOGY TRANSFER

Porath, Amiram¹; Ramos, Isabel²; Rahman, Hakikur³

¹College for Academic Studies Of Yehuda

²University of Minho, Portugal

³University of Minho, Portugal

The paper will present the conflict between the natural preference of Technology Transfer Organization (TTO)'s regarding commercialization for the licensing option and the government preference for Spin-Offs. The conflict regarding preference for one of the two main Technology Transfer options: the first, the licensing or selling of the technology and the right to use it to existing commercial entities; the second the spinning –off of firms, in which new firms are formed, to which the technology is transferred. It will further suggest that the less than expected results, are due to the conflict.

The recent prevalence of TTOs and TT support tools, (e.g. professional training, hand-books, seminars, associations etc.) are evidence of the effort to affect technology transfer from the Academy to the Industry (Fontana, Geuna and Matt, 2006). The Academy or Research Organization are organizations dedicated towards the creation of knowledge and in most cases (e.g. universities) also teaching. However, another function is the transfer of the knowledge created from these organizations to society, and in most cases that would mean the industry. For that purpose, the Academy employs internal units (the exact legal entity is depended upon the national legal system) specializing in the transfer of that knowledge – Technology Transfer. The two main avenues for Technology Transfer (TT) are Spin-Offs which is the creation of new (start-up) companies owning the technology created by the Academy (these start-ups by nature are small and therefore are included in the sector of Small and Medium enterprises – SMEs), and Licensing - in which the technology is transferred by licensing to existing companies which make use of it in their products and services. In recent years, the EU Commission (EU 2009; EU-IPR, 2010; EU-SME. 2010; FP7, 2010), has been advocating such transfer and has been promoting the transfer not only of technology but also of expertise and research capabilities (e.g. FP7 IAPP), and at the same time has put a lot of emphasis on the applicability of research results (EU, 2003; EU, 2009; EU-IPR, 2010; EU-SME, 2010). It seems however, from various reports (EU, 2006) and from the emphasis on strategies like, venture capital (EU, 2011a; EU, 2011b), that the main policy of the government is that of encouraging start-ups or spin-offs from Academia.

That policy is understandable from a governmental point of view, start-ups promise the immediate job creation that can be directly linked in an obvious way to the effort of Technology Transfer. It is therefore both, direct and measurable. In this aspect, licensing while it increases the employment of the firm by receiving the technology but presents some obvious difficulties regarding the casualty of the employment and the Technology Transfer. Licensing also makes it more difficult to measure the additional investment resulting from the process than a start-up, where all investment can be directly linked to the TT.

Therefore, for governments, interested in a measurable, direct and obviously linked to their efforts economic growth, start-up formation is a preferable solution. Additionally, SMEs make the economy more robust. The SME are faster, more resilient, require smaller markets to survive and even when they fail they discharge a smaller number of employment seekers than large firms. Building mechanisms for the easy creation of SMEs is, therefore, an economic necessity for an economy competing in international markets. Furthermore, there are additional side benefits to the Spin-Off support policy.

The evident side benefit is the formation of a service sector, the venture capital sector, which is by offering an alternative venue for investment, makes the entire financial sector more robust. That sector can attract international investment from large multinationals, creates jobs, and as a byline for its activity helps circulate the funds in the market.

For most countries where there is an increasing number of PhD holders, not in academic track, the development of the start-up sector offers another side benefit, as an outlet for the surplus of PhD holders, without burdening the academic sector. From SMEs it would spill over to the other firms in the industry.

The direct benefit as well as the side benefits explains the government preference for Spin-Off support policy. Therefore, when looking to promote that activity and deciding to help the research organizations in the process – by forming the TTOs, financing them and offering other support measures, that preference was naturally made obvious to the TTOs. However, several questions arise, as what is best for the source of the knowledge, the universities and research organizations (Luukkonen, 1998; Luukkonen, 2000)? Do they have the same preference (Laursen, and Salter, 2004)?

A research organization would have an obligation, even if only implied, to transfer its knowledge in a way that would best benefit society. Most research organizations are

supported by either official public funding, such as government budgets, or by other "public" funds, such as donations. These create an obligation to act in the public's best interest. To make sure, for example, that knowledge created by them is used to benefit the society. If they discover a drug candidate that can help cure cancer, then they should make it available to the pharmaceutical industry, so it can get it approved and then produce and sell it to the people who need it. If the new knowledge is a new communication algorithm that requires less energy and can, therefore, save energy, reduce radiation, it should be transferred to the relevant industry to improve the lives of the users.

Based on that understanding, as well as being interested in the economic benefits to be derived, the universities in most cases embraced the TTO formation. However, after consideration of the process involved it would seem that the licensing track is more attractive. When forming a start-up, there are risks involved that have nothing to do with the technology, as there are issues of managerial mistakes, not enough VC funding available and any number of reasons start-ups fail (EU, 2011a; EU, 2011), plus it takes time for that start-up to crank up the marketing and sales infrastructure that will allow to maximize economic returns. Of course the start-up may not grow up to return the high yield expected after all the works. There are heavy investments to be repaid etc. which make that Spin-Off a riskier and in the short term a less economically viable choice.

At the same time licensing to existing companies may create revenue almost immediately, depending on the licensing agreement and sector, there may be interim payments during development, and registration of the products to the TTO / research organization, which cannot be expected from a start-up. Further to that, once the product is ready for sale, the licensee would have a fully developed production and marketing infra-structure in place to capitalize on the investment. It would, therefore, seem faster and less risky for the TTO to opt for the licensing choice when available.

Along this route, a very relevant question may come up, as what happens when the two, the government preference and the TTO preference clash? That would depend in many cases on the funds available for the TTO, the nature of its knowledge and similar factors. The TTO would prefer to license but would spin-off when there is little choice, or when there are funds available for that almost exclusively. That is the case when the government concentrate efforts on the creation of financial tools for start-ups in preference to other options. Since that would make the TTO generate less income, and would make the economic independence of the TTO more difficult to attain, it would certainly take more time to reach this stage, it will make the

TTO seem less profitable and reduce that attractiveness of the TT process as an academic endeavor.

At the end an alternative is presented. The alternative suggests supporting the natural tendency of the TTO and allowing for excess activity to "Spill-Over" to the Spin-Off activity. That alternative is based on the assumption that strong TTOs encourage all venues of Technology Transfer, and have the power to sustain even less lucrative venues, or long term activities. By creating support mechanisms for the licensing activity or for the TT process in general, and allowing the TTO to select the best venue, new TTOs would be able to show economic results that would boost their activity and the transfer of knowledge to the industry. Additionally since not all knowledge can be effectively licensed, the TTOs will pursue the venue of Spin-Offs when appropriate, and in time will also create new start-ups. In that way more knowledge would be transferred and new firms would be created, with all the side benefits mentioned above. All that while the TTOs will be stronger and the TT process will have a more attractive image for the Academy in general.

IS THAT THE DIASPORA CAN BE A NETWORK OF INFLUENCE IN THE CREATION OF BUSINESS IN ITS COUNTRY OF ORIGIN ? CASE OF THE LAO DIASPORA.

Pravong, Souchinda

CNAM Laboratory for Interdisciplinary Research in Action Science, souchindasp@yahoo.fr

ABSTRACT

This contribution is intended to supplement the work of researchers in innovation networks (Dicken 2001, Bathelt and Taylor 2002, and Hamdouch Depret 2009, Ter Wal and Boschma 2009) [1] , an empirical study of Johanson and Wiedersheim Paul (1975), which describes internationalization as a slow, gradual [2] and the work of Ferrary, Pesqueux (2004) on the network organization [3] . The question of the role or the impact of influential networks in the internationalization of high-tech SMEs highlighted through four case studies such as those of Colombia (Prefontaine, Ferro, Skander) [4] leads us to make a comparative study against a diaspora network in entrepreneurship specifically the People's Democratic Republic of Laos.

Our problem is a first step to a typology of diaspora network in addition to that of Marc-Hubert and Depret Abdelillah Hamdouch (2009) on "logical clustering to work in high-tech sectors" ! secondly to analyze whether this kind of network can lead to value creation in an economy like communist.

Two hypotheses emerge from our study, firstly if the Lao diaspora network is understood as Barnes (1954) and Mercklé (2004) "networks or social groups" or following the sociological approach of Granovetter (1985) as "concrete personal relations and structures that generate trust and discourage malfeasance [5] Castells (1998) defines it as" a new technological paradigm and a new organizational logic "And Voisin (2004) "relationships that the organization and its environment " (Ekaterina in Le Pennec), on the other hand, the assumption that the organization has a weight, structure recognition, a notion of influence of French and Raven (1959, 1965) or lobbying in the sense of economic intelligence.

Our methodology uses temporal organization in the sense of Orlikowski (2002) for which the structure of time guide, directs and coordinates activities over the next *Chrosnos* and *Kairos*, ie the extent and purpose or propriety sought. It shows a long-term study, an analysis in the

time since the beginning of the formation of the diaspora and continues for almost four decades. The history of diaspora networks Entrepreneurship edited by Ina Baghdiantz McCabe, and Ioanna Gelina Harlaftis Pepelasis Minoglou explain why some countries have done better than others in the globalized competition. Diaspora networks highlighted at a conference in Cyprus under the direction of Georges Prevelakis explain how major cities become hubs of diasporas : a key to the analysis of the world of the XXI century.

Our field of research is the management sciences interdisciplinary management but is not excluded since we also use philosophy, psychology, sociology, geopolitics to achieve our result. These classical philosophers named Platon, Aristote, Epicure, Saint Augustin, Saint Thomas described by Hannah Arendt (1958) in "condition of modern man" and Jean François Revel (1994) direct us to our result.

In this study, a model was released, "sharing-effort-forgiveness-liberty". This effort defined by the dictionary as "an energetic action of the body or the mind towards a goal" and above all to share or forgiveness to be free out the human condition, the sine qua non of success.

The contribution of our research is complementary to the science research management, field management and innovation for the development of entrepreneurship, but it remains limited in practice due to the complexity of the man, the organization, strategy manager or stakeholders, the tension between the rights and the law described by Yvon Pesqueux (2009) "Network, stakeholder theory and deliberative democracy".

Keywords : Network, diaspora, entrepreneurship, processing, dissemination, information.

HORIZONTAL MERGERS AND ACQUISITIONS: HOW WINNERS AND LOSERS DIFFER: A MARKETING PERSPECTIVE

Rahman, Mahabubur¹; Lambkin, Mary²

1Smurfit Business School, University College Dublin, Mahabubur.Rahman@ucdconnect.ie

2Smurfit Business School, University College Dublin, Mary.Lambkin@ucd.ie

ABSTRACT

A majority of mergers and acquisitions are horizontal, combining companies within the same industry, motivated by a desire to achieve revenue and profit growth, with cost efficiencies being a secondary agenda. However, most research on post-merger performance has focused on cost efficiencies achieved through asset disposals, and economies of scale or scope. This paper argues that there are far greater gains to be made by deepening our understanding of post-merger performance from a marketing perspective, by investigating whether and how acquisitions achieve revenue gains, particularly the relative contributions of market expansion and product portfolio optimisation. Jaguar/Land Rover provides an excellent case study for an exploratory analysis of this topic. Tata Motors has had considerable success with a much more marketing focused strategy.

INTRODUCTION

It is well-known by now that mergers and acquisitions (M&As) come in waves and we have witnessed a major wave through the 1990s and up to 2007 when the value of deals reached an all-time record level of \$4.4 trillion representing 76,000 transactions (Martynova and Renneboog, 2008). Given this very active market for corporate assets, mergers and acquisitions have received extensive research attention from several disciplines, with most from Finance and Accounting, and least from Marketing. Each discipline looked at M&A transactions through its own lens, with one section of the literature concerned with the causes and characteristics of M&A transactions, and another concerned with the gains and losses resulting from M&A transactions.

Despite the extensive volume of research and the variety of the methodologies applied, the evidence is extremely mixed, with a broad consensus that mergers and acquisitions do not

add value (Andrade et al., 2001; King et al., 2004; Tuch and O'Sullivan, 2007; McNamara et al., 2008). A meta-analysis based on the results of 93 studies representing 206,910 companies conducted by King et al. (2004) provides a comprehensive summary of the accounting and finance research. They studied post-merger performance of acquiring firms measured by return on assets (ROA), return on equity (ROE) and return on sales (ROS) over a series of event windows (days 1-5, 6-21, 22-180, 181-3 years and greater than 3 years), using both operating performance and stock market data. They found that, after the day when the merger is announced, all of the 'abnormal returns', that is, returns over and above the norm for the industry, for the acquiring firms are either insignificant or negative. These results strongly suggest a conclusion that anticipated performance outcomes are not realised by acquiring firms.

The mixed findings of financial measures of post-merger performance may be attributed to the wide variety of methodologies used and thus are not directly comparable. Furthermore, none of these studies examined the factors influencing merger performance, i.e. what makes a merger successful or otherwise. This suggests an opportunity to add value to the literature on post-merger performance by bringing a marketing perspective to the study of why some mergers succeed while others fail. This paper reviews the little evidence that does exist with regard to M&A performance on a range of marketing variables, and identifies gaps in our knowledge and understanding around those topics. This review is brought together in a summary model that identifies a set of propositions concerning possible marketing strategies and objectives for M&A. A preliminary test of these propositions is carried out by means of a case study analysis focusing on the Jaguar and Land Rover Group which was acquired by Indian automotive company Tata Motors from Ford Motors in 2008.

LITERATURE REVIEW OF POST-MERGER MARKETING PERFORMANCE

While the vast majority of earlier post-merger performance studies took either the shareholders' or accounting managers' perspective, only a handful of studies have tried to detect gains from mergers and acquisitions in the form of increased sales revenue and market share. Others have contributed some evidence with regard to what happens to marketing costs post-merger. These few marketing studies are listed in Table 1, and the evidence their findings are summarised below.

Table 1: Studies on post-merger marketing performance

Study	Sample size and country	Industry	Variable examined	Findings
Goldberg (1973)	44 conglomerate mergers. 1950s and 1960s. USA	Mixed	Market share	Market share increase for 28 firms and decreased for 13 firms
Mueller (1985)	209 M&A, 1950-1972, USA	Manufacturing	Market share	Declined
Gugler et al. (2003)	1250 M&A, 1981-1998, Different countries	Mixed	Sales	Declined
Ghosh (2004)	2254 M&A, 1985 to 1999, USA	Mixed	Market share	Increased

In sum, a majority of the studies that have investigated the sales revenue following mergers and acquisitions have produced disappointing results. Gugler et al (2003) concluded that “no study of which we are aware has found significant increases in either the internal growth rates of merging companies or their market shares following acquisition, and several have reported significant declines”.

A NEW MODEL FOR STRATEGIC MERGER MOTIVE AND POST-MERGER PERFORMANCE

As a way of summarising this literature and to help identify gaps for research, we have developed a typology of strategic objectives for horizontal mergers and acquisitions, building on the classic Ansoff strategy matrix (Ansoff, 1957). This model views M&A as driven primarily by marketing objectives, in particular, expansion of market coverage and product portfolio extension, or some combination of these two. This model is shown in Figure 1.

The general premise underpinning this model is that firms making acquisitions are typically driven by the desire for growth, and this growth can come from expanded market coverage or an extension to their product line, or some combination of these. It is further assumed that

these objectives are valuable in their own right, even if they do not appear to gain in terms of financial metrics. In other words, a firm might succeed in increasing its product portfolio strength and market coverage, which is a valuable outcome, even if it does not make any significant gain in profit margins or share price in the short-term.

Figure 1 Marketing Objectives for M&A Transactions

	Same market	Different market
Same product	Consolidation /Cost synergy	Market Coverage Expansion
Different product	Product Portfolio Extension	Market and Portfolio Expansion

These marketing benefits come at a cost, however, most particularly in the price paid for the acquisition, but also in integrating the acquired business, and in the marketing investment required to build the acquired business so as to extract the perceived growth potential. These costs and benefits are finely balanced and, a misjudgement in managing them can easily mean a negative outcome from the whole transaction. Greater understanding of these risks and trade-offs through further research can only help to improve the probability of success, and filling that knowledge gap is the challenge for future marketing research. The case of Tata Motors acquisition of Jaguar/Land Rover seems an interesting example with which to explore these topics.

TATA MOTORS' ACQUISITION MOTIVES

Before the acquisition, Tata was at best a regional player but the purchase created the opportunity to expand its presence in the passenger car market beyond India and gave it the clout necessary to compete with global automotive players. Acquisitions of these two renowned brands helped Tata to enter the luxury segment of the auto industry. Tata Motors stated that "we believe that our acquisition of the Jaguar Land Rover business will enable us

to expand our product range and extend our geographical reach..... Jaguar Land Rover has given us the opportunity to participate immediately in the luxury performance car and premium all-terrain vehicle segments with globally recognized brands and has diversified our business across markets and product segments” (Tata Motors, Form 20 F 2008)

It thus appears that the Tata acquisition was motivated by a revenue-based synergy through capitalizing on the strength of these two brands and expanding into other geographic markets, although it was also motivated by opportunities for synergy in other areas of operations as well.

TATA MOTORS GOT MORE THAN WHAT THEY PAID FOR

Tata Motors paid more than the price the market expected for JLR, but this was still about half what Ford originally paid. Ford paid USD 2.5b for Jaguar and USD 2.73b for Land Rover in 1989 and 2000, respectively. In addition, Ford Motors paid USD 600m for the pension plan. Tata Motors acquired these two iconic brands combined for USD 2.3bn in cash. The acquisition price paid by Tata included global businesses relating to JLR including three vehicle manufacturing facilities, a worldwide sales and dealership network, one veneer production facility, two advanced design centres, 26 national sales companies, intellectual property rights (including perpetual royalty free licenses), and brands and trademarks (Tata Motors Annual Report, 2008).

Industry analysts commented at the time that Tata got these two brands at a bargain price (Economist, 2008). Tata bought these two brands at a price (USD 2.3b) below the book value of the assets of these two brands (USD 2.46b).

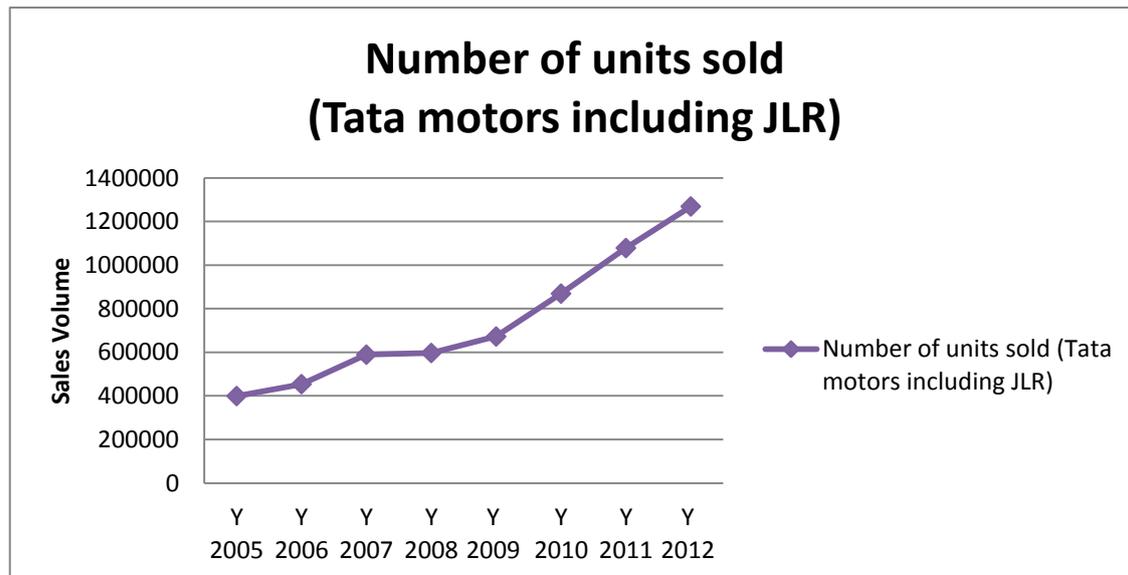

EVIDENCE OF GAIN FROM BRAND PORTFOLIO AND MARKET EXTENSION

Below we have analysed the performance of Tata Motors including JLR in the pre- and post-acquisitions years.

Sales Volume

Figure 2 below shows the number of cars sold by Tata Motors in the pre- and post-merger years. The graph demonstrates that Tata Motors sales volume grew rapidly in both pre-merger and post-merger years.

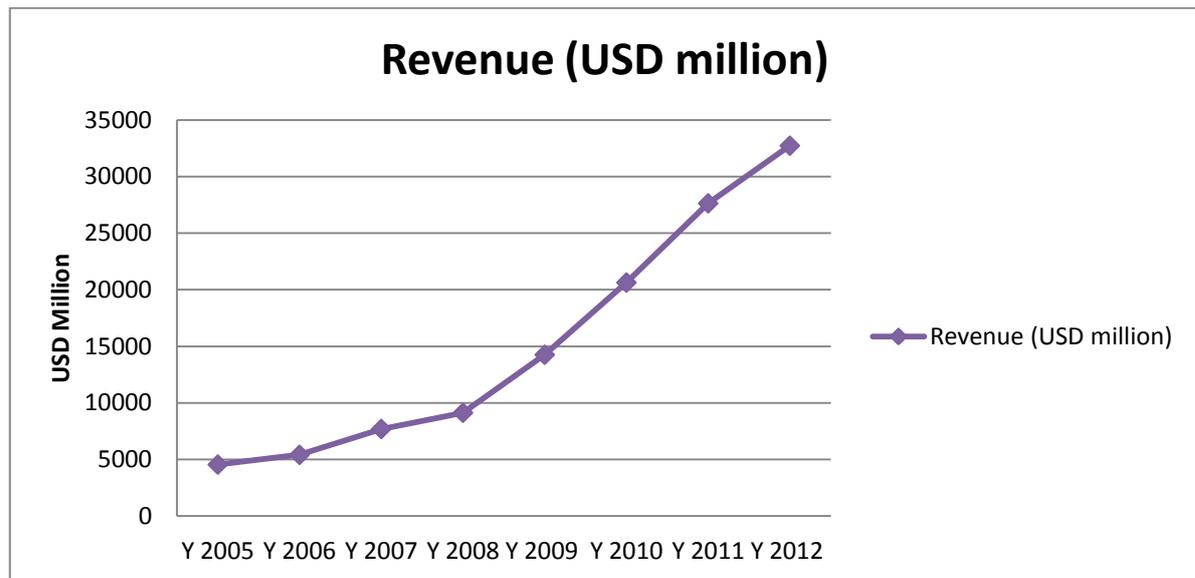

Figure 2 Consolidated Sales Volume of Tata Motors

Tata Motors has been performing better than the industry average both in the pre and post-acquisition years. The average global automotive industry growth rate in the three years before the merger was 4% whereas Tata Motors grew by 45%. The average global automotive industry growth rate in the three years after the merger was 23% whereas Tata Motors grew at an astounding 71%. It clearly demonstrates that the acquisition of Jaguar and Land Rover helped Tata Motors to further enhance its performance. The three year average sales growth difference between the global auto industry and Tata Motors was 41% in the pre-merger years and this difference in the post-merger years rose to 48%. It thus may be assumed that the additional growth rate of 7% (48-41 %) was because of merger synergy.

