FOREWORD

The Annual Conference of the EuroMed Academy of Business aims to provide a unique international forum to facilitate the exchange of cutting-edge information through multidisciplinary presentations on examining and building new theory and business models for success through management innovation.

It is acknowledged that the conference has established itself as one of the major conferences of its kind in the EuroMed region, in terms of size, quality of content, and standing of attendees. Many of the papers presented contribute significantly to the business knowledge base.

The conference attracts hundreds of leading scholars from leading universities and principal executives and politicians from all over the world with the participation or intervention of Presidents, Prime Ministers, Ministers, Company CEOs, Presidents of Chambers, and other leading figures.

This year the conference attracted over 250 people from over 65 countries. Academics, practitioners, researchers and Doctoral students throughout the world submitted original papers for conference presentation and for publication in this Book. All papers and abstracts were double blind reviewed. The result of these efforts produced empirical, conceptual and methodological papers and abstracts involving all functional areas of business.

ACKNOWLEDGEMENT

Many people and organizations are responsible for the successful outcome of the 6th Annual Conference of the EuroMed Academy of Business.

Special thanks go to the Conference Chair Professor Vitor Ambrosio, the Conference Organising Committee and the Faculty of Estoril Higher Institute for Tourism and Hotel Studies, in Portugal, for accomplishing an excellent job.

It is acknowledged that a successful conference could not be possible without the special co-operation and care of the Track Chairs and Reviewers for reviewing the many papers that were submitted to this conference. Special thanks to the Session Chairs and Paper Discussants for taking the extra time to make this conference a real success.

The last but not the least important acknowledgment goes to all those who submitted and presented their work at the conference. Their valuable research has highly contributed to the continuous success of the conference.

TABLE OF PAPERS

ANALYZING BASIC COMPONENTS OF PRODUCTION COST IN GREEK SHEEP AND GOAT FARMS	26
<i>Aggelopoulos, S.¹; Tsiouni, M.²; Pavloudi, A.³; Chioteris, C.⁴.....</i>	<i>26</i>
FACTORS INFLUENCING THE DECISION-MAKING PROCESS OF THE NEW WINE CONSUMERS.....	40
<i>Agnoli, Lara¹; Capitello, Roberta²; Begalli, Diego³.....</i>	<i>40</i>

ABSTRACT

Sheep and goat farming in Greece is of high importance because of the production of food, the insurance of adequate employment and steady income to a large number of farmers and the creation of added value in the products. Despite the high productivity and the excellent quality of the products the sheep and goat industry has low competitiveness due to high production costs. The efforts for the restructure and improve of the competitiveness of the industry should focus primarily on reducing the production costs.

The aim of this study is to research and analyze the parameters that compose the total cost of production in sheep and goat farms as well as to determine their significance. This paper tries to define the basic components of production costs, which form clusters of sheep and goat farms, with same behavior in the management of cost production. The analysis is also possible to lead to the creation of rational proposals for restructuring of farms and business management.

The application of principal component analysis revealed two main components (axes) for the cost: the first axis explains the 51%, while the second the 22% of the total variance. The first axis F_1 is associated with the depreciation, maintenance, insurance costs and the permanent fund, while the second axis F_2 is related to the feed costs, the value of self-produced feed, the total variable capital expenditures and other costs. The Hierarchical Cluster Analysis, based on factors scores, per cost component, in any goat sheep farm of the sample there was applied a grouping into three clusters, with similar demographic characteristics.

Keywords: sheep and goat farms, restructuring, cost of production, management of breeding farms

INTRODUCTION

Sheep and goat breeding (small ruminants) is traditionally one of the most dynamic sectors in Greece, contributing to the rural income with a percentage about 18% and 28.07% to the total gross value of livestock production (Eurostat, 2011, Ministry of Rural Development and Food, 2012; FAO, 2012). Sheep and goat farming is practiced in a high percentage (85% of animals and 80% of farms) in mountainous and disadvantaged areas of Greece, which constitute the 85% of its surface area and in this way regions that are not suitable for intensive use are reclaimed. Moreover, sheep and goat farming, is contributing decisively to the regional development and maintenance of the social fabric in areas with particular problems (Ministry of Rural Development and Food, 2011).

In Greece there are 99,026 sheep-goat farms. The predominant form of sheep and goat farms composed of small family farming-pastoral extensive form, which are characterized by low inputs and rely on the movement of animals to find food (grazing). Nowadays however, there is a decline of small farms and nomadic development and a systemic-stabled sheep and goat high productivity on business structures (Kitsopanides, 2006; Rancourt *et al.*, 2006; Theocharopoulos *et al.*, 2007^a; Aggelopoulos *et al.*, 2009).

In Greece, the total number of sheep reared amounts to 12.8 million animals and it's the first country in the EU, where sheep constitute the 55.8% of the animal population, followed by the UK with 23.4%. Across the EU, Greece has the first place in rearing goats (4 million goats) and the third in sheep (8.8 million sheep) after the UK (31million sheep) and Spain (16.6 million sheep) (FAO, 2012; Eurostat, 2012). The bulk of Greek sheep and goat farms (95%) has as a productive direction to the milk which herds of genetically heterogeneous farms, which consist of animals with different breeds and mostly unknown cross genotypic composition, showing great variability in terms of morphological, physiological and productive characteristics (Chatziminaoglou, 2001; Ministry of Rural Development and Food, 2011; Tzouramani, 2011).

Thus, Greece produces the 23.5% of the total goat milk produced in the EU, farm the second position after Spain (23.8%) and the 14.5% of the meat production by still farm the second place after the United Kingdom with 28.2% (FAO, 2012). It is also remarkable that Greece has

the largest annual production of sheep milk per capita (72.2 kg) and displays high quality goat meat as a result of a series of parameters that characterize the Greek reality as the extensive farming system, the domestic breeds and the administered feed (Zygoyiannis, 2006; Ministry of Rural Development and Food, 2011).

Despite the high productivity and the high quality of the products, the sheep and goat sector has low competitiveness due to the high production costs compared with other EU countries (Vlontzos and Soutsas, 2006; Aggelopoulos *et al.*, 2009). The majority of farms in the country operates under increasing returns to scale, so an increase in size to achieve lower production costs and improved profitability is necessary (Theocharopoulos *et al.*, 2007^b). The total cost of production in a sheep and goat farm configures the feed costs, the annual costs of livestock, the annual costs of fixed assets and the remuneration of labor (Kitsopanidis, 2006).

The high cost of production in the Greek goat-sheep farms is one of the major problems of the industry, resulting in reduced efficiency and low competitiveness in relation to other EU countries. As a result, every effort for business development of the industry should be coupled with reducing production costs. This study aims to identify and analyze the factors that affect the total cost of production and the determination of their significance. This work attempts to define the key components of production costs in sheep and goat farms. With the formation of clusters of farms according to "their behavior" on cost variables, it is possible to determine rational restructuring proposals, based on similar efforts to reduce production costs, and their demographic characteristics.

MATERIALS AND METHODS

For the conduct of survey we selected the Prefecture of Grevena, a region with a remarkable development of the sheep and goat farming. The variety of rearing conditions in this area allows the generalization of the research results, with no significant deviation from reality (Tsiouni, 2011).

For the research there were used financial data from sheep and goat farms in the region. The techno-economic data in this study were collected using a properly structured questionnaire, after personal interviews with farmers-owners of farms during the period 2007-2009. The sampling method followed for the selection of the sample was layered random (Siardos, 2005). The final sample included 65 sheep and goat farms. The sample size is the 4.7% of the total sheep and goat farms in the study area and it is the 0.03% of the total number of sheep

and goat farms in the country. It is also the 0.22% of the total sheep population in the country and 29.6% of the Prefecture.

It is also worth mentioning that in the final analysis there were included small, medium and large farms and as a result there is a great variation in the cost parameters that are taken under consideration. This is important because the cost components will be referred to a wide range of general and industry farms. Therefore, the findings will refer to the field of sheep-goat industry as a whole and not to specific categories of farm sizes.

For the study and analysis of production costs were calculated the annual expenditure of fixed capital (buildings, machinery, livestock breeding, etc.), costs of animal feed, the value of self-produced animal food, the total expenditure of variable capital (veterinary costs, costs of foreign mechanical work, etc.) and other expenses (taxes, expenses of electrification, communication, etc.) (Doll and Orogen, 1984; Damianos and Skuras, 1999; Kitsopanides, 2006; Aggelopoulos, 2007 and Aggelopoulos *et al.*, 2009). Table 1 shows the classification of the basic costs of production in the sheep-goat farms of the sample.

Table 1. Classification of the basic production expenses in the sheep-goat farms of the sample

production categories	expenses	Minimum (€ per animal)	Maximum (€ per animal)	Mean (€ per animal)	Std. Deviation
Depreciation		6.7	98.8	31.8	21.5
Insurance premiums		0.5	11.9	3	2.1
Maintenance		0.4	33.7	6.8	5.8
Interest		4.2	66.6	18.2	11.3
Animal food		127.6	232.3	175.3	19.3
Self-produced animal food		0.0	172.3	42.6	50.8
Other capital expenses		3.9	92.5	28.8	19.5
Expenses of variable capital		12	249.1	79	51.3

Based on the figures in Table 1, we observe that the first component is significantly correlated to all cost parameters (€ per animal) are (in descending order) the animal food, the expenses of variable capital, the self-produced animal food, the depreciations, the other capital expenses, the interest of fixed capital and in the end the expenses of maintenance and insurance premiums.

Through the application of Principal Component Analysis (PCA), we examined the structural cohesion of the variables that compose the overall production cost, and their importance in its final formulation (Hair *et al.*, 1995; Sharma, 1996; Cattell, 1978; Dunteman, 1989; Tabakis,

2001; Aggelopoulos *et al.*, 2009). These variables are represented using non-observable variables-factors, according to the following mathematical formula:

$$F_i = \sum_{j=1}^p w_{ij} Z_j = w_{i1} Z_1 + w_{i2} Z_2 + \dots + w_{ip} Z_p, \quad (i = 1, \dots, m \leq p \text{ and } j = 1, \dots, p)$$

Where w_{ij} 's are the coefficients (or loadings) for factor or component,

$i (F_i)$ multiplied by the measured value for variable $j (Z_j)$. So, each principal axis is a linear combination of the original measured variables.

Then, based on the extracted Factors scores of sheep and sheep farms in these two axes, applied the Hierarchical Cluster Analysis. The formation of clusters of farms was based on the criterion of Ward, while the squared Euclidean distance was used as a measure of (in) similarity of farms (Hair *et al.*, 1995; Sharma, 1996). The analysis was performed with the statistical package SPSS ver. 13.0. Variables before entering the analysis were transformed into z-scores. The stability of the results, with respect to the input sequence of goats farms in the analysis, was tested with the help of software PermuCLUSTER ver.1.0 (Spaans and Van der Kloot, 2004).

RESULTS

The application of PCA highlighted two axes (components) cost: the first axis explains 51% of the total variance, while the second 22% of the total variance (Table 2).

The first axis F_1 associated with depreciation, maintenance, insurance premium and the interest of the fixed capital, while the second axis F_2 associated with animal food, the value of self-produced food, total variable capital expenditures and other costs. The first axis F_1 can be characterized as the axis of fixed capital expenditure, while the second axis F_2 can be characterized as the axis of the expenses of animal feed and variable expenses (Table 3).

Table 2. Total Variance Explained

Component	Initial Eigenvalues		
	Total	% of Variance	Cumulative %
1	4.067	50.842	50.842
2	1.780	22.250	73.092
3	0.907	11.340	84.432
4	0.595	7.443	91.874
5	0.409	5.111	96.985
6	0.137	1.718	98.703
7	0.102	1.272	99.975
8	0.002	0.025	100.000

Extraction Method: Principal Component Analysis

Table 3. Rotated Component Matrix

Data of cost	Components	
	F1	F2
Depreciation	0.977	
Insurance premiums	0.974	
Maintenance	0.941	
Interest	0.938	
Animal food		0.813
Self-produced animal food		0.669
Other expenses		0.665
Variable capital		0.567

*Extraction Method: Principal Component Analysis.

Rotation Method: Varimax with Kaiser Normalization

Following the application of hierarchical cluster analysis and based on the scores per cost component achieved by the sheep and goat farms in the sample, we group them. Table 4 presents the averages of the factors scores per cluster.

Table 4. Averages of the factors scores

Clusters	F1	F2
C ₁	0,308961	1,735458
C ₂	-0,53485	-0,29669
C ₃	1,518448	-0,72176

Figure 1, shows the profile of the clusters of sheep and goat farms, according to the two components of the cost

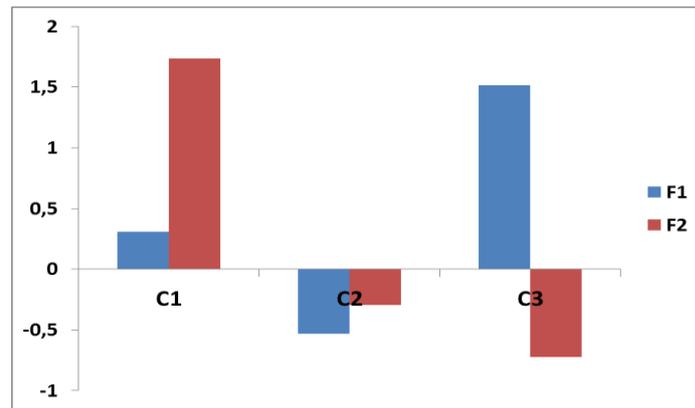

Figure 1. The profile of the clusters of sheep and goat farms, according to the components of the cost.

The application of the method highlighted three clusters of sheep and goat farms. In the first cluster (C₁) included 12 sheep and goat farms (form 12.5% of total sample). The second cluster (C₂) included 41 sheep and goat farms (63.1% of total sample), while the third cluster (C₃) included 12 sheep and goat farms (18.5% of total sample).

As it is clear from the analysis, the first cluster (C₁) consists of farms where the second axis F₂ concludes the main component of the cost. In the farms of the second (C₂) and the third cluster (C₃) the first F₁ axis concludes the main component of the cost.

The three clusters of farms are distinct for the variables of cost of the first axis F₁, while in the axis F₂ cluster C₁ is different from clusters C₂ and C₃.

Then, the profile of cluster was studied in compare with the eight cost variables (Table 5).

Table 5. Profile of clusters based on cost parameters

Cost parameters	Cluster of farms		
	C ₁	C ₂	C ₃
Depreciation (per animal)	42.02 ^b	24.32 ^c	63.39 ^a
Insurance premiums (per animal)	3.57 ^b	1.93 ^c	6.15 ^a
Maintenance (per animal)	9.87 ^b	3.69 ^c	14.26 ^a
Interest (per animal)	21.21 ^b	12.28 ^c	35.40 ^a
Expenses of animal food (per animal)	186.85 ^a	175.77 ^{ab}	161.87 ^b
Value of self-produced animal food (per animal)	104.55 ^a	31.63 ^b	18.21 ^b
Other expenses (per animal)	55.99 ^a	19.84 ^c	32.25 ^b
Expenses of variable capital (per animal)	160.35 ^a	59.52 ^b	64.12 ^b

*For each cost parameter the averages that have different letters differ significantly at a significance level $\alpha = 0,005$, according the results of the Tukey HSD test.

The three clusters are diversifying in: depreciation, insurance premium, maintenance, interest and other costs. For the cost of animal food it is observed a variation between the first (C₁) and the third cluster (C₃). Between the value of self-produced food and the variable capital expenditures it is observed a difference between the first (C₁) the second (C₂) and the third cluster (C₃).

The profiles of the clusters based on the cost parameters, it is also shown in Figure 2.

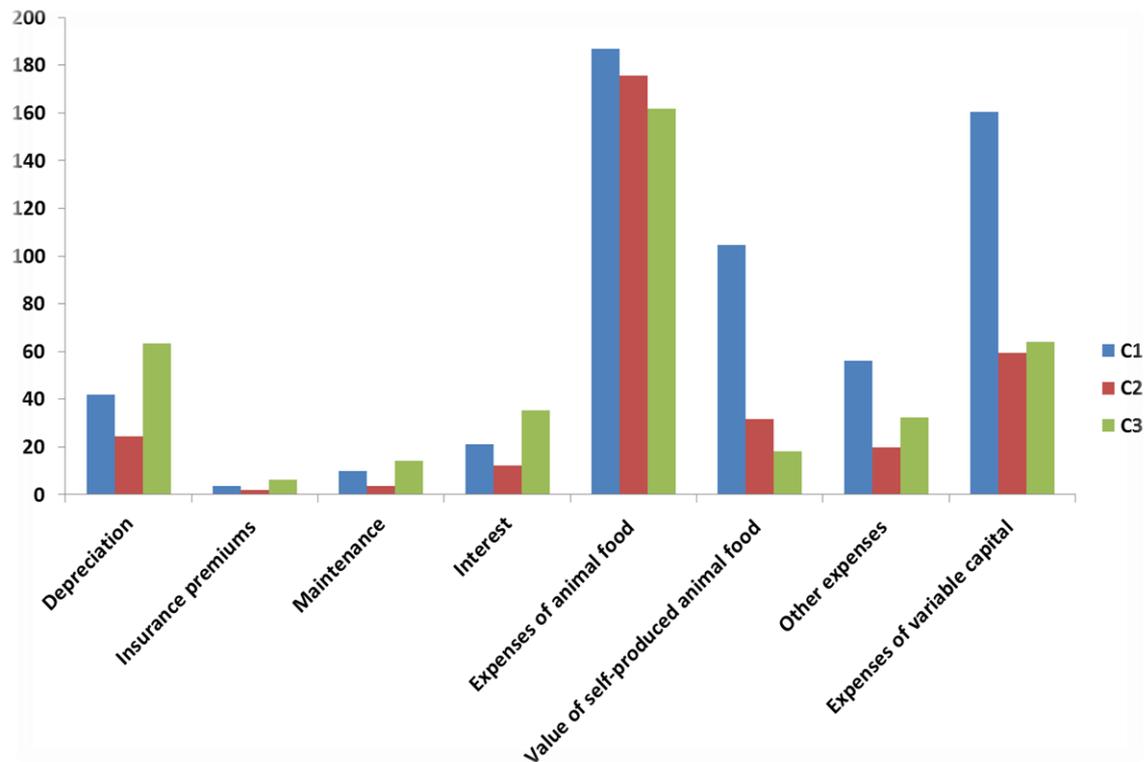

Figure 2. Configuring clusters, based on cost parameters

Then it was analyzed the second-level profiles of the three clusters, based on demographic characteristics. Table 6 presents the analysis of farms clusters according to their size. We observe that the total sample consists of large (46.1%) and medium size (38.5%) sheep and goat farms. The size distribution of the farms in three clusters is the following: the first cluster (C₁) consists of small (41.7%) and medium-sized farms (41.7%). The second cluster (C₂) consists mainly of large (58.6%), followed by medium-sized farms (34.1%) and while the third cluster (C₃) consists mainly of medium-sized farms (50%). The size distribution is shown in figure 3.

Table 6. Profile of clusters according to their size.

Clusters	Size of farms				Total
	M ₁ : 0-199	M ₂ : 200-399	M ₃ : 400-599	M ₄ : >600	
C ₁	5 41.7%	5 41.7%	2 16.7%	0 0%	12 100%
C ₂	3 7.3%	14 34.1%	11 26.8%	13 31.7%	41 100%
C ₃	2 16.7%	6 50%	2 16.7%	2 16.7%	12 100%

The statistical test of independence χ^2 revealed a statistically significant relationship between the clusters and the size of sheep and goat farms ($\chi^2 = 1.765$, $df. = 6$, $p\text{-value} = 0.05$). The intensity of the relationship is moderate (Cramer's $V = 0.313$ and $0.2 < CV < 0.4$).

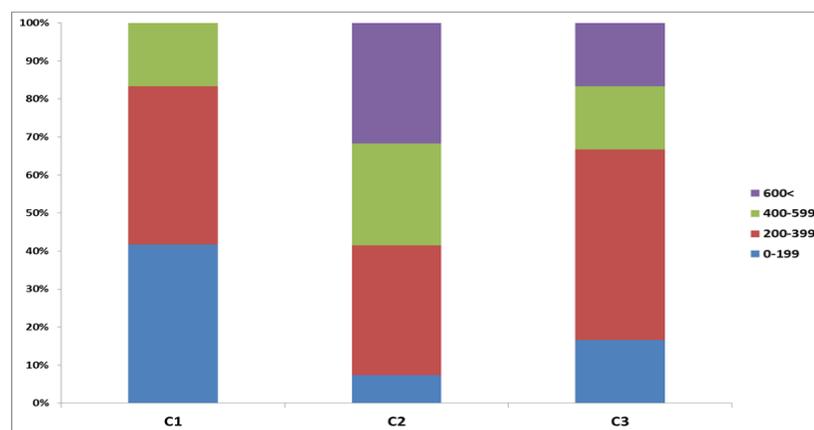

Figure 3. Profile of clusters according to their size

Table 7 shows the profile of the clusters, according to the type of farm

Table 7. Profile of the clusters, according to the type of farm

Clusters	Type of farms			Total
	T ₁ : Sheep farms	T ₂ : Goat farms	T ₃ : Sheep and goat farms	
C ₁	8 66.7%	1 8.3%	3 25%	12 100%
C ₂	15 36.6%	4 9.8%	22 53.7%	41 100%
C ₃	7 58.3%	0 0%	5 41.7%	12 100%

Total	30	5	30	65
	46.2%	7.7%	46.2	100

According to table 7, the first cluster (C₁) consists mainly of sheep farms (66.7%). The second cluster (C₂) consists mainly of mixed farms (53.7%), while a high percentage has also sheep farms (36.6%). Finally the third cluster (C₃) consisting of sheep farms (58.3%), while the mixed farms have also high percentage (41.7%).

The statistical test of independence χ^2 revealed no statistically significant relationship between the clusters and type of sheep and goat farms ($\chi^2 = 5.166$, $df = 4$, $p\text{-value} = 0.2$).

Table 8 presents the analysis of clusters of farms according to their geographical location. In a high percentage, the sheep and goat farms are installed in mountain areas (43.1%), although a large proportion of these are transhumance farms (40%), while a small number of farms located in semi-mountainous (12.3%) and lowlands (4.6%). Specifically, the farms of the first cluster (C₁) are installed in the majority in semi-mountainous areas, while 25% are installed in mountainous areas and another 25% are transhumance farms. The second cluster (C₂) consists mainly of transhumance farms (48.8%) and farms in mountain areas (39%). Finally, 75% of farms in the third cluster (C₃) are located mainly in the mountainous areas 75% and 25% are transhumance farms. The geographical distribution of farms clusters is shown in Figure 4.

Table 8. Geographical distribution of clusters

Clusters	Geographical area of farms				Total
	P ₁ : Mountainous	P ₂ : Semi- mountainous	P ₃ : Lowland	P ₄ : Transhumance	
C ₁	3 25%	4 33.3%	2 16.7%	3 25%	12 100%
C ₂	16 39%	4 9.8%	1 6.4%	20 48.8%	41 100%
C ₃	9 75%	0 0.0%	0 0.0%	3 25%	100%
Total	28 43.1%	8 12.3	3 4.6	26 40	65 100%

The statistical test of independence χ^2 revealed a statistically significant relationship between the clusters and the geographical identification of sheep and goat farms ($\chi^2 = 16.88$, $df = 6$, p -value = 0.01). The intensity of the relationship is moderate (Cramer's $V. = 0.359$, $0.2 < CV < 0.4$).

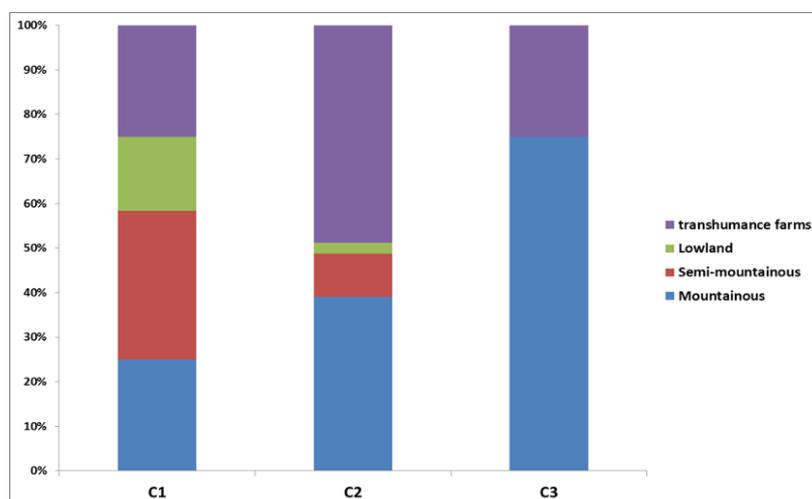

Figure 4. Geographical distribution of clusters.

In Table 9, shows the profile of clusters, based on the educational level of their owners. The owners of sheep and goat farms in the sample have mainly elementary and secondary education level. The majority of the owners with elementary education appear in the third cluster (C₃), and the owners who attend some high school are in the second cluster (C₂). Of the total of 65 owners only 2 people have university education and allocated to one of the first (C₁) and the second cluster (C₂).

Table 9. Profiles of clusters, according to owners education level.

Clusters	Type of farms			Total
	G1: Elementary school	G2: High school	G3: University	
C ₁	7 58.3%	4 33.3%	1 8.3%	12 100%
C ₂	25 61%	15 36.6%	1 2.4%	41 100%
C ₃	8 66.7%	4 33.3%	0 0%	12 100%
Total	40 61.5%	23 35.4%	2 3.1%	65 100%

The statistical test of independence χ^2 indicated no statistically significant relationship between the cluster and the educational level of the owners of sheep and goat farms ($\chi^2 = 1.620$, $df = 4$, $p\text{-value} = 0.1$).

CONCLUSIONS AND SUGGESTIONS

Sheep and goat farming is one of the most important sectors of the Greek livestock with high potential for further development. However, the dynamic of the industry impacts the increased costs of rearing sheep and goats, and as a result there is a reduced artificial efficiency and low competitiveness in relation to other EU countries. Strengthening the development direction can be achieved by reducing production costs.

In the presented study there was a research on the factors that affect the cost of production and a determination of their significance.

The application of Principal Components Analysis revealed two major cost components, showing that the first cost component, named the annual fixed capital costs (costs that are affected by the amount of the investments in farms), as the main reason for the difficulty in raising sheep and goats.

Then the application of hierarchical analysis in clusters formed three groups of farms, based on cost data, and demographic characteristics. The first cluster (C_1) consists of farms that the key components of their costs are the costs of feed and variable capital. These small and medium sized farms are located in mountainous and hilly areas. The farms of the cluster seem to be mainly sheep type farms where the owners have an elementary education.

The second cluster (C_2) consists of farms whose key components of their costs are the annual costs of permanent capital. These are large farms, which are mainly transhumance farms and located in mountainous areas. The farms of this cluster appear to be mostly mixed with their owners being of an elementary education.

The third cluster (C_3) consists of farms whose key components of their costs are the annual costs of permanent capital. In this cluster there are mainly medium-sized farms, which are located in mountainous areas. The farms of the cluster seem to be mainly type sheep farms and the owners are also of an elementary education.

The recommended policy measures that aimed to the restructuring of the Greek sheep and goat farming and they improve its competitiveness and they are based on the above analysis are:

For the sheep and goat farms in the cluster C₁ it is suggested to reduce the user cost of animal food. In particular the reduce of animal food expenses is associated with the proper use and quality improvement of animal food that it is used. Selecting the most proper and effective way of preparing the animal food, the establishment of a well-balanced and economical diet, the knowledge of animal food nutrients content and their suitability as well as the proper facilities blending power and storage of animal food are leading to a better utilization of this factor. Furthermore, it is necessary to connect the plant and animal production. The systematic and organized cultivation of animal food, is expected to help to the increase of the offered quantity and thus to the reduce of the offered price to the farmers.

For sheep and goat farms in clusters C₂ and C₃ it is suggested the better use of fixed capital (buildings, machinery, etc.). The inclusion of the farms in financial programs which will aim at improving the building and mechanical equipment is expected to reduce annual costs and improve their efficiency. Moreover, the installation of automated feeding systems, would improve the quality of animal food, lead to the reduction of animal food cost and improve work efficiency and management of animals.

Generally, the organization of training programs for the breeders-owners of farms will help to promote new technology in all phases of production process. The training is necessary for issues that are related with milking, animal husbandry management, organization and management of livestock farms and animal food preparation.

ABSTRACT

This research aims to highlight the determinants able to predict consumption trends, in order to provide important marketing evidence to wineries whose goal is to penetrate new markets. To achieve this aim, the research focuses on the average US consumer, represented by a Missouri population. The reasoned action approach (Fishbein and Ajzen, 2010) was applied to 140 wine consumers from Missouri. Behavioural and normative beliefs were surveyed to study their influence on attitudes and subjective norms, which affect intentions and behaviours. The gathering of information was divided into two phases: an exploratory analysis and a survey by questionnaire. The results confirm the new trends in wine consumption and the emerging predominant role of friends in influencing wine consumption. The importance of family as a reference social group is overshadowed. The sensory characteristics of wine remain relevant, and the role of health in determining the choice to consume wine is confirmed as controversial. The study highlights that the social pressure resulting from reference people and groups is losing significance in relation to attitudes, expressed by the opinion that the individual shapes about behavioural consequences.

Keywords: Consumer behaviour, Wine, Reasoned action approach, Average US consumer, Wine marketing

INTRODUCTION

The determinants of wine consumption behaviour are a very complex subject of study because of the complexity of wine itself, given its multiple intrinsic and extrinsic factors and its material and immaterial nature, which characterise quality perception. Further, consumers associate a risk level to their choices, resulting from the fact that wine quality is objectively

and subjectively ascertainable only after it has been purchased and when the consumption behaviour has been fully realised.

For the wine industry to understand drinking choices and establish marketing strategies, knowledge of the consumer's decision-making process, which leads to consumption behaviour, is more important than ever.

Many studies aimed at explaining consumption behaviour have drawn from social psychology and applied the reasoned action approach, as formulated by Fishbein and Ajzen (2010). This approach has been used to explain which elements determine human behaviour in many different life domains, including politics, health, discrimination and consumption.

The current study applies the reasoned action approach to offer new insight into the wine consumption behaviour of a population that is approaching wine choice with an increasing interest in wine. This approach provides an appropriate framework to evaluate the cognitive factors determining the wine consumer's decision-making process.

The article is structured as follows. First, the reasoned action approach is discussed through a literature review. In this regard, the review gives special attention to the main applications in the field of food. Second, the objectives and method are presented, allowing the paper to join in the debate initiated by three previous applications of the reasoned action approach to wine consumption. The empirical results are discussed, and some future research investigation lines are recommended.

LITERATURE REVIEW

The reasoned action approach is the basis of two theories that aim to explain the decision-making process that leads individuals to their behaviour: the theory of reasoned action (TRA) and the theory of planned behaviour (TPB).

Developed by Fishbein and Ajzen (1975), TRA argues that the behavioural intention underlying a behaviour is able to capture its motivational factors and indicates how hard a person is willing to perform that behaviour. In turn, behavioural intention is determined by attitude, namely, the degree to which a person positively or negatively assesses or qualifies a behaviour, and by subjective norm, which refers to the social pressure carried out by reference people or groups that a person perceives in performing or not performing the behaviour.

Salient information, or beliefs, explains behaviour at a more basic level than that of attitude and subjective norm. Many beliefs are available to people for all behaviours, but only a

relatively small number of them is readily accessible when people choose to perform that particular behaviour. These salient beliefs are the dominant determinants of behavioural intention and behaviour (Ajzen and Fishbein, 1980).

The relations between attitudes and intentions, and consequently behaviours, are based on the expectancy value model (Fishbein and Ajzen, 1975), according to which the evaluation of the attributes (e_i) associated with the behaviour and the strength of these associations (b_i) determines the attitude (A): $A \propto \sum b_i e_i$ (Ajzen, 2012). Attitude can explain behaviour with significant correlation if the principle of compatibility is respected and the expression of attitudes and behaviour refers to the same action, target, context and time (Fishbein and Ajzen, 2010). Among attitudes, scholars have recently distinguished instrumental and affective components to reinforce the prediction capability of intentions taking into consideration advantages/disadvantages, benefits/costs, and liking/disliking of the behaviour (Ajzen, 2011; Conner and Armitage, 1998; Elliott and Ainsworth, 2012). This advance enables a better understanding of the role of emotions, affects and irrationality in the decision-making process (Ajzen, 2011).

New research developments have enlarged the explicative power of the normative construct through the distinction between injunctive and descriptive beliefs (Cooke *et al.*, 2007; Ravis and Sheeran; 2003). Thus, normative beliefs include the perception of approval/disapproval stemming from the main referents, social pressure and situation expectation. The association of these beliefs with the motivation to comply (m_i) shapes the subjective norm (SN), contributing to the prediction of behavioural intentions: $SN \propto \sum n_i m_i$ (Ajzen, 2012).

TPB was developed from TRA by Ajzen (1991, 2005) to overcome a fundamental limitation: it can only be applied to behaviours under people's volitional control. However, many behaviours, although under volitional control in principle, can present serious difficulties in their execution that are related to non-motivational factors, such as the availability of opportunities and resources, in terms of time, money, skills or the cooperation of others (Ajzen, 2005, 2012). TPB overcomes this limitation thanks to an additional predictor of intentions and behaviour: perceived behavioural control (PBC) (Ajzen, 2012). The same concept was previously proposed by Bandura (1977) with the construct of perceived self-efficacy. PBC depends on the individual's beliefs about the opportunities or constraints facilitating or limiting their intentions and behaviours (c_i), and on their power to control these factors (p_i): $PBC \propto \sum c_i p_i$ (Ajzen, 2012). PBC acts through intention or directly on behaviour. The correlation between intention and behaviour is facilitated by the conditions of an actual behavioural control.

TRA and TPB models have been broadly applied in various domains, especially in the past decade. Investigations have just begun in food and drink choice analysis. Much research has aimed at explaining and predicting the individual's decision-making process in situations involving risky behaviour (in terms of abuse or malnutrition), food safety, healthy eating, dietary changes from a medical, sociological or psychological point of view (for example, Berg *et al.*, 2000; Brug *et al.*, 2006; Collins *et al.*, 2011; Fila and Smith, 2006; Lloyd *et al.*, 1993; Paisley and Sparks, 1998; Povey *et al.*, 2000). To date, few studies have assumed a marketing perspective. Seminal studies in the food domain were proposed by Sparks *et al.* (1995) and Shepherd and Raats (1996). Use of the reasoned action approach contributes to the investigation of the person–food interface and its integration with the consumption situation and the wider choice context. Scholars are making an effort to identify and measure whether the food decision-making process is characterised by specific constructs that determine intentions and behaviour. For example, two additional components, personal identity and moral factors, are proposed by Shepherd and Raats (1996) in organic food choice.

In addition to organic food (Arvola *et al.*, 2008; Dean *et al.*, 2008; Tarkiainen and Sundqvist, 2005), in recent years, studies have focused on different and topical themes, such as halal meat consumption (Alam and Sayuti, 2011; Bonne *et al.*, 2007), genetically modified foods (Chen, 2008; Cooke *et al.*, 2007), risk perception for dairy products (Lu *et al.*, 2010), the propensity towards imported soy-based dietary supplements (Chung *et al.*, 2012) and food safety practices (Brannon *et al.*, 2009). Empirical advances support the extension of TPB in food choice analysis in the antecedents of attitudes (Chung *et al.*, 2012), in new constructs explaining intentions (Bonne *et al.*, 2007) and in the relationship between attitudes and subjective norms (Tarkiainen and Sundqvist, 2005).

In the domain of beverage consumption, the TRA and TPB models have investigated risky situations, such as the binge drinking phenomenon, especially in young generations (for example, Dempster *et al.*, 2005; Norman, 2011; Todd and Mullan, 2011). With respect to wine, only a few studies have applied the reasoned action approach to consumption behaviour (St James and Christodoulidou, 2011; Thompson and Vourvachis, 1995; van Zanten, 2005). Thompson and Vourvachis (1995) investigated the British wine drinker, van Zanten (2005) the Australian consumer, and St James and Christodoulidou (2011) the Californian consumer. They obtained different results in relation to the weight exerted by subjective norms and attitudes in influencing behavioural intention and behaviour; they are in agreement in omitting PBC in explaining wine consumption behaviour. These results initiated a debate in the *International Journal of Wine Business Research* (*International Journal of Wine Marketing* until

2006), to which this paper aims to contribute with further insight into the analysis of the wine consumer's decision-making process. The assumption is that the influence of the wine consumer's life cycle emerges as a relevant determinant of product involvement and favourable intentions. The role of personal and cultural background factors is apparent, but these have not yet been investigated in depth by scholars from a marketing perspective.

OBJECTIVES

The innovative element of the current study is its subject. It aims to understand wine consumption behaviour in a population that is approaching wine for the first time and increasing its interest towards wine. This research aims to highlight the determinants able to predict consumption trends, in order to provide important marketing suggestions to wineries whose goal is to penetrate new markets.

To achieve this aim, the research focuses on the average US consumer, represented by a Missouri population.

The US population consumed 32 million hectolitres of wine in 2012, becoming the world's largest wine consumer. The per capita consumption is 10.3 litres, 24% more than the previous 10 years, and it has grown since the 1990s (Wine Institute, 2013). The heterogeneity of the US population translates into states in which wine consumption is consolidated (California, New York and Florida), and states in which wine consumption is still in a primordial stage (such as Missouri, Nebraska and Kansas). These represent potentially interesting catchment areas for European wineries. Most of the studies on US wine consumers have focused on the Californian consumer (St James and Christodoulidou, 2011; Thach, 2012; Thach and Olsen, 2004). In order to provide a more representative contribution of the US consumer than those outlined by previous research, this study investigates the factors that influence the behaviour of wine consumption in Missouri. A survey was conducted in St. Louis, the home of the stereotypical US consumer, far away from the Californian consumer on the west coast of the United States. Missouri can also be counted among the states that are entering the wine market, both from the production point of view—whose business, however, can only be competitive at the domestic level because of the climatic conditions that prevent the use of *Vitis vinifera*—and from the consumption point of view, presenting Missouri as an interesting destination for foreign producers.

METHOD

As proposed by Fishbein and Ajzen (1975), the analysis was divided into two phases: an exploratory phase and a phase of survey by questionnaire.

The exploratory phase aimed to determine the salient beliefs and the reference people and groups in wine consumption behaviour, which was useful for carrying out the second phase. The study involved 22 respondents. As in the studies of Thompson and Vourvachis (1995), van Zanten (2005) and St James and Christodoulidou (2011), open-ended questions were used to discover (i) advantages and disadvantages in drinking wine; (ii) free associations with the action of drinking wine; (iii) people or groups that would approve or disapprove of the wine drinking of the respondent; and (iv) people or groups that come to mind when thinking about drinking wine. Processing of the information provided the salient beliefs and the reference people and groups that influence wine consumption behaviour; these are listed in descending order of frequency in Table 1.

Salient beliefs	Referents
Wine is good for health	Family
Wine is sociable	Partner
Wine has a good taste/flavour	Friends
Wine helps to relax	Close Friends
Wine is a cultural product	Colleagues
Wine is good with food	

Table 1 - Salient beliefs and referents in drinking wine

The results of the exploratory phase were used to build the survey questionnaire of the second phase of analysis (see Table 2). The questionnaire presents some new elements when compared with those of previous studies, which arose from the results of the first phase and the important contribution of studies in other fields that have applied the reasoned action approach (Dean *et al.* 2008; Esses and Maio, 2002):

1. Items about affective attitudes have also been included in the questionnaire to analyse attitude better. Therefore, the respondents were asked about feelings aroused by drinking wine. The other studies on wine consumption behaviour consider only cognitive attitudes, namely, the characteristics and consequences perceived in drinking wine.

Theory components	Items
Behaviour	Wine drinking frequency
Behavioural Intention (BI)	Intention to drink wine sometime in the next month
Attitude (A)	Drinking wine characteristics Consequences of drinking wine Feelings from drinking wine
Subjective Norm (SN)	Thinking of reference people or group concerning the respondent's drinking wine Reference people or group's drinking wine in the next month
Behavioural Beliefs (b)	Wine is good for health, sociable/fun, has good taste/flavour, good for relaxing, a cultural product, goes well with food
Outcome Evaluations (oe)	Importance of health, sociability/fun, taste/flavour, relaxing, cultural approach and food matching when drinking wine
Normative Beliefs (NB)	Opinion of family, partner, friends, close friends, colleagues about the respondent's drinking wine in the next month
Motivations to Comply (MC)	Respondent's general will to do what family, partner, friends, close friends, colleagues want

Table 2 - Survey components and items

2. The subjective norm was analysed through what reference people and groups think about the respondents' wine consumption behaviour, as the other analogues studies do, and by investigating the wine consumption behaviour of the reference people and groups.
3. The exploratory analysis revealed new items for the components behavioural beliefs and outcome evaluations, which are linked to the relaxing properties of wine and its cultural component. Important items of other studies were not salient, namely, the feeling of sophistication (St James and Christodoulidou 2011), link to special occasions and quality assessment through the price (Thompson and Vourvachis, 1995).
4. New reference people or groups emerged concerning normative beliefs and motivations to comply, namely, the partner and the split among close friends and acquaintances. Guests were not found to be important, unlike in the study of Thompson and Vourvachis (1995).

The questionnaire was given directly to 140 people in St. Louis, the main urban centre of Missouri. The information was processed out using Stata 11 software.

RESULTS

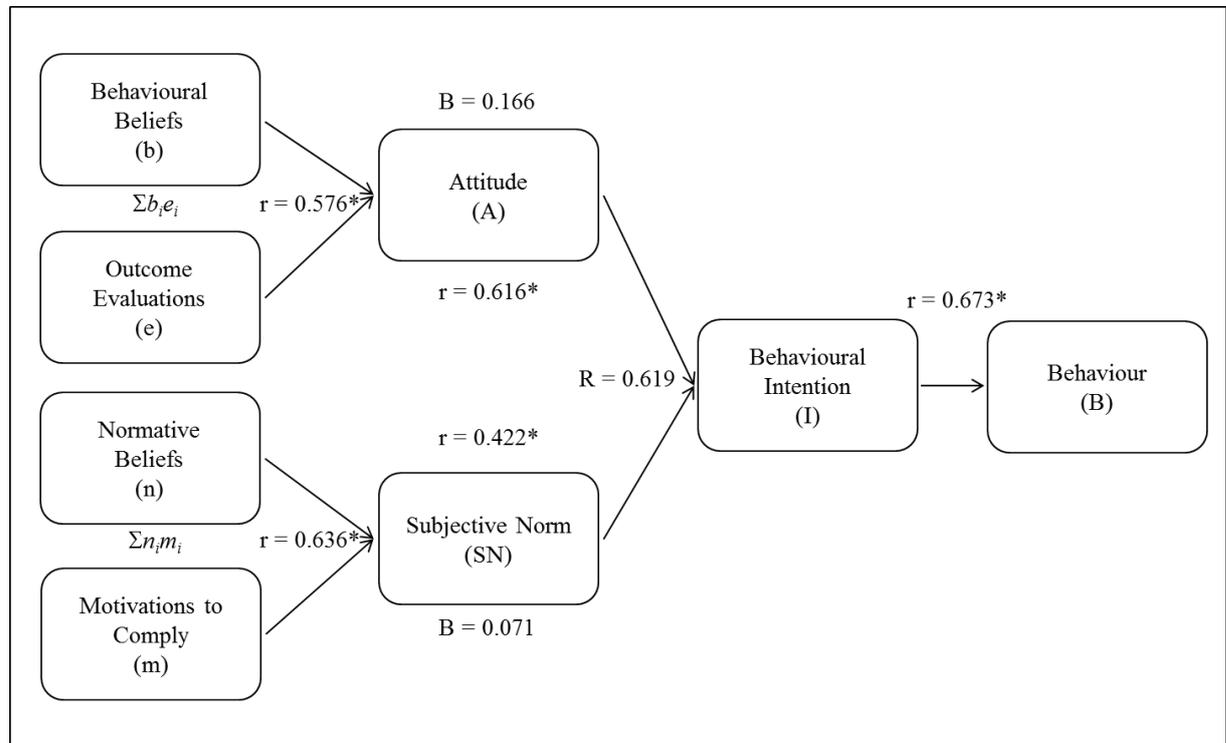

Socio-demographic characteristics and wine consumption frequency of the sample are summarised in Table 3. The sample consists of males and females in almost equal measure; the number of individuals aged below 40 and the number above 40 were also almost equal. Respondents were mostly married, had high education levels and were employees, freelance workers or managers. More than half of the sample claimed to consume wine at least once a week.

Attributes	Levels	n	%
Gender	Males	68	48.6
	Females	72	51.4
Age class	21–30 years old	47	33.6
	31–40 years old	21	15.0
	41–50 years old	35	25.0
	More than 50	37	26.4
Relationship status	Single	48	34.3
	Engaged	11	7.9
	Married	81	57.9
Education level	High school	21	15.0
	Technical school	8	5.7
	College	104	74.3
	Master's degree	7	5.0
Employment	Student	19	13.6
	Worker	12	8.6
	Employee	61	43.6
	Freelance/Manager	31	22.1
	Unemployed	4	2.9
	Other	13	9.3
Wine drinking frequency	Never	11	7.9
	Once every three months	17	12.0
	Once a month	21	15.0
	Once a fortnight	19	13.6
	Once a week	26	18.6
	Two to six a week	35	25.0
	Once a day	11	7.9

Table 3 - Sample characteristics (N = 140)

Figure 1 shows the application of TRA to wine consumption behaviour, as was the case in the other studies about wine consumption (St James and Christodoulidou, 2011; Thompson and Vourvachis, 1995; van Zanten, 2005). The formulations proposed by Ajzen and Fishbein (1980) were applied to bring out the correlations among model components. Each behavioural belief was multiplied by the corresponding outcome evaluation, and these products were summed ($\sum b_{ie}$). The same procedure was carried out for normative beliefs and motivations to

comply ($\sum n_i m_i$). The six items of attitude were summed instead (A), as were the two items of subjective norm (SN).

* $p \leq 0.01$

Figure 1 – The determinants of wine consumption behaviour

Simple correlations and linear regressions were applied to estimate the relationship between the different model components. As stated by Ajzen and Fishbein (1980), a correlation level greater than 0.30 is considered acceptable in this type of study, and a correlation greater than 0.50 is considered a strong relation. In this application, most of the correlations are higher than 0.50, showing the strong link between the model components. As in the other studies about wine consumption, it was found that both attitude and subjective norm influence behavioural intention to drink wine (St James and Christodoulidou, 2011; Thompson and Vourvachis, 1995; van Zanten, 2005) and behavioural intention is influenced more by attitude than by subjective norm, in line with the two more recent studies. As suggested by van Zanten (2005), this can be explained by the fact that group influence on intention is obvious for wine consumption because wine is often consumed in situations of conviviality. In today's society, far from the days of prohibition, subjective norm is less important because the influence of reference people or groups perceived by the average US wine consumer is more related to conviviality dynamics than to social pressure.

The relevance of attitude in determining behavioural intention is evidence that, for the analysed sample, personal evaluations about the behaviour are more important than the opinions of others in deciding to perform the behaviour.

Tables 4 and 5 show the importance of the different factors concerning attitude and subjective norm in explaining the model components.

The correlation between attitude and salient beliefs is presented in Table 4. As in the other studies on wine consumption behaviour, taste or flavour is the most important determinant of attitude. The relaxing and sociable properties of wine are also important in shaping attitudes. The link with food and the cultural connotations of wine were found to be of little influence. The health properties of wine appear to be controversial and are not significant in determining attitudes.

Salient beliefs	Attitude	
Good taste/flavour	0.568	**
Relaxing	0.479	**
Sociable/fun	0.391	**
Food matching	0.281	**
Cultural product	0.233	*
Health	0.136	

** $p \leq 0.01$; * $p \leq 0.05$

Table 4 - Correlation between attitude (A) and salient beliefs (be)

Correlations between subjective norm and the influence of reference people and groups emerged (Table 5). Close friends and acquaintances were found to be the most important reference groups in determining the subjective norm of the individual. The judgement and behaviour of family members appears to be less important than in the other studies about wine drinking behaviour (St James and Christodoulidou, 2011; Thompson and Vourvachis, 1995; van Zanten, 2005).

Referents	Subjective Norm	
Close friends	0.592	**
Friends	0.544	**
Partner	0.534	**
Family	0.524	**
Colleagues	0.493	**

** $p \leq 0.01$; * $p \leq 0.05$

Table 5 - Correlation between subjective norm (SN) and referents (NBMC)

CONCLUSIONS

To increase its effect, decisions on wine marketing should consider how consumers structure their decision-making process and what determines their choices. This research shows that TPB can be an important instrument to achieve this aim.

The study shows a strong correlation between behaviour and behavioural intention. However, there is a part of behaviour which has not yet been explained and should probably be investigated by considering PBC. This component has not been included in the other studies that applied the reasoned action approach to wine consumption, but it could provide important explanatory results.

The study highlights that subjective norms, namely, the social pressure resulting from reference people and groups, is losing importance in relation to attitude, expressed by the opinion that the individual shapes about behavioural consequences. In this regard, a personal relationship between the individual and wine emerges. From these two trends, the reference people and group, previously exerting social pressure through norms, have become the target of the individual's behavioural choices, highlighted by the social component of the wine itself. Further, the reduction of the role of social pressure leads to new issues in assessing the effect of policy in nutrition education, reduction of risk behaviours and encouragement of positive behaviours.

This research provides wineries with guidelines for implementing strategies towards an emerging market, represented by the average US consumer. The results confirm a new trend in wine consumption and the predominant role of friends in influencing wine consumption that has emerged. The role of family as a reference social group is overshadowed. The sensory characteristics of wine remain relevant, and the role of health in determining the choice to consume wine is confirmed as controversial. These are important directions for strategies to penetrate these new markets.

DO FEMALE MANAGEMENT DECISIONS IN CRISIS TIMES DIFFER FROM MALE DECISIONS? AN EXPLORATORY STUDY

Alonso Almeida, María del Mar¹; Bremser, Kerstin²

Business Organization Department, Madrid, Spain, mar.alonso@uam.es

²Hochschule Pforzheim University, kerstin.bremser@hs-pforzheim.de

ABSTRACT

The purpose of this study is to explore management decisions during the on-going financial crisis from a gender perspective. An empirical analysis was conducted using a sample of 132 personal surveys involving the managers of independent small travel agencies. This paper finds some significant gender differences in strategic management decisions in crisis times. Thus, the findings provide useful empirical evidence for leadership development that will enhance leadership effectiveness from a gender viewpoint and facilitate advances in women business management theory.

Keywords: Gender; gender management decision; crisis management; leadership; gender differences, Spain, travel agencies.

INTRODUCTION

Nowadays companies face manifold challenges that often deal with uncertainty. Thus, to lead an enterprise it is not sufficient to possess only technical skills in the industry. In addition, to demonstrate an effective and efficient leadership style, managers have to develop social and emotional capabilities (Mandell and Pherwani, 2003; Melero, 2011).

Several studies underline the change that has been going on in the labour market, starting with the massive incorporation of women in the workforce. In most developed nations this tendency started in the 70s and by now women account there for approx. 50 % of the total workforce (Hopkins *et al.*, 2008). Prior research has shown that female capabilities, acquired through education and participation in the workforce, are not reflected in the daily workplace reality. Female participation in leadership roles is still very low compared to the above

mentioned two factors education and workforce participation. (Alonso-Almeida, 2011; Appelbaum *et al.*, 2003; Broadbridge and Hearn, 2008).

One reason to explain this situation is the idea that men and women define success in private and professional life differently (Mainiero and Sullivan, 2005; O'Connor, 2001; O'Neil and Bilimoria, 2005). According to these studies men and women use different leadership styles resulting in different business decisions (Hackman *et al.*, 1992; Mandell and Pherwani, 2003). These differences lead to the use of different leadership styles between men and women that manifest themselves in the way decisions are made and management is executed. Therefore, according to the results of prior studies, the female leadership style seems to be less effective when analysing performance in companies run by men and women (Alsos *et al.*, 2006; Fairlie and Robb, 2009). Pioneer cross-sectorial studies obtained mixed results with regard to gender-related capitalization, external financing and performance but mostly showed that women achieved worse performance. Nevertheless, latest research did not find any differences in performance. Especially when longitudinal studies were conducted (Aterido and Hallward-Dreiermeier, 2011; Lafuente and Rabetino, 2011) they even show a significantly higher performance in women-led companies.

There is little empirical evidence available about what kind of decisions female managers make. Even though some attempts have been made to identify differences in male and female leadership styles, research has room for improvement (Amagoh, 2009; Appelbaum *et al.*, 2003). The main reason is that most of prior research is based on a macro level perspective. Thus, it is necessary to deepen the knowledge on female leadership from a micro level viewpoint -firm level-, in order to help women to overcome barriers that hinder them to take up the positions they deserve.

The remainder of this paper is structured as follows. Section two discusses the theoretical arguments concerning decision making from a gender approach. Section three describes the empirical design of this study. Section four presents a quantitative analysis, followed by section five, which presents the study's findings and concludes this paper with several major implications drawn from the research.

DECISION MAKING: A GENDER APPROACH

For many years, predominant research stated that male leadership was most effective in the business world in terms of financial performance (e.g. Cooper *et al.*, 1994; Alsos *et al.*, 2006;

Fairlie and Robb, 2009). Given that the business world has been created out of a male vision (Dye *et al.*, 2005), the ideal leader is characterized by traits that most men own (Broadbridge and Hearn, 2008; Schein, 2007) called this the 'think-manager; think-male' effect which apparently qualifies men as better leaders. This form of thinking currently prevails in developed countries (Bosak and Sczesny, 2011; Rodler *et al.*, 2001).

A number of authors (e.g. Eagly and Carli, 2007; Eagly and Sczesny, 2009; Melero, 2011) summarized the different characteristics in leadership among men and women. Thus, leadership theory has identified two orientations: task-oriented and interpersonally oriented leadership. According to gender roles, female managers would be more prone to lead with an interpersonal orientation, while male managers should be more likely to apply a task-oriented style (Powell and Graves, 2003). Task-oriented leadership pursues the maintenance of authority, hierarchy and achieving business goals over all while interpersonally oriented managers build their leadership on empowering their subordinates, motivating them and showing concern about their development at work as a mean to achieve business goals. Eagly and Carli (2007) mentioned that although some studies found that both men and women have the same task-oriented leadership, women shown more interpersonal orientation than men (e.g. Melero, 2011).

Another way to describe leadership styles is the differentiation between democratic and autocratic. In this line of reasoning Bird and Brush (2002) argued that men have a strategic style of management characterized by centralized decision making -autocratic- and women prefer a participative decision making characterized by high commitment to the employees -democratic-. This same idea was found in the meta-analysis done by Eagly and Johnson (1990).

On the other hand, globalization, increased client focus, the search for new markets and other factors like increased care for the environment, corporate social responsibility and the necessity to relate to different stakeholders of a company put the focus on new capabilities needed to lead companies. This gives way to a new leadership style, called transformational leadership. As Eagly and Carli (2007) asserted these type of leaders help their employees to develop their full potential and face difficult situations with innovation. It seems that women use a leadership style that is concerned with the employees they work with to keep their motivation up (Barbutto Fritz *et al.*, 2007; Davis *et al.*, 2010). This is consistent with prior literature regarding female leadership styles (Bird and Brush, 2002; Hackman *et al.*, 1992; Mandell and Pherwani, 2003; Melero, 2011). Thus, women directors prioritize stable

employment and their responsibility for the employee (Danes *et al.*, 2007) as well as long-term client-relationships (Krishnan and Park 2005; Schaap *et al.*, 2008). For these reasons, previous research suggested that in transformational leadership -opposite to transactional leadership focused in the conventional manner to manage a company-, female capabilities are more important and women are better adapted to understand the changes that take place in the market (Carless 1998; Eagly and Sczesny 2009; Schein 2007; Schaap *et al.*, 2008).

Although women leadership has changed over time, some authors (as Eagly and Carli 2007; Melero 2011) suggested men and women tend to make managerial decisions consistent with their gender-specific leadership styles. Thereby, this study proposes the following hypothesis:

Hypothesis: Gender is a significant factor in explaining strategic managerial decisions in critical situations -as a financial crisis- according to gender-specific leadership style.

METHODOLOGY

To analyse the impact of gender on strategic decision making 136 tourist companies were surveyed. To ensure that the proper person was surveyed this study only considered questionnaires when person pointed out he or she was the decision-maker person. In total, 64 companies were led by women and 69 by men, which translate to 47.8 % female led companies and 52.2 % male led companies. The survey took place between November and December of 2009 when the Spanish tourist sector was reviving from the past economic crisis. Since the beginning of the crisis, tourism declined until the end of 2009 (UNWTO, 2010) and rebounded in 2010. The rebound was confirmed in 2011 (UNWTO, 2011) and is predicted to stay in 2012.

Travel agencies were chosen for two reasons. First, data from Spanish universities show that a majority of women choose this major (Rodriguez-Anton *et al.*, 2009). However, the sector is not considered to be a female one (Williams, 1992). Secondly, fierce competition exists within the sector (Alonso-Almeida and Llach, 2011).

Most companies focus on retail, no matter if male-led (65.1 %) or female-led (64.9 %). There are slightly more male-led retail agencies. Women lead most of the wholesale agencies whereas men dominate the tour-operators, even though this type represents only a small percentage of the entire population (8.2 % out of the total). In this study, like in previous research (e.g. Appelbaum *et al.*, 2003; Schein, 2007; Aterido and Hallward-Dreimaier, 2011;

Bardasi *et al.*, 2011), female-led companies are younger and smaller, if employees are concerned. Moreover, women have less professional experience than men. 59.4 % of the women interviewed have less than five years of work experience in contrast to 40.3 % of the men. A priori, this is a normal observation since in the sample 45.7 % of all the female-led companies had owners younger than 30 years old.

In order to analyse the leadership styles of men and women and their subsequent differences in the companies they lead the measures taken to confront the economic crisis that started in 2008 were researched.

The literature regarding strategies undertaken in times of crisis was considered and from it possible measures to confront the crisis were identified. In total 22 measures were chosen. Thus, the scale used was adapted from literature. The surveyed managers were asked if they applied these measures and to what extent. The measures taken to confront the crisis were classified using a 5 point Likert scale with 1 if the measure was not used and 5 if the measure was applied fully.

RESULTS

In order to test the hypothesis an exploratory factorial analysis was undertaken which allowed to group the 22 named measures. First, a reliability analysis over all items was conducted. The coefficient obtained for Cronbach's Alpha was 0.836 which can be considered very good. Moreover, no significant benefits were accrued with regard to Cronbach's Alpha if some of the observed elements were eliminated (Malhotra, 1981). Thus, the unidimensionality of the scale can be accepted.

In order to group the 22 measures taken, a factor analysis was undertaken using the maximum likelihood method. The KMO test result, with a value of 0.770 is compatible with a good level of adjustment. Bartlett's test of sphericity took statistical values of 937.278 and a critical

value of 0.000 which leads to the rejection of the null hypothesis that the correlation matrix is equal to the identity. The study of the communalities after extraction and the anti-image matrix showed the suitability of all nine items. Convergence was achieved in few iterations.

For the extracted factors only those with an Eigenvalue above or equal 1 were taken into account. Afterwards, a varimax rotation using Kaiser's normalization was carried out for the

business decisions whose values are synthesized in table 1. Here only factor loads over 0.4 were considered. Table 1 displays of the resulting nine factors those three that have differences among men and women.

Table 1. Factorial analysis of the business decisions taken during the crisis

Factor 1 PROACTIVE MEASURES		3.18	3.36	3.01	.041*
We increased spending on advertising	.766	2.52	2.63	2.47	
We strengthened the commercial area	.604	3.38	3.55	3.19	
We looked for new business channels	.590	3.70	3.91	3.52	
We improved processes to save operating costs	.416	3.11	3.37	2.87	
We entered into strategic alliances with other companies to offer joint services	.474	2.61	2.78	2.46	
Factor 2 SOCIAL VALUE		2.49	2.71	2.28	.042*
We decreased or eliminated our training budget	.804	2.49	2.73	2.26	
We decreased or eliminated our budget for internal and external social spending	.662	2.40	2.63	2.16	
Factor 3 DRASTIC MEASURES		2.59	2.86	2.36	.016***
We renegotiated prices or payment conditions with suppliers	.639	2.71	2.67	2.79	
We reduced personnel in all departments	.523	2.80	2.84	2.76	
	<i>Factorial Load</i>	<i>Total Mean</i>	<i>Men Mean</i>	<i>Women Mean</i>	<i>ANOVA</i>

*=Statistically significant, ***=Statistically highly significant

The first factor groups proactive measures. According to literature (Alonso-Almeida and Bremser, 2013; De Sausmarez, 2004; Enz *et al.*, 2011; Kimes, 2009; Okumus *et al.*, 2005) companies have to undertake these actions to overcome the crisis. The above cited researchers found that during previous economic crises strengthening of the commercial area and increased marketing spending were crucial to reach new market segments, put in the consumer's mind the company's image and conquer clients of companies that closed down and thus needed new service providers.

The second factor includes activities that companies eliminate in order to reduce costs before recurring to other cost cutting measures. It comprises measures like personnel development and corporate social responsibility. From an internal viewpoint these factors motivate employees and impulse a professional career development through educational measures. On the other hand, from an external viewpoint these factors are important for small companies since actions undertaken in this domain increase their visibility and strengthen their market positioning (Tullberg, 2005). Those activities are also important since they enable firms to maintain a high degree of service quality towards the final customer despite the changes that might be caused by the crisis.

The third factor groups the most drastic cost cutting measures as for instance lay-offs and renegotiation of corporate debt. In the case of service industries the lay-offs go in line with a service-level reduction and thus might lead to lower degrees of client satisfaction or the loss of the client (Alonso-Almeida and Bremser, 2013; Pearce and Michael, 2006). Even though these measures are easy to undertake and are more often used by companies than desired they carry a high social cost.

Subsequently an ANOVA analysis was conducted in order to determine difference between the decisions taken to face the crisis in male and female-led companies. The results have been included in the last column in table 1. As can be seen significant differences were found in the displayed three. Robust statistics from ANOVA found the same results.

It is evident that significant gender differences were found in decision making in the following categories: Factor one groups measures that according to literature are called proactive ($F=4.241$; Squared Mean= 4.072). Those actions help to maintain or increase the business activity in crisis times. Factor two describes measures that concern responsibilities towards employees ($F=4.524$; Squared Mean= 6.260) and factor three combines drastic

measures of cost reduction that companies can make use of in times of crisis ($F=6.007$; Squared Mean= 7.193). Differences are significant on the factor level only.

DISCUSSION OF RESULTS AND CONCLUSION

Discussion of the results

The findings obtained shed light about women's strategic decisions in companies and how they lead. The study has found that in the factors in which men and women took different

decisions women received lower values. This implies that women used those measures to a lesser extent than men. Therefore, it means that women apply less proactive measures in crisis times than men. Proactive measures are necessary to optimize and evaluate all the resources of the company and to strengthen inter-company relationships that the firm developed before the crisis (Pearce and Michael, 1997). These findings could be related to the fact that women could take fewer risks than men (Bardasi *et al.*, 2011). But it could also indicate that women use other measures of risk and based on them make different decisions (Eagly and Carli, 2007). It is needed to deepen this issue with qualitative data.

According to the leader style attributed to women, they keep the social measures intact and use to a lesser extent than men drastic measures to reduce costs. Thus, they might not be able to reduce costs as far as men. The biggest difference has been found in this third factor where male-led companies are those that use drastic measures mostly. However, since this study researches service industries, the results suggest that in male-led companies staff is dismissed and more pressure is put on remaining personnel whereas female-led companies follow a more responsible and sustainable business model (Thompson *et al.*, 2010). Therefore, the research hypothesis (*Gender is a significant factor in explaining strategic managerial decisions in critical situations -as a financial crisis- according to gender-specific leadership style*) is partially supported, because some similarities in making-decision in crisis times have been found, but also some differences have been disclosed. These differences are according to the leader style deployed by gender, albeit in the last two decades both women and men managers are changing and making a balance between task and person oriented strategic decisions (Rodler *et al.*, 2001).

In addition, the research showed that agencies led by women were in general smaller and younger. This data contains a mixed meaning. On the one hand it could mean that women in this specific subsector have fast access to management positions given their educational background and the glass ceiling does not exist or is easier to break than in other sectors. It would also imply that there are fewer barriers to reach top management positions in this kind of companies than in other sectors. This fact is supported by literature because previous research has shown that around the world tourism companies have more diversified and more equal boards of directors and administrative councils than companies operating in other sectors (Alonso-Almeida, 2011). Therefore, this sector presents a good starting point to research management from a gender perspective. On the other hand, this fact could underline what some authors have discovered (e.g. Ndemo and Maina, 2007) that women are 'pushed'

to create their own jobs since they cannot find adequate ones in the labour market. Thus, one could find young women leading companies in this sector despite having on average less experience than men. Although it could be a critical factor for firm performance, not always manager experience is significant (see Aterido and Hallward-Driemeier, 2011). The analysis of this specific situation of the tourism sector exceeds the limits of the current study but it will be included in future research.

Conclusions

The resulting findings allow extracting a series of relevant conclusions for successful leadership. A study realized by Barsh *et al.* (2008) for the McKinsey Leadership project states that currently there are no differences between men and women regarding academic education, dedication and professional preparation. Given the need for more leaders that are able to manage successful companies it is hoped that more women will make it to the top.

First, the studied companies -both led by women and men- seem to have chosen the right measures to confront the crisis and survive. On the one hand, companies led by men decided to use new distribution channels via new technologies and networking while at the same time taking drastic measures to reduce costs and lay-off people. On the other hand, companies led by women strengthened their relationships with clients and added value to their offering while keeping employment and employment benefits (social value) as stable as possible. In the current economic situation managers who develop a leadership based on transformational leadership are better ready to understand the changes that take place in the market.

Secondly, with regard to the results using a statement made by Krishnan and Park (2005) both women and men are qualified to respond to the environment's difficulties and take the best decisions to maintain a company in the market. Companies should overcome their reluctance and strike down the barriers that hinder women to climb to the top given that the prevailing legends regarding underperformance and real results do not correspond to reality. On the contrary, companies might lose valuable opportunities to add to their human resources women that bring with them an innovative and fresh vision regarding business decisions. The current crisis has underlined that companies cannot continue to waste talent but instead have to break with former values and reinvent the way they operate and react in the market. In order to do this, they need well qualified and experienced men as well as women.

Inasmuch this article does not attempt to explain differences in performance, but only to verify that managerial decision are affected by gender. Performance in women-led companies should be a subject expanded in the future to satisfy that limitation. There it could be useful to employ hard financial figures and in depth business cases.

ABSTRACT

The objective of this research is to investigate the role of the relationship quality and culture between Portuguese companies and their export market intermediaries in Angola. In particular, we aim to understand the importance that the quality of the relationship has and the role of cultures in export activities.

An important aspect of this study is precisely the fact that it includes an African country, about which, in terms of the marketing literature, there is a strong lack of studies.

In terms of methodology we opted for a qualitative analysis; we present the results of two case studies of Portuguese exporting companies and one case study about an Angolan intermediate.

In general, the results are that the business relationships are influenced by trust, commitment, culture and similar values. As in the past Angola belonged to Portugal, communication is facilitated because both countries share some cultural traits. Such factors will influence the trade relations between Portuguese exporters and their Angolan distributors.

Keywords: Angola, Portugal, Exporter, Distributor, Relationship Marketing, Culture.

INTRODUCTION

This study is of great relevance since, increasingly, Portuguese companies are not confined to the domestic market but they seek new markets to ensure their survival. Thus, it becomes relevant to analyze the quality of the relationships and culture in the relations between the Portuguese export companies and their intermediaries in the Angolan market. For this purpose we used the input from Morgan and Hunt (1994) that systematizes the KMV model.

The choice of the Angolan market is due to the fact that it is an expanding market, and also one of the most promising countries in the African continent. The trade balance in terms of Portuguese exports to Angola, from January to May 2011, is about € 787,923 thousand, according to data provided by the National Institute of Statistics (INE).

In addition, Angola currently is a major destination for the Portuguese exports outside the EU, being the fifth in the ranking of destination countries, accounting for an output of 4.55%, according to data provided by INE.

The objective of this research is to investigate the role of the relationship quality and culture between Portuguese companies and their export market intermediaries in Angola. In particular, we aim to understand the importance that the quality of the relationship has and the role of cultures in export activities, within this context.

LITERATURE REVIEW

A growing liberalization, integration and competition in world economies since the post-war period have been responsible for the increasing engagement of firms in exporting activities (Douglas and Craig, 1995), because export plays a vital role in the world economic affairs and its importance is expected to grow further as markets become more globalized.

Export development has been highly regarded by both public and corporate policy-makers, due mainly to the substantial macroeconomic and microeconomic benefits derived from external trade. From a macroeconomic perspective, exporting can enable national economies to enrich their foreign exchange reserves, provide employment, create backward and forward linkages, and, ultimately, lead to a higher standard of living (Czinkota, Rivoli and Ronkainen, 1992). In microeconomic terms, exporting can give individual firms a competitive advantage, improve their financial position, increase capacity utilization, and raise technological standards (Terpstra and Sarathy, 1994).

The exporting phase of the firm's internationalization process is defined as the transfer of goods or services across national boundaries using indirect or direct methods (Young, Hamill, Wheeler, and Davies, 1989).

The interest in the impact of buyer-seller relationships in business markets has increased over the past decades. This interest reflects the importance of distribution in the value chain and the relevance of social networks and personal relationships for many conductive exchange transactions (Dwyer, Schurr and Oh, 1987).

In the same way, Achrol (1991, p. 78, 89) forecasts the rise of 'true marketing companies' within networks of functionally specialized organizations whose interrelationships, being driven, are "held together and coordinated by market driven focal organizations" by means of "norms of sharing and commitment based on trust".

Talking about exports, once a domestic manufacturer decides to introduce a product into a foreign market, a difficult question must be solved. Should the new product be distributed via a company-owned distribution channel, or is it more efficient to outsource distribution to an independent organization? Anderson and Coughlan (1987) believe that, for an economist, this is a question of vertical integration, the choice being between primarily captive agents (company sales force and company distribution division) or primarily independent intermediaries (independent sales agents and distributors). The former solution is an integrated channel, which generally gives the manufacturer more control than the latter, which is a non-integrated channel (Anderson and Coughlan, 1987).

Relationship Marketing

According to Dwyer et al., (1987); Palmatier et al., (2007); Sheth and Parvatiyar, (1995) quoted by Gupta and Sahu (2012), the evolution of relationship marketing has been one of the most significant developments in marketing over decades, particularly regarding to industrial marketing.

Relationship marketing refers to all business activities directed towards establishing, developing and maintaining successful relational exchanges (Morgan and Hunt, 1994).

Relationship marketing brings stability and decreased uncertainty to business, by acting as a barrier to competitor entry and maintaining a stable and solid base according to Alexander and Colgate (2000) (quoted by Gupta and Sahu, 2012).

According to Grönroos (1994), relationship marketing aims to "establish, maintain and improve relationships with customers and other partners as well as the maintenance of corporate profit, so that all objectives of all parties are satisfied." That is, there is a mutual exchange and fulfilment of reciprocal promises.

Chien and Moutinho (2000) argue that the level of involvement in relationships and information exchange are instrumental to the development and maintenance of marketing relationships and for buying behaviour and legitimacy.

In the case of bilateral relationships, the actors in exchange episodes are often committed to continuing relationships which involve neither a unified hierarchy nor necessarily comprehensive and detailed contractual obligations (Heide and Stump, 1994). This type of business relationship is driven by shared behavioural norms which allow for the adoption of common business behaviour, wherein opportunistic motives are constrained because of the long term benefits of conforming to system norms and other social pressures (Dwyer, Schurr and Oh, 1987). Marketing represents how important it is to develop and nurture relationships, especially when in the international arena.

According to Morgan and Hunt (1994) the expectation of reducing overall costs is a reason to build a committed relationship, thus affecting the customer-supplier relationship. The partners, in turn, should prevent opportunistic behaviour that would be detrimental to one of the parties.

The theory of Morgan and Hunt (1994) is assumed to be relevant in explaining the relationship between exporters and local intermediaries based on the concepts of trust and commitment, concepts which are central to the development of business activities based on the establishment, development and maintenance of successful relational exchanges. Thus, it can be concluded that whenever they are successful, relational exchanges contribute to cooperation between the parties involved.

According to Vahlne (1997), companies decide to choose to start the process of internationalization through exports to render markets closer in psychological terms.

Gupta and Sahu (2012, p. 63) state that an "effective relationship marketing programme provides better results in terms of increased customer base, sales and profitability". They maintain that marketing literature provides some important dimensions of relationship

marketing like commitment, trust, cooperation etc., these factors being very important for inclusion in any firm's marketing program (Gupta and Sahu, 2012).

Trust

Within relationship marketing, trust has been recognized as an important concept (Lagrosen, and Lagrosen. 2012). Morgan and Hunt (1994) conceptualize trust as existing when one party has confidence in the reliability and integrity of the other exchange partner.

For Nicholson, Compeau and Sethi (2001), trust is the security in the reliability and integrity of the other party.

According to Abosag, Tynan and Lewis (2006), trust is based on emotion. These authors consider that trust that one party puts in the other party is based on feelings and emotions generated by love, empathy, politeness, similarity and concern for the other part, which is demonstrated in their interaction.

In Marshall's (2003) view, based on Blau (1994), trust is the belief that another person will fulfil its obligations and generally do what he can.

To Hakansson (1982), trust increase is a social process that takes time and must be based on personal experience. Therefore, interaction is important for interpersonal confidence building (Zaheer et al., 1998, Nicholson et al., 2001).

According to Boersma, Margreet, Buckley and Ghauri (2003), trust is on the expectation that one of the parties will be reliable in the fulfilment of the agreements, will play its role in a competent manner and will act honourably even when promises or guarantees of performance have been given. Relational trust is the perceived ability and willingness of the other party to act in order to consider the interest of parties in the relationship (Selnes and Sallies 2003). According to Abosag et al. (2006), trust emerges from the foresight of a part on his partner as for meeting future actions/behaviours to fulfil the promises (Zaheer et al., 1998), forecasts being based on an accumulated knowledge gained through interaction of the parties (Harris and Dibben, 1999) or based on the reputation of the partner or on other relationships (Johnson and Grayson, 2005). The expectations of the parties can be a good indicator of the level of confidence. In this sense it may be said that when the trust level is high, the expectations can be predicted with confidence as all parties feel secure in their interaction. But when trust is low, expectations will be clouded by uncertainties. From the standpoint of

Morgan and Hunt (1994), "willingness to trust" should be seen as a result (or alternatively, a potential indicator) of trust and not as a part of its definition.

Blois (2003) based on Baier (1986), states that trust is the acceptance of vulnerability to possible but not expected bad faith (or lack of good faith).

To Marshall (2003), quoting Carnevale, Pruitt and Carrington (1982), trust is a concomitant expectation that the other (in a dyad) will reciprocate.

Next are presented some authors' testimonies that corroborate that trust is crucial in business relationships.

Berry and Parasuraman (1991, p. 144) argue that the "company-client relationship requires trust in marketing services, since the customer generally buys first and then experiences."

According to Berry (1993, p. 1), "in the retail sector, trust is the basis of loyalty." In this sense, he concludes that the greatest obstacle to the success of alliances is the lack of confidence. It is also relevant to examine this concept from the perspective of the level of individualism of a country (Hofstede, 1980). According to Abosag et al. (2006) this perspective is crucial because people from an individualistic culture give more room for professional interaction and give little room for personal interaction.

Trust is a complex concept with multiple meanings and dimensions (Abosag et al., 2006). Defining the scope of trust is difficult and can be frustrating. A common feature in the various definitions is that trust involves a part that depends on the other party to fulfil its obligations. Trust was conceptualized in several ways. Some studies have conceptualized it as an unidimensional concept (Morgan and Hunt, 1994, Jap 1999; Gabarino and Johnson, 1999) while others conceive trust as a two-dimensional construct (Geyskens et al., 1996, Doney and Cannon, 1997; Joshi and Stump, 1999, Nicholson et al., 2001). Still others propose a multidimensional approach to the study of trust (Rodriguez and Wilson, 1995; Brashear et al., 2003; Miyamoto and Rexha, 2004, Johnson and Grayson, 2005). All these studies show a lack of consensus on the conceptualization and operationalization of trust. Once that trust is knowledge driven, missing or incomplete knowledge creates the need for trust.

According to Obadia (2008), an international organization, wherein the legal differences between countries make it difficult to enforce contracts (Zhang et al., 2003), the existence of trust is even more important, because the partners need to trust the promises made by the other partner (MacNeil, 1980). In this sense, trust is central to all relational exchanges abroad.

In short, trust exists when a partner has faith, hopes and believes he can deliver (something) to someone without fear of loss or damage, that is, to indulge in full security.

Commitment

According to Berghall (2003), the concept of commitment, in business relationships, regards a phenomenon in which one side of the social interaction limits its behavioural alternatives, due to the presence of a long-term orientation.

To Morgan and Hunt (1994), committed relationships exist only when there is an enduring desire to maintain a relationship considered as important.

Some authors believe that the level of commitment a partner feels towards a relationship is of major importance in relationship development and subsequent success (Morgan and Hunt 1994; Wilson 1995).

To Abosag et al. (2006), commitment is like an asset, a good and/or an intention to continue to maintain a relationship in the future. A committed relationship is known as an enduring desire to maintain a relationship (Dwyer et al., 1987; Geyskens et al., 1996; Mooman et al, 1992; Morgan, and Hunt, 1994).

Commitment is often seen as an ongoing "investment" into activities which are expected to maintain the relationship (Blois, 1998). Commitment has also been found to be reciprocal in nature, and that successful relationships relying on commitment from both parties (O'Malley, Patterson and Evans, 1997).

According to Selnes and Sallis (2003), a commitment to collaboration is defined as the joint belief that the relationship is important enough to ensure joint efforts to maintain and strengthen the relationship.

To Abosag et al. (2006), a committed relationship is increasingly important; as suggested by Gundlach et al., (1995, p. 78), commitment "may very well become a focal point of explanation in marketing."

To Conway and Swift (2000), commitment can be seen as an intention to continue the course of an action or activity or desire to maintain a relationship.

Berry and Parasuraman (1991, p. 139), argue that "relationships are built on a mutual commitment."

According to Kim and Oh (2002), commitment is the extent to which a company is dedicated to a close and lasting relationship with the channel partner. It should be noted, however, that some authors warn for the fact that a committed relationship is a difficult and complex phenomenon, and a deeper understanding of this concept is hampered by the lack of a clear and complete commitment (Abosag et al., 2006).

To Rodriguez and Wilson (2002), commitment reflects the relative strength of an individual's identification with, and involvement in, a particular organization.

As mentioned by Abosag et al. (2006), who examined the role of specific investments in developing commitment throughout the life cycle of a relationship, a transaction specific investment (TSI) highlights the commitment at the exploration phase and has a positive effect during the decline phase. According to these authors, the parties recognize the need to maintain their relationship, due to the high costs associated with termination or the continuous, safe access to important benefits. In summary, since relationships require investments, the parties recognize the need to maintain their relationship, since the costs associated with termination of these and looking for new partners are very high. According to Abosag et al. (2006) in the relationship marketing literature, it is assumed that the parties' ability to exercise greater social interaction reduces uncertainty (Achrol and Stern, 1988) acts as a barrier against opportunism of the partner, improves the quality of the relationship, helps to build satisfaction in the relationship (Selnes, 1998), increases the attractiveness of the relationship (Harris et al., 2003), and leads to better cooperation.

Besides the analysis of the instrumental dimension (financial commitment) it is also relevant to study the affective commitment. This one is more personal, involving social interactions among individuals with partner organizations. However, as it is reported by Gundlanch et al. (1995) the behavioural aspect of the affective commitment is critical in terms of developing trust, reciprocity, integrity and solidarity, which are required to maintain long-term relationships. Meyer and Allen (1991) argue that the level of emotional commitment in a relationship does not affect the degree of calculation commitment and vice versa. Abosag et al. (2006) contradict this argument and, instead, they argue that the parties may increase the commitment to a course of action.

The key factor in the early development of affective commitment, according to Abosag et al. (2006), is the social bond/emotion. A social bond leads to the creation of the emotional dimension and the cognitive dimension of commitment (meaning perception, knowledge,

beliefs shared by parties), which are important antecedents of affective commitment (Sanchez and Iniesta, 2004).

Despite it is understandable that a tight personal relationship helps the duration of trade relationships, a personal relationship may have a negative impact on trade relations in some situations. In this regard, Alajoutsijarvi et al. (2000) report the damaging impacts of personal conflicts in trade relations. They point out that the costs of the emotions at the end of relationships can be high when the level of affective commitment is high (Meyer and Allen, 1991).

Trust and commitment are key elements for relationship marketing strategy success (Siguaw, Simpson and Baker, 1998).

Moreover, Tellefsen and Thomas (2005) argue that the link between personal trust and personal commitment has not been fully examined or tested in the literature.

Culture

In the international environment, culture is an element of paramount importance when a company decides to internationalize. There isn't much agreement on how culture should be defined. The choice of a theoretical and conceptual frame means the choice of different objects, methods and research instruments and perspectives. Next we present several views for this concept.

Parsons (1951,1954,1960 and 1964) consider the culture of human societies as a coherent whole, harmonious and functional in relation to the imperatives of the social system and he believes that the social order will eventually be formed whenever the symbolic values are formulated in a coherent and harmonious manner and internalized by social actors.

Hall (1973, 1977 and 1990) uses criteria to differentiate cultures in order to facilitate international comparisons and an anthropological description of the different national cultures. That is, he identifies two behavioural criteria which are significant in terms of the impact on the approaches to work and professional relationships: "Polychromic cultures" (that means that a number of actions are fulfilled at the same time or in the same period) and "monochromic cultures" (refers essentially to the performance of an activity at a time) and "reference to the context" (organization of information that may be implied (high context) or explicit (low context), versus "content of the message" in human communication in societies. According to this author, Portugal and Africa fit into the "high context" category.

National culture is like a collective mental program of the human mind or a system of patterns and meanings about the way of thinking, feeling and acting on common problems that characterizes and distinguishes one group or category of people from another group or category (Hofstede, 1980 and 1991).

Hofstede, Trompenaars and other authors use an onion diagram, wherein culture is depicted as consisting of several layers, in which centre, in the main and deeper level, are the values, while the external layers are more visible, namely the level of symbols, heroes and rituals.

In Hofstede's research, which has more than 30 years, Portugal exhibits the following scores: Average to high power distance (63), low individualism (27), low masculinity (31), very strong need to control uncertainty (104) and short-term orientation (30). Angola exhibits the following scores: Power distance (80), low individualism (25), masculinity (45) and need for control of uncertainty (85) (Hofstede, 1980 and 1991).

Skarmeas et al. (2001) suggest that the constructs reflecting cultural differences should be included in studies about the relations between exporters and importers. Conway and Swift (2000) reported that, when there is a high level of psychic distance, the establishment and/or development of business relationships can be damaged. Swift (1999) mentions studies that address the impact of culture on the interaction process between buyers and sellers. Kale and Barnes (1992) suggest that international interactions should be affected by aspects of the national culture. Shankarmahesh et al. (2003) conclude that a strong organizational culture, characterized by low level of individualism, power distance, uncertainty avoidance and masculinity, favour the maintenance of international relations. Mehta et al. (2003) add that it is necessary to include aspects of cultures when the research deals with feelings and behaviours of actors belonging to different countries, since underlying the culture of each country are "systematic differences in behaviour" (Steenkamp, 2001). Companies with international operations need to evaluate the possible impact of cultural differences on the partners' reaction to the marketing strategies. Rodriguez and Wilson (2002) argue that, on one hand, cultural distance contributes to the emergence of communication problems, distrust and distant interpersonal relationships, and, on the other hand, an intercultural adjustment is required for the development of commitment in the relationship.

OBJECTIVE AND RESEARCH QUESTIONS

The objective of this research is to investigate the role of the relationship quality and culture between Portuguese companies and their export market intermediaries in Angola. In

particular, we aim to understand the importance that the quality of the relationship has and the role of cultures in export activities. This objective can be deployed into two research questions:

RQ1) How do the differences and the similarities between Portuguese and Angolan cultures and the values influence the quality of the relationship in trade relations between the Portuguese exporting companies and their Angolan distributor(s)?

RQ2) Why do trust and commitment influence business relationships between the Portuguese exporting companies and their Angolan distributor(s)?

METHODOLOGY

According to Yin (1994) the case study methodology is more suitable when the research questions involve the "how" and "why", as it happens in this research, allowing to greater contact with the players involved, resulting in a more detailed and thorough analysis, which allows us to highlight details that might otherwise go unnoticed.

The geographical scope of this study is Portugal and Angola. Given the cross-cultural nature of this study we will take into account the specific nature of these markets.

This methodology has been applied to the field of international strategic management, since one has access to information from those involved in decision making, which results in being able to better analyze, and in more depth, one's options (Rialp, 1998).

According to Morse and Richards (2002), in areas where the skills are not well cemented or where existing theories seem inadequate, it is appropriate to opt for this type of analysis.

When choosing a single case study or multiple case studies, it was taken into account that a "potential weakness of a case study relates to the fact that this case could prove to be different from what was initially expected" (Yin, 1994, p. 41). According to this author the option for a single case is justified only if that case is critical (in order to test a well-founded theory).

According to Huberman (1994), the selection of the cases should be guided by theory, in order to establish a reference from which one can meet the objectives of the investigation, not to mention the limitations of time and resources. According to Eisenhardt (1989), the selected cases may have the function to replicate previous cases to extend the theory or they may still be chosen to fill a theoretical category or to exemplify polarized cases. According to Dubois and Gadde (2002) more interesting than the similarities to be found among the cases, are the

differences and their possible explanations. In this sense, it will be interesting to study contrasting cases. Based on what was proposed by Yin (1994), the choice of the cases should meet with certain objectives between the three possible options:

- Selecting cases fulfilling the theoretical categories in order to extend the theory.
- To opt for cases that serve as replication, to test the theory, or
- To choose contrasting cases to extend the theory.

In summary, cases should be relevant (George and Bennett, 2005) and with a potential for learning (Dubois and Gadde, 2002), in order to be able to build a more complete and noticeable mosaic.

The criteria for the selection of the case studies were:

- To be successful Portuguese export companies to the Angolan market.
- To export to the Angolan market through a distributor based in Angola.

In order to fulfil the criteria and to meet with the suggestion of the authors mentioned above it was decided to ask to the Agency for Investment and External Commerce of Portugal (AICEP, EPE), in August 2011, the most recent list of the fifty largest Portuguese companies exporting to the Angolan market.

According to Miles and Huberman (1994), one of the advantages of using a qualitative methodology is that the analysis may focus around phenomena in their natural environment, and therefore the data collection occurs close to the situation under consideration.

The methods to determine the reliability of a measuring instrument used in qualitative research are the validity of interviews, the validity of documentary analysis and the validity of the observation techniques. According to Yin (1994), a case study can be used to test a theory.

POPULATION AND SAMPLING

The sampling process is not random and is based on the latest data provided by AICEP in August 2011, including the list of the top 50 Portuguese exporters and their respective counterparts (Angolan distributors). In short, companies were not selected randomly, nor

intended to be a representative sample of any manufacturing business (belonging to different sectors in order to have an overview of the market). We are interested in companies that have been engaged in long-term relationships with their distributors.

The sample was selected according to the criteria of external validity/reliability. As for the activity sector, we opted for companies belonging to different sectors of the market, in order to get as much information about manufacturer-distributor relations in different businesses, therefore increasing this study validity.

The option to select companies within the list of the 50 largest Portuguese exporting companies and their respective pairs provided by AICEP was based on the fact of these being an added value to this investigation.

The sample was made up by two case studies of Portuguese export companies (Petróleos de Portugal- Petrogal. S.A. (Galp Energia) and Unicer Bebidas, S.A.) and one case study of an Angolan distributor (Mota & Tavares Lda.).

Unicer Bebidas, SA. |Unicer| actually is the Portuguese company, in all the sectors of activity that exports more to Angola. Unicer is a company that is now 125 years old and exports to Angola since the middle fifties of the twentieth century.

Mota & Tavares Lda. |M&T| was founded 50 years ago and it imports from Portugal since 1970.

Galp Energia |GE| founded in 1976, belongs to the oil and power sector, is present in Angola since 1982.

DISCUSSION

The **first research question** investigates how the differences and the similarities between Portuguese and Angolan cultures and the values influence the quality of the relationship in trade relations between the Portuguese exporting companies and their Angolan distributor(s)

The following interviewees' statements, and the respective theoretical explanations, will help us to understand the influence of culture and values in this context

Both Portuguese and Angolans speak the same language, which may represent "a trade facilitator" (Ghemawat, 2001):

*“The Lusophone component of Galp Energia operates as a further **facilitating factor** of the relation of cultural affinity between the parties,” |GE|*

“...the same language, other easiness.” |M&T|

Although the Portuguese and the Angolans share the same language, the way to communicate must be adapted to the local culture.

*“Unicer made a huge effort to communicate locally either by **the use of local expressions** in language, or through the **“Angolanisation”** of events like the Super Bock Super Rock.. |Unicer|*

There are many common habits and customs:

*“Portuguese companies at this time, some Angolans have **bought from Portuguese companies for a simple reason: habits and customs**, there were 500 years. And Portugal and Angola, like it or not, created a family of 500 years that is almost difficult to separate.” |M&T|*

*...“The culture is the same, because the Portuguese have a culture of long years of qualities and customs of Angola, the food, habits of dressing, are equal. Now what happens is that sometimes, both on one side as the on the other, are not properly prepared and make things easier, and then things go wrong. But **the culture is the same**, no differences. Habits, customs of the Angolan and Portuguese are the same and you cannot change them.” |M&T|*

Other important cultural traits are the notion of time (Hall, 1977) social hierarchies and national pride and nationalism.

*“The African concept of time is completely different from the European concept. There is a **bias for the short term**. The African reality is more oriented living day after day and the moment without a long-term referential. This fact often leads to misunderstandings as for a benchmark for the **assessment of investments”**.*

Angola may be considered a p-time country (Hall, 1977) since *“there is an established tolerance for delays and non-fulfilments.” |Unicer|*

As for distinct social hierarchies, *“it still prevails **the importance of age and position** in the family as a benchmark of social relations. For example, the **importance of the elder** in decision making and in social relations.”*

Angola is a low individualism country, and status oriented and so, the *“**recognition by the group** is determining of the individuals’ attitudes. |Unicer|*

National pride and nationalism are quite obvious in the following statement: *“There is an extreme sense of belonging to the Angolan nationality and patriotism; therefore, the business behaviours must take into consideration this sense of belonging. It is easy to adopt behaviours that offend the notion of “Angolanity” which can have severe negative repercussions on business and on brands. It’s easy to be perceived as neo-colonial.”* |Unicer|

These statements show the importance of cultural empathy, defined by Phillips et. al. (1994) (quoted by Swift, 1999) as the ability to (a seller) to put himself in a buyer position, from another culture. As previously maintained by LaBahn and Harich (1997), cultural sensitivity is needed to succeed in international markets, since importers may be susceptible to behaviours they deem inappropriate. Sensitivity to time conception differences, to a very stressed sense of nationalism and to social hierarchies is of paramount importance in doing business with Angolans.

An expression of nationalism is the landlord behaviour, which is very deeply rooted in the Angolans’ beliefs and business practices, maybe due to the several centuries of the Portuguese colonization:

“The Angolan deems to be the owner of his country and therefore he thinks he can take possession of some income from foreign business operating in his country. This leads, for example, to the requirement of quotas and shares in companies without capital inflows |Unicer|.

The influence of values like honesty, credibility and transparency on trade relations success, between Portuguese and Angolan companies, is quite clear from the following statements:

“One of the main bases is honesty...” ... “...because of this aspect Angola prefers to work with the Portuguese than with any other, this is known. ... “Most of moral values are honesty from both parties. Knowing that I will deliver a product and the customer will be satisfied with the product, he will not be badly served: This is the main base, don’t sell to the customer a pig in a poke. This is the main base in moral values.” |M&T|

A business with a Portuguese is always faster. And if there is understanding and honesty from both parties it is always much, much faster than with any other foreign business.” |M&T|

To be credible *“the Company must demonstrate financial and operational capacity, i.e. the existence of physical facilities and human resources in order to succeed in marketing the company’s products* |Unicer|.

Being transparent in trade relations, in this context, is also important to succeed:

Will to share market knowledge and philosophy of information share about the market, customers and business conditions in order to enable maximum efficiency of the joint operation and maximizing value. |Unicer|

Understanding the importance of local values, like masculinity and status recognition, and social practices, like rumour spreading, and being able to convert them into strategies may represent the difference between product success or failure

*“Crucial to the success of the product has also been the creation of myths about the brand. The Super Bock became known in the Angolan market as the GTI, beer with power to the riot troop. That is, through “rappers” and expressions of contemporary Angolan popular music a myth was created that **responds to the desires of masculinity in society** and that corresponds to the diffusion of the belief that Super Bock is a strong beer only **for those who have power**, those who are manly, hence Super Bock for the riot troop...Displays of virility are a form of trust building or of coming together with partners. This is an example of how the knowledge of cultural realities, at the consumer level, can be used for the communication strategy for a product/brand. This however requires **the knowledge of the idiosyncrasies of local consumers and of the culture that shapes their behaviours.**”*
|Unicer|

“The rumour spreads very fast and can be used as a weapon of guerrillas to positively influence the performance of the company’s products, as well as, if not controlled, it can cause irreparable damage to a brand or a business relationship with a distributor.” |Unicer|

Understanding local business ethics idiosyncrasies and being able to cope with them is of paramount importance

*“Most relationships, in Angola, are defined outside the current legal context. There is a prevalence of personal relationships and plots. **They set up creative ways to make money that sustain an entire subsistence economy.** Without knowledge of the rules in force in the informal sector, on which substantial part of the distribution networks of consumer products is based, **you cannot successfully do business in Angola.**”* |Unicer|

Summing up, the common language, the habits, customs and social practices, the notion of time, the social hierarchies, the national pride and its expression, the existence of cultural empathy, the people’s values, the masculinity expression and the business ethics, strongly

influence the trade relations between the Portuguese exporting companies and their Angolan distributor(s).

The **second research question** investigates why does trust and commitment influence the relationships between the Portuguese exporting companies and their Angolan distributor(s). The following interviewees statements help us to understand how to build trust and commitment, and their influence on business relationships, within this context

*“... **trust must exist** between both parties. The activity of Galp Energia in the Angolan market has demonstrated the existence of this perennial feature, and **both parties have fulfilled their commitments.**” |GE|*

*“Exactly. This is **the main base**, there has to be **trust and commitment.**” |M&T|*

*“I have been working with Portugal **for many years**, I have good relationships, and they all are **my friends.**” ... “He is a friend of mine and when I come to Portugal, I have all cars, I have to go to the factories, so I can only say good things about Portugal. **In every corner I have a friend, friend.**” |M&T|*

*“Most important, from both parties, not just one. If both parties have this behaviour, **the deal will go far and builds friendships**” |M&T|.*

*“... the relationships with our partners are based on **mutual trust** which has proved to be robust **over the years.**” |GE|*

The trust dimension “benevolence” aims to assess whether the customer sees the exporter as a friend and believes that he is on his side (Siguaw et al., 1998). These statements show the importance attached to affective trust and its role in building relationships that last “for many years” |M&T| and “robust over the years” |GE|. The commitment dimensions portrayed here are the continuity commitment - which can be referred to as the importer's desire to continue the relationship with the distributor (Skarmeas et. al. 2002) – and the affective commitment which is more effective than the calculation commitment in maintaining relationships (Sanzo et. al., 2003). From the statements, one may confirm that trust is a precondition for increased commitment (Mietilla and Moller, 1990) and, like commitment, it is often stated as a vital factor in successful relationships, mutual trust being a main factor in long-term relationships (Takala and Uusitalo, 1996).

Opportunistic behaviours can damage trust. Li and Ng (2002) state that there may be opportunistic behaviours in export channels, when the cultural gap and psychic distance hinder communication. This may explain why the Angolan importer M&T trusts more the Portuguese exporters:

"Pig in a poke. And in Portugal, throughout this time I have no problem. I do not mean that there are no individuals, but I have no problem." |M&T|

"It helps a lot, because the culture is the same, the habits are the same and there is an understanding and doing business is fast because that is what sometimes, when you are going to do business for example with a Chinese guy, with an individual of another country that has not the same language, it is not the same culture, the same customs and habits, it is always more difficult, more time consuming". |M&T|

Confirming the interviewee's statement, Harris and Ghauri (2000) note that sharing the same language, beliefs and understandings is required for high quality interactions and trust development to occur.

The level of trust in a relationship has been assessed by evaluating in what extent one partner is on the other's side (Siguaw et al., 1998), in what extent a partner is concerned with the other partner's business (Johnson et al., 1996) and in what extent one partner can count on the other when circumstances change or in an emergency situation (Sanzo et al., 2003). All these three trust items are recognizable in the following M&T's statement.

"...he phoned me to say he was troubled with the payment of things, it was not much, \$30 000 or \$45 000 and if I could help out. I sent, I transferred that money and I told him not to send the goods, to keep them until we see how it goes in the next 15 days; a week later there was a withdrawal then the goods were settled within the price they could sell. Therefore it was this help that I gave because otherwise he said he would have been obliged to shut down the factory." |M&T|

The following statements show the importance of the dimension "competence" (Walter et al., 2003) in building trust:

"You have to develop a climate of mutual trust, so that Unicer has confidence in the ability of the entity distributor to meet its commitments and to respect the values of the brand, not causing any damage to its image and possessing the ability to distribute products with success." |Unicer|

"...distributors must demonstrate their ability by repeatedly placing orders." |Unicer|

Reputation is also a process of building calculation trust (Doney and Cannon, 1997), that is a company may be trusted "because they are who they are" (Conway and Swift, 2000)". Elg (2002) argues that trust may be based on the general reputation of the company

(To build reputation) *"the distributor and/or its members **must have to demonstrate an enduring presence in the market and to be able to attest by his reputation the medium/long-term commitment to the market.**"* |Unicer|

The demonstration of commitment in relationships should be a priority, in order to build partners' trust (Buttle, 1996) since commitment serves to discriminate between those "who stay" and those "who leave" (Mummalaneni, 1987, quoted by Wilson, 1995)

*"It has always remained the same, simply because here **in Porto (Portugal) everyone knows me.** Now after independence, because I was in debt in the market square here in Porto, \$ 7 million, it was a supply to the state (Angolan) and the state did not pay me, then tomorrow, we will pay tomorrow. And then they decided to pay **and I paid** by two or three instalments, here in Porto, **I had no problems ...**"* |M&T|

*"Especially if you have paid in advance. Portugal does not, **Portugal if one pays in advance; they fulfil (the contract).** It is very difficult to miss their commitments. Even me, I appreciate in all the imports."* |M&T|

The fulfilment of one's obligations can build trust. This is quite obvious from these statements. Cognition based trust may result from the perception of performance behaviours and achievements of the partner, such as ... the fulfilment of the responsibilities of a part towards the other (Chen et al., 1998). Trust may be conceived as a belief in the reliability of the partner and the fulfilment of its obligations (Schurr and Ozane, 1985).

*Over the years **I have credit, a friendship** with all the companies, **all give me credit.** We have a great friendship, **over 30 or 40 years.**"* |M&T|

Parkhe (1998) identified three common issues in trust definitions: trust is related to uncertainty about the future, trust entails vulnerability and it is granted to someone whose behaviour is not under one's control. This being said, credit granting means that you trust the other party, since you don't know for sure that you'll receive the money.

Granting distribution exclusivity creates the conditions to build calculation commitment (Gilliland and Bello, 2002) as it becomes apparent from the following statements:

“Firstly, commitment to the UNICER brand and products and desire to work in exclusive with company’s brands...reflection of the desire of the operator to develop UNICER brands”. |Unicer|

Summing up, the statements above reveal the great importance of building trust and commitment in the relationships with the Angolan importers. Friendship is valued and it leads to long lasting relationships, i.e., benevolence trust builds continuity commitment and affective commitment.

Between Portugal and Angola the psychic distance is low, which may explain why mutual trust is higher comparatively to other markets, allowing for faster and easier business negotiations and giving rise to less frequent opportunistic behaviours.

If a partner shows he is concerned with the other partner’s business and is helpful when an emergency occurs, this may be a path to trust building and a catalyst to sound relationships.

While the regular fulfilment of obligations, the exhibition of ability and credit granting are trust builders, granting distribution exclusivity may be a way to build calculation commitment.

CONCLUSIONS AND IMPLICATIONS

The general objective of this paper is to investigate the role of relationship quality and culture between the Portuguese export companies and their intermediaries in the Angolan market. In this particular case, we aim to understand the importance of the quality of the relationship and the role of culture and shared values in the export activities.

The three case studies analysed relate to two Portuguese companies that export to the Angolan market and one case study concerning an Angolan distributor.

One of the objectives of this paper was to understand the influence of cultural differences and similarities, between the Portuguese and the Angolans, on export relationships.

A common cultural issue is the language. It became apparent that language facilitates the relationship, although the knowledge and the use of local expressions may be necessary. Common habits and customs, acquired by the Angolans through centuries of Portuguese colonization, may influence the choice of Portuguese suppliers over suppliers from other countries. Even though, a certain “Angolanisation” may be required.

On the contrary, the African concept of time is completely different from the European concept. There is a bias for the short term which may hamper business objectives setting, the assessment of investments, definition of strategies, etc.

Angola is almost a new born independent country which may partially explain the existence of a very strong sense of belonging to the Angolan nationality and patriotism. Thus, it is very important to avoid behaviours that offend the notion of "Angolanity". An expression of this is the landlord behaviour, meaning that the Angolans claim they can take possession of some income from foreign business operating in his country, somehow reducing the attractiveness of doing business locally.

Other cultural traits are the reverence for elder people, the importance attached to social position and to recognition by the group. The knowledge of these realities may help in, for example, having a proper social behaviour and in carrying out business negotiations and in choosing the right advertising messages and opinion makers.

Values like honesty, credibility and transparency on trade relations are valued and are of paramount importance in doing business with local partners besides hastening business. Portuguese business partners are generally viewed by the Angolan importers as, honest and credible. Other values, like masculinity, may be used in advertising campaigns to successfully position brands. Fast rumour spreading is a local reality that, if properly used, may benefit companies and brands.

Understanding business ethics idiosyncrasies - which are different from those in most Western European countries - like creative ways to make money, and being able to cope with them, may represent the business success or failure

Another objective of this paper was to understand why trust and commitment influence the relationships between the Portuguese exporting companies and their Angolan distributor(s).

From the interviewees' statements, one may confirm that trust and commitment are the main bases to build and develop relationships within this context and the former is a precondition for the later. It is also clear that affective trust has an important role within this process

As it has been shown previously, the cultural gap between Portugal and Angola is small, which may prevent opportunistic behaviours and consequently reinforce the level of trust in business relationships between these two countries.

Several trust builders are identifiable in the statements, such as being concerned with the partner's business, assistance when an emergency situation occur, perceiving the other partner as a friend, knowing that the other party is on one's side, credit grant and exclusive distribution grant.

The dimensions "competence", "reputation", "fulfilment of the obligations" and "reliability" are also evident.

In general, the results show that trust, commitment, culture and similar values affect the way how relationships are managed and its outcomes. Confirming some theoretical proposals, it becomes quite clear that these constructs affect the trade relations between Portuguese export companies and their Angolan distributors. It is also evident that the knowledge of some market idiosyncrasies is indispensable to succeed in the Angolan market.

The implications of this study for management are very important since managers can realize how they can do business/international trade in this specific market, Angola.

However the study's results should be interpreted with caution. Given its qualitative nature, there are limits to their generalization.

Future investigation can replicate this study in other colonizer/colonized pair of countries in order to assess if the results hold.

PARTNER SELECTION IN CO-OPETITION: A THREE STEP MODEL

Alves, João¹; Meneses, Raquel²

¹Faculdade de Economia, Universidade do Porto, Portugal, 110418021@fep.up.pt

²Faculdade de Economia, Universidade do Porto, Portugal, raquelm@fep.up.pt

ABSTRACT

Co-opetition partnerships refer to developing cooperation efforts between competitors. The scarcity of studies conducted in this field to date provides limited contribution for the understanding of the partner selection process in this particularly paradoxical concept. This paper aims to contribute towards a better understanding of the partner selection process, which anticipates a successful co-opetition partnership. This study follows a methodology based on systematic combining for the qualitative analysis of four cases of domestic co-opetition in Portugal. A sample range of eight companies was selected for a series of semi-structured interviews. After data was collected, coded and analysed, results indicated that prior personal relationships between decision makers are facilitators for the implementation of cooperation partnerships with competitors.

Based on these findings, this paper proposes a 3-step model to explain the process of partner selection for co-opetition partnerships. According to this model, after opting to commence a new cooperative business alliance, the manager undergoes a first unconscious selection based on his/her own prior personal relationships, followed by a conscious and judicious selection based on specific criteria related to partner's operational skills, resources, effectiveness and trust.

Keywords: co-opetition, partner selection, personal relationships, networks

INTRODUCTION

"Sleeping with the enemy" is how Quint (1997) illustrates co-opetition. Indeed, co-opetition partnerships imply tight cooperation between competitors simultaneously entailing a *"war and peace"* concept (Brandenburger and Nalebuff, 1996) that involves the notion of *"compete*

and cooperate at the same time”, as stated by Novell's CEO Raymond Noorda (Ritala, 2010; Luo, 2007). Co-opetition is thus inherently paradoxical as the question of why a company would join forces with a competitor and share its competitive advantages appears to be dubious. (Schmiele and Sofka, 2007). This paradox also lends itself to the question of how a firm would then proceed to select a competitor to partner as co-opetition. In other words, what are the criteria, factors or considerations that influence the selection of a competitor and its reciprocal acceptance of combining strengths to create a co-opetition strategy. While many researchers attempt to explain why the phenomenon occurs (Bengtsson and Kock, 2000; Dagnino and Padula, 2002; Zineldin, 2004), not many have described how the “enemy to sleep with” is chosen. Curiously, in a study on domestic co-opetition, Schmiele and Sofka (2007) observed that the prevalence of co-opetition partnerships was higher among graduated managers. In the same study, the authors report that the same phenomenon is unnoticed in international co-opetition. In the exclusion that co-opetition is not directly linked to the managers' level of education, Schmiele and Sofka (2007) propose that the existence of prior personal ties could facilitate the formation of domestic co-opetition partnerships, as personal networks are known to be important channels for the flow of knowledge. This observation marks the foundation of our research question: How are competitors chosen to team up for a co-opetition partnership? To answer this question, we have conducted an exploratory qualitative analysis following an abductive approach and therefore, hypothesis has not been formulated.

We've commenced by identifying four cases of domestic co-opetition and conducted interviews with top managers in order to determine how each co-opetition partnerships started. Case analysis was carried out through a Systematic Combining methodology (Dubois and Gadde, 2002) based on Grounded Theory (Glaser and Strauss, 1967) in order to propose an answer to our research question. From the analysis of these cases we learnt that prior personal relationships impacts positively on the creation of co-opetition partnerships and we've proposed a model to explain this process further. The proposed 3-step model comprises of an unconscious pre-selection of partners based on prior personal relationships, followed by a conscious selection based on judicious criteria and finally concluded with an invitation for partnership.

LITERATURE REVIEW

- **Co-opetition partnerships**

The concept of co-opetition has been introduced in the academic literature in 1996 by Bradenburger and Nalebuff (Ritala, 2010). The term is a portmanteau of “cooperation” and “competition” aimed to describe the ambivalent nature of a partnership between competitors. Despite the inherent paradox in co-opetition (Brandenburger and Nalebuff, 1996; Schmiele and Sofka, 2007), reasons pointed out as leading to such alliances are the sharing of costs, risks and/or knowledge in Research & Development (Dagnino and Padula, 2002; Schmiele and Sofka, 2007), Product Development (Bengtsson and Kock, 2000; Zineldin, 2004), Innovation (Zineldin, 2004), Production (Dagnino and Padula, 2002) and Marketing (Bengtsson and Kock, 2000; Zineldin, 2004; Ritala, 2010). Bengtsson and Kock (2000) reminds us that the complexity of such relationships results from the intertwining of two opposite interactions, in that partners can benefit from both: from collaboration partners can reduce costs for new product development, reduce lead times and benefit from partner's core competences; from competition, each firm is driven to differentiate themselves and their products and services and to perform more efficiently than its partner.

It is commonly accepted that partner selection is one of the most influential factors for the success of business alliances (Geringer, 1991; Shah and Swaminathan, 2008). The relevance of the choice is of such importance that Cummings and Holmberg (2012) refer to partner selection criteria as critical success factors, given that an unfit initial partner selection may even destroy the best possible alliance management capabilities. However, to the best of our knowledge, no research has been made on the partner selection process prior to the launch of a co-opetition partnership. For this reason, our literature review on partner selection is based on the existing literature for Strategic Alliances.

- **Factors for an enduring partnership**

On exploring long-lasting alliances, Zineldin (2004, p.781) identifies 7 factors that determine the development of enduring and mutually beneficial business relationships:

- *All parties are committed to be engage in an interactive exchange relationship;*
- *Each party can contribute with something valuable for the other parties;*
- *Relationship is perceived by all parties as mutually rewarding, by which each party is willing to give something of value in order to receive something equally valuable in return;*

- *Each party is free to negotiate the terms and conditions for the cooperation agreement;*
- *All parties are able to freely communicate and interact with each other;*
- *All parties recognise that ethical values, interdependence, commitment and adaptation are crucial for a sustainable long-term relationship;*
- *All parties can find a positive balance between pros and cons of the relationship.*

It is interesting to notice that all these factors make reference to partners (the parties), thus clearly indicating that the success of mutually beneficial business relationships depends firstly in a good selection of partners – the right match, on their joint coordination, on their mutual acceptance and understanding.

- **Partner selection process**

Motivations for the choice of partners should be clearly distinguished from motivations for a partnership formation. On such differences, Al-Khalifa and Peterson (1999) stress that motivations involved in partner selection differ from motivations for entering into a partnership, the former being a “means” for the achievement of the “ends” implied by the latter.

Bierly and Gallagher (2007) describe alliance's partner selection as a complex process influenced by three endogenous factors – fit, trust and strategic expediency – depending on the extent of two other exogenous factors – uncertainty and time constraints. According to the authors, as long as the company has sufficient time and information, the search for strategic fit is the first step when choosing a partner. When information is lacking and uncertainty rises then trust becomes important as a selection criterion. However, these factors can only explain the process in the absence of any significant time constraints, otherwise response will be based on strategic expediency, described as the ability to make effective partner selection decisions under time pressure. The authors describe that in such cases skilled managers will tend to effectively rely on intuition due to the difficulties imposed by time constraints in following a rational decision-making approach.

- **Partner selection criteria**

General motivation to partner selection has been described as being related with several purposes. The first and most cited approach was introduced by Geringer (1991) who had first

distinguished task-related and partner-related dimensions of selection criteria. In Geringer's (1991) conception, task-related criteria refer to operational skills and resources, which are required for the success of the partnership, whereas partner-related criteria group factors are associated with the efficiency and effectiveness of partners' cooperation. Despite this classification being widely accepted by many scholars, as Das and He (2006) notice it's not always clear and remains somewhat confusing, as the same criterion may be enclosed in either set of dimensions in different studies. Das and He (2006, p.126) hence suggest the following grouping of criteria in these 2 major categories:

- *“Task-related criteria: complementary products or skills; financial resources; technology capabilities or uniqueness; location; marketing or distribution systems, or established customer base; reputation and image; managerial capabilities; government relationship, including regulatory requirements and government sales; help in faster entry into the target market; and industry attractiveness.*
- *Partner-related criteria: strategic fit or interdependence, or compatible goals; compatible or cooperative culture and ethics; prior ties and successful prior association; trust between top managers; strong commitment; similar status, including size and structure; reciprocal relationship; commensurate risk; and ease of communication.”*

In addition to these two sets of partner selection criteria, Cummings and Holmberg (2012) also introduce learning-related and risk-related dimensions of selection criteria. In this conception, learning-related criteria refer to the partner's attributes that enhance learning from knowledge transfer, whereas risk-related criteria are those arising from the interdependence nature of alliances.

Altogether, the widely accepted and cited task-related and partner-related dimensions of partner selection criteria, despite being a structured and valuable attempt to explain the partner selection process, it is not always a solid or self-sufficient approach to describe that phenomena completely. It seems that there still remains an absence of an unifying theory capable of explaining partner selection process as a whole in strategic alliances in general and in co-opetition in particular. It seems as well that the study of influential factors or selection criteria for the choice of partners has not yet been depleted.

- **Prior personal relationships**

As Ganguli (2007) notices, the dominating and most relevant part in a co-opetition strategy is cooperation. Corporate success on cooperating companies depends, to a great extent, on the quality of cooperation, since it's directly linked with its cooperation experience (Fink and Kessler, 2010). Effective cooperation, in turn, relies on how good a relationship is between all the involved parties.

Studies on the field of partner selection seem to point at task-related and partner-related criteria to be on the basis of the choice of decision makers. Nevertheless, an additional criterion that seems to have been neglected may be the inter-personal relationships between entrepreneurs or decision makers, which is likely to be a relevant factor for partner selection in many cases – particularly in co-opetition partnerships where sharing information between partners means as well sharing information between competitors. In such cases, personal trust between partners stand as the basis of the business alliance itself.

RESEARCH

- **Methodology**

The starting point for this research was to answer how competitors are chosen to team up for a co-opetition partnership. As such no hypothesis was advanced for this purpose and investigation was held with a free spirit. We have conducted an exploratory study to collect qualitative data in an abductive approach. Data have been processed through a Systematic Combining methodology (Dubois and Gadde, 2002) based on Grounded Theory (Glaser and Strauss, 1967). Following such methodology the existing literature is taken as starting point for research, from which new data is systematically collect and analysed for the emergence of new concepts and categories until saturation is reached (Goulding, 1999).

- **Sampling**

The selection of cases was based on a Purposive Sampling technique as the most suitable for randomly selecting appropriate informants among the population segment with the most information on the researched topic (Guarte and Barrios, 2006). Following such technique the selected sample encompassed eight Portuguese companies with forged alliances with national competitors from four cases of established co-opetition partnerships in the sectors of

wine, tourism and construction industries. Only two partners at each partnership were selected even though two of the partnerships included five partners, in which cases partners were selected at random. For the purpose of this analysis any co-opetition relationships involving international partners were disregarded. Table 1 presents a characterization of the analysed sample.

Cases	Sector	Established	Purpose	Companies
Case A	Wine	2002	Promote sales by increasing region's brand awareness	wine Partner A.1 Partner A.2
Case B	Construction	2007	Promote internationalization enhanced complementary offer	with Partner B.1 Partner B.2
Case C	Wine	2010	Promote sales by increasing product category awareness	Partner C.1 Partner C.2
Case D	Tourism	2012	Expand product portfolio based on complementary offer	Partner D.1 Partner D.2

Table 1: Sample characterization (Source: the authors)

Case A represents a partnership of five competing wine producers from the same region who decided to jointly promote their region in international markets. These producers realized that their strength together was higher than when each one was promoting separately, therefore as a group they were able to “*cause a greater impact and a leave a better impression*” (Partner A.1). Even though they recognize that their promoting efforts are beneficial to all the wine producers from that region, the group perceives added value in their co-opetition partnership, which has been active for over a decade.

Case B stands for a partnership of competitors in construction industry. All companies are based in the same geographical region and compete in their domestic market. As a consequence of their membership and involvement in the local industrial association, top managers knew each other well previously. Such relationship had great impact in the creation of this co-opetition partnership, as stated by Partner B.1: “*I’m convinced that our personal relationships had great influence*”. This group remains active only in some previously defined external markets where all partners cooperate based on their complementarity of skills and competences.

Case C is a partnership between two competing Port wine companies aimed to “*promote Vintage Port wine next to opinion makers and consumers*” (Partner C.1). Both companies are major players in all Port wine categories, marketing their brands globally. However, they realized that their top category wine suffered from low recognition in a certain strategic market. These companies thus teamed up as a solution for a specific problem in a specific region.

Case D is a case of co-opetition in the domestic market incorporating two hotel chains with “*a perfectly complementary offer*” (Partner D.1), as each operates in different regions and with different hotel categories. The creation of this partnership encompassed synergies allowing each company to expand their own product portfolio and market presence. Partner D.2 reported that the contact was facilitated by “*prior relationships between both CEO’s resulting from their work together in the Tourism Association*”.

- **Data collection and analysis**

Data was obtained by semi-structured interviews to top managers or decision-makers at each target firm. Conversations followed an adaptive guideline in order to assure the inclusion of topics emerging from previous interviews. The aim of the interviews was to discuss the selection of partners for each partnership, namely by discussing how the partnership was created, how was each partner selected and why was each particular partner chosen to participate in the alliance. Interviews were digitally registered and the content transcribed for content analysis using RQDA software. The analysis aimed at partner selection criteria and initial codification consisted within four criteria dimensions including 19 selection criteria based on revised literature. At a later stage one new dimension and two new criteria emerged from the analysis. Additionally three existing selection criteria were included in the emergent dimension. Table 2 presents a list of all the criteria used and their origins, as well as a summary of identified occurrences and respondents. Following these codifications, we were able to determine the criteria most consistently referred to and thus establish the ground for the understanding of partner selection process.

- **Research Findings**

Content analysis to respondents’ testimonials is presented in table 2, listing all analysed partner selection criteria. Column “Respondents” shows how many respondents mentioned each criterion. Column “Occurrences” shows how many times each criterion was identified in

respondents' testimonials. The last five rows refer to dimensions of partner selection criteria and indicate the authors who associate each criterion to a specific dimension. As example, first row reads: "Prior Personal Ties, as a partner selection criterion, was mentioned by eight respondents in a total of 26 occurrences. This criterion is pointed as partner-related by Das and He (2006), as risk-related by Cummings and Holmberg (2012) and as network-related by the authors of this study".

Codings	Respondents	Occurrences	Network Related	Partner Related	Task Related	Risk Related	Learning Related
Prior Personal Ties	8	26	the	Das and		Cumming	
Prior Successful Shared Business	7	16	the	Das and		Cumming	
Similar Status	5	10		Das and			
Similar Positioning	5	9		the

Established Supply	1	2			Das and		
Technology	1	2			Das and		Cumming

Table 2: Interviews content analysis on partner selection criteria (Source: the authors)

In all four analysed cases of co-opetition partnerships it notoriously prevails that prior personal relationships between managers from all partnering companies were very present. This reference was usually mentioned when respondents were confronted with the question of "How did this partnership start?". In those cases where this fact was not mentioned in the first answer, it would eventually come up at a later stage during the interview. In the final

count, all eight respondents referred to this fact 26 times. On this qualitative data analysis, coded criteria "Prior Personal Ties" accounts for acquaintances that may come from family or friendship ties, as well as from business ties resulting from previous business associations. Even though it was not highlighted specifically as a criterion of selection, the fact that the leaders of each organization already knew each other was consistently referred to by all respondents and indicated as facilitator or as a catalyst for the partnership formation. Table 3 presents statements from all respondents supporting this interpretation.

Cases	Partners	Statements
Case A	Partner A.1	<i>"There were already some relationships, either family or friendship based"</i>
	Partner A.2	<i>"These 5 families already knew each other and had friendly relations"</i>
Case B	Partner B.1	<i>"[This partnership] was the result of conversations that we kept regularly in the industrial association"</i>
	Partner B.2	<i>"One of the factors for this idea to take shape was the fact that the CEOs already knew each other personally"</i>
Case C	Partner C.1	<i>"We know each other personally and we are friends for a long time"</i>
	Partner C.2	<i>"If we didn't know each other probably this partnership would never happen"</i>
Case D	Partner D.1	<i>"There are personal relationships between both presidents, and that certainly facilitated contact"</i>
	Partner D.2	<i>"There were already some contacts between both presidents as they already knew each other"</i>

Table 3: Statements on Prior Personal Relationships (Source: the authors)

The next most mentioned criteria were "Prior Successful Association" and "Shared Business Networks". Seven respondents mentioned that managers had previously and successfully experienced working together in informal or formal associations with the current partner(s). On this matter Partner A.1 stated that *"it was common to get together in wine shows and we used to cause a good impact. We then concluded that we had to do it in a more organised and formal way"*. The latter accounted for 6 respondents highlighting the fact that leaders of each company gathered previously in common business networks such as sector clusters or industrial

associations, as stated by Partner D.1: *“The presidents from both companies have previously worked together in the National Tourism Association”*.

Another relevant set of ideas was coded as *“Shared Vision”*. An example is the statement of Partner C.1: *“We knew that we have the same philosophy [about the market] and we both have very similar views about how to develop our market approach”*. In our opinion, such knowledge can only be acquired as a result of a close connection between top managers from both companies. Even though this code did not sum up many occurrences, it was referred to by a considerable number of respondents.

As expected from literature review, many of the cited criteria for partner selection fit partner, task, risk or learning-related dimensions. However, from the analysis of the most cited facts emerged a new dimension of partner selection criteria, presented in table 2 as network-related. This new proposed dimension highlights the importance of networks when considering a competitor for a partnership. When weighting the risks of such alliance, the experience of a positive personal relation seems to ease the managers' mind and may even serve as a facilitator for a formal gathering given that other partner or task-related criteria are met as well.

Considering that all the analysed cases revealed the existence of prior personal relationships between top managers, two thoughts must be clarified before deepening the discussion of these results: a) these cases were selected only based on the fact of encompassing domestic co-opetition partnerships. No knowledge about their origins was founded prior to our analysis; b) due to the qualitative nature of this analysis and its abductive approach, one cannot infer that prior personal relationships are a prerequisite for the creation of a co-opetition partnership, or that they are somehow common to all co-opetition cases. This last thought will be explored in our conclusion.

DISCUSSION

A new perspective of partner selection process emerged from our analysis. We observed that all analysed cases of domestic co-opetition were preceded by a prior relationship between managers¹, for all analysed partnerships seem to have been born from a previous personal

¹ Note: in this sense “manager” refers to top managers, decision makers or any other actors who may have the power to decide and implement company's strategy.

relationship. The phenomenon might be explained by a 3-step model including the awareness of a problem, a primary unconscious selection and a secondary conscious selection. Firstly the manager identifies a problem whose solution involves establishing a cooperation strategy. Secondly, the manager identifies a set of potential partners for cooperation. This mental yet unconscious process originates a group of potential partners, which is restricted to the manager's network of connections. This potential group includes just any potential partners with whom the manager has or had a relationship, thus excluding any eventual possible partners who have no relationship with the manager. Thirdly, the manager makes a finely tuned selection within the potential group. It is now a conscious selection according to a set of judicious criteria, mixed and weighted according to whatever aspects the manager finds relevant. At this stage such judicious criteria may be partner-related (such as strategic fit between companies, management commitment towards the project or similar status among all partners), task-related (such as complementarity of products or resources, managerial capabilities or access to a specific technology) and even risk or learning-related (such as a commensurately risky partner or the possibility to acquire knowledge from the partner). This pondered selection gives origin to the viable group, which will be addressed with an invitation for a partnership. Figure 1 illustrates this process.

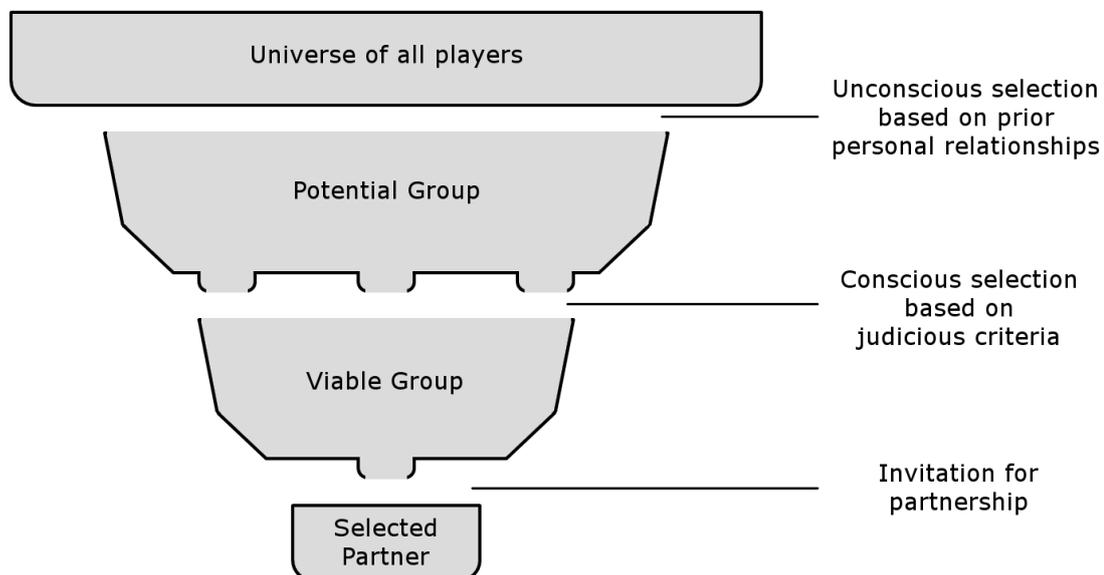

Figure 1: Three step model for partner selection (Source: the authors)

The most relevant contribution for the understanding of partner selection process is the inclusion of a step resulting in the creation of a potential group of partners. It entitles a

self-limited selection given that there is no conscious systematic approach to all existing players in the market. This unstructured mental step is then the bottleneck that will trim down the offer of partnership possibilities from a theoretically large universe of partners into a limited group of acquaintances.

CONCLUSIONS, LIMITATIONS AND RECOMMENDATIONS

Our research aimed to contribute to the understanding of partner selection process in co-opetition partnerships. The goal was to determine how companies choose partners for collaboration among their competitors. Having as starting point the existing literature on partner selection process and partner selection criteria for strategic alliances, an exploratory study was specifically directed to domestic co-opetition partnerships. Despite the similarities found with the existing literature on strategic alliances, a new dimension of partner selection criteria emerged from our research. Criteria such as prior personal relations, prior successful association, shared business network and shared vision were now included in the proposed network-related dimension referring to the set of criteria used by managers with regards to their network of relations.

Results suggest that selection of partners for co-opetition is firstly based on the existence of prior previous relationships. Regardless of their personal or business nature, the experience of positive prior relationships seems to contribute as a facilitator and even a catalyser for the formation of co-opetition partnerships. Our model proposes that managers undergo an unconscious phase of picking potential partners thus mentally limiting the range of possibilities to their network of connections, from which viable partners will then be elected. These findings suggest that the experience of positive prior relationships seems to endorse the reduction of risk perception towards a potential partner, thus lessening the uncertainty that usually accompanies a cooperation partnership with a competitor.

Despite the fact that this study aimed for objectiveness and accuracy, results are supported on qualitative analysis, which invariably comprises a personal interpretation of observations. Additionally, this is an exploratory study, for which it does not intent to confirm a given hypothesis. The contribute of this study is then to present a new hypothesis to explain partner selection processes for co-opetition partnerships, for which we would recommend a broader study supported on quantitative analysis to validate the proposed model.

In turn, the proposed 3-step model suggests a possible approach for the understanding of partners' selection processes for domestic co-opetition partnerships. However, it does not imply that all domestic co-opetition partnerships are created according to this model, as one cannot conclude from this study that a network of personal or business relationships is a prerequisite for co-opetition. It is also not implicit that the process is extensible to all kinds of co-opetition partnerships. In fact, we cannot infer on the model's application for international co-opetition partnerships, and it would probably require a certain degree of adaptation in order to be applicable to intra-organisational forms of co-opetition. Additionally our results do not allow a conclusion on the model's exclusivity for co-opetition partnerships. In fact, it is inconclusive as to whether the model can be applied to other partnership governances or broadly to all kinds of strategic alliances in general.

Yet another limitation is that the sample is entirely formed by Portuguese companies. Thus it is bounded to the culture, the economic environment and even the way of doing business in one single country. Research results would be largely enriched with the extension of this study to other countries and continents in order to represent other business contexts and cultural environments. Additionally, the sample reflects only cases of domestic co-opetition partnerships, for which it would be interesting to develop further studies including cases of international co-opetition in order to determine whether the proposed model remains applicable in such cases.

Finally, co-opetition is a peculiar kind of strategic alliances with the main characteristic being that partners are as well competitors. Such paradoxical cooperation entails great risks, such as opportunistic behaviours, disclosure of critical knowledge and loss of competitive advantages. The greatest contribution of this study is hence highlighting the importance of personal relationships in business networks as an influential criterion for partner selection, acting as a risk reduction factor thus facilitating the selection of strategic partners for the creation of co-opetition partnerships.

CORPORATE FINANCIAL DISTRESS AND BANKRUPTCY: A COMPARATIVE ANALYSIS IN FRANCE, ITALY AND SPAIN

Amendola, Alessandra ¹; Restaino, Marialuisa²; Sensini, Luca³

¹ Department of Economics and Statistics, University of Salerno, Italy, alamendola@unisa.it

³ Department of Management Research, University of Salerno, Italy, lsensini@unisa.it

ABSTRACT

The paper presents a competing-risks approach for investigating the determinants of corporate financial distress. In particular a comparative analysis of three European markets - France, Italy and Spain – is performed in order to find out the similarities and the differences in the determinants of distress.

By using the AMADEUS dataset, two possible causes of exit from the market are considered: bankruptcy and liquidation. For identifying the variables that influence the risk of leaving the market, a competing-risks model for each country is estimated and is compared with a pooled model including all the three countries. In addition, the performance of the competing-risks approach is evaluated versus the single-risk model, in which all states are considered without any distinctions.

The reached results show that the competing risks approach leads to a saving in the number of selected variables that becomes more significant when the model is estimated for each country separately. Moreover, the selected variables for each country enable to identify similarities between the different exit routes across the markets. Some of the differences between Spain and the other two countries may be related to the dissimilar definition of the distress states.

Key words: Competing-risks model, Default risk; Financial ratios; Hazard model.

1. INTRODUCTION

Business failure has been widely studied since the seminal papers of Beaver (1966) and Altman (1968). A large amount of the literature is devoted to analyze the firms' survival and to investigate the determinants of the exit decision, without considering possible distinctions among different status (Ohlson, 1980; Zmijewsky, 1984; Lennox, 1999; Shumway, 2001, among others) and without estimating the dynamical evolution (Sexton *et al.*, 2003;

Balcaen and Ooghe, 2004; Chava and Jarrow, 2004; Hillegeist *et al.*, 2004; Dakovic *et al.*, 2010; Amendola *et al.*, 2011a).

To overcome these limitations, some authors applied advanced versions of the logistic regression model (e.g. the mixed logit, multinomial error component logit and nested logit model) (Jones and Hensher, 2004, 2007; Hensher, Jones and Greene, 2007; Dakovic *et al.*, 2010) and the competing-risks models (Bhattacharjee *et al.*, 2002; Dickerson *et al.*, 2003; Headd, 2003; Rommer, 2004, 2005; Chancharat *et al.*, 2010; Amendola *et al.*, 2011b).

Therefore, in order to examine the effect of explanatory variables across the diverse states of financial distress, a multi-state approach can be used. Theoretical evidence for considering multi-exits was provided by Schary (1991) which analyzed acquisition and bankruptcy as alternative routes, while Lau (1987) had previously proposed a five state prediction model for estimating the probability that a firm enters each of the considered states. The increase in information on different types of exit and the development of statistical methods and computational techniques have caused a renewed interest in analysing how financial factors affect firm survival and the different causes of entry and exit of firms from the market.

Our interest is to investigate the causes of business failure of three European markets - France, Italy and Spain - in order to study the determinants of the probability of alternative exit routes and find out whether there are connections among the predictors of distress in the different countries.

A similar problem has been focused by some previous studies that compare the determinants of failure in several countries. For example, Hunter and Isachenkova (2000) explain the differences in the predictors of failure in Russian and UK firms. Their main results are that liquidity and gearing are not effective for failure in Russian firms, while size, profitability and turnover are good predictors. For the UK firms, it seems that profitability, gearing and liquidity are all important for predicting failure. Bhattacharjee *et al.* (2004) analysed UK and US firms by means of competing risks model, in order to identify the variables influencing the bankruptcy and the acquisition. They found out that adverse macroeconomic conditions increase the bankruptcy hazard while decreasing the acquisition hazard. The difference is related to the diverse bankruptcy definition in the two countries. Ooghe and Balcaen (2002) focus on whether a failure prediction model can be transferred across countries. They used a dataset of Belgian company accounts to build a failure prediction models potentially appropriate for different countries.

To the best of our knowledge, only one paper (Rommer, 2005) analyzes the business failure reasons in the three European markets considered here. Our contributions differ from Rommer (2005) in two main issues. Firstly we considered a larger data set including a huge number of variables and an extended sample period. Secondly, we focus our analyses on a two-way competing-risks model based on the two main exit routes (bankruptcy and liquidation).

In order to compare the effects of micro-economic indicators and firm-specific variables on the different states, we estimate a competing-risks model for each country. This model, unlike the traditional logistic framework, enables to incorporate the time to event as dependent variable in determining the probability of a firm being in a distressed status. Moreover, it allows taking into account whether and when the exit occurs, monitoring the evolution of the risk of each exits type over time. Furthermore, for sake of comparison, we also estimate a *pooled-country model* in which all countries are pooled together and a *pooled-state model* in which all financial distress states are considered at the same time. The significant variables and their sign are compared across the three country models in order to determine the similarities and the differences in the variables that influence the financial distress.

The paper is structured as follows. Section 2 gives the notion of business failure and illustrates the data. Section 3 briefly reports the methodology used in the analysis. Section 4 describes the reached results while the last session gives some concluding remarks.

2. THE NOTION OF BUSINESS FAILURE AND THE DATA BASE

Business failure has been defined in many different ways and it is not easy to agree on a widely accepted definition (Karels and Prakash, 1987; Crutzen and van Caillie, 2007). A failure state has been analyzed from different perspectives depending not only on the context and the characteristics of the firms but also on the interest of researchers (Dimitras, Zanakis and Zopounidis, 1996). In many studies, business failure is defined as a series of different situations that lead to the closing down of the firm due to relevant financial problems (Morris, 1997). However, this definition only concentrates on the financial disease without taking into account other difficulties that can affect the firms' health in the early stages of the failure process (Argenti, 1976).

Given that the empirical literature distinguishes between *economic* and *juridical* business failure (Ooghe and Van Wymeersch, 1986; Weitzel and Jonsson, 1989), the present analysis refers to the economic concept, focusing on those companies that have experienced permanent financial disease, including companies that have voluntarily chosen liquidation for whatever reason. Therefore, our sample is composed of those companies that belong to a specific sector of activity and had entered the economic procedure of bankruptcy in three European countries (France, Italy and Spain) in the period 2004-2010. In particular, we considered a firm as exiting in period t when it was the last year the firm was in business or active. This study focuses on these countries since they are inspired by the French Commercial Code (La Porta *et al*, 1998; Rommer, 2005).

The data used in this paper have been extracted from the Amadeus database, a pan-European database, provided by Bureau Van Dijk (BVD). Since our main interest is in investigating the determinants of firms that end up in financial distress in the three markets and in comparing them in terms of different forms of exit and country-effects, we focus on three mutually exclusive states of exit from the market: *bankruptcy*, *dissolved* and *liquidation*.

The bankrupt status includes those firms that have been legally declared as being unable to meet financial obligations to creditors and are under court supervision. The dissolved status includes the company that no longer exists as a legal entity, but the reason for this is not specified. This means that the company is dead, has no more activity or is no longer included in the companies register. The last state includes those companies that no longer exist because they have ceased their activities and are in the process of liquidation. The reference group is provided by active firms.

The distribution of our population consists of 874 companies that went bankrupt, 311 that had entered voluntary liquidation, and 548 that were dissolved. There are 27,292 companies in the active state. The distribution of firms by state and by countries is displayed in Table 2.1.

Looking at the Table 2.1, it can be noted that there are no firms that go bankrupt in Spain and there are no firms that are dissolved in France and Italy. This situation may be related to the different corporate failure laws (García-Posada and Mora-Sanguinetti, 2012). For this reason we decide to join the bankruptcy and the dissolved state for the rest of the analysis.

Table 2.1: Financial distress

	France	Italy	Spain
Active	13,102	12,292	1898
Bankruptcy	264	610	0
Dissolved	0	0	548
In liquidation	37	273	1

The predictors' database for the period of interest (2004 - 2010) is elaborated starting from the financial statements of each firm included in the sample, for a total of 197,181 balance sheets. In particular, we compute $nv = 72$ indicators selected as potential predictors among the most relevant in highlighting current and prospective conditions of financial distress (Table 2.2) (Dimitras *et al.*, 1996; Altman, 2000; Altman and Hochkiss, 2006).

The selected predictors reflect the main aspects of the firms' structure such as liquidity, operating structure, profitability, turnover and size and capitalization, as shown in Table 2.2. Moreover, some firm-specific variables, such as national legal status, firm size, firm age, publicly quotation, are also considered. These covariates are transformed into dichotomous variables.

A preliminary analysis is made on the database of predictors to analyze the impact of missing data and investigate the bivariate linear relations among them. Those covariates with a high percentage of missing and with a significative correlation coefficient are excluded from the analysis. It is consider as significant those correlation coefficients greater or equal to $|0.80|$ point out that correlation below that value are not harmful for an appropriate variable selection. Then we test them at a significance level 5% and we reject the null hypothesis that there is no correlation.

3. THE METHODOLOGY

The methodology used in this paper in order to compare the determinants of business failure in the three European countries considered is the competing-risks model, one of the most popular settings of the multi-state models (Andersen *et al.*, 1993 and 2002). This model

can be considered as an extension of the mortality model for survival analysis and is based on one transient state (state alive) and a certain number of absorbing states that are the death from different causes. All possible transitions are from the state alive. In this paper, we consider two possible causes of exit from the market: bankruptcy and liquidation, and we estimate the probability of transition from state active to the two states.

Let T be the observed time of exiting the market and let D be the cause of failure. The possible causes are labelled from 1 to K .

The main quantity in competing-risks model is the *cause-specific hazard function*, that is the probability of failing due to a given cause k , after one has reached the time point t :

$$\lambda_k(t) = \lim_{\Delta t \rightarrow 0} \frac{P[T \leq t + \Delta t, D = k | T \geq t]}{\Delta t}, \quad k = 1, \dots, K$$

Since the cause-specific hazard function may be depend on a set of covariates, the Cox Proportional Hazard model for each cause of exit can be considered:

$$\lambda_k(t | X_k) = \lambda_{k,0}(t) \exp(\beta_k^T X_k(t))$$

where $\lambda_{k,0}(t)$ is the baseline cause-specific hazard of cause k which does not need to be explicitly specified, X_k is the vector of covariates to k -type cause at time t , and β_k is the vector of covariates coefficients to be estimated by optimizing the partial likelihood for each cause:

$$L_k(\beta_k) = \prod_{i=1}^{n_k} \frac{\exp(\beta_k^T X_{ik}(t))}{\sum_{l=R(t_{ik})} \beta_k^T X_{lk}(t)}$$

where n_k is the number of firm in specific hazard k , and $R(t_{ik}) = \{l | t_{lk} \geq t_{ik}\}$ is the set of firms at risk at time t_{ik} .

4. THE EMPIRICAL RESULTS

This section provides the empirical results obtained from the estimated competing-risks model for each country and for the pooled data set. The effect of strategic factors on the

likelihood of exiting the market for different reasons in the three European countries are investigated and the determinants of various exit routes are compared.

The variables considered as the initial set of explanatory variables in the model, in order to assess their effect on the hazard rate of each exit route for each country, are synthesized in Table 2.2. The most relevant variables for each state and each market are selected by stepwise procedure. Then, the significance of the estimated coefficients is checked and the variables that are not significant at least at 10% level are eliminated. This significance level is chosen in order to compare the determinants of exit routes selected in the paper with the results of a few papers in the literature (Chancharat et al, 2010; Rommer, 2004 and 2005).

In addition to the competing-risks model, a single-risk model is estimated where all states of financial distress are pooled together, for all countries.

The number of variables selected and their sign are synthesized in Table 4.1, while the sign of the estimated coefficients for the competing-risks and single-risk models for each country are shown in Tables 4.2, 4.3 and 4.4.

The results show that in the single-risk model (i.e. for predicting the business failure) and in pooled-country model (in which we consider all countries together), 33 variables are selected as potential predictors. Instead, in the competing-risks model, in which the exit routes are estimated separately, a less number of variables are chosen (Table 4.1).

When the single-risk and the competing-risks models are estimated for each country separately, the results show that there is a saving in the number of selected covariates in France and in Spain (Table 4.1).

Now, looking at the sign of covariates, the results show some remarkable differences supporting the need to use not only the competing-risks model over the pooled one, but also the model for each country over a pooled-country model. Moreover, the variables are different in the determinants of the three exit routes and in their sign, not only between the competing-risks and single-risk models, but also between the states for the three countries.

In order to interpret efficiently the results, it is important to state that a positive sign of estimated coefficients means that the failure risk is high for firms with higher values of that variable, while if the sign is negative, the failure risk is lower for higher values of the variable. For further investigation, the hazard ratios, obtained by computing the exponential of coefficients are also checked, giving a measure of the covariates effect on the hazard (the results are available upon requests from the authors).

Table 4.1: Number of variables selected

	Single-risk model				Bankruptcy/Dissolved				Liquidation			
	Pooled-country	France	Italy	Spain	Pooled-country	France	Italy	Spain	Pooled-country	France	Italy	Spain
Firm-specific variables	4	0	6	4	5	1	5	4	4	1	4	0
Liquidity ratios	6	5	6	7	6	6	7	4	2	1	2	0
Operating structure ratios	5	3	5	4	3	2	1	4	3	1	3	0
Profitability ratios	5	5	8	3	4	4	8	3	3	1	6	0
Size and capitalization ratios	6	2	3	3	4	2	4	3	4	0	3	2
Turnover ratios	7	2	5	6	6	2	5	6	4	2	6	0
Total	33	17	33	27	28	17	30	24	20	6	24	2

The results for each exit route and for each country are illustrated in order to compare the determinants among the states and the countries.

Looking at the results of the single-risk model (in which all exit routes are pooled together, without distinguishing between them) for the pooled-country model, it can be noted that the joint-stock companies have a greater probability of failure, while the limited partnership and consortium have a lower probability of exit the market. At the same time, the old firms (more than 23 years) have a positive coefficient and their hazard rate decreases.

Then, high values of IND03, IND30, IND46, IND15, IND41, IND47, IND64, IND72, IND10, IND13, IND38, IND50, IND62, IND19, IND20, IND21, IND56, IND59 correspond to increase the hazard rate and the probability of failure, while the coefficients of the IND04, IND06, IND27, IND33, IND47, IND53, IND54, IND61, IND11, IND37, IND70 are negative and consequently the probability of failure is lower.

Unlike the results of the pooled-country model, the joint-stock companies have a lower probability of being bankrupted and dissolved in Italy and Spain. The old firms have a lower hazard rate. As concerns the size of firms, the medium firms in Italy have a higher risk of failure, while for the very large companies the hazard rate is lower. In Spain, the situation is lightly different. In fact the large and very large firms have a higher probability of being dissolved. The difference between Italy and Spain is related to the fact that the definition of the two failure states (bankruptcy and dissolved) is divergent. Moreover, there are some financial ratios in common between the three countries, even though the sign of coefficients is

different. For example, IND06, IND24 has a negative coefficient for Italy and France, while it is positive for Spain. The difference of sign is again related to the nature of the states included in the model.

The results of the competing risks framework for the pooled-country model showed that the joint-stock companies, limited companies, limited partnership, limited cooperative societies have a higher risk of being bankrupted. Then for the limited partnership the probability of liquidation is lower; while for consortium and limited cooperative societies the risk of liquidation is higher. As concerns the financial ratios, high values of IND03, IND30, IND15, IND49, IND64, IND72, IND13, IND38, IND20, IND21, IND56, IND69 correspond to high risk of being bankrupt. Moreover, some covariates, such as IND54, IND41, IND71, IND72, IND08, IND20, IND21, have positive coefficients, related to a higher risk of being liquidated. Then, IND04, IND06, IND27, IND33, IND47, IND53, IND54, IND11, IND37, IND70 have negative effect of the bankruptcy, and IND06, IND13, IND54, IND61, IND10, IND11, IND13, IND19, IND58 effect negatively the risk of liquidation.

By checking the results of the competing risks model for each country, it is observed that in Italy more variables are needed for predicting bankruptcy and liquidation than in France and in Spain. One possible reason is related to the period considered in the paper, which included the period 2007-2010 characterized by the global financial crisis. It seems that the effects of the financial crisis have a deeper impact in Italy than in France and Spain.

5. CONCLUSION

Competing-risks models for corporate failure in three European markets – France, Italy and Spain - have been estimated based on micro-economic indicators and firm-specific variables. The determinants of financial distress have been investigated highlighting the similarities and dissimilarities across countries. In particular a competing-risks approach has been used to estimate the risk of exit the market for two main reasons: bankruptcy and liquidation.

The reached results show that there are some differences and some similarities in financial ratios for predicting the financial distress in the three countries considered in the paper. In particular, it seems that in Italy a greater number of variables are needed to estimate the probability of failure, while in France and Spain the number of covariates is less. Moreover, the results show how there is a saving in the number of business failure determinants when a model for each country is estimated and/or a model for each exit route is considered.

SPANISH SAVINGS BANKS: AN ANALYSIS OF THEIR PERFORMANCE

Bachiller, Patricia¹; Lasa, Francisco-de-Borja²

²Ibercaja Savings Bank, Spain, blasa@gestioninmuebles.ibercaja.es

ABSTRACT

This paper analyses the determinants of the performance of the savings bank in Spain. We study whether the efficiency, the core capital, the delinquency ratio, the liquidity, the number of branches and the profitability influence in the performance of these entities. We find evidence that the efficiency and the core capital lead to greater performance. However, the results indicate that the higher the delinquency ratio, the lower the performance it will be. The results indicates that entities opened new bank offices uncontrollably, without a proper analysis of their viability and profitability, under the euphoria of real state loans, have now a network that means a heavy weight for them, both at the personal and structural level, which causes a clear drop in performance. Only the entities that have maintained a solid core capital, can keep their position during the financial crisis. They had greater financial strength and improved ability to carry out the provisions without damaging excessively its capital, and so its solvency.

Keywords: saving banks, performance, financial crisis, Spain

1. INTRODUCTION

During years Spanish savings banks have growth in unsustainable and disorganized way by opening new branches and expand throughout the country, accessing zones outside its core area. They have proven to be the weakest part in the national financial system (Parejo *et al.* 2010). With the global economic crisis, which later becomes debt crisis, the saving banks have been caught off, fully indebted, and with more weight on its balance of credits than liabilities, appearing a grater risk of liquidity. The unnecessary excess of capacity, based on growth of promoters and builders loans, with high default risk, was not assessed at the time (Franco, 2012),, the excessive borrowing in wholesale markets by the saving banks, which cause

significant weakening of its core capital, and the high rate of default ratio in Spain, caused that the balance sheets of financial institutions remain flooded of property assets that are losing value day by day. No other choice but to support the majority of saving banks or groups of them, and as a result, the nationalization of many of them.

In this paper, we study the reasons for which savings banks have suffered this situation as well as the structural imbalances that have occurred and why they have unchecked commercial banks behaviour (García-Cestona and Surroca, 2008). For this, we carry out a study of the economic factors that determine the performance of Spanish savings banks. That is, we test indicators or variables concerning financial institutions and the effects on their performance. With this analysis, some conclusions that reflect the reality of the situation of financial institutions could be obtained. The variables that have been analysed on the most part of saving banks are: the efficiency ratio (euros spent, primarily in personnel and structure, for every dollar obtained); the core capital that gives strength to the entities; the default rate of loans to individuals, businesses and institutions; the liquidity of the entities; the number of offices opened through the Spanish territory; and net interest income of financial products in liabilities (deposits) and assets (financing). These variables were analysed in connection with the performance of these financial institutions, identifying those that have had a high degree of success in their business, and those that have not survived to the present situation by his weakened situation.

2. HYPOTHESES

The scope and framework of this study can be explained by the changes that have taken place in the role of the savings banks sector in recent years in the Spanish financial sector. In this section, we analyze the factors that contribute to explaining the performance of savings banks and we develop our hypotheses.

The efficiency ratio compares the operating expenses and revenues. An entity that seeks to be more efficient obtaining higher revenues from lower expenses can reduce expenses maintaining the quality of service or increase revenues without incurring in more expenses (Prior, 2003). As financial expenses are the same for all entities (legal cost of money), the way to obtain more revenues is paying deposits with a lower interest rate or charging credits with a higher interest rate. A savings banks can also increase its efficiency reducing operating revenues, such as salaries, central services expenses, number of branches, technology expenses, buildings and so on. If savings banks are able to keep its number of clients despite

closing branches, synergies emerge due to save staff and rental costs. However, cost reduction does not necessarily imply an improvement in efficiency, as the evolution of income also influences in this magnitude. Currently, as incomes are decreasing, the efficiency is worsening in the banking sector. To solve this problem, mergers are taking place to obtain long-term synergies.

An entity with better efficiency ratio significantly improves its profit and, consequently, its ROA.

H1: Savings banks with greater efficiency ratio obtain a better performance.

The core capital of a financial entity is made up of nominal capital and reserves and defines the solvency level. A higher core capital indicates that an entity has a higher equity compared to risk-weighted assets. These assets include deposits from central banks (no risk) and industrial interests with a high risk. Entities should decrease risky assets and increase its equity, but savings banks are private foundations and cannot issue equity. An entity that has a higher core capital is more sensible and solvent and it is expected that its credits to clients have lower default risk.

The relationship between the core capital and performance is not direct. Five years ago, some savings banks had relatively lower core capital, but bigger profits. This occurs because entities obtained higher profits at the expense of a higher risk. To avoid this, regulator is stricter with financial entities and, now, the core capital must be higher than 8%. In the long-run, a higher core capital is indicative of a higher performance. The determinant factor of the core capital is not the equity of the entity, but the risk-weighted assets, which marks the entity capacity to generate revenues.

H2: When a savings bank has a higher core capital, it obtain a better performance.

The delinquency ratio informs about the default credits to total credits. The higher this ratio is, the lower opportunities to obtain revenues, which have adverse effects in the performance of the entity. The delinquency ratio establishes the quality of credits and its risk. An entity that analysed credit risk during boom economic years, it has a better delinquency ratio than those entities that gave credit without quantifying risks.

As a consequence of the economic expansion, Spanish savings banks have expanded business by opening branches in areas affected by the bust in houses prices (Bachiller and Lasa, 2013). With this practice, savings banks captured property developers as clients. When the houses prices fell, savings banks had to include properties into their balance sheet and the credit to

property developers resulted default. As the Moody's Investors Service (2006) indicates, some savings banks had 24,000 millions of default credit from property developers when they were inspected. When the business expansion derives from buildings without risk analysis, the delinquency ratio increases and performance decrease.