REVENUE

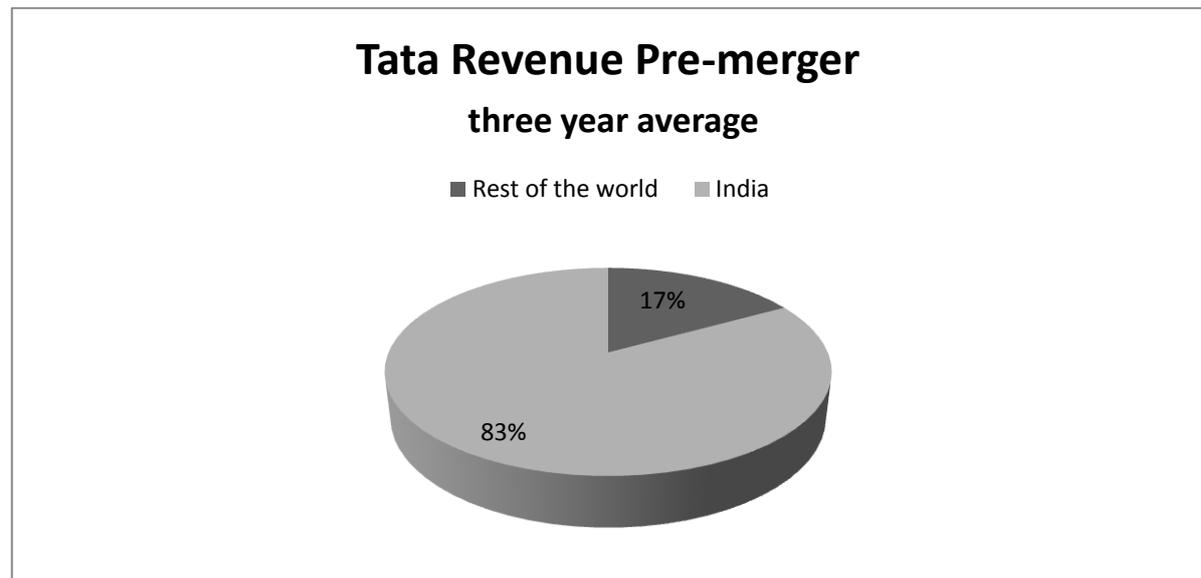

Figure 3 below illustrates that Tata Motors annual revenue also improved significantly following the acquisition in 2008.

Figure 3 Tata Motors Consolidated Revenue

The three years average revenue growth in the pre-acquisition years (2005-2007) was 34.38%. On the other hand the four years average revenue growth in the post-acquisition years (2009-2012) stood at 38.32%.

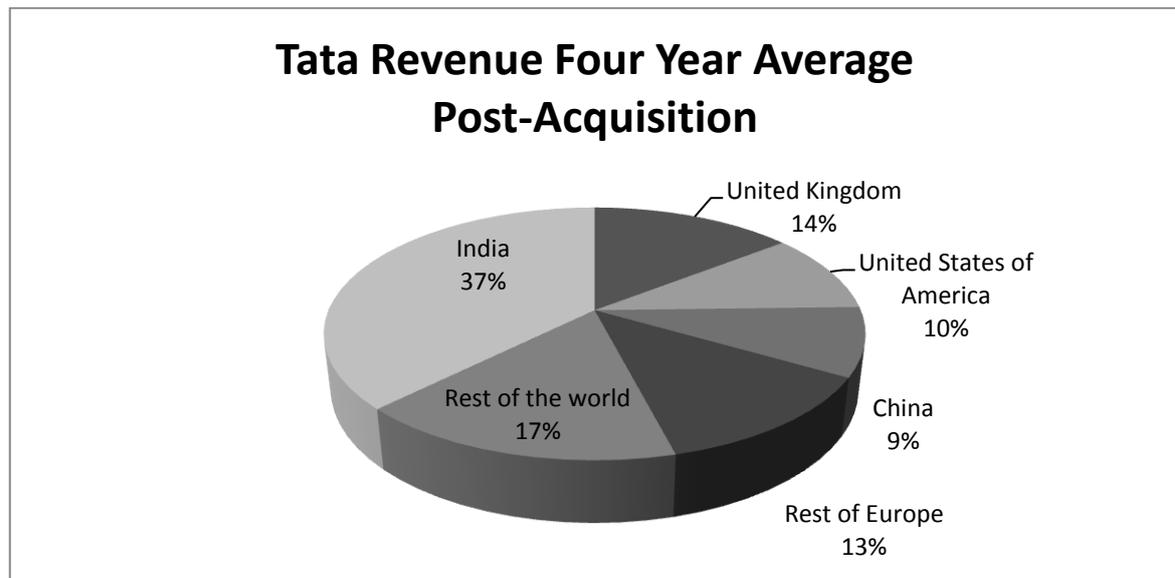

CONTRIBUTION OF GEOGRAPHIC MARKET MIX TOWARDS REVENUE

The main focus of Tata Motors was on the Indian automotive market before acquiring Jaguar and Land Rover. As shown in Figure 4, more than 80% of revenue came from the Indian market while only 17% of revenue was generated from the rest of the world market. This is not surprising given the fact that Tata Motors brand portfolio mainly consisted of organically grown brands with little or no brand equity outside the Indian subcontinent.

Figure 4 Tata Motors Geographic Distribution of Revenue Pre-Acquisition

The pie chart in Figure 5 shows that the acquisition of Jaguar and Land Rover turned Tata Motors into a global company by way of adding global luxury brands to its brand portfolio. The average revenue contribution in the four years after the acquisition from the Indian market was only 37% while revenue from other global markets stood at 63% in the four years following the acquisition of Jaguar and Land Rover.

It can be concluded therefore that the addition of Jaguar and Land Rover brands benefited Tata in two ways. First, the merger gave Tata exposure to new geographic markets and, second, inclusion of these two brands helped Tata to fill in its brand portfolio with two complimentary brands. More importantly, the acquisition helped Tata to lessen its dependence on one single market, i.e. India.

Figure 5 Tata Motors Geographic Distribution of Revenue Post-Acquisition

SUMMARY AND CONCLUSION

It appears from the above analysis that Tata Motors successfully turned around the ailing JLR brands and made them profitable in a very short span of time. Our analysis revealed that the motivations for Tata's acquisition of Jaguar and Land Rover were two-fold: firstly, to extend the brand portfolio of Tata Motors which was mainly comprised of brands focused on the Indian market. Acquisition of Jaguar and Land Rover transformed Tata's brand portfolio into a global one. The second motivation for the acquisition was to extend the market coverage of Tata motors. We analysed a number of performance measures to gauge the impact of brand portfolio and market extension. We found that brand portfolio and market extension have positively affected the performance of Tata Motors.

We found that the sales volume and revenue grew significantly in the post-acquisition years compared to the pre-acquisition years. It can be concluded therefore that Tata motors was able to achieve revenue synergies through extension of its brand portfolio and geographic markets. Moreover, Tata Motors was able to transform itself from a local company into a global one through acquisition of Jaguar and Land Rover. Before the acquisition, 80% of the revenue of Tata Motors came from India. After the acquisition, only 37% of revenue was earned from the Indian market. Tata was able to increase the sales volume for both Jaguar and Land Rover.

Our analysis further proved that variables which earlier M&A research found to have an impact on post-merger performance did not negatively affect post-acquisition performance of Tata Motors. We examined such variables as price paid for the acquisition, method of acquisition, and the mood of the acquisition. Tata Motors bought these two brands at a bargain and the price paid was below the book value of these two brands. Studies have shown that many M&As fail because of over-payment. Tata Motors got off to a good start by buying two global brands at a bargain price. Moreover, Tata bought these brands on a cash-free and debt-free basis which means that it avoided the debt burden and this gave it enough leeway for future planning for these two brands.

Secondly, the mood of the acquisition was friendly which is borne out by the positive attitude of JLR's stakeholders including employees and dealers. The employees throughout JLR and dealers welcomed the acquisition which made it easy for Tata Motors to put the two firms together despite huge national cultural difference between the two firms. Because of being a friendly takeover, the post-merger integration was smooth which facilitated performance improvement post-acquisition.

Furthermore, Tata Motors embarked on a massive plan for new product development through heavy investment and capitalized on the two iconic brands acquired by introducing a number of new models into the market. Our analysis has revealed that the new models introduced were hugely successful such as Land Rover Evoque.

In sum, this single case study provides preliminary evidence to suggest that our model of merger motivations has strong face validity, and provides encouragement to continue our study of this topic, based on a larger cross-sectional sample.

ABSTRACT

INTRODUCTION

In search of the ways to developing opportunities offered by markets around the world, several large and small companies are still trying to adopt approaches and structures cross-border. These behaviors of international openness have aroused abundant literature. They are rare the texts that focus on the process of internationalization of small and medium enterprises (SMEs), particularly in developing countries. However, local bases are increasingly mentioned as key factors explaining the behavior and performance of firms (Audretsch and Dhose, 2007). The objective of this research is therefore to highlight the specificity of the process of internationalization of SMEs in the southern Mediterranean countries and develop a causal model of this process and of the Transmediterranean factor. How this model allows it to explain the internationalization process of Moroccan SMEs?

Among the changes in the Mediterranean, two mainly have led companies to increase their presence in the international trading system. On one hand, is the integration into a model of regionalism, and on the other hand, the progress of multilateral liberalization (The signing of the GATT / WTO agreements). The increasing integration of economies is not without effect on the behavior and strategies of the companies. It is therefore important to understand how and by which means companies will be able to relay and reinforce the movement of internationalization. To do this, we must turn to the available literature on this subject. We consider the statement in Etemad and Wright (1999) and Mtigwe (2006), in which the issue of the internationalization of SMEs refers to a holistic approach resulting from the joint consideration of three schools of thought: i) incremental thought developed by the behavioral approach, ii) the thought of alliances with network theories and iii) economic approach with theories of foreign direct investment (FDI). Figure (1) describes how these three schools combine to contribute to the emergence of a unified theory of the internationalization of SMEs.

Figure 1 - The characteristics of the three schools of thought in the theory of internationalization

Source: prepared by the authors.

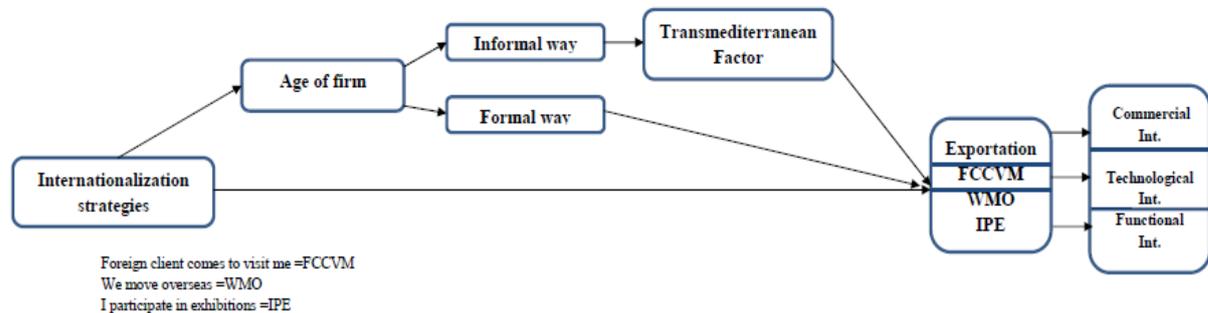

Thus, we refer to the technological internationalization affects systems and modes of production, functional internationalization modifies operating modes and organization of firm and commercial internationalization that focuses on the flow of goods, exporting, importing, outsourcing, subcontracting, etc. (Perrault and St-Pierre, 2008).

EMPIRICAL ANALYSIS

The empirical data of our study were collected by means of an ad hoc survey conducted on 22 Moroccan companies during the first semester of 2012. A questionnaire, managed face to face, related to information about business characteristics, motivations and challenges of internationalization. The conclusions of the analysis were supported by descriptive statistics, factor analysis and logistic regression analysis.

We have shown that the majority of companies do not belong to the Transmediterranean trading networks, to a network of Transmediterranean entrepreneurship nor a Transmediterranean exchange platform. In our analysis, 15 respondents indicated having no strategy for the expansion of Maghreb to Europe. Of the respondents, 17 considered the Maghreb as a reinvestment place of Maghrebian. This is explained by the informal ways of their investments in their countries of origin. In other words, the international development of these companies depends on the Maghrebian diaspora. We analyzed our causal model to test the relationship between the process of internationalization of Moroccan SMEs and the influence of Transmediterranean factor. Figure 2 presents the main results of our research.

Figure 2 - The causal relationship between the internationalization of SMEs and the Transmediterranean

Source: prepared by the authors.

Our results showed that the age of the company seems to play a key role in the involvement in Transmediterranean relations. Older firms (between 20 and 49 years) are more involved in the Transmediterranean aspect than younger (less 20 years). More a Mediterranean company is elder more the Transmediterranean factor is part of his internationalization strategy.

According to our empirical analysis four classes appear. A first class is composed of companies that take into consideration the Transmediterranean factor in their internationalization strategy. However, to date, they applied only the functional internationalization (FI) because the CEO of these companies moves overseas to identify new opportunities (WMO). They also participate in exhibitions to build networks with foreign companies for possible cooperation (IPE). These firms operate organizational and functional change in order to follow the development of their international activities. A second class gathers non-exporting firms that consider the local market is sufficient (LMS) and these firms remain unresponsive about the existence of a Transmediterranean factor. They are anchored locally and international development does not influence their strategy. The third class includes companies that anticipate their internationalization by having visits of their foreign customers (FCCVM). They are involved in a process of technological internationalization (TI) but they have never tried to establish a foreign subsidiary and do not take the Transmediterranean factor in their internationalization strategy. These companies are trying to change their production methods to improve their competitiveness in the domestic market and to face competition from multinationals. A fourth class includes the traditional companies who engage in the traditional form: commercial internationalization (CI) via export.

The analysis of the relations in Maghreb of surveyed companies identifies three types of attitudes. The first type corresponds to profiles of companies that do not consider the Maghreb as a place of reinvestment; they do not put up expansion strategy towards Europe

and do not consider Transmediterranean relationships as specific items because they are not established by the Maghrebian in Europe. These companies are involved in a process technological internationalization (TI), they have made changes in their production methods and, for now, develop the local market in order to face the competition in this market. A second type gathers exporters mainly engaged in a commercial form of internationalization (CI). They consider that there is no need to develop a specific strategy to international trade between the two sides of the Mediterranean. They are confined to the more traditional aspect that concerns some international clients with whom they used to work and focus on some exports without seeking to strengthen their presence on both sides of the Mediterranean. The third type includes companies that consider the Maghreb as a privileged place of reinvestment of the Maghrebian from Europe. They emphasize the existence of a strategy of openness towards Europe. They believe that the Transmediterranean relationship is based on the Maghrebian from Europe, and it is necessary to develop a new exchange strategy between the two sides. These companies are conscious of business opportunities between the two sides of the Mediterranean. That is why they have started a functional internationalization process to adapt in advance.

CONCLUSION

In conclusion, the support measures could be more effective if these companies were reorganized. It would be better to focus on the experience of the entrepreneur and the development of his qualifications, including the ability to create networks rather than the characteristics of the company. When reading the results, a question is worth asking: It concerns the willingness of entrepreneur's opening. This survey does not allow to determine whether the SMEs are not very internationalized because they encounter insurmountable obstacles in their efforts or because they have never considered internationalization as an economic opportunity. In addition, it is possible that many SMEs do not realize that the process of internationalization affects them even if they operate mainly on the domestic market, since internationalization is often equated with export. The availability of data on the subject of our study can only help to provide answers to these questions and, subsequently, to offer devices that overcome barriers to internationalization of Mediterranean SMEs.

INNOVATION THROUGH INFORMATION AND COMMUNICATION TECHNOLOGY (ICT) IN ROMANIAN EDUCATION

Rascu-Pistol, Silvia¹; Varga Ungureanu, Anca²

ABSTRACT

Our world, the society we live in is in continuous development. It is a dynamic environment in which man is forced to live in a fast pace and is always on the run. Our society is a blend of exceptional promise and unsettling perspective, desirable developments and technological uncontrollable outbursts, by man depends meaning evolution: progress or toward destruction.

In a few decades education at school it was, in most cases, sufficient for the entire life of an individual, today the situation changed dramatically. Education modern human must go beyond education focused on a certain level (limited in number of participants and time period) and to focus on continuing education, able to prepare peoples wherever they are and unlimited time.

Not long ago, the computer was a rare and exotic object being considered a luxury that many people in Romania do not dare to dream and said it was something unnecessary for humanity, a waste of time. But years passed, and attitudes of Romanians people were changed, now things sitting in a different light, this time in favor of technology.

In the era of new information and communication technologies, the Internet has revolutionized almost all areas of social and professional, including learning and education. Education through Internet is a new way of learning the pupil / student, but also a new way for teaching of teacher. It is vital that all students have access to the Internet to know the new technologies. Thus, in support of education interferes new information society technologies - information and communication technology (ICT).

Technological education has a specific inter-and transdisciplinary character, but also has dual purpose: scientific and technological, theoretical and practical. It also aims to training

practical skills and systematic thinking essential for development and stimulating student creativity and initiative, technical centered thinking.

Technological education acquires new valences, becoming a basic component of modern Romanian education, discipline designed to integrate more effectively into society the student after graduation.

In school, introduction the Internet and modern technology lead to significant changes in education process. Thus the act of learning is no longer considered to be the effect of the evolution steps and the teacher's work but also the result of student interaction with the computer and collaboration with the teacher. This change in the education system followed some well structured objectives, namely: increased efficiency of learning, developing communication skills and self-study

Due to information and communication, technology has opened new areas, previously unsuspected and has revolutionized the old ones. And these include education too, which reached new standards and has an amazing evolution. Like any other method of learning and teaching computer assisted have advantages and disadvantages.

As advantages we mention:

Stimulating innovative learning ability, adapted to the rapid social change;

Increased yield coherent properties of knowledge by immediate appreciating of student responses;

Strengthening students' motivation in the learning process;

The effect of personal self-improvement and competitiveness;

Development of visual culture;

Awareness that the already learned concepts will find useful later;

Fast data processing facilities to perform calculations, display the results, output graphs, tables;

Introducing a cognitive style, effectively, an independent work style;

Make the choice and use of appropriate strategies to solve various applications;

Providing a permanent feedback, the teacher being able to redesign work based on previous sequence;

Develop thinking so that starting from a general method to solve a problem student finds alone the answer for a specific problem;

Stimulate imagination and logical thinking;

Various teaching methods;

Relational perspective is enhanced by establishing human and social relations between students and teachers.

WE ALSO HAVE SOME DISADVANTAGES:

The overuse of computer can lead to loss practical skills and investigation of reality;

Excessive individualization of learning amount to the denial of dialogue teacher - pupil;

Using computer randomly without a specific purpose during the hours can cause boredom, monotony;

The high costs of the latest technology which is an impediment for a good part of the population of Romania, is accessible to people with a good financial situation.

Researches in the last five years in various countries at global level have shown that use information and communication technologies in education contributes to a great extent in improving student achievement. But however many teachers, whether you prefer traditional methods of teaching, either a general reluctance and indifference to new technologies reject dynamics hours and stimulating student by computer internet and all other associated tools.

In Romania today we see a growing concern of the executive, civil society and the education system (universities and schools) to implement an effective system of e-learning, although we have to admit, there are many gaps in this area.

We hope in the near future as in all universities and schools in Romania to have a dynamic growth in the field of educational software and teaching techniques, using the computer, which will mean encourage innovation teaching, modernization process and e-learning

programs, and on the long term the opportunity for graduates to continue learning and training.

FOREIGN DIRECT INVESTMENT AS A MEANS OF ECONOMIC DEVELOPMENT

Rios-Morales, Ruth; Brennan, L.; Schweizer, M.; Flores, A.

Centre of Foreign Affairs and Applied Diplomacy, Zurich University of Applied Sciences (ZHAW), Switzerland, ruthriosmorales@bluewin.ch

ABSTRACT

Purpose – In the era of globalization, foreign direct investment (FDI) has been acknowledged as an essential factor in the development of the economy. In recent years, creating a better investment climate has therefore been a policy priority for many governments. However, only a small group of countries have attained relative success in attracting quality FDI and using it as a method of economic growth. The purpose of this study is to identify important aspects of policy strategies of countries that have been successful in attracting FDI and using it as means of economic development and growth.

Design/methodology/approach – This is a conceptual paper based on secondary data obtained from various official entities of countries that have been successful in attracting foreign direct investment and using it as a method of economic growth and development. The information gathered has been analyzed, synthesized, tested and evaluated. From this appraisal, a holistic model which incorporates government's role in using FDI as a method of economic growth is developed.

Findings – The evidence suggest that it is a futile endeavour attracting FDI in the absence of the necessary conditions for economic development. The creation of a competitive market site requires certain conditions to be in place across a host of areas. For FDI to be an instrument of economic growth it must be approached via holistic policies framed within a national economic development plan based on long-term development goals.

Originality/value – The extraordinary role that FDI plays in economic development and growth has impelled interest among scholars. Despite the growing body of scholarly research in this field, scholarly literature that appraises policy strategies of countries that have been successful in FDI remains limited. Moreover, this study pioneers the development of a holistic model which incorporates government's role in using FDI as a method of economic development.

THE IMPACT OF INTERNATIONAL INVESTMENT AGREEMENTS ON FOREIGN DIRECT INVESTMENT: THE SWISS EXPERIENCE

Rios-Morales, Ruth; Schweizer, M.; Gamberger, D.; Ursprung, D.

Centre of Foreign Affairs and Applied Diplomacy, Zurich University of Applied Sciences (ZHAW),
Switzerland, ruthriosmorales@bluewin.ch

ABSTRACT

Purpose – The liberalization of the foreign direct investment (FDI) regulatory framework has encouraged the increase of foreign investment and prompted strong competition among countries to attract FDI; as foreign direct investment has been recognized as an important driver of economic growth. A number of investment strategies have been used to promote FDI; among the most important strategies utilized are international investment agreements. The economies with the most international investment agreements are led by Germany, China, and Switzerland. Among the developed world, Switzerland is one of the most successful economies in attracting FDI. The purpose of this paper is to evaluate Switzerland's strategies attracting FDI, especially appraising bilateral investment treaties (BITs) and double taxation treaties (DTTs) and their impact on inwards FDI.

Design/methodology/approach – This is a research paper based on secondary data analysis; data is obtained from various official entities. This study uses statistical and machine learning techniques in order to detect meaningful relationships between investment strategies and inward investment. A predictive and highly significant model has been constructed.