H3: Savings banks with a lower delinquency ratio obtain a better performance.

The liquidity can be defined as the degree to which an asset can be bought or sold in the market without affecting the asset's price. As it is a temporal indicator of economic situation, an entity can have a good liquidity position in the short term by an excess of debt, but this does not mean that the entity will be able to meet its responsibilities in the long term. When a financial entity cannot meet their payment obligations, the entity is more vulnerable, especially in the current economic situation. Now, it is expensive and difficult to find funding in the market (Ibercaja, 2012), therefore the lack of liquidity leads to savings banks to get into debts. The extra cost derived from higher interest rates affects the income statement.

An entity that does not have capacity to pay their loans due to the lack of liquidity can cause a panic situation into the financial system by the default risk. To solve this, the European Union has introduced massive injections of liquidity into financial entities at a low cost. Excess liquidity does not always cause an improvement in the performance of the entity, but an illiquidity situation can generate a worse performance.

H4: Savings banks with a higher liquidity obtain a better performance.

In the period of economic growth, savings banks opened branches to cover more businesses and to be more efficient and profitable. The higher the number of branches is, the higher the economies of scale are (for example, economies of scale due to central services). Financial entities also open branches to be present in most of Spanish regions. This marketing decision aims to improve the image of the entity.

This variable does not follow a fixed criterion of direct or inverse relation, although depending on the economic cycle, and the over sizing of the entity, may have an implication or another. In a period of economic expansion, if the entity is small, for expanding, it must increase the number of offices, to capture new business and increase the volume of activity, and since the activity is expansive, to increased benefits. If the entity is large and implemented nationwide, increasing the number of offices does not involve excessive improved profitability, unless expanding in new geographic areas, previously unconquered. Under recession, is always true that the improved performance is achieved on the basis of reducing the number of offices. As the entity has been oversized (excess of branches), it

should be reduced to cost containment, trying to keep the business achieved in the expansionary phase.

H5: Savings banks with a lower number of branches obtain a better performance.

The main activity of an entity is based on capturing customer money to lend to other customers. Since the overall interest rate that is paid to the lender is less than the interest rate that the borrower receives, it generates a margin. Such net interest income is the most important item in the income of the entity (supplemented by utility commissions and other concepts), which has a direct relationship to the benefit. In addition, this indicator is affected negatively with the default rate, as the default of a credit finance income decreases.

Therefore, there is a direct relationship between the margin and the ROA of the entity. However, an entity with high net interest income, but with a portfolio of industrial stocks or real state losing value continuously under the crisis, may be unable to offset this loss with its high margin and will arrive into a lower ROA.

Net interest income is the core of the financial business. However, this can be benefited in some cases (mainly with businesses other than financial), but mostly hurt by loss of value of the assets of the entity, whether real estate, industrial portfolios, etc. Certainly, an increase in net interest income will produce a better performance on profitability of the entity.

H6: Net interest income of a saving bank is directly related with ROA.

3. METHODOLOGY AND DATA

We have used the panel data methodology to analyze the factors that determine the performance of savings banks. Our database is made up of observations of 38 entities over 4 periods (2006-2009). We then run panel data estimations to explain the determinant factors of the performance. Data is collected from annual reports from savings banks for 2006 to 2009.

To analyze the performance, we use the return on assets (ROA) as dependent variable. This profitability indicator is calculated by dividing revenue by total assets. We focus on the financial dimension of the savings banks' performance. Hodge (2000) shows that only a few

performance indicators are common across studies and, among these, profitability is the most frequently used.

The variables used in the study as explanatory factors of the performance of savings banks are:

- Efficiency. Efficiency ratio defined as general, administrative and amortization expenses to profit margin. The higher the ratio is, the most efficient the entity is. This variable has been inversed to facilitate its interpretation.

- Core Capital. Defined as the equity capital and reserves (or retained earnings) to risk-weighted assets ratio. We introduce this indicator because is indicative of the entity risk.

- Liquidity. Ratio calculated as credits to deposits. It is an indicator of the dependence of entities on funding requirements.

- Delinquency. Ratio defined as past-due credits divided by total credits. This variable measures the quality of a bank's loan portfolio.

- Branches. The number of branches has been included as variable in the regression as the period analysed coincides with the great expansion of savings banks in Spain.

Intermediation margin. The intermediation margin, defined as the sum of net interest income from financial service activities. The intermediation margin is indicative of the traditional business of the banking sector: granting credit and capturing deposits.

With this information, a regression is run to study the relationship between performance and several factors (efficiency, core capital, liquidity ratio, delinquency ratio, branches and intermediation margin).

$$ROA_{it} = \beta_0 + \beta_1 \text{Efficiency}_{it} + \beta_2 \text{Core_capital}_{it} + \beta_3 \text{Liquidity}_{it} + \beta_4 \text{Delinquency}_{it} + \beta_5 \text{Branches}_t + \beta_6 \text{Intermediation Margin}_{it} + \varepsilon_{it}$$

Panel with T = 4 and N = 38.

5. RESULTS OF THE STUDY

The results obtained using the panel data methodology are presented (see Table 1).

Table 1: panel data regression analysis

Variable	Coefficient	Std. Error	Z-Statistic	Prob.
Constant	0.5902869	0.2640609	2.24	0.025
EFFICIENCY	0.0059722	0.002701	-2.21	0.027
CORE CAPITAL	0.0781742	0.0118457	6.60	0.000
LIQUIDITY	0.0005135	0.0012911	0.40	0.691
DELINQUENCY	-0.1594029	0.0127015	-12.55	0.000
BRANCHES	-0.0000555	0.0000867	-0.64	0.522
INTERMEDIATION MARGIN	0.0001384	0.0001331	1.04	0.299
R ² = 0.5461				
Wald Chi ² = 266.48 Prob>chi2 = 0.000				

As can be observed, there are three statistically significant variables in the regression: efficiency, core capital and delinquency. The Wald test indicates statistical significance in the model.

- The coefficient of efficiency is positive, so this variable is directly related to the performance of savings banks. That is, when a company is more efficient, it shows better performance than when is less efficient. This result is coherent with our initial hypothesis (a more efficient entity obtains a better performance). When a savings bank saves costs, it manages optimally its resources and its ROA is higher.

- As can be seen, the variable core capital is positively related to performance. That is, when the core capital is higher, the savings bank obtains a better performance. This supports our hypothesis that an entity that manages efficiently its risk, is more profitable and has a better performance.

- In our model, liquidity ratio is not related to performance, so we cannot accept our hypothesis. The higher dependence to external funding is not an explicative factor of the performance of the savings bank.

- The delinquency ratio is inversely related to the performance. This supports our hypothesis, that is, a savings banks with less past due credits obtains a poor profitability. This relationship indicates that the credit risk generates a worse performance.

- The variable branches is not related with the ROA of savings banks. The performance of savings banks does not depend on the number of branches, but the profitability obtained in every branch.

- Finally, the intermediation margin is not related with the ROA. This is not consistent with our hypothesis, but it is logical as commissions and other products not included in this margin also determine the profit of savings banks.

6. CONCLUSIONS

With the significant drop in revenues produced in recent years, due to the narrowing of interest margins, the efficiency ratio has become one of the main indicators to optimize resources and improve productivity and performance of the entities. Those savings banks that were not concerned with this aspect in good times could hardly sustain a positive bottom line under the decrease in incomes. Logically, those who have efficient production systems and optimize their expenses have been able to survive under the current financial situation.

Our results indicate that only the entities that have managed to maintain a solid core capital, can keep their position during the financial crisis, in spite of the significant increase for supplies demanded by the government of the country. They had greater financial strength and improved ability to carry out the provisions without damaging excessively its capital, and so its solvency.

The type of credit provided to the national productive system, the public administrations and the private client, is a very important variable for the performance of the entities. Those entities that provided credit without prudent risk assessment, found a higher default rate on these loans, which obviously hurts his performance. This occurs due to the important provisions on outstanding claims that have been set by national and international supervisors and, also, from the arrival of goods derived of the lack of payment of real state developers, builders and end final customers. These assets arrive in the banks' balance sheets but on the current real estate situation, lose value continuously, causing loss of balance value of the entity.

Today business in financial institutions is largely influenced by withdrawal of business from the past. Most of the revenue of the entities, especially in the asset, comes from past operations that endure over time. Those entities that put in the market very cheap credit, with

low intermediation margins, now are with a default business, since money seeking from abroad is much more expensive than that provided by the borrowers.

ACKNOWLEDGEMENTS

This study has been carried out with the financial support of the Spanish National R+D+I Plan through the research project ECO 2010-17463 (ECON-FEDER).

COMPENSATION-BASED SKILLS DEVELOPMENT APPLIED TO MANUFACTURING EMPLOYEES: A CASE STUDY IN QUEBEC

Beaupré, Daniel

Department of Organization and Human Resources, Université du Québec à Montréal (UQAM), Montreal, Quebec, Canada, beaupre.daniel@uqam.ca

ABSTRACT

The concept of “skill” has been the subject of considerable research in recent years, particularly revolving around management skills within firms, without necessarily connecting skills to a framework of learning. The question can be asked: What happens when a model of skills development is applied to production employees whose tasks are simple and routine? This paper addresses this question, as well as the related social and managerial issues, through a case study of the implementation of a skill-based pay system in a middle-sized manufacturing company. The case study reveals surprising results with regard to the effects on employee retention and increased productivity, as well as the effects on employee identification to the company. Needless to say, a direct relationship had been established between the skills development model used and the pay increases, which could be seen as substantial when compared to the prevalent wages within the industry and for other jobs in the area. The most important limitation of this study is related to the methodological approach, which precludes any theoretical generalizations. Nonetheless, this article opens the door to further research based on new hypotheses. It is also hoped that the findings will help practitioners understand the process used in this instance and transfer the critical elements in order to achieve similar success within their organizations.

Keywords: Social constructivist model of skills, skill-based pay system, SME, personnel turnover.

INTRODUCTION

Although the literature is replete with examples of the use of compensation-based skills development systems, few have explored the effects of skills learning in a manufacturing setting. This paper addresses this through a case study of a medium-sized Quebec company. The paper first clarifies the concept of skills and proposes a social constructivist model of

skills development that illustrates the acquisition of contextualized knowledge. The concept of skill-based pay system is then presented and its main advantages are exposed. After a brief explanation of the methodological approach, the case study itself is presented and discussed. The paper concludes by recalling the contributions, limitations and further research avenues opened by the case study.

DEFINITIONS AND CONCEPTUAL FRAMEWORK

This section presents the main definitions delineating the complexity of the concept of skills, both to help the reader develop a sufficient understanding of the concept and to determine the most appropriate choice for use in the current study. We will then discuss the conceptual framework and describe what is entailed in a skill-based pay system.

Definitions

The first clarification that must be made is between the concept of qualifications and the concept of skills. The concept of qualifications is a more instrumental notion in which the person acquires the abilities involved in carrying out a specific task, whereas the concept of skills refers to knowledge development with regard to actions, but also with regard to organizational contingencies. The distinction is thus made within a broader relative view. While the concept of qualifications connotes a single goal, the concept of skills refers not only to acquiring knowledge, but also to realizing the individual's potential within an organizational setting that has its own dynamics.

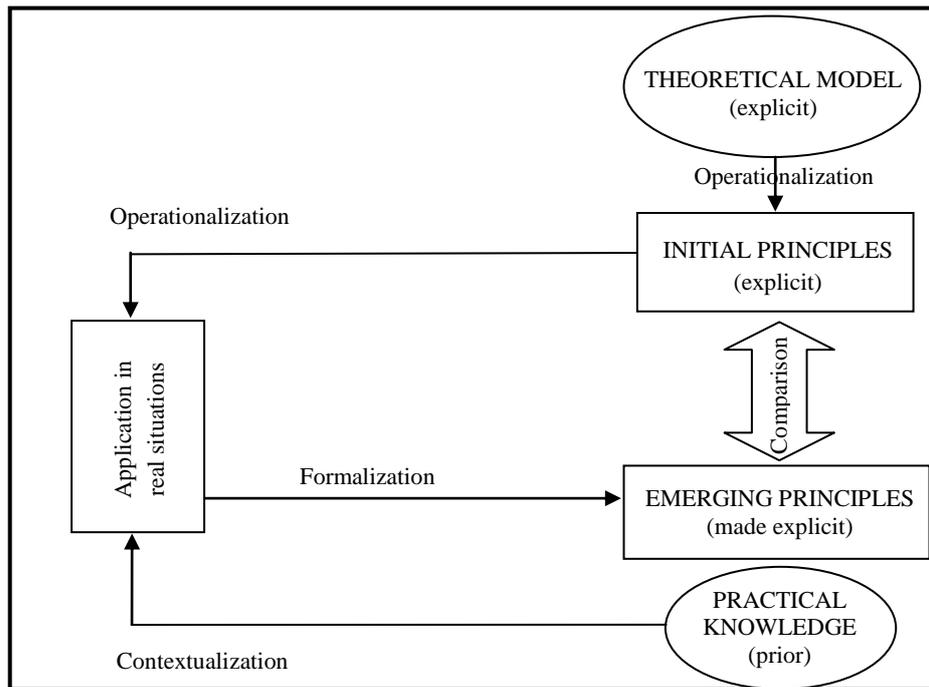

To understand what the concept of skills means in practice, several authors have developed definitions whose perspectives converge on the realization of the individual's potential. Carré and Caspar (1999) define skills as the knowledge that makes it possible to act and/or resolve the problems of a company within a particular context by mobilizing various abilities in a systematic approach. For Le Boterf (1997), skill refers to the application of many forms of knowledge in a given situation and context. In earlier work, the definition developed by Katz (1974) refers to three types of knowledge: conceptual skills (i.e., the ability to analyze, understand and make connections), technical skills (i.e., knowledge of task-specific methods, procedures and techniques), and personal intelligence (i.e., intra- and interpersonal skills). Although these definitions are all worth examining, the most pertinent definition for our purposes is that developed by Samurçay and Pastré (1995). For these authors, the concept of skills involves a goal, a purpose; they are acquired for a particular activity and through

performance of that activity. Skills are thus learned through specific training or by carrying out the task to which the skill applies. Finally, the application of a skill can be either explicitly or tacitly integrated in the execution of a given action.

This definition is particularly appropriate for use in this study because it points to the development of knowledge and takes its meaning within the social constructivist paradigm, thus finding its epistemological *raison d'être*. It is within this conceptual framework that the present case study was carried out (Jonnaert, 2006). Despite this, it is impossible in this case to separate the development of action and knowledge from the achievement of organizational objectives, which were established beforehand, independently of the workers involved. The solution to this paradox lies at the intersection of management's intentions and the commitment of the production personnel. Clearly, as each party may have differing rationales, there is a shared need for collaboration (Edwards, 1986).

Conceptual framework

More specifically, the conceptual model used to construe the realities of the situation is based on a principle of oscillation between assimilation and accommodation during the learning process. A phenomenon of repeated iterations of oscillations between these two modes can also be added. That is, knowledge is acquired through a cyclical process in which new information is first assimilated and then integrated into existing cognitive frameworks through action, thus modifying those frameworks (accommodation). The model below (Strauss and Corbin, 1990; Ouellet and Guilbert, 1997) illustrates this acquisition of contextualized knowledge. It is a social constructivist model because acquisition of knowledge is based on the principle of repeated iterations between theory and practice; employees build their knowledge through practice.

This model makes it possible to see the cycle of learning in context and to grasp the full process of operationalization of knowledge. This model has previously been used in non-business contexts, but is also relevant and easily be adapted to production workers in the manufacturing sector.

The skill-based pay system

But even if skills development is, as we shall see, mutually beneficial to employees and to the company, skills development is not self-induced; employees need to have a concrete reason to get involved in the process. The most obvious and efficient starter is to be found is a compensation system that rewards skills acquisition, that is some form of skill-based pay system. A skill-based pay (SBP) system is usually defined as “a system of compensation in which people are paid for the number, type and depth of skills they have developed” (Ledford, 1991). In this type of system, compensation is determined by the variety of skills the employee has acquired or by the number of positions the employee could effectively fill (Tremblay, 1996). Thus, the more employees progress in learning different skills, the better paid they will be. In fact, the concept of skill points to a significant change in the new employment agreement, thus restructuring the social relationship between employer and employee, in keeping with the conceptual framework of this paper (O’Neal, 2000).

From a managerial point of view, there are five main reasons for implementing a SBP plan (St-Onge, Haines and Klarsfeld, 2004; Tremblay, 1996).

1. To develop and maintain productivity in the most efficient manner possible.
2. To promote more flexible use of the workforce. Through flexibility in job positions and by training a group of available and mobile employees (versatility), the company is better able to deal with problems related to absent employees, staff turnover or temporary staffing requests during certain periods or to deal with critical situations. Greater employee versatility also helps meet production and service delivery requirements.
3. To increase the quality of products and services. Skill-based compensation can also give rise to greater accountability with regard to quality control among members of a work team because of their increased versatility and the skills they have acquired.
4. To make better use of new technologies and support new management values. For this purpose, a more flexible workforce enables the organization to adapt more easily and quickly to changes in technology, modifications of production processes, or new additions to the product line.
5. To have more motivated and involved personnel, improve teamwork, and enhance job descriptions to create more opportunities to reward the occupants of those jobs. With regard to this last point, Vroom's expectancy theory (1964) holds that employees will be more motivated to develop their skills to the extent that a reward they are likely to value (i.e., their pay) is accorded based on those acquired skills. Indeed, this theory postulates that a person's motivation to achieve a result or adopt a behaviour is greater when they perceive a stronger link between their efforts and the result (or behaviour), when they perceive a stronger link between this result (or behaviour) and rewards received, and when they value those rewards (St-Onge, Haines and Klarsfeld, 2004). In general, SBP systems fulfill all three of these criteria.

Several studies have pointed out the advantages of this approach to compensation. For example, a study by Ledford (1991) confirms that establishing an SBP system improves employee attitudes toward their pay, their job and the organization, as measured over two years. Another study of employees who had recently been switched to an SBP plan showed that they considered this system of compensation to be more fair and found that it had several advantages compared to traditional systems: higher wages compared to those offered in the job market, more rich and varied work, enhanced career opportunities and greater personal control over wages (St-Onge and Peronne-Dutour, 1998). According to another

study, employees of firms using SBP systems viewed their company's financial performance (estimated based on sales growth and the size of profits) in a much more positive light compared to employees of organizations that do not use this method of compensation (St-Onge, Haines and Klarsfeld, 2004). Finally, a study of 214 organizations conducted by Mitre *et al.* (2011) showed significant associations between this form of compensation and increased productivity.

The present article is a contribution to this body of research. Its specific contribution is that it applies manufacturing employees whose tasks, as we observed before, are simple and routine.

METHODOLOGICAL APPROACH: CASE STUDY

The literature is filled with explanations of the case study approach. Although not diametrically opposed, there are rather contrasting notions as represented by, on the one hand, Yin (2003), who considers case studies to be, on the theoretical level, illustrative studies that strive to confirm one or more hypotheses, and on the other hand, Hammersley and Gomm (2000), who view case studies as a more ethnographic approach that gives a voice to the subjects and attempts to give a broad and detailed description of social phenomena. Our thinking in this case is based on a formalized and structured model of learning, which is closer to the view put forward by Yin (2003). However, given that there are few similar case studies in the literature, it has been difficult to establish hypotheses in advance; in this sense, this case study can be considered exploratory, and thus similar to ethnographic research. Despite this apparent paradox, Hamel (1998) asserts that there is common ground that can minimize this obstacle, in that both approaches seek to explain a phenomenon within its context. The purpose of this paper then is not to resolve the debate, but to examine the realities of what we consider a vector of a social and managerial phenomenon with theoretical and practical value.

Data collection took place between September 2010 and March 2011. The data source was company documents, as permission was granted to consult all records considered relevant to our research. Subsequently, five interviews were conducted, each lasting approximately 90 minutes. Two interviews were conducted with the company president to gain an understanding of his vision, the problems he faced, and the decisions made with regard to setting up a skill development model for production employees. Three interviews were

conducted with the director of human resources to examine the process of setting up the model as well to obtain additional information concerning how it functions. Concomitantly, the employees were observed for a total of ten hours on the factory floor.

THE COMPANY

We will first present a description of the company and the issues it was dealing with, followed by an explanation of the different skill levels that the employees need to acquire to obtain wage increases. Finally, we will discuss the tangible results obtained by both the employees and the company.

History of the company

This SME is located north of Montreal, Quebec, and was acquired in 1995 by a company headquartered in Vancouver, British Columbia.

The company is a leader in the design and manufacture of plastic cartons for specialty eggs such as omega-3 and organic eggs. The products are made of PET² and contain a minimum of 50% recycled material. In addition to producing egg cartons using recycled material, the company shows its commitment to environmental values in various ways including, for example, lighting its offices with compact fluorescent bulbs and entrusting disposal of hazardous wastes to a specialized firm (Perreault-Labelle, 2010, in lesaffaires.com). Similarly, by producing strong, precision-made egg cartons that protect the eggs during shipment and handling, the company limits the number of broken eggs and the resulting waste. The company's innovative products are sold across Canada and exported throughout the Americas and Europe. The company has approximately 80 employees who work in three shifts.

The president is a chemical engineer by training, and has been head of the company since 2008. He has worked in the plastics and packaging sector for over 20 years. His management philosophy is based on creating a healthy and safe workplace for the employees. In his opinion, it is the cornerstone of efficient and productive operations. An ardent advocate of workplace health and safety and accident prevention, he believes that profitability and

² PET stands for polyethylene terephthalate. It contains oxygen, hydrogen and carbon and its disposal is considered "harmless" by the Confederation classification. PET is a polyester, that is, a plastic, and is commonly used in the textile industry. Recycling PET can result in a 50% reduction in energy use.

sustainability are generated by sound management, which includes worker health and safety. "If an employee is injured, everyone loses as a result. In addition to the injured individual, the incident impacts the family, the co-workers and productivity." The president also asserts that by dealing with the health and safety of its employees, the company is sending them a message that they are important to the company and that they will be held accountable for their behaviour and obligations to their co-workers. He believes that educating and training the employees with regard to health and safety will always be profitable for the company.

The values the company president attempts to transmit thus include integrity and the importance of employee well-being, a good working environment, teamwork and coaching. With regard to training, he holds that it is one of the best means available to make the work interesting for employees.

The Challenges

At the time that the company president assumed his duties, the turnover rate was 67%, which reflected mainly turnover among operational personnel (plant employees). This statistic indicated to management that they were constantly hiring new employees. The challenge was thus to retain employees, which led to a key question: How could the company increase employee involvement to elicit a greater degree of commitment?

The chosen solution was to set up a compensation system based on the acquisition of skills. Before 2010, there was no established salary structure. With a starting wage of \$10/hour³ and an average increase of 3% per year, employees had to be very patient to reach \$15/hour.

The skills-based pay system for operations positions (plastic thermoforming machine operator and senior plastic thermoforming machine operator)

The company underwent a major reorganization in 2010, eliminating the assistant supervisor level (which was between the supervisor and the machine operators) to place greater emphasis on the operator positions.

As mentioned above, to meet the challenge of improving employee retention, the company had decided to connect pay levels to the development of progressive skill levels indicating the extent of the production employee's qualifications and ability to perform the tasks required at each level. Each skill level targets the acquisition and application of specific skills. Table 1

³ The minimum wage in Quebec was \$9.90 /hour in 2012. As a comparison, the minimum wage in France was €8.90/hour in 2010. Any further comparisons should take the cost of living of each country into account.

presents the details of the skill levels for the program set up at the company.

	Level		2010 Hourly Wage	2011 Hourly Wage
New hires	A0	3 months	\$10.50	\$10.50
Grade 1	A1	1-2 years	\$11.00	\$11.20
Grade 2	A2	1-2 years	\$11.25 – \$11.75	\$11.40 – \$11.95
Grade 3	A3	1-2 years	\$12.00 – \$12.50	\$12.20 – \$12.65
Grade 4	A4	1-2 years	\$12.50 – \$13.50	\$12.70 – \$13.70
Senior Grade 1	S1	1-2 years	\$13.50 – \$14.00	\$13.70 – \$14.20
Senior Grade 2	S2	1-2 years	\$14.00 – \$14.50	\$14.20 – \$14.70

Table 1. Payroll structure for production employees.

All employees are hired at the A0 pay level and remain at that level for three months. During that period, they receive the following training:

- Full integration training, lasting 2 to 3 weeks depending on how quickly the employee learns. During this time, a trainer works closely with the employee to provide the basic training.
- Health and safety training on procedures such as wearing PPE, lockouts, ergonomic working methods, etc.
- Training concerning the manual and automatic operation of the plastic thermoforming machine.
- Training on the process of collecting production data.

After the three months integration period, the trainees are evaluated by the supervisor, using an assessment form, and by the trainer, to confirm that they can apply the concepts they have learned. If the assessment is positive, the employee receives A1-level certification and the commensurate wage increase. All new employees will then progress through the skills development program with four possible skill levels. The trainer monitors the progress of each employee and serves as the resource person for the workers at all times.

In the following one to two years, the employees receive training to qualify them for certification at Level A2. The assessment is carried out during the second year, when the trainer observes that the new concepts are consistently applied, again depending on how quickly the employee learns. This assessment consists of both written tests and observation by the trainer on the factory floor. Upon successful completion of the tests and a positive assessment by the trainer, the employee receives A2-level certification. This certification entitles the employee to a performance-based wage increase, within the range established for this grade, a decision made by the director of operations and the human resources committee. The same process is repeated for progression from each level to the next.

Notably, A2-level certification involves comprehensive training in quality control; A2-certified employees thus become accountable for the quality of their work.

Level A3 includes training on managing priorities, organizing production activities to maximize productivity (resulting in a significant reduction machine downtime), preparing production reports, and performing basic mechanical procedures.

Level A4 consist mainly of training on carrying out somewhat more advanced mechanical procedures.

For new employees, progressing from Level A1 to Level A4 requires six years on average. All employees should be able to reach Level A4.

Results

This compensation plan, which is based on increasing the versatility of the employees and upgrading their professional skills, resulted in a decrease in the turnover rate and an increase in retention of skilled workers. Indeed, the turnover rate dropped from 67% in 2008 to 8% at the end of 2011. Several other improvements were observed, including:

- a decrease in overall costs, despite the increase in payroll;
- a 19% increased in productivity; and
- stimulation of interest in skills development and promotion of a culture of continuous improvement and lifelong learning.

As O'Neal (2000) has stressed, the use of SBP usually comes about in response to the need to encourage workers to act less like simply occupants of a certain job and more like the "owners" of the primary means of production: themselves.

DISCUSSION

As was suggested, a social constructivist conceptual framework is useful to understand the situation in this case study, because this framework helps establish links between the abilities of the workers and a contextualized situation where they need to adjust according to the principle of oscillation. That is, the employee acquires skills through explicit theoretical instruction followed by validation of the skill in practice, or even the development of new skills or, at a minimum, the ability to adapt to new tasks; the oscillation between theory and practice is easily observable. The case study also illustrates that skills development induced by a skills-based pay system does indeed generate most of the benefits put forward in the literature that we have previously exposed.

But, in spite of the clear benefits, this model of workplace learning linked to compensation has some limitations. It can potentially lead to insidious competition among employees whose ability to respond to the requirement for skills development depends on their logical-spatial and reasoning abilities, which are clearly unique to each person in a given situation. Employees who do not voluntarily participate may also be marginalized by the system or by their peers, leading to various forms of exclusion. In practice, there is also potential for conflict between the employees who participate in a skill-based compensation system and those who are excluded. In addition, managers must be prepared to be patient when setting up such a system, particularly in the modern business world where short-term profitability is viewed as the prerogative of any company.

Several exportable elements of success emerge from this case study. First, we noticed that it is critical that the skill profiles for each level be clear and well thought out: they must be both appropriate to the company's mission and attainable starting from the current knowledge base of the personnel. The compensation levels must be perceived by the employees as sufficiently generous to serve as a motivation and stimulus for learning. Managerial leadership, in the form of a consistent focus on human resource development, is also needed to implement this type of compensation system. Finally, this leadership must remain steadfast despite the vagaries of the market during the transition period, which may appear long in the eyes of shareholders.

CONCLUSION

This case study makes four significant contributions to the field. First, on a theoretical level, it helps strengthen the social constructivist model as a valid explanatory framework for the

implementation of compensation systems based on skill acquisition. There has been a tendency in the literature to favour a problem-solving approach in business settings, relegating the social constructivist framework to the context of education. Second, this study highlights the appropriateness of using this conceptual framework in real time business context, paving the way for future research on the impact of socialization with regard to performance indicators for employees and for the company itself. Third, in practical terms relevant for managers, the findings elucidate several critical elements that can be transferred to other organizations and contribute to their renewed success.

Finally, this case study emphasizes the importance of skills development in giving a legitimate meaning to work, in contrast to a merely instrumental vision that focuses on how to achieve short-term results.

Of course, these results need to be used with care. This is a single case-study, which precludes any theoretical generalizations. Obviously, many replications in different companies with different skills-based pay system and different ways to implementing SBP would have to be conducted, possibly using different methodologies, before generalizations can be attempted.

TOWARD A LUXURY BRAND DEFINATION

Becker, Kip¹; Nobre, Helena²

¹Boston University, USA, kbecker@bu.edu

²University of Minho/Boston University, Portugal, hnobre@bu.edu

ABSTRACT

A luxury brand represents social and cultural meaning which are used by consumers to fulfill their social goals toward brand conspicuousness. Consumer-brand relationship is considered an important variable in understanding the meanings that consumers bring to their lives when involved in symbolic consumption. Although research on consumer-brand relationships has been developed in the last years, this variable has never been operationalized in the luxury brands field. Of greater importance is that, while the term is used extensively, a clear definition of what constitutes a luxury brand has not been developed. Without a clear, consistent and accepted definition there is likely to be confusion in research outcomes due to investigations involving different product types. This paper attempts to provide a definition of the Luxury brand and the development of a model which describes its product and behavioral components. The model is a result of an investigation of the theoretical literature as well as the application of an author's developed scale that measures the relationships consumers develop with luxury brand.

Keywords: luxury brand, consumer brand, definition luxury, luxury model

INTRODUCTION

Although for several years luxury brands had not receive considerable attention as a topic of research (Vigneron & Johnson, 1999, 2004; Beverland, 2004), it is accepted that the luxury industry has been increased since the 90's with the creation of conglomerates such as LVMH, Gucci group and Richemont (Okonkwo, 2009). In the last two decades, the luxury construct has gained relevance in the literature due to the importance that luxury brands have assumed in contemporary consumption and communication activities (Chevalier & Manzalovo, 2008). For Peirce, all knowledge and meaning is derived, with its basis in

experience (Mick, 1986). Accordingly, it is a person's experiences with a brand that determine the meaning(s) that consumers will attribute to their familiar brands (Heilbrunn, 1996). Grönroos (2001) adds that the sum of experiences that the consumer establishes with a brand forms the "brand relationship".

The consumption of brands gives meaning to the lives of the consumers (Levy, 1959; Kassarian, 1971; Sirgy, 1982; Malhotra, 1988; McCracken, 1989; Biel, 1993; Holt, 1995, 2002). That meaning is the result of the way the consumers live and perceive their experiences with brands. A brand relationship, or a consumer-brand relationship, is based on the assumption that a brand is a partner in a dyadic relationship with the customer (Fournier, 1998; J. Aaker et al., 2004; Aggarwal, 2004). Thus, a brand relationship is a source of meaning to the person who engages it (Fournier & Yao, 1996). While there is increasing research relating to luxury brands there is no clear, consistent or agreed upon definition of what actually constructs the elements of a luxury brand. While there generally the concept of luxury has become like the classic definition of art, "I may not know what excellent art is, but I know what I like." It is clear that luxury has product, economic and cultural aspects as what may be luxury in one culture or region may be a mundane product in another. Kleenex, low end cars and even ice may be seen by some as a luxury item. This makes it clear that the definition of luxury product or brand is essential to assure that the term has a broadly accepted meaning resulting in a standardized use of the term. Without such agreement it will be increasingly difficult to compare research results as investigations in this area increase.

There is some agreement in the literature that a luxury brand represents social and cultural meaning (Wilcox et al., 2009) that are used by consumers to fulfill their social goals toward brand conspicuousness. These social goals may be of social-adjustive order, or value-expressive order, or a mix of both (Shavitt, 1989). A luxury brand carries out important symbolic meaning that fulfills consumers' psychological needs. The great emphasis on psychological benefits versus lower emphasis on functional benefits is one of the aspects that characterizes luxury brands and allows distinguishing them from non-luxury brands (Vigneron & Johnson, 2004). In this vein, the study of luxury brands should imply to understand the meanings that consumers bring to their lives when involved in symbolic consumption.

The study of brand relationships has emerged as an interesting topic in recent years. The research of Fournier (1998) appears as an innovative example since it imported the interpersonal relationship metaphor to the universe of the consumer-brand relationships

(Keller, 2003). According to Aggarwal (2004) "Once, products and brands are associated with human qualities people may interact with them in ways that parallel social relationships, and their interactions are guided by the norms that govern these relationships" (p. 88). Thus, it makes sense to view the study of consumer-brand relationships under the umbrella of the theories of social relationships.

Although research on consumer-brand relationships has led to a better understanding of consumer behavior and company positioning as they relate to luxury brands a clear definition of what constitutes a luxury brand derived from this research has not been developed. This paper offers a review of the research as it relates to developing a definition of a luxury brand which can be used to promote better understand the key value dimensions behind a luxury brand choice and usage. A clear definition of luxury brands can help; to assure that those involved in luxury brand research are investigating the same types of products/services, lead to a focus of future research in luxury brands, extend the knowledge in the field and stimulate further empirical research on consumer-brand relationships. At the managerial level a clear definition of luxury brands should allow practitioners to define strategies and actions to address lasting consumer-brand relationships.

TOWARD A DEFINITION OF A LUXURY BRAND

This study explores the definition of luxury brand products based on two measures, first the luxury product characteristics and second consumer's psychological association to the luxury brand products. The luxury product characteristic is controlled by the luxury product owners where at the base the luxury product requires high quality offering with high price as well as charming and different product aesthetics. The product owner drives the product further to exclusivity by making it hard to attain by general public and adding extraordinariness to its features. At the highest level of its luxurious characteristic the product matures to a well-respected sign established firmly within the luxury brand consumers.

At its base the luxury consumer's psychological characteristics requires a firm understanding and assurance of the luxury product's high quality. This characteristic is a perceived quality and could stem from the luxury product's image and aesthetic more than the product's true quality. At a later stage the luxury consumer enjoys belonging to a premium social status and seeks positive attention from others by being part of a very select group possessing the luxury brand product. As the consumer's psychological characteristic

matures to the highest level, a sense of self identification and togetherness to the luxury brand develops. At this stage the feeling toward the product is matured to the point where the consumer perceives a total sense of natural righteousness to be a regular client of the luxury product.

Initially the behavioral relationships to brand were investigated by Fournier (1998) in which facets of Brand Relationship Quality were determined. These were further examined Aaker, Fournier and Brasel (2004). Aaker et al. (2004) offer a model to understand consumer-brand relationships, in which brand personality significantly influences and predicts Relationship Strength and Partner Quality (an unidimensional scale) is a mediator of this relationship. According to their model, Relationship Strength is a multi-dimensional scale including four constructs: Commitment, Intimacy, Satisfaction, and Self-Connection. They concluded that: (1) sincere brands tend to facilitate strong and stable relationships based on trust but are more susceptible to the transgression effects which may be irreversible; and (2) the brands of excitement tended to nurture less stable relationships but that customers are more benevolent with their transgression acts and the reparation of problems may actually serve to reinforce the relationship. These two types of consumer-brand relationships fit with bi-dimensional model for intimate interpersonal relationships developed by Fletcher et al. (1999). Fletcher's et al. (1999) personality research explored interpersonal relationship theory and expressed relationships as developing the behavioral characteristics of passion and intimacy-loyalty. The work of Fletcher and Aaker was expanded by Nobre, Becker and Brito (2010) who further defined the influence of the behavioral characteristics as well as their effect on partner quality. These studies, attempting to refine the relationship between behavioral characteristics and brand loyalty investigated a broad spectrum of goods. Among all, four characteristics of Commitment, Partner Quality, Intimacy-Loyalty and Passion are considered as four-measures of LUXBRAND-RELATIONSHIP. At the highest maturity level where the luxury product and luxury consumer's psychological characteristics intersect, these four dimensions would emerge and define the relationship between the luxury consumer and luxury product at the most in-depth level.

Luxury brands

In defining a luxury brand different aspects and dimensions should be taken in account, such as the product category, the degree of luxury associated with the brand and the context of use. According to Chevalier and Manzalovo (2008), a restrictive definition of luxury brand, such as "almost the only brand in its product category, giving it the desirable

attributes of being scarce, sophisticated and in good taste. It also has a slightly understated and aristocratic dimension" (p. viii), does not make sense in the reality of consume. A luxury brand image relies on strong consumer involvement; therefore the notion of luxury brand is partially built on the consumer perceptions which help to create an image of luxury (Vigneron & Johnson, 2004).

Familiar brands are purchased by the consumers to satisfy different goals, necessities, and expectations, according to a dichotomy of meaning: functional attachment and existential attachment. This dichotomy serves as a basis to classify the several categories of meanings which consumers assign to brands (Heilbrunn, 1996): brands with functional significance, brands related to deepening experiences, brands as extension of the self, brands that embody cultural and personal values, brands effectively related to a close person or a personal environment, brands that act as an extension of memory, brands associated with a social exchange and/or status.

Consumer-brand relationships

Consumer-brand relationships represent a source of value for both brands and consumers (Blackston, 1993, 1995, 2000). This value is founded on the meaning that the relationships with brands have and bring to the lives of people (Fournier, 1998). Baumgartner (2002) states that people use consumption for self-creation and "strong self-brand connections are associated with better quality stories involving the brand" (p. 289). Thus, the experiences with brands influence the development of the individual identity. A relationship does not necessarily imply loyalty, but loyalty implies the establishment of a relationship – "relational condition of brand loyalty" (Fournier & Yao, 1996, p. 3). Loyalty is just a particular kind of a relationship (Jacoby & Chestnut, 1978). Thus, the relational approach may provide a better and broader understanding of the phenomena that arises between the customer and the brand. Adopting a relational view of consumption is consistent with the need for a more holistic approach for developing brand knowledge (Keller, 2003). Additionally, Gummesson (2003) emphasizes that reality cannot be analyzed based on independent objects but as a social construct that includes all interactions and relationships. Thus, in the analysis of brand consumption the emphasis should be placed on the consumer-brand relationships as a whole and not individually on the brand or the consumer (Heilbrunn, 1996).

Blackston (1993) developed a communicational model based on consumer-brand relationships similar to the interpersonal relationships. According to this model the relationship concept is defined as “the interaction between consumers’ attitudes toward the brand and the brand’s “attitudes” toward the consumer” (p. 113). The author states that successful consumer-brand relationships rely on the consumer perceptions of the brand’s attitudes and on brand’s ability on creating meaning to the consumer. The Brand Relationships Model (Blackston, 1993, 1995, 2000) states that a brand can be viewed as having two dimensions: the objective brand (i.e., one-dimensional brand image) and the subjective brand (i.e., the brand attitude). Brand-customer relationships are an important source of value and flexible an area more easily changed or adjusted than the elements that make up the objective brand.

Cognitive Characteristics

Quality appears in many literatures as a basic requirement of luxury products. A research by Heine and Phan (2011) identified several concrete and abstract constructs that when evaluated as an aggregate, forms an encompassing definition of quality. The literature acknowledges that different product categories lead consumers to evaluate product quality using differing dimensions (Saricam et al., 2012), but in general the higher the rating of these constructs the higher the product quality (Heine & Phan, 2011). Product quality is also a cornerstone for rationalizing the purchase of often higher-priced luxury brand products (Eastman & Eastman, 2011). The cognitive perception of quality is often cited as being more influential than actual quality (Heine & Phan, 2011; Eastman & Eastman, 2011), and it is this psychological perception of quality that forms one of the bases of luxury brand image. Consumers often expect higher comparable quality in luxury products, and it is unlikely that a luxury image can be sustained without sustaining high levels of product quality (Christodoulides, Michaelidou, & Li, 2009).

Aesthetics is a distinct characteristic often cited as being a significant in the perception of luxury (Townsend & Sood, 2012). Aesthetics is a product characteristic of an abstract dimension that is difficult to compare in concrete terms. But studies have shown that product design is a highly valued attribute of luxury products (Heine & Phan, 2011). Aesthetic design and ideology is often an extension of highly creative individuals, and the aesthetic characteristics they imbue into a product brand frequently resemble works of art, inducing emotions of exclusivity and superiority (Dion & Arnould, 2011). There appears to be

an innate tendency in humans to appreciate and pursue aesthetic pleasure (Townsend & Sood, 2012). The inherent non-functionality of aesthetics represents a cultural relativity of luxury (Heine & Phan, 2011) and can be meaningfully understood in terms of consumer perceptions of aesthetic product features, creating a link between high aesthetics and a luxury image.

Price is the other product characteristic that is a basic requirement of luxury. Kapferer's (2012) absolute concept of luxury illustrates that in current socio-economic context, wealth is the only remaining consistent differentiator of social status (Han, Nunes, & Dreze, 2010). To this end, raising the price of products creates social separation and the image of luxury to those who are unable to afford. Price has proven to be the most objective characteristic in evaluating the luxuriousness of a product (Heine & Phan, 2011) and requires no psychological perceptions except to know the price. Although price alone does not create luxury image (Eastman & Eastman, 2011), as not all expensive products are considered luxury, low-priced products are never considered luxury, and therefore is a basic requirement for luxury.

In a study conducted by Allison and Uhl (1973) the perceived quality, rather than the actual quality, of a product was of considerable importance in consumer preferences. Numerous studies (Anderson & Cunningham, 1972; Bilkey & Ness, 1982; Rasky, 1986; Schooler, 1965) have explored the "made in" implications to consumers as they relate to country of origin and its effect on the consumer's perception of quality. Understanding the importance of origin of country is paramount when attempting to market against foreign competition whose goods are perceived by the consumer to be of superior quality. It would appear then that product value is not only a function of price and actual quality but also the quality that is perceived. The concept can be expressed as: $Value (F) = Price + Quality_{actual} +/- Quality_{perceived}$

These three product characteristics can be categorized as the basic building blocks of luxury products. This correlates with the most basic cognitive psychological functions consumers use to evaluate these characteristics, and their perceptions of these characteristics are the fundamentals of a luxury brand image. When these three luxury product characteristics interact with luxury brand consumer perceptions and judgments, this creates satisfaction (Saricam et al., 2012) at the most basic level in a luxury brand relationship between the product brand and the consumer.

Extrinsic Characteristics

Extrinsic product characteristics are those that serve a social purpose for the consumer. Rarity, when defined as limited availability, is one such product characteristic. Rarity come in two forms, concrete (Heine & Phan, 2011) and virtual (Kapferer, 2012). Concrete rarity is physical limitations on production capacity that adds value for consumers that have access (Heine & Phan, 2011). Kapferer (2012) describes a concept of virtual rarity, where luxury brand products using selective distribution and marketing strategies create value through artificial inaccessibility. Uniqueness is an abstract product characteristic that is derived from qualities of unique product design (Dion & Arnould, 2011) or construction that can be either functional or trivial, that is almost exclusive to the image of luxury (Heine & Phan, 2011). The perception of uniqueness in this characteristic enhances the desirability of a product brand and therefore derives value in its consumption (Vigneron & Johnson, 2004).

Consumers use the extrinsic product characteristics of rarity and uniqueness, and their concrete or abstract connections with luxuriousness to exhibit social status and association or dissociation from social groups (Han, Nunes, & Dreze, 2010). The study by Han, Nunes, and Dreze (2010) clearly indicates that the majority of consumers actively signal to those equal and above their perceived social status using the consumption of prominent luxury product brands. High price is also frequently perceived as a differentiator of social status, where conspicuous consumption of luxury is used for the purposes of conveying social status (Eastman & Eastman, 2011). Social association (Wilcox, Kim, & Sen, 2009) and social dissociation (Han, Nunes, & Dreze, 2010) are consumer aspirational goals, where consumers of perceived higher social status consume luxury to dissociate from those of perceived lower status, and vice versa.

An inference that can be made between extrinsic luxury product characteristics and extrinsic luxury brand consumer psychological attributes, is that the more rare or more unique a product characteristic is perceived, the higher the perceived social value, and therefore the higher price premium and luxuriousness attained. Luxury product brand consumers derive social status and social association through the display of these product characteristics (Podoshen & Andrzejewski, 2012). The interactions between product brand and consumers at this level develop a luxury brand relationship of prestige, being defined as a distinction of perceived social values within a socioeconomic context (Vigneron & Johnson, 1999).

Intrinsic Characteristics

Intrinsic product characteristics exist at the highest level of sophistication and include a complex integration of concrete and abstract attributes. Symbolism is one such product characteristic, and can refer to human values and lifestyles that exceed functional benefits (Heine & Phan, 2011). Symbolism can be thought of as the spiritualization of a product brand that embodies iconic and intemporal ideologies with little emphasis on physical form factor (Dion & Arnould, 2011). Luxury product brands often have a 'war chest' of subtle symbols, immortalized through public displays of superiority, but discreetly embedded within luxury product features (Kapferer, 2012). A similar product characteristic with more concrete basis is heritage. Heritage encompasses attributes such as country of origin (Godey et al., 2011), historical foundation (Kapferer, 2012), and authenticity (Alexander, 2008). A prestigious heritage is constructed and sustained through time and culture by product brands that are imbued with historic notions of luxury (Kapferer, 2012; Alexander, 2008), and is often perceived as being of superior quality, uniqueness, and authentic (Dion & Arnould, 2011).

Consumers' understanding of a product brand's symbolism and heritage drives intrinsic perceptions of the self. Sophisticated symbolism and prestigious heritage are sought by consumers of the highest caliber who have the financial capacity to consume without regard to functionality or social pursuits. Consumer psychological characteristics of self-esteem (Truong, McColl, & Kitchen, 2010) and self-affirmation (Townsend & Sood, 2012) are tied with these product characteristics because they induce an inward valuation of one's identity and worth (Townsend & Sood, 2012). Consumption of luxury product brands laden with subtle symbolism and heritage is related to emotional qualities of indulgence and a self-expression of individuality (Eastman & Eastman, 2011). Due to the transcendence of these intrinsic characteristics from functionality and social pursuits, the value attributable to symbolism and heritage defy traditional means of price valuation (Kapferer, 2012), the perception of luxury of which is driven beyond cognitive and extrinsic characteristics.

At this level of interaction between luxury product characteristics and luxury brand consumers, a strong relationship is created based on the constructs of commitment, partner quality, Intimacy-Loyalty, and passion. This framework is to show how the combination of the physical characteristics of luxury products and psychological perceptions of luxury create a luxury brand relationship with the consumer. This model depicts how the physical and psychological aspects of luxury brands inter-relate in a hierarchical structure of values.

Luxury product physical characteristics can be considered as a varying range of dimensions that increases proportionately with perceived luxuriousness. The major characteristics can be further categorized into concrete and abstract features, with quality having many sub-characteristics. Price is recognized as the function of physical costs of production and the perceived value. It is the most basic requirement of luxury definition in the current socio-economic context because wealth remains the only consistent differentiator of social status.

Luxury brand psychological characteristics largely derive from the consumers' perception of the luxury product physical characteristics. On a basic level, consumers develop a positive perception of the quality and aesthetics of a product, inducing satisfaction. On a secondary level, consumers use luxury brand products as an extrinsic signal of higher social status and association with, or dissociation from specific social groups, relying on the rarity and extraordinary physical characteristics to create self-connection. On an advanced level, luxury brand psychological characteristics become more intrinsic and spiritual, which correlate with increasing symbolism in physical characteristics. As luxury brand products exhibit higher degrees of desirable physical characteristics, it induces higher levels of psychological perceptions of value within consumers. Together, they create brand partner-quality and stronger consumer luxury brand relationships, which have been elusively attributed as the magic or passion behind luxury brands.

The Luxbrand relationship and partner quality

Commitment is defined according to Morgan & Hunt (1994) as a lasting and strong desire to keep the relationship and the willingness to make efforts toward it, and is described according to the Gundlach, Achrol, and Mentzer (1995)' works by items that reflect the instrumental nature of the investments in commitment, the time horizon that the construct implies, and more widely, the behaviors suggesting loyalty. Partner Quality Inferences are an important subclass of character inferences (Altman & Taylor, 1973). Consumers make inferences through the observation of a brand's behaviors. The sum of these inferences will form a global evaluation that the customer develops of the brand and its role as partner in a relationship (Blackston 1993), and will act as a mediating variable on the effects of brand personality on the relationship strength (Aaker et al., 2004). Partner Quality Inferences are nurtured in judgments of equity and justice, in socio-emotional benefits, and have the purpose of calibrating the belief the customer has in his relationship with the brand. It includes aspects of dependability, reliability, trust, support and accountability, regarding brand's performance in terms of respect for promises, avoidance of failures, problem-solving

processes and long-term consumers' interests served. The partner-quality construct includes items that focus on aspects of trust and trustworthiness (Moorman, Deshpandé, & Zaltman, 1993; Sheppard & Sherman, 1998; Braun & Zaltman, 2000), "behavioral indicators of benevolence", "problem-solving prowess", "perceived reliability and dependability" (Aaker et al., 2004, p. 7), and transgression commission (Smith, Bolton, & Wagner, 1999).

Two more constructs, intimacy-loyalty and passion, emerge and represent the two Relationships Ideals of intimate (romantic) inter-personal relationships proposed by Fletcher, Simpson, Thomas and Giles (1999). In a new approach to the interpersonal relationships field, Fletcher et al. (1999) developed the Relationship Ideals, a factorial model for explaining intimate (romantic) relationships, which is composed by two basic factors: Intimacy-Loyalty and Passion. Relationships of Intimacy-Loyalty are caring, respectful, honest, trusting and supportive; and relationships of Passion are related to feelings of exciting, fun and independence. The authors note that results may not be necessarily generalized to other relationship domains and social contexts but that issue could represent an interesting direction of research. According to Aggarwall (2004) customers will relate to brands in ways that resemble their social ties. Aggarwall further states that the norms of interpersonal relationships are a basis for the assessment that customers make of their relationships with brands.

ABSTRACT

Various typologies of trust were suggested in the literature. Although abundant literature has examined online trust, the different approaches were scarcely integrated to explain consequences of online trust. This paper addresses this gap by adopting an integrative approach to online trust antecedents and explaining its consequences on perceived risk and purchase intention. A survey is carried out on a sample of Indonesian cyberconsumer. The findings show that Purchase intention is determined by perceived risk and online trust. Besides, there is significant impact of personality based trust, cognitive based trust and institutional based trust on online trust.

Keywords: Online trust, personality based trust, cognitive based trust and institutional based trust, Perceived risk, Purchase intention

INTRODUCTION

The digital age deeply changed the way people communicate, learn, and shop. Nowadays, More than 2 billion people are using the Internet in the world (WorldInternet stats, 2011). As a reaction, businesses have been doing E-commerce and offering their products and services online. To positively integrate the online environment, businesses have to deeply comprehend cyber consumer behaviour, to meet cyber consumer expectations. According to Yoon (2002, p.50) "Electronic commerce can be characterized as transactions on the Internet which are conducted between individuals and firms through different forms of online-linking media such as shopping mall web sites or portals". Although the recent exponential rise in online transactions, several issues still hinder the development of e-commerce. It has been

demonstrated that cyberconsumers browse trading website to seek information and very few would proceed with the buying stage in their buying decision processes (Chen and Barnes (2007). This highlights trust and risk perception as critical issues for the future of e-commerce. Trust is important when consumers start to form an intention to buy products online (Kim et al., 2008). Moreover, it has been found that trust has strong relationship with perceived risk (Yoon, 2002 and Kim et al. 2008) which also has an effect on purchase intention (Chang and Chen 2008, Yoon 2006, Kim et al., 2008, Li et al. 2008). Consequently, it is very important for any business to identify and understand online trust, consumer risk perception and their impact on online purchase intention.

Various typologies of trust were suggested in the literature. McKnight and Chervany (2001) suggested four concepts: disposition to trust, institution-based trust, trusting belief and trusting intention. McKnight, Choudhury, & Kacmar, (2002) focused on the web vendor to define trust as beliefs and intentions or willingness to rely on another party. Li et al. (2008), Brown et al., (2004) suggested a personality based conceptualization of online trust.

Cognitive Based Trust is another conceptualisation of online trust (Li et al, 2008 and Meyerson et al, 1996) which suggest two dimensions: reputation of the web vendor (Li et al. 2008, Mcknight et al.2002 and Gefen et al. 2003) and calculative trust (Li et al. 2008). Moreover, Yoon (2002) demonstrated that website properties factor is a significant antecedent to online trust and that assurance of transaction security and personal variables both play a role in enhancing web-site trust.

Although abundant literature examined trust in a Website, the different approaches to trust were scarcely integrated to explain consequences of online trust. This paper addresses this gap by adopting an integrative approach to online trust antecedents and explaining its consequences on perceived risk and purchase intention.

The research objectives are (1) to examine the antecedents and consequences of online trust in terms of perceived risk and purchasing intention, and (2) to investigate these antecedents and consequences using a sample of Indonesian cyberconsumers shopping at kaskus.com.

THEORETICAL BACKGROUND

In the literature, trust has been found to be essential in B2B and B2C relationship (Rosseau et al, 1998, and Doney and Cannon, 1997, Doney et al. 2007). It is an important factor that

enables companies to build long term relationships with consumers and generate their loyalty (Fletcher and Peters, 1997 and Selnes, 1998). Morgan and Hunt, (1994) defined trust as something that arises when one group or individual believe in the reliability and integrity of his exchange partner. With regards to consumer trust there are two perspectives in the study of trust. Firstly, individual trust related to the personality characteristics. Lewicki and Bunker (1995) conceptualise individual trust as a belief, expectancy or feeling that is deeply rooted in the personality, with its origins in the individual early psychological development and can also be based on individual experiences. In addition, satisfaction from exchange with other people can develop individual trust (Sheppard and Sherman, 1998). Secondly, trust can be considered between individual and their social institutions and trustiness can be built based on social environment recommendations (Buttler, 1991). Online environment emphasises the importance of trust and the absence of trust may be one of the most important obstacles of accepting online trade (Isaac and Volle 2008).

CONCEPTUAL MODEL

Online trust has been triggering the debate since the last two decades. The rise of online shopping is also, it became critical for businesses to comprehend the online trust antecedents and consequences. Typologies of trust were suggested in both B2B context and B2C (Hofstede, 2010, Gulati and Sytch, 2008, Mcknight et al. 2002). In online context, online trust has five antecedent that differently contribute to it (Li et al., 2008 and Wang, 2010): the knowledge-based trust, the cognition-based trust, the calculative-based trust, the institution-based trust and the personality-based trust

PERSONALITY BASED TRUST

Doney and Cannon (1997) defined trust as the perceived credibility and benevolence of a target of trust. Mcknight and al. (2002) added a third dimension of trust, which is the integrity. These dimensions are widely accepted and used in research (Bhattachjee 2002, Gefen et al. 2003). The first dimension of trust, perceived credibility, is the extent to which one partner believes that the other partner has the required expertise to perform the job (Denis 2007, Chouk et Perrien 2003, Gefen 2002, Morgan et Hunt 1994) effectively and reliably (Ganesan 1994). Then, trust based on a partner's expertise and reliability focuses on the objective credibility of an exchange partner: expectancy that the word or written statement of

the partner can be relied on (Wang et Emurian, 2005). Wang and Emurian (2005) refer to the belief that the electronic supplier has the required knowledge to do his job effectively. The second dimension of trust, benevolence, is the extent to which one partner is genuinely interested in the welfare of the other and is motivated by the search for common gain (Denis, 2009). It reflects the belief that the supplier wishes well to the user despite its own profits (Gefen 2002, Ganesan 1994). Benevolence is thus the belief that the electronic merchant is interested in user interests (Wang and Emurian 2005, Chouk and Perrien, 2004, Chen and Dhillon, 2003, Bhattacharjee, 2002). The third dimension of trust, the perceived integrity, is the belief that the other party accepts the honesty and the respect of promises and commitments (Isaac and Volle, 2008, Chouk and Perrien, 2004, Gefen, 2002). The perceived integrity is the confidence that the merchant-mail do not exploit the vulnerability and that it will honor its commitment by promising to protect the security of transactions and the confidentiality of information (Jannouri et Gharbi, 2008, Wang and Emurian 2005, Chouk Perrien and 2003, Bhattacharjee 2002). Based on the above discussion, we posit:

H1: Benevolence in personality based trust is positively related to Online Trust

H2: Integrity in personality based trust is positively related to Online Trust

H3: Competency in personality based trust is positively related to Online Trust

COGNITIVE BASED TRUST

Parayitama and Dooleyb, (2009) demonstrated that cognition-based trust is a moderator in the relationship between cognitive conflict and decision outcomes. Cognitive based trust is built through people use of their common knowledge – own mind or asking relatives or friends- when they want to purchase online a particular product (Li et al, 2008). In the same vein, Meyerson et al. (1996) explained that cognitive based trust arises from first impression rather than experiential personal interactions. Based on this first impression, Li et al. (2008) and Mcknight et al (2002) pointed out that reputation of web vendor as being an antecedent factors of cognitive based.

Reputation is another dimension of cognitive based trust (Mcknight et al., 1998, Li et al., 2008, Jarvenpa et al., 1999). Reputation is the extent to which buyers believe that the selling organization is honest and concerned about its customers (Doney and Cannon, 1997). Organization's reputation and size were found to contribute to trust (Anderson and Weitz,

1989, Ganesan, 1994, Doney and Cannon, 1997). Mcknight et al., (1998) explained that reputation categorization can be known through second hand information i.e. relatives and friends. Sabater and Sierrathe (2005) emphasized that the main sources of information used by the trust and reputation models are direct experiences and information from third party agents. Quelch and Klein (1996) and Lohse and Spiller (1998) speculate that the reputation of the store will influence perceptions of the website. In addition, Powel (1996) also mentioned that reputation may reflect to the professional competence. Jarvenpaa et al. (1999) added that reputation of a website has become the most significant antecedent of cross cultural trust building in consumer. In addition, Gefen (2000) explained that when people lack of information and experience about particular vendor, the cognitive process will be running based on second hand knowledge and impressions. Doney et al (1991) added calculative or cost and benefit calculation dimensions as an antecedent of cognitive based trust. Furthermore, Shapirro et al. (1992) stated that calculative based trust is driven by economic principles, when people shaped by their rational assessment of the cost and benefits of another party cheating or cooperating in the relationship. Moreover, people tend to trust when the trustee is thought to have nothing to gain, or the cost overwhelms the benefit, from being untrustworthy (Shapiro et al., 1992). Paul and McDaniel (2004) evaluated calculative trust in an initial interpersonal trust context and argued that as long as the trustor is vulnerable to the non-performance of the trustee, calculative trust is effective. Based on this discussion, we posit:

H4: Reputation in cognitive based trust is positively related to Online Trust

H5: Cost/Benefit Calculation is positively related to Online Trust

INSTITUTIONAL BASED TRUST

Bachmann and Inkpen (2011) claimed that institutions can be an important and efficient facilitators of trust that develop through legal provision, corporate reputation, certification exchange partners and community norms, structures and procedures. Besides, the authors add that institutions matter differently according to stages of a trustor-trustee relationship, level of assets specificity, level of maturity of the business and the rapidity of decision making requirement.

Mcknight et al. (2003, p. 339) defined Institutional based trust as “the belief that needed structural conditions are present (e.g., in the Internet) to enhance the probability of achieving

a successful outcome in an endeavor like e-commerce". According to Mcknight et al (2003) there are two dimensions of institution trust based which are: structural assurance and situational normality. Trust is supported by institutions through the use of guarantees, regulations, promises, legal recourse, or other procedures are in place to promote success structures that create an environment that feels safe and secure to participants (Bachmann and Inkpen 2011, Shapiro, 1987; Zucker, 1986). Corbitt et al (2003) explained that a quality of web vendor developed through usefulness, timeliness and advance of the website can build trust. Selnes (1998) mentioned that quality of web vendor is achieved through giving correct and accurate information about products or other information about company also being part of quality of web vendor. Quality of web vendor influences trust beliefs (Mcknight et al. 2002). Moreover, situation Normality is another dimension of institutional based trust which means that a people will believe that the situation they face is normal, in or in proper order because it is favorable (Baier, 1986). In addition, with regards to the e-commerce, people who step in this situation will feel that the internet environment is appropriate well ordered, and favorable for doing transaction (Mcknight et al., 2003). Based on this discussion, we posit:

H7: Quality positively is related to Online Trust

H8: Situation Normality is positively related to Online Trust

ONLINE TRUST, PERCEIVED RISK AND PURCHASE INTENTION

Trust and perceived risk are strongly related (Mayer et al., 1995, Mcknight et al, 2002, Corbitt et al, 2003, Lu et al. 2005, and Zhao et al, 2010). Mcknight et al (2002) found that online trust affect perceived risk. Perceived risk is the perceived probability of loss or harm (Rousseau et al. 1998). Graziolli and Jarvenpaa (2000) mentioned that high perception of perceived risk will adversely affect consumer willingness to share personal information, follow vendor advice, and also their purchase intentions. In addition, trusting another party's behavior involves risk as the trustor is unable to confirm his/her decision outcomes prior to performance (Doney et al., 2007). Furthermore, perceived risk comes from uncertainty condition and undesirable as a result of purchasing product from ecommerce or online shopping (Lim, 2003). In uncertainty condition, customers rely on their trust beliefs to reduce their feeling about how much perceived risk they will have when shopping online (Zhao et al, 2010). Moreover, trust can reduce the levels of perceived risk associated with transaction process (Pavlou, 2003) especially when know little about the seller (Koufaris and Sosa, 2004).

Intention is a plan or will to behave in certain ways whether a person will do it or not (Ajzen and Fishben, 1980). Yoon (2002) and Kim et al. (2008) online trust significantly affect purchase intention. Besides, online purchase intention is significantly correlated with online perceived risk (Kim et al., 2008). Chang and Chen (2008) also stated that perceived risk has a mediator effect between trust and purchase intention. Rousseau et al. (1998) demonstrated that trust and perceived risk has a significant effect to the purchase intention of consumer. Based on the above discussion, we posit:

H9: Online Trust is negatively related to Perceived Risk

H10: Online Trust is positively related to Purchase Intention

H11: Perceived risk is positively related to purchase intention

CONCEPTUAL MODEL

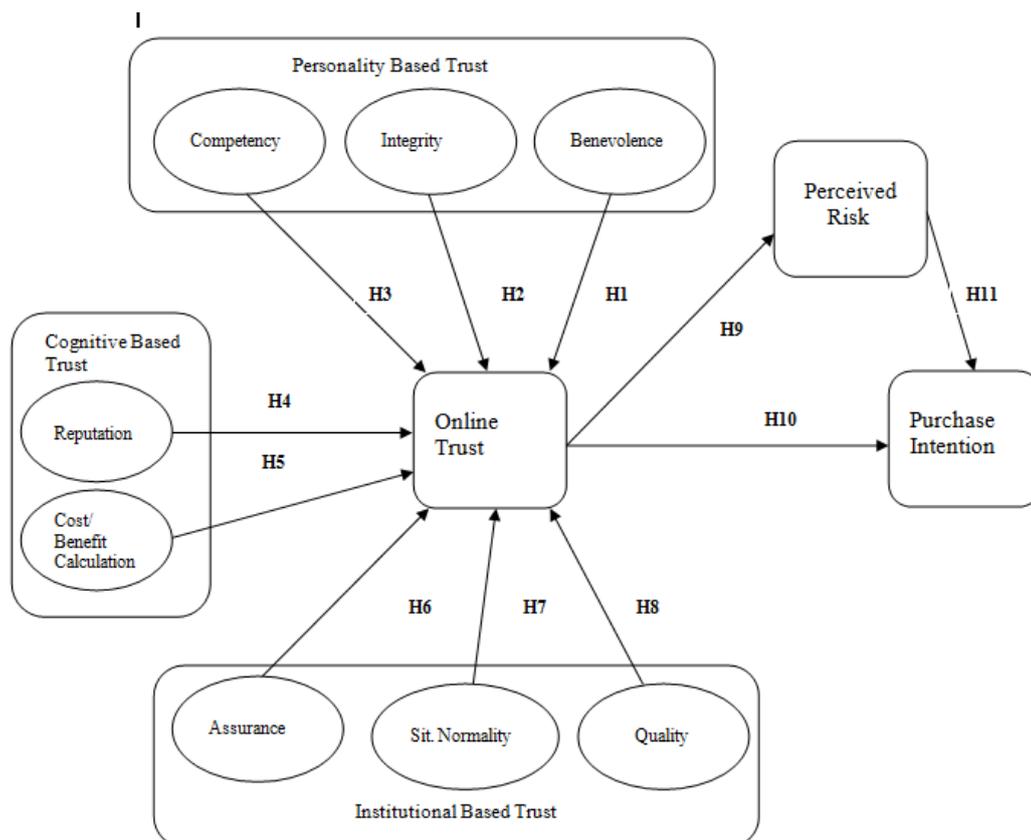

Figure 1: An integrative approach to online trust antecedents and consequences.

RESEARCH METHODOLOGY

A survey is carried out to collect primary data. A questionnaire was designed by adapting measures from prior research to ensure the content validity of the scales. The measurement of personality based trust (competency, integrity and benevolence) was adapted from the scale developed by Li et al., (2008). Besides the three dimensions attributed to the personality based trust, the two dimensions of cognitive trust (reputation and cost/benefit calculation) were measured respectively using the scales developed by Mcknight et al., (2002) and Gefen et al., (2003). The two first dimensions of institutional (structural assurance and situation normality) were measured by the scale developed by Gefen et al., (2003), the third dimension (quality) was measured by the scale of Mcknight et al., (2002). The scale of Chang and Chen, (2008) was used to measure online trust. Perceived risk was measured by the scale of Corbitt et al., (2003) and purchase intention was measured by the scale of Pavlou, (2003). Finally, the survey instrument used in this study consisted of a total of 39 items related to the eleven constructs of the research model. The items were measured using a 5-point Likert-type scale for all constructs. The questionnaire is translated to Indonesian then back translated to English by two experts to check translation reliability.

A snow ball sampling method was applied. The questionnaire was emailed to kaskus.co.id e-shoppers who were asked to forward it to all their contacts that are also shopping on kaskus.co.id. Kaskus is the biggest merchant website in Indonesia with more than 3 million members (Kompas, 2011). Individuals sell new or used product to other individual in auction or "buy it now" system (Kompas, 2011). Indonesian customer is a massive market with strong purchasing power (Guardian, 2011). A pilot test was conducted and the wording of the items used in the questionnaire was slightly modified. 401 questionnaires were completed.

The male respondents were 53.5% and female respondents were 46.5%. 45.3% of total respondents were between 19-25 years old. 23% of total respondents were between 26-35 years old, followed by 20% of total respondents who were between 36-45 years old. Most of respondents were in bachelor (29.8%) degree followed by college (27.8%), master degree (20%), high school (14.5%) and other education level (8.1%). The most of the respondents were students (37%), respondents from corporate employee were 25% of total respondents, followed by government employee (18.3%) and entrepreneur were (16%). 44% of total respondents have an expenses between 5 to 10 million Rupiahs per month; followed by 32.5 who have expenses 1 to 5 million Rupiah per month.

DATA ANALYSIS AND RESULTS

Measurement model

A confirmatory factor analysis using Amos 16 was conducted to test the reliability and the validity of the measures. Some common model-fit indices were used to assess the model overall goodness of fit (GFI, AGFI, RMR, RMSEA, NFI, TLI, CFI, Normed Khi-square). As shown in Table I, the majority of the model-fit indices approach or exceed their respective common acceptance levels. So, we can conclude that the measurement model has an acceptable fit with the data collected. Therefore, we can evaluate the psychometric properties of the measurement model in terms of reliability, convergent validity and discriminant validity.

Fit indices	Recommended value	Measurement model
GFI	> 0,9	0,910
AGFI	> 0,9	0,859
RMR	< 0,1	0,078
RMSEA	< 0,08	0,039
NFI	> 0,9	0,936
TLI	> 0,9	0,962
CFI	> 0,9	0,975
Normed χ^2	< 5	1,594

Table I: Measurement model goodness fit

Within confirmatory factor analysis, T test associated with each factorial contribution is much higher than 1.96, thus confirming the significance of the relationship of each indicator with the corresponding construct. Construct reliability, which reflects the internal consistency of the scale items measuring the same construct for the collected data (Straub, 1989), was assessed by computing Jöreskog's rho. As can be seen in Table II, the ρ coefficient for each construct was above 0.715, exceeding the common threshold value (0.70) recommended by Fornell et Larker (1981). Thus, it is determined that the scale was reliable or internally consistent. The convergent validity of the constructs was estimated by calculating the rho of convergent validity (ρ_{cv}) which indicates the average variance extracted by the construct. The average extracted variances are for the majority above the recommended 0,5 level (Fornell et

Larker, 1981) which mean that more than half of the variances observed in the items are accounted for by their hypothesized factors. However, both integrity and purchase intention measures have a rho of convergent validity nearby the common 0.5 value, respectively 0.499 and 0.497. We can conclude to their acceptable validity. Thus, all factors in the measurement model have adequate reliability and convergent validity (Table II).

Construct	Reliability (ρ of Jöreskog)	Convergent validity (ρ_{cv})
Competency (CMP)	0,738	0,518
Integrity (INT)	0,726	0,499
Benevolence (BNV)	0,757	0,513
Reputation (RPT)	0,723	0,567
Cost / Benefit calculation (CBC)	0,719	0,566
Assurance (ASS)	0,771	0,622
Sit. Normality (SN)	0,737	0,525
Quality (QLT)	0,833	0,666
Online trust (OLT)	0,715	0,593
Perceived risk (PR)	0,785	0,524
Purchase intention (PI)	0,745	0,497

Table II: Measurement model reliability and convergent validity

To examine discriminant validity, the shared variances between factors is compared to the average variance extracted of the individual factors (Fornell et Larker, 1981). This analysis shows that the shared variance between factors is lower than the average variance extracted of the individual factors, confirming discriminant validity (Table III).

	CMP	INT	BNV	RPT	CBC	ASS	SN	QLT	OLT	PR	PI
CMP	0,720										
INT	0,681	0,706									
BNV	0,487	0,568	0,716								
RPT	0,621	0,523	0,328	0,753							

	CMP	INT	BNV	RPT	CBC	ASS	SN	QLT	OLT	PR	PI
CBC	0,702	0,559	0,505	0,618	0,752						
ASS	0,363	0,366	0,336	0,436	0,476	0,789					
SN	0,489	0,483	0,486	0,530	0,584	0,493	0,725				
QLT	0,580	0,710	0,692	0,400	0,546	0,332	0,511	0,816			
OLT	0,653	0,569	0,528	0,616	0,378	0,716	0,457	0,549	0,770		
PR	0,085	0,001	-0,063	0,140	0,036	-0,034	0,144	-0,043	0,035	0,724	
PI	0,643	0,499	0,458	0,470	0,546	0,393	0,453	0,548	0,686	-0,151	0,705

Table III: Measurement model discriminant validity

In summary the measurement model shows adequate reliability, convergent validity and discriminant validity.

STRUCTURAL MODEL

A path analysis is conducted on the structural model in order to determine the direct and indirect effects of the research variables on purchase intention. Similarly to measurement model a set of indices is used to examine the structural model goodness fit (Table IV). In comparing fit indices with their corresponding recommended values, we conclude to an acceptable model fit.

Fit indices	Recommended value	Measurement model
GFI	> 0,9	0,963
AGFI	> 0,9	0,872
RMR	< 0,1	0,049
RMSEA	< 0,08	0,077
NFI	> 0,9	0,966
TLI	> 0,9	0,921
CFI	> 0,9	0,973
Normed χ^2	< 5	4,771

Table I: Structural model goodness fit

Thus, we can examine the path coefficients of the structural model. As shown in Table V, standardised path coefficients, t-values and variances explained for each significant equation of the hypothesized relations between constructs in the research model are presented.

As expected, the basis hypothesis (H1, H2, H3, H4, H5, and H7) were supported, in that online trust is determined by personality based trust dimensions (competency, integrity and benevolence), cognitive based trust dimensions (reputation and cost / benefit calculation) and institutional based trust dimension (situation normality). The two institutional based trust dimensions (assurance and quality) seem to have no effect on online trust, so the hypothesis H6 and H8 were rejected.

Online trust and perceived risk have direct effects on purchase intention. Thus, we conclude to the validity of the hypothesis H10 and H11. However our results show that there is no direct link between online trust and perceived risk, so H9 is rejected. We also note that perceived risk is not a mediator of the relationship between online trust and purchase intention. The explanation power of the model is 50,5%, that is 50,5% of the variance of the purchase intention is explained by exogenous variables perceived risk and online trust which is determined for 74,6% by personality based trust dimensions (competency, integrity and benevolence), cognitive based trust dimensions (reputation and cost / benefit calculation) and institutional based trust dimension (situation normality).

Table V: Hypothesis testing results

DISCUSSION, IMPLICATIONS AND RESEARCH LIMITATIONS

This research in vein with previous findings (Isaac and Volle, 2008, Mcknight and al. (2002), Chouk and Perrien, (2004), Gefen, 2002, Doney and Cannon 1997) demonstrated that online trust has three categories of antecedents: personality based dimensions - competency, integrity and benevolence-, cognitive based trust dimensions - reputation and cost/benefit calculation- and institutional based trust dimension which is situation normality.

However, assurance and quality dimensions related to institutional based trust (Corbitt et al 2003, Selnes 1998, Mcknight et al., 2003) were found to have insignificant effects on online trust. According to Bachmann and Inkpen farmework (2011), this finding can be justified because Indonesian consumers are at an advanced stage in their relationship with kaskus.com (searchcowboy, 2011). Besides, kaskus.com is a mature business and purchasing goods on Kaskus.com is commonplace. Therefore, Indonesian consumers make swift decisions with little concerns of assurance and quality. Moreover, the website has a strong reputation and is provided with the requested certification.

We also found a direct effect between online trust and perceived risk on purchase intention. This result confirms previous authors' findings (Lu et al. 2005, Zhao et al, 2010, Kim et al., 2008, Chang and Chen 2008). The more an individual trusts a website, the less he perceives risk and the bigger is his intention to purchase on this website. Surprisingly, we did not find a significant relationship between perceived risk and online trust. This can be explained by the nature of the activities that can be done on Kaskus.com ranging from information seeking, news and gossips, social events, to hobbies and advertising. Besides, Kaskus.com has more than 2,5 million users which emphases it as Indonesia's largest community. This might explain the low perceived risk amongst this community.

The findings of this research have several managerial implications. Online brands have to develop integrity, competency and benevolence dimensions

These results provide valuable insights for professionals who should consider influencing online purchasing by promoting professional competency, benevolence and integrity. They should, certainly, create informative interfaces for potential cyber consumers, provide fast page downloads, short transaction times and frequent-user advantages for active users. Thus, practitioners should give an extra attention to prevent cyber consumers from consequently experiencing access difficulties, system crashes, drop outs, service delays and system malfunctions which consequently decrease their trust belief. Moreover, professionals should

reveal their integrity and credibility by respecting their promises, by developing the features of security and privacy, and by promoting their trustworthy brand.

This empirical study has some limitations. First, the study findings and implications are obtained from a single study that examined a particular website context. Thus, additional research efforts, replicating the study on other website are needed to evaluate the validity of the investigated model and our findings. Second, this study was conducted with a snapshot research approach. This reduces the ability of this study to reflect the temporal changes in the research constructs, especially when e-shopping experiences increase. Longitudinal evidence might enhance our understanding of the causality and the interrelationships between variables that are important to online purchase intention.

ABSTRACT

The modern workplace worldwide is facing the new reality of multigenerational challenges. While organizations are struggling to manage values-diverse workforce, the ability to understand various generational needs and expectations, and to target them with tailored employer branding activities, could be a winning strategy to attract, retain and engage key talent. Therefore it is the purpose of this paper to explore generational perspective in employer branding. It is also the particular ambition of this study to promote the yet largely unexplored field of employer branding in higher education. Specifically, generational differences in the work values are investigated in 19 Lithuanian higher education institutions ($N=1105$), identifying particular aspects of employment experience that are the most significant to Generation Y, Generation X, Baby Boomers and Traditionalists. The paper also examines how data differentiates between and across two types of higher education institutions, i.e. universities and colleges. Implications and recommendations for generational segmentation in employer branding in higher education are presented.

Keywords: employer branding, generational differences, work values, segmentation, higher education.

INTRODUCTION

“... the traditional rules of management, motivation, and reward fly out the window. Can this be the essence of the change going on in the workplace today? Can it be as simple, and as complicated, as a change

in philosophy about the reason for working? Maybe. Time will prove this theory right or wrong. But many employers say that this is precisely what they're seeing. They describe the tremendous repercussions this change in values and principles is having on management's mode of operations – on the way executives recruit, communicate with, manage, motivate, and retain employees in order to remain competitive in the marketplace" (Marston, 2007: 4).

In modern economies where products and services become very alike, industries get overcrowded and competition for the best employees is almost as fierce as competition for customers, organizations are most likely to be heartily investing in distinctive employment practices and differentiating themselves from their competitors in the labour more than the product market (Lievens and Highhouse, 2003; Sørensen, 2004; Berthon et al., 2005). Employment practices determining the employment experience "guide the firm in selecting *particular* types of people with *particular* kinds of aptitudes and abilities to pursue *particular* goals in *particular* kinds of ways, motivated by *particular* kinds of rewards" (Baron, 2004: 5). It is no longer enough for organizations to manage their human resources effectively. In order to attract, select and retain the right employees and talents, organizations have to look for a "secret sauce" (Sartain and Schuman, 2006) – to immerse themselves in *employer branding*, i.e. identify *what* is so special and valuable about them, what exactly the current employees or possible candidates love and embrace about a particular work place, to create an employer value proposition and market it both internally and externally, winning the label of an attractive employer and in the same vein, signaling what kind of people the organization is eager for. In other words, employer branding refers to "how a business builds and packages its identity, from its origins and values, what it promises to deliver to emotionally connect employees so that they in turn deliver what the business promises to customers" (Sartain and Schuman, 2006: vi).

Most of the approaches for clarifying and uncovering employer brand are aimed at discovering "what is common among employees, their shared needs, motivations, perceptions and values. However, most organizations are diverse" (Barrow and Mosley, 2011: 100) and the simple fact is that different people have different perceptions about the value and importance of different job characteristics (Schokkaert, 2009). Even though "different" has many names, after a few decades of coping with gender, racial, ethnical, and cultural diversity, the modern workplace worldwide now is most sharply facing multigenerational challenges (Zemke et al., 2000).

The concept of *generational differences* and the conflicts, collisions, challenges and opportunities this diversity presents is a *topic of popular* discussion in a vast amount of management practitioner literature. Recent years have witnessed a steady march of studies on the development of generational competencies offering bundles of insights, methods and tools on how to effectively recruit, retain, motivate, manage each generation, and bridge the gap (Marston, 2007; Lancaster and Stillman, 2003; Espinoza et al., 2010; Martin and Tulgan, 2006; Sujansky and Ferri-Reed, 2009; Lipkin and Perrymore, 2009; Dorsey, 2009; Elliott-Yearly, 2011). However, only limited and mixed empirical evidence for generational differences in work values is available to reliably demonstrate whether or not and to what extent these differences exist (Smola and Sutton, 2002; Cennamo and Gardner, 2008; Hansen and Leuty, 2012; Parry and Urwin, 2011; Twenge et al, 2010; Tolbize, 2008). Moreover, while organizations are struggling to manage a values-diverse workforce with “different ways of working, talking, and thinking” (Zemke et al., 2000:11), and work hard to attract and retain talent, surprisingly far too little attention to shifting demographics has been paid in the theory of employer branding. It is only lately that some books, articles, investigative pieces, podcasts, and blogs about approaching employer branding from a generational perspective have emerged (Gruber, 2012; Employer Branding Today, 2013; Scrivener, 2013; Hubschmid, 2012; Hughes, 2013).

Therefore it is the aim of this paper to explore generational differences in work values and to provide evidence and insights for application of market segmentation approaches in the context of employer branding. The target population of the study was higher education institutions, since this sector has been – albeit with a *few exceptions* (Stensaker, 2007; Temple, 2006) – largely *unexplored* in branding literature, despite evidence showing it to be worth such thorough research. Namely, knowledge-intensive industries and knowledge-based organizations are merely dependent on the expertise, competencies and excellence of their employees, thus the ability to effectively attract and retain best possible faculty and staff is crucial to them.

THEORETICAL BACKGROUNDS OF GENERATIONAL DIFFERENCES

“The problem of generations is important enough to merit serious consideration” (Mannheim, 1952: p.286).

‘Generation’ is a cohort of people, born around the same time, raised in a unique era and sharing significant social and historical life events and experiences at critical development

stages (Parry and Urwin, 2011; Twenge et al., 2010; McCrindle and Wolfinger, 2011). As Kotler et al. (2009: 347) assert, “each generation is profoundly influenced by the age in which it is reared – the music, films, politics and defining events of that period ...”, and as a result generational behaviors, work values and preferences do differ (Zemke, et al., 2000; Smola and Sutton, 2002; Hansen and Leuty, 2012; Cogan, 2012; Buahene and Kovary, 2007; Schultz et al., 2012; Hu et al., 2004). This “difference of attitudes between people of different generations, leading to a lack of understanding” (Oxford Dictionaries, 2013) termed as a ‘*generation gap*’ has always existed, but as a phenomenon in fields of marketing and business management literature it has attracted increasing attention since the late 1960s when two generations, the *Traditionalist* and *Baby Boomers*, have been fighting and learning how to co-exist (Howe and Strauss, 1992; Simons, 2010). A new generational gap emerged in 1990 when *Generation X* rushed into the labor market with their different visions of society and self (Howe and Strauss, 1992), and, eventually, after *Generation Y* has joined the battle, it is the first time in history when four different generations are working side by side, sharing and dividing the labor market (Hansen and Leuty, 2012; Tolbize, 2008). Furthermore, the near future (or already a new reality) of work demographics brings with it five generations in the workplace at once and “this mixed, multi-generational environment is a new diversity challenge for ... organizations everywhere” (Shah, 2011: para. 2).

Nevertheless there is little agreement on the starting and ending points for generations with high discrepancies of time spans (Smola and Sutton, 2002, Crowley and Florin, 2011; Burke, 2004; Tolbize, 2008; McCrindle and Wolfinger, 2011; McCrindle, 2006; Buahene and Kovary, 2008; Simons, 2010. Zemke et al, 2000; Becker, 2012; European Commission, 2011; Hansen and Leuty, 2012), the majority of literature defines *Traditionalists* as those born before 1946, *Baby Boomers* as individuals born between 1946 to 1964, *Generation X* as people born between 1965 and 1980, and *Generation Y* as including members born between 1980 and 1994 (Hansen and Leuty, 2012) (see Table 1). The newest *Generation Z* is reported to begin as early as 1991 or as late as 2001.

Generation	Birth Years
Traditionalists (aka Veterans, Matures, Silent Generation, WWII Generation)	Born before 1943/1945/1946/
Baby Boomers	1943/1945/1946/– 1960/1964/1970
Generation X (aka Baby Bust Generation, Gen Xers, Pragmatic Generation)	1960/1963/1965/1968/1970– 1976/1979/1980/1985
Generation Y (aka Millennials, Nexters, Digital generation, Echo Boomers, Generation www, Generation E, Net Generation, Gen Yers, Generation Me, Unlimited Generation)	1977/1978/1980/1981/1985– 1994/1998/2000
Generation Z	1991/1995/2000/2001 – Present

Table 1. *Generational time spans*

Admitting that there are some theoretical grounds to consider generational differences across national contexts and cultures (Schewe and Meredith, 2004), though “the notion of global generations as the incidence of ‘global’ events becomes more common” (Parry and Urwin, 2011: 92), providing with comparative approach, and facilitating the process of assigning particular work values to particular generation.

Despite some ambiguity in defining and delineating generations, most researchers agree on the inherent attributes of each generation (Hansen and Leuty, 2012; Twenge, 2010) and argue that generations “can be characterized by a certain set of attitudes and beliefs” (Smith, 2008: 8). Elaborating on this idea further, a qualitative and empirical literature review on generational diversity provides the means to categorize some aspects of each group’s behaviors, needs, personality traits, workplace perceptions, perspectives, interaction styles and preferences as summarized below.

- Traditionalists have grown up in the “do without” era, they believe in hard work and sacrifice, honor and compliance, are dedicated, very uncomfortable with change and aim at building a legacy (Buahene and Kovary, 2007). Traditionalists feel appreciated if their experience is respected, perseverance admired and knowledge valued (www.mcfrecognition.com). Characterized by high levels of loyalty, they believed they would (and commonly did) work for the same company their entire career (Marston, 2007). Described as liking structure, authority, formality and hierarchy (Burke, 2004), “averse to risk and strongly committed toward teamwork and collaboration” (Tolbize, 2008: 2), Traditionalists are gradually retiring.
- Baby Boomers are the Post-Second World War generation that lived through, adapted to, and created the incredible change. They are ambitious, loyal to the team, value personal growth, equality and collaboration (Buahene and Kovary, 2007). Having grown up in a healthy economic era, Baby Boomers strive for status, leadership, career and higher salary. They want their opinion to be heard and valued, and contribution recognized (Cennamo and Gardner, 2008). Baby Boomers are result driven, they give maximum effort (Burke 2004), are described as willing to “go the extra mile” (Zemke et al., 2000) and living to work (Marston, 2007; Smola and Sutton, 2002), which has started the workaholic trend (Tolbize, 2008).
- Generation X is referred to as a “bridge generation” which can easily understand Baby Boomers and, at the same time, connect with Generation Y (McCrinkle, 2006). Grown up in the era of distrust for national institutions, members of Generation X tend to be cynical,

skeptical, pessimistic, pragmatic, comfortable with change, more independent, self-reliant, autonomous and not overly loyal (Tolbize, 2008; Hansen and Leuty, 2012; Smola and Sutton, 2002). Research has found that Generation X is placing increased importance on compensation, working conditions, security, moral values (Hansen and Leuty, 2012), quick promotion (Smola and Sutton, 2002), flexibility, work-life balance, continuous learning, challenging work and supervisor relationship (Buahene and Kovary, 2007; Tolbize, 2008; Burke, 2004).

- Generation Y, which was raised in the era of financial boom, is the most highly educated generation (Tolbize, 2008). Its members embrace diversity, learn quickly (Burke, 2004), are devoted to their own careers (Marston, 2007), confident, optimistic, innovative, techno-savvy, loyal to peers, not title or company; they expect continuous change, rapid career growth and personalized experiences (Buahene and Kovary, 2007). Generation Y feels comfortable with multitasking, connects responsibility with personal goals, builds parallel careers (www.mcfrecognition.com) and is characterized by productivity, networking and openness (Employer Branding Today, 2012). Besides, several studies have revealed that representatives of Generation Y are more active volunteers but not “more caring, community oriented, and politically engaged than previous generations” (Twenge et al., 2012: 1060).
- Generation Z, commonly referring to people born from the mid 1990s to 2010, seems to be still miles away from the workplace, but it will take a flash of time for those bright, flexible and tech-savvy youngsters to enter the labor market, and some of them are already there. Influenced by the Internet, technology, war, terrorism, the recession and social media, members of Generation Z are connected globally to their peers and knowledge, and “expect to be able to work, learn, and study wherever and whenever they what” (Renfro, 2012, para. 9). By 2020, 36% of the workforce will be made up of this generation of employees, who have specific expertise, create no long-term plans, make no long-term contracts, are not loyal, expect quick results and quick promotions, are comfortable with and even dependent on technology, more socially responsible, constantly multitasking and always connected.

While generations demonstrate a number of differences in their work-related attitudes, research indicates many points of agreement as well: they all like teamwork; fair, ethical and collaborative/friendly workplace culture; want to be valued, supported and involved (Tolbize, 2008). As Smith (2008: 25) has concluded, “all generations basically want and value

the same things” – people expect to be respected, recognized, remembered, coached, consulted and connected. However, even though “people may want the same things, but they want them delivered in different packages, depending on when and how they grew up” (Ibid.).

EMPLOYER BRANDING AND MARKET SEGMENTATION

“...organizations of all shapes and sizes have much to learn if we are to attract and keep the talent we need to succeed. And, by the way, it’s not all about the millennials ... it’s really about everyone in the workforce” (Smith, 2008: 5).

Market segmentation, defined as “the process of dividing a market into distinct groups of buyers who have distinct needs, characteristics, or behavior, and who might require separate products or marketing programs” (Kotler and Armstrong, 2010: 73), has been analyzed in marketing since 1970s and remains one of the key elements of its success. Demographic segmentation, which is considered to be the most common one, deals with – among other demographic values – age, generation, and the changing age structure of global population. Referred to as ‘generational marketing’ (Schewe et al., 2000), it makes a huge impact on today’s marketing strategies which attempt to appeal to the consumers’ emotions, beliefs, values and attitudes.

In the context of human resource management, segmentation “is a tool used to identify the most significant and meaningful way of dividing people into groups who can be catered for differently according to their specific needs” (Barrow & Mosley, 2011: 100). Although proving to be beneficial and helping companies “to be more efficient and effective in attracting, retaining and motivating both current and potential employees” (Moroco and Uncles, 2009: 181), application of market segmentation approaches to employer branding context is definitely yet unexplored and underappreciated, though idea itself is not entirely new (Hubschmid, 2012; Dahlström, 2011) and “is likely to grow in both frequency and sophistication over the coming years” (Barrow and Mosley, 2011: p. 100). Still, only the top companies which extensively apply employer branding strategies focus their efforts to offer a particular “package of functional, economic and psychological benefits provided by employment” (Ambler and Barrow, 1996: 187) to particular generation. Best practices of multigenerational employer branding include a pharmacy innovation company *CVS Caremark* ([www. cvscaremark.com](http://www.cvscaremark.com)), which sends a message to mature employees saying “Talent is

Ageless”, or the world’s largest home improvement retailer *Home Depot* (www.homedepot.com), which targets the next Generation Z by “looking for the bold, the dreamers, the innovators and the problem solvers” under the slogan “Who’s next?”. And similarly, the second largest professional services network *Deloitte* (www.deloitte.com), assuring that “we understand that your personal life and your professional life deserve an equal amount of attention ... and provide a comprehensive array of benefits that can help to provide balance and flexibility”. Isn’t it exactly what Generation X is looking for?

It is asserted that one of the most useful approaches of segmentation is to cluster people according to their different attitudes towards employment, for instance in such types as ‘Work-Life Balancers’, ‘Want it All’ and ‘Pleasure Seekers’ found by Tesco or ‘Ambassadors’, ‘Career Oriented’, ‘Company Oriented’ and ‘Ambivalent’ as produced by TNS analysis (Barrow and Mosley, 2011).

It should be noted though that for segmentation in employer branding to be necessary and economically feasible, the first thing to determine is whether the wants and the needs of an employee are heterogeneous enough, and whether different groups are not too small, or the total number of them too great (Neely et al., 2002; Barrow & Mosley, 2011).

Nonetheless, the first and the biggest issue to address in relation to generational employer branding is to accept that different generations choose and stay with companies for very different reasons, that generations are not sharing the same definition of ‘success’ (Marston, 2007), and that they work, think differently and have different sets of priorities (Espinoza et al., 2010). Further, it should be answered what kind of employment experience the organization wants to create, how it may need to vary by generational segment, and “how your employer brand can and should mean different things to different people” (Sartain and Schuman, 2006: 40). All these actions may be defined as ‘generational competence’ or ‘generational perspective’ – the ability of organizations to understand various generational identities, to appreciate diverse needs of each generation and to meet them. As Kupperschmidt (2000: 65) asserts, “a generational perspective enables managers to leverage employee uniqueness as a source of learning, productivity, and innovation and to create and role model a shared vision of positive co-worker relationships”.

Using internal research, organizations must answer, for the employee, the fundamental question “What’s in it for me?” if I work there (Sartain and Schuman, 2006). Clarifying generational expectations should be viewed as a starting point for every employer’s branding campaign (Hubschmid, 2012), which assists organizations in developing efficient target

group-oriented employer branding strategies to attract, retain and engage key talent and enhance productivity (Fraone et al., 2008).

METHOD

The study reported here was carried out in 19 Lithuanian higher education institutions – 7 universities ($N = 715$) and 12 colleges ($N = 390$) – during the period from March until November 2012. Table 2 below shows the demographic characteristics of the total sample ($N = 1105$). Age intervals used in the questionnaire to cluster respondents into age groups were adapted (with one year start-date and end-date error) from the Statistics Lithuania (2012), which commonly follows them to report about research and development personnel by age.

Characteristics	Frequency	Percentage
Gender		
Females	636	59,6
Males	431	40,4
Age		
<=25	25	2,3
26-35	317	28,9
36-45	308	28,1
46-55	239	21,8
>55	206	18,8
Employee group #1		
Academic staff	808	74,1
Administrative staff	282	25,9
Employee group #2		
Subordinate staff	837	77,3
Supervising staff	246	22,7

Table 2. Demographic characteristics of the sample.

To collect the data, invitations to participate in the present study were sent by email to employees of higher education institutions, whose management had expressed survey approval. The email contained a link to a web-based anonymous questionnaire. Although e-mail surveys are prone to poor response rates and it is possible that results will be biased, it is still the most effective method to reach respondents in scattered faculties, departments and divisions of higher education institutions. The list of items was randomly mixed not to provide respondents with a clue as to what dimension is being measured and to avoid inertia and bias. Twofold 10-point response scale was used for evaluation of each item. Firstly, respondents were asked to assess whether a statement reflects actual employment experience in a particular higher education institution, with “1” used to indicate “least experienced”

(lowest perceived experience), and “10” – “most experienced” (highest perceived experience). Secondly, the respondents were asked to evaluate how important such employment experience is to them, with “1” used to indicate “least important” (lowest perceived value) and “10” – “most important” (highest perceived value).

An Organizational Attractiveness Extraction Scale (OAES), originally developed by the authors, was used to measure the perceived actual and desirable characteristics of employment experience in higher education institutions. Particularly, the research was focused on the measurement of employment-based identity as perceived actual and desirable characteristics of employer’s attractiveness. Following the best practices of scale development, both deductive and inductive methods were used in item generation. As for deductive scale development, 8 international methodologies of workplace attractiveness assessment were analyzed. In parallel, applying an inductive approach, three focus groups of university staff (total $N=70$) and four focus groups of students (total $N=160$) were conducted with the aim of identifying dimensions of organizational attractiveness in a university. Further, content validity was used to refine dimensions that make up the attractiveness of the higher education institution as an employer and to expand them with the statements collected during the pilot surveys. After collection of initial data ($N=186$) the scale was purified and resulted in a total row of 67 items measuring 11 factors, i.e. *Organizational Culture, Fairness & Trust, Teamwork, Academic Environment, Strategic Management, Job Satisfaction, Supervisor Relationship, Compensation and Benefits, Training & Development, Work-Life Balance, and Working Conditions*. In order to test reliability of OAES with the present study data, a series of Cronbach’s alphas were calculated for each of the 11 factors ranging from 0.675 to 0.953 with only one factor (*Work-life Balance*) returning coefficient lower than 0.70.

Additionally, Affective Commitment Scale developed by N. J. Allen and J. P. Meyer (1990) was used to measure employees’ loyalty, or employees' perception of their relationship with the organization and their reason for staying.

DATA ANALYSIS

To explore generational differences in higher education, respondents were categorized into four generations based on the age intervals used in survey, as they approximately pertain to the generational birth frames. Only 25 respondents indicated being younger than 25 years old and presumably composing a mix of late Generation Y and early Generation Z members. This group was not included in further analysis. The group of respondents born between 1977-

1986 and aged 26-35 in 2012 was labeled as Generation Y; the group of those who were born between 1967-1976 and were aged 36-45 in 2012 was labeled as Generation X; the group of people born between 1957-1966 and aged 46-55 in 2012 was labeled Baby Boomers; and finally, the group of those who were born before 1956 was labeled as Traditionalist. The latter group is likely to contain some Baby Boomers as well, however, since the number of employees aged 65 and older was low and accounted to almost 8 percent of the total academic workforce in Lithuania (Statistics Lithuania, 2012), the highest margin of above 55 years old was employed to facilitate data analysis.

The data of the survey was analyzed using the IBM SPSS Statistics 19 for Windows software package. The aim of this study was to explore and describe generational differences in the preferences for work values and employment experience in academic workplace, consequently only the data from *Importance scale*, which indicated the employees' needs, wants and expectations, was used in further analysis. Table 3 reports descriptive statistics – the means, standard deviations and ranks for OAES item scores for each generational group.

The Kruskal-Wallis test was used to determine whether the generational groups' distributions were identical. The results of the Kruskal-Wallis test were significant ($H(3)=16.727, p=.001$); the mean ranks of importance values are significantly different among the four generations. Accordingly, considering statistically significant differences, analysis of rank ordered data was performed, exploring most wanted employment experience facets for each generation. Additionally, total mean of responses, referred to as *Importance Index* [$M=8.960$], was calculated to facilitate interpretation of results.

It can be seen from the data in Table 3 that Generation Y places most importance on an interesting job [$M=9.60; SD=.914$], supervisor guidance [$M=9.44; SD=1.154$], supervisor attention and respect [$M=9.43; SD=1.107$], recognition of performance results and competencies [$M=9.40; SD=1.056$], job meeting one's experiences and abilities [$M=9.38; SD=1.059$]; supervisor support [$M=9.37; SD=1.060$], study quality assurance [$M=9.36; SD=1.253$], keeping promises [$M=9.34; SD=1.198$], possibility to combine work and personal life needs [$M=9.33; SD=1.388$], and help and support from colleagues [$M=9.32; SD=1.133$]. Other generations also have a fairly high regard for these work values, except Traditionalists, who were found to value recognition for performance results [$M=8.95; SD=1.614$] and proper prioritizing between work and life [$M=8.91; SD=1.565$] much lower than Generation Y, and below the Importance Index.

Analyzing the preferences of work values of Generation X, it could be concluded that an interesting job [$M=9.50$; $SD=1.224$] which meets one's abilities and experience [$M=9.45$; $SD=1.000$] is the first priority as in the case of Generation Y. Further, "walk the talk" is most appreciated by Generation X [$M=9.42$; $SD=1.133$], fairness of treatment [$M=9.40$; $SD=1.116$] is considered as very important, keeping promises [$M=9.40$; $SD=1.189$] is most valued, and good atmosphere is embraced [$M=9.38$; $SD=1.059$]. Generation X also places more importance on consistent administrative support provided to faculty members [$M=9.37$; $SD=1.091$], appreciation of best employees [$M=9.35$; $SD=1.232$], attentive supervision [$M=9.35$; $SD=1.122$], and study quality assurance [$M=9.32$; $SD=1.53$]. It should be noted that, again, Traditionalists do not perceive consistent administrative support [$M=8.87$; $SD=1.502$] as a must, with scores falling below the total average.

When it comes to the work values of Baby Boomers, echoing the previous groups' results, they place the highest emphasis on an interesting job [$M=9.43$; $SD=1.144$], fairness of treatment [$M=9.41$; $SD=0.899$], job and experience match [$M=9.32$; $SD=1.210$] and reward of achievements [$M=9.29$; $SD=1.198$]. Good relationship with colleagues [$M=9.26$; $SD=1.040$] and procedures promoting transparency [$M=9.29$; $SD=1.257$] are also most valued by Baby Boomers. However, further preferences of attentive supervision [$M=9.24$; $SD=1.247$], study quality assurance [$M=9.23$; $SD=1.391$] and keeping one's word [$M=9.21$; $SD=1.130$] overlap with both Generation Y's and Generation X's priorities. In agreement with Generation X, Baby Boomers place increased importance on faculty support [$M=9.22$; $SD=1.056$]. Largest discrepancies are observed in the Traditionalists' case, where three of ten highest work value preferences of Baby Boomers, i.e. recognition of results [$M=8.95$; $SD=1.614$], faculty support [$M=8.87$; $SD=1.502$] and procedures promoting transparency [$M=9.96$; $SD=1.464$], are found below Importance Index.

Dimensions		Generation Y			Generation X			Baby Boomers			Traditionalists		
		Mean	SD	R	Mean	SD	R	Mean	SD	R	Mean	SD	R
Organizational Culture	1. Work environment is collegial.	9.03	1.471	39	9.07	1.471	35	9.00	1.448	36	8.95	1.495	29

Table 3. Descriptive statistics for OAES items on Importance scale by Generation

It is apparent from the Table 3 that Traditionalists are consistent with other generations above on three aspects of employment experience, which are a job that is interesting [$M=9.31$; $SD=1.063$] and meets one's experience [$M=9.31$; $SD=1.063$], and attentive supervision [$M=9.17$; $SD=1.194$]. Similarly to Baby Boomers, Traditionalists embrace good relationship with colleagues [$M=9.23$; $SD=1.135$], just like Generation Y, they value helpful colleagues [$M=9.20$; $SD=1.128$], and, like both these groups, place much emphasis on fair treatment of employees [$M=9.19$; $SD=1.171$]. Traditionalists also agree with Generation Y on high importance of supervisor guidance [$M=9.11$; $SD=1.526$]. In contrast to other generations, Traditionalists express their appreciation for trusty supervisors [$M=9.15$; $SD=1.337$], leaders [$M=9.13$; $SD=1.126$], and the institution's positive reputation and image [$M=9.11$; $SD=1.649$].

Eventually, the data of *Affective Commitment Scale* was checked and strong evidence for significant differences between generations ($F(3,1033) = 22.587, p < .001$) was found, supporting previous findings (AON Hewitt, 2012) and showing declining employee loyalty with each younger generation with Traditionalists being most loyal [$M=8.00; SD=1.909$], Baby Boomers [$M=7.66; SD=2.031$] and Generation X [$M=7.11; SD=2.111$] getting less loyal and, finally, Generation Y representing the least loyal group [$M=6.58; SD=2.202$].

Further analysis was performed on the level of overarching values, i.e. eleven OAES dimensions. To determine whether identified generational work value preferences are universally applicable, the non-parametric Mann-Whitney U test was used to compare mean values of universities and colleges and indicated statistically significant differences ($p < .001$) between generations in these two subsamples on all dimensions on *Importance scale*, without exceptions. Given these statistically significant differences, the remaining analyses were performed separately for universities and colleges, but only the data from 10 higher education institutions – five universities ($N = 672$), and five colleges ($N = 262$) – was analyzed, as the samples of the remaining 9 institutions did not exceed 30 respondents, which is considered too small for segmentation.

Kruskal-Wallis non-parametric test was used to compare generational groups inside higher education institutions. Results indicated (Table 4) that there were statistically significant differences in attitudes between generations within all universities, except University B ($H(3)=5.664, p=0.129$), and in all colleges, except College D ($H(2)=2.071, p=0.355$), where no evidence of significant differences between generations was found.

Table 4. Results of non-parametric Kruskal-Wallis test for ten higher education institutions.

In order to identify the most preferable work values and to determine whether any group-preferential pattern could be observed in the subsamples of five universities and five colleges, three dimensions with the highest mean values and ranks, perceived as the most important by employees, were listed and summarized in Table 5 for each generational group with indicated frequency.

This analysis is quite revealing in several ways. First, it is apparent from table below that all or most of the generational groups across surveyed universities and colleges agree on one or

two highest priorities in work values. Namely, *Supervisor Relationship* and *Job Satisfaction* are embraced by Generation Y, *Fairness & Trust* is most valued by Generation X, *Academic Environment* and *Fairness & Trust* are most appreciated by Baby Boomers, and *Job Satisfaction* and *Fairness & Trust* are most desired by Traditionalists in the universities' subsample. In the same way, *Working Conditions* and *Fairness & Trust* are most appreciated by Generation Y, *Supervisor Relationship* is most valued by Baby Boomers, and *Supervisor Relationship* and *Fairness & Trust* are most expected as employment experience by Traditionalists in the colleges' subsample. Interestingly, no clear pattern emerged for Generation X in the colleges' subsample. Secondly, it is evident that certain employment facets are given the highest importance only in particular institutions, therefore revealing their specificity.

Work values:	Generation Y	Generation X	Baby Boomers	Traditionalists
perceived as most important by Universities' employees	Supervisor Relationship 5/5 Job Satisfaction 4/5 <i>Academic Environment</i> 2/5 <i>Fairness & Trust</i> 2/5 <i>Working Conditions</i> 1/5 <i>Organizational Culture</i> 1/5	Fairness & Trust 5/5 Job Satisfaction 3/5 Compensation & Benefits 2/5 Academic Environment 2/5 Supervisor Relationship 2/5 <i>Organizational Culture</i> 1/5	Academic Environment 4/5 Fairness & Trust 4/5 <i>Job Satisfaction</i> 3/5 <i>Supervisor Relationship</i> 2/5 <i>Teamwork</i> 1/5 <i>Organizational Culture</i> 1/5	Job Satisfaction 5/5 Fairness & Trust 4/5 <i>Supervisor Relationship</i> 3/5 <i>Academic Environment</i> 2/5 <i>Working Conditions</i> 1/5
perceived as most important by Colleges' employees	Working Conditions 4/5 Fairness & Trust 4/5 Supervisor Relationship 3/5 Compensation & Benefits 2/5 <i>Academic Environment</i> 1/5 <i>Work-Life Balance</i> 1/5	Supervisor Relationship 3/5 Job Satisfaction 3/5 Fairness & Trust 3/5 Teamwork 3/5 <i>Working Conditions</i> 1/5 Compensation & Benefits 1/5 <i>Academic Environment</i> 1/5	Supervisor Relationship 4/5 Academic Environment 3/5 Job Satisfaction 2/5 Fairness & Trust 2/5 Working Conditions 2/5 Strategic Management 1/5 Training & Development 1/5	Supervisor Relationship 4/5 Fairness & Trust 4/5 <i>Strategic Management</i> 1/5 <i>Academic Environment</i> 2/5 <i>Job Satisfaction</i> 1/5

Table 5. Work values perceived as most important by employees of universities and colleges.

CONCLUSION AND DISCUSSION

The contribution of this study is threefold. Firstly, it provides evidence for generational differences in work values in higher education. Secondly, it explores the generational diversity between and across universities' and colleges' subsamples. Thirdly, it elaborates on yet properly unexplored field of employer branding segmentation based on the criterion of age.

The results of this study support previous observations (e.g. Tolbize, 2008), indicating that generations, starting with dedicated Traditionalists and ending with self-concerned Generation Y, are **successively** less loyal to their employers. Furthermore, consistently with previous research (Smith, 2008; Burke, 2004; Marston, 2007; Meister and Willyerd, 2010; Zemke et al., 2000; Tolbize, 2008, Twenge et al., 2010), Generation Y was found to be driven by personal relationships with colleagues, flexibility to combine work and personal life needs, sense of greater good expressed as a concern for study quality assurance, need for immediate, straight and continuous supervision, and inclusive, transparent management style (measured

there as Fairness & Trust). There was no clear evidence found to support recent findings that representatives of Generation Y are placing less importance on social interaction and “more value on work that provides extrinsic rewards” (Twenge et al., 2010: 1133), except for higher emphasis on working conditions, which was particularly observed in the colleges’ subsample. Interestingly, Strategic Management was not given much importance by Generation Y in universities and colleges and by Generation X in universities, which could be explained both by particularity of academic workplace, which is “built on a culture of individualism and academic personal autonomy” (Coaldrake and Stedman, 1999: 1) and generational values of independence, flexibility, and ‘challenging authority’. The results of this study also indicate that Generation X holds high expectations for security provided by credible, trusted and fair leadership, and places increased importance on salary, namely Compensation & Benefits. Generation X was not, as expected (Smola and Sutton, 2002), found to place much emphasis on work-life balance, and continuous learning and working conditions (Hansen and Leuty, 2012; Tolbize, 2008). The findings of this study suggest that Baby Boomers exceptionally value Academic Workplace which “serves as as symbolic economy, in which academic performance assumes a symbolic value that is worth little in other occupations” (Bauder, 2006: 232), accordingly providing Baby Boomers with a particular sense of achievement, recognition and contribution that motivates them (Cennamo and Gardner, 2008). Finally, consistently with previous findings (Burke, 2004), Traditionalists were found to be the most distinct generational group, which values authority, institutions’ reputation and image, wants to be heard, collaborative and cares the least about compensation, benefits and recognition of results.

The results of this study also support previous evidence (Tolbize, 2008; Smith, 2008) that generations have many points of agreement or a ‘common good’ that is shared by all and not much dependent on generations. Specifically, the study indicates that all generations in higher education appear to be predominantly driven by job satisfaction, i.e. work which is interesting and meets one’s experience and abilities. These findings support the idea that higher education institutions have preserved a continuous identity that is bonded by “love”, settled by academic men of ideas and ruled by personal autonomy, collegial self-governing and altruistic commitment (Clark, 1986). The research has also found that such work values as Fairness & Trust and Supervisor Relationship are embraced almost unanimously by all four generational groups. These findings are consistent with previous research showing that trust is among the key universal values and the defining principles of great workplace (www.greatplacetowork.com) as well as interpersonal relationships (especially in the area of

supervisor-subordinate relationship) are leading psychological growth, development and long-term satisfaction (Montana and Charnov, 2000; Sachau, 2007).

Summarizing it could be concluded that, supporting previous research on generational differences, people raised in a particular era and sharing specific historical and social experiences and events tend to have similar work values and employment experience preferences. However, although the results of this study indicate that generations differ, this diversity – as investigation of generational preferences in universities' and colleges' subsamples revealed – is increasing when analysis is being gradually detailed elaborating upon types and, especially, individual higher education institutions. Therefore, it clearly suggests that generational 'packages of work benefits' should be neither generalized nor 'prescribed' to all institutions. On the contrary, altogether these findings argue for individual approach and specific case analysis researching the wants, needs and expectations of employees in a particular organization.

All in all, this study provides new evidence for generational segmentation and encourages organizations to apply generational perspective in their employer branding strategy. And the main reason for demographical targeting is not generational differences per se. Due to the effects of ageing society, this will be the most noticeable between 2015 and 2035, when a large part of the Baby Boomers will retire (European Commission, 2012) and "the competition to attract and retain key performers will become more fierce – companies will solicit candidates and not vice versa" (Dahlström, 2011:10). Therefore, in order to reach the right employees in today's complex and segmented society, "every future leader will have to be culturally dexterous, knowing how to motivate and reward people of different backgrounds" (Ibid.:11). Generational employer branding targeting individuals based on their generational preferences or even personal values becomes imperative for organizational survival and success in winning the war for talent.

Finally, considering the fact that higher education institutions are increasingly facing the challenges and opportunities presented by the aging academic workforce, and employing disproportionately higher numbers of older people in the labor force in general (Kaskie et al., 2012), they are even more sensitive to generational differences and struggling with "reallocation of resources and staffing policies for the older and the younger generation of academics" (Enders and de Weert, 2004: 11). Additionally, regarding the particularity of higher education institutions, making them a "substantial reservoir of knowledge, talent and energy" (European Commission, 2008: 11), yet admitting that "in many countries the career

patterns and employment conditions of academic staff as well as the attractiveness of the academic workplace for the coming generation are of a major concern" (Enders and de Weert, 2004: 12), higher education institutions should start building their strong employer brands as a leading strategy to attract and retain multigenerational talent.

ABSTRACT

The article draws a comparison between family and non-family businesses' financial and economic performance in the years 2006, 2008 and 2009. The objective is to assess how Italian companies have reacted to the international crisis which started in 2008 and identify possible differences between family and non-family firms.

Only few studies examine the crisis effect and how Family Businesses reacted compared to Non-Family Companies. Moreover, the main contributions in this field focus on large companies, while small and micro enterprises represent the majority of the European economic fabric.

The sample was built based on the European Commission's family business definition. It includes 3,200 Italian firms, 1,600 family businesses and 1,600 non-family ones, divided into four size categories.

The analysis of the indicators for the 3,200 companies over the period shows that family businesses have higher profitability in terms of Return on Investments and Return on Equity and suffered the crisis as Non-Family Businesses because the contractions recorded by these indexes are at the same level. The financial structure analysis reveals both categories have the same debt level and Family Businesses show an higher debt sustainability in terms of Net Financial Position on EBITDA. Overall, the analysis of variations 2006-2008 and 2006-2009 shows that family businesses are able to better respond to crises.

Keywords: Family Business, Company Performance, Financial crisis, Italian Companies

INTRODUCTION

Family businesses are one of the most common firm types in the world (Family Business International Monitor, 2008). Anderson & Reeb (2003) show that one third of the S&P 500 index firms are controlled by one family, whereas the Instituto de la Empresa Familiar (2009) considers that in Europe there are around 17 million family businesses, representing 60% of the total and employing around 100 million people. In Italy, their presence is even more widespread, as 73% of firms are family-run and employ 52% of the workforce (Family Business International Monitor, 2008).

Family businesses are not only quite widespread, but they also play a fundamental role in the economy. The IFERA report (2003) estimates that family businesses' contribution to European GDP averages 50%. Astrachan (2003) considers this contribution to be even higher in the US, where it reaches 64%.

Precisely because family businesses play such an important role in the economy, in time many researchers have analysed their economic and financial performance. A large literature identified unique features in family firms such as altruism, trust and long term commitment that can in principle enhance company performance (Davis, 1983; Chami, 1999).

Different authors explained the influence of the family factor on business' performances. Chrisman et al. (2003) and Dyer (2006) focused on agency theory showing the presence of certain family members lowers the agency costs improving results, whereas Donaldson and Davis (1997) and Miller (2006) used the stewardship theory to investigate the positive and the negative influence of the family on company's economic and financial performances. Others such as Sirmon and Hitt (2003) and Habbershon et al. (2003) assert family businesses have a competitive advantage basing on the Resource Based View theory.

Different authors empirically compared the economic and financial performances of family businesses with non family businesses. Anderson & Reeb (2003) investigated the Tobin Q and ROA ratios in S&P 500 companies, showing that family businesses achieve better performance, while Villalonga & Amit (2006) looked at the companies included in the Fortune 500 list and reached the same conclusions, but only as far as the first generation is concerned. European companies studies are basically in line with the American ones (Górriz & Fumás, 2005; Cucculelli & Micucci, 2008; Barontini & Caprio, 2005; Maury, 2006). In Italy, Favero (2006) and Gnan & Songini (2003) traced similar conclusions to international studies' results.

The international crisis started in 2008 is the deepest since 1929 and recession represent a significant test for the continuity and the solidity of a company. During economic downturns, the management behavior and decision could differ compared to stable periods. This makes

interesting the investigation of the performance differences between family and non-family businesses. According to Braun and Latham (2011) family firms are deemed to exhibit strong stewardship and stakeholder orientations, and the combination of a clear leadership and ample resources could positively smooth performance effects over the course of a recession.

Few authors had the opportunity to empirically analyze the behavior of family businesses during such downturn period. Lee (2006) examined the company performances during the 2000 recession finding the family firms are characterized by higher employment stability, without analysing financial performances.

Though literature on family businesses' performance is quite vast, we have identified some aspects which need a closer examination. We particularly make reference to studies examining the link between Family and Non-family businesses and the economic crisis and to researches whose samples include small and micro enterprises, which represent the most important part of the Italian and European economic fabric (Family Business International Monitor, 2008).

Based on the results of our literature review, we intended to assess the impact that the 2008 economic crisis has had on Italian Family and Non-Family businesses' performance.

LITERATURE REVIEW

The lack of a single unambiguous definition of family business does not favour comparisons among the authors who have written on this subject.

Literature includes several definitions and, to this day, none has been universally accepted by academics. Astrachan, Klein & Smyrniotis (2002) state that there often is no definition of family, which creates further problems at international level, where families and cultures differ in space and time.

Some researchers define family business based on the degree of involvement of the family, which is measured through variables such as ownership, management and succession (Chrisman et al., 2003). Other definitions only use ownership, which can vary from total possession to owning the majority of voting rights. Others take into consideration the management aspect.

Westhead et al. (1998) examined the definitions given by previous studies, highlighting that the real problem is not so much that of establishing the difference between a clearly family-run business and a clearly non-family one. Rather, according to them, the real challenge is classifying what lies in the middle. The authors consider that the percentage of family business varies significantly based on the definition used.

Astrachan et al. (2002) developed a scale to measure the family's influence over the enterprise using three dimensions: "power", "experience" and "culture". These were then used by Klein et al. (2005), who measured them developing the so-called "F-PEC scale".

Habbershon et al. (2003) introduced a new perspective, called "familiness", which describes those unique resources and abilities that stem from the family's involvement in and interaction with the enterprise.

In 2007 the European Commission launched a project called "Overview of family-business relevant issues: research, networks, policy measures and recent studies". The project identified more than 90 definitions and highlighted that, even within the same country, several different ones are used. One feature many of them share is that they are hardly suitable to be effectively used for statistical purposes. The Commission's definition uses objective parameters to identify family businesses, based on relations among shareholders and on the composition of the business' governance. This allows for a standard definition which can be used in any investigation and grants a certain degree of comparability among different studies.

The European Commission recommends the use of this definition of family business within the Member States of the European Union in order to produce comparable quantitative results at cross-European level.

FAMILY FIRMS AND PERFORMANCES

There are several articles comparing the financial performances of Family Businesses against Non-Family Businesses (Anderson & Reeb, 2003; Villalonga & Amit, 2006; Barontini & Caprio, 2005; Maury, 2006), but only few observed the differences during a downturn period (Lee, 2006).

Recession is a particular period for the human gender and for its organisations, in which resources become scarce and the competition for survival higher. The Evolutionary Theory, in particular Evolutionary Psychology, could contribute to explain the peculiarities of Family Businesses in such a hard period.

In the evolutionary theory, the family is the main mean by which transmitting the identity in the future (Emlen, 1982). This gives family companies a special power to infuse meaning, self-sacrifice and altruism into their workers. According to Nicholson (2008), Family Firms have an advantage because their forms fit better with the human nature than Non-Family firms.

Nicholson (2008), after reviewing the Darwinian perspective, suggests that Family Businesses are able to generate unique advantages through their capacity to link naturally diverse individuals together in a common enterprise and purpose.

Other theories explore the interaction between the family and the business from different point of views. Miller et al. (2006) use the stewardship theory to analyze the relationship between governance and business performances. They recognize the emotional involvement of the family plays a strong role in the company, because the future of the family is strictly tied to to the future of the company. The authors observe the strong motivation of family members brings advantages such as employee retention, higher accountability and cautious investments. Miller et al. (2006) observe also the negative consequences a family involvement in the company could cause low involvement of the entire organization and incautious strategic decisions. Donaldson and Davis (1997) argue that Family Businesses represent most fertile ground to the application of the stewardship theory because the interest alignment between management and property is easier and frequent. The family, acting as the company "guardian", adopt a conservative behavior that lead to better performances, especially during economic downturns.

Chrisman et al. (2003) through the agency theory assert that the presence of relatives in the company reduce the agency costs allowing better economic performances. According to Dyer (2006), Family Businesses have lower agency costs because of the trust and the value condision within family members that lead to better monitoring of the targets.

On the other hand, the same author observe that conflicts within relatives could represent a source of higher agency costs. In fact some members could present different opinions in terms of power distribution, remuneration, risks and responsibilities. Schulze et al. (2001) agree with Dyer (2006), asserting the "altruism" that distinguishes Family Businesses could cause moral hazard issues and have consequences on company economic and financial performances. Greenwood (2003) says this altruistic behavior has a negative impact on other difficulties family businesses face and on company results.

In general, the findings of these studies suggest that family businesses perform better than non-family ones. Such evidence is found by some studies that value performance through both accounting and market indicators. In fact, Anderson & Reeb (2003) conducted an analysis on the companies included in the Standard & Poor's 500 index. Their research indicates that family businesses have better economic and financial performance compared to non-family businesses. In particular, they analysed the ROA and Tobin Q trends. Both indicators showed higher results for family businesses, particularly when family shares

amount to less than 30%. The higher this percentage, the worse the results. Villalonga & Amit (2006) concentrated their attention on Fortune 500 list of companies, finding that the family business' value, measured through the Tobin Q, grows when the founder is involved in the enterprise and plays an active role in its governance.

The literature lack of evidences about the behavior of Family Firms during economic crisis. Lee (2006) examined the same sample as Anderson and Reeb (2003) and assessed the enterprise's competitiveness and stability. He measured the revenues growth rate, profits over revenues and market capitalization during the period 1992-2002, which included the 2000 recession. He observed that family businesses grew more in terms of revenues and profit before the downturn and they presented flat performances for the period 2000-2002. However his main finding concerns the employment, because showed that Family Businesses maintain employment stability during temporary downturns.

RESEARCH QUESTION AND HYPOTHESES

As explained in section 3, literature on family business performance is quite vast. However, while examining literature we identified some gaps which have become the starting point for our research question.

First of all, there are few studies investigating the impact of the recent economic crisis on companies and comparing family businesses' reaction to that of non-family firms in Italy.

Another point arising from literature analysis concerns the type of indicators used. Several studies focus on indicators that measure market performance (Filatotchev et al., 2001; Villalonga & Amit, 2006; Poutziouris, 2006) or operating performance, such as productivity and efficiency in the use of resources (Gòrriz & Fumàs, 2005; Mannarino et al., 2011). Those studies assessing the typical economic and financial indicators in companies focus on the main tools such as turnover, ROA and ROE (Thomsen, 2000; Anderson & Reeb, 2003; Gnan & Songini, 2003; Lee, 2006; Maury, 2006; Favero, 2006). While these indicators can summarize company performance, they are not able to explain many of its aspects. Particularly when studying the effects of an economic crisis, the set of indicators used needs to be widened, so as to have a clearer and more complete vision of the company's situation.

Given these gaps, we want to investigate how family businesses performed against non family business during the 2008 economic crisis.

As showed by evolutionary theory, stewardship theory and agency theory, the family has strong incentives to protect the company over the long run and for these reasons the company performances should be better than non family businesses. On the other hand there

are other factors and empirical studies that show negative influence of the family on company's performances, especially after the first generation. Given what emerged from the literature review, the hypotheses we want to test are:

$$H_0 : \text{FBIndex}_{200X} - \text{NFBIndex}_{200X} = 0 \text{ against } H_1 : \text{FBIndex}_{200X} - \text{NFBIndex}_{200X} \neq 0$$

Where FBIndex_{200X} and NFBIndex_{200X} are the means of a generic performance indicator called "Index" for the year 200X.

Because we'd like to investigate the impact of the 2008 downturn, we compare the means of each performance index for the years 2006, 2008 and 2009. We use the t-statistic on the differences among the means of a specific financial index to verify if that difference is significant or not.

METHODOLOGY AND DATA

For the purpose of this study, we adopted the family business definition put forward by the European Commission because it fits the needs of our investigation and grants that our results are significant at European level, as they are fully comparable with other studies.

The sample was built based on the European Commission's family business definition. It includes 3,200 Italian firms, 1,600 family businesses and 1,600 non-family ones, divided into four size categories: micro, small, medium and large, including 400 firms each.

As highlighted in the literature review, only few studies examine small and micro family businesses, despite the fact that they represent the majority of the European economic fabric. Therefore we decided to include these types of firm in our sample to find possible behavior differences due to their size.

For classification purposes, we used turnover as our main criterion, creating the following four categories: Micro enterprises (total turnover not exceeding 2 million Euros); Small enterprises (turnover between 2 and 10 million Euros); Medium enterprises (turnover between 10 and 50 million Euros); Large enterprises (turnover exceeding 50 million Euros).

Firms were randomly selected and classified using the AIDA – Bureau Van Dijk database, which includes data from corporations, excluding banks, insurances and trust companies.

From the database, we collected economic and financial information concerning the years 2006, 2008 and 2009, as well as information on shareholders which we used to classify firms as family/non family.

A second gap highlighted in the literature review concerns the lack of indicators used for the appraisal of companies' economic and financial performance.

As a consequence, in order to assess the economic and financial performance of companies, we have identified a broader and more complete set of indicators, allowing for a thorough understanding of all the aspects that have characterized the sampled companies during the economic crisis: turnover, added value, added value/turnover, number of employees, average cost of employees, total debt/total assets, net financial position/EBITDA, operating cash flow, operating cash flow/turnover, ROI, ROS, ROE, investment turnover.

The analysis of the sample indicates that almost 80% of family businesses belong to either one of two macro-sectors: manufacturing (58.5%) and wholesale and retail trade (20.9%). This is not the case for non-family businesses: although manufacturing remains the main activity (37.3%), their distribution in the different sectors is more even. It can also be noted that the majority of firms within the "Transport and warehousing" macro-sector are non-family.

MACRO-SECTOR	FB (#)	NFB (#)	FB %	NFB %
Manufacturing activities	936	596	58,5	37,3
Wholesale and retail trade; Motor vehicles repair	334	107	20,9	6,7
Transport and warehousing	40	186	2,5	11,6
Construction	105	62	6,6	3,9
Insurance and financial activities	37	95	2,3	5,9
Professional, scientific and technical activities	33	87	2,1	5,4
Information and communication services	25	91	1,6	5,7
Electricity, Gas, Steam and Air-conditioning supply	3	110	0,2	6,9
Others	87	266	5	17

Table 1: Industry distribution of the sample

RESULTS

The database analysis produced the following results:

Index	Family Businesses			Non Family Businesses			Difference FB-NFB (%)		
	2009	Delta	Delta	2009	Delta	Delta	2009	2008	2006
	M€	2008/ 2009	2006/ 2009	2009	2008/ 2009	2006/ 2009	2009	2008	2006

Table 2 – Means, deltas and t-statistics of the analysed data in 2009, 2008 and 2006

The examination of 2009 data shows that on average family businesses are smaller, and have a lower turnover (-10.58%) and less employees (-2.31%) than non-family businesses. However these numbers are not supported by a significant level of the the t-statistic value, so we cannot conclude that family businesses are smaller than non family businesses. On the other hand, the t-statistic values support, at a 5% level, that the average added value for Family Businesses is lower (-32.87%) and their added value /turnover ratio indicates that, for every Euro of turnover, non-family firm are able to create around 4% more value.

We can observe that there is a large difference (21,91% in 2006 and 25,86% in 2009) between the average cost of employees in family businesses and non family business. This difference is significant at 1% level.

From a financial point of view, there are no substantial differences in debt levels; however, the Net Financial Position / EBITDA ratio is clearly favourable to family businesses (3.03 compared to 5.36), which indicates that they are more able to pay their financial debts with their operating results.

The operating cash flow and its weight on turnover has the same characteristics as the first indicators, as family firms generate lower cash flows both in absolute terms (-8.33%) and in relative terms (4.97% vs. 5.32%), but the t-statistic does not provide strong support to this result.

Though we can not assert that family businesses have smaller dimensions and lower performance in absolute terms, but the analysis of the main profitability indicators highlights the fact that they performed better in 2009.

Comparing family firms' ROI with that of non-family ones, the first is higher by 27.86% (4,50% FB vs 3.59% NFB). Equity profitability is even higher, as the difference between the two ROE is 54.78% (4,71 FB vs 2.13% NFB). Analysing the ROA, which is the index main authors (Anderson and Reeb, 2003; Lee, 2006; Barontini and Caprio, 2005) used to compare company performances, we have the same result. The Family Business ROA in 2009 is 7,58% higher that the Non Family Business one (3.30% FB vs 3.05% NFB).

Profitability ratios provide the strongest evidence in favour of family businesses, since the t-statistics are significant at 1% level, except for the ROI in 2009, which is significant at 5% level. The analysis of 2008 data led to conclusions that are similar to those for 2009. In 2008, too, family businesses appeared smaller in terms of turnover (-8.72%) and number of employees (-1.14%) without support by the t-statistics, but performed better from the point of view of the indexes, with significant evidence given by the t-statistics.

The ROI of family businesses for 2008 is 7.66%, 3.5 percentage points higher than that of non-family firms; as for the ROE of the same year, the difference between family- and non-family businesses is even larger (9.57% compared to 3.43%).

Although the added value / turnover ratio is higher for non-family firms both for 2008 and 2009, it is important to underline that the cost reductions performed by family firms were higher than their revenue contraction.

This is highlighted by the fact that their indicator grew (+5.13%), while the non-family firms' indicator remained basically stable (-0.39%). For both types of company the average number of employees stayed the same (-1.04% compared to +0.31%), but there is some difference in the average cost per employee. In both years this figure in family businesses is around 26% lower than in non-family ones; however, it varies in a significantly different way: non-family firms achieved an 8.72% cost reduction, against a 2.4% reduction for family businesses.

With reference to the operating profitability, family businesses have higher results than non-family ones in both years (7,66% compared to 4,18% in 2008 and 4,50% compared to 3,59% in 2009). However, in 2009 the gap between the two ROI values tends to narrow because the family firms' index decreases by 41.30% compared to a -14.80% for non-family firms. Breaking down the ROI into its factors we find that the significant reduction for family businesses is partly due to a lower profitability on sales (-29.29%) and to a decreased investments turnover (-17%). On the other hand, the negative variation of non-family firms is solely due to the reduction of the investments turnover (-15.48%).

The ROE follows suit: both types of company show a contraction of this index from 2008 to 2009, though this is stronger for family businesses (-50.79% compared to -38.96%). Despite this, family businesses' ROE is still higher both in 2008 (9,57% vs. 3,49%) and in 2009 (4,71% vs. 2,13%).

CONCLUSIONS AND LIMITS

This work aimed at giving a contribution to existing literature on family business, trying to fill some gaps highlighted in the literature review. They mainly concern the fact that there are no studies analysing the performance of family businesses, during a period of serious crisis like the one that we are living.

The analysis of indicators for the period 2006-2009 leads to conclude that, in general, both types of business significantly felt the impact of the 2008 economic crisis. This is confirmed by the fact that the majority of variations on indicators are negative.

However, the findings show that family businesses were able to better mitigate its negative effects; indeed, they had better economic and financial performance. Evidence of this is, first of all, the analysis of the ROE and the ROI, which show higher values and lower contractions compared to 2006 for family firms.

The ability to handle the negative trend is also confirmed by the assessment of the profit and loss account values.

Not only were family businesses able to improve their effectiveness more than non-family firms, but they also showed a certain amount of cost efficiency, so much so that their added value grew more than their revenues.

Finally, considering leverage, Italian companies are in general less able to cope with their debts. However, within this overall negative trend, once again family businesses stand out for their virtuous behaviour, showing a lower Net Financial Position/EBITDA value than non-family firms, as well as a lower contraction of this figure.

These conclusions give a significant contribution to existing literature on family business. On the one hand, they confirm the findings of the main European and US authors on family business performance. On the other hand, they add new elements that can widen the field of study in two directions: from the point of view of time, an analysis carried out at a time of economic crisis is a considerable contribution to what was found in previous literature; from the point of view of size, widening the scope to include Small and Medium enterprises gives greater significance to the research itself, given that for the most part family businesses belong to this category.

This work has some limits. The main one is that it analysed only Italian firms. However, even though this is a limit, it also offers a stimulus for future studies, which will be able to carry on the analysis at European level.

A second limit, is due to the fact that we provided strong evidence of the differences between family business and non family business performance using the t-statistic, but we don't say anything about the causes of the differences. A multivariate regression analysis could be done with the updated data.

A further stimulus to continue the present work is linked to the fact that today the world economy is still on the threshold of a real recovery. Therefore the analysis of family businesses' behaviour in a upturn phase would represent a natural continuation of this research.

ONLINE LABORATORY FOR LEARNING ACCOUNTING IN PRACTICE – AN IDEA AND IMPLEMENTATION

Białek Jaworska, Anna¹; Gabryelczyk, Renata²

¹Faculty of Economic Sciences, University of Warsaw, abialek@wne.uw.edu.pl

²Faculty of Economic Sciences, University of Warsaw, resa@wne.uw.edu.pl

ABSTRACT

We start to build a programme aiming at creating an online laboratory for obtaining practical experience in professional accounting to enable students to develop an understanding of the business environment and relate the acquired knowledge and skills to accounting and financial practices and to develop professional judgment, analysis and problem-solving skills.

The initiative is an integral part of Europe 2020 Strategy, where stimulating entrepreneurship, creating conditions for development of microenterprises, as well as improving the human capital quality are the tools to be used to fight unemployment. Studies on the business world's real needs have inspired the scientific circles, including the University of Warsaw's Faculty of Economic Sciences, to initiate and develop such teaching programmes that would provide students of various universities and faculties – not only economic – with an opportunity to gain practical experience in running a microenterprise, with a special focus on accounting, which is often fundamental to success in business.

The article presents learning projects being implemented by the University of Warsaw and based on the international e-learning platform FASTER (Financial and Accounting Seminars Targeting European Regions). We are proposing ways how the platform could be developed further and how it could integrate new forms of teaching students towards entrepreneurship, such as ERP, illustrating business operations with real accounting documents, process approach and IT modelling and process analysis tools.

Keywords: online laboratory, web based model for accounting, e-learning, stimulation of entrepreneurship, process approach

INTRODUCTION

We start to build a programme aiming at creating an online laboratory for obtaining practical experience in professional accounting to enable students to develop an understanding of the business environment and relate the acquired knowledge and skills to accounting and financial practices and to develop professional judgment, analysis and problem-solving skills.

We intend to introduce students to the modern technological environment of business decisions using spreadsheets, database software, business process management (BPM) techniques and integrated database application technologies (ERP) through exposure to accounting processes and software package(s). The programme will make use of hands-on computer applications and case studies on real situations that enable students of economy to obtain practical experience in professional accounting.

EUROPE 2020 – ENTREPRENEURSHIP AS A TOOL TO FIGHT UNEMPLOYMENT

According to Europe 2020 strategy, entrepreneurship and self-employment are key to sustainable and inclusive growth. The agenda for new skills and jobs is expected to help the EU reach its employment target for 2020: 75% of the working-age population (20-64 years) in work. In case of Poland, the target has been set at 71%. The initiative provides activities that will help speed up reforms to improve flexibility and security in the labour market (the so-called flexicurity model), equip people with the adequate skills for the jobs of today and tomorrow, improve the quality of jobs and ensure better working conditions, as well as improve the conditions for job creation. Currently, there are 23 million unemployed across the EU – 10% of the active population. In its activities aimed at supporting entrepreneurship and self-employment, the European Commission focuses its efforts on business start-ups by unemployed and people from disadvantaged groups, sustainability and quality of work of sole proprietorships and micro entrepreneurs, support for social entrepreneurs and seeks to increase knowledge about entrepreneurship and self-employment. The European Social Fund promotes entrepreneurship through financial and business support services. According to data published by the Central Statistical Office, in the period 2009-2011 microenterprises and small

businesses constituted an important segment of the Polish economy, generating almost 40% of GNP and employing nearly 2.4 million people.

year	number of employees vs. value added	total	small	of which micro	medium	large
2009	average number of employees	6 554 917	2 413 391	1 361 022	1 605 280	2 536 246
	Value added	804 864	303 215	218 237	145 501	356 147
2010	average number of employees	6 495 266	2 334 809	1 282 217	1 584 703	2 575 755
	Value added	830 807	303 582	213 651	146 310	380 914
2011	average number of employees	6 595 759	2 398 175	1 303 034	1 592 734	2 604 850
	Value added	862 864	309 288	214 615	147 070	406 507

Table 1. Value added and average number of employees of Polish enterprises in 2009-2011

In 2011 in Poland, 1 711 thousands non-financial micro enterprises conducted activity, which is an increase of 3.3% compared to 1 655 thousands micro enterprises in 2010. As in previous years, the micro enterprises, employing up to 9 persons, dominated among all enterprises, representing 95.8% of the total population (small units employing up to 49 persons – 98.9%). The share of medium and large units accounted for 0.9% and 0.2% of all enterprises. Due to the basic legal form of entities, 94.3% of the micro enterprises belonged to natural persons.

As far as economic development is concerned, it is important to stimulate development and growth of micro enterprises and small businesses through improvement of the human capital. For this aim to be achievable, it is necessary to facilitate access to information and knowledge needed to set up and run one's own business successfully.

Today, skills and knowledge acquired at the university do not meet the expectations of potential employers, hence there is such high unemployment among graduates. Graduates from specialist faculties are particularly threatened by unemployment, due to their lack of professional experience, as well as the fact that there are no vacancies in companies.

	2010	2011	2012
Unemployed with tertiary education level	1 122	1 203	1 247
Total unemployment of new entrants at 4th quarter	287	336	350
of which school leavers	152	173	171
increase in number of enterprises (in thousands):			
micro-enterprises	51	56	no data
small units (bigger than micro)	2,4	2,4	no data
medium enterprises	33	-24	no data
large enterprises	54	22	no data

Table 2. Increase in unemployment of new entrants relating to number of enterprises established in 2010-2012 (in thousands)

Although the number of new micro enterprises is growing, it is still by far insufficient, since it accounts for 33% of the number of unemployed university graduates. For the sake of comparison: in 2010 only 33 medium-sized and 54 large enterprises were established, but one year later the first group shrank by 24, while the second grew by 22 only. Analyses of the causes of companies bankruptcies (Zakrzewska-Krzyś, 2012) reveal that only two thirds of all new companies manage to survive the first two years, while after four years less than 50% of them are still on the market. 74% of all bankruptcies occur in the small business sector. The main causes include insolvency, poor management, inadequate financial control, especially in the area of working capital or cost level management (Kowalewska *et al.*, 2011). Therefore, the purpose of business-related education is not only to provide knowledge required to set up a firm, but first of all to develop business skills that would guarantee financial stability of the enterprise, with no risk to its continuity.

FROM TEACHING ACCOUNTING TO STIMULATION OF ENTREPRENEURSHIP

Teaching practical, technical business skills should focus on developing business competence, not only in the field of management or accountancy, but also – in the system approach to the entire organization and its business processes, not only in terms of relations between functional areas inside the organization, but also those going outside, such as contacts with

clients, suppliers, public institutions and administration bodies – all of them affect both the profits and the tax burdens. Making the right and prompt decisions in a company requires regular inflow of comprehensive and reliable business-related information that provide a basis for strategic, tactic and operating decisions. Sources of information used for making managerial decisions include data from accounting records, as well as financial reports, where effects of company business operations are aggregated.

number of enterprises	small - but bigger then micro			micro			medium			large		
	2009	2010	2011	2009	2010	2011	2009	2010	2011	2009	2010	2011
Total	49	54	55	1605	1 655	1 712	15,8	15,8	15,8	3,1	3,1	3,1
legal persons (keeping books of account)	28	28	29	90	88	98	13,5	13,5	13,5	3	3	3
natural persons keeping:	21	26	26,5	1515	1567	1613	2,3	2,3	2,3	0,1	0,1	0,1
books of account	7	7	7,5	19	14	15	2	2	2	0,1	0,1	0,1
tax books of revenues and expenditures	14	19	19	1067	1106	1 154	0,3	0,3	0,3			
revenue account				342	351	357						
tax card				87	96	87						

Table 3. Basic information on micro enterprises by form of accounting records in 2009-2011 (in thousands)

Reliability of information and its usefulness to managers depend on quality and informational capacity of the accounting records. It is therefore surprising that only 6.6% of the micro enterprises kept books of accounts. Most of them (67.5%) kept tax books of revenues and expenditures only for tax purposes (Table 3), recording their revenues (sales of goods and services and other revenue items) and costs (categorized into trade goods and materials at purchasing prices, purchase-related costs and payroll-related expenses (in cash and in kind) and other cost items), without recording any settlements with recipients (accounts receivable) or suppliers (accounts payable) and computing their taxable income

only, instead of finding out the baseline result. Teaching programmes should emphasize the role of an accountancy information system in business management, since if chosen well, it not only provides an overview of the current standing of the company, but also signals any operational problems that may emerge in the future or predicts bankruptcy. It is worth showing the role of finance and accounting in the company, not only as a supporting process, but as the central point (the heart) of an efficient flow of information, documents and managerial decisions.

The purpose of introducing to university curricula courses teaching practical business-related knowledge – in the form of hands-on exercises and workshops, with business case simulations and samples of documents, contracts and tax return forms used in real-life business transactions and formal procedures – is to provide students with an opportunity to practice and gain experience required by employers, as well as to encourage them to start their own business (in the form of self-employment or a micro enterprise).

Acceptable practical experience is extremely important in all areas of accounting including the areas of receivables, payables, financial statements, reconciliation of taxes, including mainly VAT and income tax and cost analysis, as well as bookkeeping with use of IT accounting. It is this experience which distinguishes graduates with any accounting qualifications in the job market. Practical experience is required to protect the interests of enterprises, employers and the general public by ensuring that trained accountants have obtained the professional training necessary to competently apply the knowledge, skills and values of the profession. Practical experience is also required to bookkeeping and calculating tax obligation resulted from VAT tax of sales over purchases and income tax of taxable base (profit) or wages and salaries paid out to employees.

In practical accounting teaching, students should be able to notice relations between the areas of finance and accounting and organization's other functional areas, as well as its external environment. They should be aware that the area of finance and accounting is not only the basis for drawing up a basic financial statement, but it is the core of the document and managerial information flow across the organization. In particular, ignorance of the cost of sales leads to setting the selling price incorrectly, below the cost. Without monitoring the status of accounts receivable, liquidity and ability to pay the liabilities is jeopardized and consequently, an impatient supplier may file a petition in bankruptcy or initiate debt enforcement proceedings. Terms of payment offered to customers, if too long, may lead to

shortage of cash needed to pay VAT to the Tax Office and hence – to the bank account seizure (see Figure 1).

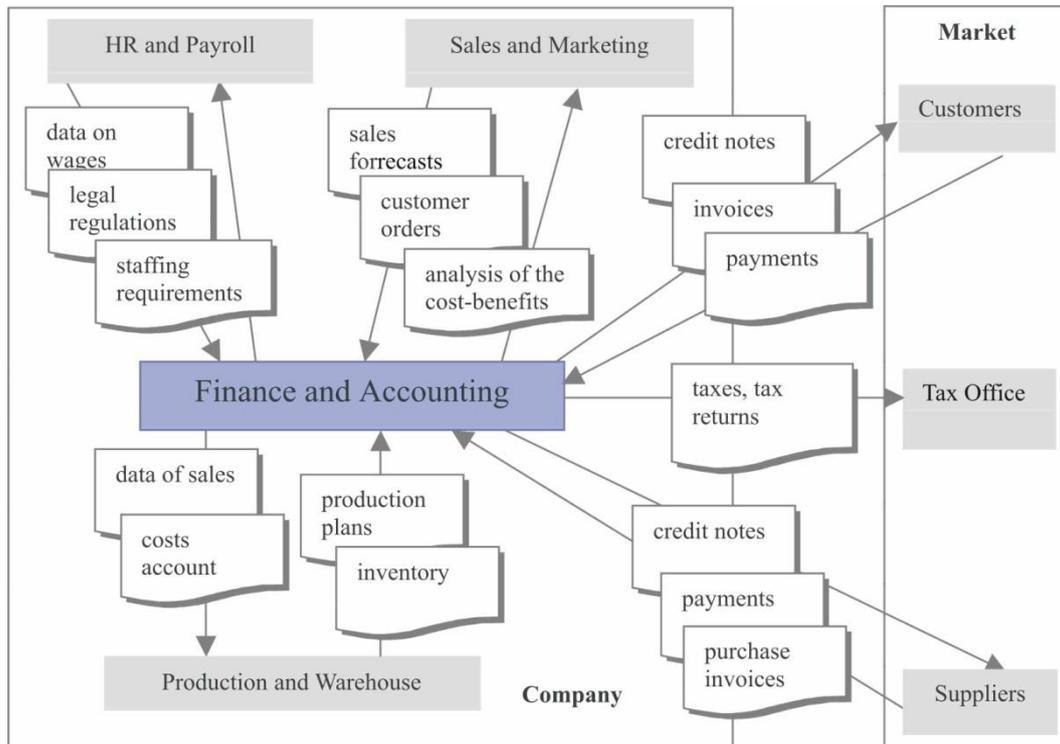

Figure 1. A map of the finance and accounting areas relations

In our opinion, sole traders running micro-enterprises do not need any knowledge of recording business operations in bookkeeping accounts – what they need is to understand the impact of these operations on the balance sheet, their tax-related consequences and their influence on relations with various business partners.

LITERATURE REVIEW

Since '90s process approach has been management paradigm in big organizations and number of studies prove that it is a starting point for increasing effectiveness of those organizations [Hammer, Champy, 1993; Rummler, Brache, 1995; Harmon, 2007]. In microenterprises process approach is natural part of functioning in the early stages of business life cycle [Marciszewska, 2009], when they are focused on maintaining customers' relations and satisfying their needs and the owner is personally involved in enterprise's activities. Along with development and increase of company size, when organizational structures start to formalize, employees and managers are being employed, role of owner and manager separate, small enterprises lose their natural flexibility and ability to respond to

clients' needs. In such circumstances they should systemize their processes not only to avoid problems that plague big enterprises [Hammer, Champy, 1993; Gabryelczyk 2000], but also to increase their competitiveness and make right management decisions [Harmon, 2007; Kaplan, Cooper, 1998]. Studies show process approach as a starting point for implementing controlling and activity based costing [Gunasekaran, Marri, Grieve, 1999; Kluge 2009]. Activity Based Costing requires process approach [Kaplan, Cooper, 1998]. Owners and managers of small enterprises often can't find methods and tools to measure customer profitability, effectiveness of organization, or to identify main cost drivers. They mistakenly think that process management, ABC, or Activity Based Management are concepts targeting mainly big enterprises, although studies prove that in small companies ABM can be low-budget investment [Adamska, 2005]. Thus we postulate continuing familiarization of future micro- and small enterprises with concepts, methods and techniques of modern business.

EVOLUTION OF THE APPROACH TO TEACHING ACCOUNTING AT THE UNIVERSITY OF WARSAW TOWARDS EXPANSION OF THE E-LEARNING PLATFORM FASTER

Since October 2008 Faculty of Economic Sciences has been offering facultative programme of Accounting Information Development, which expands teaching Financial and Managerial Accounting at specialisation of Business Economics by Business Information Systems, Computer Accounting in business processes (RAKSSQL and Symfonia Premium), Controlling and International Financial Reporting Standards (IFRS). We implemented RAKSSQL and Symfonia Premium packages for educational purpose few years earlier, but we have been using them for facultative separate courses dealing with recording group of documents describing one period transactions of the enterprise. Student has to use knowledge of financial accounting to record different accounting documents using computer packages.

An approach like this, based on recording various accounting documents, without paying attention to the type of business operations described in these documents, although represents another step further, taking students closer to the business reality than descriptions of operations in instructions to exercises, still remains abstract and is far from any practical, process-based performance. During courses of Computer Accounting in business processes we familiarize students with the principles of business management using integrated financial - accounting software. Students use RAKSSQL and Symfonia Premium packages in order to obtain knowledge of business transactions' book keeping.

In March 2011 we applied for a grant to support an international project initiated to build an e-learning platform for teaching accounting in practice, integrated with tools facilitating search for a job in accounting and finance, both in domestic and international companies.

Longlife learning project FASTER enables implementation of the concept of the practical education in the field of the entrepreneurship. The Programme for EU Action in the Field of Lifelong Learning (the Lifelong Learning Programme – LLP) aims to contribute through lifelong learning to the development of the EU as an advanced knowledge society, with sustainable economic development, more and better jobs and greater social cohesion. In particular, it aims to foster interchange, co-operation and mobility between education and training institutions and systems within the EU so that they may become a world quality reference. In this way, it addresses the modernisation and adaptation of education and training systems in the participating countries, particularly in the context of the goals set in the EU 2020 Strategy and brings European added value directly to individual citizens participating in its mobility and other co-operation actions. The European Commission's Lifelong Learning Programme creates education and training opportunities, enables people at all stages of their lives to take part in stimulating learning experiences, as well as helping to develop the education and training sector across Europe. Key Activity 3 Development of ICT-Based Content EU actions aim to harness the power of Information and Communications Technologies (ICT) to develop innovative education and training practices, improve access to lifelong learning and help develop advanced management systems.

FASTER (Financial and Accounting Seminars Targeting European Regions) is a two year KA3 ICT - Multilateral Project (2011-2013) funded by the Lifelong Learning Programme co-financed by the EU (75%). FASTER develops an innovative ICT e-learning toolbox emphasizing on a teaching & information exchange web mechanism comprising of a resources and glossary and e-courses in order to facilitate the flow of existing practical knowledge produced in the daily routine of financial services of enterprises. FASTER links studies and working environment, meets standard academic requirements to obtain industrial recognition as well as works complementarily to the already acquired academic background of interested parties. The educational feature of FASTER Platform includes the development of 8 e-modules starting from basic financial accounting, through charts of accounts, code for accounting books, public limited companies and limited liability companies law, consolidation of financial statements of groups of companies, tax accounting, financial reporting and its analysis with business valuation, accounting ERP, ending on

International accounting standards. Each e-module contains a concise-relevant theoretical review supported by Power Point presentations, self assesment tool including Yes/No questions and multiple choice questions, as well as exercises and problems to be answered and solved by the user.

The end web based product of the project is the development of the FASTER PLATFORM in five languages (English, Greek, Bulgarian, Polish and Slovakian). Interactive web-based educational applications and case studies on real accounting situations provide accumulated knowledge in forms suitable to non-formal, practical learning, serving both Erasmus and Leonardo Da Vinci strategic objectives. The courses are in 5 languages. Furthermore accounting, taxing, legislative differentiations between nations are spotted. The idea to allow and encourage the mobility of EU citizens to work in foreign countries, demands not only knowledge of finance and accounting, but training based on local conditions (law, terminology and ethics) and familiarity with national law & taxes. FASTER will also include a job-seeker tool for finance and accounting, including job vacancies and e-CVs, enabling transnational pursuit of jobs. FASTER as the longlife learning programme will foster longterm career advancement and international mobility, ensuring that the professional development of certified general accountants remains a lifelong experience. It will also be designed to provide graduates with degrees in disciplines other than accounting, or people employed in business, with the foundation studies to become a professional accountant. The online programme will meet standard academic requirements to obtain industrial recognition.

During the first year the requirement analysis was completed with the participation of 133 academics, 1030 graduates and undergraduate students, 176 people interested in vocational training and 97 employers who replied to the FASTER interviews and online questionnaires. In total, requirement analysis gathered 1528 online replies to questionnaires and 64 replies to interviews. Participants in the requirement analysis considered as very important: the usefulness of an on line platform in teaching accounting and analyzing accounting information as well as the use of new technology in developing accounting skills.

When making a survey on the demand for the e-learning platform FASTER, we found out that accounting knowledge is also needed by those of entrepreneurs, employees of sales, marketing and debt collection departments, investment consultants, who do not have any educational background in economics. This observation made us aware of the need for developing the e-learning platform FASTER towards teaching non-economists business.

The EU Commission has also noticed the importance of propagating practical knowledge of business, which helps spread one's wings and gives courage when making decision to set up and develop one's own business, starting with a micro-enterprise. In the justification of Priority IV of the Human Capital Operational Programme, the Commission stressed that to enhance the competitive position of the Polish economy, it is necessary to provide stronger linkage of the science sector to economy needs, as well as to increase the research and development sector staff qualifications in the field of intellectual and industrial property protection, research project management and commercialisation of the results or research and development studies. Projects of this type will contribute to enhancing the qualifications of the R&D sector staff, improvement of the quality and effectiveness of research and consequently – the growth of the innovation of the economy. The purpose of Priority IV is to adjust education at the tertiary level to the needs of the economy and the labour market, enhance the attractiveness of education at the tertiary level in the field of mathematical-natural and technical sciences, as well as to improve the qualifications of the R&D staff.