Findings – Our findings suggest that the formulation and implementation of sound policies to promote investment play an important role in attracting FDI to Switzerland. The results also indicate that in some cases the formation and implementation of international investment agreements are important determinant of FDI inflow.

Originality/value – The availability of comprehensive datasets and the very limited set of empirical studies related to international investment agreements in Switzerland have motivated us to integrate quantitative resources and assess the significance of government policies and strategies in relation to international investments agreement in Switzerland.

FACTORS IMPACTING CUSTOMERS' FOOD AND GROCERY RETAIL FORMAT CHOICE IN PAKISTAN

Rotem, Shneor¹; Shujaat, Ali²

¹University of Agder

²University of Agder, shujaat10@gmail.com

ABSTRACT

Food and grocery retail has shifted significantly from traditional stand-alone small scale shops to modern and complex superstores. This trend is especially evident in emerging economies, which experience intensified competition with the opening of their markets in recent years. The current study seeks to capture customer sentiments and motivations to shop in either traditional or modern retail formats. It does so based on a survey of 471 Pakistani consumers from Lahore. Results indicate that relative proximity to residence and perceived lower prices are the main influencers on shopping in traditional stores, while product variety, staff courtesy, store atmosphere, and household income levels are the main factors influencing consumers' preference for modern stores. Moreover, age, gender and family size demographics don't seem to impact consumer choices of food and grocery retail store format.

Keywords: Store Format, Food and Grocery, Retail, Pakistan, Staff Courtesy, Product Variety, Store Atmosphere, Price, Location, Convenience

INTRODUCTION

Food and grocery retail has shifted significantly from traditional small scale stand-alone shops to multi-dimension and multipurpose modern superstores (Sexton, 2010). A traditional store format can be defined as any retail outlet that is managed locally by the owner or the

caretaker of the shop, including small neighborhood stores, street vendors, and 'mom and pop' stores (Raja, 2011). Such outlets lack technical and accounting standardization, and their supply chain and sourcing are locally embedded (ICRIER, 2005). A modern store format can be defined as any retail outlet that is professionally managed including supermarkets and hypermarkets with complete shopping experience under one roof (Raja, 2011). A store is termed as 'modern' if it has accounting transparency with proper usage of management information system (MIS) and accounting standards, as well as organized supply chains with centralized quality control and sourcing mechanisms (ICRIER, 2005).

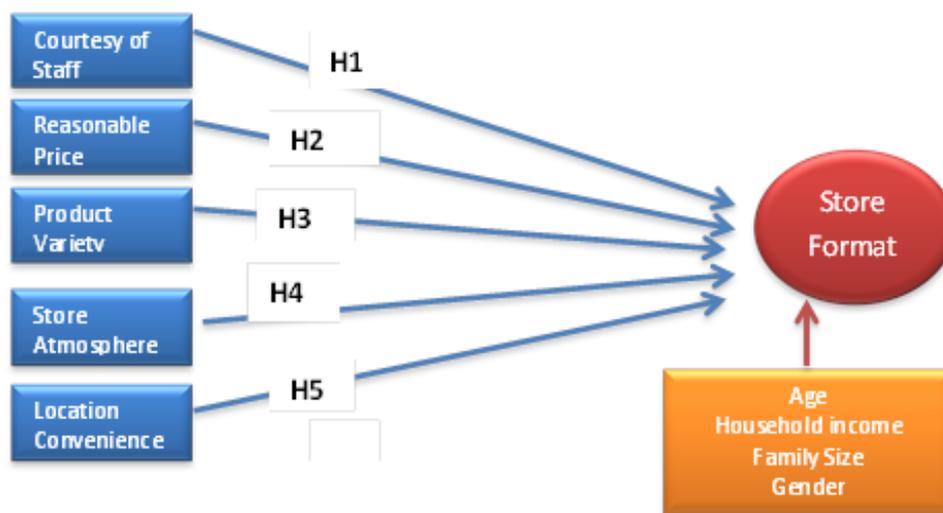

In emerging markets, the gradual opening up of economies, as part of global trade liberalization, has led to large scale introduction of modern retail formats and growing competition between retailers. And, hence, the current study seeks to understand consumer mind-sets in such environments in terms of their motivations to shop in modern versus traditional retail store formats.

More specifically, the current study will examine customers' preferences for food and grocery retail formats in the Pakistani market. Pakistan was deemed as a suitable context for such an analysis, as until recently it has been dominated by small-scale independent neighborhood shops (EIU Economist Intelligence Unit, 2010, FIAS Foreign Investment Advisory Service, 2005), locally known as 'Kiryana Stores' (Raja, 2011). However, in the last decade, the entrance of global retailers such as Dutch-based Makro, German-based Metro, and French based Carrefour (locally branded as 'Hyperstar'), has led to the de-facto introduction of new style of food and grocery retailing in Pakistan (Aman and Hopkinson, 2010).

Based on a literature review of earlier studies examining food and grocery store choices (i.e. Bhatnagar and Ratchford, 2004, Carpenter and Moore, 2006, Prasad and Aryasri, 2011, Seiders et al., 2000), preferences (i.e. Thang and Tan, 2003), patronage (i.e. Arnold et al., 1983, Zameer and Mukherjee, 2011), perceptions (i.e. Dalwadi et al., 2010, Farhangmehr et al., 2000), and loyalty (i.e. Huddleston et al., 2004), a model was suggested.

The model includes five independent variables capturing store characteristics as perceived by customers, and four control variables capturing customer demographics. Variables are included based on either their dominance in earlier studies (i.e. perceived price, store atmosphere, and locational convenience), or controversy concerning their actual effects (i.e. courtesy of staff, product variety, and demographics).

Figure 1: Factors impacting Store Format Choice

METHODOLOGY

Data was collected through a structured questionnaire which was administered via on-site face-to-face short interviews with customers in key commercial areas, in seven different quarters of the city of Lahore in Pakistan. Overall, 471 completed questionnaires were collected and used in the analysis.

While the dependent variable – store format preference, was captured through a dichotomous variable (traditional vs. modern), as used in Zameer & Mukherjee (2011), the independent variables were mostly captured via multiple item scales mostly adopted from Dalwadi et al. (2010), who conducted a similar study in India. An exception here was store location convenience, which also included items from Yilmaz et al. (2007) and Prasad & Aryasri (2011). Nevertheless, a factor analysis of the relevant items did require measurement changes.

These included the removal of 1 item from measurement of location convenience, 1 item from measurement of courtesy of staff, and 2 items from store atmosphere in order to achieve the required factor structure and satisfactory internal reliability levels.

Once no problems of multicollinearity were ensured (see VIF and tolerance values in Table 1), the analysis proceeded with a logistic regression.

FINDINGS AND DISCUSSION

Results (see table 1) indicate that relative proximity to residence and perceived lower prices are the factors influencing preferences to shop in traditional stores. Product variety, staff courtesy, store atmosphere, and household income levels influence consumers' preference for modern stores. Moreover, age, gender and family size don't seem to impact consumer choices of food and grocery retail store format.

Cox & Snell R^2 .363 * $P < 0.05$; ** $P < 0.01$

Overall, our study contributes to the growing body of knowledge on consumer store format preference in the food and grocery sector in general, and in developing markets contexts in particular. While not fully solving existing controversies, our study does contribute to the discussion by suggesting both measurement refinements and concrete observations in support of particular effects.

In terms of practical implications the study suggests both short and long term implications. In the short-term, retailers using different formats can cling onto those aspects attracting customers to them, as core advantages in their positioning strategies, and their manifestations in promotional efforts. However, in the long term, the resource-rich firms behind modern formats, with their scale advantages, may also enter neighbourhood location with smaller shops. Under such scenario, repositioning of competition may require that traditional shops improve their service quality via greater staff courtesy, as well as specialize in narrower product range, but with greater variety within specific product categories.

EXPLORING THE INTERRELATIONS BETWEEN CODES OF CONDUCT AND FINANCIAL PERFORMANCE: EVIDENCE FROM GREECE

Roumeliotis, Michael¹; Kyriakogkonas, Panagiotis²

¹Department of Business Administration, University of Aegean, Chios, Greece, m.roumeliotis@aegean.gr

²Department of Business Administration, University of Aegean, Chios, Greece, kyriakogkonas@ba.aegean.gr

ABSTRACT

Extensive research regarding the interrelations between corporate social responsibility and a firm's financial performance has been carried out over the past 30 years (Bromiley et al., 1989; Ingram, 1978; Cochran and Wood, 1982). However, surveys' outcomes were controversial; some appeared to reveal no relationship, while others to indicate either a positive or a negative relationship. Many factors may account for such variances; for example, the criteria used for the measurement of corporate social responsibility or financial performance, the timeline used and so on. Furthermore, the debate on the definition of corporate social responsibility still exists (Davis, 1973; Carroll, 1979; McWilliams *et al.*, 2006), adding controversies and further complicating the issue.

A code of conduct is a tool used by many companies in order to apply their social responsibility principles into practice and to declare their core values. It facilitates companies in recording and classifying their values, policies and procedures regarding issues like treatment of employees, the environment, consumer safety etc. Deployment of a code of conduct by companies is sometimes legally mandatory. Recent literature has been showing great interest on issues such as the existence, the content and the code of conduct's enforcement within companies (Lefebvre and Singh, 1992; Farrell *et al.*, 2002). Furthermore, many authors have examined the underlying ideas behind the use of codes of conduct (Weaver, 1993; Farrell *et al.*, 2002). Weaver (1993) for instance, perceives ethical codes as distinct, not particularly related to any other company policy manual, while McDonald (1999) refers to codes of conduct as the first step in applying an ethical culture.

Our research focuses on specific aspects of applying a code of conduct in companies listed in the Athens Stock Exchange companies. We first examine the existence of a code of conduct, its content, and certain aspects of its. Furthermore, we investigate the relation between the use of a code of a conduct and financial performance bearing in mind that, not only the deployment of a code of conduct may affect the company's financial performance, but that the company's

financial performance may also affect the deployment of a code of conduct. For the purposes of the survey a questionnaire has been developed and is currently in the process of dissemination to the Internal Audit executives of the Greek listed firms.

In order to examine the relation between financial performance and the code of conduct, certain criteria of measurement must first be determined. As far as the financial performance measurement is concerned, we rely on the methodology used by Parket and Eilbirt (1975), who calculated three different financial ratios, for each company (i.e. earnings per share, sales margin and return on equity). With respect to the content of the codes of conduct, we classify the rules according to a tripartite distinction: the rules that center on the company, the ones that center on employees and those that regard society in general. And finally we further differentiate, according to the method used for the composition, communication and enforcement of the code of conduct.

A QUALITY MODEL FOR INTEGRATED HEALTHCARE IN POLAND

Rudawska, Iga

Department of Business Analysis and Strategy, Faculty of Economics and Management, University of Szczecin, igita@wneiz.pl

ABSTRACT

PURPOSE

The main purpose of this paper is to identify the indicators of quality management model for integrated healthcare settings in Poland. The idea of the integrated healthcare lies within the provision of healthcare services through the coordination of different activities (diagnostics, therapy, rehabilitation, health promotion), where the patient is the final beneficiary (Stranberg-Larsen and Krasnik, 2009). A coherent set of services is planned, managed and delivered to individual service users across a range of healthcare organizations and by a range of co-operating professionals. The lack of a consistent set of elements and a generic quality management model, which would suit Polish healthcare settings, provides the mainspring for this study. Therefore the objective is to assemble knowledge of indicators (elements) of integrated healthcare and to construct an overall quality management model, based on these elements, that covers chronic patients segments and integrated healthcare settings in Poland. The research questions are:

- 1) what are crucial items for developing integrated healthcare in Poland?
- 2) how can these elements be logically segmented and labelled in order to build a quality management model?

METHODOLOGY

This project has been financed by National Science Centre, based on the decision No. DEC-2012/05/B/HS4/02213. In order to construct the model a combination of three methods were applied.

Firstly, a literature study on elements of integrated healthcare was performed. Wherein, an element of integrated care has been defined as an activity concerning realization, improvement, innovation or sustainability of integrated healthcare, based on the quality continuum of Feussner (Feussner *et al.*, 2000). The EBSCO database was searched on recent reviews (2003 onward) in English with search terms “integrated care” and “quality

management". As a result we obtained 270 records, which were reviewed and refined, focusing on the elements of integrated healthcare. This stage of the research let us reach the international perspective and state-of-the-art studies in quality management. The reviewed papers referred mainly to healthcare systems in West-European countries and United States. Among many of them, there were works conducted by Armittance, Suter et. al (2009), Goodell, Boderheimer and Berry-Millet (2009), Kroger, Touringny et. Al (2007) and Ouwens, Hulscher et. al (2009).

Secondly, Delphi methodology has been applied. In this way expert-based knowledge has been used to complete and restrict the list of elements of integrated healthcare, derived for the literature study. In a Delphi study, carried out by the means of CAWI, 34 experts experienced in integrated healthcare, commented and prioritized 95 items in two anonymous rounds. Respondents were asked, using Likert rating scale, to rate the importance of each element for developing integrated healthcare in Poland. This Delphi procedure let us come out with a final list of indicators for the design of a quality management model for integrated healthcare settings in Poland.

Finally, Concept Mapping was applied in order to cluster the elements, position them on a map and analyze their content. During three-hours long session with the expert panel, each expert was asked to individually cluster the identified dimensions with a maximum of 12 segments. The data generated by the experts were used for the statistical procedure. Multi-dimensional scaling and cluster analyses have been used to design the model. After that, experts were divided into nine groups. Each group labeled and described one cluster.

FINDINGS

The literature study and then two Delphi rounds generated a set of elements that formed a basis for a quality management model for integrated healthcare settings in Poland. The hierarchical cluster analyses resulted in a nine-cluster representation. The additional statistical analysis of sort similarities between experts finally demonstrated values between 0.59 and 0.89, showing a high similarity in clustering. Based on the experts' subgroup discussions we received the following labels of the nine clusters: 1) "structural integration", 2) " patients' support", 3) "clinical decisions' support", 4) "patient centeredness", 5) "information integration", 6) "management of patient pathways", 7) "cross-sectoral cooperation", 8) "coordination of activities", and 9) "trust and commitment". Each cluster has

been composed by from 4 to 17 items. A final step in the Concept Mapping procedure resulted in the four poles, corresponding with the clusters' contents: "internal processes", "external process", "delivery system" and "performance management".

PRACTICAL IMPLICATIONS

Polish healthcare managers could use the model proposed in this study as a useful tool for quality management. The model has thus a potential to serve evaluation and improvement purposes in integrated healthcare settings and to make more informed managerial decisions. The above presented findings provide the basis upon which healthcare managers could design effective quality strategies. It is possible to put the results to further use, especially in designing:

- the quality indicators in integrated care settings;
- the evaluation framework to assess integrated healthcare practices;
- the improvements' programmes focused on quality management concerning both internal and external processes;

The research findings let us draw the conclusion that in the competitive environment in which Polish healthcare providers now operate, understanding quality indicators that encompass the holistic approach towards healthcare delivery is essential. The proposed model exhibits new dimensions that strongly focus on effective collaboration and conditions for integrated healthcare.

RESEARCH LIMITATIONS

The present study develops a basis for further research in quality management in integrated healthcare settings in Poland. Firstly, the nature of the literature study and the use of expert-based knowledge cannot fully guarantee that no important quality items are omitted. Secondly, there is a need for further methodological studies to assess validity and reliability of multidimensional cluster analysis in healthcare sector. To date, published research in the area is scarce. The external validity could be improved by replication of the study in other healthcare systems. Contextual variables such as health reforms, history of quality and management practices could have an impact on the results. Thirdly, more research is

recommended into the involvement process of other stakeholders of health sector, especially chronically ill patients.

ORIGINALITY

The paper contributes to the discussion concerning the methodology of quality management for integrated healthcare. The application of hierarchical cluster analysis made it possible to observe the multi-dimensional character of quality indicators in health sector. This systematic approach can be treated as a promising framework for developing quality management model also in other service sectors. It offers quality managers a chance to see the quality process in the innovative way and to boost the satisfaction of both external and internal customers of their businesses.

The study contributes also to theory building. It adds value because it creates a conceptual model of complex concept, by identifying quality elements and bringing them together in clusters. Proposed model is well-suited for health sector in Poland. It extends existing quality concepts by adding new dimensions, i.e. network cooperation and process integration.

THE IMPLEMENTATION OF FORMAL AND INFORMAL HRM PRACTICES BY MIDDLE-MANAGERS IN THE PUBLIC SECTOR: THE CASE OF CYPRUS

Sakka, Georgia

University of Nicosia, Cyprus, geosakka@cytanet.com.cy

ABSTRACT

Research on public and private sector organisations asserts that organisational actions are managed via formal and informal practices. The term formal practices is used to describe the practices that are designed by governmental authorities and are included in the formal documentation of the public sector organisations. These define the procedures, rules and instructions according to which people management is formally organised (Kotey and Slade, 2005). Informality refers to policies of management of people in an organisation that are mainly based on unwritten customs (Cunningham, 2007) but are equally important for the day to day operation of any organisation, public or private. As Truss and Gratton (2006) add, if something is formally planned, this does not mean that it will be implemented, and if something is not planned it may be implemented but through an informal way. They argue that the fact that some HR practices may be implemented without explicit prior planning or that some planned HR interventions are never implemented, has never been explored in detail. Kotey and Slade (2005) also explains that the term 'formal' is linked to prescribed documented practices and include procedures, rules and instructions that are formally designed. Taking into consideration both the formal and the informal aspects of the HRM strategy of a public organisation, it has been suggested that in order HR function to be successfully implemented, both a formal strategy and daily operations (day to day reality) should be adopted and implemented successfully (Human Resource Management Strategies, 2005).

Relating to the formal and informal matters of an organisation, the role of managers in public sector is to find a balance between the broader institutional context and the organisation-specific Human Resource Management (HRM) practices (Gestel and Nyberg, 2009). Their role seems challenging as they are expected to combine both formal and informal practices on a day to day basis. However, the role of managers in relation to the adoption and implementation of HRM practices is strictly connected with the character of a public system. Cyprus belongs to the Mediterranean/South European Tradition with a strong centralised

traditional system (The Impact of Individual Assessments, 2007 and Georgiou, 2012). The majority of Southern European countries (75%) have centralised public systems (The Impact of Individual Assessments, 2007). Specifically, it is a public administration tradition country and all the HR policies, practices and principles are controlled centrally (Georgiou, 2012). Via this study a completed picture of managers' role in centralised institutional context will be pursued. The aim of this study is to assess the extent to which a range of factors such as centralisation, impact the extent to which formal and informal HRM practices are adopted by middle-managers. Therefore the contribution will be to unfold the rationale of HRM practices adoption by managers, in a modern-centralised public- sector government and to explore empirically the conditions that affect this adoption in order to assist the recent public centralised sector in the design and revaluation of this system.

In private organisations, there is extensive research on how managers perform their role in centralised organisations with strong bureaucratic elements and strict central policies, rules and regulations (Francis, 2006). The level of formality and informality of HRM practices in small private firms has been examined largely in the past; mainly in order to identify if there is a link between the size of the firm and the formality of HRM practices (Hornsby and Kuratko, 1990; Kok and Uhlaner, 2001). It has been concluded that not only the company's size, but also the organisational strategy and resources, the practices by CEO (Kok and Uhlaner, 2001), the culture (Daft, 1998) and also the owners-managers' control have an impact on the level of formality in small private organisations (Kok and Uhlaner, 2001). A research accomplished by Mayd (2009) in private organisations (in small and medium enterprises of Sri Lanka), discovered that the informal HRM practices are positively connected with higher organisational performance. *"While formalization enhances the level of professional and management control, the informal culture can be a source of competitive advantage of SMEs"* (Mayd, 2009, p. 564).

However, in public sector this kind of research is not so widely extended. As far as the public managers' role is concerned, theoretically it has been suggested that further research is needed for addressing managers' role in relation to the formal HRM practices and implementation (Alnagbi, 2011). McConville (2006) argues that it is necessary to research the expertise and investigate the conditions according to which managers perform effectively their role. Furthermore, it has been suggested that while there is concern for the certain government strategies from a theoretical perspective, there should be given more concern on the actual effective implementation of those practices on a local level. The practices adopted

even by a public organisation must meet the needs and the requirements of the specific organisation (Human Resource Management Strategies, 2005).

In addition, Hayton (2005) and Kok and Uhlaner (2001) believe that a theoretical explanation that will address the formal and informal aspects of HRM is in need. This study is based not only on the exploration of HRM practices but specifically designed to identify the extent that middle-managers implement formal and informal HRM practices in the public centralised sector. It will identify the extent and the way that managers implement formal and informal practices in the public sector organisations of Cyprus, and also the parameters and factors that affect their adoption.

Consequently, a conceptual framework that will elucidate and further clarify the adoption of formal and informal HRM practices will be developed. The purpose of this study is to create and test a model that predicts the adoption and implementation of formal and informal HRM practices by middle-managers of modern-centralised public sector. This framework therefore aims to aid middle managers of centralised public sector to effectively blend HRM formal and informal practices.

For the collection of primary data, a combination of qualitative and quantitative methods will be employed. Semi-structured interviews will be conducted with the middle-managers of the public organisations (ministries of the Republic of Cyprus), in order to identify: a) the level of implementation of both formal and informal HRM practices and b) the reasons, the circumstances, the conditions and even the barriers that picture this situation in recent centralised public organisations. Following this, a questionnaire consisted by closed-questions (using a five-point Likert scale) will be distributed to the employees of the organisations in order to enable a triangulation regarding the implementation of formal and informal HRM practices by middle-managers in public organisations.

SOCIAL RESPONSIBILITY AS DRIVER OF COMPETITIVE SUCCESS IN SMEs IN THE REGION OF EXTREMADURA

Sánchez-Hernández, M. Isabel¹; Gallardo-Vázquez, Dolores²

¹Faculty of Economics and Business Administration, Business Management and Sociology, Badajoz, Spain, isanchez@unex.es

²Faculty of Economics and Business Administration, Accounting and Financial Economy Department, Badajoz, Spain, dgallard@unex.es

Keywords: Social Responsibility, SMEs, Competitiveness, Competitive Success, Innovation, Performance, Extremadura.

INTRODUCTION

The small business environment today is very dynamic and competitive. The contribution of Small and Medium Enterprises (SMEs) has been recognized as main actors for sustaining economy because of their capacity in enhancing local economies output and fostering regional development and population welfare. On this basis, this paper assesses the specific relationships between Social Responsibility and competitive success in SMEs. Moreover, firm performance and firm innovation are also considered very important mediator variables in this primarily relationship.

The paper is structured as follows. First we indicate the problem and objective of the paper developing the conceptual framework. Later, we define the methodology and show the analysis and results. We finish with some conclusions and future research.