The purpose of the e-learning platform FASTER expansion occurring under entrepreneurship-related education modules of two EU projects: 4.1.2 OP Human Capital - Increasing the number of graduates of specialisation "Mathematics" at the University of Green Mountain (2012-2015) ("Mathematics") and 4.3 OP Human Capital - Modern methods, medicines and therapy for the health care and the economy of Europe of the 21st century - interdisciplinary education in the area of biomedical sciences on master and doctoral studies ("Biotechnology"), is to create a virtual laboratory for learning accounting in practice.

Table 4. Expansion of FASTER platform towards teaching business skills

The table 4 shows the planned expansion of FASTER towards setting up practical business classes for non-economists: mathematicians and biologists, presented as an evolutionary process from establishment of a path of facultative courses Accounting Information Development through expanding the international e-learning platform FASTER in order to teach accounting in practice and thereby stimulate entrepreneurship. The purpose of the projects is to encourage the target group members to set up and develop their own businesses in the form of self-employment (freelancing) or micro enterprises with a status of a civil law partnership, a commercial partnership or a limited company. This form of employment enables young people to start working at the time of the economic recession and growing unemployment. The ability to run a business eliminates the risk of occupational and social exclusion. Providing a comprehensive background needed to set up and run a business to graduates of technical faculties associated with the knowledge-based economy and prepared to work in professions expected to be in greatest demand within the time frame until 2020, will have a positive effect on their occupational activation and self-actualisation, as well as on the growth of GNP and reduction of unemployment.

PROCESS APPROACH IN PRACTICAL TEACHING OF ACCOUNTING

The basic task of accountancy today is to meet information-related needs of various users, both internal, including the management and external – mainly the equity owners (shareholders) and outsiders: loan providers, creditors and public institutions.

Meeting the requirement to provide a complete, consistent and up-to-date information is impossible without advanced IT tools and the accounting system integration with organization's other information systems. This integration is made possible by integrated IT systems supporting management processes in the area of sales, procurement, warehouse

management, production, fixed assets, customer and supplier payments, finance (bank and cash), HR or payroll. Financial and accounting systems, as well as ERP-class tools (Enterprise Resource Planning) are mainly used for automation of business operations recording and for creating reports (trial balances, VAT registers, balance-sheet, income statement, tax returns). As these functionalities provide a basis for operating organization's financial and accounting processes, universities teaching economics in Poland have been trying to familiarize their students with the accountancy rules and the use of accounting software for more than a decade now. Most of the tasks, i.e. entering documents in accounting records or generating purchase orders, are automated and this is obviously the basic benefit of using an integrated system, but in the process of teaching accountancy it may impede students' understanding of the business processes performed by the system.

Experience gained during financial accountancy classes in six subsequent editions of the Inter-Faculty Post-Graduate Accountancy and Financial Audit Studies co-organized by the Faculty of Economic Sciences and the Faculty of Law and Administration of the University of Warsaw, attended by 866 students in total, justifies a conclusion that full automation of the accounting operations recording in an integrated financial and accounting software represents a considerable barrier to understanding the rules of business operations recording and their effect on the proprietary and financial standing reflected in a financial statement. Our assumptions are supported by the findings of the postgraduate students' learning outcomes evaluation (Białek-Jaworska, 2011).

The incomprehension of the general business concept, of business processes occurring in the company and of relevant source documents, as well as the inability to distinguish between business events and business operations, purchase invoices and sales invoices, especially when accounting document bears the "invoice" title only – all this may result in incorrect recording of operations. Hence a proposal to include modern, business process based management concepts, methods and tools in the accountancy courses contents. To understand how ERP systems work, one first needs to understand how business works.

Building a process-oriented organization is a time-consuming task and requires resources to be engaged in identification, modelling, analysis and improvement of processes, but on the other hand, defining a company based on description of its business processes has a strong effect on students' imagination, while facilitating abstract thinking and deeper understanding of how accountancy works in practice. Looking at a company in the context of its business processes enables understanding how the organization functions and what activities generate

value for the client and result from the basic operations. Such aspects as description and documentation of business processes, defined flow of accounting documents within the company structure and description of the accounting documents processing should be addressed by an accounting policy document and should constitute a basis for the economic knowledge management framework in the company.

In terms of legal requirements specified in art. 10 of the Polish Accounting Act, the accounting system documentation can be evaluated based on very generic criteria only, where the existence or non-existence of documents required by regulations is identified. The wording of statutory requirements is so complex, with multiple components involved, that they permit an entirely arbitrary approach to description of the documentation's accounting system actual status. Meanwhile, bookkeepers and company managers are seeking to identify the rules governing the financial performance and to distribute the relevant knowledge across the unit's decision-making and operational structure, both in its content-related (the valuation rules) and technical aspects (book keeping methods, especially computer-based, particularly when subsidiary ledgers are independent on the financial and accounting software – e.g. HR-payroll program or sales dedicated program) (Gospodarek, 2008).

Thus, the process approach gains importance in the area of accounting policy building and this is a good rationale for broadening the use of the process concept in teaching accounting and business skills. The purpose of process modelling, i.e. representing processes by means of graphic symbols is to document these processes in order to be able to control them, while in the aspect of teaching accounting it supports the entire process of learning, where the student:

studying process maps, is able to identify and understand the activities that bring value to the organization, the logical and temporal interfaces between process activities, and thereby identifies relevant documents, assigns them adequately to processes and activities,

identifies the information and documents transformed within a process, as well the information and documents obtained as a result of the process, regardless any formal boundaries of the organization's units,

understands the flow of information, work, decisions and documents and thereby is able to draw correct conclusions in the area of balance-sheet related and tax-related consequences of business operations, as well as in the area of managerial decisions concerning relations with various business partners.

Process modelling is effected by means of dedicated IT tools, where various types of models (process maps, value chain diagrams, process flow, document models, organizational structure models) are not only created, but they can also be collected in a database, thereby allowing for analyses and simulations, e.g. of the given process cost in various time units or process sensitivity to changes in availability of resources. In the business process modelling and analysis courses at the Faculty of Economic Sciences of the University of Warsaw, ARIS and ADONIS systems are used and experience shows that they make it easier for students to understand the business organization operation before studying theoretical microeconomics or financial models. The “Accounting ERP” module of FASTER platform explains the place and the role of accountancy in describing business processes and their impact on the company financial and proprietary standing presented in its financial statement. Other projects where FASTER is used – „Mathematics” and „Biotechnology” – “Accounting ERP” evolved towards process approach in teaching accounting and business skills, reflecting not only the flow of documents, but also showing those sources of information and activities within the processes that determine the decision making. In most management models accounting is regarded as an auxiliary component, supporting organization’s main core processes, but the outputs from the accounting system are needed for these processes to be performed correctly and for their outcomes to be reflected in financial statements and activity reports. The role of a micro-enterprise owner or a small business accountant is evolving too, because in order to manage the business efficiently he or she should have access to similar type of information as the one being provided to a major corporation’s CFO.

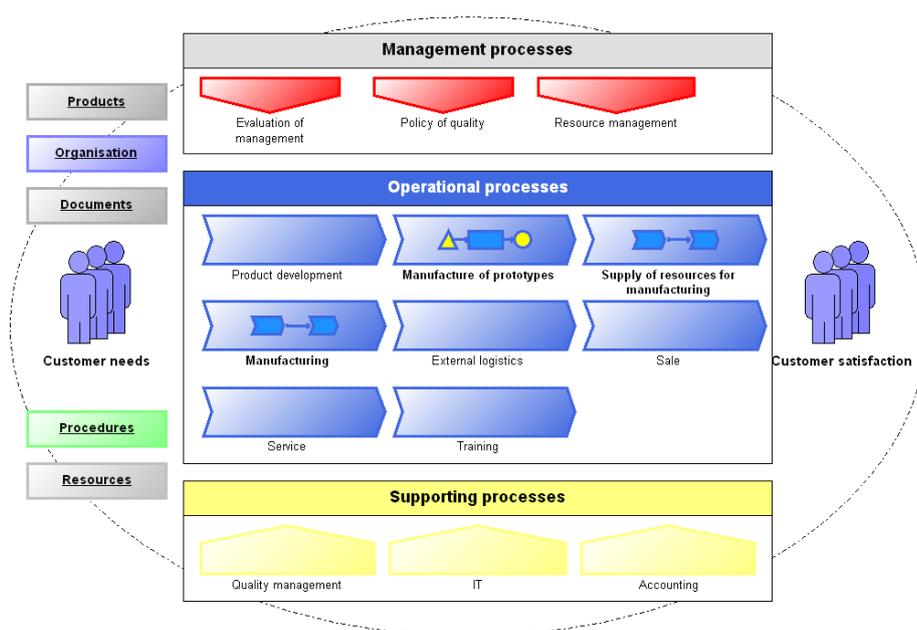

Figure. 2. An example of a process map created in ADONIS system

The process approach is inscribed in the basic logic of integrated management systems, despite their modular structure and functional division into such functions as Accounting, Inventory, Sales, Purchasing, etc.

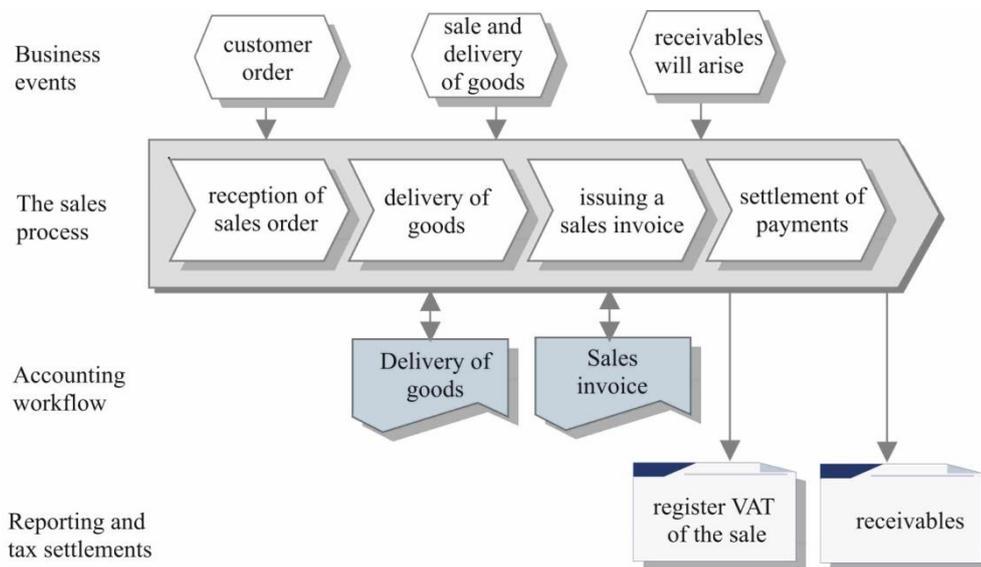

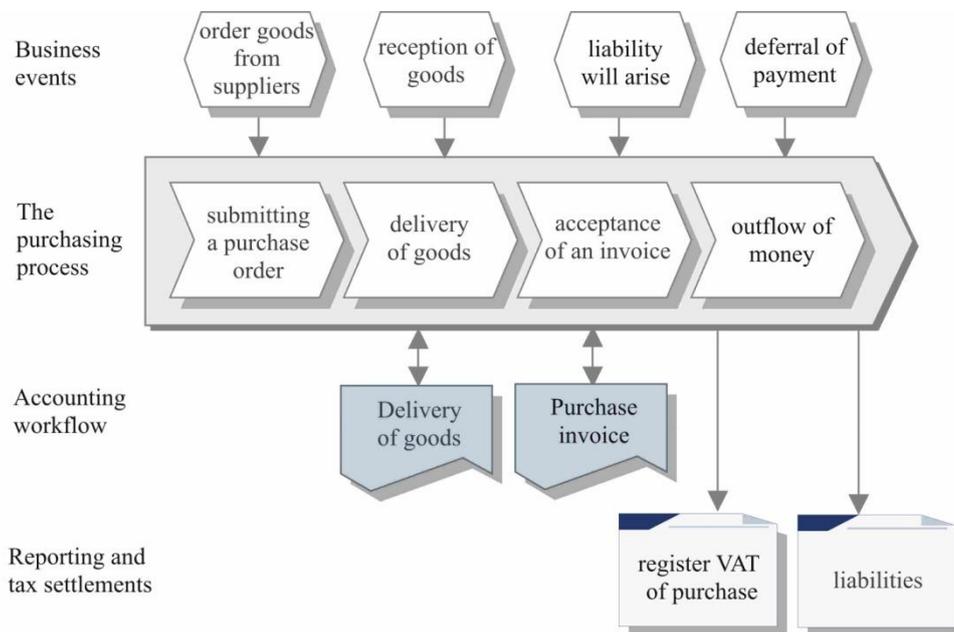

Figure 3. Data and document flow in the sales process – process visualization based on ARIS system

Figure

4. Data and document flow in the purchasing process – process visualization based on ARIS system

The nature and the essence of integration in IT systems is implied by business processes. When the organization is regarded through the prism of its processes, the way how one department works affects the performance in other areas and the employees can see the effects of their work and understand how activities are interrelated, and thereby they share

responsibility for the entire process instead of focussing on isolated tasks performed within traditional structural units. For example, if the sales department personnel is aware that the way how the store documents and the invoices are filled affects the accounting operations directly, they will most probably generate less errors.

In further development of the e-platform FASTER and implementation of the business skills teaching programmes („Mathematics” and „Biotechnology”), we are preparing process maps and models illustrating company document and data flow. Process visualization enables students to spot the activities and the operations that initiate the circulation of accounting documents and result in tax obligations.

The process approach applied in learning business skills through the prism of accounting, taxes and legal regulations applicable to businesses, has a chance to provide practical knowledge and to equip students with practical skills needed to plan and run one’s own business. In our view, it is worth to expand FASTER platform by incorporating IT tools into it, along with concepts that facilitate understanding of micro-enterprises operation, including ERP systems, illustrating business operations with real accounting documents, process approach and IT tools designed for process modelling and analysis. Our activities correspond to implementation of Europe 2020 Strategy.

ABSTRACT

The present research paper analyzes the results collected by a survey conducted in 2012 in Poland and Bulgaria. The purpose of conducting such a survey was at first place to identify which teaching tools and methods are considered to be most useful in the process of teaching accounting using the e-learning platform and secondly to test and estimate the gained accounting knowledge among four target groups: students, people interested in vocational trainings, academics in accounting and employers from the two countries.

The reason to conduct the survey in Poland and Bulgaria, was to compare results among groups in different circumstances such as educational curricula in the area of accounting, tax system and law stability, national accounting laws and regulations and their relation to international financial reporting standards (IFRS). Moreover, the results of the survey allowed us to determine what could be the determinants of stakeholders' preferable teaching tools, both between groups and countries.

Participants were asked to fill out questionnaires covering their age, occupation and experience in the field of accounting, use of computer and internet in daily life, opinion about the need of existence of e-learning platform with theoretical courses and practical applications and finally their assessment of specific methods of teaching in accounting. In addition academics were asked about their methods of teaching (especially if they are using e-learning platforms, ERP systems and Internet

during classes). As for the employers, additional aspect about need and ways of employees' trainings, was raised.

Keywords: accounting, e-learning, teaching tools, accounting practice, training

INTRODUCTION

The present research paper analyzes the results collected by a survey conducted in 2012 in Poland and Bulgaria. The purpose of conducting this survey was at first place to identify which teaching tools and methods are considered to be most useful in the process of teaching accounting using the e-learning platform and secondly to test and estimate the gained accounting knowledge among four target: students, people interested in vocational trainings, academics in accounting and employers from the two countries.

Organization of such a survey in Poland and Bulgaria, aims a comparison to be made between the answers of the target respondents in different circumstances such as educational curricula in the area of accounting, tax system and law stability, national accounting laws and regulations and their relation to international financial reporting standards (IFRS). Moreover, the results of the survey allowed us to specify what are the determinants of participants' preferable teaching tools, both between groups and countries and to identify if after the technology progress in the recent years, the people still have some concerns using educational platforms and how they find the necessary accounting information/knowledge.

The survey was conducted by using questionnaires which were distributed among the target groups. The questionnaires contained common questions for all target groups but also specific ones for the different participants. The gathered data include age, occupation and experience in the field of accounting, use of computer and internet in daily life, opinion about the need of existence of e-learning platform with theoretical courses and practical applications, assessment of specific methods of teaching in accounting, academics' methods of teaching (especially usage of e-learning platforms, ERP systems and Internet during classes), the need and ways of employees trainings. All these data allow us:

- to compare the preferences of teaching tools in the accounting field among the target groups and the respective determinants for these preferences;
- to identify the gaps between the knowledge gained during the studies in the university and the knowledge needed in the daily accounting work;

- to assess how adequate are the accounting studies to the market demands.

SAMPLE CHARACTERISTICS

Questionnaires were distributed during February and March 2012 to a study group of 1395 students, 260 people interested in vocational trainings in accounting, 279 academics in accounting and 126 employers, in Bulgaria and Poland. From among all distributed questionnaires there were 807 positive responses. The exact data covering total population of groups, population of participants and percentage share of answers is shown in Fig. 1

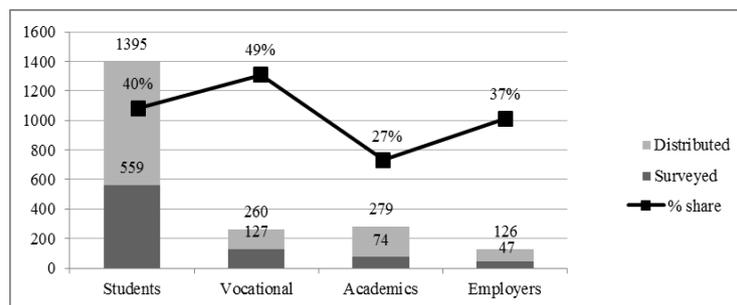

Figure 1. Distributed questionnaires and positive responses by target groups

The number of positive responses from target groups indicates their interest in existence of e-learning platform on accounting containing theoretical and practical courses. Biggest interest show people interested in vocational trainings who are active on the labor market (49%). They see the need of broadening their knowledge, improving their skills and gaining qualifications in the field of accounting. Deeper analysis show, that the main reason for majority of vocational people is their personal interest (71%), followed by the employers' suggestions (28%) and the needs of the labor market (15%). (Fig. 2)

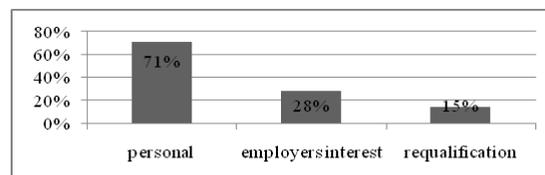

Figure 2. Reasons of interest in accounting of people interested in vocational trainings (%)

The second group open to innovation in learning are students (40%). Those, who just start working in accounting field, clearly see the gap between theory and practice and the need to adjust education systems to market requirements.

Also employers seem to notice lack of necessary practical knowledge among accounting employees (37%), but the share is smaller than previous groups, because the process of recruitment and assessment should turn down those who are not well prepared for market demands. The employers probably see the possibility of e-learning platform as a cheap training tool, especially in aspect of improving skills of low-level employees.

The least interested group are academics (27%). The cause may be that academics are used to their standard and trusted teaching methods. Such low response may also imply that academics highly assess self-prepared educational material and do not see a need of its changing or using e-learning in accounting. On the other hand, academics who gave positive responses, even if they use standard methods of teaching, view interactive tools (such as e-learning platforms) as a good assistance in refreshing students' knowledge and practical verification of their skills.

As mentioned before overall, 807 stakeholders (197 men and 610 women), participated in our survey. The specific data of gender of participants is shown in Tab. 1

	Bulgaria (%)		Poland (%)		Total (%)	
	Male	Female	Male	Female	Male	Female
Students	38	62	23	77	24	76
People interested in vocational trainings	17	83	20	80	20	80
Academics in accounting	35	65	30	70	32	68
Employers	19	81	40	60	34	66

Table 1. Participants by gender and group

As we can see the majority in all target groups were women (76% of all participants), which can indicate that the field of accounting is more popular among them than among men.

STUDENTS' SAMPLE

The sample among students includes 392 graduates and 167 under-graduates. Percentage distribution of students in Bulgaria and Poland is shown in Figures 3 and 4.

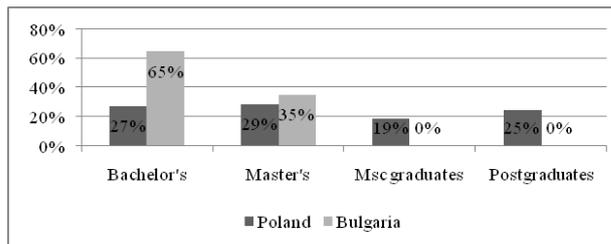

Figure 3. Distribution of students' questionnaires by academic degree and by countries (%)

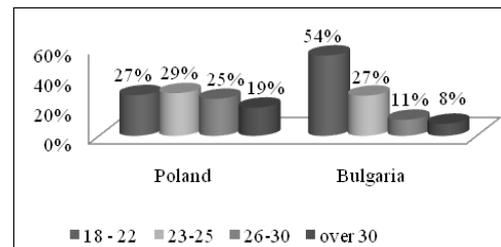

Figure 4. Distribution of students' questionnaires by age and by countries (%)

More than 3/4 of all student participants are women (62% in Bulgaria, 77% in Poland), the aged groups are shown in Figure 4 by country. In Bulgaria the significant part of the students are in bachelors programs (65%), while in Poland majority of respondents have already graduated from bachelor's degree (73%) (Fig.1). Almost 40% of the Polish participants of student's group presently work as accountants and only 11% of Bulgarian students work in the field of accounting.

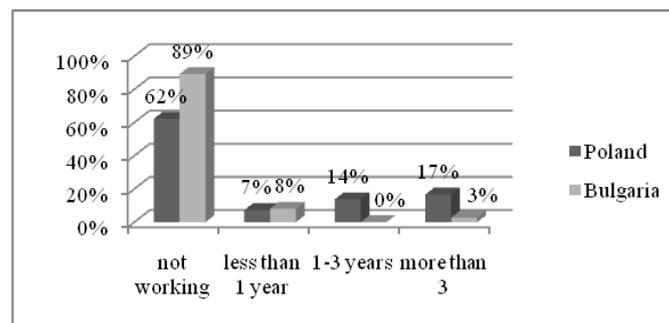

Figure 5. Students target group by working experience in the field of accounting

Of total Polish (Bulgarian) respondents with experience in accounting, 19% (75%) of them have experience less than 1 year, 37% (0%) - between 1 and 3 years, and 44% (25%) of respondents have an accounting experience more than 3 years. (Fig. 5)

PEOPLE'S INTERESTED IN VOCATIONAL TRAININGS SAMPLE

In comparison between the countries' participants interested in vocational trainings – it is visible that the female participants that took part in Bulgaria (83%) and Poland (80%) predominate. Two thirds of the respondents currently work, without studying (66%), mainly

those from Poland (76%), while almost ¼ are studying and working (23%), mostly from Bulgaria (70%). Only 11% of respondents don't have any job, mostly because their studying (only in Poland there are 5% unemployed participants). (Fig. 6)

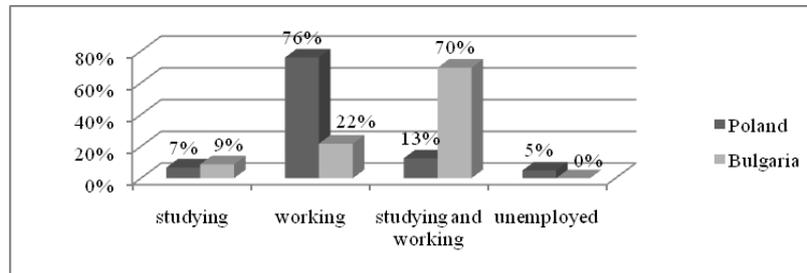

Figure 6. Distribution of vocational questionnaires by working status and by countries (%)

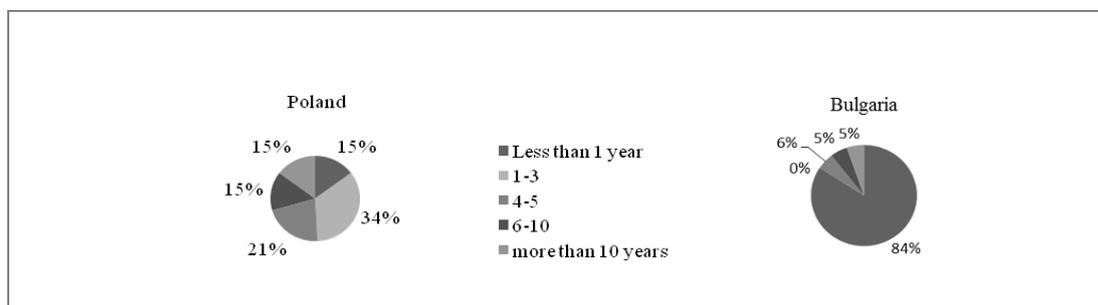

Figure 7. Experience of vocational respondents in accounting (%)

The majority of participants are working in the field of accounting, particularly those from Bulgaria (90%), while in Poland (66%). In Bulgaria the greater is the share of accountants with experience less than 1 year - 84% (15 % in Poland), while in Poland most participants have 1-3 years of experience (34%) (Fig. 7).

ACADEMICS SAMPLE

The survey includes 74 academics from different universities and educational institutions. Once more women's share dominates in the sample (65% in Poland, 70% in Bulgaria). The academic degree of the respondents is shown in Figure 8.

In Poland about 36% of the survey's participants have academic accounting experience between 11 and 20 years, followed by those with less experience (4-10 years) (30%), those with the biggest time of service as academics (over 20 years) (26%) and those with minimal experience (8%). On the other hand in Bulgaria majority of academics are those with 0-3 years of academic accounting experience, followed by those with experience between 11 and 20 years (19%), finally ending on both: those with minimal and highest experience

(10%). (Tab. 2)

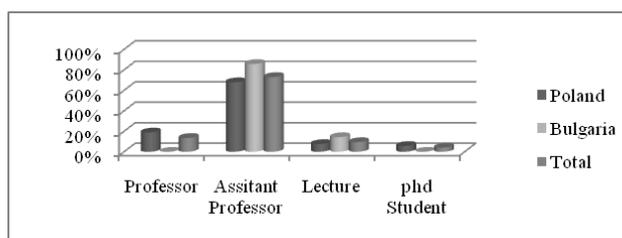

Figure 8. Distribution of academics' questionnaires by academic degree and by countries (%)

In Poland young academics are reserved to new, unverified methods of teaching. Contrary to Polish academics, Bulgarian PhD students are open to innovative teaching methods (Tab. 2).

Practice experience ↓	Teaching experience →	Poland					Bulgaria				
		0-3	4-10	11-20	> 20	Total	0-3	4-10	11-20	> 20	Total
no		4%	8%	6%	8%	25%	0%	0%	0%	0%	0%
less than 1		0%	2%	4%	4%	9%	52%	0%	0%	0%	52%
1-3		0%	11%	9%	4%	25%	10%	0%	0%	5%	14%
4-5		4%	4%	8%	2%	17%	0%	0%	0%	0%	0%
6-10		0%	4%	0%	2%	6%	0%	10%	5%	5%	19%
more than 10		0%	2%	9%	8%	19%	0%	0%	14%	0%	14%
Total		8%	30%	36%	26%	100%	62%	10%	19%	10%	100%

Table 2. Academics' respondents by experience in teaching of accounting and in accounting work (%)

The academics with both practical and teaching experience over 10 years are about 15% of all academics in Poland and in Bulgaria. Moreover Polish academics with longer teaching experience are more interested in new ways of teaching, regardless exact time of teaching or work experience (about 30% per each age range over 4 years, and about 5% per working experience), while noticing students' weaknesses in systematic work and developing new skills. Meanwhile in Bulgaria, apart from PhD students, only senior academics with long practical experience display such interest. (Tab. 2)

Additionally academics were asked about non-traditional ways of teaching

accounting. E-learning courses are popular in Bulgarian curricula – 81% of academics offer such methods, and are rarely offered at Polish universities (11%). As for the ERP systems, fluent use of such programs is considered important in future accounting job (96% in Poland, 76% in Bulgaria). (Fig. 9)

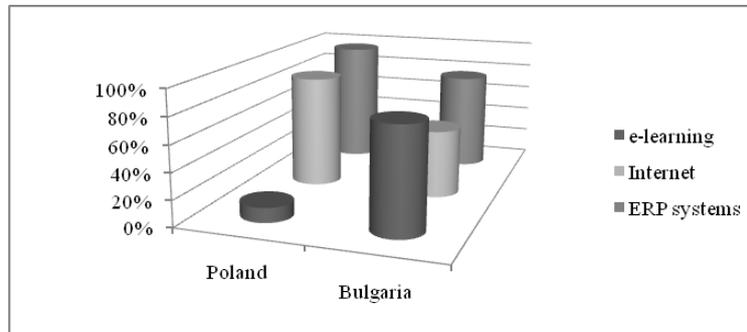

Figure 9. Electronic tools in teaching of accounting

EMPLOYERS' SAMPLE

The survey includes 47 employers: 27 from Poland and 20 from Bulgaria, among whom women are still majority (80% of Polish respondents and 60% of Bulgarian). (Tab.1).

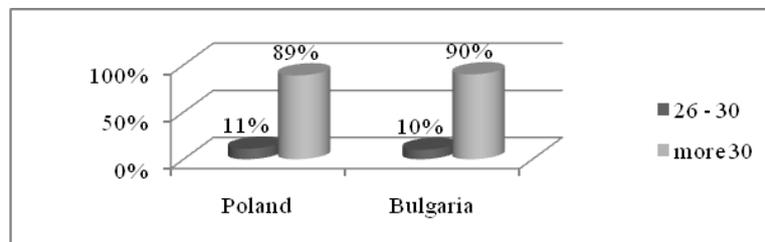

Figure 10. Employers by age and by countries (%)

In Figure 10 is shown the age group of the employers. In Poland 85% of the respondents work in the field of accounting with predominance of those with working experience more than 3 years (Fig.12). In both countries employers fully agree that constant development of their employees is important (Fig. 11).

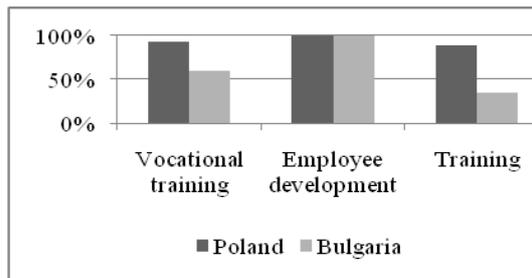

Figure 11. Employers trainings and opinion

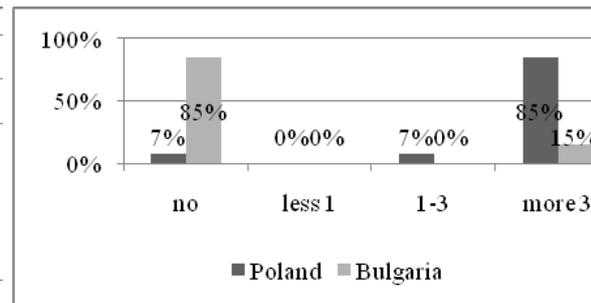

Figure 12. Experience of employee's in accounting

country \ skills	Poland		Bulgaria	
	Computer	Internet	Computer	Internet
Student	99%	96%	89%	84%
Vocational	100%	98%	96%	65%
Employers	100%	100%	100%	100%

Table 3. Computer and Internet use (%)

In respect to the opportunities for e-learning in accounting, almost all of surveyed groups use computer in everyday life, the result are presented in Table 3. Easy and natural use of computer and Internet may have positive influence on perception of self-development interactive tools such as e-learning platforms. Furthermore, modern teaching methods offer more flexibility (no fixed time lines), lower costs of teaching and higher comfort and satisfaction from self-development.

TEACHING TOOLS IN THE ACCOUNTING FIELD

In the last part of the questionnaires participants were asked to assess which tools used in teaching is in their opinion an effective and comfortable way of learning accounting and evaluating knowledge and skills. The respondents chose one level of importance, per each tool, out of 5 levels (1 – not at all, 2 – a little, 3 – enough, 4 – a lot, 5 – very much). For the need of analysis the importance level is accumulated result of answers “a lot” and “very much”. The results for all groups from 2 countries are described in Table 4. It is visible that, the highest esteem and the smallest dispersion from all categories of respondents receives the practical method with examples of use of accounting theory in practice and case studies.

* difference of means is significant ($p < 0.05$); MS_B - Mean Square Between groups; MS_w - Mean Square Within groups

Table 4. Preferred tools of accounting education (in order of their overall significance)

Using ANOVA at $p = 0.05$ it is visible, that greater differences are between groups than within groups (Tab. 4). The only group which does not follow such rule are employers in Bulgaria (65% by importance). The high position is explicable, because, although base knowledge of theory is a must in the field of accounting, inability to implement theory in market-accounting events makes accountants useless, because they are unable to faithfully reflect actual financial standing of the company in financial statements. Such inability may lead to extra costs for companies, mostly deriving from higher costs of control, additional costs of dismissal or trainings and even financial penalties. As for the groups, vocational people find examples as most significant (99% in Poland, 100% in Bulgaria), followed by students (96% PL, 97% BG), academics (92% PL, 90% BG) and employers (100% PL, 65% BG). Vocational people find it more useful than students, because they are more experienced in the

field of accounting and had more time to assess inadequacy of pure theory. Academics, may lower practice's significance, due to their goal to provide students with full accounting theory during studies, in hope that they will develop practical skills in future job.

Table 5. Differences in mean significance of examples with case studies between and within groups by countries

* difference of means is significant ($p < 0.05$); MS_B -Mean Square Between groups; MS_W - Mean Square Within groups

The 35% divergence between Polish and Bulgarian employers (Tab. 4) might be a result of sample characteristics. Using ANOVA at $p = 0.05$ it is visible, that greater differences are between Polish and Bulgarian employers than within these groups (Tab. 5). As mentioned before, 85% of Bulgarian employers are not currently working in the field of accounting and don't have any accounting experience, which is why they may not clearly see the difference between theory and practice. On the other hand, in Poland only 7% of them have not had any direct contact with accounting (Fig. 12). Similar results ANOVA test at $p = 0.05$ shows only for Polish and Bulgarian students, which may also result from significant difference in accounting experience between Polish and Bulgarian students.

Glossary	Students PL/BG		Vocational PL/BG		Academics PL/BG		Employers PL/BG

Table 6. Differences in mean significance of glossary between and within groups by countries

* difference of means is significant ($p < 0.05$); MS_B -Mean Square Between groups; MS_W - Mean Square Within groups

The next, overall, most popular tool is teaching of accounting terms in foreign languages (glossary). Once more the group which finds it very important is the group of vocational people (approx. 90%), followed by students (81% PL, 86% BG). The Tab. 4 show that significance of teaching foreign financial and accounting terms is more important in

Bulgaria (apart from employers), especially among students and academics. Although ANOVA ($F(7,799)=2,402, p<0.05$) shows greater differences are between all eight groups than within groups (Tab. 4.), comparison by countries for the same kind of respondents points the difference between groups greater than within groups only for Polish and Bulgarian employers (Tab. 6). The positive 5% gap between students may derive from that, more Bulgarian students often look for a job at international companies, such as the “Big Four” audit companies, where fluent foreign language is extremely mandatory, than Polish students. In Poland students usually aim to start working in a bit smaller companies with less severe requirements. What is worth mentioning is that, academics in Bulgaria notice accounting jobs’ trends among students and evaluate highly the need of understanding accounting terms used in foreign accounting documents and documents concerning international movement of products and services (export, import, intra-community delivery of goods) teaching (86%), while in Poland such tool is less important for academics. Moreover, Polish academics pay lesser attention to knowledge of foreign business language (77%) rather than Polish employers (96%), Polish vocational (90%) and even Polish students (81%). On the contrary, Bulgarian academics evaluate language skills higher (86%) than Bulgarian employers (50%). It may indirectly indicate poor level of compatibility between theory at academic level and practice on the market. High difference between Polish and Bulgarian employers, much greater than within these groups (Tab. 6) comes from the fact that on Polish labor market, knowledge of foreign business language is standard requirement even in national companies.

Accounting databases	Students PL/BG		Vocational PL/BG		Academics PL/BG		Employers PL/BG	
	MS _B /MS _w	12,588	0,703	0,956	0,740	0,790	0,738	0,718

Table 7. Differences in mean significance of accounting databases between and within groups by countries

* difference of means is significant ($p<0.05$); MS_B -Mean Square Between groups; MS_w - Mean Square Within groups

The other teaching tools are also differently evaluated by the target groups. ANOVA analysis supports such conclusion at mean level for Accounting databases, Accounting sites, Regulations and legislations databases and Slides (Tab. 4). For instance access to accounting

databases with financial statements is important for vocational people (approx. 82%) and academics (75% PL, 81% BG). The least interested group are employers (63% PL, 61% BG) – maybe, because the information from financial statements is useful only in long-term strategies, such as M&A (mergers and acquisitions) activities (in Poland) or financial investments (in Bulgaria). As ANOVA test show, there is very significant gap in needs among Polish and Bulgarian students in and less significant difference between vocational people in Bulgaria and Poland and between such groups of academics ($MS_B > MS_W$ in Tab. 7). The cause may be curricula in both countries. Especially during the bachelor's studies in Poland, the emphasis is on how to read the financial statements in order investment decisions to be taken, how to compare the financial statements of different companies and to teach the students from where the information included in them comes from. In comparison, in Bulgaria, the emphasis is more on usefulness of the accounting information in the efficient management of the companies and that is why more important seems to be the examples. In addition there are also more easy ways of getting access to such databases in Poland (especially electronic databases) than in Bulgaria, which raises the importance of accounting databases for vocational people in Poland.

Accounting sites	Students PL/BG		Vocational PL/BG		Academics PL/BG		Employers PL/BG

ANOVA test F / p-value	9,249	0,002*	2,278	0,134	0,091	0,764	0,002	0,967

Table 8. Differences in mean significance of accounting sites between and within groups by countries

* difference of means is significant ($p < 0.05$); MS_B - Mean Square Between groups; MS_W - Mean Square Within groups

Comparing data from Tab. 3 it is explicable that those with poorer Internet skills would avoid using Internet as an efficient way of finding accounting information. Results (Tab. 4) clearly show that searching accounting information on accounting sites is less popular in Bulgaria (among all groups range from 57%-76%), than in Poland (range from 70%-82%). Furthermore in Poland many good quality sites contain described examples of theories, which is very useful in learning process (and explain the greater differences between Polish and Bulgarian students and groups of vocational people by the countries than within these groups shown by the results of ANOVA (Tab. 8)). Although in Bulgaria there are more good quality forums where accountants provide help, which is more problem-concerned, but it is also more time consuming (due to reply time).

Regulations and legislations databases	All respondents in Poland vs Bulgaria		Students PL/BG		Vocational PL/BG		Academics PL/BG		Employers PL/BG	
	MS _B	MS _w	F	p-value	F	p-value	F	p-value	F	p-value
MS _B /MS _w	5,544	0,993	3,760	0,999	1,896	0,948	0,642	0,791	3,133	1,219
ANOVA test F / p-value	5,583	0,018*	3,765	0,053	2,000	0,160	0,812	0,371	2,570	0,116

Table 9. Differences in mean significance of regulations and legislation databases between and within groups by countries

* difference of means is significant ($p < 0.05$); MS_B -Mean Square Between groups; MS_w - Mean Square Within groups

The next analyzed tool are the links to national and international regulations and legislations. All groups in Poland find it more significant than the groups in Bulgaria, and ANOVA test shows much greater differences between countries for all respondents (Students, Vocational, Academics and Employers together) than within respondents in the country, although at $p=0.05$ it is not significant for any separate group of respondents (Tab. 9). This definitely comes from differences in tax and accounting regulations in both countries. Firstly in Poland there are about three times more differences between financial and tax income. This is extremely important for vocational people's group (84% in Poland), where majority works in accounting, employers due to possible tax control (83% in Poland) and academics, who should emphasize the problem of disparity in law during classes. Compared to the significance of differences between countries in assessment of importance of regulations and legislations by students, employers and even vocational peoples, for academics ANOVA analysis points greater differences within groups (characteristic respondents from one country) than between countries, which suggests that perception of role of regulations and legislations in teaching accounting differs between academics inside country: Poland or Bulgaria. (Tab. 9) Furthermore, in Poland not listed companies are not obliged to prepare financial statements in compliance with IFRS, but in accordance to national standards, which differ significantly from international ones. In Bulgaria national standards are very similar to IFRS, so mentioned problem does not seem so essential. In addition, links to regulations and legislation allow accountants to be up to date with current changes in law (which in Poland happens even few times a year, while in Bulgaria significant changes are rare).

In regards to the form of educational materials, ANOVA shows contrary source of differences in preference of form of educational materials, preferences of text differ more

within groups of respondents and preferences of slides differ more between countries (Tab. 10). Students in Poland prefer slides over text (75% to 73%), in Bulgaria otherwise, 86% for text and 73% for slides (Tab. 4). The significant role of practice as well as lack of lectures of accounting in Poland, indicates that the Bulgarian students are more theoretically prepared. Thus it is not surprising for Bulgarian students to wish more advanced materials with practical examples and case studies, which is usually offered in form of text (on seminars).

Groups of respondents compared by countries	Text				Slides			
	MS _B	MS _W	test F	p-value	MS _B	MS _W	test F	p-value
Students PL/BG	0,026	1,073	0,024	0,877	1,638	0,916	1,787	0,182
Vocational PL/BG	0,543	0,856	0,634	0,427	1,096	0,863	1,270	0,262
Academics PL/BG	0,912	1,064	0,857	0,358	2,235	1,136	1,967	0,165
Employers PL/BG	0,794	1,093	0,727	0,398	1,804	0,787	2,292	0,137

Table 10. Differences in mean significance of educational materials (text vs. slides) between and within groups by countries

Contrary in Poland, students still lack basic knowledge, so they prefer concise description of various accounting aspects in form of slides (lectures) rather than deep analysis of them. Moreover due to lack of time during classes and broad material Polish students are asked to complete their knowledge, which is why Polish academics use text forms and upload them on sites. Meanwhile in Bulgaria academics use slides during lectures and distribute them via mails (common practice is the lecturers to distribute materials via e-mails in Bulgaria or to upload them on the internally used e-learning platforms). Educational materials in form of text dominate over slides in vocational group, whereas employers prefer slides. Of course vocational people possess basic knowledge of accounting issues, so theory on slides may be not sufficient to their needs. Theory in form of text usually provides more well-arranged advanced information. As for employers it seems that slides are necessary as summary of accounting issues, while dealing with advanced problem lies in scope of employees' responsibilities. According to data, in Bulgaria students put pressure neither on m/c tests nor true/false questions, but rather on open questions and exercises, which are better ways of evaluating practical knowledge. In case of Poland, as mentioned in previous paragraph, the lack of knowledge definitely hinders solving practical exercises. That's why Polish students prefer questions which check the theoretical knowledge. All other groups in Bulgaria display more concern on both ways of assessment than Polish groups (Tab. 4). It

seems that they treat it as a good and fast way of repeating and checking acquired knowledge. ANOVA analysis points greater differences within groups (characteristic respondents from one country) regarding preferences of Multiply choice tests (in spite of vocational people) and True/false questions for academics and employers. Differences between countries play greater role in explaining Bulgarian and Polish vocational preferences for both ways of checking acquired knowledge rather than differences within groups (from the same country) (Tab. 11).

Groups of respondents compared by countries	Multiply choice tests				True/false questions			
	MS _B	MS _W	test F	p-value	MS _B	MS _W	test F	p-value
Students PL/BG	0,083	0,961	0,087	0,768	2,414	0,979	2,464	0,117
Vocational PL/BG	1,387	0,719	1,928	0,167	2,678	0,746	3,588	0,061
Academics PL/BG	0,398	0,910	0,437	0,511	1,057	1,073	0,984	0,324
Employers PL/BG	0,646	0,893	0,723	0,400	0,027	0,960	0,028	0,868

Table 11. Differences in mean significance of multiply choice vs true/false questions between and within groups by countries

Students in the both countries are the least interested in the additional literature. Main reason is the high cost of purchasing along with the not easy access to good accounting books, but the preferences differ more between countries than within these groups (Tab. 12 $MS_B > MS_W$), as well as the searching particular information in books is too high time consuming. The negative difference in Bulgarian case can be explained by the fact that the books don't cover solving of practical issues and are another database of theoretical knowledge. As for the academics in Poland, the higher popularity may be connected to concern about poor students' theoretical knowledge and small amount time to improve it during classes but it depends more on individual characteristics than differences between countries, $MS_W > MS_B$ (Tab. 12). As for journals, only employer's preferences depends more on individual characteristics than differences between countries $MS_W > MS_B$ (Tab. 12).

Groups of respondents compared by countries	Further reading (books)				Journals			
	MS _B	MS _W	test F	p-value	MS _B	MS _W	test F	p-value
Students PL/BG	1,524	1,011	1,508	0,220	6,788	1,178	5,764	0,017*
Vocational PL/BG	1,425	0,877	1,626	0,205	1,482	1,054	1,406	0,238

Academics PL/BG	0,068	0,948	0,072	0,789	1,000	0,977	1,023	0,315
Employers PL/BG	2,213	1,014	2,183	0,146	0,066	0,720	0,092	0,763

Table 12. Differences in mean significance of books/e-books and journals between and within groups by countries

Other authors also analyzed the usage, effectiveness and impact on the studies of different tools using during the teaching process. According to the analysis about the preferences of the students of structure of the power points presentations (Apperson, Laws & Scepanisky, 2006) using in class-room, it is determined that mostly the students prefer the studying material to be presented in power point form because that way the class is more understandable, clear and organized and this form facilitates their learning. Other researchers, who examined how helpful the power point presentations are for the learning and if the different types of power point presentations have different impact on the learning, concluded that this form of presenting the material is beneficial, but can be harmful in case the material is pertinent to the presentation (Bartscha, & Cobern, 2003). Making more attractive the content of the material presented on the slides, visualization is used (e.g. pictures, diagrams, charts etc.) but not always the visualization helps the learning, from learning perspective the text slides are better because of the short-term memory of the learners (Blokzijl & Andeweg). Most preferable tool for assessment of the learners' knowledge is the tests (e.g. multiple-choice, true/false) which are easy to be created and to be used, but the negative aspect is that the students do not spend enough time to prepare themselves (Roediger & Elizabeth, 2005). Alternative of the class-room studies, are the web-based environment studies but the effectiveness of this form of learning depends on the instructional design and how the student's approach and process the curriculum materials (Chang & Yang, 2010).

Main conclusion based on the conducted survey is that at first place all target groups prefer more the practical-oriented teaching tools – the examples demonstrating the accounting theory on practice, the cases studies giving the opportunity to show the gained knowledge and to reduce the knowledge gaps, and the glossary, containing the English terms. Secondly, we can conclude that the inability to put into practice the theory in market-accounting events and cases leads to extra costs for companies, mostly deriving from control, additional costs of dismissal or trainings and even high financial penalties. Third, the gaps in the accounting and legislation knowledge can be reduce by using e-learning platforms in case

these platforms provide adequate teaching materials in forms which are suitable for the end users.

ABSTRACT

Disclosure requirements of listed companies, containing financial statements and accounting policy with applied valuation methods, is a very important due to the need to provide shareholders knowledge necessary to make investment decisions and reduce information asymmetry, especially at NewConnect – a share's market based on an Alternative Trading System and dedicated for companies from Centre and Eastern Europe with brief history relatively, innovative, engaged in R&D, generating losses more often than profits.

The paper discusses consequences of allowance companies listed on the NewConnect stock exchange to use different financial reporting standards: Polish, national applicable in the issuer's country, not only Polish but foreign as well, or recognised standards on an international scale (IFRS). The paper aims to answer a question about the reason for allowing the legal possibility of preparing financial statements according to such different accounting standards. It seems that applicable regulations not enough are protecting investors, aren't delivering comparable financial information to them, preventing them from comparing financial results established according to various accounting standards. Maybe differences in the influence of diversifying methods of valuation of assets and liabilities, on the financial result and the equity (revaluation reserve in equity), within groups of companies applying the same (especially Polish) accounting standards are significant enough to exceed differences in the effects between groups of companies applying different accounting standards: Polish, foreign or IFRS. It would explain the legitimacy of authorizing the public trading of companies applying different accounting standards. The paper presents received findings of the conducted research of significance of difference in accounting policy of 414 companies listed on the NewConnect stock exchange in Poland, including 383 using Polish accounting standards, 27 using IFRS and 4 basing

on foreign accounting law applicable in their country (quantitative analysis) and qualitative analysis of accounting policy on valuation of 355 firms.

Keywords: accounting standards, IFRS, valuation of assets and liabilities, alternative trading systems

INTRODUCTION

Disclosure requirements of listed companies, containing financial statements and accounting policy with applied valuation methods, is a very important for the proper functioning of stock exchanges around the world. This is due to the need to provide shareholders knowledge necessary to make investment decisions. Applied methods of the balance sheet valuation are reflecting the adopted concept of evaluations, concerning the realization of the main purpose of the financial statement: transaction method (continental (European) model based on income statement) or method of the value (Anglo-American model regarding mainly balance statement) with opposing tendencies: conservative or mark-to-market accounting.

The issuer listed on most of Alternative Stock Exchange, notably the NewConnect in Poland, prepares financial statements in accordance with the national applicable in the issuer's country, not only Polish but foreign as well, or recognised standards on an international scale (IFRS). As companies listed on NewConnect have brief history relatively, are conducting Research and Development activity, as a result of which largely they are making a loss, a question about the reason for allowing the legal possibility of preparing financial statements according to such different accounting standards seems justified. It seems that applicable regulations not enough are protecting investors, aren't delivering comparable financial information, preventing them from comparing financial results established according to various accounting standards. In the paper we verify, if differences in the influence of diversifying methods of the evaluation of assets and liabilities, applied by issuers as part of their accounting policy, on the financial result and revaluation reserve in equity, within groups of firms applying the same (especially Polish) accounting standards are significant enough to exceed differences in the influence of valuation between groups of firms applying different accounting standards: Polish, foreign and IFRS. It would explain why companies listed on NewConnect are allowed to apply different accounting standards. The NewConnect is an alternative choice for companies, which through a stock debut wish to raise capital for the development of, and which are not able to meet the requirements associated with the

issuance of shares on a regulated securities market. It directs its offer above all to, developing from a variety of industries, including new technologies, both small and medium-sized start-ups' (edifying their story), as well as firms with a strong position, from Centre and Eastern Europe.

NEWCONNECT AS AN ALTERNATIVE STOCK EXCHANGE OF CENTRE AND EASTERN EUROPE

Capital market more widely opens to the small and medium-sized companies. Alternative financial markets, with issuance and turnover of securities for smaller operators, are formed all over the world for over 40 years (the oldest market is an American NASDAQ2) and in Europe for 17 years (Alternative Investment Market (AIM) operated by the London Stock Exchange). A characteristic feature of AIM is its internationality - in the middle of 2013 there were 226 foreign companies (no-British) among the 1085 listed ones. For comparison on the NewConnect market (a share's market (functioning from 30.08.2007) based on an Alternative Trading System, which is operated outside the regulated market by Warsaw Stock Exchange) quoted is only 9 foreign companies (no-Polish). It is worth noting that the AIM market also benefited American companies despite the opportunities available on the home market [Kordela, 2010]. The majority of alternative platforms from European market were formed in the first decade of the 21st century, such example is Alternext (2005 year, it is operated by NYSE Euronext market). Currently there are 202 listed companies on this market, of which 8 companies are no European ones and 8 are located outside the alliance of French, Dutch, Belgian and Portuguese markets. Conceptually, Alternext market was supposed to be an alternative market in the euro area reference for young firms, however, a lot of companies with long experience, even twenty, have taken advantage of it. The advantage of platform is a good protection for the interests of investors, manifesting itself in the larger market entry requirements and obligations after the firm debut information [Porębski, 2009].

In addition, it is worth to indicate German Standard Entry (2005), the Scandinavian First North (2006), Italian MAC (2007), Norwich Axess (2007), Austrian Dritter Market (2007), Italian AIM Italia (2008) and Spanish Mercado Alternativo Bursatil (2008). The reason of formation of these markets was to allow access to the booming capital of the smaller companies, which one wants to have innovation in the future and very often capital-investment [Kachniewski, 2007]. In accordance with the concept of an alternative market, promotion entities with large growth prospects associated with simplified formalities and lower, compared with the stock market, cost of entry and operation in the market. Simpler

and cheaper entry procedure, however, translated into a higher risk of investing in these markets, which offset is potentially high return which is the result of an increase in the prices of securities. In comparison to alternative European markets the NewConnect market has a small number of foreign companies, but it is relatively young and his goal is to become the leader mainly in Central and Eastern Europe.

Companies listed on the NewConnect (NC) market represent different branches, including innovative sectors, based especially on the intangible assets (e.g., telecommunications, computer science, biotechnology, alternative energy). Most companies listed on NC belong to sectors: trade, other services, computing, financial services, media and technology. Also foreign companies are interested in the offer of NewConnect market. At the end of 2012, you could observed the quotations of 9 foreign companies established in the Czech Republic, Bulgaria, Ukraine, the United Kingdom, Netherlands and Switzerland.

NewConnect's companies, depending on their listing, could hit to the one of the three segments that are created by Warsaw Stock Exchange. The most important, but also the smallest segment is NC Lead Segment (created in 2010). NC Lead' goal is to promote businesses that have a high chance of transferring their listing to the main market of the Warsaw Stock Exchange securities. Companies, which want to be in this segment, must fulfill a lot of quality criteria, including: the average number of transactions of the issuer's shares has been greater than 5 transactions per trading day or the average value of trading has been greater than PLN 5,000 per trading day; the average price of the issuer's shares has been greater than PLN 0.50 and its average volatility has been no greater than 15%; the issuer's shares have been listed on the NewConnect market for at least 12 calendar months and the company complies with information about the obligations with due diligence, provides high quality of published information. In June 2013 only 19 issuers of 437 companies listed on NewConnect belong to this segment. The next segment - the NC High Liquidity Risk (HLR) includes the company's enhanced liquidity risk. Firms, which start to be listed on this market, have the average value of free-float shares in the past three months no higher than PLN 1,000,000. There were up to 150 companies in this segment in June 2013. The last segment - Super High Liquidity Risk (SHLR) includes the company's enhanced liquidity risk and additionally characterized by strong volatility of share price or being in the liquidation or bankruptcy (35 firms in June 2013). The result of classification into the SHLR is the removal of company's shares from the participants' list of NewConnect market indices, transfer of its shares to the single-price auction system, and in the worst scenario - withdrawal from the NC market. Within 6 years of existence of NC, there were 40 withdraws, the majority in 2013.

FINANCIAL REPORTING STANDARDS ALLOWED TO BE APPLIED ON THE NEWCONNECT MARKET

The big interest in the NewConnect market stems primarily from the small formal requirements (relating to the admission to trading and arising from the obligations of information), low-cost debut (the ability to take advantage of the private tenders) and quotations, excellent exposure of the company to investors, the promotion and visibility of the company and the lack of compulsion applied national accounting rules changes to IFRSs.

Mainly due to the low cost of the debut, companies choose emission of shares in the form of private tender. This offer is directed to a maximum 99 investors. It is also simpler, faster and less expensive than public emission. Moreover, it does not apply to the requirements of the Polish Act about Public Tender and there is no obligation to prepare a prospectus or information memorandum. However, in this case companies cannot use medias as the way to find the investors, they have to guide the offer directly to potential investors. In both case (public and private tender), the decision to broadcast on the NewConnect market must precede the change of the legal form of the company to a joint-stock company (or limited shelf) and the consent of the general meeting of the company.

The issuer prepares financial statements and comparative data in accordance with the national applicable to the issuer or recognised standards on an international scale. In case of issuers of securities, who wish (or are going to) to have their securities listed on the NewConnect market, prepare the Polish draft individual and consolidated financial statements according to the Polish laws, while units forming part of the group, in which the parent undertaking draws up consolidated accounts in accordance with IFRS (article 45 paragraph 1 b and article 55 paragraph 7 of Polish Accounting Act). Issuers, who are outside of Poland, draw up individual and consolidated financial statements according to the rules applicable in compliance with their national requirements, or according to IFRS. Only the issuers, who wish to apply for admission of its securities to trading on regulated markets, must prepared their consolidated financial statements according to IFRS and the separate financial statements according to IFRS (or according to Polish law or to other national accounting standards in force in the country of the issuer). (Annex No. 3).

Polish Accounting Act absolves small capital group from obligation of preparing consolidated financial statements. A parent company may not prepare consolidated financial statements if at the balance sheet date of the financial year and the balance sheet date, of the year preceding the financial year, the total data of the parent and all subsidiaries of each level without performing consolidation exemptions, meet at least two of the following conditions

(article 56. of Polish Accounting Act): total year employment is no more than 250 people (full-time), total carrying amount in the Polish currency does not exceed the equivalent of 7.5 million euros, total net revenue from the sale of products and goods, and financial operations in the Polish currency did not exceed the equivalent of 15 million euros.

By mid-2012, a small capital group listed on NewConnect, in accordance with the above mentioned article 56, did not prepare consolidated financial statements. The parent company informed investors about their results and their own financial situation and assets. However, in accordance with the revised in June 2012 The Alternative Trading System Rules, a parent company, in spite of non-compliance with conditions related to balance sheet, employment or income from art. 56. of Polish Accounting Act, is committed to the consolidation in situation if the issuer is listed on NewConnect or seeks to enter NewConnect market (§ 11 point 2 of the Annex No. 1 and § 5 point 2 of the Annex No. 3). Until March 2013 there were 113 units of dominant capital groups on NewConnect, that published consolidated financial statements.

By the end of the first month of the financial year, the issuer is obliged to identify , in the form of a current report, and meet the dates of transfer in the financial year of the periodic report (quarterly and annual), taking into account holidays. Annual report (both individual and consolidated) shall be transmitted immediately after the release of the opinion of the Auditor, but not later than within 7 days from the date of its receiving by the issuer and not later than 6 months from the date of the balance sheet, on which it was drawn up the annual accounts, as well as no later than 15 days before the date of the ordinary General Assembly, responsible for the approval of the annual financial statements, contained in the annual report.

Although most commonly committed errors by companies listed on NewConnect are: not respect of the time limit, failure to observance of the timetable for the publication of regular reports, no publication of periodic report updates in compliance with the schedule set up, change of publication date with a date which is out of the maximum set up time for publication of periodic reports. Unfortunately, the companies present also unreadable reports without attachments listed in the content of the reports, make adjustments for invalid reports or contain a lot of corrections to published reports.

If the issuer does not perform its obligations, the organizer of the Alternative Trading System may admonish him, and information about the reminder post on its website, suspend trading in financial instruments of the issuer in an alternative system, and even exclude financial instruments of the issuer from the Alternative Trading System (§16 of the Rules).

Companies listed on NewConnect are burdened with higher than average risk, certainly higher than on a regulated market. This risk is increased also by the lack of detailed data about companies (lower information requirements) and the lack of State oversight. As a result, the purchasers of shares are those who accept a higher level of the risk in their business like venture capital funds, investment funds, individual investors willing to take a high risk [Dykto, 2010].

LITERATURE REVIEW

Selection of the appropriate accounting policy affects a number of internal and external decisions concerning the company, including secure capital placement, borrowings and loans, taking correct investment decisions, as well as minimizing the risk of receiving the expected economic benefits from their trade relations [Brzezina, 1995]. By choosing the valuation principles (conservative or market), you need to be guided by the objectives of financial reporting resulting from the accounting structure, needs an economic interpretation of financial statements and their importance for users (banks or stock-market investors) [Hendriksen, van Breda, 2002]. In agency theory, choosing the right agency principal-agent contract (based on outcome or preserving agent) may affect the accounting policy [Eisenhardt, 1986] and consequently on the value of a business [Watts, Zimmerman, 1986]. Empirical studies show the positive impact of the company's results on management salaries [Barkema, Gomez-Mejia, 1998], which raises moral hazard.

In situation of too strongly rising profits leading to political costs or large profit declines causing reduction of management's revenue, a logical behavior of managers is income smoothing, which means the use of a variety of possible solutions within the framework of the accounting policy, including the selection of appropriate valuation methods, so as to increase their control over the fixed result [Coenenberg, Haller, 1992]. Therefore, a well-functioning accounting system should reduce the asymmetry of information and contribute to a better functioning of the market by supplying as accurate picture company [Stiglitz, 2006] and exposing assumptions and valuation methods applied to its findings. The overriding role of accounting is to ensure the protection of property owners (Board of Trustees controls), that the management gives a report to the owner on the facts occurred in the accounting period and not on expectations or manager's rating [Mattessich, 1995]. It argues for the conservative approach based on historical cost rather than a valuation at fair value [Le Coutre, 1933].

As it is shown, the adoption of adequate accounting policies, including the selection of the valuation methods of assets and liabilities, affects the functioning of company in the economy, the efficient management in the face of conflict, access to debt financing, the asymmetry of information and security of investments of shareholders.

ACCOUNTING POLICY OF VALUATION ADAPTED BY NEWCONNECT LISTED COMPANIES - EMPIRICAL RESEARCH

We conducted qualitative inquiry of accounting policy adapted by NewConnect listed companies on the basis of Introductions to the Financial Statements and Additional Information (Notes) to the published individual financial statements for 2010-2011. Our research contained 355 companies, including 8 preparing financial statements in accordance with IFRS and 1 preparing financial statements in accordance with the Czech Accounting Act. We analysed methods of valuation of assets and liabilities as at the balance sheet date (the end of accounting period) and their impact on companies' financial position. Below we are presenting received findings of the conducted research.

Valuation (measurement) is a process of determination of the value of assets and liabilities under the fundamental accounting concept of historical cost or one of the value based concepts. The historical cost is a concept that relates to the purchase (acquisition) price (cost) or the cost of manufacture. Value based concepts relate to the net realizable value (net selling price) or present value of future cash flows or fair value.

Valuation (measurement) of assets and liabilities is conducted at least as at the initial recognition date of an item and as at the balance sheet date (the end of accounting period). The initial valuation (conducted when the item is recognised in accounting books) depends on the way the item is gained. The asset is usually valued at:

- a) acquisition (purchase) price (or cost of purchase) - if it is acquired;
- b) cost of manufacture - if it is produced (manufactured);
- c) fair (market) value - if it is received free of charge;
- d) nominal value - if it is a part of equity or an individual amount of receivables
- e) other reliably and reasonably estimated amount - if it is provision or accruals (appraisal of future costs) when other specific operation appears.

All companies listed on NewConnect use nominal value to measure shareholders' equity which is in accordance with the Polish and IFRS requirements. Second most used valuation is the acquisition price - 89% of investigated companies declare to use it to measure their assets, especially intangible and fixed assets. It is also popular valuation of inventory, together with

purchase cost and manufacturing cost. About 44% of companies declare to apply market value and fair value to measure investments and financial liabilities as at the balance sheet date as well as for initial valuation of assets received free of charge. About 33% of companies declare to apply cost of manufacture to measure intangible and fixed assets. Adjusted acquisition price is applied most rarely (17%), only to long term financial investments, if a maturity date is specified for a given asset. In comparison with the IFRS requirements (*IAS 16 Property, plant and equipment*) the tangible assets should be initially measured at its cost which is the cash price equivalent. The cost includes beside the purchase price, the initial estimate of the costs of dismantling and removing the item and restoring the site on which it is located.

In general 40% of companies have not set up any provision, overstating the economic results, but also breaking the prudence principle of the conservative estimate. Financial statements of all NewConnect listed companies are subject to the audit obligation. Meanwhile, accruals for costs of obligatory audit of the financial statements have been set up by less than 14% of companies. According to the *IAS 37 Provisions, Contingent Liabilities*, there are two approaches concerning the accounting treatment of the audit costs – if as at the reporting date any audit work is performed then the audit fees have to be accrued and shown in the financial statements, but in case no audit activities have been performed during the last period, the entity has not obligation based on past event and accruals are not created. An extremely important element of the work connected to the preparation of financial statements is to perform an accurate evaluation of assets and liabilities on the balance sheet date.

Valuation as at the balance sheet date depends on: the type of assets/liabilities, time for which the item is held by the company and the way of using of the assets and discharging the liabilities. For different types of assets/liabilities we use different methods of valuation described in the article 28 paragraph 1 of the Polish Accounting Act. Each company should choose appropriate methods of valuation (initial and for closing books purpose), suitable for conducted activity and describe it in own accounting policy. Especially the division into fixed (long-term) and current (short-term) items, according to criterion of time in which item is held by the company, is very important because of different impact of valuation at balance sheet date on the company financial position. Valuation of current items, even by market value, affects current period profit or loss, and valuation of fixed (long term) assets by market value sometimes impacts reserve capital according to the principle of keeping capital (financial assets). Reserve capital serves the function of "shock absorber" of negative effects caused by decreasing of market value in part exceeding the purchase price.

The way of using of assets and discharging liabilities is especially important, because Polish accounting standards allow valuation by market or fair value only for items used for investment purpose, including investment properties, investment intangible assets and financial items used for investment purposes. Other items used in operating activity cannot be valued in market or fair value as at the balance sheet date. Regarding the liabilities *IAS 39 Financial Instruments, Recognition and Measurement* determines the financial liabilities to be classified either to financial liabilities at fair value through profit or loss, either to other financial liabilities measured at amortized cost using the effective interest method and the commercial payables to be initially recognized at nominal value and subsequently measured at their amortizing value less any payments associated with settling the liability.

Unfortunately, not all companies listed on the NewConnect market provide information about used or planned (in the case of a zero balance sheet items) valuation methods. After analyzing the provided information most frequently used method is the valuation according to acquisition prices. In the case of fixed assets valuation at acquisition price is applied by 73% of the companies investigated, and valuation at manufacturing cost is applied by 50% of companies, and for purpose of intangible assets valuation 69% of companies apply acquisition price and manufacturing cost - 44% of them. In Poland a company can evaluate property, plant and equipment and intangible assets at the acquisition price or manufacturing cost or adjusted value (after revaluation of property, plant and equipment based on separate acts), less depreciation or amortization charges and impairment losses.

In Poland companies could measure fixed assets in revalued amount only in 1996, based on the Regulation of the Finance Minister from 20 January 1995 on depreciation of fixed assets and of intangible assets, as well as of revaluation of fixed assets. According to IAS 16 Property, Plant and Equipment is initially measured at its cost, subsequently measured either using a cost or revaluation model, and depreciated so that its depreciable amount is allocated on a systematic basis over its useful life. Under the revaluation model, revaluations should be carried out regularly, so that the carrying amount of an asset does not differ materially from its fair value at the balance sheet date. The increase in the carrying amount is reported in the equity as revaluation reserve, the reduce in the carrying amount is recognized as an expense. In most cases, companies listed on the NewConnect market apply a straight-line depreciation - 84% of the investigated companies declare this method. In turn, only 5% of the companies use digressive depreciation methods. In addition, only 1% of companies declared that the depreciation rates used in balance sheet differ from the tax ones. Most of companies, which

declared the methods of measuring inventory, choose the valuation at acquisition price, manufacturing cost and purchase cost (all methods are used by 31-34% firms). Meanwhile the Polish Accounting Act is implying valuation of tangible current assets at the acquisition price or manufacturing cost not higher than their net selling price as of the balance sheet date which is the same as the requirements imposed by the IAS 2 Inventories.

Financial liabilities are usually measured at market or an otherwise determined fair value (12%) and adjusted acquisition price (8%). Immovable property and intangible assets classified as investments are usually valued at acquisition prices – 38% of the analysed companies used this method. The subsequent valuation of the investment properties according to *IAS 40 Investment Property* is based on the *model of the fair value* and any difference between the fair value and the book value of the asset should be reported directly in the Comprehensive Income statement as profit or loss for the period when it arises. Other used valuations are manufacturing cost (15%), market or fair value (14%) and revalued amount (3%). Another long-term investments are usually valued at acquisition price (36% of all firms), less often at fair value (18%) and adjusted acquisition price (9%) (see Table 1).

Valuation methods	Selected items of the balance sheet				Investments			
	intangible assets	fixed assets	inventory	financial liabilities	immovable property and intangible assets	fixed assets and participating interest in other undertakings	amounts receivable and loans granted	short-term
manufacturing cost in which standard cost	44%	50%	34%		15%			
acquisition price	69%	73%	34%		38%	36%		
purchase cost			31%					
including: not higher than net selling price			13%					
revalued amount		13%			3%			
market or fair value				12%	14%	18%	6%	32%
adjusted acquisition price				8%		9%	4%	9%
at the lower of acquisition price or market price (value)								12%
equity method						2%		

Table 1. Methods of valuation of selected items of assets and liabilities (100% - 355 companies)

Receivables are valued at the required repayment amount, observing the conservative accounting principle. In turn, amounts receivable and loans granted classified as financial

assets are usually measured at market price or otherwise determined fair value (6% of all firm) and adjusted acquisition price (4%). Short-term investments of listed companies are usually valued at market price or fair value – method applied by 32% firms. Shareholders' equity, save for treasury shares, and any other assets and liabilities may be valued at their nominal value, that for the investigated companies is obvious. The NewConnect listed companies often don't include in their reports information about the valuations of assets, which they do not have. As a general rule, if the balance sheet position is set to zero, in the introduction to the report lacks information concerning valued methods of this position. It can be assumed that many companies creates accounting policy under the current needs, assuming that, in the case of the emergence of new assets or liabilities, they will supplement it by annexes.

From the point of view of testing in case of impairment of assets, the way of using of assets and discharging liabilities is extremely important, because it determinates its net selling price or in case of its lack - its fair value (determined in other way), especially when assets can be held for internal use by the company or for sale or resale. The impairment loss decreases the value of asset to net selling price or in case of its lack - to in other way determined fair value [article no. 28 point 7 of Polish Accounting Act]. In accordance with *IAS 36 Impairment of Assets*, the impairment loss decreases the value of asset to recoverable amount (the higher of an asset's fair value less costs to sell (sometimes called net selling price) and its value in use). Impairment loss is recognised when it is very likely that an asset controlled by the company will not bring, in whole or in part, expected benefits in the future. The impairment loss is an expense in the income statements (unless it relates to a revalued asset where the value changes are recognized directly in equity). In 2010-2011 testing in case of impairment of assets, conducted by NewConnect listed companies, resulted in write-downs on the value of assets, most often for trade receivables (60%), long-term receivables (35,77%), long-term investments in related enterprises (26,48%) and inventories of materials (24,23%) (Table 2). Impairment occurs when there is a huge probability that controlled component of assets will not bring in the future, in greater part or totally, predictable economic profit.

Type of assets valuation	Type of impact of	in balance sheet - revaluation reserve	in P&L statements	
			other operating activity	financial activity
Long-term (non-current) receivables		1,69%	11,55%	13,80%
Long-term investments:				
1. Investment properties		1,41%	10,99%	5,92%
2. Investment intangible assets		2,54%	4,51%	4,23%
3. Long-term financial assets in related enterprises		4,51%	2,25%	11,55%
4. Long-term financial assets in other enterprises		5,07%	1,69%	15,49%
5. Other long-term investments		2,54%	1,97%	11,27%
Current assets:				
Inventories – Materials			24,23%	
Inventories - Semi-finished products and work in progress			13,52%	
Inventories - Finished products			16,06%	
Inventories - Goods for resale			18,87%	
Trade receivables			51,83%	18,87%
Financial receivables			1,97%	13,52%
Current financial assets				29,30%

Table 2. Effects of adjustment of the value of separate assets in 2010-2011 (% of NewConnect listed companies)

Provisions for impairment of amounts receivable are recognised in other operating expenses or financial expenses, as applicable, depending on the type of amount receivable to which the provision relates. These provisions are an expense contrary to the provision found in the credit side of the balance sheet and form a sort of liabilities. Cancelled, time-barred or uncollectible amounts receivable should decrease the impairment provisions previously recognised in this respect. The amounts receivable in respect of which no or partial impairment was recognised, should be classified as other operating expenses or financial expenses, as applicable.

Apart from that, adjustment of the value of assets or liabilities relates usually to prudence principle, measurement of the amount due to the company or creditors, changes of exchange rates or their revaluation to fair value. In accordance with the article 30 paragraph 1 of the Polish Accounting Act and the IAS 21 The Effects of Changes in Foreign Exchange Rates assets and liabilities expressed in foreign currencies should be measured no less frequently than on the balance sheet date at the average exchange rate effective on that date and published by the National Bank of Poland.

Adjustment of the value of assets or liabilities can be recognised in the income statements, as other operating or financial revenues or costs, or in the balance statements - directly in equity, as an increase or a decrease in revaluation reserve, or even in cash flow

statements (foreign exchange rate differences or other adjustments). When an increase of assets or a decrease of liabilities appears, a company can recognise revenues (incomes), for instance positive exchange differences of receivables or liabilities expressed in foreign currency, increase of market or fair value of current financial investments or a reversal of impairment in case of terminating causes which lead to forming a write-down. When a decrease of assets or an increase of liabilities appears, a company can recognise expenses (costs), for instance negative exchange differences of receivables or liabilities expressed in foreign currency, or impairment of assets. Revaluation of long-term financial assets over their purchase price resulted in the revaluation reserve. In purpose to verify presumption stated in the introduction concerning significance of differences in the influence of diversifying methods of the evaluation of assets and liabilities, on the financial result and the equity between groups of companies applying different accounting standards: Polish, foreign and international, we conduct ANOVA analysis. To measure the influence of the applied evaluation on the financial result, relying on data presented in the profit and loss account, we create the following indicator:

Revaluation effects in net income = $(- \text{impairment} + \text{profit-}rev\text{-}inv - \text{loss-}rev\text{-}inv) / \text{net income}$

where: *impairment* - revaluation of non-financial assets (included in Other operating charges),

profit-}rev\text{-}inv - revaluation of investments (included in Financial income),

loss-}rev\text{-}inv - revaluation of investments (included in Financial costs).

In the conducted analysis we use dates of valuations effects only directly presented in separate items in Profit and loss statement in accordance with Polish accounting act. On account of presenting the effects of an increase of non-financial assets' values, including reversal of impairment, in one common position: other operating income, in the above indicator we omitted these effects of the valuation. Similarly on account of the presenting the exchange differences, both realised and unrealised (from valuation as at the balance sheet date) in one common position: „Other“ included in Financial income or Financial costs, we didn't take them into account in the constructed indicator measuring effects of the valuation in net income. As equity (own funds) contains net income and revaluation reserve, we separate this effects and measure the influence of valuation of long-term financial assets as at the balance sheet date on revaluation reserve. The influence of the applied valuation of long-term financial investments on the equity, presented in the revaluation reserve, we measured as follows: *Revaluation effects in equity* = $\text{revaluation reserve} / \text{equity}$.

The table 3 presents received findings of the conducted quantitative research of significance of difference in accounting policy of 414 companies listed on the NewConnect stock

exchange, including 383 using Polish accounting standards, 27 using IFRS and 4 based on foreign accounting law applicable in their country. Regarding results of ANOVA analysis, differences in the influence of diversifying methods of the evaluation of assets and liabilities, on the net income, within groups of companies applying the same (especially Polish) accounting standards ($MS_w=2,044$) are more significant than differences in such effects between groups of companies applying different accounting standards: Polish, foreign and international ($MS_B=0,035$). Although the ANOVA analysis for significance of differences in valuation effects in equity, especially in the revaluation reserve, shows different mean effects of valuation and greater differences between groups applying different accounting standards ($MS_B=465,38$) than within groups using the same (especially Polish) accounting standards ($MS_w=6,883$), mean valuation effects in equity for companies applying Polish accounting standards is the lowest and has got the lowest standard deviation compared to the companies preparing financial statements in accordance with IFRS or other foreign accounting standards.

Groups by accounting standards	N	valuation effects in equity (revaluation reserve)						revaluation effects in net income					
		Min	Median	Max	Mean	Variance	Std Dev	Min	Median	Max	Mean	Variance	Std Dev

Table 3. Differences in mean revaluation effects in equity and net income between and within groups by accounting standards

The table 4 presents significance of difference in valuation of 414 companies listed on the NewConnect by 14 sectors. ANOVA analysis presents that differences in the influence of diversifying methods of the evaluation of assets and liabilities, on the net financial result as well as the revaluation reserve in equity, between sectors (groups of companies conducting almost the same operating activity and using similar accounting valuation) is much greater than within companies from the same sector applying similar accounting policy (for revaluation reserve $MS_B = 19,81 > MS_w = 8,75$ and for net income $MS_B = 2,934 > MS_w = 2,01$).

	MS _B MS _W	19,810	8,755	2,934	2,010

* difference of means is significant ($p < 0.05$); MS_B -Mean Square Between groups; MS_W -Mean Square Within groups *Table 4. Differences in average revaluation effects in equity and net income between and within groups by sectors*

The received findings of qualitative and quantitative analysis support our presumption that differences in accounting valuation applied by NC firms of different sectors are so significant that exceed differences between different accounting standards: Polish, foreign and IFRS.

CONCLUSION

Based on the conducted research we can notice that differences in the influence of diversifying methods of the evaluation of assets and liabilities, applied by issuers as part of their accounting policy, on the financial result and the equity (revaluation reserve in equity), within groups of companies applying the same (especially Polish) accounting standards are significant enough to exceed differences in the influence of valuation between groups of companies applying different accounting standards: Polish, foreign and IFRS. It explains why companies listed on NewConnect are allowed to apply such different accounting standards.

ABSTRACT

Organizations have always realized that access to quality information and knowledge will help them remain competitive. However, with the advent of rapidly changing business environments, managers are now realizing they need to develop an effective knowledge strategy and provide employees with best available knowledge to support the decision making process. The paper addresses this within the context of how Decision Support Systems, Artificial Intelligence and Information Technology can aid the transformation process of knowledge. The 21st century brings along the recognition for the necessity to understand and measure the activity of knowledge management, for which reason organizations and system organizations, together with decisional governmental factors, do their best in order to develop policies that would promote these benefits. Knowledge Management (KM) implies any activity regarding the capture and the diffusion of knowledge within the organization. In our study we analyze the impacts and dimensions of KM upon the innovation and labour productivity within the organization, and how KM affects the firm's innovative performance. A key component of knowledge management is to provide access to stored knowledge components to improve decision making and to facilitate knowledge acquisition by the user. Now, enterprises should create – entirely – new ways of working to survive in a competitive environment. Organizational transformation depends of the creation of a powerful vision of what future should be like. We claim that an in depth understanding of the current functioning is also required.

Keywords: knowledge-based economy, knowledge management, the new model of the organization, knowledge, explicit and implicit knowledge, innovation, productivity, diffusion of knowledge

1. INTRODUCTION

Innovation is built on collective knowledge sharing activities of, especially, tacit knowledge (Howells 1996, Nonaka *et al.* 1995 and 2000, Gibbons 1994). Dialogue and frequent interaction between different individuals or groups forms the basis for knowledge recombination and creation of innovation. Due to this interaction, relationships and perspectives are shared between employees creating a cooperative atmosphere useful for the transfer of tacit knowledge (Gold *et al.* 2001). At this point, KM gains importance: it is seen as a managerial tool which can promote the knowledge creating and sharing processes essential for innovation. Theoretical approaches, as well as implementation strategies of KM, concentrate a lot on IT related issues (Swan *et al.* 1999, Nonaka *et al.* 2000, 6), Alavi *et al.* (2001). However, knowledge sharing activities cannot be enhanced by IT networks alone. KM is rather an organizational device, a problem-solving tool, which increases knowledge exploration and knowledge exploitation success of firms (Swan *et al.* 1999, 264). Hence, there is a need for a shift towards organizational and personnel issues in KM (Carter *et al.* 2001).

2. CHANGES IN KNOWLEDGE MANAGEMENT AND LITERATURE REVIEW

Knowledge Management, new as it is, is changing. In the opinion of Firestone, and McElroy (2002) there are at least three accounts of how it is changing and about how we should view The New Knowledge Management (TNKM). One account, by Mark Koenig (2002), sees KM as a field that was originally driven by information technology, the Internet, best practices, and later lessons learned, and most importantly knowledge sharing. This theory sees a second stage of KM as about human factors, organizational learning, and knowledge creation viewed as the conversions among tacit and explicit knowledge. The third stage of KM is the stage of the arrangement and management of content through taxonomy construction and use, and like the first is also heavily biased towards information technology.

The second view of change, by David Snowden (2002), is a bit more subtle than the first. According to this theory, the first age of knowledge management is one in which the word knowledge itself was not at first 'problematic,' and in which the focus was on distributing information to decision makers for timely use in decisions. The second age replaced the information technology focus with one on tacit/explicit knowledge conversion inspired by Nonaka's SECI model. It is just ending. Snowden contends that the third age will be one in which: knowledge is viewed paradoxically as a thing and a flow; context, narrative and content management will be central to our view of KM; Further, he believes that there will be an understanding of organizations as engaged in sense Knowledge Management, new as it is, is changing. There are at least three accounts of how it is changing and about how we should view 'The New Knowledge Management' (TNKM). One account, by Mark Koenig (2002), sees KM as a field that was originally driven by information technology, the Internet, best practices, and later lessons learned, and most importantly knowledge sharing. This theory sees a second stage of KM as about human factors, organizational learning, and knowledge creation viewed as the conversions among tacit and explicit knowledge. The third stage of KM is the stage of the arrangement and management of content through taxonomy construction and use, and like the first is also heavily biased towards information technology.

The second view of change, by David Snowden (2002), is a bit more subtle than the first. According to this theory, the first age of knowledge management is one in which the word knowledge itself was not at first 'problematic,' and in which the focus was on distributing information to decision makers for timely use in decisions. The second age replaced the information technology focus with one on tacit/explicit knowledge conversion inspired by Nonaka's SECI model (1991). It is just ending. Snowden contends that the third age will be one in which: knowledge is viewed paradoxically as a thing and a flow; context, narrative and content management will be central to our view of KM; Further, he believes that there will be an understanding of organizations as engaged in sense making through utilization of complex adaptive systems (CAS) phenomena constrained by human acts of free will attempting to order them; and finally, the use of the insights and practices of scientific management will be restricted to appropriate contexts, while 'insights and learning' from theories of chaos and complexity will supplement them in contexts where these new insights are relevant.

The third view of change, first presented by Mark W. McElroy (1999) based on work hosted by the Knowledge Management Consortium International (KMCI) and continuing

partly under its auspices since then, views first generation KM, also called 'supply-side KM,' as primarily about integrating ('supplying') previously created knowledge through knowledge distribution, sharing, and other integrative activities. It is typically associated with two well-known phrases that serve as the mantras for advocates of the 'knowledge sharing' side of KM: (1) It's all about capturing, codifying, and sharing valuable knowledge, and (2) It's all about getting the right information to the right people at the right time. The third view sees second generation KM as first appearing in the mid-90s and as being focused not only on 'supply-side' knowledge processing such as knowledge sharing, but also on 'demand-side' knowledge processing, or 'knowledge-making' in response problem-induced demands. This combined focus on knowledge integration and knowledge production is the defining characteristic of second generation KM (SGKM), or alternatively, The New Knowledge Management (TNKM). But an important aspect of it is also the recognition that organizations are permeated with complex adaptive systems phenomena, and that knowledge management in them is about using KM to enable or reinforce self-organization in knowledge processing for the purpose of achieving sustainable innovation in support of organizational adaptation.

So in light of these contrasting views the questions arise: which of the three views is correct? Are there two generations, stages or ages of KM? Is a third age about to begin? Or are there already three? Are the changes best seen as occurring along the information technology dimension? Or along linguistic dimensions such as taxonomy construction, context, and narrative? Or in terms of whether we view organizations as mechanisms, or CASs, or CASs modified by human Promethean interventions? Or just in terms of the popularity of different intervention types from one period to another? Or is change in KM best viewed as occurring in terms of the shifting focus of management on the scope of knowledge processing as identified by McElroy?

3. THE NEW MODEL OF THE ORGANIZATION IN A KNOWLEDGE-BASED ECONOMY

In the past decades, there has been a (re)birth of the principles and practices related to education, development, and learning. With the advancement of technology and the increasing complexities of the marketplace, executives began to realize that learning no longer could be isolated to the classroom. A new *community of practice* merged to focus on the learning organization. Ray Sata (1987) and CEO of Analog Devices, in a *Sloan Management*

Review article described the business implications: ‘... an organization’s capacity to learn as their only sustainable competitive advantage – especially in knowledge-intensive industries’. An entire new way to view the innovation process was born.

One way to show the relationship between these key elements of modern management is presented in Figure 1. Managers need to focus on *knowledge* as the evolution from data and information. This provides a way to describe the *content* that needs to be managed. The second focus is on *innovation* as the process. However, in this regard we are framing the process from the movement of ideas rather than the advance of technology *per se*. The *methodology*, which is the real-time *learning*, is the only way to increase the content level of knowledge and ensure business results through the full innovation process. The increasing spiral represents an accumulation of value throughout the process if both domains (*i.e.* content and process) are managed simultaneously. Anything less is a suboptimal strategy.

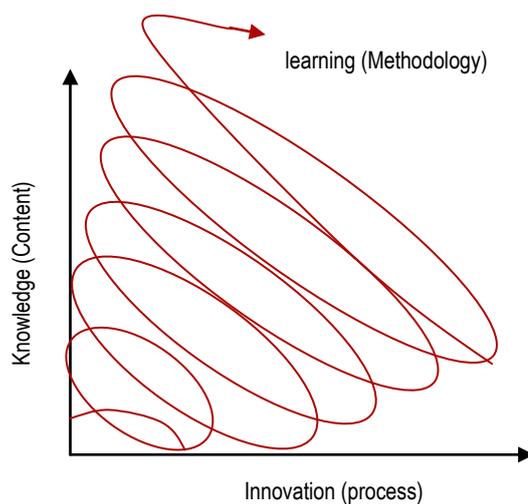

Figure 1. Integrated Focus: Knowledge and Innovation

Current market conditions are likely to intensify over the next decade. Organizations must develop new ways to incentives, capture, and utilize new ideas expeditiously. The intangibles must become measurable in both qualitative and quantitative terms. The answers are unlikely to be found in current practice. In fact, the most superior benchmarking capabilities of best practices – even in KM – can provide only signals of direction as companies try to gauge their proximity to the norms of best-in-class.

Internal knowledge of the firm refers to product and process specifications and capabilities, technology capabilities, inter-operability, reconfigurations, organizational culture, employee skill sets and leadership. The external knowledge refers to the knowledge of markets, competitors, technological trends, changing consumer preferences and others. It also refers to the knowledge present in other players in the marketplace and other collaboration mode acquires the knowledge for its own use (Ștefănescu & Ștefănescu2008).

The globalization appears when the companies, the regions, the nations and the continents are in the permanent competition in the attraction of investments, the thing that depends in a great measure on the conditions which influence the competition in the businesses. The competition in the businesses, at its turn, bases more and more on the capacity of answering promptly at the clients' needs. This thing means the control of a big volume of knowledge through the medium of the utilization of the information technology (Rodrigues 2002). Of course, the knowledge itself is not a new concept; it always is the base of the human activity. That what appears as the novelty is the rhythm in which it creates, it accumulates and it is diffused, in an economy and in a society based on a new scientific paradigm. The conditions of work and life were redefined, the markets and the institutions got a new form after the new rules and the possibilities of information exchange. More, the knowledge becomes not only the incomes source for the population, the businesses and the nations, but it also becomes a primary source of differentiation between these. In other words, although the knowledge is the key of the rising competition, it can also bear at a regress of the social cohesion and at a discrepancy more and bigger between the regions, the countries and the continents.

And now the knowledge is the key source, the human factor, which materializes a big part from the knowledge, this gets a terrain more and bigger. This thing does not lead towards a capital question: in what measure can the well trained human source counter-balance with the European populations in the continuous process of ageing?

The European leaders already have recognized that the transition towards a knowledge-based economy also implies a fundamental exchange, and that all the provocations that Europe meets must be reformulated in the light of this terror.

4. KNOWLEDGE AS STRATEGIC POINT OF KNOWLEDGE-BASED ECONOMY

From the beginning of the 70s, the most advanced economies of the world passed through a process of structural exchange, passing from the industrial economy based on the work, with the capital resources and the creation, the diffusion and the exploitation of the new knowledge. One from the main features of this exchange is the structural intension of the research activities. In the rising *knowledge-based economy*, which is also named the *learning economy*, the economical increasing depends more on the investment in the information, what bears to the increasing of the production capacity, than the traditional factors of production (Lundvall and Jonhson1994). With the other words, the knowledge brings with itself the other types of investments (Abramovitz and David 1996). Within the production function, where the knowledge becomes the basal factor, the human resources and the professional abilities play a more important role. The human factor is the key element in the creation of new knowledge and in the dissemination and their assimilation in the big sectors of the industrial, commercial and social life.

Process of generating information/ knowledge in the market

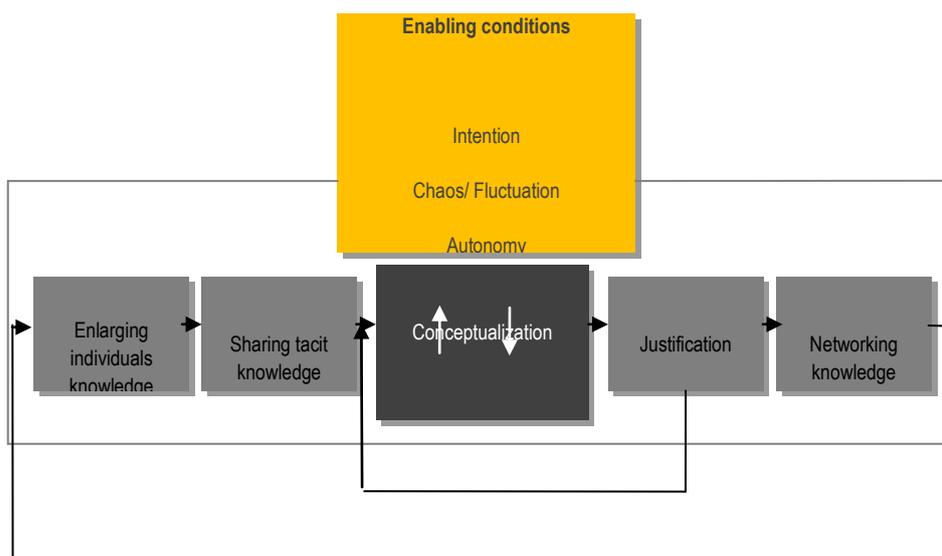

Figure 2.Organizational Knowledge Creation Process

Organizations nowadays are playing a critical role in mobilizing tacit knowledge held by individuals and provide the forum for a 'spiral of knowledge' creation through socialization, combination, externalization, and internalization. As knowledge emerges as an ever more important feature of advanced industrial development, it is necessary to pay

increased attention to the processes by which it is created and the assessment of its quality and value both to the organization and society.

The new elements of knowledge were however the source of the big economic progress in the past. The importance of the knowledge for the economical increasing was recognized in the specialty works from the last two centuries. The economists, as the historians always were conscious of the importance of the accumulation of the necessary knowledge for the rise on long term (see the classical operas Marx and Schumpeter). Abramovitz and David (1996) say that the importance of the intangible investment increased in a considerable way in the perspective. In the second half of the 19th century, the rise of the physical resources on the worked hour counted for the two thirds from the rise of the work productivity, and at the end of the 20th century represented only a fifth from this.

What is new is the movement of the production and of the knowledge dissemination. In the production process, in the accumulation in the infusion of the knowledge a fundamental exchange happens, and this thing had the bigger implications than the technical or economic implications. Without being exhaustive, we could describe the **transition process towards a knowledge-based economy** from three points of view (Lundvall2001, 45 – 60, Rodrigues 2002, 1 – 27, Soete 2002, 28 – 53, Viginier2002): the impact of the new key technologies on the process of creation, the diffusion and the exploitation of new knowledge and implicitly on the economical rise, the intensification in the production, the diffusion and in the implementation of the technological organizational and institutional innovations; the rising impact on all the aspects of the society.

■ The impact of the new key technologies

The new technologies and their crowned of success diffusion had a decisive impact on the economy and on the society. The three new technologies are staying at the base of the transition process towards a knowledge-based economy now. Essentially, there are the Information Technologies and Communications (ITC), which remained still from the 8s0. Recently, the biotechnology demonstrated that it has an increased potential and it had a recognized impact on many fields of the economic and social life. A third key technology of the 21th century is the nanotechnology. These key technologies have the revolutionary qualities. Technically, the key technologies are those which give rise to the new technologies and influence decisively those which already are existent; with the other words they have

horizontal effects on many industrial sectors, with the consequences on all the economy. They can be a catalyst for the radical technological progress, which can bear not only at the exchanges in the innovation process of the firms, but they can also have a strong impact on the society. ITC, the bio- and nanotechnology seem to have all the features of the key technologies, namely they can influence strategically the new products, the processes and the employment. Really, ITC has already had an important role, as the basal mean, of collection, of stockage and diffusion of the codified knowledge. With its help the information exchange is made easier, without the temporary or partial compulsions. It increases the efficiency of the knowledge production and it hurries the accumulation of these.

The bio- and nanotechnologies have a horizontal impact on all the industries. They generate the technologies included in a larger gamut of products and of processes, as the semiconductors of nanoscale would be which will revolutionize the information technology.

More, these technologies seem to react more and more one with the other, creating the new fields and the applications as the bio information science (*e.g.* IT which helps at the study of the genetic chain) or the nano-biotechnology. Their use more and more often in the diverse technological borders, what makes that the distinction be made harder and the products and the processes be redefined. Therefore, the rising utilization of these technologies changed significantly the perception about the innovation process in the last decade. In fact, many authors classify the innovator capacity less in function of ability of discovering the new technological principles, but in function of ability of exploiting systematically the effects of the new combinations from the cadre of knowledge already existent (David and Foray (1995)). The access at the knowledge of the already existent artistic works becomes more and more important and helps the innovators that they know the other innovators' work. In the knowledge-based economy, the scientific and technological system evolves towards a structure of the production of the more complex 'socially distributed' knowledge. After how Soete (2002) affirmed the ex-system was more based 'on a simple dichotomy between, on the one hand, the wanted learning and the generation of the knowledge (the research labs – the development and the universities) and, on the other hand, between the activities of production and consumption, where the motivation of making was not the accumulation of new knowledge, but the getting off the contrary effects'. In the knowledge-based economy this dichotomy is somewhere destructive.

With the other words, there is a bigger diversity of 'the learning organizations', where the production and the knowledge assimilation become the basal objects (David and Foray

1995, 16 – 38, Smith 2002). Moreover, Ștefănescu A. (2008) shows that organizations invest in information technology in an effort to more expeditiously gather and analyze information and to create and share knowledge that can be leveraged for improving performance.

The motivation of this paper is to draw attention to important issues of technology in capturing, codifying and disseminating knowledge throughout the organizations. It reflects the need to store not just different forms of knowledge, but different types of knowledge. However, it should be remembered that an overemphasis on technology might force an organization to concentrate on knowledge storage, rather than knowledge flow. New insights and opportunities are available to organizations if they are able to integrate knowledge across shared and different contexts.

The Internet has enabled the creation of virtual communities, networked through technologies only available just a few years ago. As the Internet is becoming the standard form of collaboration between organizations, the trend of the e-knowledge network looks set to continue. While technology can greatly enhance an organization's knowledge management strategy, it does not necessarily ensure an organization is managing its resources and capabilities in the right way. However, technology is vital to enable the capturing, indexing, storing and distribution of knowledge across and with other organizations. Knowledge is more than a fad and it is now at the centre of an organization's strategic thinking. The essence of any knowledge management strategy can be summed up by the following quote, from Drucker (Drucker (1993)'... *A company's key to success resides not so much in its work and capital as in the capacity to treat knowledge, corporate knowledge, be it explicit or tacit.*'

■ Technological, organizational and institutional innovations

It is clear that the diffusion of a knowledge-based economy represents more than a temporary intensification in the production of technological innovations in some sectors.

A bigger exchange happens in all the sectors of activity, from the manufacture and the agriculture, under the influence of the new technologies. The technological innovations invade all the economic sectors and they change our lives. More, this exchange is not only technological, but includes the institutional and organizational basal innovations, because it reformulates the rules after that the economies, the businesses and the institutions works, because of the new possibilities of changing and of exploiting of the knowledge. The

knowledge management becomes a key element of the strategically management, putting into service the relation between the marketing, the research and the production, and modifying the way in which the organization works. Beyond these organizational innovations, the diffusion, during the years 90, of the protection of the intellectual right for the new types of knowledge, was an essential innovation, because it made more attractive the instruments in the products and in the companies of high technology. During the 90s, the offices of European and American patent magnified the concept of invention which is protected by a patent, presenting the new field as the *life sciences*. From 1995, The *Patenting Office* approves inclusively the researches about the genetic chain. During the 90s it was recognized in USA and in a part of Europe, the author right at the software packet (the program of computer without the physical intervention). In the last years, the intellectual protection was extended by the businesses methods (Viginier 2002, 148 – 152).

In USA, it helped and even it stimulated the industries of software and biotechnology, the market of the high-tech actions and the creation of pilot programs by the researchers. In this context, the development of a capital market in USA, which offers the supplementary resources for the investments in the creation and the accumulation of knowledge, became a basal institutional innovation in the 90s, and it shows that the private financial sector is ready to invest in the new activities based on the knowledge.

The last ten-fifteen years were the witnesses of the exchanges of mark in the production process, as: the extensive use of the assisted production technologies on the computer, the advance in the information technologies and communication, the emergence of the new ideas concerning the organization of the firms, the exchanges in the requirements of the abilities which concern the work and in the workers' preferences for the conditions of more flexible work. Starting from this premise, of recent date, the numerous authors formulated a new paradigm of the firm. Some from these concentrated their attention on the technological exchanges and some of them found that the introduction of the new organizational practices represents the main feature of this paradigm of the exchange.

A third group concentrated, first of all, on the exchange which intervened, in the last 20 years, in the demand at the level of the firm for the force of highly qualified work and at same the time on the analysis of the factors which led at this exchange.

Milgrom and Roberts (1990) concentrated their attention on the manufactured, proclaiming the replacement of 'the production of mass by a vision of the flexible firm and by

a multi-product vision which is characterized through the quality and the big speed of answer at the conditions of the market, while they use the equipment's of advanced technologies and the implications of these for the efficiency and the performance of the firm and of the new form of organization'. The exchanges concerning the techniques of production and of the implication of these for the efficiency and the performance of the firm are the principal subjects of their theoretical analysis.

Lindbeck and Snower (2003) analyze the exchange starting from 'the taylorist organization (characterized by the charges specialization) at the holistic organization (the relation of the posts, the integration of the charges and the learning from the charges)'.

Bresnahan (2003) considers that the relative demand of force of highly qualified work being the departure point of the analysis, considering that the rising use of the complementary systems of the information technology, the placement of the force of highly qualified work within the organization and the innovative products are the motors of the technological exchanges. A central point in all the types of analysis and a common feature of these studies is the existence of the complementarities between the factors which bear at the mutual rise of their impact on the performance of the firm. From the variety of the realized investments in the knowledge field (the education, the software, the research-the development, the training, etc.), the knowledge management (KM) is the least known equally, quantitatively and qualitatively, but also that of the implied costs and of the balance of this in the profit of the organization. The motivation which stayed at the base of this study starts from the imperious need to know more about these new activities based on the knowledge, about the actual state of the KM as the organizational process between the diverse types of companies and sectors, the multitude of methods and instruments which also developed on the economic effects of the actual practices of the KM.

The denomination of knowledge-society is used in the entire world today. This denomination is an abbreviation of the term of knowledge-based society. The knowledge society supposes (Drăgănescu 2001): an extension and the thoroughness of the scientifically knowledge and of the truth about the existence; the use and the KM which is existent under the form of the technological and organizational knowledge; the production of new technological knowledge through the innovation; a dissemination without the precedent of the knowledge to all the citizens through the new means, using prevalently the Internet and the e-book and the use of the learning methods through the e-procedures (e-learning), the knowledge society has a global character and it is a globalization factor; the knowledge

society is fundamentally necessary for assuring a sustainable society ecologically; the knowledge society represents a new economy in which the innovation process (the capacity to assimilate and to convert the new knowledge for creating the new services and products) becomes determinant.

The innovation, in the knowledge society, follows the improvement of the productivity, not only the classical productivities in rapport with the work and the capital, but also the new productivities in rapport with the energetic resources and the natural materials, with the protection of the environment. Because of that the new economy supposes the encouragement of the creation and of the development of the innovator enterprises with a structure of own knowledge. Such enterprises are born from the cooperation between the firms, the universities and the governmental or public institutes of research (inclusively the academic institutes).

There were defined two big classes of vectors of the knowledge society (Drăgănescu2001): the technological vectors; the functional vectors. A vector of the knowledge society is an instrument which transforms the informational society in a knowledge society. For making the first steps in the knowledge society it is necessary the detent of a minimum number of alike vectors. The first alike vector is the creation of an developed Internet which is a technological vector, then the technology of the e-book (the technological vector) and the knowledge management, (the functional vector with two valences, one for the economical and organizational working of an enterprise, of the corporations, of the multinationals or of the companies, the other for the moral use of the knowledge in the globalized society). But the number of these vectors of the knowledge society is much bigger, every new vector bringing a step before in the development of this society.

5. KNOWLEDGE MANAGEMENT FOR ENTERPRISES, ORGANIZATIONS, INSTITUTIONS, NATIONAL AND LOCAL ADMINISTRATIONS

One from the first studies of our country regarding the KM was published by Ștefan Iancu (2001). In this study the accent is put on the notion of intellectual capital and of economical, creative and innovating organization. In the occidental literature (Thomas and Prusak,1998,Koulopoulos, Spinello and Toms 1997, Leonard-Barton 1955,Nonaka and

Hirota 1995, Thomas 1997) a series of dedicated volumes to the enterprises and to the knowledge appeared.

The problem of the management in rapport with the knowledge is looked in two ways: as the organization management which is preoccupied of the utilization and of the integration of the different types of knowledge; as the proper knowledge management. In fact, these aspects must normally joint in a general vision about the organization and the knowledge management.

The specialty literature abounds in the definitions of the KM (Earl and Scott 1999, 29 – 38.). The most referred definition of the KM is in our opinion the definition given by the *Knowledge Management Practices Survey* in accordance with which, ‘...the knowledge management implies any systematic activity regarding the capture and the diffusion of the knowledge by the organization...’ Another assimilated definition of the KM concept would be that this represents the conceptualization of an organization as integrated system of the knowledge, and the effective management of the organization uses the respective knowledge.

The information refers to the knowledge and the innovation processes and at the artefacts which tolerate them.

In this definition, the focus is put on the organization management which must in fact include KM, too. The anterior definition avoids, it is recognized, not only the KM, but especially the extremely delicate problem of the knowledge measurement. The diverse authors present the considerations about the different aspects of the KM in the largest meaning of the notion or only from one from the two mentioned points of view before. Thus, C. Grayson shows in every organization there are the hidden knowledge tanks which are not known and which must be knowledge mining, captured, organized and transferred for contributing at the rise of the value, of the profit and of the efficiency. Madhavan and Grover (1998) pay attention to the KM for the *development of new products* (DNP). The DNP management must put the accent on the processes of the cognitive groups and not on the social processes, for using the tacit knowledge of the members and for becoming interesting firstly for the members of the group. The group needs a leader who constitutes such a group. Marshall (1997) shows us that the KM refers to the control and the utilization of the intellectual capital in an organization. The author affirms clearly that not information, but the knowledge is the biggest asset of an institution. He recommends that an institution have a

Chief Knowledge Officer. This must count on the intranet of the institution for assuring the discovery and the creation of knowledge in the institution.

For Romania, the phenomena and the processes which happen on the international plan, contouring the transition from the industrial society at a new type of society, represents a chance, that of the integration in the process of transition from the industrial society at the knowledge society, without running over all the preliminary stages. The Romanian reconstruction can determine the fundamental mutation which stays at the base of this transition: the mutation from the specific institutional centre of the industrial society (the enterprise) at the institutional centre of the knowledge society, the school and the research institutes, which does not act 'from outside' of the productive system, but as the endogenous factors of the production process.

6. CONCLUSIONS

In the modern knowledge-based economies, the firms increased the individual and collective knowledge as the major factor of the economic performance. The firms were bigger and their relations with the intensive industries in the technology were stronger, they were in measure to implement the KM policies, as they promoted the culture for the information and the diffusion of the knowledge, motivating the personnel and the managers that they remain in the company, making the partnerships and the fusions for the acquisition of the knowledge, implementing the KM rules.

Another motivation of this paper is to draw attention to important issues of technology in capturing, codifying and disseminating knowledge throughout the organizations. It reflects the need to store not just different forms of knowledge, but different types of knowledge. However, it should be remembered that an overemphasis on technology might force an organization to concentrate on knowledge storage, rather than knowledge flow. New insights and opportunities are available to organizations if they are able to integrate knowledge across shared and different contexts.

The Internet has enabled the creation of virtual communities, networked through technologies only available just a few years ago. As the Internet is becoming the standard form of collaboration between organisations, the trend of the e-knowledge network looks set to continue. While technology can greatly enhance an organisation's knowledge management strategy, it does not necessarily ensure an organisation is managing its resources and

capabilities in the right way. However, technology is vital to enable the capturing, indexing, storing and distribution of knowledge across and with other organisations. Knowledge can be viewed in a number of other contexts, it is vital each is addressed if an organisation is to improve performance.

- Successful knowledge strategies depend on whether organisations can link their business strategy to their knowledge requirements. This articulation is vital to allocating resources and capabilities for explicating and leveraging knowledge.
- The competitive value of knowledge must be addressed to assess areas of weakness. Strategic efforts should be made to close these knowledge gaps to ensure the organisation remains competitive. The strategic value of knowledge should be addressed, focusing on the uniqueness of knowledge.
- Finally, an organisation should address the social aspects affecting knowledge initiatives, namely cultural, political and reward systems. Beyond the management roles proposed in the paper, the environment should promote co-operation, innovation and learning for those partaking in knowledge based roles.

ARE CONSUMERS OF HEALTHY FOOD ECOLOGY MINDED AS CONSUMERS OF HEALTHIER FOOD IN ISRAEL?

Bijaoui, Ilan¹; Dayanzada, Dana²; Vdee, Hadar³

¹Bar Ilan University, Israel, ibii@netvision.net.il

³Bar Ilan University, Israel

ABSTRACT

Healthy food consumption is a cultural trend, based on the assumption that natural ingredients have a positive impact on health. Healthier food is focused mainly around the phenomenon of obesity represented by calories, fat, trans-fat, sugar or salt. We found that the profiles of consumers of healthy and healthier food are different. The healthy Israeli consumer is ecology minded and care of the health of his children. There is no difference between both genders. The positioning of healthy products must be focused on content value related to ecology, children's health and on preventive medicine for their relatives.

The healthier food consumer has a different profile than the healthy food consumer. He is not ecology minded. Nutrition content related to obesity is the only common denominator of healthier food consumers.

Keywords: healthy food, ecology, consumer behavior, healthier content, product positioning

INTRODUCTION

Seventy nine percent of top executives in the food and beverage business agree that healthy nutrition is the key issue driving the industry forward, ahead of convenience and price growth pressure (Deloitte, 2012).

Healthy food is a global and growing trend (Nielsen, 2012; Feunekes et al., 2008; Nørgaard and Brunsø, 2009; Grunert, Willys, 2007). The desire to maintain good health is of prime concern for consumers, and they read labels in order to obtain information about ingredients, nutrition (Wills et al., 2009), and negative nutrients in food products (Cowburn and Stockley, 2005; Drichoutis et al., 2006).

Consumers in North America show the highest confidence in understanding nutrition labels. Nearly six in ten (57%) regional respondents indicated that they mostly understand the details of such labels. This result is based largely on U.S. respondents, as consumers in the U.S. appear more comfortable with the labels than are Canadian consumers. Fully 58% of U.S. respondents report mostly understanding the information, compared with 49% of Canadian respondents (Nielsen, 2012).

Eight in ten Americans make an effort to eat healthfully; 42% are highly concerned with the nutritional content of the foods they purchase (FMI, 2011a,b). The overall U.S. healthy foods sector has sales of approximately \$140 billion (NBJ, 2011a). Nine in ten American consumers agree that processed foods are not as healthy as fresh foods (MSI, 2010). In 2011, 56% switched to whole-grain bread, 42% to whole-grain pasta, and 39% to whole-grain rice (FMI, 2011a). Forty seven percent stopped buying foods they perceive to be unhealthy, and 46% buy new healthy products that they have not bought before (FMI, 2010). Sales of organic food reached \$23.4 billion in 2010, and natural food sales were \$18 billion (NBJ, 2011).

European consumers are split, with 45% reporting a strong understanding of nutritional labels. Sixty percent of Portuguese respondents largely understand nutrition labels, the highest percentage for any country reported in the study. Similarly, at least half of respondents mostly understand food labels in Italy (59%), Denmark (53%), and Spain (50%). French consumers are the least likely to understand nutrition labels, with only 31% (Nielsen, 2012).

The Asia Pacific region has the lowest percentage of consumers with a full understanding of nutrition labels, and only 31% are mostly comfortable with this information. One fifth of consumers in Taiwan and Hong Kong and one quarter of respondents from China and South Korea indicate that they mostly understand nutritional labeling.

Customers driven by emotions buy and consume healthy products Customers driven by brain buy healthier products (Kemp and Kopp, 2011; Garg et al., 2007). A reduced-salt snack is better than a fully salted snack, but it remains a salty product (GulAygen, 2012). By healthy food, top executives in Deloitte's research refer to both healthy and healthier foods.

Few studies tried to analyze separately these two growing markets in order to adapt products to the two different consumers' profile.

Food manufacturers are satisfying the consumers' desire for healthy and healthier versions of their products (Dawson et al., 2008; Golan et al., 2009). General Mills launched

FiberOne, Kellogg of Kashi, a healthy product. The introduction of Smart Balance by GFA Brands (Grunert and Willys, 2007) is a move to offer mainly healthier versions of existing products.

The objective of the present research is to analyze the profile of the consumer of healthy and healthier food in Israel, and to compare it with similar consumers in other countries.

NEW FOOD TRENDS

A majority of consumers worldwide agree that there are benefits to eating healthy foods such as whole grain/high fiber foods (71%), yogurts with acidophilus cultures/probiotics (63%), or healthier products such as iodine-enhanced cooking salt (58%) and cholesterol-reducing oils and margarines (56%) (Nielsen, 2012). Regional differences reflect customs and traditions. Soy milk ranks fourth on the list of products purchased regularly and occasionally in Asia Pacific, and tenth or lower in Europe, the Middle East, and North America. Cholesterol-reducing oils and margarines are more popular in Latin America (73%), the Middle East/Africa (71%) and North America (64%) than in other parts of the world.

Healthy products meet a demand by consumers seeking natural foods in order to prevent major risk factors for a range of chronic diseases, including cardiovascular diseases, cancer, and diabetes (WHO, 2011). Fifty eight percent of American consumers buy healthy products in order to prevent diabetes, 57% to loose excess weight, 56% to prevent high cholesterol, 48% to prevent digestive disorders, 46% to lower the risk of cancer, and 42% to prevent cardiovascular damage (Hartman, 2010). Cocoa/dark chocolate is now in the top quintile of consumer ingredients of high interest/awareness, on par with antioxidants, vitamins/minerals, omega-3s, and whole grains (HealthFocus, 2010). Young adults aged 18-24 remain the top users of functional foods and beverages (Mintel, 2009). Oatmeal and yogurt are the products most frequently purchased for their specific health benefits (Packaged Facts, 2012).

Fifty percent of consumers deliberately avoid preservatives, 49% MSG, 47% artificial flavors, 44% colors/dyes, 43% hormones/antibiotics, and 29% genetically modified organisms (GMOs) (Hartman, 2010a). Two-thirds of moms monitor their children's diets very closely; 60% of families practice some form of healthy eating strategy (MSI, 2010; FMI, 2010). More than one-third make a strong effort to increase their child's consumption of calcium,

vitamins/minerals, whole grains, protein, and vitamins C and D; 24% are working to increase fiber intake, 20% omega-3s, and 18% probiotics (MSI, 2010).

Saturated/trans fat was at the top of consumers' "to avoid" list. Fifty nine percent of shoppers considered information about both to be highly important. Next on the list is fat content, which is very important to 56% of consumers, followed by salt/sodium at 52%, calories at 48%, and chemical additives at 47%.

Dietary supplements are a key indicator of interest in individual nutrients concerning fortified foods, and their use is at an all-time high: 69% of adults took a supplement in 2011. Among users of supplements, 53% took them regularly, 36% used a variety of them, and 71% took a multivitamin (CRN, 2011). Omega-3/fish oil passed calcium last year as the second most-used supplement; calcium was tied with vitamins D and C for third place.

Organic foods belong to this category. Organic products are pesticide-free, hormone-free, contain no chemicals, no pollutants, no antibiotics, and no genetically altered organisms. Consumers of organic foods support "non-mass marketed" products (Zahaf, 2009; Fotopoulos and Kryskallis, 2002; Larue et al., 2004; Wier and Calverley, 2002; Grankvist et al., 2007).

Some studies have demonstrated the effects of organic foods. For example, an organic diet may reduce the risk of Parkinson's disease (Baker, Thompson, and Engelken, 2004), whereas consumers of products exposed to pesticides had a 1.6 times greater risk of developing Parkinson's disease (Baker, Thompson, and Engelken, 2004).

Scholars have profiled organic buyers in order to describe who they are and what their purchase intentions are (Davis et al., 1995; Fotopoulos and Krystallis, 2002; Roddy et al., 1994). Based on observation of the organic food industry, Tutunjian (2004) noticed that organic consumers share attitudes and values rather than demographics. The socio-economic profile of organic food consumers shows that organic purchasing grows as consumers reach into their 30s and have no children.

People who are among the highest spenders on organic food are on average more affluent and younger (Padel and Foster, 2005), well-educated, professionals or white collar workers, willing to pay a premium for organic foods and ecology minded (Hamzaoui-Essoussi and Zahaf, 2012).

Choosing to feed an organic diet to a baby is said to have many health benefits, including lowering a baby's risk of asthma and allergies, decreasing the chances of being selective or picky eaters, improving the baby's digestion and immune system, and decreasing exposure to toxic chemicals (Protecting the next generation, 2009).

Consumer behavior with respect to healthier products is related mainly to obesity. In 2011, low-fat/fat-free remained the largest selling products related mainly to obesity but including also lowering a baby's risk of asthma and allergies, decreasing the chances of a child being selective or picky eater, and improving the baby's digestion and immune system

. In 2011, low-fat/fat-free remained the largest "avoidance market" (i.e., nutrients consumers are seeking to avoid) in supermarkets, with sales estimated at \$46 billion; sales of reduced-calorie products were \$10.4 billion, and sales of low sodium/ low-salt offerings totaled \$10 billion (Nielsen, 2011).

The market for healthier products is broader than that for healthy foods. More than half (53%) of consumers worldwide consider themselves to be overweight, up from 50% three years ago (Nielsen, 2012). The worst situation is in North America with 63%, and in South America and Europe with 58%. According to 70% of global online respondents, the most popular way to shed unwanted weight is cutting down on fats. Trimming back on chocolates and sugary foods (62%) and eating more natural, fresh foods (55%) round out the top three ways in which consumers are changing their diets.

During the period 2007-2010 we observe significant changes in the obesity trend in Europe. Excess weight affects 30-70% and obesity 10-30% of adults in EU countries. Among children of primary school age, the highest prevalence of excess weight (based on Cole et al. cut-offs and measured data) was found in Italy (8-9 years, 35.9%), Portugal (7-9 years, 31.5%), and the Czech Republic (6-10 years, 30.6%); the lowest rates were found in the Czech Republic (11-14 years, 14.1%) and France (7-9 years, 15.8%). Surveys based on self-reported weight and height found a prevalence of excess weight of 21.8% in Belgium (5-9 years) and 19.5% in Sweden (8 years) (WHO, 2011)

The positioning of healthy food as healthier food could extend the market to incorporate a wider range of customers.

CONSUMER SEGMENTATION

A worldwide survey has found that around a quarter (24%) of the shoppers worldwide always check the nutrition information on the packaging, and 37% check when considering purchasing a product for the first time (Nielsen, 2009). In European countries these values were lower: 18% and 34%, respectively. Significantly more women than men pay

attention to the list of ingredients, nutritional grid, and nutritional claims. According to the UK Food Standards Agency (2011), the ingredients and nutritional value of a product were checked by significantly more respondents with higher education levels than by those with lower education. Moreover, high-income consumers were more interested in the list of ingredients than low-income consumers were.

With respect to the information that consumers look for on a nutrition label, the most frequently mentioned items of information across various studies were calories (Grunert and Wills, 2007; Misra, 2007; Grunert et al., 2010), fat, sugar, and salt (Grunert et al., 2010). These are the characteristics of the healthier food consumer. Less requested was information about iron (Marietta et al., 1999; Misra, 2007), dietary fiber (Marietta et al., 1999; Misra, 2007; Grunert et al., 2010), and vitamin A (Marietta et al., 1999; Misra, 2007), characterizing the healthy food consumer.

In March 2006, after several years of preparatory research and consultation with stakeholders in the food industry, the UK Food Standards Agency (FSA) (2011) announced a scheme for front-of-pack labeling using color-coded signs. The FSA allowed supermarkets and manufacturers to develop their own label designs with an individual look and feel, but recommended that the schemes should comply with four core principles: information about fats, saturated fats, sugars, and salt (which is the information sought by consumers of healthier food).

Unilever has developed a single-score system for the healthier market segment that combines points based on six factors: trans fat as a percentage of energy, saturated fat as a percentage of energy, fat quality as a ratio of saturated to non-saturated fat, salt per unit of energy, total sugars per unit of energy, and added sugar as a percentage of weight (Nijman et al., 2007). Positive points are assigned for beneficial components, such as dietary fiber or fruit and vegetable content for the healthy market.

PURPOSE OF THE RESEARCH

Food companies agree that healthy and healthier food is a growing market with a potential for high profit (Nielsen, 2012). In each country the maturity of potential consumers and their behavioral profile changes according to local culture and openness to new trends. In the present research we propose to compare the profile of the healthy and healthier food consumer in Israel with that portrayed by the research studies cited above and their attitude about ecology.

Hypotheses

If we assume that the Israeli consumer of healthy or healthier food has the same profile as similar consumers in developed countries, the following hypotheses must be proved:

H1: The customer of healthy food in Israel is ecology minded. educated and affluent (average-high income), a woman, prefers fresh products and is single.

H2: The customer of healthier food is mainly a woman with high education, medium-high income, interested in nutritional content.

The sample

The sample has been randomly selected at Tel-Aviv and surrounding region. We selected participants within a medium-to-high economic and educational level who were more than 23 years old, students in Bar Ilan university or related to them: family or friends.

We explained to the interviewees the objective of the research. The majority, around 80% completed the questionnaire immediately. Others returned them to us by mail. Ten questionnaires were not fully completed and were not included in the study. The final sample included 160 questionnaires.

Questionnaire and Variables

The questionnaire contained four groups of variables:

The first group included personal data: gender, marital status, number of children, age and salary.

The second group included food consumption habits: expenditure for food, scope of products, purchasing frequency, brand, price, nutrition, fresh products, ecology.

The third group was related to healthy food: fiber, no trans fat, no cholesterol, no sweetener, no preservative, minerals, iron.

The fourth group was related to healthier food: low calorie, low fat, low carbohydrates.

Responses were graded on a 5-point scale ranging from 1 (not important) to 5 (very important).

Dependent Variables

The two dependent variables were:

HF: Healthy food – sum of scores assigned to each variable belonging to the third group.

HRF: Healthier food – sum of scores assigned to each variable belonging to the fourth group

We used the sum of scores for each group of variables because we were interested to take in account the different relative importance of each variable in the group of variables by each one.

RESULTS AND DISCUSSION

Based on former studies cited above, we assumed in both hypotheses that women tend to be more responsive to healthy and healthier food. This turned out not to be the case of Israeli consumers. Both men as women, whether more or less educated, are consumers of healthy and healthier food.

According to the first hypothesis the consumers of healthy food are assumed to be single with higher income, ecology minded, and with a preference for fresh products. Israeli consumers of healthy food have a higher income (Income), care about ecology, consume fresh products (Fresh), but are concerned with healthy food because they have a family and children (Nchildren).

Their level of expenditure (Expenditure) for food is higher than average and they consume a wider range of products (Scope) than their lower-income peers (Table 1).

The first hypothesis was partially rejected. The higher income and ecology variables were the only ones that were positively correlated with healthy food in both the international and the Israeli cases.

Table 1: Correlations between Healthy and Healthier variables and customer's profile variables

		Healthy (HF)	N. children	Ecology	Income
Healthier (HRF)	Pearson correlation	.092	-.018	.025	-.119
	Sig. (2-tailed)	.245	.826	.754	.134
	N	160	160	160	160
Healthy (HF)	Pearson correlation	1	.229	-.182	.256
	Sig. (2-tailed)		.004	.021	.001
	N	160	160	160	160

		Fresh	Nutrition	Expenditure	Scope
Healthier (HRF)	Pearson Correlation	.094	.249**	-.079	-.029
	Sig. (2-tailed)	.238	.001	.322	.719
	N	160	160	160	160
Healthy (HF)	Pearson Correlation	.191	.032	.180*	.173*
	Sig. (2-tailed)	.016	.692	.023	.029
	N	160	160	160	160

Consumers of healthier food have a different profile, and the only significant variable is their interest in nutritional content.

In the following regression, three independent variables, number of children, the habits of buying fresh products, and the attitude toward ecology,, confirm their positive correlation with the healthy behavior attitude (Table 2). The second hypothesis was partially confirmed because of emphasis on nutritional content.

Table 2: Regression between HF and customer profile variables

R ² adjusted: .108		B	Std. Error	Sig.
	(Constant)	14.761	1.955	.000
	N. children	.371	.118	.002
	Ecology*	-.464	.181	.011
	Fresh	1.022	.407	.013

*1 was the highest mark and 5 the lowest

A healthier behavior attitude as the dependent variable is explained only by the independent variable, Nutrition content (Table 3)

Table 3: Regression between HRF and customers's profile variables

R ² adjusted: .056		B	Std. error	Sig.
	(Constant)	7.376	.302	.000
	Nutrition	.323	.100	.001

The profile of the Israeli customer of healthy products differs from the "classic" profile described in the studies cited above. More than in the past, families care for their children from the point of view of their security, but also of their health. The number of children in Israel is the highest among OECD countries, close to 3 per family, compared with an average of 1.74 in OECD countries (OECD, 2011). This may be the result of the survival effect of the Holocaust and of the conflict situation in the Middle East today. In Israel, children have become one of the main motivations for buying healthy food, especially in

young families. These families are prepared to spend more money on food and prefer to buy fresh products.

The profile of the Israeli consumer of healthier food is similar to the international one. It can be a man or a woman, with low or high income, and with low or high education. The only parameter of interest to the consumer of healthier food is nutritional content.

CONCLUSION

Positioning of healthy products in Israel must focus on content value related to ecology, children's health and on preventive medicine for their relatives. This is probably true of other countries as well. The issue is the care for their health. In developed countries a lower number of children may also correlate with their health as expressed by MSI (2010) for the American consumer: "two-thirds of moms monitor their children's diets very closely". Firms in the food market should conduct research in this area. As in other researches, consumers of healthier food consume also more fresh products and are ecology minded.

The healthier food consumer has a different profile than the healthy food consumer. He is easier to persuade to purchase a product by outlining its nutritional content, mainly related to weight loss. Symbols on the label, as suggested by the UK Food Standards Agency could be the best way to arouse the interest of this group of consumers.

ENTREPRENEURSHIP AND "CLUSTERIZATION PROCESS" IN THE TOURISM AND AGRICULTURE SECTOR*

Bijaoui, Ilan¹; Regev, David²

¹Bar Ilan University, Israel, ibii@netvision.net.il

²International Business and Innovation Institute

ABSTRACT

The development of a cluster in rural areas requires appropriate environmental and human capital conditions. Our research shows that businesses at the "family care" level of entrepreneurship attempt to establish new trends in business and are open to improving their entrepreneurial level. Entrepreneurs at three of McClelland's entrepreneurial levels are ready to invest in their own businesses and to cooperate with other businesses. The "need for power" level is even ready to seek external sources of financing. "Connectors," those able to transfer knowledge, are strongly entrepreneurial, ready to take risks, and to pursue new trends in business. But "mavens," who have knowledge, are not ready to share their business knowhow with other businesses. "Salesmen," those able to transform knowledge into added value, belong to the family care entrepreneurial level and are ready to take risks in order to improve entrepreneurship in family business.

Missing in the Western Negev is the networking between businesses, which is needed to create common interests. An open incubator can fill this gap by improving current business activities and generating new, common business activities; supporting connectors and salesmen in their advancing family care businesses; improving efficiency; and supporting mavens by a wider transfer of knowledge using research centers and relevant training programs.

Keywords: entrepreneurship, cluster, value chain, networking, rural development, open incubator, tipping point

* Research funded by the Small and Medium Enterprise Authority, Ministry of Economics, Israel

INTRODUCTION

Entrepreneurship in rural areas is a challenge in many developed countries. Because farms require increasing means of production (land, machinery, irrigation, etc.) in order to compete, the agricultural workforce is leaving the agricultural production cycle, which necessitates the development of business initiatives in other areas. The rural population of the European Union decreased by 0.8% between 2010 and 2011, compared with a 5.8% growth in the urban population (Eurostat, 2012). To keep the balance between village and town, the EU initiated a program called Leader +, which aims to help develop projects that provide employment in rural areas. Dozens of projects have been approved to be implemented and supported by this program. In a recent document, the European Commission indicated that despite various programs that encourage employment in the rural areas, these areas represent only 17% of all areas of employment growth in the last decade (2012, EU).

The percentage of the rural population in Israel is changing slowly. In 1995, about 510,000 people lived in rural areas compared with about 640,000 in 2010, an increase of 25%. By contrast, the urban population grew from 5.1 to 7.0 million, an increase of about 37%. In the south of the country the situation is worse. Between 2009 and 2010, 72,000 people left the region, compared with 68,000 people who arrived (CBS, 2011), a net loss of 4,000 people.

Existing rural entrepreneurship in the Western Negev is not capable of jumpstarting economic development. The share of earnings from agriculture in household income is decreasing. Industry creates almost no new employment and during the hot summer months tourism is weak.

STUDY OBJECTIVE

The objective of the study is to determine whether the existing entrepreneurial level is able to generate the development of clusters in two main rural sectors of this region, agriculture and tourism, and under which conditions.

ENTREPRENEURIAL THINKING

According to Schwab (2011), entrepreneurship is the innovative fuel that generates employment and economic growth. To promote entrepreneurship, it is necessary to combine economic, social, and cultural activities (Hart, 2003). Wennekers, Uhlaner, and Thurik (2002)

and Peña et al. (2010) distinguished between activity at the level of the entrepreneur (supply side) and that of the business environment (demand side). At the level of entrepreneur, they refer to the ability to establish and develop businesses and examine the entrepreneurs' priorities, education and training, skills, and knowledge. At the business environment level, they refer to environmental conditions that create opportunities for entrepreneurship, such as culture, taxation, R&D, capital, health, economic development, immigration, science and technology, and aid organizations.

The connection between the entrepreneur and business environment levels requires the implementation of a model that supports and encourages appropriate networking between entrepreneurs, and a supportive and nurturing business environment. First, we examine the studies that deal with the profile of the entrepreneur (supply side) and discuss ways to promote entrepreneurship that generates economic development. Next, we consider the business environment (demand side) and the models implemented to promote economic development based on the promotion of entrepreneurship.

The literature on entrepreneurs focuses on aspects of their cognitive perceptual ability and the degree of risk they are willing to take (Pena et al., 2010). Craid (1992) referred to communication skills, analytical skills, knowledge, and the ambition of the entrepreneur. Kurilsky (2000) stressed the entrepreneurial spirit that directs the entrepreneurship. Shane and Venkataraman (2000) emphasized the importance of the combination of identifying an opportunity and realizing it as a major factor in the success of entrepreneurship. According to Wennekers and Thurik (1999), entrepreneurial ability becomes stronger with increasing intensity of activity, level of innovation, willingness to take risks, competitive aggressiveness, and desire for independence. The greater this capability, the better the business results (Keh et al., 2007; Stam & Elfring, 2008; Wiklund & Shepherd, 2005) and the stronger the business growth (Moreno & Casillas, 2008) are.

McClelland (1961, 1977) focused on the motivational potency of distinct levels of self- and social actualization. He calls the first level of motivation beyond necessity the "need for achievement." This level requires personal responsibility, calculated risks, performance feedback, and task accomplishment.

The second level of motivation is defined as "need for affiliation," requiring the "approval" of the community and conformity with its "wishes and norms." The third level of motivation is characterized by the "need for power" to exercise control and maintain leader-follower relationships. Bijaoui (2011) showed that some participants in the Songai (Benin) training

programs had the capability to achieve the first and the second level and a few of them the third level.

Gilad and Levine (1986) and Verheul et al. (2010) distinguished between necessity entrepreneurship and business entrepreneurship. They claimed that the former, defined by them as “push theory,” affects economic development only slightly, whereas the latter, defined as “pull theory,” has a more meaningful effect on economic development.

Bonnet, Nelson, and Le Pape (2011) showed that in the 2007-2011 period 10% of initiatives accounted for 50% of new employment (business entrepreneurship). This means that if we want initiatives to have a greater impact on economic development we must identify and encourage entrepreneurs who have a greater ability than others to influence economic development, in other words, entrepreneurs who are business- and not necessity-minded. Gladwell (2000) argued that socio-economic phenomena can spread like an epidemic if specific entrepreneurial and environmental conditions are fulfilled: those defined by the law of small numbers, stick factor and context.

The law of small numbers is based on three elements: maven entrepreneurs, those in possession of knowledge; connector entrepreneurs, those capable of transferring knowledge; and salesman entrepreneurs, those able to transform knowledge into added value. A small group of mavens and connectors is likely to affect a large number of salesmen and through them create a viral process of economic development.

Giacomin et al. (2011) examined common types of entrepreneurship in 27 countries and found that the share of business opportunity entrepreneurs among new businesses is largest in the Scandinavian countries (Sweden, Norway, Denmark, and Iceland) and in Anglo-Saxon countries (Britain, the U.S., and Ireland), followed by France, Germany, Italy, Belgium, and the Netherlands. Necessity entrepreneurship is more characteristic of European Mediterranean and Eastern European countries.

Entrepreneurship education greatly affects the number of initiatives, in particular the number of business entrepreneurs. Fayolle and Gailly (2009) demonstrated that the introduction of programs for entrepreneurial education to engineering schools increased the rate of business entrepreneurship among students. Research by the Kauffman Center clearly shows that students who completed their entrepreneurship studies are more successful in sales and in the volume of employment they create.

Entrepreneurship education affects entrepreneurship capacity differently for different entrepreneur profiles. The Center for Entrepreneurship at Kingston University studied the effect of the Bright Future training program on the entrepreneurial capacity of trainees (Athayde, 2010). The enrichment program has significantly increased the desire of trainees to become business entrepreneurs: 71.4% of participants in the training program were convinced that they had the skills to start a business, compared with 42.4% before the training. For trainees aged 20-30, the training program had a significantly positive effect on creativity and the willingness to take risks. The desire to work in a team, however, was strengthened at the expense of readiness to lead, especially among those aged 31-44. Strengthening of creativity was particularly evident in trainees with education in social sciences and the arts.

MODELS FOR ECONOMIC DEVELOPMENT

A cluster is defined as a "geographic concentration of competing, complementary, or supporting firms that develop sale-purchase relationships, use the same pool of technologies, and share customers and existing human resources pools." Firms in a cluster develop competitive advantages based on human capital, the knowledge generated in the environment, and local and international demand (Porter, 1990, 1998). But in order to generate a cluster, business entrepreneurship and an "ignition process" initiated by private interest or a public organization are needed.

The incubator as the starting point of a cluster

The Silicon Valley cluster started as a technological incubator established by the University of Stanford in the early 1950s. Creative enterprises such as HP and Intel were established there in 1967 by former Fairchild Semiconductors employees. The area became a point of attraction for small and large companies alike specializing in the same fields, such as Sun and Apple.

The biotechnology cluster in San Diego developed around the university and research institutes: the Salk Institute, Scripps, and the University of California, San Diego. The initiative began in 1965 with the establishment of Torrey Pines Mesa biotech, which operated as an incubator. The development of the area into a cluster began with the entrepreneur Ivor Royston, who in 1978 founded the company Hybritech, to be acquired in 1986 by Elli Lilly (Bennett, 2008). The success of the Silicon Valley and San Diego clusters is credited largely to the creative entrepreneurship of isolated individuals, at the beginning of their way, who persuaded developers and other firms to follow them.

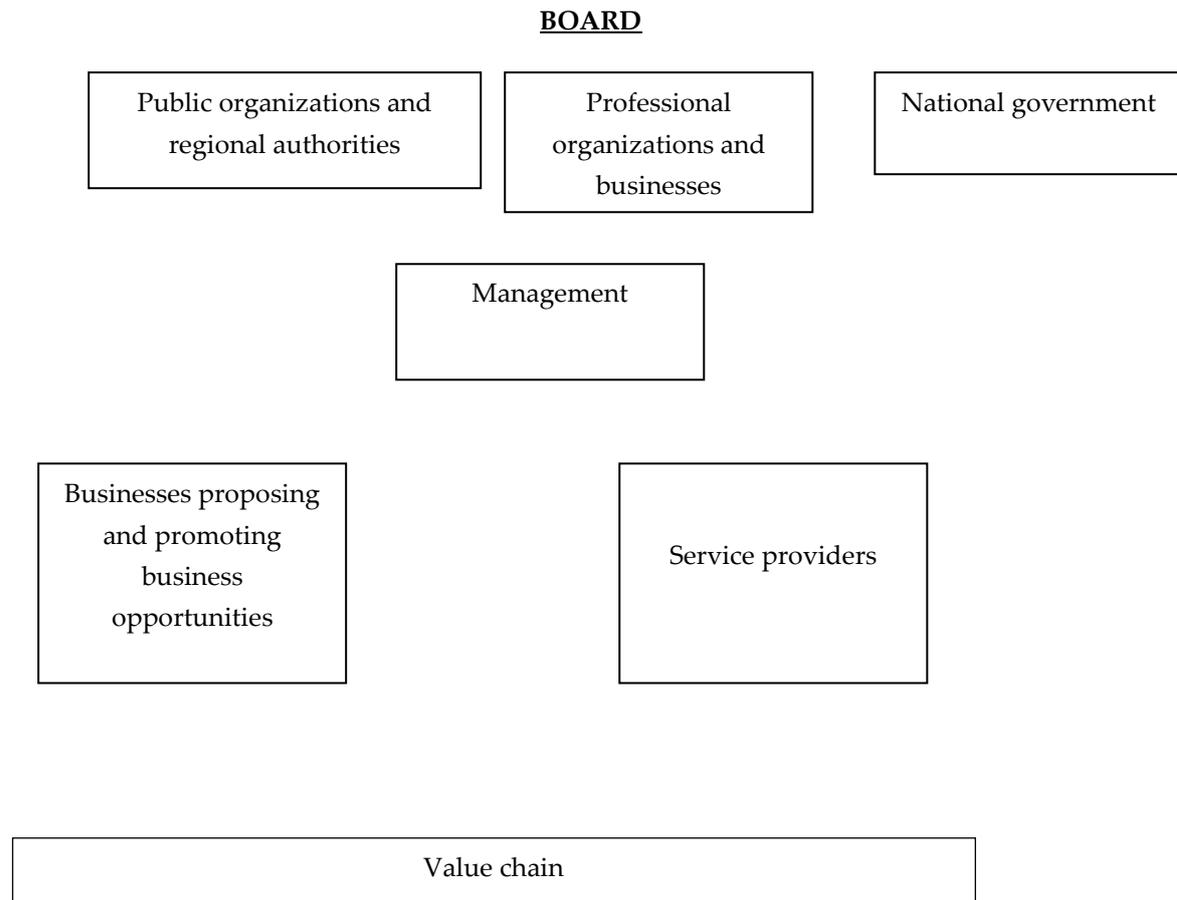

Government policy initiating a cluster

Cluster development in Europe is the result of government initiatives in cooperation with local authorities (European Union, 2007). Programs such as EXIST and BioRegio in Germany are the result of federal and regional decisions to support the development of specialized clusters (Colovic-Lamotte & Tayanagi, 2004). The Finnish government supported the networking program "Networking" as a first step, which later developed into specialized clusters in the field of communications in Turku and Oulu. Companies such as Nokia and ABB were part of the same network (TEKES, 2005). Since 2001, the Japanese government has implemented a new policy presented in the Industrial Cluster Plan (METI) and the Intellectual Cluster Plan (MEXT) (Colovic-Lamotte & Tayanagi, 2004). METI includes 19 projects in local clusters, including those dealing with metal parts for machines and parts for aircraft (Higashi-osaka), manufacturing of original equipment for the environmental industry (Hitachi), as well as clusters related to ceramics and metals. MEXT acted primarily to expand the budget of universities and to improve the infrastructure and human resources for technology transfer and patent strategy.

Open incubator as the generator of a cluster

Regular incubators create a temporary framework for new small businesses and support a limited number (several dozen) of them. The businesses belong to different business areas, and there is no basis for cooperation between them. At the end of the process, which lasts one or two years, every business must cope with the business environment outside the incubator. It took several years for Stanford incubator and for the San Diego Institute for Research and Development of Torrey Pines Mesa to generate a cluster.

The open incubator (Bijaoui & Tarba, 2012) handles existing and new businesses that belong to the same business area, located in their natural setting. It guides the individual business as a regular incubator would, and it supports the business sector along the entire value chain. The structure of the open incubator is as follows:

The Board represents the interests of the region and of the selected business sector. Management establishes the networking between the businesses belonging to the same value chain and proposes common initiatives related to business opportunities or common business activities. .

Ketels (2004) specified the following conditions for the success of a "clusterization process:"

- Taking advantage of proximity for cooperation
- Linkages between the firms' activities to advance common goals
- Active interaction between firms in the cluster
- Critical mass of firms required to accomplish significant achievement

Rural "clusterization process"

In the Lublin area in Poland farmers organized into 110 groups of related industries, and together they market their agricultural produce (fruits and vegetables) to retailers in Poland and the European Union (Walukiewicz, 2003). Also in the Lublin region eight different associations of related industries were established, with various specializations in the field of agricultural tourism, including a hospitality industry with a flavor of local culture and folklore, and manufacturing products such as local fabric for tourists. The association, Ziemia Lubartowska (The Lubartow Country), combines the roles of a common board and management for the different open incubators.

Maniwa, in the north of Okayama in Japan, is an area 80% of which is covered by woods. In 1992 a group of 20 people concerned by the aging of the population and the need for renewal of the traditional industry (Anbumozhi, 2007) initiated the clustering process based on 34 timber plants, 16 plants for drying wood, and dozens of factories producing furniture. Their goal was to establish ecological industries based on wood-processing waste, manufacturing ethanol for the production of energy, cellulose, and construction materials. About 75 small and medium-size firms now specialize in these fields. The local university collaborates with the University of Tokyo in developing knowledge in the field of energy. The area has become a center specializing in energy and has attracted investment and other entrepreneurs.

In Udine, Italy, the manufacturers of wooden chairs in 11 local councils, consisting of more than 1,200 businesses, organized the Italian Chair District as a collective, flexible, and efficient network that combines contemporary influences with local culture. The management of the District acts as an open incubator for part of the value chain (chair manufacturing), and emphasizes common promotional activities. Most businesses employ fewer than 20 employees. A total of 14,000 workers are employed and 250 exporters operate in the cluster.

In 1865 in the U.S. state of Vermont, the first cooperative specializing in the production of cheddar cheese was established. Since then, cheese producers have multiplied in the region. In 1998, the Vermont Cheese Council, the board/management of the open incubator, organized support for cheese manufacturers by the transfer of knowledge from the Vermont Institute for Artisan Cheese and from the local university in training, research, and technical services.

In the southeast of Ohio eight counties organized together and formed the Appalachian Center for Economic Networks (ACENet), a kind of open incubator for the purpose of

developing a "clusterization process" based on processing of agricultural products. From an initial number of about 12 specializations, today they have reached 100. The ACENet Development Center includes a kitchen incubator and a farmers' market. It created a common brand and helped develop find new markets. The opening program, Entrepreneurship in Action, funded by the Appalachian Regional Commission, enables expansion of the clusterization process into packaging, tourism, and the arts.

Networking in the cases cited above was generally initiated by the businesses and supported by local authorities or public institutions: universities, research institutes, or professional associations. They encouraged the activities of the businesses and provided solutions in the areas of training and technical or business knowledge. The degree of support provided by the authorities varies between cases. In the case of Maniwa, 75 firms producing goods from waste wood decided to create a network. The main support from a public institution was provided by the local university in collaboration with the University of Tokyo.

In Udine chair manufacturers have created a network of cooperation among themselves and co-opted the local authorities and public institutions to establish the appropriate supporting infrastructure. In Vermont the networking initiative originated with the cheese makers, and local authorities supported them through the establishment of the Cheese Committee. In Ohio eight local authorities self-organized and together formed a network of producers of processed agricultural products. The authorities initiated the creation of a joint brand.

ENTREPRENEURSHIP AND "CLUSTERIZATION PROCESS" IN THE RURAL AREA OF THE WESTERN NEGEV

Tourism generators

Crouch and Ritchie (1999) developed a complementary approach to the traditional approach to tourism based on local attractions (destination attractiveness) using the concept of destination competitiveness. It is based on four elements: qualifying determinants (location, dependence, safety, cost), destination management (sources, marketing, organization, information, service), core resources and attractors (physiography, culture and history, commercial ties, mix of activities, special events), supporting factors and resources (infrastructure, accessibility, supportive resources, and initiative). Kim and Wicks (2010) distinguished between local, natural, and historical attractions (endowed resources), and

centers that have evolved over time (created resources) such as festivals or other special events.

The hospitality area in the Western Negev evolved around three endowed resources: desert nature, historical sites, and religious sites. The created resources, such as special events, developed around the endowed resources (Figure 3).

Endowed resources

- Desert nature

A wide variety of changing landscapes over a small region, desert flora and fauna, many paths in the area that offer various field trips. At the edge of the area there are hot springs that create an environment of relaxation and the possibility to develop paramedical treatment options.

- History

The main historical sites are those of early Jewish settlement in the region and heritage sites connected to the battles of the War of Independence and its aftermath. At the edge of the area there are the ancient historical sites from the times of the Nabateans who controlled the incense route. The remains of four cities are left in the Negev, as well as several fortresses, khans, milestones, portions of ancient roads, remains of ancient agriculture, and waterworks that were declared a World Heritage Site.

Created resources

- Nature and the blooming season

February to mid-March is the blooming season in the Negev. The Red South Festival takes advantage of the period of the anemones in bloom and of the pleasant weather to offer a range of activities that attract domestic tourism to the Negev, among them organized tours, open markets of local produce, including cheeses, fruits, and vegetables, music shows, and more.

- Nature and agriculture

There are larger tracts of land in the Western Negev where potatoes are grown. These gave the impetus for a Potato Festival that takes place each year in April, during Passover. The festival includes tours of the potato fields, cooking shows and

demonstrations, activities and workshops for children, potato characters, street theater, and a farmers' market.

- Religion

Netivot in the Western Negev has become a cultural and educational center of the ultra-Orthodox community, especially the Mizrachim, thanks to the activity and the graves of famous rabbis who made their residence there. The most famous among them are Baba Sali (Rabbi Israel Abuhatzzeira), Baba Shalom (Rabbi Shalom Ifergan), and his son Rabbi Yaakov Ifergan. These centers have become a focus of attraction to a wide public.

Agriculture generators

In the Western Negev, kibbutzim, which are cooperative structures, are responsible for most of the production of crops, mainly potatoes and carrots. Moshavim, private structures, specialize mainly in vegetables, particularly tomatoes, peppers, and fresh spices. At present, no large agricultural organizations are operating in this area, as they used to in the past. Some of the growers are organized and cooperate in selling their produce. Most of them must deal with the local market, a cartel of large retail chains and wholesalers. More than 100 export companies are active in the international market, but few have been able to guarantee stable revenues for the growers.

Human capital and the feasibility of the open incubator in tourism and agriculture

Our research is focused on two main and related issues: whether the required entrepreneurial capabilities are present in the region, and how the open incubator must proceed in order to generate a "clusterization process."

The sample

In the agriculture sector we have identified approximately 500 growers in the Western Negev. Of these, we have selected randomly 53, 13 of which specialize in field crops and 40 in vegetables. In tourism we have selected a sample of 62 businesses, representing 35% of the business population in various specializations: guest houses, agro-tourism, attractions, restaurants, and catering. The total sample contains 113 businesses.

Agriculture	Sample	Estimated Population	%
Field Crops	13	40	33
Vegetables	40	460	8
Total	53	500	10

Tourism	Sample	Estimated Population	%
Guest house	23	44	52
Agro-tourism	8	23	35
Attractions	17	64	27
Other	12	60	20
Total	60	176	31

The questionnaire

To evaluate the level of entrepreneurship required for the clusterization process initiated by the open incubator, we used McClelland's and Gladwell's classifications as dependent variables, and entrepreneurial attitude as an independent variable.

The questionnaire includes the following variables.

Dependent variables

- Parameters classifying the entrepreneur at his relevant level of entrepreneurship according to McClelland:

Family care represents the necessity level: the entrepreneur operates a business by necessity in order to meet the needs of his family.

Wider Business represents the first McClelland level, "need for achievement:" the entrepreneur is ready to invest in his business in order to achieve personal and professional objectives.

Appreciated by others represents the "need for affiliation:" the entrepreneur develops and invests in a business in order to improve his economic and social status.

Lead represents the third highest McClelland level, "need for power:" the entrepreneur intends to be one of the leaders.

- Groups of parameters evaluating the attitude of the entrepreneur according to Gladwell's classification:

Connector: brings people together, has a wide range of contacts, participates in events, consults, likes challenges, is curious, is ready to cooperate, likes to socialize.

Maven: finishes the job, plans, solves, has a different view.

Salesman: is able to convince and is close to customers.

Answers for each parameter were recorded on a scale of 1-5, 1 representing the lowest level and 5 the highest. Some parameters required a yes (1) or no (0) answer.

Independent variables

We defined two groups of independent variables:

- Entrepreneurial behavior: readiness to take risks, plan, cooperate, join forces, solve problems, consult, convince, transfer responsibility, acquire knowledge, understand customer needs, socialize, develop relations, participate in events, innovate, and open new horizons.
- Expected support and readiness to invest: in the current business, in marketing and sales, in training, in management, in export, in new trends, in financing, in the brand, in negotiation, and in a new organization.

Hypotheses

We checked the following hypotheses:

H1: Businesses at the family care entrepreneurial level are focused don't seek for new trends in business and don't cooperate with other businesses.

H2: Businesses at the business wider (need for achievement) entrepreneurial level are seeking new knowledge and are ready to cooperate with other businesses .

H3: Businesses at the appreciated by others (need for affiliation) entrepreneurial level are seeking new trends in business and are ready to cooperate with other businesses

H4: Businesses at the lead (need for power) entrepreneurial level are able to convince and are seeking external financing.

H5: Connectors are at the need for affiliation entrepreneurial level and explore new trends in business.

H6: Mavens are at a high entrepreneurial level, possess business knowledge, and are ready to cooperate.

H7: Salesmen belong to the family care entrepreneurial level but are ready to take risks and to become also connectors.

Results and Discussion

The family care entrepreneurial level displays weak entrepreneurial behavior (R^2 weak, 0.170). Contrary to expectation, entrepreneurs at this level are seeking new trends in business but do not cooperate with other businesses.

H1, was partially rejected.

Coefficients^a

R ² = .170	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
(Constant)	3.778	.213		17.772	.000
Customer support	.114	.048	.212	2.369	.020
New trends	.168	.053	.286	3.177	.002
Cooperate with other businesses	-.353	.148	-.209	-2.384	.019

Dependent Variable: Family care

The need for achievement level of entrepreneurship shows a stronger entrepreneurial orientation ($R^2 = 0.223$). Entrepreneurs are ready to cooperate and are interested to invest in training in order to improve their knowledge. They are also developing new trends in business. H2 was confirmed.

Coefficients^a

R ² = .223	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
(Constant)	1.617	.461		3.511	.001
New trends	.214	.075	.251	2.853	.005
Bring people together	.287	.095	.264	3.009	.003
Invest in training	.224	.081	.230	2.746	.007

Dependent Variable: "Wider business "

Entrepreneurs at the appreciated by others (need for affiliation) level are seeking new business trends and are ready to cooperate. They have a similar profile as the need for achievement level, but more emphasized ($R^2 = .355$ compared to $R^2 = .223$).

H3 was confirmed.

Coefficients^a

R ² = .355	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
(Constant)	-1.226	.581		-2.112	.037
Bring people together	.509	.120	.339	4.234	.000
New trends	.368	.094	.312	3.899	.000
Invest in training	.386	.103	.287	3.759	.000

Dependent Variable: Appreciated by others

Entrepreneurs at the lead level, representing McClelland's need for power level, are able to convince and are seeking external financing to expand their business. They are also ready to cooperate with other businesses. H4 was confirmed.

Coefficients^a

R ² = .347	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
(Constant)	-1.898	.607		-3.126	.002

Connector	.100	.028	.297	3.579	.001

Dependent Variable: Salesman

CONCLUSIONS

The Western Negev has unique tourist attractions that combine desert landscapes, agriculture, and history. Entrepreneurs at the family care level are seeking to follow new trends in business and are therefore open to raising their entrepreneurial level. Entrepreneurs at the family care entrepreneurial level are seeking for new trends and the three of the McClelland entrepreneurial levels are ready to invest in their own businesses and to cooperate with other businesses. The need for power level is even ready to seek external sources of financing.

Connectors are strongly entrepreneurial, ready to take risks, and to follow new trends in business. Mavens are not ready to share their business knowhow with other businesses within the framework of a common organization. Salesmen belong to the family care entrepreneurial level and are ready to take risks in order to improve entrepreneurship in family businesses.

Missing in the Western Negev is the networking between businesses, which is needed to create common interests. The open incubator described above can play this role by providing the required support, including:

- improving current business activities and generating new common business activities in order to convince the mavens to share their knowledge with others and improve the entrepreneurial level of family care businesses;
- supporting connectors and salesmen in their support of family care businesses;
- improving efficiency;
- supporting mavens by a broader transfer of knowledge using research centers and relevant training programs.

CONCEPTUALIZING, VISUALIZING AND MEASURING CORRUPTION, STATE CAPTURE AND THEIR IMPACT IN ITALY.