SOCIAL RESPONSIBILITY AND COMPETITIVENESS IN SMEs

SMEs are considered as main actors for sustaining economy because of their capacity in enhancing local economies output and fostering regional development and population welfare but, unfortunately they are not always managed to assume social responsibility as an important axis of their strategies to get competitive advantages. The purpose of this paper is to present an empirically-tested model showing the social responsibility orientation is a factor of success SMEs. It attempts to bridge social responsibility orientation with competitive success.

Competitive success has been identified as a key achievement of firms who have been undertaking SR actions, understanding success to include results that go beyond just the financial sphere. We considered that a firm has competitive success at regional level when it is able to attain a favorable position in the market and obtain superior results, while avoiding the need to have recourse to an extremely poor retribution of the factors of production. To measure competitive success, we considered aspects of competition related to human resource management, the managers' capabilities, aspects of marketing, the quality of products or services, and the levels of quality in organization and management, technological resources and information systems, financial management, shared corporate values, and adequate organizational structure and know-how.

METHODOLOGY

The methodological approach, a structural equations model (SEM) has been selected because it allows incorporate directly unobservable abstract constructs (latent variables), as is the case of SR and competitiveness. Despite the heterogeneity of the results and conclusions to be found in the literature, most of relevant contributions indicate that firms which are carrying out actions of social responsible actions perform better. In the proposed model, SR of a firm has being considered a second order construct being reflected in other three sub-constructs according with the Triple Bottom Line defined by Elkington (1994): a) The economic dimension; b) the social dimension; and c) the environmental dimension. Firm performance and firm innovation are also considered as mediator variables.

A questionnaire was elaborated to inquire into the manager's perceptions concerning each construct, with responses on a 10-point Likert scale. The sample, representative of regional SMEs in Extremadura (Spain), comprised 758 firms with their corresponding predetermined substitute firms to control the non-response index.

RESULTS AND CONCLUSIONS

The results suggest that managers and owners in SMEs are also concerned in assuming social responsibility principles. SMEs must ensure that internal and external aspects of SR management are taken into account in order to implement their strategies to be successful in their markets. SMEs need to be more proactive, trying to include responsible

actions in their management. Understanding social demands they would make enterprise efforts in competing much more likely to succeed.

The results of the current study are context specific. In the near future, authors will expand the study to other regions in Spain and other countries with a large representation of SMEs as Portugal for instance, to test the validity of the model and to be able to generalize conclusions. The present work is just a beginning, and further work on a variety of regions in the Mediterranean area will be necessary if a reliable picture of SR as key success factor for business competitiveness is to emerge. The authors trust that this article may represent a first step towards the further examination of the relationship between SR and competitiveness in the Mediterranean SMEs.

AN EXAMINATION OF HUMAN RESOURCE EMPOWERMENT APPLIED TO THE PUBLIC SECTOR: THE CASE OF GREEK RESEARCH CENTERS

Sarri, Stavroula¹; Kriemadis, Thanos²; Papaioannou, Alkistis³

¹Department of Primary Education, National and Kapodistrian University of Athens, Greece, stavi_sarri@hotmail.com

²Department of Sport Management, University of Peloponnese, Greece, thanosk@uop.gr

³Department of Sport Management, University of Peloponnese, Greece, alkistisp@uop.gr

ABSTRACT

PURPOSE OF THE STUDY

Human resource empowerment has come to be seen as a vital strategy for the organizational success and improvement in the public sector (Fernandez & Moldogaziev 2011). Research has pointed out the critical role of empowerment in the public sector in promoting employees' effectiveness (Nyhan, 2000; Fernandez & Moldogaziev 2011). A critical part of the public sector is the research centers which, if they are to be successful in accomplishing their mission and objectives, should be staffed by people with vision, people who innovate, people who promote knowledge, people who create knowledge. Various researchers have looked at the dimensions of empowerment through different perspectives. The literature on employee empowerment can be divided into two groups: managerial empowerment and psychological empowerment (Papaioannou, 2009). Human resource empowerment refers to a change strategy with the objective of improving both the individual's and the organization's ability to act and to operate more effectively in an extremely competitive environment (Papaioannou, et al., 2012). The primary purposes of this study were: (a) to determine the extent to which human resource empowerment is applied to research centers of Greece, and (b) to examine the relationship between human resource empowerment and managers' educational background of the research centers.

DESIGN/METHODOLOGY/APPROACH

The study was a quantitative design and the analysis was exploratory in nature. Descriptive statistics and Independent samples T-test were used to examine the purpose of the study, using SPSS software (version 17). The authors addressed the research to all research centers of

Greece (12 research centers, which are inspected by the General Secretariat of Research and Technology of the Ministry of Education and Religion, Culture and Athletics) and involved 145 senior researchers (who lead the research teams) who were the most knowledgeable regarding personnel management issues. Responses were received from 120 head researchers of 12 research centers with a 82.7% response rate. For the purpose of this study a 30-item questionnaire, was used (developed by Vogt & Murrell, 1990, focused on the issue of empowerment, and modified and simplified by Kriemadis, 2011 & Papaioannou, 2011), in order to provide information on how senior researchers see themselves in terms of the human resource empowerment process and demographic characteristics, using a five point Likert scale. The scales represented three different managerial styles which were: (a) the “empowering style” of management, (b) the “middle-ground style” of management and (c) the “controlling style” of management. In the first case the senior researcher has a managerial style that reflects the manager who creates and shares power. In the second case the senior researcher has a managerial style that combines the two styles of controlling and empowering in equal proportions, and in the third case, the senior researcher is concerned with control or seldom shares, creates or empowers subordinates. The reliability of the scale was found to be: $\alpha = .80$.

FINDINGS

From the analysis it is shown that senior researchers used 65% “empowering style”, and 35% “middle-ground style” in the six key factors of human resource empowerment (Total of all Managerial functions). Furthermore, there was a significant difference in the implementation of the human resource empowerment process between senior researchers in accordance with their educational background (M.Sc. & Ph.D. educational levels). More specifically, in one of the key factors of empowerment, titled “project-planning, organizing, and system-integration skills”, the holders of Master’s degrees ($M=3.40$, $SD=.569$) had a significantly lower level of human resource empowerment when comparing with the holders of Ph.D degrees. ($M=3.72$, $SD=.595$) ($t(118) = -2.94$, $p=.004$). This result is consistent with previous studies on human resource empowerment and educational background of managers, in public sector (Pitts, 2005), and shows that the level of empowering style which senior researchers exercised in the research centers is related to their educational background. Moreover, the results confirm the theory which suggests that the good level of education, the knowledge, and the skills of

directors can lead to better implementation of the human resource empowerment process (Vogt & Murrell, 1990). No other significant differences were found. Our study implies that empowering style is applied to a mediocre extent by the senior researchers of research centers. Considering that empowerment plays a crucial role in ensuring that organizations will survive and prosper, the senior researchers of research centers can be encouraged to implement it in a greater extent. This could happen by developing an empowering culture based on a series of specific principals such as: (a) collaborative process of decision making, (b) evaluative systems, which build on the process of “valuing” and not of “criticizing”, (c) participative planning process, (d) reward systems which encourage team work and cooperation, and (e) developmental plans that emphasize career goals but also set out the training, experience, and growth in skills needed to make a progress in the organization (Vogt & Murrell, 1990).

RESEARCH LIMITATIONS

A total of 120 (82.7%) of the senior researchers of research centers responded to the survey. According to Babbie (2004), a response rate of 50% or more is generally considered an acceptable response rate in the surveys. Based on this fact and the high response rates, it appears that the results of the study could be generalized to the target population (all Greek research centers). The limitations of the study might be the honesty of the respondents and the way that each of them understands the human resource empowerment vocabulary.

ORIGINALITY/VALUE

This study is useful in extending the concept of human resource empowerment to Greek public sector, and more specifically to research centers. The study will be useful in helping directors and senior researchers, to their further understanding of the empowerment process in their respective organizations.

Keywords: Human resource empowerment, public sector, research centers.

CREATIVE ADVERTISING, CLASSICAL LEARNING AND PRODUCT IMAGE

Shuv-Ami, Avichai¹; Shuv-Ami, Sivan²

¹The Marketing & Advertising Department, The College of Management, Israel, shuvami@gmail.com

²The Department of Photographic Communications, Hadassah College, Israel, sivanshuvami@gmail.com

ABSTRACT

Research into classical learning theory and marketing generally focuses on a variety of topics: the visual and verbal content in advertising (e.g., Kim, Allen and Kardes 1996; Rossiter and Percy, 1980); the impact of repetition in absorbing advertising messages (e.g., Gorn 1982; Janiszewski, Hayden and Sawyer 2003); the influence of branding on memory; music conditioning (e.g., Blair and Shimp, 1992); and the influence of negative and positive conditioning attitudes towards a brand (e.g. Blair and Shimp 1992, Cunha and Laran 2009, Gresham and Shimp 1985, Janiszewski and Van Osselaer 2000). Recent research papers in marketing used classical learning theory to propose a monetary, goal-based model for evaluating products and consumer choices (Van Osselaer and Janiszewski 2012).

Interestingly enough, a review of the marketing literature indicates that there has been no research into the creative side of advertising from the perspective of the photographer and graphic designer whom the advertising agency employs. These individuals are the professionals who create advertisements by using creative design elements to influence a brand's evaluation and image. This paper presents research that was carried out to test the impact of three creative elements on product image. Using a group of six experimental designs, two different color backgrounds, two types of clothing and two kinds of watches were compared.

The results of the current research are based on an on-line sample of 60 participants aged 20-35 who were divided randomly and equally into two groups. One group rated three pictures with backgrounds that were hypothesized to have more prestigious unconditional stimuli; the other group rated the three other unconditional stimuli which were hypothesized to be less prestigious. Each participant completed a questionnaire with nine questions about an unknown pen, the conditional stimuli, and three questions for each picture. The more prestigious unconditional stimuli contained a black background for the pen; a person using the pen dressed with a white shirt and tie; and a Patek Phillip watch placed next to the pen.

The less prestigious unconditional stimuli used a light blue background for the pen; a person using the pen dressed with T-shirt; and a Swatch watch standing next to the pen.

As hypothesized, the pen ratings (the conditional stimulus) were significantly higher when the pen was associated with the more prestigious unconditional stimuli than with the more prestigious unconditional stimuli. More specifically, an ANOVA was used to test the rating differences in between the black color backgrounds for the pen as opposed to the light blue color; a person using the pen dressed with a white shirt and tie compared to the same person in the same position dressed in a T-shirt and a Patek Phillip watch standing next to the pen versus a Swatch watch placed next to the pen.

The results showed that the black background compared to the light blue background caused the participants to attribute more quality to the pen (a mean of 7.13 versus 5.46; $F=7.341$, $P=0.011$); more luxuriousness (a mean of 6.73 versus 5.20; $F=6.733$, $P=0.015$); and somewhat more reliability (a mean of 7.53 versus 6.33; $F=2.380$, $P=0.134$). Putting the pen in the hand of a person dressed with more respectable clothing (white shirt and tie) compared to the same person holding the pen but wearing more simple clothing (T-shirt) caused participants to attribute somewhat better quality to the pen (a mean of 7.13 versus 6.00; $F=3.383$, $P=0.077$); more luxuriousness (a mean of 7.00 versus 5.53; $F=6.297$, $P=0.018$); and greater reliability (a mean of 8.06 versus 6.40; $F=8.768$, $P=0.006$). A similar impact on the perception of unknown pen's quality, its prestige and reliability occurred when a luxury brand watch was displayed next to the pen. The pen when placed near a luxurious watch brand (Patek Philippe) and then a simpler watch (Swatch) caused participants to evaluate the pen as associated with increased prestige (mean of 7.60 versus 5.93; $F=7.622$, $P=0.010$), higher quality ((mean of 7.10 versus 6.06; $F=2.524$, $P=0.123$) and more reliability ((mean of 7.53 versus 5.93; $F=9.164$, $P=0.005$).

Based on Pavlov's learning classical conditioning theory, the research presented here shows that the image of an unknown product or brand can be influenced by simply using pictures with background that has a meaning to the receiver. In advertising, pairing colors, people and brands with meaning with an unknown brand will affect how this unknown brand is perceived. Further research is necessary in order to test how many repetitions of this pairing are required beyond the original time of exposure in order to influence the memory (Janiszewski, Hayden and Sawyer 2003) of those who perceive the image.

FANS' BRAND COMMITMENT TO THEIR FOOTBALL TEAM

Shuv-Ami, Avichai

The Marketing & Advertising Department, The College of Management, Israel, shuvami@gmail.com

ABSTRACT

Sport marketing literature has dealt with the concept of fans' loyalty (e. g. Mahony, Madrigal and Howard 2000) and fans' satisfaction (e. g. Kennett. Sneath and Henson 2001). However, research in sport marketing did not examine the concept of fans' commitment to their team. The current study suggests that in sport marketing as in the commercial world, commitment to sport team is more than just loyalty and satisfaction. Following Shuv-Ami's (2012) 4E's scale, the present research suggests that in sport marketing fans' team commitment has four underlying dimensions. Two representing the affective component and two the calculative component of commitment. The affective component is underlined by the feeling of loyalty that represents the emotional attachment and by the degree of involvement with the sport team which represents the engagement attachment. The calculative component of commitment is based on satisfaction which reflects attachment caused by experience with the team and relative perception of brand performance as the functional or evaluative attachment.

The 4E's (Evaluation, Experiential, Emotional and Engagement) attachments to the brand commitment scale are reflective (Shuv-Ami 2012). That is, the direction of causality (Jarvis et al. 2003) is from commitment to the calculative and affective components of commitment and from them to the specific measures of the 4E's. Brand commitment, defined here as "a degree of attachment" to the brand, is reflected in each of the four dimensions that underline it. It is a reflective model that affects the overall commitment and whose dimensions reflect a high correlation (Jarvis et al. 2003). These four related constructs have been widely discussed in the marketing literature. This scale combines loyalty, involvement, satisfaction and performance to represent the degree that the 4E's are attached to the brand or brand commitment.

The hypotheses regarding both the measurement and structural parts of the brand commitment's nomological net with four oblique first-order factors - involvement, satisfaction, loyalty and performance – are sufficient to account for covariations of the brand commitment scale items. It was also expected that the two oblique second-order factors –

affective and calculative - explain the covariation among the four first-order factors and that an overall brand commitment underlies the two second-order factors.

Two studies were conducted. In the first study a sample of 320 Israeli football fans were used (ages ranged from 17 to 69 with a mean age of 36.6, 60% were males, and 56% had an academic education). In this study the 12-items of the 4E's Brand Commitment Scale were subjected to exploratory factor analysis with oblique rotation. According to the criteria of eigenvalue > 1 and Scree test (Hair et al., 2006) four factors were extracted. On the basis of hypothesized structure and items content, labeled in four factors of involvement, satisfaction, performance and loyalty. These factors accounted for 85.6% of the common variance, above the recommended minimum threshold of 60%.

In the second study, 245 Israeli football fans participated (ages ranged from 17 to 77 with a mean age of 37.5, 59% were males, and 56% had academic education). In order to validate the hypothesized one-third order factor model, Confirmatory Factor Analysis (CFA) was used. The CFA results for the hypothesized model and the additional three comparison models showed that the one first-order factor model had unacceptable fit indices suggesting that the most restricted model is inappropriate for explaining the scale's inter-items covariation. The hypothesized one third-order factor model, the one second-order factor model, and the four correlated first-order factor model showed acceptable fit to the data.

The two studies suggest that brand commitment, as measured by the 4E's scale, is a valuable and valid concept in measuring fans attachment to their football team. Future research may study the impact of this measure of Brand Commitment on the behavior of such fans toward their football team, toward other teams in football or in other types of sport.

ABSTRACT

The 1990s were a period of reforms for the Portuguese Public Administration. Within the philosophy of the New Public Management, hospitals from the government business enterprise sector have at their disposal a set of instruments associated to private management which allows them to implement a more efficient trading policy, controlling, therefore, the costs of resources.

Portugal is going through a serious financial crisis, and the Memorandum of Understanding (MoU) is forcing public expenses to be considerably reduced. The health care system is a sensitive one, where the reducing of expenses has to be dealt with additional care and is organized around a National Health Service (NHS), whose main source of funding is Government budget's transfers. In fact, some of the proposed measures regarding health care sector contained in MoU, aiming at introducing mechanisms for future control of expenditures, were already present in the recommendations of the report commissioned by the Portuguese government on the financial sustainability of the NHS [Barros, P. P. (2012),]. "Health Policy Reform in Tough Times: The Case of Portugal", *Health Policy*, Vol. 106 No. 1, pp. 17-22].

Through a combination of Resource Dependency Theory and Institutional Theory as an integrative conceptual framework, this study aims at understanding how environmental and organizational factors had impact in the introduction of management practices, particularly in what concerns antibiotics and its costs. For this purpose a longitudinal case study research of a hospital, belonging to the government business enterprise sector, in the North of Portugal, is developed, for the period 2009-2012.

The study makes use of a combination of quantitative and qualitative data. The quantitative data consist in a set of 35639 observations for the above mentioned period of time, concerning

the expenses with the consumption of antibiotics, which are one of the most important costs for hospitals and have a significant weight in the total of pharmaceuticals. The choice of antibiotics is reinforced by the fact that these drugs are subjected to very standardized measures of prescription by doctors. The qualitative data is obtained through in-depth interviews with key agents in the organization.

Being such a particular drug with a significant importance in the costs of hospitals, the study demonstrates that the combination of trading policies, exceptional measures to reduce public expense, the adoption of generics in the Portuguese market, and the competition among pharmaceutical companies has implications in management practices, and these practices influenced the consumption and costs supported by the hospital and in the hospital's performance indicators.

Key words: New Public Management, Health Care System, Drugs, Hospitals' Costs and Performance Indicators, Resource Dependency Theory, Institutional Theory.

ACHIEVING QUALITY AND EFFICIENCY BY IMPROVING PHYSICIAN MEDICATION ORDER ENTRY IN THE HOSPITAL SETTING

Silva Martins, Anabela¹; Macedo, Isabel Maria²; Silva, Joana Isabel³

¹University of Minho, School of Economics and Management, Portugal, anabela@eeg.uminho.pt

²University of Minho, School of Economics and Management, Portugal, imacedo@eeg.uminho.pt

³University of Minho, School of Economics and Management, Portugal, jifcs@sapo.pt

ABSTRACT

Purpose: The purpose of this study is to evaluate the implementation of a computerised physician order entry (CPOE) system in the hospital setting.

Healthcare systems are, currently, under great pressure to reduce costs and to increase productivity while meeting efficiency and quality goals. Within the context of budgetary constraints, such concerns are widely shared across the globe by governments and public agencies. Thus, the need to balance growing demands on the system with sustainability objectives implies the adoption of more effective management frameworks. In the public hospital setting, several reforms have been implemented during the last decades to respond to such pressures. Although assuming different contours, a common theme in most programs and initiatives were target at improving the quality of information technology systems required to support more rational and cost effective management decisions (Mosebach, 2009; Robbins, 2007; Simonet, 2008).

Within the context of hospital organisations, CPOE systems have been increasingly adopted. These systems integrate a complex set of standardised routines which also include electronic prescription and integrated drug management facilities. In general terms, its use is often associated with error prevention in prescribing and dispensing (Schiff and Rucker, 1998). In the present study, the implementation of a drug prescription system derived facility (stop-orders) conceived to automatically determine the period associated with antibiotics therapy prescription is analysed. In particular, we examine the impact of stop-orders implementation on the patterns of antibiotics consumption in a large Portuguese Hospital Trustee. CPOE systems have been the focus of much research addressing different aspects which include but are not restricted to patient safety, cost and efficiency, alerts, time, satisfaction and usage (Eslami, Abu-Hanna and Keizer, 2007). However, research undertaken to examine the impact of a stop-order computerised system in the hospital setting is rare. Therefore, this study is

particularly relevant, considering that the prevention of medication errors and the delivery of better health care services are critical issues in the public health agenda.

Design/Methodology/Approach: A quantitative methodological approach was used to appropriately address the purpose and objectives of the study. This research was undertaken in large Hospital Trustee located in the North of Portugal. Data was obtained from a sample of 35,680 records related to the prescription of antibiotics for a total of 19,933 admission episodes reported between June 2009 and July 2011. In the present analysis, two different periods, corresponding to the year before and after the implementation of a stop order functionality in the CPOE system, were therefore considered.

Findings: In the data analysis, statistically significant differences were found in the consumption of antibiotics in the period before and after the implementation of the electronic tool, evidencing a significant decrease in quantity and value on the daily average consumption of antibiotics. A more detailed analysis also demonstrated that this trend is particularly noticed in the daily average quantities reported for the prescription of 17 different antibiotics (representing approximately 60% of its consumption). Therefore, this study demonstrates that significant cost reduction was achieved with the implementation of a stop orders computerised antibiotics prescription and management system.

Practical Implications: Findings of the present study may assist physicians, hospital managers as well as public policy makers to improve quality in healthcare delivery by promoting efficiency in the prescription of antibiotics medical orders. In addition, these results may encourage other health units to develop and implement similar functionalities in their CPOE systems.

Originality/Value: This study underscores the importance of evaluating the use of a computerised automatic stop-order system in the hospital setting. We have shown evidence of meaningful benefits associated with the implementation and usage of CPOE related functionality as that of stop-orders. In essence, this study concludes that the system under analysis promotes a more efficient and autonomous medication ordering with respect to antibiotics.

THE ECOTOURISM EXPERIENCE AN EXPLORATORY STUDY IN A TUNISIAN CONTEXT

Smaoui, Fatma¹; Ben Ali, Amira²

¹Marketing Department – Institut Supérieur de Gestion – Tunis, University - Tunisia, LARIME Research Laboratory, fatma.smaoui@gnet.tn

²HEC- Geneva – Geneva University, Switzerland, amirabenali@yahoo.fr

ABSTRACT

The purpose of the present study is to explore and analyze the specific motivations of the ecotourism experience among domestic tourists and to investigate about the role of the existential authenticity in this experience. An ethnographic research is led in Tunisia among a domestic ecotourism club and its members. Results show that the ecotourism experience is multi-faceted, recovering such experiences as group and social interaction, self construction or bodily feelings. The various motivations identified converge towards the quest for existential authenticity.

Keywords: ecotourism, consumption experience, existential authenticity, ethnography.

CONTEXT AND RESEARCH OBJECTIVES

The modern consumer is in permanent quest of emotions and new experiences (Holbrook and Hirshman, 1982). Tourism industry is considered as “the business of selling experiences” (Mannell & Iso-Ahola, 1987; Waitt, 2000 ; Ooi, 2002). New and alternative forms of tourism are gaining in popularity. One of these forms is Ecotourism, where tourists’ main motivations are to observe and appreciate nature in a responsible way and to respect local traditions. It has emerged since the early 70s in the developed countries, in response to mass tourism and to new environmental and social consumer concerns. The materialistic character of modern life (consumption society) has led some tourists to look for “authentic experiences” (McCannell, 1976 ; Wang, 1999). Nature based tourism offers favorable conditions for such experiences. Ecotourism can be ranged as an extraordinary experience that offers consumers intense feelings and vivid memories (Kim, 2010).

The concept of authenticity has played an important role in understanding tourist motivation and experience. In early tourism studies, researchers emphasize objective authenticity where Tourists experience original, genuine objects and displays offered to them (.....). Later, Wang (1999) introduced the concept of “existential authenticity”. Feelings of authenticity are not related to objects but to an internal state of being, activated by the activities of the tourists, especially when engaged in an “extraordinary” experience. (Kim and Jamal, 2007). Wang (1999) identifies two main dimensions of authenticity: interpersonal and intrapersonal dimension.

In Tunisia, a south Mediterranean country, this form of tourism is at its beginning. There is no specific government interest for ecotourism, and therefore, very few investments are devoted to this area. Besides, domestic population sensitivity to environmental issues is not important and there is almost no specific culture of ecotourism among local population. However, in recent years, we can observe the emergence of some domestic groups, using social network or social to organize and practice based nature tourism activities.

The research questions of the present study are the following: What are the deep motivations of these domestic tourists? What drives them to be interested in the ecotourism experience in their own country? What relationship do they have with the self, with others and with nature? And what place for existential authenticity in their nature based experience?

The purpose of this research study is then to explore and analyze the specific motivations of the ecotourism experience among domestic tourists and to investigate about the role of the existential authenticity in this experience.

METHODOLOGY

An ethnographic approach is adopted. The ethno-methodological approach helps exploring individual motivations, but also understanding the group members’ behaviors (Fetterman, 2010). Ethnography was led among an eco-tourists group “Eco Vadrouille Club de Tunis” identified and contacted through Facebook, the most popular social network in Tunisia. This club was founded in 2008 by two friends who were nature lovers and wanted to discover natural sites of their country. We checked the profile of the group adherents, examined their blog and the photos published in their facebook account. The ethnography lasted 11 months. We participated to six visits to eco sites ranging from mountain to sea sites, interviewed main

club members and participants, had continuous contact with the main founding members of the group, took pictures and wrote down all our observations and thoughts.

RESULTS

The immersion in the “Eco Vadrouille Club” universe, supported by the participant interviews and other ethnographic material allowed identifying the main motivations of the participants in the ecotourism experience. This experience is multi-faceted, recovering such consumption values as group and social interaction, self construction, bodily feelings, etc. Group members are indeed driven by various motivations of different intensities, but all these motivations converge towards the quest for existential authenticity as conceptualized by Wang (1999). This search for authenticity is allowed by the interactions of each member of the group with others, and with nature. Wang identified two main existential authenticity dimensions, interpersonal and intrapersonal. However, little research has been carried out on the meanings and components of these main dimensions.

Interpersonal dimension of existential authenticity: interaction with the different members of the group but also with the local inhabitants is among the main experiences looked for by almost all the participant. As suggested in Wang (1999) authentic human relationship constitutes for our informants an important axis of tourism experience. Feelings of confidence and solidarity as well as a sense of community are frequently evoked by the Club members. Meeting with the local population has grown in importance over the time, to become a ritual. The social exchange with the local inhabitants covers two dimensions: a utilitarian dimension (asking for information about the site) and a “human” dimension (discussing with villagers, sharing meals). This social exchange of experiences is also an opportunity for ecotourists to think about their lives, and to question some of their attitudes and behaviors.

Intrapersonal dimension of existential authenticity: the quest for self through environment and nature interaction. The natural environment in which takes place the ecotourism experience offers participants a variety of vivid emotions: wonder, fear, risk taking, discovery. Participants are in continuous search for their identity and authentic self. The intrapersonal dimension of this experience covers two main facets: *body feelings* generated by the contact with nature (excitement, anxiety, sensation of lightness and well being) and the *self reconstruction* resulting from the break with the daily norms and routine, the discovery of cultural and ecological heritage and the emergence of an alternative self. Ecotourism activities can release

individuals and their body of the binding rules and help him regain his authentic self not controlled by social norms.

In conclusion, we can argue that the concept of existential authenticity in the sense of Wang (1999) provides a relevant conceptual framework to explain the experience of ecotourism, where nature is the central axis of the experiment. Our research study emphasizes the specificity of the natural element in this experience. The particular context of this ethnographic research (local tourism in developing countries) have helped to identify some features of this experience, such as the importance of the local population contact and the contribution of the ecological heritage discovery in the reconstruction of the authentic self.

A REVIEW OF THE CURRENT SITUATION OF GENDER DIVERSE CORPORATE BOARDS AND THE IMPACT OF MORE DIVERSITY

Snorrason, Jón Snorri

School of Business at the University of Iceland, jon@hi.is

The paper gives an overview over the number of women serving on corporate boards and will analyse the development and find plausible explanations of the present situation as women in Western countries hold only about 15 percent of board seats. A discussion about how to increase the number of women on the boards of corporations is prominent, followed by a debate about if a mandatory legal framework or a voluntary regulatory framework is the best method to increase the gender balance in business leadership.

We will introduce recent research papers in this field and explore the impact of more diversity on firm performance. We will address the question: Are more gender diverse boards likely to perform better than firms lacking the diversity?

The evidence in the research papers show that gender diversity on corporate boards can contribute to more effective corporate governance through a variety of board processes, but do not show up as a direct influence on the firm's bottom line and thus is inconclusive of the effects of gender diversity on firm performance, but better performing firms tend to have more women on the board.

Why are so few women on corporate boards considering in Europe and the USA, women account for approximately six out of every ten university graduates and represent almost half of the labour force. Lack of gender diversity in business leadership has been in the spotlight, both in Iceland as elsewhere in Europe.

There are many potential explanations for this gender imbalance. The main assumption is that there is a glass ceiling, an invisible barrier to the advancement of women at the top levels in the business sector. Norway was the first country to introduce a quota for women on company boards in public limited companies (plc) and the Norwegian quota law can be seen as a direct regulatory push to break the glass ceiling. Since its introduction the number of women on board has reached 40 per cent as required by the law. But did the diversity and increased number of women on boards have positive influence on the number of women in top management positions in the same firms? The data from Norway did not support the hypotheses that women's presence on corporate boards leads to a greater number of women in management positions (Teigen, 2011).

Research by Adams og Ferriera (2009) and Böhren og Ström (2010) show the correlation between the size of the firms and women on boards. The increase in the number of women board members was partly achieved through an increase in board size, firms respond to external pressure for board diversity, or firms have developed internal preferences for diversity. All would account for a greater demand for female board members.

In several European countries a debate has begun on how to increase the number of women in leading positions in business. Many European countries are currently debating whether or not to impose quotas and legislation in this respect. The question of whether or not quota legislation is needed to reach this goal is highly contested.

There is significant opposition to this process and the main concern is that increasing the number of women on boards would increase a sense of tokenism (Storvik og Teigen, 2010). Erkut, S., Kramer, V. W. and Konrad, A. M. (2008) find that such issues are reduced when there is more than one female director and this opinion is shares by Adams og Ferreira (2009) Terjesen og Singh (2008).

Another main counter-argument is that regulation of the gender composition of corporate boards would is not fair. Recruitment to corporate boards should not be based on the gender of candidates. The owners should have the right to select the candidates they find most suitable to sit on the board and board appointments should be made on the basis of business needs, skills and ability.

Iceland is the 2nd country in Europe and in the world, after Norway, to implement quotas on gender in boards of corporations. In March 2010 legislation on a minimum of 40% of either gender on boards for companies (with more than 50 employees) was passed in the Parliament with an adaptive period until 1 September 2013. Women hold only around 20% of boards seats and similar number of women is in top managements in Iceland.

There is a large international economic literature that has analysed the relationship between women in leadership and on boards and the economic performance of firms. Still, there is no consensus about the direction and strength of these relationships (Terjesen and Singh 2008).

Although we find evidence that women tend to serve on better performing firms it is difficult to see whether more profitable firms demand women on board or the women seek and choose to be on the boards of the better performing firms. Therefore, we fail to find convincing evidence that gender diversity in the corporate boardroom is a value enhancing strategy.

Different types of measures of economic performance are used in some of the more recent studies. The results suggest that there is a statistically significant positive relationship

between having members of both genders on the board of a company and its performance. The most common empirical proxy is market value of the firm per unit of book value (Tobin's q) and measures such as Return On Assets (ROA) and Return On Equity (ROE). There is no body of research which demonstrates how the appointment of female directors can improve a company's performance.

Adams&Ferrera (2009) point out that the evidence on the relation between gender diversity on boards and firm performance is difficult to interpret and appears to be complex as one key challenge is to isolate the causal effect.

The Norwegians Böhren og Ström (2010) find that the current politics of board design cannot be justified by valuation arguments and evidence does not provide support for quota-based policy initiatives. Mandating gender diversity in the board room should be considered an inherent part of a broader political program to ensure equal opportunities. Proposals for regulations enforcing quotas for women on boards must then be motivated by reasons other than improvements in firm performance. Implementing such a program seems costly for stockholders, but may still be beneficial for society at large.

THE INTRODUCTION OF ACCRUAL ACCOUNTING IN THE ITALIAN PUBLIC SECTOR: THE 'EXCEPTIONAL' ACCOUNTING TREATMENT FOR FINANCE LEASE

Sorrentino, Marco

Department of Legal Sciences and Economics, Pegaso Telematic University, Italy,
marco.sorrentino@unipegaso.it

ABSTRACT

Starting in the early 1980s, the major English-speaking countries⁴⁹ adopted sweeping innovative processes in the public sector. In different ways and with different degrees of intensity, these processes eventually affected the great majority of the western democracies (Pina and Torres, 2003).⁵⁰ These changes, following the New Public Management (NPM) model (Anselmi 2003, Barzelay 2001, Gruening 2001, Hood 1995), were inspired by managerial approaches aimed at eliminating bureaucratic obstacles (Barzelay 1992) and raising efficiency, accountability and results-orientation in the complex world of public administration (Seccolini 2003).

A fundamental role in this reform process is played by changes in accounting measurement and recognition systems (in this case, the literature speaks specifically of New Public Financial Management – Guthrie, Humphrey and Olson 1998; Jackson and Lapsley 2003). It has been characterized by a gradual shift from cash accounting, which aims to control processes, to accrual accounting, which is typically used in the for-profit sector and aims primarily to evaluate results (Pina and Torres 2003, Hepworth 2003).

Though the trend to adopt accrual accounting in the public sector has not been uniform in its path or its pace, over the years it has had an increasingly universal impact and can no longer be considered a prerogative of the English-speaking countries. To the contrary, the fact that a great part of the literature, both technical and academic, makes continuous reference to Australia and New Zealand as pioneers of a full-accrual accounting system may have limited the consideration and analysis of the experiences of a growing number of countries around the world that are now implementing this radical change, and in some cases have already done so (Carlin 2005; Deaconu, Nistor and Filip 2011; Grossi and Soverchia 2011; Osterkamp 2007; Paulsson 2006). Even in those parts of continental Europe and Latin America where

⁴⁹ Meaning here Australia, Canada, New Zealand, the United Kingdom and the United States.

⁵⁰ Regarding the process of putting public administrations in Italy on a business-like footing, see inter alia Anselmi 2001, Borgonovi 2005, Steccolini 2003.

historical, cultural and structural aspects have limited its diffusion, today it is hard to find instances of the use of a solely cash basis accounting system (Morphett 1998).

The following table summarises the status of accrual accounting in the public sector of different countries.

Table 1

Public sector accrual accounting	
Country	Introduction of accrual accounting in the public sector
Austria	Accrual accounting only partly introduced: assets are recognized, but no depreciation; stocks and provisions are not recognized, but income and expenditure are on an accrual basis.
Belgium	No or not known.
Czech Republic	Accrual accounting for fixed assets and stocks but not for tax revenues.
Denmark	During the 2000s.
Estonia	During the 2000s.
Finland	During the 1990s on central and sub-central level.
France	During the 1990s on local level; 2007 on central level.
Germany	After 2000 on local level; around 2005 in some federal states (Berlin, Bremen, Hamburg); no present consideration for the central level.
Hungary	Pure cash accounting on all levels of government.
Italy	After 2000 on local level; no present consideration for the central level.
Latvia	During the 2000s.
Lithuania	Accrual accounting for fixed assets and stocks but not for tax revenues.
Luxembourg	No or not known.
Malta	Under consideration.
Netherlands	During the 1980s on local level; planned introduction on the central level postponed.
Portugal	No or not known.
Romania	2007.
Slovenia	No or not known.
Spain	During the 1990s on central and sub-central level.
Sweden	During the 1970s on local level; during the 1990s on central level.
United Kingdom	In the early nineteenth century, accrual accounting in most major municipalities; shift to cash accounting in 1866. During the 1990s shift back to accrual accounting on central and sub-central level. The reform started in the early 1990s with the introduction of accrual accounting in the British National Health Service.
EU Commission	2005.
Switzerland	In some Cantons in the 1940s; all Cantons agreed to accrual accounting in 1977; after 2008 on national level.
Australia	1997, but only on the central level; on the local level the change is currently under way.
Canada	2001.
Chile	1973 during the economic reforms under Pinochet.
New Zealand	1990; at present on of the most advanced accrual accounting countries.
USA	1997, but only on the central level; on the local level the change is currently under way.

Source: The table has be compiled from: FEE 2007, Tiron-Tudor and Mutiu 2005 and Wynnne 2003.

Italy, whose public sector is still tightly tied to cash accounting, recently took an important step forward by enacting Legislative Decree 118 dated 23 June 2011, which contains provisions regarding the harmonization of accounting systems used in the General Government Sector (meaning local and territorial government entities). This decree was intended to revise the structure and operation of the accounting systems used by Regions, provinces and municipalities (and their agencies). As of 2014, after a two-year period of

experimentation (starting January 1st, 2012),⁵¹ these entities will be required to use accrual accounting alongside their chief accounting system – i.e., cash accounting – in order to increase the information content of their accounting reports as regards both their economic performance and changes in their net worth (Ranucci 2012).⁵²

Analyzing the correlated evaluation criteria, it is interesting to observe the ‘exceptional’ accounting treatment required for finance lease. In contrast with a formal and legal approach, typical of the Italian accounting tradition, it has been substantially authorized the use of capitalized lease method according to IPSAS 13 – *Leases*.

Considering this background and the explicit recognition of leasing as a suitable financial operation for the Italian General Government Sector (Finance Act 2007), the paper describes the key elements of IPSAS 13 and focuses on the accounting treatment to use in Financial Statements of both lessee (principally) and lessor (less).

As a result, the author shares some observations on the possible effects generated by the application of this international accounting standard within the Italian public sector context, describing the advantages in terms of external (or political) and internal (or managerial) accountability that this kind of ‘exceptional’ accounting treatment could produce.

Keywords: accrual accounting; public sector; Italy; leasing; IPSAS 13

⁵¹ Pursuant to the Prime Minister's Decree dated 28 December 2011, 85 local-government entities (5 regions, 12 provinces and 68 municipalities) were involved in the two-year experiment (2012-2013). By 13 July 2012, six out of the 68 municipalities (Turin; Grazzanise; Sospirolo; Naples; Frosinone; Porto Cesareo) had been excluded from the experimentation.

⁵² Encouraging the use of accrual accounting in the public sector was not a totally new idea in Italy. Law 142/1990 and Legislative Decree 77/1995 had already required local government entities to file balance sheets and income statements; these rules were reenacted in 2000 in the Consolidated Text on Local Government Entities (“TUEL”).

THE WORKPLACE MOBBING: THE NEGOTIATED CODES OF CONDUCT AS EFFECTIVE CONTRAST AGENTS

Spanò, Isabella

Italian Ministry of Labour, Territorial Directorate of Parma - University of Modena and Reggio Emilia, Italy, ispano@lavoro.gov.it.

ABSTRACT

PURPOSE

The phenomenon of “workplace mobbing”, or also, more restrictively, “bossing”, is taking today, in Europe, but not only, substantial proportions, also regarding to the generalized social instability on many fronts, from the ethical to the economic, that had an effect also at the organizational level.

It is therefore worth examining what are the more suitable organizational tools to avoid that employees are affected by this phenomenon, considering, apart from the primary direct negative effects on the single individual, its negative redundancy on corporate productivity.

Consequently, this study, leaving out the specific legislation - in Italy, for example, it still does not exist - aims to verify if in the European context codes of conduct already exist not only as a result of a management choice, but also as an outcome of enterprise bargaining, such as to prevent the emergence of mobbing through the cogency of organizational behaviors and / or methods explored by the organizational science (private sector) / science of administration (public sector), eventually promoting the “workplace decency”.

It's true that many codes are written by factories, and the corporate codes with more employee participation in general are set by workers' organizations or prepared by multi-stakeholder organizations: so it is interesting to examine if there are codes, with a specific section or articles devoted to mobbing, arising from the collective agreement of employers and workers; moreover, if it is possible to think to a new example to such a code of conduct.

DESIGN/METHODOLOGY/APPROACH

The first part of the research focuses on the examination of codes of conduct at the enterprise level in Europe, covering “antimobbing” measures, such as the *appointment of a Confidential Counselor or a Company Counselor, as determined by* the EU Resolution A3-0043/94.

In the second part the paper particularly stresses the importance, to face mobbing, of any codes of conduct resulting from corporate collective bargaining, highlighting the opportunity of a preventive bargaining as “close” as possible to the workplace: to this purpose it shows an appropriate rigorous demonstration.

By an experimental approach, in the third part the paper proposes a detailed model of an “antimobbing” code of conduct framed in a broader model of decentralized collective bargaining, showing its better quality (stability - effectiveness) compared to the classic examples.

The conclusions consist in a global inductive evaluation of the previous findings.

FINDINGS

The research primarily demonstrates the importance of the collective bargaining instead of, or in addition to, the unilateral granting of codes of conduct, in whole or in part devoted to counter the phenomenon of the workplace mobbing. In particular, it offers a new model of such a negotiated code.

ORIGINALITY/VALUE

The main originality of this research is to develop a new model of decentralized collective bargaining agreement providing detailed organizational measures to prevent the workplace mobbing. This is made from the established knowledge in the organizational sciences and from the most current examples in this field.

Keywords: Workplace mobbing, bossing, organizational behavior, codes of conduct, HR management, corporate collective bargaining.

ABSTRACT

Brands are everywhere and so are people's accomplishments. A brand carries a signature, a unique attribute that is infused in the outcome of a specific value-adding process. This signature inspires feelings of respect from the brand's environment that come to be the actual and sustainable trust for the unique value it holds.

From a broad perspective anything can be a product and by extension any product can have a signature, but having a signature does not make any object a brand. A product is anything that can be offered within a market that *might* satisfy a want or a need. In contrast, a brand has to be earned. A brand is not a commodity and it is not a product. A brand is a life partner for its valued customers that has come to be an unchallenged part of their lives.

When *The Coca-Cola Company* replaced its cash cow with New Coke in 1985, its hotline received 1,500 complaint calls per day and the psychologist hired from the company to monitor the calls remarked that some people sounded as if they were discussing the death of a family member (Oliver, 1986). Coca-Cola is a brand.

Brands have come to be unique cultural attributes of our world that have satisfied profound needs and provided unsurpassable value. This is the narrow approach, for it may seem general, but brands are so much more...more in what they consist of, since brands are not only products of a firm and more in how they come to be, since brands are entities that more accurately resemble systems in themselves than outcomes of systems.

One million years ago, fire itself was a brand for *Homo erectus*; whereas today the latest brand to take over the world via the uncontested global internet democracy is the meme *Harlem Shake*, instigated from a single YouTube upload in the beginning of February 2013 that led to thousands of viral replications. As a result, the world spent roughly 2,782 years watching Harlem Shake videos in one month (Feb. 2013). With human life expectancy being 67.2 years (global average, 2010), this means that in only one month people globally spent collective

time that is equivalent to over forty individuals watching the Harlem Shake internet meme from birth to death ceaselessly.

Branding (brand management) is not a conceptual marketing element, but a function that is certain to be one of the underlying factors of a sustainable competitive advantage. A brand may be a project in perpetuity (and even if it is not it should be considered as such) and since one of the key conceptual principles of a firm is permanence (Brealey *et al.*, 2012), the same principle must be applicable to its brand(s). In addition, all major components of strategic management apply in branding. What a firm utilizes and implements in regard to a brand is not some arbitrary execution of production, financing, marketing and management activities, but a never ending quest for excellence.

In 2004 the concept of lovemarks intended to replace the concept of brands, asserting that brands inspire high respect but low love and that only lovemarks inspire love and respect simultaneously (Roberts and Lafley, 2004). This under consideration, there may be brands that might not inspire love, but in the present context the brand is considered the ideal (even if this means that it is no longer a brand but a lovemark).

The principles of branding can be effectively applied to individuals and not because people can be thought of as products, but because by correlating brand management with self-management, the individual is given a powerful conceptual framework towards self-motivated and self-driven accomplishment. The ethics of branding (Lair *et al.*, 2005) along with marketing myopia (Levitt, 1960), corporate or personal misconduct and fraud are instances that must only be mentioned; since branding is not a tool to be utilized in order to befool. Branding practiced for any activity other than adding value consists of branding abuse (Gall, 2010) and will inevitably lead to inadvertent situations as can be observed in our modern systems of financial, political and social intercontinental crises.

Self-assessment is considered to be one of the key contributing factors in the effectiveness of accomplishing one's goals, in improving performance (Trujillo, 2009) and is the first step towards a personal branding project. Through the utilization of the fruits of the research community, along with concepts rooted in project management and strategic management, a value-system consisting of ten distinct parameters is proposed, containing the components that may be included in personal branding. This value-system is interwoven with the principles and structure of the balance sheet in order to provide a concise and practical framework that is able to aid the personal branding project of any individual, not as much in

the wave of self-help philosophies but in the direction of a *transparent* branding being (Hewer *et al.*, 2013). Said value-system is differentiated from other self-assessment instruments since it utilizes a projected assets approach that can include needs assessment as well as the strategies in order to obtain these assets; though instead of sources and applications of funds one will have sources and applications of values.

In time when crisis give no other chance, business people become innovative at the limit law. This research have canvassed the way that crisis has affected the business in Romania, identifying in this particular mode the innovative services that lead to sustainable development in times of crisis. Corroborating all these data, in one stream of investigation it is conceptualized a four dimension model of social innovation environment, taking into account the real opinion of people who face problems on this market.

Keywords: crisis, model, innovation, online, clustering, networking

RESEARCH METHODOLOGY

Gallouj and Weinstein (1997) outlined six innovation models that could be used for describing service innovation. They distinguish between radical innovation, improvement innovation, incremental innovation, ad hoc innovation, re-combinative innovation and formalization innovation.

Pim Den Hertog (2000) presented four dimensions for service innovation: the service concept, the client interface, the service delivery system/organization, technological options.