Borgonovi, E.¹; Esposito, P.²

¹Bocconi University, Milan, Italy, paolo.esposito@eco.unipmn.it;

²University of Piemonte Orientale, Italy, elio.borgonovi@unibocconi.it

ABSTRACT

Many researches outlined that one of the most relevant obstacles to development is the weakness of public administrations at both local and central state level. Also in developed countries low efficiency of public administrations is considered an obstacle to overcome the crisis and to recover development growth. Why does this happen? For sure because principles, criteria, techniques of good management are not tailored to the peculiarity of public interest organizations, but also because “pathological degeneration” oriented people to use it as an instrument to exercise power.

After summarizing the most relevant negative effects of the State Capture and Society Capture Degeneration, the paper analyses why NPM was not sufficient to break the vicious circle of inefficient public administration. In the second part, it highlights that the recovery of credibility and legitimacy of public administration system cannot be delegated only to managerial tools, quality of policies, institutional reforms (all important and sometimes necessary measures), but mainly to the recovery of a strong social sense of ethics.

This research aims to propose a conceptual framework on State and Society Capture in Italy, focusing corruption like also a management problem. Its main objective is to prevent and control “the negative corruption effect” attempts toward the common good, also characterized by capital rationing, penalizing the present-day as well as the future community. This paper also focuses on corruption events and their causes (Klitgaard, 1988; Rose – Ackerman, 1999; Caiden, 2001; Heidenheimer, Johnston, 2002; Bull, Newell, 2003; Huberts, 2005; Lamboo, 2005; Treismann, 2007; Lasthuizen, 2011, Borgonovi, 2012) and shows that the (ab)use of power activities is able to warp not only the citizens’ behavior, but also the State and sometimes the entire Society (Esposito, 2010).

Keywords: State Capture, (ab)use of power, integrity distortion, rules, accounting regulation

INTRODUCTION

The financial and economic crisis that broke up in 2008, even if some early signs have been identified since 2007, was analyzed mainly with regards to the relationship between financial and real economy, role of market and state intervention (government bail-outs of banks, real estate investing institutions, automotives and other enterprises in strategic sectors). Policies to restore public finance balance, to reduce or at least not to increase public debts, to favour the economic recovery, to avoid some countries' defaults in order to defend Euro and the world economy have been discussed at national and supranational level (European Union, Euro Group, G8, G20, IMF, World Bank). Inadequate attention was given to the hidden or, even worse, black economy impact on legal (or transparent) economy.

As the black economy grows, it becomes harder and harder to support economic growth and social development through adequate public policies.

In this context the public sector has the goal and the responsibility to promote social sustainability in order to facilitate growth and development, taking into account all stakeholders' requirements, in one word to pursue public interest. The Italian critical situation is due to many factors: a rigid labour market, a vast majority of SME that are not able to challenge the global competition, a high level of public debt and, consequently, a high level of interests, a fragmented financial system, as well as a political system where parties in power sometimes operate only to favor specific interests, so that they become accountable to people willing to use *corruption* and *bribery* to achieve their goals (Borgonovi, 2005; Broadman, Recanatini, 2001; World Bank, 1997).

In order to overcome the (ab)use of power (Ricci, 2010), organizational, reporting and anti-corruption models⁴ may be helpful to monitor, prevent, control and report the phenomenon of corruption (Klitgaard, 1988; World Bank, 1997; Broadman H.G., Recanatini F., 2001; OECD/PUMA 2002; Meneguzzo, 2005; Borgonovi, 2002, 2006, 2009, 2012; Ricci, 2010; OECD/PUMA 2002), alteration, *integrity distortion* and State capture, both in service delivery and regulatory functions (Mintzberg, 1996; Schick, 2003; Scott, 2000; Rawls, 1971; Moran, 2002; Bresser Perreira, 1999).

⁴ E. Borgonovi, *Principi e sistema aziendali per le amministrazioni pubbliche*, pagg. 2, 18, Egea, Milano, 2002. In reference to the anti-corruption paradigm, see: Ian Senior, *Corruption – The World's Big C. Cases, Causes, Consequences, Cures*, London, The Institute of Economic Affairs, 2006 .

The main questions the paper tries to answer can be synthesized as follows:

- i. What is the impact of corruption and crime on the Italian economy and, in particular, on the economic difficulties of southern Italy?
- ii. What do the terms *State capture* and *Society capture* mean?
- iii. Have the interventions to reduce crime and corruption been effective?

The paper propose a conceptual framework (deductive approach) and an analysis of the Italian case (inductive approach). Section 2 presents the general framework to analyze the phenomenon of corruption and its relation to crime. In section 3, the relationship between corruption and economic development is analyzed. In section 4, the main findings about the Italian case are discussed. Sections 5 deals with legislation to fight organized crime and to dismiss local government in case of crime and corruption infiltration. Section 6 deals with the policy of reinforcing accountability. Section 7 deals with recent legislation to fight corruption. Finally, some conclusive remarks are drawn in section 8.

METHODOLOGICAL PROCESS

The research is based on a literature review, *visualizing* a theoretical framework, useful to investigate the variables and the dimensions producing State Capture and corruption in the Italian case.

As corruption is in itself an obscure and confused phenomenon, it is impossible to have a large database of homogeneous data. So, this paper is based on a methodology that is summarized as follows. From the literature analysis was designed a conceptual framework that was used gathered information from (i) a national survey and (ii) data published by Transparency International. The population of the study are the Institutions dissolved from Mafia infiltration in City Councils.

The definition of the framework is the deductive part of methodology, while the inductive part was realized through the analysis of the literature on the subject and the empirical analysis with the administration of questionnaires both at the top of public companies both to the National Secretaries of the major Italian parties. For the former, in particular, were chosen elected administrators: Mayors of Italian local authorities. Only municipalities with more than 10,000 inhabitants, municipalities where the policy exceeds the local civic responsibility and for which the relations among elected, voters and political parties could reasonably be regarded as more solid or consolidated balances.

After an in-depth study of national and international literature about integrity distortions (corruption, tax evasion, ab-use of power) and New Public Management (from now on NPM) theories, Italian local governments and their model of governance are explored following an inductive/deductive method.

The analysis of corruption level achieved by some Italian local governments in crisis, is measured on the responses to a semi-structured questionnaire by councilors and public managers, looking at understanding the potential link between good governance practices and a suitable accountability system able to improve citizens' and stakeholders' participation and loyalty (Borgonovi, 2005). The paper aims with measuring political commitment in order to undertaking responsible policies and involving stakeholders into strategic decision-making processes ruling out client and patronage behaviors.

Through a questionnaire the paper analyzes which are the key factors in defining political accountability and how transparent and efficient public governance model might improve government performance in managing public resources, in providing public services and in getting better inter-governmental relationship. The work doesn't fail critical perspective on accountability and limits of transparency (Roberts, 2009; Messner, 2009) because this study in experimental way is the first stage of a largest research on the possible methods in assessing accountability.

“CONCEPTUALIZING”

THE CONCEPTUAL FRAMEWORK

Literature defines integrity as the quality of acting in accordance with relevant moral values, norms (Lawton, 1998; Pollock, 1998) or rules (Benjamin, 1990, Klochars, 1997; Solomon, 1999; Kaptein, Wemp, 2002; Lashuizen, 2011). Lack of integrity or distortion in politicians' and public officials' behavior causes the condition of *State capture*: actions of individuals, lobbies, companies, in both the private and public sector, that may influence the enactment of laws, regulations, decrees and other government policies to their advantage through illicit and non-transparent provision of benefits to public officials (Broadman, Recanatini, Klitgaard, Helmann, Jones, Kaufmann).

The World Bank (2000), defines *State capture* as *the tendency by some elites, firms and groups of power and/or interest, to illegally contribute to the formation of laws, policies and regulations of the State.*

Hellmann (2002), defines *State capture* as *group of companies' efforts to contribute to the design and approval of laws, policies, and regulations of the State, to their advantage, by providing illicit private gains to the officials, to maintain public order.*

Broadman and Recanatini (2001) define *State Capture* as *a form of corruption that is particularly harmful in the ability of companies to subvert the entire political process to ensure that policies and regulations favorable to their interests are enabled or captured.*

In the World Bank Transition Report (2000) on the analysis of "anti-corruption" measures, a distinction is made between *State capture* and *administrative corruption*. The latter is defined as an intentional distortion (Di Tella 1999; Broadman and Recanatini, 2001) in implementing laws, rules and regulations as a result of illegal and non-transparent provision of personal benefits to public officials. In addition, the report points out the way politicians and state officials may either promote or be subjected to corruption. The authoritative body Transparency International defines *corruption* as *"abuse of entrusted power for private benefit"*, either material or not, linked to political and/or professional ambitions.

The aim of corruption is to allow undeserved advantages to stakeholders. The economist Ian Senior underlined a further aspect of corruption, as he argued that there is corruption *"when a briber secretly does a favor to a corrupted or an appointed person, in order to influence some actions that may benefit both the corruptor and the appointed person, and on which the corrupted has authority"*.

The World Bank Report also propose a taxonomy of institutions being captured (executive, legislative, judicial system, independent regulatory agencies), type of capturer (private companies, interest groups, political leaders), and type of benefits provided to public officials (money bribes, in-kind gifts, shares or property rights in companies and businesses). Capture through corruption may also occur beyond the borders of the State by companies and foreign investors or by foreign governments (Mauro, 1995; Kaufmann, 1999; Hellman 2002).

Among several corruptive phenomena (legal, business-based, political, legislative, etc.), OECD identifies a clear distinction between corruption, State capture, abuse of office, lobbying activities and conflict of interests (OECD/PUMA, 2003). Furthermore, OECD

identifies a set of causes that interdependently contribute to produce the phenomenon of corruption and State capture (Cepiku, 2002, 2004): *i*) inadequate compliance with accounting and reporting procedures, *ii*) weakness of the system of internal and external control, *iii*) legal appointments of non professional people, *iiii*) lobbying and funding activities aimed at substituting private to general interest, *iiiii*) weakness of public guarantees for contracts.

However, as corruption is a complex and difficult issue, researchers, academics or organizations dealing with it have different points of view (Burke and Cooper, 2009). Actually, there are many disciplinary perspectives (in the fields of macroeconomics, political science, sociology, public management, business management, business ethics, law and administrative law), that can be considered more inductive and descriptive in Northern America, UK and Northern Europe, more deductive and normative in Germany, France, Italy (Borgonovi, 2005; Borgonovi, Fattore, Longo, 2009; Meneguzzo, 2005; Cepiku, 2004; Mussari, 1990, 2004; Bianchi, 2009; Ricci, 2010) and Southern Europe in general. Several scholars focused on economic determinants (annex 1), political determinants (annex 2), regulation determinants (annex 3), geo-cultural determinants (annex 4). Moreover, many institutions carried out surveys on corruption diffusion in different Countries (annex 5).

Until recent years, economics and managerial studies showed inadequate interest in corruption. These disciplines were much more oriented to understand the physiological behavior of enterprises, markets, economic systems rather than their pathological aspects. Economics and management theories have been defined with the aim of enhancing an efficient functioning of economic systems, enterprises and public institutions. Corruption was considered mainly an effect of anthropological, ethical and moral attitude.

In the last two decades, it has become clearer and clearer that weaknesses and even failure in economic development and international cooperation, increase in public deficits and debts in many developed countries, economic crisis, bankruptcy of companies and banks have been caused or accelerated by corruption. Black and grey money flows generated by corruption, as well as by rackets and drugs deal, caused distortion in international trade, financial transactions, public works, international tenders and market functioning in general. Corruption affects the market creating deviance, malformation, deformation and degeneration (Heidenaiemer, 1970; Banfield, 1975; Neild, 2002; Johnson, 2003-04; Stiglitz, 2003; Ireland, 2003; Booth, 2006; Dine, 2008). Therefore, economic ethics and business ethics have become a more and more relevant issue for research and teaching in the fields of economics and management.

To summarize, corruption is an informal economic process that generates hidden costs in the market transaction, in particular with regard to business government relations (because of alterations in politicians' and public officials' integrity). This process leads to: *i*) private profits and benefits to the detriment of the public community; *ii*) State capture and Society capture; *iii*) competition distortions, hindering economic growth. This is how corruption becomes a systemic failure of legal and formal economy.

FROM NEW PUBLIC MANAGEMENT (NPM) TO PUBLIC INTEGRITY MANAGEMENT (PIM)

The New Public Management, or simply management applied to public administration, as it is in the Italian *Economia Aziendale* or German *Betriebswirtschaftslehre*, is undoubtedly an advancement in comparison to the bureaucratic model. Actually, it enables to deal not only with sovereign functions for which legal and formal criteria are prevalent, but also with functions for which economic and social criteria are relevant or prevalent. Nevertheless, it shows more than one weakness in an increasingly multicultural, pluralistic and fragmented society, in which the involvement of many subjects is needed to reach common objectives. So the government governance and the system governance frameworks have been developed.

But the main problem that bureaucratic, New Public Management, government governance models cannot solve is the "pathological degeneration" of public administration that has been considered, or has been characterized, as a means to exercise power by authoritarian governments or representative bodies (politicians), who pursue particular instead of general interests. This degeneration has determined the phenomenon defined as "state capture", that happens when visible or invisible lobbies, and often organized crime, infiltrate in the administration as well as in political bodies. A wider vicious circle arises because through the infiltration in the public administration interest groups (and criminality) condition the whole society ("society capture"). This phenomenon has been studied until present in relationship with transition economies [Hellman, Jones and Kaufmann, 2000].

The main consequences of this degeneration can be summarized as follows:

1. Progressive loss of respect for the law (e.g. substantial and increasingly weakening of attention, also formal) and loss of the sense of public institutions (weakening of attention to public interest and common good);
2. Progressive delegitimization of public institutions in both the political (e.g. elected bodies, political parties) and the technical/professional component (e.g. employees and public officials);
3. Low levels of functionality and productivity of the public administration, that causes an increase of costs for citizens, families, businesses, other economic and social activities and reduce the rate of development and competitiveness of the whole country;
4. Permeability of the public administration, especially in public procurement processes, to the interference of politics (or politicians), to the pressure of interest groups (establishments) that hinder the modernization process, to the infiltration of groups of obscure power (freemasonry of any kind) and organized crime, and to the spread of corruption (bribery);
5. Distortion in the processes of recruitment and career development of personnel, that are not implemented on the basis of merit and professionalism.

Anyway it must be clear that it is inappropriate to consider public administration as a great and homogeneous Molok. Actually, the public system is composed by thousands of public administrations, such as an economic sector is composed by thousands of enterprises. So some of them are characterized by high levels of functionality, effectiveness, efficiency, productivity, while others display in a more or less extensive way the negative phenomena mentioned above.

VISUALIZING

CORRUPTION AND ECONOMIC PERFORMANCE

Economic development theories underline a negative relation between underdevelopment and corruption of public bodies (both central and local governments), that is confirmed by many empirical researches and evidence-based analyses. The higher the corruption, the lower the development or, as in the case of developed countries, the lower the increase in GDP. This is at the same time a direct and indirect consequence of the impact of corruption on legal environment weakening, public administration inefficiency and unfair or distorted competition. Broadman and Recanatini's explanation is appreciable from a theoretical point of view (see formula below adapted), but it reveals perhaps a lack of empirical robustness in

some of the institutional indices that are likely to be endogenous to corruption: if it is true that low quality of government, weak institutions, low level of real democracy, low trade/GDP ratio may clear the way for corruption, it is also true that the diffusion of corruption prevents the strengthening of legal context and public administration reforms, creating a vicious circle.

Several programmes of the World Bank, IMF, Regional Development Bank and bilateral or multilateral agreements for economic development did not achieve the expected results (according to a macroeconomic model) because of corruption in government. For this reason, in the last 10-15 years a chapter on institutional building was introduced in all dossiers that refer to economic development and economic stability international agreements. The national responses involve fighting against corruption, whereas regional integration is seen as a way of introducing external pressure for better policies. This implies going beyond the trade agenda into deeper issues of policy reform. The question would then become whether peer pressure at the regional level can bring about responsive national institutions to global challenges. "Answering this question is more likely to provide policy makers with a handle on how to bring about the positive interaction, rather than simply liberalizing their economic regimes in the hope that the appropriate institutional change will materialize". (OECD working paper n.181-How globalization improves Governance, November 2001).

In Transparency International NGO 2011 ranking, underdeveloped countries are stable in the lowest positions (2009-2011). The main exceptions are the BRICS countries, characterized by a high growth rate but still affected by an unequal distribution of wealth (a strict minority of very rich people compared to the vast majority of really poor population). Out of 183 countries, Russia is ranked 143, India 95, China 75, Brazil 73, South Africa 64. If we consider the developed countries, the main exceptions are those countries characterized by high public debts or deficits and economic weakness. In the Euro zone, Italy and Greece are ranked 69 and 80 respectively (see table 3.1 and 3.2). The analysis is based on a number of factors, from the existence of anti-corruption task forces to the degree of transparency and the presence/absence of conflicts of interest. Even if the rank is based on surveys carried out in each country by 12 independent agencies that collected documented opinions with statistical representativeness, it does not show the actual but only the perceived corruption. There is no doubt that interpretation of surveys in some countries can be controlled and even manipulated by governments for political and international reputation reasons. Nevertheless, the negative relation between corruption and economic performances is confirmed. The 2011

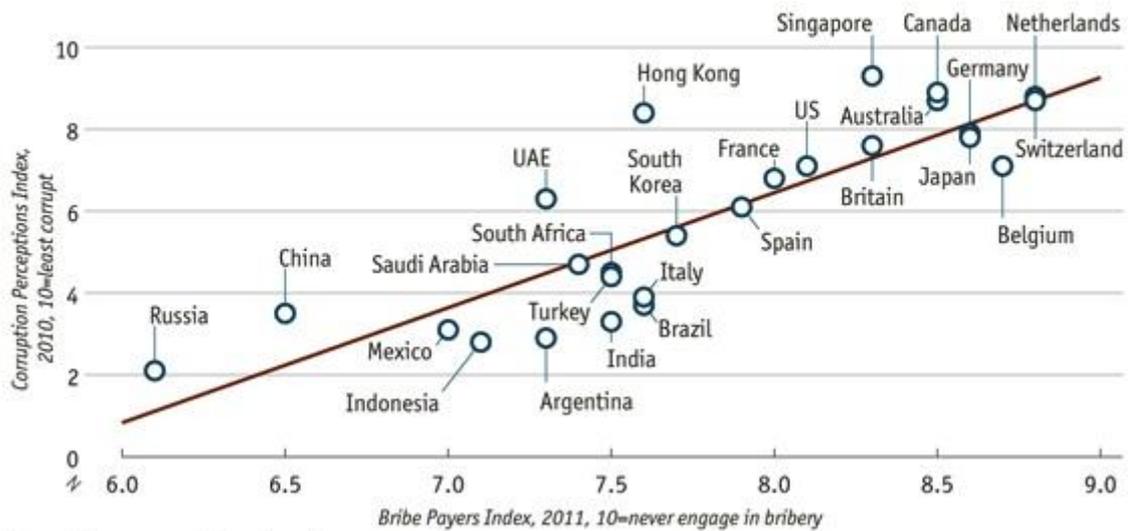

Report underlines that the Euro zone difficulties are partially related to some national governments' inability to fight corruption and tax evasion, pointing out that lack of transparency and high corruption are among the key factors of the crisis which is now gripping Europe.

(Source: Transparency, 2011)

Data on perceived corruption in the last three years (Transparency International NGO Ranking) show that economic underdevelopment or low economic growth rate are also a consequence of the impact of corruption on the competitiveness of enterprises and overall economy. Countries at the top of the corruption ranking are mostly the same ranked at the top of competitiveness. Furthermore, the World Bank economic studies show that the investment rate increases when the incidence of corruption decreases: recovering two points in a hypothetical corruption scale from 10 to 1 (from low to high incidence), the investment rate/GDP would grow at least by 4% and the GDP per capita would increase at least by 0.5% per year. "Confirming available results in the literature, a detectable significant direct effect from trade policy is not measured; however reducing trade barriers may still bring positive corruption reductions in the long run. More open economies, enjoying more foreign competition and investing abundantly in institution building, will normally register lower corruption levels." (OECD working paper n.181-How globalization improves Governance, November 2001).

Perceived corruption levels by country and companies' propensity to bribe

Source: Transparency International

In Italy, some institutions and independent researchers and think tanks (Italian Central Bank, Treasury Department, Finance Ministry, Italian Statistical Institute and others) estimate that corruption reaches 70 billion Euros, around 4.5% of GDP, that is a relevant part of the hidden economy estimated in 150 billion Euros, around 9.4% of GDP. Even if corruption is a general phenomenon in society, Public Administration can be considered its privileged place, especially with regard to public procurement of goods and services, planning permissions, trade licenses and permits, credit-granting or subsidized loans to private enterprises. It is clear that the Country's economic recovery may be facilitated by an effective policy to reduce corruption. This is a requirement to attract foreign investments that nowadays are constrained also by bureaucratic procedures.

Moreover, corruption is strongly related to crime, as described in the next section.

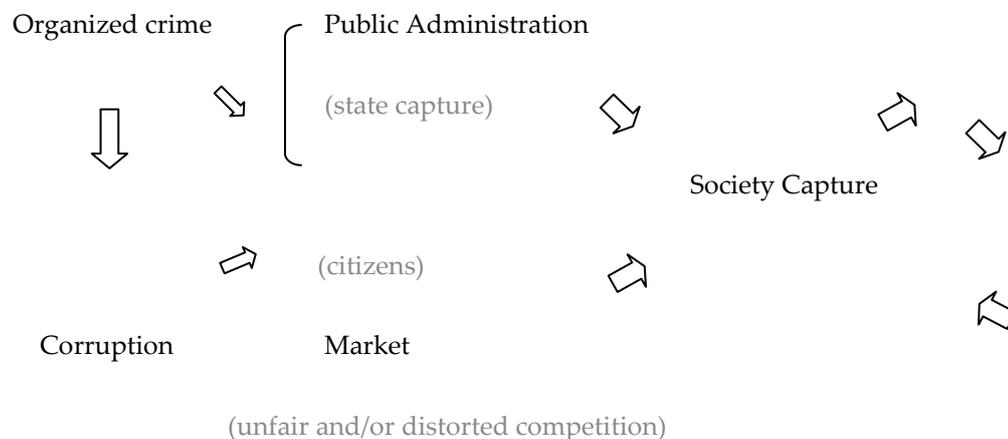

CORRUPTION AND CRIME: THE DARK SIDE OF ECONOMY IN ITALY

Corruption is a dimension of informal economy and is strongly related to criminality. Mafia, organized crime and racket collect money and manage hidden economic activities that strengthen corruption power. They have their own rules and, in some way, can be considered as "a State in the State". Organized crime influence Public Administration and market behavior in different ways: extortions, murders, lobbying on election processes and public officials'/managers' appointments, and, above all, corruption. As mentioned above, the

negative influence on Public Administration can be defined as State capture, while the negative influence on market can be defined as unfair and distorted competition. Analyses of investigative activities of public accounting (*Corte dei Conti*), administrative jurisdiction (*Consiglio di Stato*), and civil and criminal jurisdiction (*Courts*) outlined a structural system of patronage and collusion among businessmen, politicians and public officials, undermining the proper functioning of the tendering system (Francesconi, 1994; Pozzoli, 2005a). This system creates a growing risk of political interference in all decisions concerning management of public utilities and outsourced services such as school meals, cleaning services, waste disposal (Farneti, 1997; Mussari, Grossi, 2004; Pavan, Mudu, Zuccardi Merli, Grossi, 2004; Pozzoli, 2005b). In order to provide financial resources to corrupt politicians during election campaigns, organized crime and businessmen contribute to distort market competition.

So, in some analyses and legal settlements, corruption is considered to be a financial crime against Public Administration, market and society. The relationship can be summarized as follows:

Table

In its 'Socio Economic Crime Observatory', the National Council for Economy and Labour (CNEL) has placed corruption in government management (1996) at the centre of its study and research, started in the mid-90s. It has highlighted the risk of infiltration by organized crime with relation firstly to EU funding in southern Italy (Act 488), secondly to public works and then to the *silent conquest of pieces of the legal economy* and Public Administration also in the northern Regions of the Country.

Mafia “is one of the main obstacles to economic and social progress”. It is estimated that Mafia turnover in Italy is around 160 billion euro/year. So “in thirty years mafia has destroyed about 20 percent of southern Italy GDP. [...] Even southern Regions commonly considered to have a less relevant Mafia presence, such as Apulia and Basilicata, showed a 16% lower GDP than the expected in a “virtual Region” without Mafia infiltration in the same period (this “virtual Region” was defined taking into account the average economic development of Veneto, Abruzzi, Molise and Umbria). [...] From 1950 to 1970 the economic growth rate of the two Regions was equal to the virtual one. [...] From 1970 to 2010 the gap increased as Mafia density, became similar to other southern Regions like Sicily, Calabria and Campania. For example, in 2010 10 cases of Mafia collusion out of 100.000 Apulia inhabitants were discovered, which is a similar density to that of the three above-mentioned Regions. [...] Nowadays, without Mafia, Apulia’s and Basilicata’s per capita GDP would be the equivalent to California’s (Italian Central Bank report, March 2011). This negative effect is estimated only taking into consideration lower foreign investments due to Mafia presence.

Mafia is a “glocal” phenomenon, which has influenced the development of Italian capitalism and is related to very complex historical, cultural and economic reasons: the failure of the entrepreneurial culture, the “Mafia clan or family” as the basis of all social relationships, a weak democracy, the code (or conspiracy) of silence. Local because Mafias are rooted in local culture and environment, global because different Mafias are strictly connected to each other.

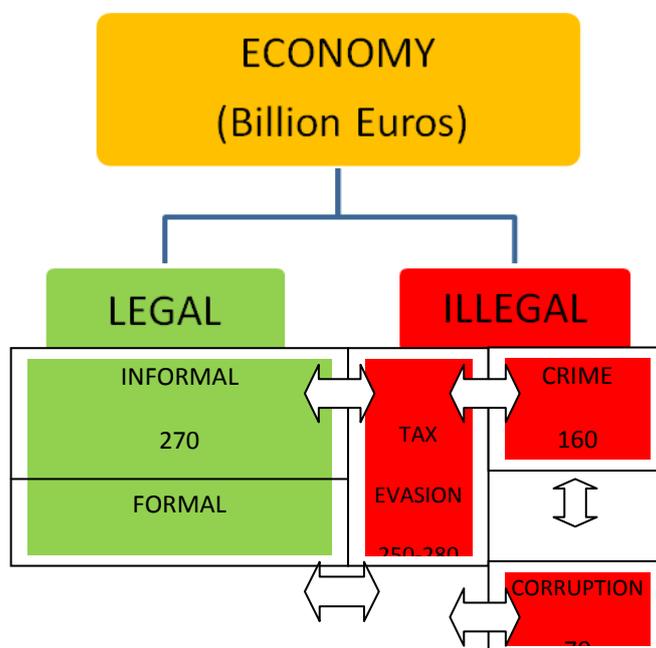

The anthropologist Francis A.J. Ianni (1972) approaches the Mafia phenomenon differently from the dominant social scientific model of organized crime, that links criminal organizations to businesses or governments. Actually, the formal organization model, defined by Donald Cressey, suggests that crime families are rationally structured in order to create profits, and that they have a system of authority that is based on positions with job titles, endures beyond their existing personnel, and is designed for efficiency. On the contrary, Ianni proposes a view of Italian-American or Sicilian Mafia families not as formal organizations, like governments or businesses. They are not rationally organized in clear hierarchical positions and functions in order to “maximize profits” and carry out tasks efficiently. Rather, they are traditional social systems based on the *Godfather’s* power and organized by actions and cultural values, that are completely different from modern bureaucratic virtues.

MEASURING

THE “INFORMAL” ECONOMY EFFECTS IN ITALY

Crime and corruption are a part of the illegal economy and interact with tax evasion (estimated around 250-280 billion Euros in Italy). The legal economy can be divided into a formal and informal component. The former is worth around 1,600 billion Euros, the latter involves the work of volunteers, housekeepers, family-care givers, self-production and consumption communities (such as monasteries). It is impossible to measure informal economy, even if it is estimated around 15-20% of the formal GDP in Italy (around 300 billion Euros). The legal economy interact with the illegal one through tax evasion, that is also an effect of criminal activities and corruption. It can be said that there is a huge overlap among tax evasion, crime and corruption. Black money obtained as a consequence of criminal activities is laundered through corruption and enter into the legal economy, both informal and formal. These complex relations are summarized in the next table:

Table: Relation between legal and illegal economy

How is it possible to break this negative relationship and release State and Society from capture? In Italy some policies has been adopted:

- a. An intelligence department against Mafia (DIA);
- b. A legislation to dismiss local governments directly captured by organized crime (Cosa Nostra in Sicily, 'Ndrangheta in Calabria, Camorra in Campania, Sacra Corona Unita in Apulia);
- c. Reinforcement of accountability at all levels of Public Administration;
- d. Anti-corruption legislation.
- e. Educational System and corruption in Italy

AN INTELLIGENCE DEPARTMENT AGAINST MAFIA AND LEGISLATION TO DISMISS LOCAL GOVERNMENTS

In the '70s the unclear and very dangerous relationship among Mafia, politics, Public Administration and business became stronger and stronger. An exemplary case was the Michele Sindona's affair. In 1975 two different legal proceedings related to the bankruptcy of Banca Privata Italiana (Italy) and Franklin National Bank (USA), both owned by Michele Sindona, started. In the following four years Michele Sindona tried to corrupt Giorgio Ambrosoli, who was in charge of the Banca Privata Italiana bankruptcy proceeding, also asking for help from some politicians. As Giorgio Ambrosoli resisted all attempts of corruption and collaborated with USA authorities to condemn Michele Sindona both in Italy and the US, he was murdered by Cosa Nostra on July, 11th 1975. Michele Sindona was condemned to prison for 25 years in the US and 15 years in Italy for bankruptcy, and then to life imprisonment in Italy for Giorgio Ambrosoli's murder. In 1983 he committed suicide or was poisoned in an Italian jail. In 1980 a list of 500 affiliates to a Freemasonry lodge was discovered (including many politicians, judges, Generals and high Officials of the Army, Navy and Air Force, diplomats, entrepreneurs, bankers, university professors, publishers of the most important Italian newspapers and many others). The investigation activity declared that the aim of the 500 members was to manipulate information and to direct public policies, businesses and financial activities towards illegality. The commitment of judges together with a special parliamentary committee brought to the introduction of a law against illegal associations in 1983 (Legge Anselmi).

In the early '90s judges Giovanni Falcone and Paolo Borsellino activated special investigation actions against Mafia and obtained the introduction of DIA, with the aim of collecting and

organizing information on its activities all over the Country, coordinating interventions to prevent and fight crimes. Another objective of DIA was to disclose the dark relation among politics, business and organized crime. Indeed, businesses are often used to launder dirty money generated by crimes. Those proposals have been hampered by some politicians, judges and businessmen colluded or corrupted. This is the reason why the two judges have been murdered by Mafia.

Since the early '90s some laws have been introduced, in accordance to which the President of Republic can dismiss local government councils when Mafia infiltrations are discovered by local representatives of the central government. The last version is Art.143 of Decree 267/2000. The authors carried out a survey on 60 municipalities in Campania, representing a quite significant sample (44,3%) of the total municipalities dismissed in Italy since the early '90s. The negative effect of crime infiltration is clear, as it does appear by the main findings, that can be summarized as follows: all municipalities were affected by financial troubles, as they were not able to respect the financial stability objectives (constraint of expenditure increase and cash flow balance). None of the dismissed municipality had adopted the General Socio-Economic Development plan (3 years), that was compulsory in accordance to Decree 267/2000. Public infrastructures, activities and financial plan of most of them were only a "cut and paste" from documents approved by other municipalities or were more or less the same, year by year. It is clear that these documents are completely meaningless. None of them introduced cruel accounting (in substitution of commitment accounting), analytical cost accounting, managerial control system, as indicated by Decree 267/2000. Moreover, 12 out of 60 municipalities in Campania and 9 out of 25 municipalities in Naples province were dismissed twice in a 20-year period and all of them showed heavy financial troubles, as they were no longer able to guarantee mandatory public services. In the period covered by the survey, some municipalities were dismissed three times and one four times (Casal di Principe, the Casalesi's clan headquarter).

The above mentioned research on Campania's dismissed municipalities also analyzed the state-of-the-art of reporting and monitoring systems of local authorities (ex art.143 Tuel). Politicians, council members, secretary generals and top managers didn't answer questions aiming at verifying the actual knowledge and use of management tools to monitor and report (like planning, control, budgeting, personnel evaluation), creating paths to social reporting, adopting an ethical infrastructure of each institution as an essential investment to strengthen the level of trust and legitimacy by the administered community. Moreover they did not

know the OECD anti-corruption manual at all. This part of the questionnaire was answered only by 20.7% of the sample.

SOME EVIDENCE FROM ITALIAN CASE STUDY

Local authorities dissolved pursuant to art. 143 Decree 267/2000, in Italy, from the date of entry into force of Law (1991) on the date of September 2009 are 152 and are the reference standard to which we sent the questionnaire.

A semi-structured questionnaire has been submitted to municipalities in the sample in order to assess accountability through some key factors able to evaluate accountability level achieved. According to authors, analyzing the responses on a questionnaire, it's possible to inflect seven key factors with the aim at understanding how important is accountability for municipalities interviewed in planning and control activities and in improving citizens' loyalty and participation.

A suitable accountability system may improve managers social responsibility and responsiveness toward their stakeholders allow them able to evaluate the actions taken and results achieved (Cardillo, 2008). According to Perks R. (Perks, 1993) the term public accountability may be applied to any entity in which exist a responsibility toward the public community.

The questions proposed in the questionnaire allow authors able to evaluate how municipalities adopt each one of the seven key factors of Ricci's scale. This process is useful to understand and assess the accountability level and political commitment in order to take politic and strategic decisions. For this reason the authors are going to assign a score on the responses collected in the questionnaire taking into account the number of possible solution proposed by authors for each questions.

As regards the first one of seven key factors, all municipalities interviewed realize the planning process implementing the Anticipatory and Programmatic Relation (60%) and the Electoral Mandate Program.

No one's adopt the General Developing Program perhaps due to the fact that this isn't yet mandatory document for municipalities

To support the management in the strategic and operative decision making process, each one adopts cost accounting system (50%) and only the 30% implement accrual accounting system, perhaps due to the complexity of policies and strategies (Esposito, Landi, Serluca, 2012).

The roles and responsibility for administrative officers are defined by Administrative manager and by Mayor, while Town Clerk and Chief Executive don't have relevant powers. The subjects and officers responsible to measure performance and results are the Internal Audit office or an external Team of Evaluation. Only for three municipalities the Town Clerk is responsible to evaluate performance (see previous table). This is a paradox because, according to authors, actors responsible to assign role and responsibility in the entity is not the same subjects responsible to evaluate results and performance.

In order to managing officers and administering activities, the major part of municipalities adopt financial and accrual accounting without a systematic bookkeeping process. Other ones consider financial accounting the best one tool to measure results and activities.

There isn't an extended accounting system adopted by municipalities interviewed because looking at the following activities, they just use financial accounting instruments.

For some municipalities managerial control has been implemented recently (2008/2009), just for one, it has been set up on 1999.

Internal Audit has both control and collaborative function. In the half of the sample, municipalities have participated Public Utility Companies, but only 30% of municipalities have a specific Department and a suitable accounting system in monitoring controlled companies.

Looking to external accountability, the questionnaire tests the capability of Local governments in crisis to communicate in a transparent way toward their stakeholders. Even if, there have been a financial crisis with a wrong and distorted use of public resources by politicians and parties in power, they do not realize any Social Reporting process and they don't know Standards or Guidelines for Social Reporting.

Social Responsibility could be considered as a culture of "to be transparent and responsible". Municipalities whose City Council has been broken up due to corruption and bribery that don't have a social reporting process highlight the low inclination towards the context in which the entity operates and towards citizens and stakeholders. These responses means

there isn't any social control or power from citizens and community where municipalities operate.

The Internet is the common external communication instrument followed by e-mail and newsletter. Only one recourse to television or radio. The website is up-data every day.

On website are available a lots of administrative documents such as Annual Reports and Town Council Resolutions, while is not available on the Internet benchmarking indicators due to the fact that they don't have performance indicators to compare with other municipalities.

There isn't a homogeneous point of view in defining the key factor to assess accountability but all the evidence makes it clear that they give much more importance to the planning process and to define internal duties and internal control evaluation in assessing accountability, then other five key factors proposed. To define an entity as accountable they take into account the manager responsibility in the action undertaken and the stakeholder's expectations in the decision making process. Less weight, overall, appear to play benchmarking activity and the use of technology to communicate toward internal subjects and external environment.

No one of municipalities answerers, implement all seven key factors proposed, only some of them, in except benchmarking activity, adopt some activities provided also by Local Government laws (programming programming process, accounting system, etc).

In an experimental way, looking at total score gained by each one of municipalities interviewed as regards seven key factors, it is possible to assess accountability level achieved. Total score has been calculated taking into account the average of score gain respect of each one of seven key factors proposed in the questionnaire.

REINFORCEMENT OF ACCOUNTABILITY

During the last three decades Italy has been characterized by efforts to introduce a management approach in public institutions at central, regional and local level. Consistently with the Italian approach to management ("Economia Aziendale"), similar but not completely equal to NPM, principles, criteria and techniques of

- administrative productivity and efficiency,

- expenditure containment and cost control,
- quality of services,
- effectiveness and efficacy of policies,
- economic sustainability,
- formal procedure simplification,
- clients-citizens orientation

became more and more popular in the scientific world and have been experimented in advanced public institutions. “Economia Aziendale” is rooted in Continental Europe’s institutionalism theory and approach, while NMP is rooted in North America’s and UK’s scientific management theory and approach. Nevertheless, the transition from a bureaucratic to a managerial model was unsuccessful for many reasons: worsening of the political arena and adverse selection of elected administrators, weakening of public institution credibility, prevailing of individual interest on public interest, inadequate managerial education, both in junior and executive managers.

All the more so, managerial culture and techniques were not effective to challenge Mafia informal economy. Something more is needed that can be achieved through the transition from management to accountability, that means openness in public procurement and personal recruitment procedures, easy accessibility to public documents, urban planning and other strategic choices, government decision-making processes, disclosure of accounting and social reporting to all citizens.

Accountability has been conceptualized in terms of responsibility – ensuring that officials (and extensively also private managers) are responsible for respecting the law or code of ethics (Bovens, 1999). The concept of accountability emphasizes the role of external actors in enforcing the respect of laws and codes of ethics. A stronger citizens’ “voice” generates incentives for public officials to budget and deliver services of the quality and quantity expected by their clients. Only accountability can strengthen the “voice” influence when the exit solution (as it happens in the market) is not available. The concept of responsibility relies more on public servants’ internalized values and understanding of the law and appropriate behavior. Such a standard of personal responsibility may be acceptable and enforceable in countries with strong and credible public institutions, but this approach may be risky when the level of agreement on behavior standards is low. On the other hand, in terms of responsiveness, accountability system is closely related to civil servants’ willingness to really serve citizens rather than to pursue their own interest. This concept points out the numerous

pressures that impinge on public servants' behavior and the expected difficulties they may face in determining an appropriate course of behavior.

Management can improve the internal functioning of Public Administration and govern formal economic and social relationships, but only society, that means citizens' pressure, can remove or at least reduce corruption and its connection with crime. The hope is that the transition from accounting and government to accountability and system governance paradigm, that implies the involvement of many public and private economic and social bodies, could be more successful in fighting crime and corruption, not only in increasing economic growth. To eradicate or to minimize corruption and crime is a prerequisite for economic growth and sustainability. Actually, a better accountability and governance system could break the vicious circle around the political consensus, as synthesized in the following table:

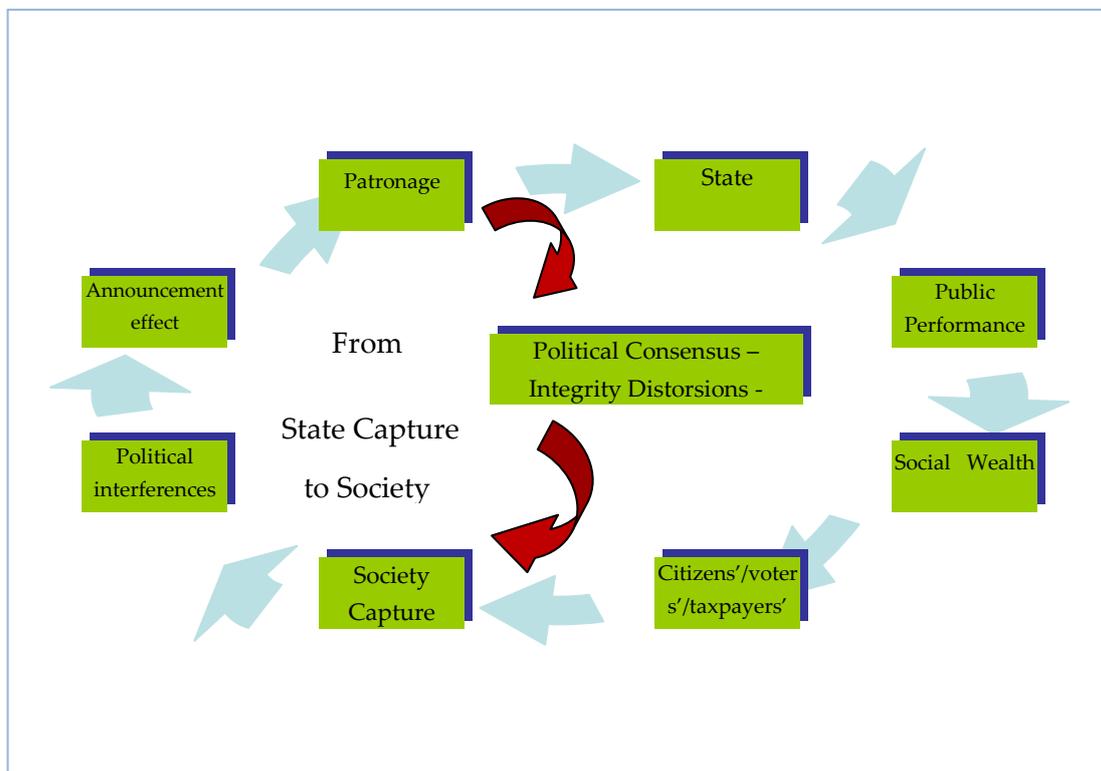

Table: Political consensus determinants and society capture

Indeed, accountability (that enables to recognize merits and professionalism and to evaluate Public Administration's performances) can reduce the level of patronage, that connects public managers and employees to political parties and organized crime. The "vicious circle" leads to Public Performance deterioration, due to political pressure to manipulate public resources, in order to pursue hidden agendas.

Accountability approach helps to redefine the models of spoils system in order to ensure independence and accountability in the recruitment and appointment of public managers. Moreover, it facilitates public employees' review and top managers' evaluation and it guarantees the assignment of incentives or penalties according to the performance achieved.

Accountability also reduces the misuse of the announcement effect, that arises when politicians try to get consensus by announcing some programs or actions that are not concretely implemented. As accountability is related to Public Administration's actual results, the negative connection between organized crime and political consensus is broken. Managerial and accountability reforms and the efforts to fight organized crime, poor political game, inefficiency and waste of resources have been unsuccessful in Italy, in particular in southern regions.

ANTI-CORRUPTION LEGISLATION

The conceptual framework concerning the issue of anti-corruption legislation is clearly defined by Clifford Chance, a leading global law firm based in London, that reports *"corruption is illegal in many countries in the world, but what constitutes corruption varies considerably from jurisdiction to jurisdiction and the murky grey area between acceptable corporate behaviour and corruption can be very large. A number of international agreements on corruption have tried to set common standards, and to improve the ability of national authorities to prosecute corrupt individuals and companies by mechanisms on information sharing and extradition. Differences remain, however, causing headaches for multinationals wanting to implement global anti-corruption compliance policies"*. The same report is analyzed in different countries.

In France *"The offences of corruption are set out in the Criminal Code. The offences of corruption in relation to foreign public officials (Law of 30 June 2000) and corruption in relation to private individuals (Law of 4 July 2005) were recently added to the offences of corruption in relation to public officials in the French legislation. Both passive and active corruption fall within the scope of the legislation"*.

In Germany *"The principal corruption offences (Straftaten) concerning public officials (Amtsträger) are defined in ss. 331 et seq. of the Criminal Code (Strafgesetzbuch ("StGB"))*. Further legislation - the European Bribery Act (EU-Bestechungsgesetz, "EUBestG") and the International Bribery Act (Gesetz zur Bekämpfung internationaler Bestechung, "IntBestG") - has extended the scope of the offences".

In the UK *“The Bribery Act 2010 creates statutory offences of bribing and being bribed. It is due to be brought into force in April 2011. Until then the Prevention of Corruption Acts 1889-1916 are still the applicable law. The Bribery Act offences of bribing another person are set out in Section 1. ... The offences of bribing and being bribed apply equally to bribery in the public and the private sector. Section 6 of the Bribery Act sets out a separate offence of bribing a foreign public official.”*

In the U.S. *“It is a crime under US law to bribe both domestic and non-US government officials, and to engage in private commercial bribery. Bribery, however, falls under several distinct federal and state criminal statutes. In general, the prohibited conduct involves paying, offering, attempting or promising to pay, public officials improperly to influence their official acts, or, in the private context, causing an employee or agent to act in a way contrary to the interests of their employer. US law also generally recognizes the concept of aiding and abetting a violation and conspiring to engage in violative conduct as separate criminal offences.”*

The United Nations Convention against corruption, signed by 140 countries, states that *“The purposes of the Convention, stated at Article 1, are: to promote and strengthen measures to prevent and combat corruption more efficiently and effectively; to promote, facilitate and support international cooperation and technical assistance in the prevention of and fight against corruption, including in asset recovery; to promote integrity, accountability and proper management of public affairs and public property. All Parties to the Convention are required to criminalize: the bribery of national and foreign public officials, as well as officials of public international organizations; the embezzlement, misappropriation or other diversion of either public or private funds by a public official to whom the funds have been entrusted; the laundering of proceeds of crime; and obstruction of justice. In addition Parties must consider criminalizing trading in influence, the abuse of functions by a public official, illicit enrichment and private sector bribery”*.

The OECD Convention on Combating Bribery of Foreign Public Officials in International Business Transactions, signed by 38 countries, states that *“The Convention requires Parties to make the bribery of foreign public officials (as defined) a criminal offence, as well as related offences of incitement, aiding and abetting, authorization, attempt and conspiracy. Parties must also (in accordance with their legal principles) establish the liability of legal persons for the bribery of foreign public officials, and must put in place effective penalties, including seizure and confiscation or comparable monetary sanctions.”*

These examples of legislation, agreements and conventions are a clear signal of awareness all around the world of the danger that the connection among crime, corruption, politics, public

administration and private businesses can provoke to the legal economy and sustainable development. In Italy, the first attempt to fight crime and corruption is the Rognoni-La Torre law (1983) to fight against organized crime. The enactment of this law swung between successes and failures, but it was not enough effective in stopping corruption. Only seizure (confiscation) of Mafia assets and their donation to non-profit organizations and social enterprises positively reduce Mafia's economic power, so that it is becoming a more and more successful strategy to fight corruption. In March 2010, after many political scandals and cases of corrupted politicians and officials, the Italian Government submitted a law proposal against corruption to the Parliament. Surprisingly, this proposal has not been approved yet (at the time this paper was written - January 2012). It is interesting to underline that, if we consider the number of Google reports, there are only 45.200 entries regarding the law proposal and 1.880.000 entries regarding the decree over the period March 2010 - January 2012. The evidence is a misleading effect: most of the Italian citizens are convinced that the law has already been enacted (decree), while it is only a proposal (decree proposal) to be discussed and approved.

CONCLUSIVE REMARKS

The phenomenon of corruption, crime and bribery infiltration in the economy and in particular in the public sector has been studied by several sociologists, anthropologists, political scientists, while economists and management scholars demonstrated little interest. Awareness of the negative economic impact of corruption, crime and bribery infiltration has only recently grown. In the last decade, national legislation in many countries and agreements and conventions of international and supranational organizations have been adopted. Nevertheless, the enactment was poor and at least unsatisfactory.

The phenomenon strangled the economic growth in Italy, in particular in southern regions with a high Mafia density. Recently, it also attacked some northern regions. A special legislation to fight organized crime and, consequently, to reduce corruption and crime, was introduced in 1983 but it can be considered widely unsuccessful. The attempt to enact this legislation and to break the vicious circle among Mafia, politics and black business caused a real war, where dozens of faithful civil servants (Giorgio Ambrosoli, Giovanni Falcone and Paolo Borsellino are the most well-known cases) were murdered.

The introduction of NPM, according to the Italian model of “Economia Aziendale”, did not achieve the desired effect of increasing productivity and efficiency, downsizing the public sector, improving the quality of public services, increasing transparency of actions taken by public managers, and, worse, reducing the black economy related to crime, bribery and corruption. Moreover, even legislation to dismiss local governments in which crime and corruption was discovered, did not achieve its objectives. The survey demonstrated that the renewal of councils did not wipe out infiltrations.

Therefore, the authors are convinced that only a wide participation of citizens and their empowerment through a public accountability and governance system can give chances to fight against crime and corruption. Accountability means:

- a) to implement social and not just bureaucratic control: that means to create some communication tools (social balance, office budget and report) to grant citizens' participation to political choices in the planning, managing and control stages;
- b) to redefine the models of spoils system to ensure independence and accountability in the selection and appointment of public managers;
- c) to review the pattern of recruitment and evaluation of public employees and top managers to assign awards or penalties according to the results achieved;
- d) to organize an inter-institutional task force to support collaboration and create a single database able to match information: an anti-corruption network can become a more effective “watchdog” to prevent crime and corruption.

Obviously, none of these interventions can solve the problem on its own (Lasthuizen, Huberts, Heres, 2011). Only an integrated approach can substantially reduce the negative impact of crime and corruption on the public sector and overall economy. Cultural and social changes are the keystones to strengthen the legal and to fight the informal illegal economy.

Ethical behavior requires to go beyond mere professionalism in order to reject proposals and policies “idealistic” or impractical. Ethical behavior requires not only to develop knowledge, technical skills (such as macro-economic or public finance knowledge) but also to strengthen negotiating ability, to communicate properly and to push through unpopular choices. Ethical behavior requires to overcome the resistance to change, through the ability to develop proposals aimed at implementing the win-win strategy.

Synergizing good public management with strong ethics can also help to break the vicious circle of State Capture and Society Capture, to create the conditions to overcome the crisis erupted in 2008 and to restore hope in the future, that - as stated by S. Augustine - has two children: the anger and the courage to change. In concrete terms, hope for a better future is based on:

1. Willingness to criticize what is negative in public administration as well as in market economy;
2. Challenge to the established power, both economic and political;
3. Will to set high and challenging goals and not to accept mere objectives of rationalizing the existing economic systems and public administrations;
4. Belief that change does not mean to approve reform bills or to recover public finance equilibrium, but means the capacity to implement reforms and to realize them substantially.

In conclusion, quoting J. Maritain, even public administration ethics requires “to have a tough spirit (e.g. principles, virtues) but a tender heart (in behavior towards others)”. It means that who works in public administrations, and also those who want to diffuse ethics in, of and for the public administrations, must be resolute and firm in proposing laws, operating rules, policies, evaluation criteria for the administration, and flexible in applying principles and rules to specific situations. Equity and ethics demand to treat differently different situations. This attitude doesn't weaken principles, rules or general criteria but rather reinforces them.

ABSTRACT

The paper deals with the issue of human resources as the important factor of territorial and economic development. The aim of the paper is to characterize the situation in the field of human resources as a key factor of territorial development and its development by universities in the Slovak regions as a potential competitive area, to identify the problem areas and highlight the important role of universities in the context of territorial development based on internal resources. The theoretical part defines the role of human resources in the process of competitive advantage creation, its importance especially in relations with the universities and research institutions by methods of scientific abstraction, synthesis and analysis. The analysis of the paper draws from the outputs of secondary research and selected results of primary research. Firstly, a questionnaire survey in the local municipalities of Slovak Republic was conducted, and then structured interviews were realized with the managers of regional self-governments. The research results aimed on theoretical aspects of exploring issue were gained through questionnaire survey in the form of Delphi method realized with the experts in the research field. The description method, deduction, synthesis and analysis, and the statistical apparatus were applied. The final section contains a list of the proposals, which implementation would contribute to develop the quality human resources in Slovak regions. Slovakia has good prepositions for building creative economy and industries based on the skilled and educated human resources, what can initiate the creation and use of further competitive advantages.

Keywords: human resources; territorial development, universities; cooperation.

INTRODUCTION

Human resources have always been a part of the competitive advantage factors, each approach to competitive advantage, and each of the authors, who are devoted to this issue; consider human resources as very important for the formation, existence or use of a competitive advantage. A number of authors (e.g. Borseková, 2012, Vaňová 2006; Skokan 2004, Martin, Kitson, Tyler 2004, Barney 1991, 1997, 2002, Ulrich, Lake 1991, etc.) consider human resources as a key factor for competitive advantage in the territorial economic and social development. They become a part of the territorial offer, but also the holder of strategic decisions in the territorial progress and efficient use of its endogenous resources.

The aim of the paper is to characterize the situation in the field of human resources as a key factor of territorial development and its development by universities in the Slovak regions as a potential competitive area, to identify the problem areas and highlight the important role of universities in the context of territorial development based on internal resources.

The paper is an output of the project VEGA 1/1010/11 Theoretical and methodological basis of planning in terms of public administration and the possibility of its application in the Slovak Republic.

HUMAN CAPITAL AS A COMPETITIVE ADVANTAGE IN THE TERRITORY

Considering several approaches and research studies (Vaňová 2006; Martin 2004, 2005; Kitson, Tyler 2004; Annoni, Kozovska 2010; Huovari 2001; Boschma, Cooke 2007; Skokan 2004; Gardiner 2003; Kloudová 2010; Florida 2002; Barney 1991, 1994, 1997, 2002; Hall 2003, 2004) is possible to define sources of unique characteristic of territory which are based on endogenous resources and should be considered as factors of competitive advantage based on resources. Our more than 3 years long research has confirmed that the human resources are the most important factor for proper identification and exploitation of the competitive advantage on the regional level. The quality of human potential is inimitable characteristic of the region and plays crucial role for identification, building and utilization of competitive advantage in the area (Borseková, Vaňová, 2010, 2011, 2012).

Human capital is generally seen as a set of knowledge, abilities and skills of the individuals, used in the activities that stimulate economic development and growth (Muhamad, Sulaiman, Sanus, 2012). Human capital with high quality can represent an important competitive

advantage, because the human is a holder of the development, decides about utilization of potential and resources available in the territory.

There exist various studies that declare the positive relation between human capital and the economic development. Glaser et. al. (2004) researched the positive affects of human capital on the political institutions, what fosters economic growth. Castelló-Climent (2008) finds evidence that and educational improvement experienced by the majority of the population influences democracy via both implementation and sustainability of democracies. Coe et al. (2009) deal with the specific role of institutions for knowledge creation and they evidence that better institutions increase the returns to R&D investments, and also increase the benefit from international R&D spillover and human capital formation. The positive interaction between human capital and institutions is declared also by Dias, Tebaldi (2012). They see the institutions as a key factor to set up the path of human capital accumulation, which fosters technology and output growth. In their empirical study they confirmed that the structural institutions positively affect long-term economic performance.

The importance of human capital and institutions (universities, research institutes) stresses also the innovation systems literature (e. g. d'Agostino, Scarlato, 2012, Barbosa and Faria, 2011, Lundwall, 1992). The authors underline the influence of intangible assets and specific institutional characteristics on innovation capacity at the regional level. They research the different aspects of social and institutional quality on innovations and economic development (Crescenzi, Rodriguey-Pose, 2011; Agostino, Scarlato, 2011; Sterlacchini, 2008). The special attention was given to the research of correlation between local capital, educational institutions and quality of life by Winters (2011). He confirmed by multivariate regression that the human capital stock and the presence of educational institutions make areas nicer to live and increase the quality of life.

Our previous resources (questionnaire survey through the Delphi method realized among the experts from theory and practice dealing with issue of competitive advantage – from March to November 2011; empirical research among the managers and employees in all Slovak regional self-governments realized through structured interviews in 2012) shows that among experts from theory and praxis, high quality human capital is the most important factor of competitive advantage. Based on the results of the questionnaire survey, when human resources are extremely good they can act as a separate competitive advantage due to the fact that the quality human capital can act as a catalyst of innovations, creative thoughts and ideas. It favors the territory with such high quality resources to others and increasing the competitiveness of the territory or generates new jobs in the same time.

The dominant role of quality human resource (educated, skilled and talented) in the territorial development reflected the new economic approach – creative economy. The creative economy is defined as industries that have their origin in individual creativity, skill and talent, and which have a potential for wealth and job creation through generation of ideas, products and/or services (The Office of Cultural Affairs & Special Events 2010). The creative economy has the potential to generate income and jobs through promoting social inclusion, cultural diversity and human development (Deisbury and Basu 2010). The roots of creative economy are found in the knowledge economy, but the main point of creative economy is human creativity producing ideas and creative content, the realization of which initiates a production characterized by high added value and marked economic growth. It follows that the creative economy can be understood as a new evolutionary stage of the knowledge economy (Florida 2002).

UNCTAD defines creative economy as an evolving concept based on creative assets potentially generating economic growth and development. It can foster income generation, job creation and export earnings while promoting social inclusion, cultural diversity and human development. It embraces economic, cultural and social aspects interacting with technology, intellectual property and tourism objectives. It is a set of knowledge-based economic activities with a development dimension and cross-cutting linkages at macro and micro levels to the overall economy. It is a feasible development option calling for innovative, multidisciplinary policy responses and interministerial action. At the heart of the creative economy are the creative industries (UNCTAD, 2010).

Arts, culture, and the sciences belong to the main pillars of the creative economy. It contains the production of a creative sector, which is a part of the tertiary sector including companies doing business in areas such as research, development, science, media, film, theatre, music, art, architecture, leisure time activities, and sports. The creative sector plays an important role in the competitiveness of economically developed countries (Kloudová and Stehliková 2010).

In connection with the development of the creative sector has formed a new working class named creative class. Among the first authors who have dealt with this issue belong John Howkins and Richard Florida. The authors highlight the economic contribution of scientists, artists and people with talent who have the ability to come up with new, original, unconventional and creative ideas that generate the highest added value in advanced economies (Kloudová, 2010, p. 13-14). The creative class includes the creative professionals and the creative core. The creative core includes all real creative workers – designers, programmers, artists etc. The abilities of creative core are developed with assistance of the

creative professionals. They are usually higher educated and oriented on solution of specific problems. They come from the academic environment of universities and research centers. They influence the further creative development in the territories (Florida, 2002).

Florida (2002, p. 74) states that in the last century in advanced economies (especially in the USA) there has been significant growth of creative workers to the detriment of worker professions. Many researches support this claim. For example the Report in Nova Scotia Building the creative economy in Nova Scotia (Hamilton, Arbic, Baeker, 2009) states that the creative industries in 2005 were 3, 4% of total world trade and exports reached \$ 424, 4 billion. The growth of world trade in creative goods and services was 8, 7% from 2000 to 2005. The report also states that the industry related to culture and directly and indirectly related activities in Canada have created a significant economic impact and formed 7, 4% of GDP. Cultural sector together with its directly and indirectly related activities in 2007 employed 1, 1 million workers, while almost the same number as employing agriculture, fishing, mining, and service sectors combined. The importance we attached to the creative economy and high quality human resources in terms of global economic and financial crisis. Several surveys showed that the creative sector was the least affect by the crisis and become a stable pillar of several economies in the world. As an example we can mention the situation from USA in November 2008 when the country's overall unemployment rate climbed to 9, 4%, but unemployment in the creative industries was less than 3% (Suciu, Ivanovic, 2009, p. 382).

To develop creative economy successfully, it is necessary to know the region, and to support key creative economy factors: the leadership and participation, awareness and education, infrastructure, investments and policy (Hamilton, Arbic, Baeke, 2009).

For the deep analysis, we focus on the one of the key creative economy factors – awareness and education. Where universities and research centres play the dominant role as well as in the economic and social development of the territory based on quality human resource (see chapter Human capital). The university comprises a potential – and, in some places, actual – creative hub that sits at the center of regional development” (Florida, Gates, Knudsen, Stolarick, 2006, p. 20). It means that the most important part of the territorial potential for the creative economy has an innovation potential which include universities and research centres (Godard, Chatterton, 1999; Holland, 2001; Etkowitz, 2002; Mille, 2004; Florida, 2006; Vaňová). They should be considered as the main actors in the knowledge generation process (Castells, Hall, 1994) and their location in the region is a key presumption of the economic and social development (OECD, 1999, Godard, Chatterton, 1999, Holland 2001, Etkowitz, 2002). Universities make an economic contribution to their host territory in two ways. Firstly, there

is the direct impact of the initial investment and the effects of students and staff spending and universities operating expenditure on the surrounding economy. However, universities are also public institutions that carry out missions of higher education, training and knowledge dissemination that contribute to the local accumulation of human capital, as well as missions of research and knowledge creation that promote technological progress in the host territory (Mille, 2004, p. 2). The universities should be seen as an important stakeholder in the territorial development and development of human capital. They are not able to achieve these aims separately, only in collaboration with all other relevant stakeholders in the territory mainly with local government, entrepreneurs, non-profit organisations etc. (Petríková, 2011). Mille (2004, p. 81) identified two ways in which universities contribute to the development of economy. Firstly, education and training activities improve the level of human capital of the individuals attending universities and of society as a whole and, secondly, universities' basic and applied research activities, whether contractual or not, contribute to improving the economy's stock of scientific and technological knowledge.

Slovakia has a potential to develop the economy and industries based on quality human resources, what is also the preposition for development of creative economy. Due to this fact, in the next part of the paper we characterize on the basis of statistical data the Slovak regions from the innovation point of view and with the detailed focus on universities and colleges and their cooperation with the local municipalities as a core for the territorial development based on the human resources.

RESEARCH AND METHODOLOGY

Refer to the theory; the paper presents the selected outcomes of primary and secondary research. Secondary research summarizes statistical data focusing on the data about the structure of universities in Slovakia, R&D expenditures and its comparison with EU, unemployment rate of university students, regional gross domestic product in Slovakia provided by the Statistical Office, Euro stat and data of Slovak Ministry of Education.

The primary research includes the results of two surveys. Firstly, the questionnaire survey was conducted in 100 municipalities. The aim of the research was to analyze the relationships (the level of cooperation), among the universities research centers and local municipalities in Slovakia with focusing on the activity of these stakeholders, importance and quality of the relationship and the reasons for their disruption. The representative sample was prepared in the form of quota selection. We established two basic quota - size of the municipality and

region, in which the municipality is located. The sample comprises 66% municipalities of the small size (from 0 to 999 people), 28% of medium-sized municipalities (from 1,000 to 4,999 people), and 6% of large municipalities over 5,000 people. Respondents in the selected municipalities were identified as mayors (66%) and representatives of the mayors (18% of respondents), heads of municipal offices (7% of respondents), 9% of respondents did not specify their position. Employers all of these positions in the structure of Slovak municipalities are responsible for the development of relationships with stakeholders on its territory.

Secondly, the questionnaire survey through the Delphi method among the experts from theory and practice was conducted. It dealt with issue of competitive advantage; and empirical research among the managers and employees in all Slovak regional self-governments realized through structured interviews. The results of the Delphi method were used in the formulations of theoretical presumptions in the field of identification the human resources as an important factor of the competitive advantage.

The empirical researches were done during the same election period (2009 – 2012). All collected data were processed by the programs – MS Excel and IBM PASW Statistics 18.0 with using various mathematical and statistical methods – correlations analysis, medium values etc.

In the paper we use also the methods of scientific abstraction, synthesis and analysis, description and in the processing of the research outputs mainly descriptive method, deduction, analysis, synthesis.

The end of the article concludes the possible ways to initialize the improving measurements in the cooperation of local municipalities and universities, and how to support the talented, creative and innovative human resources helping in the economic and social development in the Slovak regions.

UNIVERSITIES IN THE SLOVAK REPUBLIC AND THEIR ROLE IN THE REGIONAL DEVELOPMENT

The Slovak Republic was established in 1993 as a republic. Nowadays, it belongs to the post-transitional economics as well as Poland, Czech Republic and Hungary. The overall population of the Slovak Republic is approximately 5,405 million and consists of 51% women and 49% men. In 2009 Slovakia achieved the highest natural (8304) and overall growth (12 671) of the population over the last 13 years. (<http://portal.statistics.sk/showdoc.do?docid=1686>).

The most valuable capital in Slovakia is a human capital. Its high quality and price were the main factors which have attracted the foreign investors to invest in Slovakia during last ten year. But the world economic crisis shows that the situation is not sustainable because there is a lack of sophisticated and innovative production with the high added value (Report about the current state of business environment in Slovak Republic, 2010). One of possible way how to minimize the effects of the situation and initiate the new sources of development can be the orientation on the education system and strengthening the role of universities and research centers in the economic and social development in Slovakia.

In Slovakia, there are 33 high schools with diversified orientation, including 12 universities, 11 colleges (1 College of Economics, 5 Technical Colleges, 3 Colleges of Art and 2 Military and Police Academies), 10 private colleges and 3 foreign colleges. Their structure by the regions and by the owner present table 1.

Table 1 Structure of the universities and colleges in Slovak regions

Universities and colleges in Slovak regions	public	state	private	Total
Bratislava	5	2	4	11
Trnava	2	0	2	4
Trenčín	1	0	2	3
Nitra	3	0	0	3
Žilina	2	1	0	3
Banská Bystrica	3	0	0	3
Prešov	1	0	1	2
Košice	3	0	1	4
Total	20	3	10	33

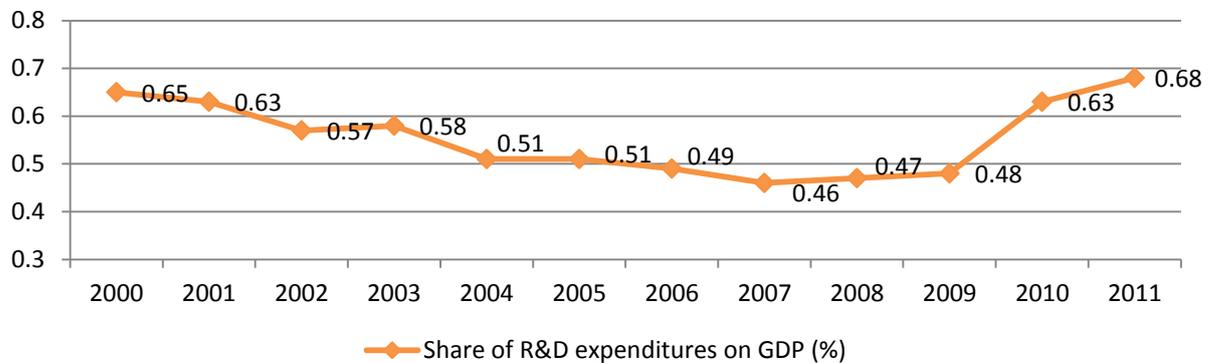

Source: Own workmanship of data from Slovak Statistical Office.

Number of higher education institutions we consider sufficient. The highest number of universities and colleges is localized in Bratislava region. The region is an administrative and economic centre of Slovakia and also the seat of capital city. There concentrates also the qualified human capital. Four universities and colleges are situated in the regions of Trnava and Žilina. The less number of universities and colleges is localized in Prešov region.

The universities and colleges are the main holders of research activities and also the key source of innovations. The position of Slovakia and the contribution of Slovak universities and colleges to the global research development are endangered by the low financial support from the national level, understood as a share of research and development expenditures on the GDP in Slovakia. It is a real weakness or competitive disadvantage connected with the

quality human resources. The development of the indicator during 11 years is illustrated in Figure 1.

Figure 1 R&D expenditures as a % of GDP in Slovakia form 2000 to 2011

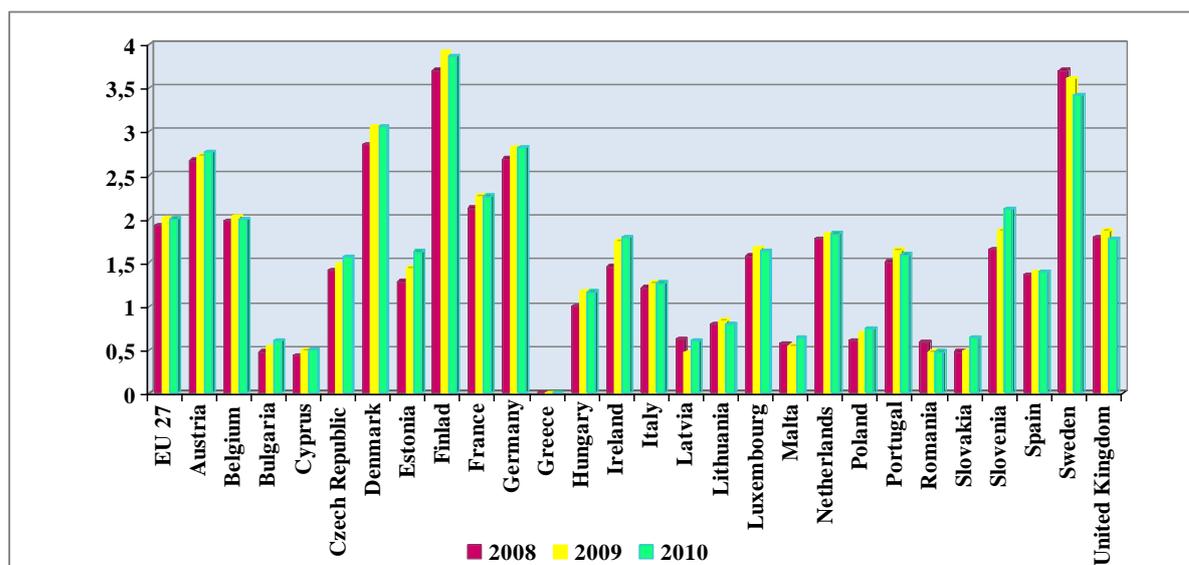

Source: own workmanship of Slovak Statistic Office data.

During the whole observed time period, the level of R&D expenditures share on GDP is less than 0.70 %. This weakness negatively affects the building of the potential competitive advantage associated with high quality human resources. In comparison with other European countries, the situation in Slovakia is alarming and the change in this area is really necessary. The following Figure 2 shows the expenditures on research and development (R & D) as a percentage of GDP of all member states of the European Union. Figure 1 shows that in 2009 Slovakia ranked the 2nd last position among all EU countries. The share of R & D expenditure was less than 0.5 % of Slovak GDP. In 2010 Slovakia was the 5th from the end before Cyprus, Bulgaria, Romania and Latvia. This position we consider as an extremely negative indicator that influences dominantly the possibilities of further development in this area.

The expenditures on R & D in Slovakia are inadequate and their share of expenditure on R & D on GDP should be increased, not only because they are committed to a number of strategic documents and plans, but mainly because the research and development, knowledge infrastructure, creative and innovative potential and related innovation activities belong among the key factors of competitive development of territory. Due to the age and educational structure of Slovak population, the support of science and research in Slovakia through the synergistic effect could contribute to emergence of innovation and increase of competitiveness in Slovakia.

Figure 2 R&D expenditure as a % of GDP in all EU countries

Source: own workmanship according to <http://epp.eurostat.ec.europa.eu/tgm/table.do?tab=table&init=1&plugin=1&language=en&pcode=tsiir030>

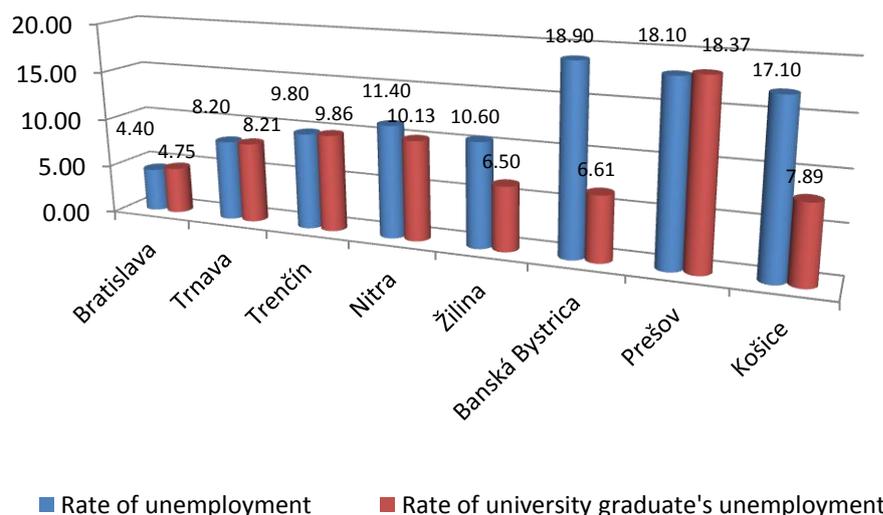

Increased spending on research and development is not sufficient solution of outstanding problems in this area. Before increasing expenses, it is necessary to review the whole system of R & D funding, which is in urgent need of restructure change. The current system is characterized by the resistance of the structure and forms of public funds invested into the science, research and innovations, not-reflecting the needs of private and public sector, lack of international cooperation within the European research area. The aim of restructuring scientific and technical infrastructure in Slovakia should be to achieve higher quality of research activities, university educations and lower depending R & D institutions on government decisions (National Strategy of Regional Development in Slovak Republic, 2008; Report about the current state of business environment in Slovak Republic, 2010).

One of the reasons why to invest more in the field of research and development is the fact, that educated people have better opportunity find the job position regardless their qualification and skills. The unemployment rate of university graduates in 2009 (data from the years 2010, 2012, are not available) presents figure 3 (see next page) in comparison with the registered rate of unemployment in Slovak regions.

The unemployment rate of university graduates is in four regions – Košice, Banská Bystrica, Žilina, Nitra lower as the registered rate of unemployment. The rate of university graduates is a little bit higher in Bratislava region, but it can be caused by the number of graduates from 11 universities and colleges. The similar situation is in Trnava region. The worst situation is in

the Prešov region. In this region, the lowest number of universities and colleges is localized, only 2, the rate of unemployment of the graduates is the highest. But the position of Prešov region influences also the economic situation (see table 3 - the share on national GDP is only 8,42% what indicates the lowest level of economic activities in comparison with the rest of Slovak regions).

Figure 3 Unemployment rate of university graduates in 2009

Source: own workmanship of data of Slovak Ministry of Education and data of Slovak Statistical Office.

These findings confirm the fact that the localization of universities and colleges in region can be a source of economic and social development, as well as the results in table 2. They illustrate the regional gross domestic product in Slovak regions.

Table 2: Regional Gross Domestic Product in EUR in 2010 at current prices

Region	Mil. Eur	Share on SR in %	GDP ratio to average of Slovakia in PPS
Bratislava	18 297	27,78	241,05
Trnava	7 666	11,64	112,39
Trenčín	6 435	9,77	88,57
Nitra	7 105	10,79	83,07
Žilina	7 500	11,39	88,59
Banská Bystrica	5 857	8,89	73,97
Prešov	5 546	8,42	56,56
Košice	7 464	11,33	78,98
Total in SR	65 869	100	100

Source: Eurostat.

Table 2 presents that the regional GDP was the highest in Bratislava region, its share on national GDP is 27.78 %. Nearly the same volume of GDP is produced in regions – Trnava, Žilina, Košice and Nitra. The lowest contribution to the national GDP brings regions Prešov, Banská Bystrica, Trenčín.