Innovation in services, rarely represent just changing certain characteristics of a service. Offering a completely new service may differ considerably from offering an existing service using a new distribution channel. For example the reason why most of the companies didn't survive in the online environment is that they didn't have a particular concept for online. More than that, they did not follow a precise strategy that can approach them with customers. The way the service provider interacts with the client can itself be a source of innovation. They didn't take into account the technological innovation. The linking between these four dimensions is very important, because a complete new service will mean that a new service delivery system will have to be developed, employees will have to change the way they work or relate to customers (the client interface), the way IT is used in business processes, while a new service concept may also be involved.

RESULTS

Based on the principles of Gallouj, Weinstein and Pim Den Hertog and after a detailed review upon the business environment from Romania this research proposes for analyze a four-dimensional model of social innovation in the online environment.

The four dimensions are: client, strategy, promoting, clustering and networking

The first dimension: The client

In times of crisis, the one from which you must start when you develop / open your business is the client. Unlike the traditional sale when you are the one who is looking for the client to sell, in the online environment, the client is the one that is looking for you, and if the page that represent you has a constantly updated content and enrolled in several directories, than the client will find you without too much effort. Furthermore, the client must be involved in designing and structuring the product range.

THE SECOND DIMENSION: THE STRATEGY

The strategy is always the best response to a crisis situation. In times of crisis, whatever its form of manifestation, the random action without any direction and without clear objective is likely to result in impulsive and risky behaviors with adverse effects. The strategy is the one that lucid examines the growth and potential that organization demonstrates, analyzing its efforts to specific, controllable and reproducible objectives.

The third dimension: Promoting

Most companies have fallen into the online environment because they have no longer allocated financial resources to marketing and promotion with the coming crisis. Promotion is the key to success in the online environment. Internet advertising campaigns are very facile and at a very low cost to anyone. An unfrequented site is something nonexistent. As a site to be visited, to reach his goal, should be visible to his current and future clients and visitors.

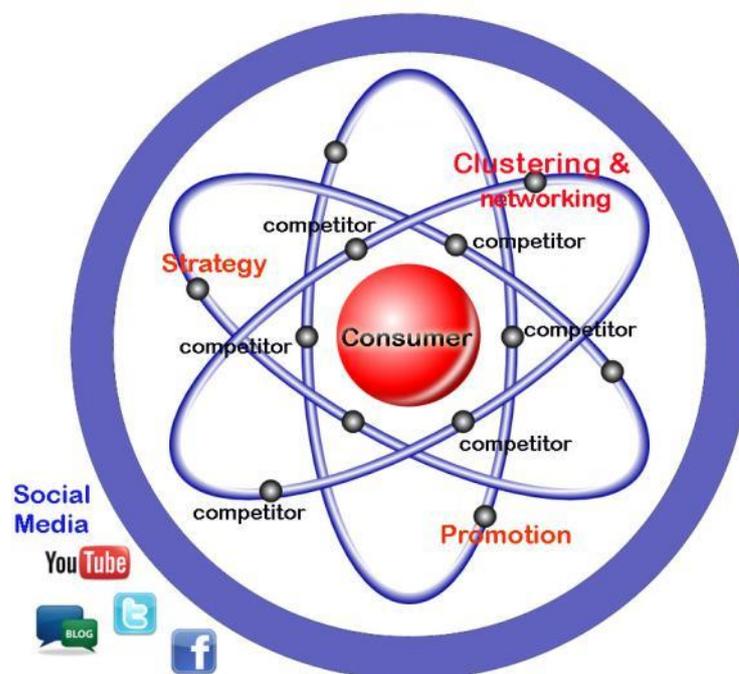

The fourth dimension: Clustering and networking

Affiliation and the creation of new networks offer benefits to the sites. The evidence of development that have appeared until now demonstrates that relations of cooperation and joint action are most likely to occur when companies operate in proximity. Proximity in the online environment means to be part of the same groups or clusters. Besides the fact that fixed costs are smaller the websites are easier to be coordinated, being fostering mutual knowledge and trust. Proximity in terms of the distance to the client means a mouse click away.

Linking the four dimensions

Any social innovation in the online environment involves some combinations of the above-mentioned dimensions. A completely new service or product is the more difficult to be sold online, than on the traditional market. The four-dimensional model that we propose, can be observed in figure no. 1.

To cope with competition, and to maintain on the market, the product must respond exactly to the customers' needs, in this case to the needs of a customer that experiment an economic crisis. In times of crisis, customers place great emphasis on the financial resources, because this is what they lack.

*Figure 1. A four-dimensional model of service innovation in online environment
(original material)*

The non-stop electronic businesses are the solution for companies that want to be competitive in the new digital economy. For this purpose, the companies must fulfill some basic conditions: to operate nonstop, to be present on the Web, to maintain permanent contact with the clients, partners, employees, suppliers, to have networked storage solutions that allows the management of a huge volume of information, to have solutions for virtual applications through which to ensure the permanent availability, scalability, performance and security.

ABNORMAL INVESTOR RESPONSE TO THE INDEX EFFECT FOR DAILY AND INTRADAY DATA

Tavor, Tchai

Department of Economics and Management, Yezreel Valley College, tchai2000@yahoo.com

ABSTRACT

The stock index is the basis for the existence of various index instruments such as ETFs and index funds. Consequently, events in the index are of considerable importance in the investment world. One of the most important of such events involves updating the index, an event taking place once or twice per year, with effects on the capital markets that are known as the 'index effect'. This anomaly draws one of strongest and most influential long-term effects on the capital markets. Using two different methods, I examine in this study the broadest impact of the index effect on the Israeli capital markets. I shall examine the three leading market indices, the Tel-Aviv 25 index (TA25), the Tel-Aviv 75 (TA75) and the Tel-Tech 15 index (TECH15) for entering and exiting firms both for daily and intraday data. In the first examination, I divided the sample based on each of the three market indices and examined the effect using daily data. This analysis shows that the market responds differently for firms entering and exiting the Tel-Aviv 25 index, than it does to the two other indices. For the second examination, the sample was divided based on each stock's volatility during the period prior to the event, using intraday data. This analysis shows that more volatile stocks respond stronger to the indexing event.

INCREASING ECONOMIC NEED SATISFACTION ON THE PUBLIC SOCIAL SOFTWARE PLATFORM FACEBOOK – INSIGHTS FROM THE AIRPORT INDUSTRY

Tenge, Marion

University of Latvia, Latvia; University of Applied Sciences Kufstein, Austria; email: marion.tenge@gmx.net

ABSTRACT

Purpose: The adoption of public Social Software Platforms (SSP) by individuals and business organizations is no longer in a state of infancy, but on “the verge of commoditization” (vor dem Esche and Hennig-Thurau, 2013, p. 30). 92.6 % of German Internet users have registered with at least one SSP, while the average German Internet user maintains a profile on three SSP (ibid, p. 13). SSP can be described as “digital environments that support human communication and collaboration. Contributions and interactions are globally visible and persistent over time” (McAfee, 2006, n.p.). SSP provide the infrastructure for business organizations to extend beyond organizational boundaries and establish network connections with their customers. Network ties that cross organizational boundaries, i.e. bridging social capital, have been acknowledged by scholars of various disciplines as a major source of competitive advantage. However, as Porter (2006, p. 225) noted, “the mere presence of firms, suppliers, and institutions in a location [i.e. SSP] creates the potential for economic value, but it does not necessarily ensure the realization of that potential”. The purpose of the paper is to explore, if airport organizations are able to increase their economic need satisfaction when interacting with their passengers on the online social network Facebook. Facebook captures the majority of German Internet users with an audience of 38.6 million unique visitors per month and 25.0 million registered active users (ComScore, 2013).

Design/Methodology/Approach: The paper adopts a Strategy Map approach (Kaplan and Norton, 2004) to propose cause-effect-relationships between leveraging the intangible asset ‘bridging social capital’ on SSP and economic need satisfaction of airport organizations. The Strategy Map framework considers intangible assets “as the ultimate source of competitive advantage” in today’s knowledge society (ibid, p. 10). Strategy Maps vary by industry and strategic focus of organizations (Kennerley and Neely, 2003). Hence, a generic airport industry Strategy Map was developed by the author. Based on the developed Strategy Map five economic needs were identified: ‘customer insights’, ‘operational process efficiency’,

'innovative strength', 'customer advocacy' and 'customer satisfaction'. As economic needs are theoretical constructs they were operationalized by indicators.

A semi-structured questionnaire was constructed and distributed to six out of the eight major German airports (annual passenger volume > 5 Mio.). The airports Berlin (Tegel/Schönefeld) and Cologne-Bonn were excluded from the study. The existing airports in Berlin will close down due to the planned opening of the new airport Berlin Brandenburg International. Cologne-Bonn focuses predominantly on the low-cost traffic segment and is therefore only to a limited extent comparable to the other airports in the sample, which have a rather balanced traffic segmentation. Based on the questionnaire face-to-face interviews with the airports' Corporate Communications Managers responsible for social software activities were conducted in the time period from November 2012 to January 2013. The questionnaire included both open-ended questions and likert-scale ratings. The likert-scale ratings report to what extent the respondents agree that Facebook increases the economic need satisfaction of airports as compared to traditional communication channels, such as e-mail, call-center or corporate website. The interviews were recorded and transcribed. The results were submitted to quantitative analysis (aggregation of likert-scale items to variables, analysis of distribution of variables) and qualitative analysis (text analysis, item identification based on frequency of occurrence). As SSP are a relatively recent and fast changing phenomenon and little knowledge currently exists regarding the adoption of SSP of organizations, it was necessary to integrate quantitative with qualitative analysis to be able to draw meaningful conclusions.

Findings: While airport organizations already experience some increase in economic need satisfaction when comparing SSP to traditional communication channels, they are not yet able to tap into their full potential. Despite that the number of Facebook users connecting to airports is constantly increasing, the critical mass for passenger insights and feedback to be fully representative is not yet reached. This currently restricts the utilization of Facebook as an instrument for market research or active involvement of passengers in innovation processes. Currently, communication goals, i.e. fostering positive word-of-mouth or faster information dissemination in case of air traffic disruptions, have priority over other business process-oriented goals. This is not surprising, as the Facebook activities of airports are anchored in the Corporate Communications Department. Airports are currently only at the beginning of a transition process for a more interdisciplinary approach to Facebook management. Hence, they are currently facing the challenge of adapting organizational structures, routines and resources.

Limitations: The study reports on German airport organizations. This restricts the generalizability of research findings to other countries. As SSP are a still emerging phenomenon a longitudinal study would be beneficial to assess changes in economic need satisfaction of German airport organizations caused by an increasing adoption of SSP by passengers. Notwithstanding the study focuses on the airport industry, it can be adapted to any other industry by adopting an industry-specific Strategy Map approach.

Originality/Value: The Balanced Scorecard / Strategy Map framework has been criticised by scholars for being too internally focused, while failing to consider relations maintained with the external environment (Bontis, 1999; Mooraj *et al.*; 1999; Norreklit, 2000; Saint-Onge, 1996). By integrating the intangible asset bridging social capital into the Balanced Scorecard / Strategy Map framework the paper responds to the need for acknowledging the extended value chain as an “essential element of today`s networked organizations” (Mooraj *et al.*, 1999, p. 482). From a practitioners` point of view the paper contributes to an understanding of the organizational challenges that need to be addressed by airport organizations to be able to exploit the full potential of SSP.

Key Words: social capital, social software, strategy map, economic needs, airport industry

THE DETERMINANTS OF E-GOVERNANCE AND HOW TO ESTABLISH A SUCCESSFUL RELATIONSHIP WITH CITIZEN

ABSTRACT

The knowledge based socio economy is more and more emerging due to IT tools and innovation changes of markets in any fields. Social innovation is part of our lives but usually we don't notice its effects. This paper focuses on the value created by the emergence of e-governance concept, shaped in different processes. It emphasizes on the important role in meeting citizen's needs and solving their problems by using resources and technologies. More than ever the request for electronic services and programs are needed for the interaction with citizens. The result should be the general well-being, social satisfaction and a consolidated relationship between the state and its citizens.

Most of the things that are now granted in our lives usually appeared for the first time as an innovation. Geoff Mulgan describes how in specific periods in our history, civil society provided the perfect scene for creating social innovation. The wave of industrialization and urbanization was accompanied by various forms of social enterprise and innovation: building societies, cooperatives, trade unions, etc. (Mulgan, 2006).

Social innovation represents all the activities and services that are motivated by the goal to meet a social need and are spread through organizations that have a social activity core. The starting point for innovation is usually an idea of a need that is not being met. Ideas are generated by needs which involve searching for alternatives and solutions. In the current conditions of a volatile social, political and economic environment, the ability to use the information in an intelligent way requires a coherent strategy and vision in order to identify the essential points of leverage. This is where the concept of social innovation and business intelligence interferes.

Social innovation results are permanently present in our lives: zero carbon housing schemes, when we talk to a telephone help line or the community wind farms they are all

examples of social innovation because they bring new ideas that work in order to meet people's needs and improve their lives in the same time (Mulgan *et al.*, 2007).

The concept of smart communities refers to the locus in which such network intelligence is embedded. A smart community is defined as a geographical area ranging in size from a neighborhood to a multicounty region which citizens, organizations, and governing institutions deploy an NICT (National Institute of Information and Communications Technology) to transform their region in significant and fundamental ways (Eger, 1997). Clusters and communities should become interlinked, and they must be viewed and treated as parts of a local ecosystem where interests converge as communities grow. This is the path proposed by the concept of smart communities.

"A truly smart community will need to develop comprehensive plans to address, in more depth, the issues surrounding access and education to ensure that all citizens and all organizations converge on the opportunities to benefit from the knowledge-based economy" (Coe *et al.*, 2001). Furthermore, while there is little doubt about the increasing importance of the local nexus of the government and smart communities, technology alone cannot transform how people and organizations interact and promote their collective interests in processes that are fundamentally different from what is currently happening.

E-governance is a form of social innovation, a platform within the public sector and a significant discipline within the field of public administration. It is an online platform of the government, where it delivers services and programs, provides information and interacts with citizens. Public institutions will need to make sure that the e-governance platforms are user-friendly, interactive and easy to access (Riley, 2003). Some of the main benefits after a proper e-governance implementation are: a simplified process of information for both users and businesses; empowerment of the citizens to gather information related to any department of government and to get involved in taking decisions; citizen participation at all levels of governance; services automation; the elimination of corruption; transparency; better delivery of services and most important the strengthen relationship between the two parts involved.

We require social innovation because we need smart ideas to improve our lives. E-governance will become more and more important due to its important role: supports and simplifies governance for all parties: government, citizens and businesses (Backus, 2001).

Particularly, by using an e-governance platform we offer society the chance to improve its capacities in solving its problems. Moreover, while the current paper represents

an introduction to the determinants of the e-governance and citizen relationship success, further research in the field of social innovation and e-governance is needed in order to test the validity of the most important expressed ideas. Using the anchors provided, concrete steps should be taken to increase the efficiency of the relationship between citizens and government. Also, some differentiators that have a high contribution in deciding the nature of the relationship should be emphasized. Furthermore, a study on the Romanian market will lead to results in a thorough knowledge of how e-governance platforms permit the development of a new level of communication between Romania's citizens and public institutions, so that the individuals will use the information in achieving their goals. The research will have its limitations since in Romania there are less than 50% Internet household users.

GENDER ROLE STEREOTYPES AND REQUISITE MANAGEMENT CHARACTERISTICS: EVIDENCE FROM GREECE

Tsoukatos, Evangelos¹; Giovanis, Apostolos²

ABSTRACT

BACKGROUND

Although the number of women pursuing management careers has grown quite rapidly in the last decades, women *remain* substantially *underrepresented* in upper-middle and senior management positions while the number of female CEOs in large corporations remains extremely low. Quite a number of theories attempting to explain this phenomenon appear in the literature, including lack of line experience, inadequate career opportunities, gender differences in socialization, the “old boy” network etc. (Schein, 1973, 1979, 2001, 2007)

Alternative explanations involve gender-role and requisite management characteristics stereotyping by men and women (Schein, 2001, 2007; Eagly and Carli, 2003). In this respect, seminal is the work of Helen Schein who in 1973 introduced a 92-item Index (Schein’s Descriptive Index) of human personality characteristics that was subsequently used to unveil gender-role and successful managers’ stereotypes; that is, determine genders’ perceptions of each other and managers with the view to developing adequate understanding of perceptual barriers limiting women's progress towards occupying management positions. Schein’s (1973) “think-manger, think-male” aphorism was subsequently and up to the present day researched in quite a multitude of settings (Brenner et al., 1989; de Pillis et al., 2008; Dodge et al., 1995; Schein et al., 1989; Orser 1994; Booysen and Nkomo 2010) with reported results considerably varying. With a few distinct exceptions (e.g. Booysen and Nkomo, 2010) however, most published studies report findings from, allegedly egalitarian, protestant societies. To the best of the authors’ knowledge no published study exists on evidence from Greece.

Not having researched a particular topic in a specific culture would not justify per-se setting up a study if “gender paradoxical” findings hadn’t been reported proposing gender role stereotyping and gender – related personality differences to be significantly larger in more

gender egalitarian cultures as compared to less egalitarian ones (Costa et al, 2001; McCrae et al., 2005). Hence, pursuing further the investigation of gender role stereotyping across different cultural settings will supplement existing knowledge on the subject and certainly add to the literature.

Purpose

The purpose of this study is to follow the research trail on the relationships between gender role stereotyping and requisite management characteristics, originated by Schein (1973), on evidence from Greece that reportedly stands quite apart (e.g. Hofstede, 2005) from the protestant – egalitarian societies that so far have hosted studies on the subject reported in the literature.

DESIGN/METHODOLOGY/APPROACH

This study is quantitative in nature. Data was collected through a research instrument built around Schein's Descriptive Index (SDI) (Schein, 1973) in two stages. Stage one dealt with collecting evidence on respondent's perceptions of personality characteristics of managers while stage two with collecting evidence on respondents' assessment of own personality characteristics. Questionnaires were administered on-line to two separate samples of $n_1=134$ and $n_2=101$ respectively. All items, except demographics, were rated on identical 7-point Likert scales. Intra-class correlation coefficient (r') (Hays, 1963) was used to assess resemblance of stage one and stage two respondents' responses across the 92 SDI items.

RESULTS

Data analysis resulted in findings directly challenging Schein's "think manager think male" maxim and, on the other hand, offering support to previous culturally paradoxical findings suggesting gender role stereotyping being larger in gender egalitarian societies. (Costa et al, 2001; McCrae et al., 2005). This study resulted in findings indicating that: a) perceptions of managers' personality characteristics between men and women are matching, b) the idea that managers should have masculine characteristics is challenged and c) no differences between men and women were revealed in relation to identification of own personality characteristics.

IMPLICATIONS/LIMITATIONS

This study's findings yield important implications to both academia and practice. In relation to academia the study adds to the literature on existing relationships between gender role stereotyping and perceptions of managerial personality characteristics. As regards practice the study unveils lack of gender role stereotyping and significant similarity of personality traits across genders, both leading to the conclusion that popular aphorisms such as "Think manager – Think male", "Old Boys Club" etc. are seriously challenged in Greece, even though the countries cultural position is not considered as being among the most egalitarian in Europe and the world. Limitations of this study are certainly related to: a) drawing evidence from a convenience sample and b) surveying through the internet. However, due care was taken so that sampling bias was excluded.

ABSTRACT

Basing on a dense activity of literature review and on the results of a pilot study, the purpose of this work is to analyze the role played by deliberate learning mechanisms in building an alliance management capability, thus improving a firm's alliance performance.

In today's competitive environment, firm's ability to manage interorganizational collaborations, defined *alliance management capability*, has been identified as an important source of competitive advantage (Dyer *et al.*, 2001; Ireland *et al.*, 2002; Schreiner *et al.*, 2009). As a consequence, several scholars have addressed the question of how firms should develop such a capability. Building on organizational learning and evolutionary economics, most of these studies assume that a relevant antecedent of a firm's ability in managing collaborations, and therefore of alliance success, is previous alliance experience (Anand and Khanna, 2000; Kale *et al.*, 2002; Zollo *et al.*, 2002; Sampson, 2005). However, as highlighted by several scholars, alliance experience can be considered as a necessary but not sufficient condition for building an alliance management capability, thus improving alliance performance (Simonin, 1997; Kale *et al.*, 2002; Heimeriks and Duysters, 2007). Simonin (1997) suggests that the lessons of experience have to be internalized by the firm and drawn into specific know-how in order to achieve benefits from future partnerships. Similarly, several scholars have stressed the importance of investing in *deliberate learning mechanisms* in order to leverage a firm's previous alliance experience (Simonin, 1997; Zollo and Winter, 2002; Draulans, *et al.*, 2003; Heimeriks and Duysters, 2007; Kale and Singh, 2007). The use of these mechanisms is aimed at interpreting previous collaborative experience, deriving lessons that can be used in future partnerships and diffusing alliance management knowledge within the organization.

In this study we focus on the role played by such mechanisms in improving alliance performance. More specifically the investigated research question is: Which is the effect of different types of deliberate learning mechanisms on the alliance management capability building process?

In particular, this work presents the results of a pilot study conducted on 11 aerospace firms in the Campania Region (Italy).

The aerospace industry was chosen because it is a high-tech and innovation-based industry where alliances are fundamental for firm strategy and success and, therefore, alliance management capability can be considered a key asset for a firm's competitive advantage.

We aimed at evaluating whether alliance experience (as measured by the number of alliances a firm had entered in the previous 10 years) and different types of deliberate learning mechanisms (such as: formal meetings for the exchange of relevant knowledge, alliance training systems, rotation across different partnerships of experienced alliance managers, databases containing the firm's alliance history, manuals and/or checklists for managing collaborations, etc.) have a positive effect on alliance performance. Moreover we investigated whether firms have an alliance manager or a dedicated alliance function, that is a function responsible for coordinating all alliance-related activity within the firm (Kale *et al.*, 2002).

A mail survey questionnaire was sent to firms (followed by telephone calls) and assessed by managers responsible for the firms' alliances. According to responses on alliance performance the 11 firms were divided into high, medium and low performers (Table 1).

	Number of firms	Average number of employees	Total number of alliances	Total number of deliberate learning mechanisms in use	Number of firms with an alliance manager	Number of firms with a dedicated alliance function
High Performers	4	138	55	9	0	1
Medium Performers	3	131	30	5	2	2
Low Performers	4	22	17	3	1	0

Table 1 – Results of a pilot study on alliance experience and the use of deliberate learning mechanisms in 11 aerospace firms in the Campania Region (Italy)

The findings reveal that, on average, high and medium performers not only entered more alliances but also made use of a higher number of deliberate learning mechanisms than low performers. Moreover, the study shows that only a few firms have an alliance manager or a dedicated alliance function.

The pilot study has been used in the pre-testing phase of the research design in order to evaluate the suitability of the questionnaire to be used in a subsequent quantitative analysis as well as to detect any biases arising from it, whether in its formal structure or in the semantic nature of the variables/questions used. Future analysis should allow to investigate more in depth the issue, focusing on the relation between the specific characteristics of firm's alliance experience and adopted deliberate learning mechanisms on the one hand, and on the link between different types of mechanisms and alliance performance on the other.

1. INTRODUCTION

The quality management discipline is strongly rooted in business practice. This link with practice has resulted in quality models (like the Business Excellence Models) that appeal to managers and, as a result, have been used widely. Research has shown that a universalistic approach is inappropriate because quality management is in fact context dependent (Sousa and Voss, 2001). The management control discipline has acknowledged the importance of the business context already more than a decade ago, and can provide important insights for quality management. In this paper we will discuss these insights and argue why they can benefit quality managers.

2. CONTROL SYSTEMS

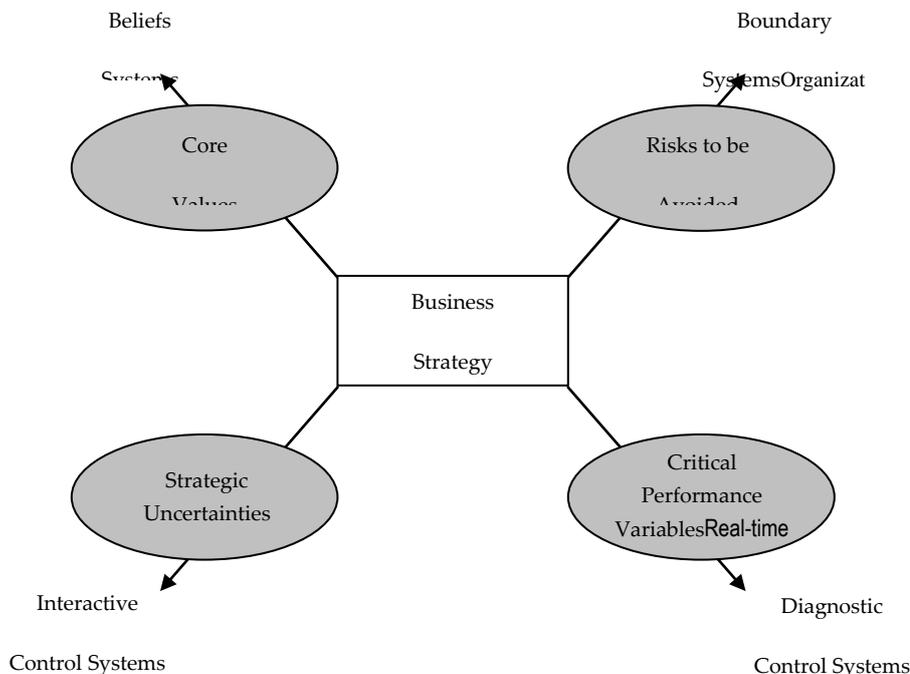

Figure 1. Simons' Four Levers of Control Model (Simons, 1995)

It can be argued that quality management can be seen as a management control system since it is aiming to control an organisation's processes and to improve these processes in response to all kind of changes and developments (technological; economical, social etcetera). This view of quality management is further strengthened by the conclusion of Merchant and Simons (1986) that definitions of management control generally contain two key concepts: "A focus on the behaviour of organizational participants and a concern with the effect of this behaviour on organizational outcomes". Simons' Four Levers of Control Model is displayed in Figure 1.

Simons' Four Levers of Control Model is used to balance control mechanisms in an organization in order to realize the business strategy. The model distinguishes four different types of control mechanisms: (1) beliefs systems, (2) boundary systems, (3) diagnostic control systems, and (4) interactive controls systems. Two of these four levers increase individual freedom (i.e. beliefs systems and interactive control systems), and two restrict individual freedom (i.e. boundary systems and diagnostic control systems). The four levers are explained below.

- *Beliefs systems*

Beliefs systems are used to inspire and direct the search for new opportunities. Managers use beliefs systems to indicate to subordinates in what direction they want the organization to go.

- *Boundary systems*

Boundary systems are used to set limits on opportunity-seeking behaviour. Boundary systems define the limits within which the management wants employees to operate. These limits are based on defined business risks and strategic choices.

- *Diagnostic control systems*

Diagnostic control systems are used to motivate, monitor, and reward achievement of specified goals. Diagnostic control systems are essentially feedback systems, which are fundamental to traditional management control. Diagnostic control systems have three distinguishing features: (a) the outputs of a process can be measured, (b) the existence of predetermined standards against which actual results can be compared, and (c) any deviations from these standards can be corrected. Because of these three features, they are designed to ensure predictable goal achievement.

- *Interactive control systems*

Interactive control systems are used to stimulate organizational learning and the emergence of new ideas and strategies (Locke and Latham, 2006). Based on the unique strategic uncertainties they perceive, managers use these systems to activate search. Interactive control systems focus attention of employees and force dialogue throughout the organization.

3. RESEARCH METHODOLOGY

An analysis of an organisation's quality systems by means of Simons' control model enables managers to look at quality from a different perspective. The model makes it possible to take strategic aspects and characteristics of the business environment into account when assessing an organisation's quality management systems. As such, it helps managers to make the switch from a universalistic approach, towards a context dependent approach to quality management. By determining in which of the four levers each of the existing quality systems fits, an overview of the dominant levers emerges. Management can then assess whether their use of each of the levers fits the environmental uncertainty and complexity. Given the fact that the business environment evolves over time, the dominant focus in terms of the control levers may be out of sync with the business environment. Simons' control model then makes clear which type of quality systems is overrepresented in the quality strategy, and which type of quality systems is underrepresented, and therefore needed for future business success.

4. CONCLUSION

What do leading European companies see as the major challenges they are experiencing in managing quality in their organizations today? Our research findings - based on interviews over a period of three years with three companies: Novaled (Dresden), Trimo (Ljubljana), Dubai World (Dubai) - indicate that uncertainty is a key issue and leading companies realize that they have to be more aware these days of uncertainties in relation to their key processes.

In order to manage the crucial uncertainties it is not enough to measure and control what is going on now. Moreover, management's time and attention, which are scarce, have to be devoted to these uncertainties in interaction with the other players that are involved in those key processes. From a management control perspective, this means that besides the diagnostic control systems that are most of the time well developed in organizations, there is a need to pay attention to the more interactive control systems. The balance between

diagnostic and interactive control systems will have to shift in the direction of the interactive systems or the diagnostic systems have to be used in a more interactive way.

THE IMPACT OF 'CREATIVITY' ON STUDENT EMPLOYABILITY*

²School of Business, European University Cyprus, S.Mihai@euc.ac.cy

PURPOSE

The year 2009, has been designated as the European Year of Creativity and Innovation (EUROPA, 2009) as an attempt to highlight the importance of creativity not only for Europe's economic prosperity, but also for our social and individual well-being. Nevertheless, despite its increased recognized importance, specifically within the European Higher Education Area (EHEA), universities have made little adjustments to their teaching practices, their curricula and to their relationship with the industry to help nurture creativity.

SCOPE AND OBJECTIVES:

more specifically, the scope and objectives of the paper are directed by a set of aspiring guiding principles identified during the literature review, as follows:

- 1 The need to generate pioneering research that will enhance and improve the current largely unchallenged teaching methods.
- 2 The need to rethink how we can teach and generate knowledge that can prepare university students to cope with the current economic challenges and which will allow them to adapt, to work in currently undiscovered jobs and face the unpredictable.
- 3 The need to involve employers in the design of the undergraduate curricula that is more relevant, as well as innovative, to the needs of the work environment.
- 4 The need to promote good teaching practices which foster creativity and enhance the quality of undergraduate competencies and skills specifically in the university sector.
- 5 The need to respond in practice to the European Commission strategy of establishing an "Innovation Union" by 2020.

The development of creativity skills for both academics and students at teaching/ learning and research levels is more important now, within the context of the economic crisis experienced in many E.U. countries, than ever before. Over the past two decades the massification of higher education coincided with a record of high unemployment rates. In fact, the European graduates of 2013 especially from South Europe are facing one of the most difficult employment challenges of the last century. During these difficult times there is an urgent need to explore the quality of the learning experiences these students receive. "It is no longer sufficient in this new society, to produce knowledgeable and erudite students. Rather,

we must produce students who can manipulate, transform and create new knowledge” (Caridad Garcia-Cepero, 2007, p.3) that is currently in much demand in revitalising the economy. Certainly, our focus on creativity skills does not imply a lesser need for critical thinking and problem solving in higher education, on the contrary it looks at creative and alternative ways of finding solutions to nowadays problems, existing theories as well as in reaching innovations. The latest represent the purpose and the link with the employers who are searching for creative labour force to overcome the increasingly uncertainty future of their businesses.

DESIGN/METHODOLOGY/APPROACH

The current paper makes a serious attempt of introducing new knowledge that is innovative and original and that is the direct result of empirical research findings that can transform creativity, and in particular ‘small c’ creativity (Begetto and Kaufman, 2007, Schilling, 2005), into specific pedagogical methods and strategies across disciplines. The paper aims to fill a missing gap of research regarding teaching in *Cypriot* universities. Many local researchers appear to focus on making their findings applicable to the entire education system, paying little attention to issues specific to the HE sector and the cultural patterns of their area. In order to reach these goals, the study has produced a critical analysis of the literature in the field and based on its findings and gaps has prepared a methodological framework, predominantly a constructivist one, which comprises of a set of 100 quantitative questionnaires to academics, a set of 6 qualitative focus groups and 30 semi-structured interviews with major stakeholders: the students, the academics and the industry. The obtained set of data has been processed under an interpretative inquiry approach, aiming to answer the gaps found in the literature review and those emerging from the interviews. This approach is commonly accepted ways of thinking about creativity, and how this is reflected in the university classes and in the industry at large.

Thus, in this paper, an attempt is made to link the ‘creative capital’, as defined by Florida (2002), and the pedagogical practices of faculty, by outlining a number of principles that, when taken together, may represent a structure for coordinating a learning environment that prioritizes the curriculum design and that which enhances creativity in universities.

FINDINGS

In the anticipated findings it appears that the part of the approach of creativity is contextual to the individual creativity thinking versus the societal creativity and that there are many ways of measuring creativity, where appropriateness (Hocevar, 1981), error and rewards (Mihai-Yiannaki and Savvides, 2012) are subjective. Moreover, when linked to employability, there is a subliminal researched link between creativity and dishonesty, bringing thus a dark shade over the concept in the industry (Gino and Ariely, 2011), which makes us pay attention to the ethics issue when delivering creativity at University level. Eventually, we found at local level that originality, awareness, the students and academics environment, the teachers creativity, the play factor, the assessments, the learning processes, the policy makers flexibility and the link with a flexible industry accepting creativity fosters it further and brings students satisfaction.

ORIGINALITY/VALUE

Finally, this paper is putting a case forward: that creativity can be fostered and learned and universities can play an influential part. At the heart of this approach is the understanding that employability, creativity and effective learning are closely linked and relate closely with the qualities rated highly by employers (Yorke & Knight, 2006).

AN INSIGHT INTO THE RATIONALITY OF ECONOMIC ENTITIES: EMERGING FROM CRISES WITH NEW APPROACHES TO SOCIAL SCIENCES

Vasile, Adrian¹; Mihoreanu, Larisa²; Bondrea, Aurelian³

ABSTRACT

Mainstream economic thought has grappled with the concept of rationality as a premise for most macroeconomic scenarios. Nevertheless, the notion that entities operate solely based on the information available and are constantly searching to maximize their utility has been placed under scrutiny in various situations. Simplistic assertions have been formulated in support of neoclassical models, disregarding the intricate nature of social phenomena. Contemporary economic developments are characterized by complexity, and consequently, require an updated methodology.

Key words: Rationality, Bounded rationality, Maximization, Social science, Behavioural Science.

ACKNOWLEDGEMENT

Adrian Vasile: Work on this paper was co-financed from the European Social Fund through Sectoral Operational Programme Human Resources Development 2007-2013; project number POSDRU/107/1.5/S/77213 „Ph.D. for a career in interdisciplinary economic research at the European standards”.

INTRODUCTION

The dynamic nature of markets has repeatedly underlined the limits of most economic models and constructions for social phenomena. The failure to determine the behaviour of large populations or the inability to accurately predict economic cycles constitute telling examples of the confines in economics and business planning. Keen (2001)

considers that a systemic flaw in neoclassical thinking consists in the presumptions of perfect rationality and profit maximization.

Earlier scholars have indicated the inappropriate manner in which neoclassical economics has considered the notion of rationality. In contrast to other social sciences, this strand of thought has considered behaviours as being uniform and consistent in time, has formulated the claim that entities are objectively rational in relation to their environment and has remained silent in regard to the goals and values of individuals (Simon, 1986).

Prior to assessing the approach to this matter, one should define the concept and identify its full implications. In simple terms, rationality describes the ability of entities to become aware of their condition and pursue the realization of their goals and objectives. In the study of economics, rationality has been associated with the efficient allocation of scarce resources (Simon, 1978). Furthermore, Simons describes the term as being characteristic to individuals who are “maximizers”, meaning that they consistently seek to optimize their solutions.

In game theory and negotiation studies, participants are considered rational when they are aware of their available strategies and potential payoffs. Additionally, the participants are perceived as being intelligent when they are rational and are concurrently aware of the rationality of others (Moorthy, 1985).

In keeping with the previous definition of the concept, rationality revolves around individual utility and the stride for its maximizing. The essential problem or inconsistency with its application resides in the generalization of utility. It is fundamentally flawed to consider that individuals share the same goals, values, preferences and beliefs. Thus, in negotiations or in macroeconomic models, it proves difficult to determine the rational response of all participants.

In the field of negotiations, a clear limit on projecting a correct rational approach to others consists in the cultural differences which exist between people of different nations, regions or backgrounds. An example of this assertion may arise in the business communication between Western companies and their counterparts in other regions such as East Asia, the Middle East or the Arab World (KhaKhar and Rammal, 2013).

A DISCUSSION ON CLASSICAL AND EVOLUTIONARY APPROACHES TO MARKET BEHAVIOUR

As Haltiwanger and Waldman indicated (1985), rationality can be understood in two different ways, initially in a broader definition which is characteristic to individuals in society, and secondly, in a meaning specific to economic studies. This paper, in keeping with most business and economic literature, focuses on the latter understanding of the term, describing rationality as the ability of entities to effectively process information and correctly establish their objectives. The same authors highlight one essential problem in the assumption of rationality which is frequently expressed in the support of equilibrium and macroeconomic models. This problem consists of the heterogeneity of market participants (Haltiwanger and Waldman, 1985). A fact which is often ignored in generalizations and theoretical interpretations of intricate phenomena is that there remains a significant variance in the ability of individuals to acquire, assess and act upon information from their environment.

For a comprehensive presentation of the various hypothesis and results employed or generated by the classical and evolutionary strands of thought, the discussion incorporates, among others, key elements from game theoretical constructions in social sciences. Classical game theory has been acclaimed as the “universal language” which provides valuable insight and unity to behavioural sciences (Gintis, 2000). Initially developed by von Neumann and Morgenstern (1944), the principles and mechanism were adopted and expanded by numerous scholars such as Raiffa (1957), Harsanyi (1986) or Khun (2004). The theoretical endowment accumulated has represented a valuable instrument for delving deep into the interactions found in multiple fields of research, from international relations, military strategy, market behaviours and business negotiation.

The realization that entities operate differently, based on the same available information, gave rise to the introduction of games in incomplete information (Aumann, 1987) and subsequently to the notion of bounded rationality patented by Herbert Simon (Simon 1956, Simon 1991, Gigerenzer and Selten, 2001). Bounded rationality has come to represent decision making depending on environmental factors and the access to information (Simon 1991). Models which incorporate this latter concept have renounced the theoretical drive for optimization or maximization (Gigerenzer and Selten, 2001) and focused on the evolutionary or adaptive aspect of behaviours.

A distinct strand of thought that has focused on the dynamics of phenomena by abandoning the notion of rationality driven equilibrium has been that of evolutionary economics (Dosi and Nelson, 1994). Deriving from biological and natural processes, the same

principles, when incorporated in the game theoretical background have generated the methodology of evolutionary game theory. Generalizing Darwin's doctrine of survival, this approach connects the size of the payoffs with the perpetuation of a particular strategy or behaviour in a given population (Weibull, 1995). By utilizing a probabilistic assessment of behaviours, the models are able to eliminate the hypothesis of perfect rationality, and can focus primarily on the adaptive nature of entities and the stability of their behaviours. Applications of evolutionary scenarios to market phenomena have been proposed (Friedman, 1998) and included in previous studies in relation to issues such as market competition or cooperation (Vasile et al. 2012).

In the absence of a consensus on the nature of economic entities, the pattern of their behaviour and the intricate mechanisms of markets, concepts such as rationality, in its pure or bounded forms will continue to occupy the scientific agendas of scholars going into the next decades.

COST BEHAVIOR OF SELLING, GENERAL, AND ADMINISTRATIVE COSTS AND EARNINGS MANIPULATION.

Venieris, George¹; Naoum, Vassilios-Christos²

¹Athens University of Economics and Business, Athens, Greece

²Athens University of Economics and Business, Athens, Greece, bnaoum@aueb.gr

ABSTRACT

This study focuses on earnings management as a significant determinant of the sticky cost phenomenon, for explaining both firm-level cost behavior and cross-country differences in cost behavior. We combine firm-level incentives to manipulate earnings with country-level differences in earnings management practices, to provide a richer understanding of the effects of these practices to cost stickiness. We find that cost stickiness is mitigated in the pervasiveness of earnings management. Our research design firstly addresses the global nature of the sticky cost phenomenon.

The traditional assumption in cost accounting literature states that the relation between costs and activity volume is mechanistic, contemporaneous and linear symmetric towards both volume increases and decreases (Noreen 1991). Anderson et al., (2003) challenged this assumption by introducing a different way of thinking about cost behavior. Focusing on the behavior of selling, general and administrative expenses, they built a new concept named as "cost stickiness" which postulates an explicit role for managers in affecting cost behavior. Managers maintain idle resources after volume declines and as a result activity costs falling less with decreases in activity volume than rising with increases.

According to the literature, managerial discretion is intricately linked with earnings management. There are different methods available to isolate the effects of managerial discretion on earnings management (Jones, 1991, Leuz, 2003, Gopalan and Jayaraman, 2012). Drawing on the earnings management literature we build on the concept of sticky costs by examining the following research question: Are the differences on the degree of cost asymmetry attributable to firm-level and cross-country differences on the earnings management practices? The subject of our study is the impact of the different management accounting practices on managerial cost behaviour and as a result on cost stickiness. Furthermore this study examines the global nature of the sticky cost phenomenon. It differs

from the past individual country research by documenting the asymmetric cost behavior of SG&A expenses for a panel dataset that comprises of firms that operate in the G-7 countries.

Keywords: Sticky costs, cost behavior, earnings management incentives.

THE CONTEMPORARY “HOMMO ECONOMICUS”: DEFINING WELLBEING AT THE CROSSROADS OF ECONOMIC GROWTH AND BUSINESS ETHICS

Viciu, Tania Georgia¹; Mihoreanu, Larisa²; Goran, Laura³

¹ASE Bucharest, Romania, viciu_tania@yahoo.com

²ASE Bucharest, Romania, lmihoreanu@yahoo.com

³Spiru Haret University, Romania, sp.goran.laura@spiruharet.ro

ABSTRACT

The concept of Hommo-economicus is constructed around the notion that wellbeing can only be maximized through the optimum allocation of resources throughout society. Thus, the measure of a sustainable development resides in the relation existing between socio-economic growth, having as proxy the human development index, on one side and business ethics seen through the magnifying glass of corruption perception index and democracy index, on the other. The paper seeks to enquire into the characteristics of individual and national wellbeing into the role and effects of corruption and to determine the manner in which these elements influence each other, and how they impact decisions of business planners and policymakers.

Keywords: Business ethics, Corruption, Quality of life, Wellbeing, Economic development.

INTRODUCTION

One of the cornerstones of the modern commercial activities is represented by business ethics. According to Zhuang (2007), this notion examines the ethical rules and principles within an economic enterprise, numerous moral or ethical problems derived from the business environment and any other special obligations applied to individuals who engage in commerce.

Economists have been driven by the concept of “homo-economicus”, corresponding with the rational understanding of utility and the consequent efficient allocation of scarce resources (Dinu, 2007).

Sustainable development advocates abandoning of short term profit goals, characteristic to numerous emerging economies (Costea et al. 2010), in favour of a

reorientation towards long term ethics and values. These two concepts are seen as drivers of robust economic growth. The challenges faced by businesses in terms of ethics reside in the intricate process of establishing the correct decision or response to market evolutions, as former US President Lyndon B. Johnson once stated “[...] doing what’s right isn’t the problem; it knows what’s right”.

Quality of life or wellbeing has become a key element to be taken into account in the policy making process, due to the fact that individuals are more aware of their place in society and have ever increasing demands. Understanding and influencing this factor has become a hallmark for business planning, as companies are realising that they can attract and retain more customers by addressing their fundamental needs. Furthermore, nowadays a major concern of any government is the wellbeing of its citizens (Fleche et al. 2011).

The approaches in defining and measuring quality of life can be divided into two broad categories: first one, the objective approach, dominated by the discipline of economics, where quality of life is measured by indicators such as reported income; and, secondly, the subjective approach, generated by social scientists where quality of life is measured by indicators such as reported happiness with life (Manrai et al. 2000).

Subjective wellbeing can be measured using indicators that have an intrinsic value for individuals that often are considered to be intangible and to some extent abstract (Viciu et al, 2012).

An accepted objective measurement for national wellbeing, as proposed by Fleche et al. (2011), is the Human Development Index (HDI). This indicator incorporates numerous parameters that portray a state’s social, political, economic evolution and stability.

Subjective wellbeing and its evolution depending on the level of income have been considered by certain research (Luhmann et al. 2011). Improvements in subjective wellbeing are considered to be the result of a comparison between current levels of income and previous or standard ones. With the passing of time, both the actual level of income and the standard are modified, increasing or lowering the perceived wellbeing of individuals.

One of the factors that influence both the individual and national wellbeing is corruption. This liaison will be referred further in to the paper.

Following a definition provided by Transparency International, corruption represents “the misuse of entrusted power for private gain”. The democratization process of emerging markets was characterized by widespread poverty, weak civil society and institutional inefficiency. These three aspects have been identified as prerequisites for an environment where corruption flourishes (Dillon et al, 2006). Subjective wellbeing of individuals is

negatively influenced by corruption as the latter generates frustration and apathy among a country's citizens.

Corruption can be present in various sectors of activity. A highly significant strand of corruption that influences the values, the culture and the professional training of individual scan be found in the educational system (Rumyantseva, 2005). Corruption in the educational sector generates a wave of social and economic problems in the long term, as the labour market is distorted, the civic structure is modified and the quality of potential future leaders is altered.

There is a strong argument in favour of the notion that quality of life is dependent on the efficient and sustainable exploitation of resources (Knight and Rosa, 2011). As a consequence, unethical or non-transparent dealings in natural resources, unavoidably encroaches on the wellbeing of individuals.

This uneasy relation between corruption and quality of life is supported further by the fact that subjective wellbeing is enhanced by: voice and accountability of persons, political stability, and government effectiveness, and regulatory quality, rule of law and control of corruption (Abdallah et al. 2008). Moreover, since studies have shown that individuals gain utility from procedural fairness and the possibility of participation in political decision making process (Brereton et al. 2009, Stroup 2007), one can assert that the lack of transparency with regard to public institutions and private corporations unavoidably reduces the actual level of quality of life.

DATA AND RESULTS

By utilising a cross-section analysis for 176 countries, this paper identifies and assesses the correlation between the Human Development Index, the Corruption Perception Index (CPI) and the Democracy Index (DI). Through this empirical inquiry, the impact of unethical behaviour is measured.

Table1 "The correlation coefficients between HDI, CPI and DI"

	CPI	HDI	DI
CPI	1		
HDI	0.665565226	1	
DI	0.635407917	0.388705933	1

Source: Constructed based on data from: United Nations Development Programme- Human Development Report, Transparency International and The Economist Intelligence Unit.

Further attention must be given to the significance of these results by applying T-student test.

$$t \text{ calculated} = \frac{\vartheta}{\sqrt{\frac{(1 - \vartheta^2)}{n - 2}}}$$

where: ϑ represents the correlation coefficient

n represents the number of observations

As the values of t calculated for the three correlations are 11.58, 10.98 and 5.58, by comparing with the Student's distribution table, one can assert that the results are significant for confidence level of at least 95%.

The economic evolution of recent years has brought about significant changes in policy making and theoretical thinking. Efficient markets are changing their focus from the factory planning economy towards a service and customer based phenomenon. This latter concept can be defined only by understanding individual needs and the level at which there are fulfilled. Thus, quality of life becomes a key element in long term policy making and business planning.

CREATING A BUSINESS COMPETITIVENESS INDEX: AN APPLICATION TO GREEK MANUFACTURING FIRMS

Voulgaris, Fotini¹; Lemonakis, Christos²

¹Technological Educational Institute of Crete, Department of Finance and Insurance, Greece, fvoulgari@staff.teicrete.gr

²Technological Educational Institute of Crete, Department of Finance and Insurance; Pancretan Cooperative Bank, Greece, lemonakis@staff.teicrete.gr

ABSTRACT

PURPOSE

The purpose of this paper is to construct a single index that reflects, as fully as possible, the measurable factors constituting firm and sectoral level competitiveness. In this research we investigate the competitiveness on company level, identifying a competitiveness Index which classifies the competitiveness of companies into three different group categories, based on micro economic factors. The study is undertaken on selected manufacturing sectors in the Greek industry, in the pre and post economic crisis era, based on firm level financial and qualitative data and firm exportability and attempts to identify critical determinants of competitiveness in the manufacturing sector.

DESIGN/METHODOLOGY/APPROACH

We present a framework to understand the meaning of competitiveness and its applications based on firm level financial data. Initially, a set of financial and economic ratios is investigated in the firms' competitiveness prediction context. The research is based on a balanced panel data set of over 771 firms from the sectors of food, beverages and textiles for the period 2003-2011. Discriminant analysis is used to test the Index and multivariate logistic regression to test the different competitiveness groups. With the help of the competitiveness index we create three categories of companies in the research sample, i.e. leading, average and falling behind. The index score will be used to classify the firms into those categories. Independent variables used are financial ratios of market share, market share growth, profitability, profitability growth, efficiency, capitalization rate, liquidity, etc. We seek to create a relatively robust index in the sense that small changes in the weighting of indicators do not greatly alter the rankings of manufacturing firms' sub-samples.

FINDINGS

Although it is an ongoing research, we seek to make comparisons of the firms' ranking on the basis of the value of each index, and to underscore core characteristics in firms'

competitiveness ranking. The results suggest a competitiveness index, which uses the same fixed weights applied to every firm (or group of firms).

ORIGINALITY/VALUE

Other studies and research on competitiveness in Greece have measured factors in isolation and have not sought to produce an overall index. The present study aims to fill this gap. The method has wide applicability to the general issue of comparing performance across different firms based on exporting and non-exporting activity and other performance variables, as well as on features that enhance firms' performance especially in the post crisis period.

POLICY IMPLICATIONS:

The index described above, can be used to measure relative company competitiveness in the Greek manufacturing sector and can give an insight to managers of firms and State officials to reinforce appropriate policies and strategies to improve the competitiveness of the Greek manufacturing firms. The development, growth and job creation of the Greek economy and every economy, is to a great extent based on its manufacturing sector. Therefore the results of this research are very important for both academics, firm executives, banks and policy makers.

Keywords: Firm competitiveness, financial performance, panel data, exports and financial performance, manufacturing, competitiveness index.

DETERMINANTS OF USER ADOPTION OF E-GOVERNMENT SERVICES AND THE ROLE OF CITIZEN SERVICE CENTRES (CSCS), IN GREECE.

Voutinioti, Anastasia

¹ATEI of Peloponnese, School of Management and Economics, avoutinioti@teikal.gr

ABSTRACT

The aim of this research is to investigate e-Government users' behaviour and the role of 'Citizen Service Centres' (CSCs) in e-Government adoption. The ultimate aim is to contribute to the understanding of the citizens' intention drivers or barriers at the local government level in adoption and diffusion of e-Government realms in Greece, by building a theory and proposing a validation research framework using a quantitative research approach. At the practical level it aims to provide guidelines and recommendations that would help e-Government policy decision makers and web designers to better plan e-Government, design and implement policies and strategies to increase the take up of e-Government services.

Although European Union has invested heavily in e-Government implementation in all country members, these implementations have varying results and delayed outcomes. The empirical findings illustrate that the adoption and diffusion of e-Government in Greece comes second last, in the 27 EU countries (European Commission, Digital Agenda scoreboard, 2010).

In Greece and other countries besides government portals the public service delivery is offered through channels like CSC offices (KEP, in Greek). These have been launched by the Greek government to facilitate service delivery and seamless interaction to citizens, to communicate their needs; to help increase accessibility of e-services by offering more points of availability of services for the public and to support the training and education needs of citizens, by facilitating the assisted use of technology. This should enable the gradual transition of citizens to 'self-using' new technology (Griffin and Halpin, 2004).

Nowadays 1.086 CSCs are running under the supervision of Greek local municipalities, operating all over the country and mostly work on behalf of citizens as a front-end of government agencies to deliver e-services (Tambouris et al., 2004). So far, they have enjoyed citizens' trust (Kalogridis St., 2007) and they are gradually being transformed to e-CSCs,

following government legislation and technical requirements in terms of security, data protection and electronic transactions.

Research in IS, in the topic of e-Government has done much to improve the e-government adoption by the end users. Recently, various theories and models have emerged on new technology and e-Government dissemination and explain adequately the phenomenon under investigation (i.e. TAM, TPB, UTAUT). However, there are remaining determinants not fully explored to be applicable for the Greek context. The reason is that e-Government acceptance depends on various factors that differentiate among different group members, particularly with regard to expectations, cultural variations, level of use and interaction, and commitment to the e-Government initiatives. Thus further research is needed.

This study following a quantitative approach uses a survey to understand citizens' perspectives regarding the role of CSCs in e-Government adoption. A conceptual model was created by extending the UTAUT (Venkatesh et al., 2003) theoretical model with the trust factor. Lack of trust is one of the most important barriers to e-service adoption, especially when personal or financial information is involved (Al-Sobhi et al., 2009).

To empirically test the extended theoretical model a measurement instrument by the form of questionnaire was used. It was constructed and tested on an appropriate sample of CSC and e-government service users. The research has refined the model by conducting exploratory research and then confirmed the hypothesized model using relevant data. The final model was tested empirically, by using the Structural Equation Modeling (SEM) approach.

This research has identified as the most important factors that affect adoption of e-Government in Greece the following: 'effort expectancy', 'trust of intermediary' played by CSCs, 'trust of the government', 'trust of internet', 'social influence' and finally 'performance expectancy'. It has also identified financial security and integration between different government departments as the most prominent issues impeding e-Government implementation and diffusion. CSCs should deliver services as e-CSCs support the training and education needs of citizens and increase their efforts for gradual transition of citizens to 'self-using' the new technology. This way Greek government supposed be able to encourage Greek citizens' e-service usage, bridge digital divide and make steps forward to electronic age.

Findings contribute to theory by understanding the drivers of e-Government adoption in local government level. It has practical implications for practitioners and web designers on

how e-citizens might increase their willingness to interact online. It will also help strategy makers to further enhance delivery of e-services to citizens through multi-channel service delivery. This study emphasises the role of CSC in assisting communication with citizens online and acting as a trusted gateway towards e-services. This clearly indicates that if Greek government works closely with CSCs, e-Government usage will increase. Further it can be concluded that e-Government websites alone do not influence citizens' attitude to adopt e-services as they are likely to seek help in CSCs to interact with government online.

It is anticipated that it will stimulate discussion among the e-Government research community, particularly in Greece but also in other countries with similar characteristics across key variables, in the planning of e-Government uptake.

THE HYBRIDIZATION OF HRM PRACTICES WITHIN MNCS: SHIFTING FROM RECEPTIVE TO LEARNING SUBSIDIARIES

Yahiaoui, Dorra¹; Chebbi, Hela²

¹Normandy Business School - France, d.yahiaoui@em-normandie.fr

²EDC Paris – France, Hela.chebbi@edcparis.edu

ABSTRACT

The aim of this paper is to highlight the characteristics of a learning subsidiary. Recently, more attention has been focused on the role played by these entities within MNCs. For Birkinshaw and Hood (2001), the subsidiaries could be autonomous, contributory or receptive. While the two first aspects value the contribution of the subsidiaries, the last one leads them to submission logic. To overcome this position, certain “rebels” subsidiaries change the knowledge and the practices transferred by their parent company to make them fit better the local context (Milano et al., 2002). Thus, the hybridization of the knowledge received may inspire other subsidiaries embedded in similar contexts. The importance of this new type of subsidiary led us to formulate this research question: How to transform a totally receptive subsidiary into a learning subsidiary?

To answer this question, several aspects could be taken into account: the role of the parent company, the Group's strategy, the characteristics of the local market and the characteristics of the subsidiary. For this paper, we chose to focus on the latter, considering the subsidiary as a learning organization. More precisely, we are interested on the identification of the characteristics that promote learning in receptive subsidiaries. The concept of the learning organization "*describes the internal capacity of organisms to learn from experience, to consider and adopt new ideas and transform them into policy and action plans in order to obtain a competitive advantage*" (Mitki and Herstein, 2011, p 455). Several studies have attempted to identify the dimensions of this type of organization (Senge, 1990; Pedler et al, 1991. Gardiner and Whiting, 1997; Watkins and Marsick, 1998; Garvin, 2000; Griego et al, 2000). Therefore, most of these studies were more focused on the domestic learning. To our knowledge, no study has been made on the international learning.

For this study, we chose to focus on the international context and mobilize the five dimensions of Senge to have a more holistic approach. In fact, Senge (1990) has introduced five disciplines to define the learning organization. The *Systems thinking* is focused on the interrelationships between different parts and helps apprehending the complexity of reality.

The *Personal mastery* is based on individual development and self-criticism. It combines a lucid perception of reality and the knowledge of personal motivations. The *Building shared vision* provides the necessary motivations to progress towards common aspirations. The *Mental models* are based on the articulation of existing knowledge. They aim at improving the representations that one has when observing the functioning of the environment. Finally, the *Team learning* is achieved through communication, discussions and creative thinking.

Despite the theoretical character of these attributes (e.g. Smith, 2008), it is also important to study their importance within the subsidiary unit. In this context, we carried out a study within two Tunisian subsidiaries of French MNCs. We conducted a non-participant observation and semi-structured interviews with 16 local managers from different departments and 4 HR from both parent companies. The interviews focused on the HRM practices transferred by each parent company to its Tunisian subsidiary (recruitment, compensation, performance appraisal and career management), the level of these practices' reception, use and learning by the locals.

The analysis of the data collected showed that the hybridization process starts as soon as the knowledge transferred by the parent company does not fit the local context of the subsidiary (Djelic, 1998; Boyer, 1998). Through a continuum of the transferred HRM practices, this study shows that the subsidiaries may modify certain global practices into a hybrid one that we call "double-iteration" learning. While other practices are totally adopted without any change that we call the "single-iteration" learning (Argyris and Schon, 1996). This different reaction is primarily due to the learning characteristics of each subsidiary. It appears that subsidiaries which are part of double-iteration learning are characterized more by three main dimensions (among the 5 of Senge (1990)): personal mastery, mental models, and team learning. In contrast, the subsidiaries which are part of learning without changing routines are characterized by a more systemic approach and a shared vision. This shared vision is fostered by different variable linked to the contextual similarities of the educational system, the labor code, the cultural influences, the strength of the corporate culture, the fascination effect, and the dominance effect.

"SOME CUSTOMERS THINK THE SERVICE INCLUDES ME" – SEXUAL HARASSMENT BY CUSTOMERS TOWARDS WOMEN SERVICE PROVIDERS

Yassour Borochowitz, Dalit

Department of Human Services, Emek Yezreel College, Israel, dality@yvc.ac.il

The twenty-first century has been labeled "The Service Age". It seems that the traditional role of family and community in meeting human's needs, has been supplanted by other social structures, mainly service organizations. In other words, we live in a society in which most human needs are supplied by organizations (Cook, Gogh and Chung, 1999). A unique quality of service organizations lies in the intensive encounter between service-providers and the organization's customers (Lu-Ming, 2013; Yagil, 2008). As such, services-providers are in danger of customers' bullying in general (Grandey, Dickter and Sin, 2004; Goussinsky, 2012) and sexual harassment in particular (Guerrier and Adib, 2000; Lu-Ming, 2013; Yagil, 2008).

The current study seeks to hear and give voice to the personal experiences of female services providers in Israel who were sexually harassed by customers.

Empirical research suggests that customers' sexual harassment is quite common for women services-providers (Guerrier and Adib, 2000; Lu-Ming, 2012; Yagil, 2008). Sexual harassment is one of the main reasons for work-stress burnout (Ben zur and Yagil, 2005; Rosen and Martin, 1997; Yagil, 2008). However, there is relatively little research conducted on the problem of customers' sexual harassment in general, and of its impact on the functioning and stress of women service-providers in particular. Since services-providing has become a major occupation in the western work market, it is important to look into this impairing phenomena and to learn more about its influence on women who experienced it.

Sexual harassment at work is defined widely as unwanted sexual behaviors that are forced in an unequal relationship, against the will of the victim of these behaviors. It includes verbal sexual suggestions (en vivo and via telephone calls), unwanted sexual stares, impersonation of body parts and actions, presentation of pornography, and any unwanted touching, fondling, attempts of rape and actual rape (Folgero and Fjeldstad, 1995; The Merriam-Webster Unabridged Dictionary, 2013).

The study is a part of a larger scale project. The present study examines the themes from a qualitative research with 30 women services-providers from Israel. The participants are all

"first-line" service providers (= in a direct contact with customers) of different services (such as shops, cellular service centers, hotels and restaurants, etc.). Their age range from 21-35, they are all Jewish, and all of them have been sexually harassed at least once by a customer in the year preceding the research interview. The interviews were in-depth, semi-structured interviews conducted by my research- seminar female students and lasted between half an hour to an hour. The participants were selected by my students because they knew them as study and work associates and through "snow ball". The only criteria for participation was being a first line service provider, a female, and having experienced at least once sexual harassment from a customer. Some of the students (three) who collected the data asked to be interviewed by others because they wanted to voice their own experience. The sensitivity of the subject, the need to receive informed consent, and the importance of privacy and secrecy were taught and discussed as part of the classes dealing with ethics in research. I received my students' agreement to use the raw data (i.e. the transcribed interviews) for this study.

The interviews included questions regarding the setting and context of the sexual harassment incident, the influence it had on the personal and working life of the interviewed women, the organizations' attitudes to it and the means it was / should be handled.

Two major themes that emerged from the interviews will be presented: 1 – The emotional and behavioral effects of sexual harassment on the life of the harassed women. 2 – Means of dealing with the harassment at work and in the harassed women's personal life.

The findings and their implications to service organizations and their policy will be discussed in light of the high burnout and soaring stress inflicted on women service – providers by customers' sexual harassment (Ben Zur and Yagil, 2005; Deery, Walsh and Guest, 2011; Goussinsky, 2012; Guerrier and Adib, 2000).

FRAMING TEAM LEADERSHIP FROM A STRATEGIC HUMAN RESOURCE MANAGEMENT PERSPECTIVE

Yüksel, Müberra

Department of International Trade and Logistics, School of Applied Studies, Kadir Has University,
Istanbul, muberray@khas.edu.tr

ABSTRACT

In cross-cultural management as well as strategic human resource management research, there is a lack of a shared conceptual understanding of organizational culture. Sustainable organizational culture is increasingly defined as a frame or a set of psychological commonalities shared by a group that prescribes codes of conduct and consequently an organizational behavior. Granting that individuals have shared experiences with members of several groups within organizations, they share, to different degrees, the cultural characteristics in each of several groups. Thus, we are all multicultural to the extent that we belong in various cultural groups within organizations. Yet, the patterns of behavior and roles played by both teams and individuals differ particularly with respect to their different contexts.

After reviewing the literature regarding organizational culture and its implications on leadership and teamwork, we have first employed Belbin's team role profile model (1993) based on role theory and typology among a few managers in the graduate class. Our research questions are: In an emergent market where transactional "solo" leadership is salient, under which organizational culture may "team" leadership according to Belbin, that is, transformational leadership (Bass, 1985) develops? Our assumption is that team leadership is a behavioral process or competency cluster which can be learned; however, it needs a supportive environment.

Most of the prior research has focused on the linkage between personality traits and team roles, we have suggested that the context is significant in the execution of team leadership. Moreover, the literature on successful teams does not focus on context in relation to leadership styles or competencies. Although the general management literature views effective leadership as a critical success factor for the high performance of organizations, the enabling and disabling contextual factors are often overlooked.

We have employed mixed methodology to be able to confirm our research questions. Thus, we have first employed Q sort methodology among 10 to 20 managers to understand how leadership and team are perceived with a spectrum of viewpoints. Then, an empirical research exploring the differences between organizational culture and/or leadership dimensions of employees in different organizations is employed. A survey is conducted for 75 employees in the three organizations that the graduate students are working. A questionnaire on organizational culture which are based on Harris and Morgan's (1994) cultural dimensions is used so that investigating the cultural differences between different kinds of organizations (e.g., multinational versus local or manufacturing versus service firms) in more detail.

On the whole, an intercultural dialogue in organizations is not concerned solely with behavioral patterns, but with perceptive and evaluative habits. While mainstream socialization promotes an attitude that equates "context blindness" with the engine of future growth as a consequence of which criteria of "objectivity-neutrality" and a search for "universality", analyzing unique contexts, patterns and subjective cultural differences pave the way for multiple readings of facts and behaviors with more focus on the past and/ or present. However one does not have to replace the mainstream thought, which is perfectly adequate when the context is not complicated and the implicit premises can be taken for granted. Instead, one may enhance it with a more thorough framework of reference. That is why, we will make both a quantitative and qualitative inquiries. Then, contextualizing and framing of specific intercultural issues at workplace through intersubjectivity (e.g. Q-sort technique or 360 framework of Belbin) is possible either with hindsight or with foresight. We will finally try to link the theoretical framework with the empirical findings, while making suggestions for further query.

ABSTRACT

BACKGROUND

All the transactions are conducted through contract. Contracts play an important role in the society, economics, law and politics. Contracts have changed in quantity and quality especially in explaining the consumer behavior due to the fact that the society and technology are becoming more complex. After one transaction such as having a meal in a restaurant, the consumers may not remember the items about the seller's responsibility in the written contract. They have their own opinions about the sellers' responsibilities. The explicit contract cannot explain consumer behaviours well and therefore, implicit psychological contract become one of the theoretical underpinnings in understanding consumer behaviours.

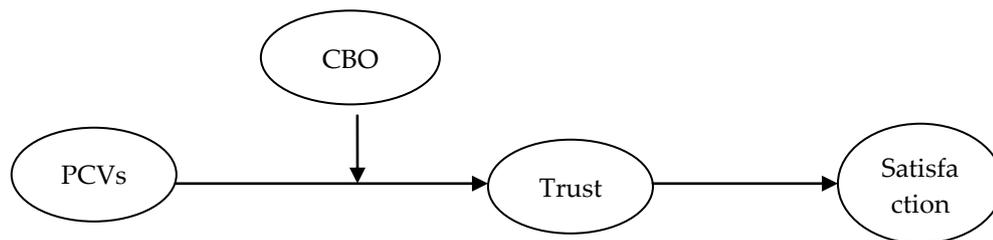

Consumer psychological contract is defined as customers' beliefs concerning mutual obligations of seller and themselves. Consumer psychological contract provides a different view of understanding consumer behaviours.

OUR WORK

Psychological contract has been studied well in the employee-employer relationships (Rousseau, 1995). In principle, it is a general concept involving two parties (Roehling, 1996), such as consultant and client (Boss, 1985), husband and wife (Dunahee & Wangler, 1974), and student and teacher (Kolb, Rubin, & McIntyre, 1984). It also includes the clients and service providers in marketing field (Pavlou & Gefen, 2005). In this study, we applied psychological contract theory to explain the antecedents of consumer's attitudes toward the service provider. Particularly, we examined the negative impact of psychological contract violations on consumer's satisfaction through the mediator of trust. In addition, the moderating role of consumer's beliefs obligations of themselves is tested in the psychological contract violations and trust link. Figure 1 presents the theoretical model.

By surveying 450 restaurant consumers, the results using structural equation model analysis and structural equation multi-group analysis show that trust mediates the relationship of consumer psychological contract violation and satisfaction, and this effect is moderated by customers' beliefs concerning obligations of themselves.

Figure 1. Conceptual model

Note: PCVs = psychological contract violations; CBMO = customers' beliefs concerning obligations of themselves

RESEARCH IMPLICATIONS

This study finds that psychological contract violations reduce customers' satisfaction through reducing customers' trust. The customer's beliefs concerning obligations of themselves moderates the link between psychological contract violations and customers' trust where the link is weaker at higher level of customer's beliefs concerning obligations of themselves. By doing so, this study enriches the research of psychological contract in a different field – from the traditional employer-employee relationship in organizational behaviour to service provider-customer relationship in marketing. For practice, this study highlights the importance of trust for managers in the service contexts. It also demonstrates that more attention needs to be paid to enhancing customer's beliefs concerning obligations of themselves as it can reduce the negative effect of psychological contract violations. Overall, this research on psychological contract violations in service context is interesting and meaning for both researchers and practitioners.