When the table 1 and table 2 is compared, there is possible to see that the regions where more universities and colleges are localized, also the regional GDP is higher – namely in Bratislava region, Košice region, Trnava region. It declares a lot of experts dealing with the human resources and its role in territorial development (Godard, Chatterton, Holland, Etkowitz, Mille, Florida, etc.). But when we compare the figure 3 and table 2, the results are more different. In spite of the fact that in Košice region, 4 universities and colleges are situated, it produces 11.33% of national GDP, the unemployment rate is the third highest in Slovak regions. This problem can be caused by various factors, as we said e. g. price of human resources, the location of Roma ethnical minority, but the important role can play also weak cooperation of stakeholders in regions.

In Slovakia, the flow of ideas, knowledge among universities and colleges, entrepreneurs and other relevant stakeholders stagnates in the regions. It creates also the barriers for development of creative environment and exploiting the creative potential as well as the lack of financial support of research (see Figure 1).

The next factor, which strength the existing barriers is a disinterest of entrepreneurs, also local and regional managers in cooperation with universities and colleges, including the underestimating its effects for territorial development. However, the local and regional management could be in a position of mediator that can support the flow of the innovations and creative ideas and develop the cooperation among the universities and entrepreneurs. They could help to keep the graduates in the regions and bring new idea to their development.

The same results were researched also by the questionnaire survey among the experts from the theory and practice. They consider the cooperation as very crucial for identification and exploitation competitive advantage, but nowadays in Slovak regions is a lack of cooperation one of the greatest barrier for building competitive advantage.

In the next chapter, we present the partial outcomes of national research aimed at the exploring the relationships between the universities and colleges and local municipalities in Slovak Republic. It provides the complex view on these relationships and identifies its development possibilities.

COOPERATION OF UNIVERSITIES AND COLLEGES WITH THE LOCAL MUNICIPALITIES IN SLOVAK REPUBLIC

The existence of high quality human resources is closely linked, and dependent on the level of higher education that is guaranteed in the Slovak Republic, especially by colleges and universities. The primary impacts of these institutions are manifested in the closest areas – in the place of its residence, in the region where they are located. In the questionnaire survey conducted by us, we focused on examining the characteristics of the relationships between the selected local governments and colleges and universities, the reasons for their development and problematic issues that are associated with its building. Selected results are presented in the table 3 and explained in the text below.

Table 3 Selected characteristics of relationship between local government and universities, colleges

Selected characteristics of relationships between local government and universities, colleges					
Kind of relationship in %		Importance and quality of the relationship (standard deviation)		Activity in the relationships in % (100 % = 44 local governments)	
Partners	43	Importance	5.19 (\pm 2.71)	Both partners	34.09
Partners and rivals	1	Quality	2.78 (\pm 1.05)	Local governments are more active	20.45
No cooperation	48	Difference	2.42	Universities and colleges are more active	25
Without answer	8			Only the universities and colleges are active	6.82
				Without answer	13.64

Source: Own workmanship of data of questionnaire survey

Respondents of the local governments showed by their responses that the expected assumption that cooperation between municipality and university is minimal. Up to 48% of local governments do not cooperate with universities and colleges, 1% of respondents perceive them as rivals and partners; 43% of local governments see the college or university as partners, 8% of respondents did not answer.

Generally, the development of the relationship between local governments and colleges and universities should have an interest in both parties. But, according to the local governments, the relationship is developed by both parties only in 34.09 % of municipalities. 20.45% of local governments are more active in this relationship and 31.82 % of answers declared more active approach of universities and colleges.

Furthermore, all asked governments evaluated the importance (the potential level of relationship) and quality (the real level of quality) of the investigated relationship with colleges and universities. The respondents could evaluate these aspects by the scale of points from 1 to 10, where 10 meant the most important, the best and 1 the least quality and the least important. The average value of the importance of the relationship with colleges and universities was evaluated by local governments at 5.19 points (with a standard deviation of ± 2.71); the quality of the relationship was evaluated by 2.78 points (with a standard deviation of ± 1.05). Comparing these values, we find out that by the importance is the investigated relationship with colleges and universities is considered to be moderately important for local authorities and by the quality of relationships, it belongs to the low quality relationships (difference between quality and importance is 2.42 points). The presented results show a negative level of cooperation between universities, colleges and local governments, and also the fact that local governments have not yet realize the importance and potential of colleges and universities for the development of its territories.

In detail analysis of this relationship, we continued by the Spearman correlation test between quality and importance of the relationship (Table 4).

Table 4 Spearman correlation test

Correlation		Universities, colleges	Universities, colleges
Spearman's rho	Correlation Coefficient	1,000	0,793*
	Sig. (2-tailed)	-	0,000
	N	58	58
	Correlation Coefficient	0,793**	1,000
	Sig. (2-tailed)	0,000	-
	N	58	58

Source: Own workmanship of data of questionnaire survey

Based on the test results, we claim that there exist the correlation between the importance and quality of relationships between local government and universities, colleges. The correlation coefficient is 0,793, what means the strong interdependence. If the local governments considered the relations more important, also quality should be higher. The results of the questionnaire survey show that the local governments do not realize sufficiently important position of colleges and universities in the development of human resources, which then has an impact on the efficiency of the use of endogenous resources in the territory, which includes also human resources.

Another researched aspect of relationship with colleges and universities is the reason for its existence. The largest number of municipalities (23%) reported as a reason for the development of the relationship - increasing the educational level; 12% of municipalities develop this relationship to ensure awareness. Among the reasons for building a relationship with colleges and universities (10% and less), local governments include also promotion of municipality, education of youth, ensuring effective collaboration, ensuring satisfaction, building a good image of the municipality; support of youth activities, attractiveness of municipalities; legislative obligation; coordination of different interests; development of joint actions, and others.

Relations of local governments and colleges and universities belong to the less conflicted. Nevertheless, local governments have identified a number of problematic issues. They include mainly the unavailability of higher education institutions (28%), lack of communication (14%), lack of awareness (9%), lack of financial resources (6%) and others (e.g. different goals and priorities, disagreements in the past, favoring their own interests, lack of reliability, etc.).

To conclude the results, the situation in cooperation between local municipalities and universities and colleges is inconvenient. The local municipalities do not use the potential that these education institutions provide, what can be a source of stagnation and lower level of development.

The similar situation is also in regional self-governments. According to our previous research in Slovak regions in 2012, all respondents of structural interviews confirmed our assumption that the level of cooperation is not sufficient. None of the representatives of regional self-governments considered the localization of universities and colleges in their region as an advantage. They also do not cooperate with universities and colleges in preparation of strategic, planning and development documents and representatives of universities do not act in advisory roles. This situation is unsatisfied and requires change in minds and attitudes of stakeholders.

CONCLUSIONS

The position of human resources as a basis for competitive advantage has been confirmed by many foreign and several domestic researches. The secondary and primary research showed that the Slovak Republic has a strong potential of human resources. However, not all

supporting tools are utilized for their development. Especially, the role of universities and colleges is underestimated.

Quality human resources are considered as the most important factor in the competitive advantage of region. If the human resources are in good quality and permanently developed, they can act as an independent competitive advantage. This is mainly due to the fact that the quality human resources can act as a catalyst for innovation, creative thoughts and ideas, which favor the territory with such high-quality resources to others, increase the competitiveness of the territory and generate new jobs.

Human capital in Slovakia, in our opinion, is in high quality and its low price create predisposition to be a strong potential competitive advantage of Slovakia. Human resources are owners of scarce capital in the form of knowledge, skills and know-how that can create, acquire or use. It is extremely important to create the conditions to human resources by the central and regional authorities in a country or region. This field is problematic in the Slovak republic as showed the empirical research. The expenditure on research and development in Slovakia are one of the lowest in the whole European Union. There absents the conceptual cooperation among universities, colleges and local municipalities which help to keep the university graduates in regions, to employ at the local entrepreneurs or investors. There is a lack of research cooperation between the stakeholders in regions, lack of networking support, connecting skills and knowledge, lack of creative employee's motivation.

To utilize the potential competitive advantages associated with human resources and create real competitive advantage based on the quality human resources, we recommend a number of measures that should be implemented by the regional and local body. The local and regional authorities in cooperation with the universities should support existing businesses in its territory, as well as start-up creative and innovative entrepreneurs, e.g. in the form of startup competitions and pilot innovative projects. For example, the authorities can help them by providing space for lower rate, through promoting, organizing business seminars. The universities can help by developing ideas and knowledge at the workshops or conferences, where the entrepreneurs can gain valuable contacts, partners, customers and potential employees. The local and regional self-government bodies should seriously consider and implement the systemic approach to improving the quality human resources, training of the population to the true market economy and build quality creative class through cooperation with colleges and universities. The emphasis should be placed on the rapid transfer of new knowledge and ideas into practice, exchange and sharing of experiences and know-how.

Implementation of these measures would contribute to increase the competitiveness of human resources of the Slovak Republic, but can be also a valuable source of Slovak regional development.

ABSTRACT

The present paper aims:

- (i) to achieve a consistent systematization of business and economic literature on Public Private Partnerships (PPPs) and Service Concession Arrangements (SCAs), in favour of the implementation and management of public assets granted to contractual entities (Foldvary, 1994, 2010), falling within the discipline of IFRIC 12, before and after its adoption by scholars from different countries;
- (ii) to analyze and systematize the clarification provided by IFRIC 12 (Laghi, 2010; Campra, 2012: 2675), in relation to service concession for concession operators providing a public service or public work, especially in Italy, by means of a “literature survey ” also evaluating the bibliometric analysis from other studies (Capellaro, Cuccurullo, Marsilio, 2009, 2011).
- (iii) to determine to what extent IFRIC 12 helped to improve the order and to simplify the conceptual vagueness and chaos of definitions applying to the different forms of PPPs and SCAs. How much evidence does currently exist in the literature subsequent to the introduction of IFRIC 12. Will the analysis of the selected case studies proposed in this paper be able to get an answer to this question.

IFRIC 12 gives guidance on the accounting by operators for Service Concession Arrangements (SCAs) between a public body and a private company, it does not

specify the accounting by grantors, and provides for the concession assets, once verified some objective and subjective conditions (Laghi, 2010: 127), an alternative way to recognize them. In fact, infrastructure within the scope of this Interpretation shall not be recognised as property, plant and equipment of the operator because the contractual service arrangement does not convey the right to control the use of the public service infrastructure to the operator. Infrastructure shall not be recognized as material activity (highways, water supply, etc.), but as a right to charge users (intangible asset); or a right to receive consideration from the grantor for utilities paid (financial assets); or a mixed method, forked method (Campra, 2011). The proposed systematization of business literature, even in the presence of a weak and not systemic defense of the doctrine on the subject, would make it possible:

- a) to highlight in a systematic manner the weaknesses linked to the application of contractual PPPs and SCAs in Italy, detected by different scholars with regard to the adoption of IFRIC 12;
- b) to provide a starting point for future researches, identifying elements that are capable to predict crisis or scandal (Di Pietra, McLeay, Ronen, 2010; Di Pietra, Gebhardt, McLeay, Ronen, 2012), even through subsequent international comparisons by scholars from different countries (stone, 2000, 2002; Ronen, 2008; Dean, Gebhardt, 2008).

Keywords: *Public Private Partnership (PPP), Service Concession Agreement (SCA), public services, regulation, concession, IFRIC 12.*

INTRODUCTION

The present paper aims:

- (i) to achieve a consistent systematization of business and economic literature on Public Private Partnerships (PPPs) and Service Concession Arrangements (SCAs), in favour of the implementation and management of public assets granted to *contractual entities* (Foldvary, 1994, 2010), falling within the discipline of IFRIC 12, before and after its adoption by scholars from different countries;
- (ii) to analyze and systematize the clarification provided by IFRIC 12 (Laghi, 2010; Campra, 2012: 2675), in relation to service concession for concession operators providing a public service or public work, especially in Italy, by means of a

"literature survey " also evaluating the bibliometric analysis from other studies (Capellaro, Cuccurullo, Marsilio, 2009, 2011).

- (iii) to determine to what extent IFRIC 12 helped to improve the order and to simplify the conceptual vagueness and chaos of definitions applying to the different forms of PPPs and SCAs. How much evidence does currently exist in the literature subsequent to the introduction of IFRIC 12. Will the analysis of the selected case studies proposed in this paper be able to get an answer to this question.

The accounting treatment to be applied to "Service Concession Arrangements" (SCA), under IFRIC 12, represents one of the most significant and emblematic cases where the principle of the prevalence of substance over form prevails (Meyer, 1976; Shere, 1986; Adwinckle, 1987, Di Pietra, 2010), as to highlight "typical light and shade" of a principle which is the basis of IAS/IFRS accounting model (Laghi, Giornetti, 2009; Laghi, 2010).

IFRIC 12 gives guidance on the accounting by operators for Service Concession Arrangements (SCAs) between a public sector body and a private sector entity, it does not specify the accounting by grantors, and provides for the concession assets, once verified some objective and subjective conditions (Laghi, 2010: 127), an alternative way to recognize them. In fact, infrastructure within the scope of this Interpretation shall not be recognised as property, plant and equipment of the operator because the contractual service arrangement does not convey the right to control the use of the public service infrastructure to the operator. Infrastructure shall not be recognized as material activity (highways, water supply, etc.), but as a right to charge users (intangible asset); or a right to receive consideration from the grantor for utilities paid (financial assets); or a mixed method, forked method (Campra, 2011). The proposed systematization of business literature, even in the presence of a weak and not systemic defense of the doctrine on the subject, would make it possible:

- a) to highlight in a systematic manner the weaknesses linked to the application of contractual PPPs and SCAs in Italy, detected by different scholars with regard to the adoption of IFRIC 12;
- b) to provide a starting point for future researches, identifying elements that are capable to predict crisis or scandal (Di Pietra, McLeay, Ronen, 2010; Di Pietra, Gebhardt, McLeay, Ronen, 2012), even through subsequent international comparisons by scholars from different countries (stone, 2000, 2002; Ronen, 2008; Dean, Gebhardt, 2008).

SECTION I

RESEARCH OBJECTIVE

The objective of the present paper is to analyze the impact and the scope of IFRIC 12 's innovative discipline on accounting , in reference to PPP, and in particular with regard to service concessions for concession operators offering public service or public works in Italy, through an organic systematization of the business literature on the topic (Laghi, 2010; Campra, 2012: 2675). The work is divided into two main sections. The first section describes the relevance of the research theme, its practical implications, the historical reconstruction and the regulatory framework referring to PPP in Italy. The second section is divided into two parts. The first part, highlights the phenomenological trend in Italian PPPs; the second part proposes a classification of literature on PPPs and the SCA (literature survey), *before and after* the adoption of IFRIC 12.

IFRIC 12, provides a set of guidelines on accounting by concessionaires for Service Concession Arrangements (SCA) between public authorities and private companies (Oricchio, 1996), it does not deal with the accounting by the grantor, and provides for the concession assets, once verified some objective and subjective conditions (Laghi, 2010: 127), an alternative way to recognize them. In fact, infrastructure within the scope of this Interpretation shall not be recognised as property, plant and equipment of the operator because the contractual service arrangement does not convey the right to control the use of the public service infrastructure to the operator. Infrastructure shall not be recognized as material activity (highways, water supply, etc.), but as a right to charge users (intangible asset); or a right to receive consideration from the grantor for utilities paid (financial assets); or a mixed method, forked method (Campra, 2011). The proposed systematization of business literature, even in the presence of a weak and not systemic defense of the doctrine on the subject, would make it possible:

- a) to provide a systematization of economic literature on the complex and multi-faceted discipline of Public Private Partnership (PPP) and Service Concession Arrangements (SCA), falling within the interpretation of IFRIC 12;
- b) to highlight in a systematic manner the various problems of interpretation, legislation, regulation and application of the different types and different models of Public Private Partnership (PPP) and Service Concession Agreements (SCA), before and after the application of the interpretations offered by IFRIC 12;

- c) subsequent international comparisons offer by other scholars of different countries.

METHODOLOGY

The research methodology is both theoretical and empirical:

- Theoretical framework of Service Concession Agreements and its evolutionary path in the Italian, European and international context. Review of literature;
- Significant analysis of literature through a survey process according to the different applications of IFRIC 12 and the interpretive positions by various organizations (World Bank, Oecd, the IASB, EFRAG, Eurostat, OIC, AVLP, Court of Auditors);
- Analysis of development applicative models based on differentiating variables, highlighted by the empirical analysis (case method. Triangulation: sources, methods, results);
- Case studies (Yin, 1984, 1995), "testing", new areas of investigation.

The selected case studies, have in the first case, an atypical nature, representing an anomaly for survey and accounting treatment models of IFRIC 12 (financial model); in the second case, a typical scenery, a listed company which is representative of the whole sample of reference in the panel of analyzed and classified Italian listed companies. The first case study, is characterized by being held in a majority of capital shares by the same public body which is the grantor of functional privatization (grant) for the realization of interests and works of public interest and utility. The control upon the concessionaire is held by the grantor that corresponds to the majority shareholder of the concessionaire providing public assets or services. The selected methodological support provides an answer to the following questions: does IFRIC 12 apply in the case the private entity is essentially a public body and coincident with the grantor? Would it be a public-private partnership or, would it be appropriate to consider Public Public Partnership? And does IFRIC 12 apply?

Theoretical/deductive (Yin, 1984, 1995): systematization of theories by means of an empirical verification of the evolution of the selected business models, up to an outline of future potential circumstances. Critical reflection and proposals.

RESEARCH QUESTIONS (RQS)

In Italy, the development of the business literature on IFRIC 12, is being merely guaranteed by some authoritative scholars in addition to a large and growing group of professionals (Campra, 2005, 2012; Laghi, 2009: 26; Giussani, 2009: 180; Delladio, Gaiani, Meneghetti, Pozzoli, 2011: 168; Giovando, 2012: 200; Rotondaro, Zambon, 2010: 2010; Leo, 2011: 164; Brescia, Muraca, 2011: 381; Cordazzo, 2008: 40), despite the strategic importance and interest expressed by international literature. Shown below are the research questions to which we will try to provide an examination in the next few paragraphs:

Is it unclear the overview on business models and on the accounting treatment of concession services linked to PPP? If Yes, why?

Is the theoretical approach by Italian scholars, on service concession, different from the theoretical approach by scholars from other countries? If Yes, why?

Do literature-identified cases find a response in the empirical evidence offered by the selected case studies?

Do publicly-owned concession companies corresponding to the grantor of functional privatization, represent further forms of PPP?

After having identified the different approaches to the research theme, we will develop evolutionary profiles and any emerging experiential practice raised in literature.

Considerations, critical reflections and proactive analysis are aimed to investigate a tenuous and weak presence of Italian corporate economic doctrine within the complex and multiform rules concerning Private Public Partnership (PPP) arrangements and concession services (SCA) falling within the application discipline offered by IFRIC 12, in spite of the robust and growing interest by scholars of international law and economists, particularly by scholars of public management in the international business economic doctrine. The systemization of literature, will detect the emerging practices in the business economic doctrine, in order to verify, in a context of growing scarcity of financial resources, the identification of new business models supporting public decision-makers in an increasingly complex financial framework, in an effort to combine the pursuit of economic balance under the respect of rules, needs and rights.

This systematization can be regarded as a starting point to develop new lines and future research on PPPs and SCAs falling within the application of IFRIC12, through international comparisons, analyzing business models and specific mostly.

THE IMPORTANCE OF THE RESEARCH THEME AND AREA

The current economic situation is characterized by increasing scarcity of public resources that are therefore inadequate to finance investment in structural works.

Consequently, it is now remarkable the possibility for public authorities to co-operate with the private investors in order to benefit from the know-how of the private sector and to overcome public budget constraints, for a given number of years, through Public Private Partnerships (PPP), within the concession system.

IFRIC 12, has radically innovated accounting methods to record and monitor financial transaction related to this phenomenon.

The analysis of IFRIC 12 allows us to handle the issue of the interaction between public body and private sectors in the field of the construction and management of infrastructure.

The analysis of national legislation and regulation regarding concessions essentially aims to identify several business areas to which these aspects apply.

The study of IFRIC 12 – given its innovative impact in comparison with the past approach – is greatly important and interesting since it represents a starting point for an analysis aimed at determining which sectors may come under its application segment and, specifically, what business might adopt IFRIC 12 (companies, etc.) or which ones might not adopt it (public-owned companies or non-listed companies, etc).

The examination will focus on the impact analysis of the accounting change produced by IFRIC 12, in relation to service concession by concessionaires providing construction or upgrade services (or more ancillary services). Further problems resulting from international comparisons will be examined, with particular reference to budget representation and business models.

The research aims to investigate the universe of concession companies that have implemented IFRIC 12, in order:

- to offer a comprehensive evidence on IFRIC 12 distinctiveness, after its introduction;
- to provide an international comparison between different application methods of PPP and SCA, in different EU countries and non EU countries.

The logical path of research, will be broken down into five main phases (Bailey, 1982; Corbetta, 2003b; Ricolfi, 2001), such as:

- bibliographic search and theoretical study of the arguments that are object of the search;

- the formulation of hypotheses and research objectives;
- research design formulation and definition of the tool (method) to be implemented in the selected case studies;
- Organization, reworking and representation of data;
- data interpretation and formulation of conclusions.

PPP, PF, SCA AND IFRIC 12. THE PREVALENCE OF THE LEGAL APPROACH: A CLASSIFICATION.

PPP (Public Private Partnership)

The Public-Private Partnership (PPP) refers to contract forms, based on the cooperation between a public sector entity (grantor) and a private sector entity (operator) through which their respective expertise and resources are integrated in order to perform public works or services and related management services.

A PPP process- wholly or partly - embraces the following activities:

- design;
- funding;
- construction or renovation;
- management;
- maintenance.

SCA - Service Concession Arrangements

The absence of a precise definition of service concession both in national and EU legislation was filled by Community directives no. 17 and no. 18 of 2004. They both defined the service concession as "a contract that has the same characteristics of a public service contract, except for the fact that the consideration received or receivable by the operator providing public services solely consists in the right to operate the service or in this right together with payment.

Moreover, apart from the merits of defining the provision of services, the above mentioned directives exclude service concession within the Community framework. In fact, article 18 of Directive 17/2004 states that its rules do not apply to work and service concessions as well as article 17 of Directive 18/2004 provides that, without prejudice to the application of the provisions referred to article 3, this Directive shall not apply to service concessions. The above definition of service concession was drawn from the Public Contract Code (art. 3, c. 12), which also provides, at article 30 ("service concessions") the discipline of the institution for ordinary

sectors and at article 216 ("work and service concessions")-containing a reference to article 30 – the discipline for special sectors.

This definition is based on the one referring to public procurement contract: a notion concerning the concession contract is not provided as considered necessary within the European Community. However the definition solves the thorny question concerning the delineation of service contract institution, in relation to the contiguous notion of service concession and similar figures, that have been engaging both internal and European doctrine and jurisprudence, for many years.

PPP from Giolitti to Law no. 142/90

The discipline concerning local public services in Italy, dates back to the early 1900, in harmony with the Giolitti law (Law No. 103 March 29, 1903) in Italy. This law, which allowed municipalities and provinces to hire and manage the services deemed essential to the local authorities, remained in force until the end of the 80s of the last century, and allowed local authorities to take from the market economy those goods and services aimed to satisfy collective needs. Municipal enterprises, were therefore public enterprises operating in a single production structure and acting within the territory reference framework.

This area was excluded from the intervention of the private sector entity, which could still get reference by the administration of a concession for the management of the service.

Municipal companies and concessions, however, were not the only way in which it was possible to manage a public service. The Giolitti law, in fact, allowed the local Government to directly manage the monopoly service. Besides providing the management of the public service on the part of the local authority, the law 103/1903 also provided a list of services to be defined as such, but did not specifically outline this notion. Through this list it was possible to identify essential services for the community, services that were to be returned to the authority. The Giolitti law remained into force until 1990, year in which the dismantling of State-owned companies began in order to ensure the free market wished by the European Union. In fact, since the European Union affirmed the primacy of competition at an European level, the Italian authorities have been establishing a process of privatization of public enterprises, thus determining a u-turn compared to what happened in the early 20th century; the State basically ceased to be an entrepreneur in order to ensure the autonomy of the market, this process met strong resistance on the part of our government. The result was a long reform process, still continuing and that found his starting point in Act No. 142. of June 8, 1990,

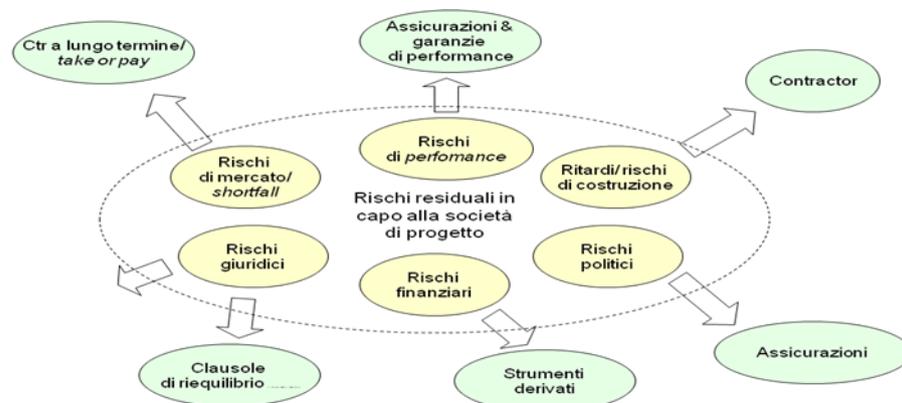

The Act, which represents the first comprehensive standard in terms of local public services and resulting from European Union law, tried to open the sector to competition according to the article 22.

THE ITALIAN CASE: COMPLEXITY, REGULATORY CONFUSION AND STATUTORY PROFILES.

Unlike the experience of other European countries, Italy regulatory efforts have focused on the procedural aspects of the PPP, with limited attention to other relevant segments, but especially with regard to the civil rules of the relationships between the various actors involved in these operations, this also gives explanation of the scarce number of projects and little finance in relation to PPPs (Bentivoglio, Panicara, Tidu, 2008, 2010).

The term public-private partnership (PPP) refers to all forms of cooperation between public sector and private sector aiming at the design, construction, financing, operation and maintenance of public works or utilities, or the supply of goods or the provision of services.

Subjects and risks: contractual allocation as a form of mitigation.

In our system, the first general discipline of PPP for the realization of public works was introduced by Law no. 415 in November 18, 1998, (the so-called Merloni-ter law), which included articles from 37-bis to 37-nonies in the framework law on public works (Law no. 109 February 11, 1994, the so-called Merloni law), then merged into the legislative decree no. 163 April 12, 2006, (the Public Contract Code: articles from 153 to 160).

These articles are divided into two groups, governing both logically and chronologically distinct phases: i) the first group, whose articles are mainly focused on recent reform measures, is aimed at the selection of the private contractor as well as at the commitment of

the public works concession ; ii) the second group relates to the implementation of the contractual relationship between the public authority and the concessionaire and provides certain forms of guarantee in favour of the funding bodies.

With reference to the latter stage, the most relevant laws are related to: i) the possibility to succeed in the project company concession relationship potentially formed by the successful contractor; ii) the favour in respect of funding bodies, according to which the sums owed by the government to the concessionaire as compensation in the event of termination or withdrawal "are intended primarily to satisfy the claims of the concessionaire financiers and are unavailable on the part of the concessionaire until full satisfaction of financiers' claims"; iii) the so-called step-in right ", which grants to funding bodies the chance to appoint a substitute in the event of termination of the concession relationship for reasons resulting from the concessionaire; iv) introduction of a conventional privilege to protect claims of those financing the realization of public works or public service management.

Despite the importance of these remedial provisions for the regulation of public works, since they removed the obstacles to successful use of PPP, interpreters and professionals have showed the insufficiency and inadequacy of these guiding principles. It is possible to consider, for example, the need to introduce) a dynamic step-right up, enabling the intervention of funding bodies before the concessionaire will be in a full-blown default situation; as well as ii) more detailed rules on privilege, which ensures the PPP project "locked-in".

The PPP in the Public Contract Code

In particular, art. 3, par. 15-ter of the Code of Public Contracts defines PPP contracts as "contracts for one or more services such as design, construction, operation or maintenance of public works or utilities, or the provision of a service, including in all cases the total or partial financing by private entities, even through different forms, of such services, with the risk allocation in accordance with the EU regulations and guidelines in force".

The PPP in the European Commission Green Paper

The European Commission Green Paper on Public-Private Partnerships and EU law on public contracts and concessions, issued on April 30, 2004, provides useful guidelines, explaining the institution characteristics and different forms, by making a distinction, based on different types of contract, between the institutional partnership and the contract partnership.

The institutional partnership entails cooperation between the public sector and the private sector within a specific entity, assuming the existence of a corporate or institutional structure, which, being held jointly by the public authority and private entities, carries out the task of ensuring the delivery of a work or a service on behalf of the community. The Government is geared to the use of this formula for primarily managing public services at local level.

The legislation on the discipline of the PPP different application modes has been strong and growing in the last decade, as showed for example in table 1.

2008 The implementing regulation and implementation of the code of public contracts

The contractual partnership is based, instead, on purely formal ties between public authorities and private entities for the commitment of the public work. In this context, one of the best known models is the concession model, which is characterized by the existence of a direct link between the private entity and the final user, providing a service to the community in place of and under the control of the public authority (Gallia, 2008).

This model is also characterized by a specific mode of private remuneration, since the operator's consideration results from users of the public service (Vecchi, Amatucci, 2008, 2009).

With reference to the Italian legislation on remuneration method, the concession of public service under the Consolidated Act on municipality, R.D. No. 2578 of 1925, is ruled by article 267 of the R.D. No. 1175 of 1931. This article provides for concession contracts regarding local public services, a participation notice to be published in order to allow private sector entities to submit or enter into an agreement when advised by "special circumstances in relation to the nature of the services" subject of the commitment. This discipline, referring to special circumstances and not exceptional circumstances, has effectively legitimised an interpretation and application of article 267 which allowed the widespread use of private agreement, on the assumption of the fiduciary nature of the relationship between the grantor and the concession operator, as well as by reason of technical financial and organisational requirements-. The concession as a tool for the management of local public services was considered in the reform of local authorities provided for by Act No. 142 of 1990, as an alternative model, including the innovative reliance on mainly public partnerships. Italian law envisages both institutionalized PPP and contractual PPP.

In the Italian legal system, the institutionalized PPPs are realized through:

- mainly public capital partnerships;
- mainly private capital partnerships;
- public-private partnership established according to the civil code;
- urban transformation partnership.

The main forms of contractual PPPs are:

- concession of construction or upgrade services and operation services;
- sponsorship;
- leasing ("leasing in costruendo")

SECTION II

TRENDS AND THEORY

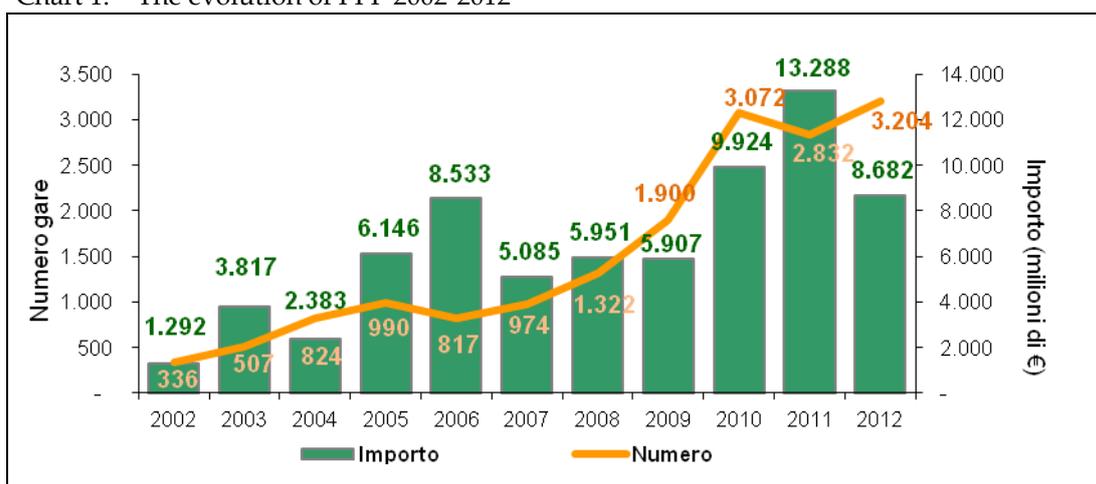

THE NETWORK OF STRATEGIC INFRASTRUCTURE UNDER CONCESSION IN ITALY

The Public and Private Partnership (PPP) demand, on the basis of available data by the National Observatory of the Public-Private Partnership, an information and monitoring

system and alerts of concession contracts within the entire landscape of the PPP, the economic and financial crisis scenario, continued to grow in 2012, but the execution path becomes increasingly difficult.

Developing analysis, assistance and technical knowledge programs become a strategic variable in this difficult market period, to delineate the possible effectiveness and synergies that may allow the growing demand for public-private partnership to play a role as a driving force for the revival of the country. *In 2012, participation notices were 3,204 for a business volume of 8,682 million. Compared to 2011 there has been a growing demand compared to a sharp decline in economic value, that was sub sequential to the general crisis which made it difficult to find financial resources through funding even for private companies. Between 2011 and 2012 the number of competitions increased by 13.15% from 3,204 tenders to 2,832 notices, while the business volume decreased by 34.7%, from 13.3 billion euros of amounts devoted to competition to 8.7 billion euros.* This remarkable decline resulted from the collapse, after an expansive period, of over 50 million large-scale works to be realized through PPP, decreasing by 39.7% in one year. Last year no exceptional amount work was realized, such as the two public work concessions, convened in the second half of 2011, for the strengthening and maintenance of the A22 Brennero-Modena motorway (3 billion euros) and for the construction of the Rome – Latin Intermodal Corridor and Cisterna-Valmontone connection (2.7 billion), in addition works exceeding 50 million significantly reduced, passing from 22 annual participation notices between 2010-2011 to 14 participation notices in 2012.

Chart 1. – The evolution of PPP 2002-2012

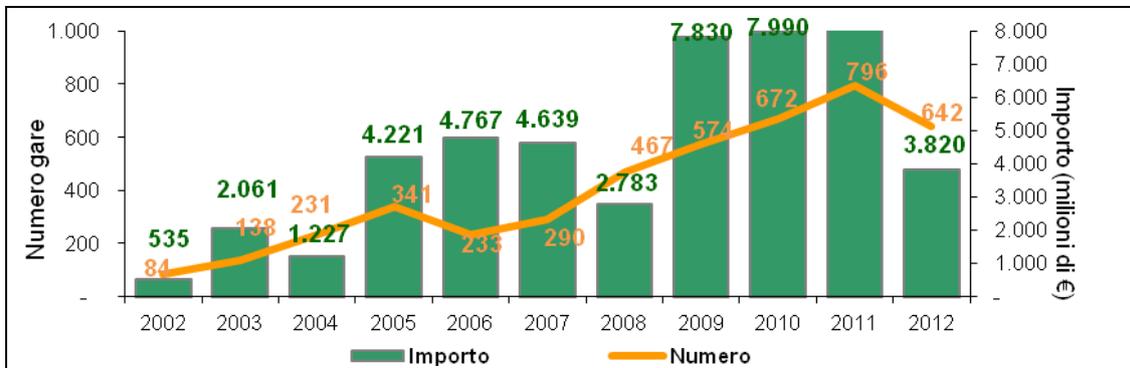

Source: Unioncamere, Dipe-Utfp and Ance and realized by CRESME.

The PPP demand continued to grow in 2012, driven mainly by the municipalities and local stakeholders, but it became increasingly difficult to materialize, not surprisingly, things went even worse for the PPP works that were adjudicated: from 796 participation notices

adjudicated in 2011 to 642 participation notices adjudicated in 2012 (-19.3%) and from 8.3 billion euros to 3.8 (-54%).

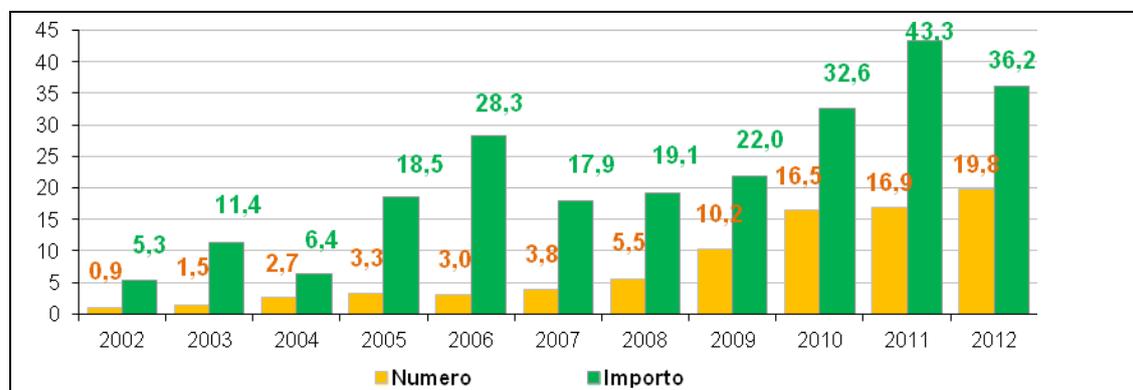

Chart 2. – The evolution of PPP contract awards 2002-2012.

Source: Unioncamere, Dipe-Utff e Ance e realizzato dal CRESME

The dynamics in progress are also highlighted by the importance of PPP in the public work market, risen from 16.9% in 2011 to 19.8% in 2012 in terms of number of opportunities – the highest level recorded since the Centre was operational, i.e. since 2002 when it represented less than 1% of the opportunities – and from 43.3% to 36.2% for economic value.

Chart 3. PPP – percentage on OOPP 2002-2012

Source: Unioncamere, Dipe-Utff and Ance and realized by CRESME

Additionally, by aggregating the identified PPP 18 sectors into three main groups of interventions, we see an increasing emphasis on urban regeneration, meaning the set of regeneration interventions on built space, functional to improve the quality of life⁵. It is a market sector, triggered mainly by municipalities, which approximately represented 70% of

⁵ This group embraces the following sectors: rehabilitation of urban areas; urban planning and public parks; trade and handicrafts; directional constructions; sports facilities; leisure; tourist landings; parking.

demand and 17% of the total business volume between 2002 and 2012, and it was the only sector with a total positive balance sheet in 2012. Basic service sectors (transportation, health and education and social) and essential service sectors (water, energy, lighting, cemetery services, waste disposal) were the main sectors with reference to revenues, but during the last year these sectors registered a decline in the amounts linked to tender notices.

Compared to the size of PPPs, in 2012, works of less than 5 million euros continue to grow and investments have mainly covered initiatives of higher amount.

The initiatives of less than 5 million euros were 1,553 corresponding to a total of 974 million, that are at odds respectively in number and amount, of 92% and 11% of the PPP total market when excluding the initiatives for which we do not know the value of the contract.

The initiatives of more than 5 million euros, on the other hand, were just 127 (only 8% of demand) but their economic value exceeded the 7.7 billion equivalent to 89% of the total market of PPPS (in 2011 initiatives were 169 for 12.2 million euro equal to 92% of the market).

THEORY

ELABORATION OF THE REFERENCE THEORETICAL FRAMEWORK .

PPP, SCA AND IFRIC 12: A LITERATURE SURVEY

("Before" and "After" the application of IFRIC 12)

In some countries, infrastructure for services and public works (stadiums, kindergartens, roads, ports, airports, hospitals, cemeteries, prisons, parking lots, telecommunications networks, water distribution systems, networks for the supply of energy), is created, managed and controlled directly by the public sector taking care of the maintenance over time through direct financial allocations (Campra, 2005, 2012; Hall, 2008).

However, subsequent to the introduction of new stringent budgetary constraints, the respect of general government budgetary balances (Stability Pact in EU countries), and the increasing scarcity of resources, worsened by the financial crisis, in some countries, over the past twenty years, (Borgonovi, 2005, 2006, 2009; Amatucci, Vecchi 2009, 2011), governments have introduced (as shown in the following table), public-private partnership (PPP), through contractual service arrangements (Oricchio, 1996; Robinson 2001; Hawksworth, 2001), in order to attract private sector participation in the development, financing, operation and maintenance of works and utilities (Laghi, 2010), even to keep their rising debt under control (Broadbent, 2001; (Broadbent, 2001; Broadbent, Laughlin, 1999, 2002, 2004; Ricci, 2005; Eurostat, 2004).

The agreements regulating the different concession services in the recurring form of PPP (Parker, Gould, 1999; Pisani, 2001; Grimsey, Lewis, 2005; Guthrie, 2005), fall within the scope of IFRIC 12 (Campra, 2012: 2675) and the different accounting treatment of the operator's rights on infrastructure, depending on the different tasks of control and regulation to be provided to the public on behalf of the public sector in accordance with the terms specified in

the contract for a specified period of time (Hall, 2008), and on the identification and detection of the party on whom demand risk stays (Campra, Faraudello, Malfatti, Passarani, 2011),

The accounting treatment of "Service Concession Arrangements" (SCA), ruled by IFRIC 12, represents one of the most significant and emblematic cases of the application of the principle of the prevalence of substance over form (Meyer, 1976; Shere, 1986; Adwinckle, 1987), to highlight "typical light and shade" of a principle which is the basis of IAS/IFRS accounting model (Laghi, Giornetti, 2009; Laghi, 2010). It is a significant case because it falls within the definition perimeter of the concession services (SCA), all forms of public-private partnership and Project financing, particularly focused and copiously considered and debated in the business literature over the past fifteen years (Vecchi, Amatucci, 2008).

In the following paragraphs, business literature on different forms of PPP and SCA before and after the adoption of IFRIC 12 will be separately analyzed and reclassified, in order to determine the contribution that IFRIC 12 interpretation produced in favour of the improvement of the conceptual vagueness characterizing such instruments even under an increasing normative isomorphism (DiMaggio, Powell, 1983, 1991; Sullivan, Skelcher, 2002; Dickinson, Glasby, 2010).

PPP, SCA:

THE THEORETICAL FRAMEWORK "BEFORE" THE APPLICATION OF IFRIC 12

"Service Concession Arrangements" (SCAs) refer to those forms of PPP projects through which a public sector entity (grantor), entrusts to a private sector entity (operator), the concession to construct or to operate a public work or infrastructure, in order to perform a public service in the public interest, upon consideration, and resulting in deep functional privatization processes (Pivato, 1958; Amaduzzi, 1978: 227; Caramiello, 1988: 546; De Robertis, 1992; Guatri, 1992: 498; Oricchio, 1996; Kunz, 1997; Perfolini, 1999; Dell'Atti, 2001; Rijna, 2010). The operator's consideration may consist in a right to charge users of the public services (intangible asset), or in an unconditional contractual right to receive cash or another financial asset (financial asset) from or at the direction of the grantor for the construction services (Campra, 2011; Laghi, 2010).

The following table reproduces the critical success factors regarding PPP, from an international literature view, prior to the adoption of IFRIC 12.

<i>Reconstruction and classification of literature</i> <i>(Critical success factors, PPP Projects)</i>

(Adapted from Li, Akintoye, Edwards, Hardcastle, 2007)

In the national scenario, business and economic literature on the topics of the PPP and the SCA remains weak and non-systemic, there is small evidence of PPPs and SCA application. This is partly compensated by students of industrial engineering who have tried to classify standards, dimensions, variables and recurring characteristics of a number of PPP arrangements (*Carbonara, Costantino, Pellegrino, Sciancalepore, 2012*), reclassified on the basis of the legislation on PPPs and of their division into contractual and institutional PPPS.

Dimensions	Variables	Values	
<i>PPP arrangement's structure</i>	Contract type	Based on the legal structure of the transaction	Institutional PPPs Contractual PPPs
		Based on operational aspects	Management contract Leasing model or Build-Lease-Transfer Design-Build (and Design-Build with warranty) Design-Build-Operate-Maintain Design-Build-Finance-Operate Build-Operate-Transfer Build-Own-Operate-Transfer Build-Own-Operate
	Use of private resources and expertise		Degree of involvement of the private sector in the lifecycle of the project (from design to management)
	Time horizon of contract		Long term (25-30 years)
	Revenues sources	Payments based on usage volumes or demand	By private sector By public sector By public and private sectors
		Public financial contribution	Lump sum payment by public sector
	Special purpose vehicle (SPV)		Private company Publicly- and privately-held company
	Risk allocation		Private sector Public sector Shared between public and private sectors
<i>PPP arrangement's financing</i>	Use of private finance		Financing in whole by the private sector Financing partially by the private sector Government-funded projects (no private capital)
	Type of funding options		Bank debt Equity Bonds Loan from shareholders Mezzanine finance
	Debt to equity gearing		High (debt exceeds 70%)
	Investment value		High
<i>PPP arrangement's financing</i>	Use of private finance		Financing in whole by the private sector Financing partially by the private sector Government-funded projects (no private capital)
	Type of funding options		Bank debt Equity Bonds Loan from shareholders Mezzanine finance
	Debt to equity gearing		High (debt exceeds 70%)
	Investment value		High
<i>Public Leverage on PPP</i>	Scope	Assuring Value for Money	
	Legislation	Degree of PPP formalization by a Government legal/statutory framework	

(Carbonara, Costantino, Pellegrino, Sciancalepore,, 2012)

		do not still use tools, such as risk matrix, to best evaluate and allocate risks.
PPP arrangement's financing	Use of private finance	Generally, private funding is used for these projects, but lenders give funding only in exchange for traditional guarantees (Bentivogli et al., 2008). But PPPs are usually financed also by a quote of public funding: an example for this is the Autostrada Cispadana highway (Costantino et al., 2011)
	Type of funding options	The culture of the use of capital market, by selling bonds or shares to investors, for such projects is not spread in Italy: consequently, the financing is generally granted by banks with a deep experience of such projects (Etro, 2007). But even the access to this source of funding is characterized by disadvantageous conditions in comparison with other countries: the interest rate is about 10 - 11%, while in UK, for instance, the required spread on the risk-free rate is 0,75-1% (Iossa and Antellini Russo, 2008)
	Debt to equity gearing	Generally, Italian PPP projects are characterized by high leverage: for instance, debt to equity gearing is more than 80:20 for Vigliena port project in Naples (Micelli, 2009) and it is estimated from 75:25 and 85:15 for wind energy plant projects (Scarnati, 2007)
	Investment value	PPP projects are characterized by little or medium economical dimension (Iossa and Antellini Russo, 2008)
Public Leverage on PPP	Scope	Italian law does not prescribe the estimation of VfM before the approval of a PPP project. Thus this practice is not still sufficiently adopted (UTFP, 2010). Contrarily, they often choose PPP route on the basis of other reasons, such as their financial situation, the possibility of getting infrastructure costs off the public balance sheet while keeping investment levels up (Iossa and Antellini Russo, 2008).
	Legislation	Italian PPPs are ruled by Code of Works, Services and Supplies Public Contracts. This imposes some rules on PPP schemes, call for tenders, SPV, concessionaire default and its substitutions (Vigliano and Bicchieri, 2007). Until 2007, differently than in the other European countries, if there was a private promoter of the project, this had the pre-emption right on the awarding. This discouraged many firms entering the market (Iossa and Antellini Russo, 2008): in Lombardy, the 75% of the PPP tenders with promoter were without any other competitors (Bentivogli et al., 2008). In 2008, a substantial modification about the use of the pre-emption right was introduced, which is expected to reduce the anti-competition effect (Ricchi, 2009).

	Legislation		Degree of PPP formalization by a Government legal/statutory framework

(Carbonara, Costantino, Pellegrino, Sciancalepore,, 2012)

These configurations are reproduced in various search models identified as distinct disciplinary sectors, even divided within the same sector (SECS P07), similarly to the several pieces of a puzzle to be recomposed, into fractionated subsets of specific interest depending on scholars specializations and interests (public companies and private companies), delivering to professionals and operators a confuse interpretation without any systemic and comprehensive vision of criticality, models and configurations assumed over time.

PPP, SCA:**THEORETICAL FRAMEWORK "AFTER" IFRIC 12 APPLICATION**

The discipline of IFRIC 12 is essential and also constitutes an "emblematic" case, even if it is partial and partially satisfactory, for the application of the principle of prevalence of the substance over form (Laghi, 2010), since all aspects determining the accounting treatment of "service concession arrangements" (SCA), starting from the same definition of the scope of IFRIC 12, ending with the accounting models to be used for the purpose from the representation of the effects of SCA are "filled" by the continuous research of the representation in the "economic substance" (Heald, Georgiou, 2011), regardless of the legal

form they are regulated the transfer of risk and responsibility for the realisation of the works or services under concession and the management of public services or in the public interest. The continuous research of the economic substance of the SCA, becomes a crucial condition for achieving the reliability of financial information and to avoid errors and distortions in relevant economic and financial communications.

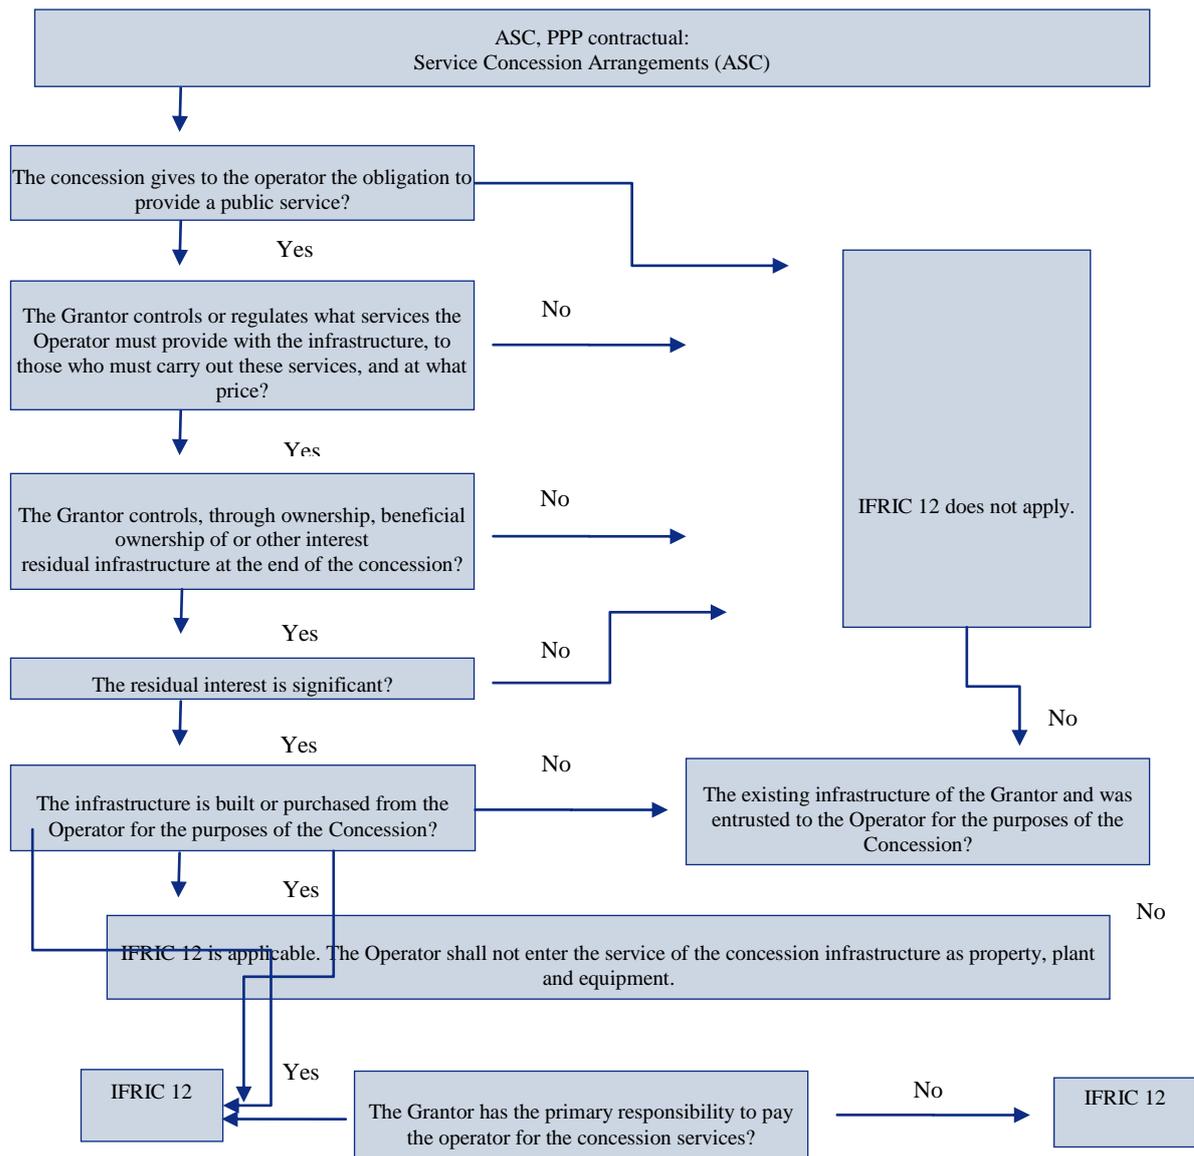

Support and expected effects of IFRIC 12, published on November 2006, are also found in literature (Laghi, 2010), and are linked to the need to frame, simplify and clarify the complexity of the accounting treatments relating to different forms of PPP and ASC, caused by a stress between orientations and operational practices and legislation hypertrophy (Capaldo, 1998; Oricchio, 1996; Pinto, 1996; Pisani, 2002; Laghi, 2010), as well as to avoid any confusion in the scope of other international accounting standards. The Regulation (CE) n°. 254/2009, regarding the SCA and IFRIC 12 interpretation, places in the introduction to the same interpretation, references to the basis of the number and complexity of the different principles:

IFRIC 12 Interpretation – Service Concession Arrangements. References

IFRS 1, IFRS 7, IAS 8, IAS 11, IAS 16, IAS 17 e IFRIC 4, IAS 18, IAS 20, IAS 23, IAS 32, IAS 36 , IAS 37, IAS 38, IAS 39

IFRIC 12, provides guidance on the accounting by operators for public-to-private service concession arrangements, it does not deal with the accounting by grantors, and provides for the concession assets, once verified some objective and subjective conditions (Laghi, 2010: 127), an alternative recognition according to which infrastructure shall not be recognised as a material activity (highways, water supply, etc.), but as a right to charge users of the public service (intangible assets); or a right to receive a payment (Laghi, 2010), namely a consideration by the grantor for the utilities paid (financial assets); or through a mixed or forked method (Campra, 2012).

IFRIC 12 then provides an analysis to verify, for subsequent grades, which types of concession come or do not come under its scope, and when falling within the discipline of IFRIC 12, the application of Financial Asset Model or the Intangible Asset Model. The path is defined below.

Few years after the adoption of IFRIC 12 and the previous long, tiring, unclear (Frab, 2007; Nobes, 2008: 183; Martiniello, 2011) and controversial (Kaufmann, 2006), endorsement on accounting treatment of concessions (European Commission, 2008: 15; Campra, 2012), literature, especially international literature paid more attention, (Paris, Cruz, Rodriguez, Brugni, 2011), to the outline of the different evolutionary developments, applications and interpretation of IFRIC 12, in different countries (Zeff, Nobes, 2010).

International literature has carefully investigated the application of IFRIC 12, and in some EU countries (Bing L., Akintoye A., Edwards, P. J., Hardcastle C., 2005, 2007; Treasury, 2008; McQuaid, Scherrer, 2010; Heald, Georgiou, 2010; Camfferman, Zeff, 2011; Zeff, Nobes, 2010; Heald, 2011), such as Spain (Acerete, Shaoul, Stafford, 2009; Rangel, Valende, 2009; Rangel, Vassallo, Galende, 2010), France, (Schevin, 2001; Marty, 2011; Dupas, Marty, Voisin, 2011), Denmark (Petersen, 2010), Greece (Roumboutsos, Anagnostoupoulos, 2010), UK (Bringhlie, 2005; Li, Akintoye, Edwards, Hardcastle, 2005, 2007); and other non-EU countries, such as Brazil in particular (Cruz, Silva, Rodrigues, 2009; Lima, 2010; Martins, Andrade, 2009, 2010; Costa, 2010; Paris, Rodrigues, Cruz, Brugni, 2011), Japan (Uozumi, 2007) or Australia (Raisbeck, Duffield, Xu, 2010) offering comparative analysis with applications in different countries.

The following tables show the aspects characterizing the different forms of public-private partnership in the interest of their useful and systematic organization, in order to compare different countries or similar business models to better support the choices of public decision-makers and of concession companies.

The following table, offers a scheme of the selected literature and summarizes the content and variety of the current national and international debate on the topic of PPP and the SCA.

Table III: selected Literature

Anglo-Saxon Literature	(Bing L., Akintoye A., Edwards P. J., Hardcastle C., 2005, 2007; Treasury, 2008; McQuaid, Scherrer, 2010; Heald, Georgiou, 2010; Camfferman, Zeff, 2011; Zeff, Nobes, 2010; Heald, 2011)

Italian Literature	(Capasso, 2002; Amatucci, Vecchi, 2008, 2009; Laghi, 2010; Campra, Faraudello, Malfatti, Passarani, 2011; Campra, 2012; Pozzoli, 2011; Martiniello, 2008, 2012; Vecchi, Hellowell, 2012; Cappellaro, Marsilio, Cuccurullo, 2009, 2011; Cappellaro, Longo, 2011)

This section aims to show, through an international literature survey, the multidisciplinary approach adopted for the study of PPP. In the table below, a reconstruction of the existing literature on the sources of PPP in developed countries and in developing countries is represented, paying attention to the various theories which are based on multi-disciplinary approaches:

- macro-economic;
- business and economic
- political science;
- public management.

Table IV: PPP, SCA determiners

		Lasthuizen, Huberts, Heres (2011)
Public Procurement		Pashev (2011)

These comparative analyses highlighted application problems and confusion in the various systems of service agreements involving public authority and private entities, in relation to creative accounting treatments asymmetries (Martiniello, 2011), produced by (immaterial and financial) unusual methods, as well as by the responsibility of the entities or parties affected by the demand risk (Campra, 2012: 2705), also through the different models of accountability adopted (Ricci, 2005, 2010).

The theoretical framework that outlines, making it useful to deepen the evolutionary trends in the application of IFRIC 12 in different countries, in the light also of new paradigms that are setting up new conceptual-logical cognitive maps in re-thinking the common goods, contractual communities (Foldvary, 2010), the collective property; the allocation and risk management; report systems and (in) dependency between ownership and control (Flick, Cearns, 2008; Ellwood, Lacalle, 2012), and control over significant residual interest of infrastructure (Campra, 2012: 2678).

In Italy, business literature on IFRIC 12, is solely developed by some authoritative scholars and a large and growing group of professionals (Campra, 2005, 2012; Laghi, 2009: 26; Giussani, 2009: 180; Delladio, Gaiani, Meneghetti, Pozzoli, 2011: 168; Giovando, 2012: 200; Rotondaro, Zambon, 2010: 2010; Leo, 2011: 164; Brescia, Muraca, 2011: 381; Cordazzo, 2008: 40; Bauer, 2007: 327), notwithstanding the strategic importance and interest manifested by the international literature on the one hand, and the continuing lack of an overview on the accounting treatment of the PPP concession services by local authorities (Ricci, 2005, 2007, 2009).

Though addressed to concession companies, and therefore private entities, IFRIC 12 is however vital for scholars of public companies and public management, since the same definition framework, pointing out and stressing the principle of the prevalence of substance over form, it focuses on the need for further reflection on some issues, and some key concepts, such as:

- the boundaries for the public and private sectors;
- the risk identification and allocation;
- infrastructures;
- public services, services of public interest and/or utility;
- important economic and social services;

- service price/value;

The interpretation of IFRIC 12 also allows researchers to avoid confusion in the classification, measurement, and detection of SCAs involving public and private entities such as outsourcing contracts, contracts of network capacity, take-or-pay contracts, ruled instead by IFRIC 4 (Treasury, 2008; Heald, Georgiou, 2010. Laghi, 2010: 6); or even errors in classification of PPP, where the prevalence of economic substance is entirely public, as in the case study, and then can be traced in the discipline of IAS 20.

Among other positive aspects of IFRIC 12, there is the attempt to improve the budgetary information for investors, clarifying the nature and risks of the ASC, object recognition and measurement.

However, several authors in literature measure that the centrality of complexity is also interpretative effect and not only because of the demands of public finance (Laghi, 2010).

The registration or cancellation of a budget, are sometimes connected and based on the model of "risk/benefit" transfer, sometimes related to the prevalence of the "control" on the activity (Laghi, 2010; Martiniello, 2011; Head, Georgiou, 2011), which leads to an absolute complexity of interpretation. Complexity that recurs like a mirror (Head, Georgiou, 2011), evaluating the adoption of IFRIC 12 compared to evaluation based on the model of "control" (control model), or to risk/benefit model "(risk and reward model), or the new information provided by institutions such as the UTFP sustaining principle-related costs for implementation and management (Martiniello, 2011) and not dependent on budgetary implications of local and more generally on public finances (Internal Stability Pact).

NOT CONCLUSIVE REMARKS

The construction and management of infrastructure in the framework of concession relations between public sector entities and private sector entities, presents, from the financial point of view, several critical aspects, especially with reference to cases in which the public work or infrastructure construction is entrusted to an undertaking which draws up the budget according to the Ias/Ifrs accounting standards. For Ias adopter subjects operating on the basis of concession agreements, starting from the budgets relating to exercises that began after January 1, 2010, the new rules on financial representation provided by Ifric 12, already subject of analysis by the Oic in application No. 3 of July 2010, have become compulsory rules. The new rules on financial representation provided by Ifric 12 apply to public-to-

private service concession arrangements when: the grantor controls or regulates what services the operator must provide with the infrastructure, to whom it must provide them, and at what price;. and the grantor controls — through ownership, beneficial entitlement or otherwise — any significant residual interest in the infrastructure at the end of the term of the arrangement.. According to the new rules laid down by the IFRIC 12, the grantor who builds and manages a public work shall not list tangible assets among the goods to be transferred at the end of the concession, but grantor must include the fair value of the performance. In particular, in accordance with IAS the concessionaire/operator shall recognise (Laghi, 2010; Campra, 2011):

- a financial activity when having an unconditional contractual right to receive cash or another financial asset from or following the instructions of the grantor for construction services;
- an intangible asset when from the construction of the asset the concessionaire/operator draws the right to exploit the work in relation to third parties, acquiring the right to charge users of the public service,

The concessionaire/operator that is required to apply IFRIC 12 shall recognise in the income statement, on the one hand, the construction cost and, secondly, the amount that is determined by reference to the relative fair values of the services delivered, already incorporating an estimated contract margin. In this regard, it should be firstly noted that, by virtue of the principle of reinforced derivation art. 83 of the Tax Code, in the version in force since 2008. qualifications, charges, classifications of financial statements arising from the adoption of IFRIC 12 find direct recognition from the point of view of taxation. In particular, subsequent to the recognition of the intangible asset it will become applicable the discipline under the art. 103, paragraph 2 of the Tax Code, which, with reference to the cost of the concession rights and other rights recognized in the balance sheet provides that the accumulated depreciation charges are deductible in proportion to duration of the use specified in the contract or by law. Some doubts arise with regard to the possibility of using the so-called sinking fund provisions according to the art. 104 of the Tax Code, which allows the deduction of variable depreciation charges in lieu of ordinary depreciation.

There are, however, no good reason to exclude the application of this discipline in the case of IAS adopter entities, provided that the same art. 104, paragraph 1 of the Tax Code provides that this type of depreciation is allowed in a planned ordinary depreciation for both physical

assets and intangible assets. Another problem of a fiscal nature in respect of operations of replacement and restoration that, according to IFRIC 12, must be calculated pro rata basis taking into account the time of maturation of the bond and its deferral in time: this involves the necessity to account, in each year, a special fund, based on its current value. With reference to the above provisions, it is believed that the art. 107, paragraph 2 of the Tax Code can be applied, it allows the deduction within the limit of 5% of the cost of each item, and up to the total amount of expenses incurred for each item in the last two years. A number of systematic reasons, lead to the conclusion that it can not be accepted the argument of those who believe that the under discussion provisions concern the constructed item which does not appear in the financial statements of companies IAS adopters. Other themes of interest regard the improvements to be borne by the concessionaire without the recognition of tariff increases.

It may happen, in fact, that the concession agreements require the concessionaire the construction of real additions or additional works without additional economic benefits. In this case, according to the interpretative guidance of the OIC, the accounting practice is to be preferred to enrol at the time of incurrence of such liabilities the present value of future liabilities in return for a corresponding increase in intangible asset, which is thus subjected immediately to the amortization procedure, in full respect of the principle of correlation with revenues. This system is not dissimilar to the one provided for the costs of remediation and environmental restoration, for which the explanatory report on the Ministerial Decree of 1st April 2009 stated that the accounting rules of IAS express a qualification designed to find direct tax recognition. Therefore, it seems logical to assume that the costs for improvements to be borne by the concessionaire, capitalized on the value of the intangible asset, conform to the same treatment as the cost of remediation and environmental restoration.

IFRIC 12, although addressed to the concessionaires/operators, then to private sector entities, however, is of fundamental importance for scholars of public enterprises and public management, as the same definitional framework, stressing the principle of substance over form, highlights a central need for further reflection on some issues and some key concepts, such as:

- The boundaries for public and private entities;
- The identification and allocation of risk;
- Infrastructure;
- Public utilities, public interest services and / or benefits;

- Major economic and social;
- Price / value of the services;

The interpretative usefulness of IFRIC 12 is essential in order to avoid confusion in the activity of classification, measurement and recognition of ASCs involving public sector entities and private sector entities, such as outsourcing contracts, contracts of network capacity, take-or-pay agreements, all regulated instead by IFRIC 4 (Laghi 2010: 6), or even errors in the PPP framework, where the prevalence of economic substance is entirely public, as in the selected case study, and then having reference to the discipline of IAS 20 .

Among other positive aspects of IFRIC 12, there is an attempt to improve the financial reporting for investors, clarifying the nature and risks underlying the ASCs subject to measurement, recognition and assessment. However, several authors in the literature reveal that the centrality of the interpretative complexity is an effect and not just source of greater needs of public finance (Laghi, 2010).

In fact, the entry or cancellation of balance sheet assets, are sometimes linked and based on the "transfer risk / benefit" model, sometimes they are linked to the prevalence of the activity "control" model (Laghi, 2010; Martiniello, 2011; Head, Georgiou, 2011), this circumstance generates an undoubted complexity of interpretation. Such a complexity comes back as in a mirror (Head, Georgiou, 2011), when assessing the adoption of IFRIC 12 with respect to the choice of evaluation based on the "control" model (control model), or to the "risk / benefit" model (risk and reward model), or to the new information provided by institutions such as the UTPF related to the principle of incurring the construction and management costs (Martiniello, 2011).

SERBIA A RECOMMENDABLE DESTINATION: SLOVENIAN AND SERBIAN PERSPECTIVE

Branka Novčić¹; Marija Jović²

¹Faculty of Organizational Sciences, University of Belgrade, brankanovic@gmail.com

²Faculty of Organizational Sciences, University of Belgrade, marijaj@fon.bg.ac.rs

ABSTRACT

The main purpose of this study was to examine the perception of Serbia brand identity elements viewed from the stand point of Slovenian residents - external stakeholders, and Serbian citizens - internal stakeholders. The main aim of this research paper is to identify, compare and contrast different perspectives of Slovenian and Serbian residents regarding Serbia brand identity. Multiple surveying techniques consisted of on-the-filed and on-line surveys were applied. 2228 responses were collected in Slovenia and 740 responses in Serbia. Principal component analysis was used for results analysis. Research findings point that certain differences and similarities in the perception of Serbia brand identity between Slovenian and Serbian residents do exist. First difference is reflected in the number of brand identity elements identified by each of the two examined groups. Slovenians identified 4 brand identity elements which are marked as **recommendable tourist destination, development, national treasury and cultural heritage**; whilst Serbian residents identified 6 elements: **people, obsolescence, negative media bias, cultural uniqueness, tourist destination and national treasury**. Second difference, is reflected in the view point of both groups. Slovenian residents perceive Serbia as a favourable tourist and business destination, and emotions involved are mostly experiential, whilst the perception of Serbian residents is mainly shaped by emotion of national pride. A side from differences, our research suggests certain similarities in perception of both groups. Slovenian and Serbian residents both hold the view that Serbia is associated with positive attributes, such as: recommendable tourist destination, rich with national treasury and distinctive culture.

Keywords: country brand identity, external stakeholders, Slovenia, residents, Serbia

1. INTRODUCTION

Widely spread trend of globalization, rapid development of modern world, and increasing customer mobilization led to the changes in concept of destination branding. More than ever, highly competitive marketplace influences the need for destinations to create a unique brand identity in order to differentiate themselves from competitors, attract visitors, and increase foreign investments. Despite all the challenges, this opened numerous opportunities for international brand experts and marketing scholars to get involved and give contribution in the terms of destination branding and strategic destination brand identity development. Foremost goal of the destination branding is to shape future visitors' perception regarding certain destination (Sartori et. al., 2012; Murphy et al., 2007; Ekinci et al., 2006; Hankinson, 2004; Morgan & Pritchard, 2002). Many developed countries such as Canada, New Zealand, Spain, UK, Portugal, and many others, approached the issue of destination branding with great attention (Hudson & Ritchie, 2009; Morgan et. al., 2003; Gilmore, 2002; Freire, 2007; Aziz et. al., 2012). But, not only developed countries are seeking to create appropriate destination branding strategy, developing countries are also searching for a way to position in the global marketplace.

Yugoslavia once consisted of 6 countries: Serbia, Montenegro, Croatia, Bosnia and Herzegovina, Slovenia, FYROM (Former Yugoslav Republic of Macedonia), and after dissolution these newly formed countries faced a challenging task to create their new brand identities. In order for destination branding planners to begin with the process of creating a destination brand, it is necessary to assess destination brand's current position. Konecnik et al. (2010) argue that managing destination brands focusing on only one stakeholder is myopic. Therefore, examining the perception of external and internal stakeholders is essential because internal perception of destination brand image is usually not in accordance with external perception. The inconsistencies in perception are most commonly related with positive and negative elements linked with destination brand identity, attitudes toward a destination, and overall experience (Hankinson, 2007; Hudson & Ritchie, 2009). Having this in mind, our study examines Serbia destination brand perception through the spectacles of two interrelated but different audiences: Slovenian residents (external stakeholders), and Serbian residents (internal stakeholders) once part of the same country. The main aim of the study is to determine differences and similarities in the perception of these two stakeholders groups regarding Serbia as a destination brand.

At the first glance, Serbia may appear as a fertile research context for destination brand image type of study. Following arguments should justify the reasons for investigating Serbia as a brand from the perception of Slovenians. First, after Serbia became independent in 2003, country became 'new to the market'. In this way Serbia became interesting and attractive destination for ex-Yugoslav, neighbouring countries, especially Slovenia. Two countries, once part of Yugoslavia, have been bonded by strong historical, cultural, and economical ties for decades, which only emphasize the experiential component value for future visits. Second, Slovenia and Serbia always had good bilateral relations, not burdened with legacy of the past times. Also, two countries never had any conflicts, which enabled development of strong economical and business cooperation between them. Having this said, it is not surprising that Slovenia plays an important role in Serbian foreign direct investments portfolio, both in terms of number of projects and value of investments (SIEPA, 2013). Third, in past couple of years Slovenians are ranked as the most frequent visitors to Serbia. In recent years Serbia became city break destination for Slovenians, where they come to enjoy gastronomic specialties, nightlife, hospitable people, and pleasant ambient (National Tourism Organization of Serbia, 2012).

Therefore, this paper should help scholars and practitioners to better understand differences and similarities in the perception of Serbia brand identity from the stand point of closest neighbours, once part of the same country, today very influential external stakeholder. The results presented in the study will point out core competences of Serbia as a destination brand, which will allow destination branding planners to tailor appropriate branding platform for Serbia and create adequate destination branding strategy toward external stakeholders.

2. LITERATURE REVIEW

First literature stream relevant for this study is general literature on destination branding, destination brand identity and destination image. The interest of scholars and practitioner for the issues surrounding these topics is steadily growing in the recent years (Qu et. al. 2011; Roy and Banerjee, 2007; Tasci and Kozak, 2006). In the period 1998-2007, 74 destination branding publications by 102 authors were identified (Pike, 2009). Gilmore (2001) provided a "diamond shaped" branding framework consisting of four factors essential for the branding of each country: macro-trends, target stakeholders, competitors and core competences. Author outlines the fundamental value of branding framework for setting adequate

destination branding strategy. Mainstream studies on brand strategy development at the national level mostly explore attitudes of external stakeholders, usually focusing on the multiple stakeholder groups. For example, Anholt (2005) explores consumer perspective on America's brand image from the viewpoint of ten different countries. Morgan et al. (2003) examine influence of public and private sector stakeholders on brand image of New Zealand. Stancioiu et al. (2011) highlight the role of visitors' perception of tourism and historic attractions in the development of a destination image of the brand Romania. Several studies (Ekinci and Baloglu, 2007; Aziz et al. 2012) explore USA visitors' opinion about brand personality of Turkey and concluded that integrated marketing communication strategy should focus on presenting Turkey as a country to discover rather as an escape alternative. Nowadays, the focus of destination branding literature is slowly shifting toward experiential component of a destination. For example, Canada has recently launched a repositioning campaign targeting domestic and international tourists under the name "Brand Canada", using experiential marketing techniques to communicate new brand identity and brand promise (Hudson & Ritchie, 2009).

Second relevant literature stream has particular focus on destination image of ex-Yugoslav republics. A respectable number of studies outlined rebranding necessity of former Yugoslavian republics that appeared as new states on the global scene burdened with their post-conflict media image. The increased interest was followed by the number of publications. For example, Hall (2002) examined Serbia brand identity and found Serbia as the meeting place of cultures, religions and languages. Furthermore, he found Serbia as multiethnic country where all the ethnicities have one thing in common - their homes are wide open to the friends. In the case of Bosnia, Duborija and Milvic (2008) recognized local people as the key element for building a distinctive brand image of Bosnia. In the case of Croatia, Martinovic (2002) analyzed poor international destination brand recognition. Author suggested Croatia to focus on geo-economic position, natural resources, human resources, tradition and social and cultural activities in positioning their destination brand. Konecnik and Go (2007) describe endeavours of Slovenia to position their small country on the fierce international destination market as one of the smallest countries in the world but a country in the heart of the Europe that has ideal opportunities for the tourism industry.

Third literature stream is studying importance of local people for a destination brand identity. In the case of Portugal (Freire, 2007), friendliness of local people was found to be important for brand building process in Portugal. In the case of Stoke-on-Trent (UK), Phillips and Schofield (2007) found that perception of residents is an important component of the

place brand identity. Sartori et al. (2012) presented evidence which confirmed strong link between the internal and external performance of destination brands caused by commitment of internal stakeholders, especially local people. Previous studies on Serbia by Hall (2002), Popesku et al. (2010) and Novčić et al. (2012) explored brand identity of Serbia, focusing exclusively on Serbia destination brand elements perception of internal stakeholders – Serbian residents and Diaspora. Novčić et al. (2012) highlight important difference in the perception of Serbian residents and Diaspora. Serbian residents recognized people as the most important element of Serbia as a brand, whilst for Diaspora people are not an important brand identity element. To the best of our knowledge, there have not been any studies examining destination brand perception from the stand point of the neighbors, EU country, not so long ago part of the same country.

Based on literature review we identified literature gap regarding the perception of country brand identity elements, from the view point of the EU country and the closest neighbours, once part of the same union. Therefore, we have chosen to investigate perception of Slovenian residents, regarding Serbia as a destination brand. Three main reasons for choosing Slovenia as an influential external stakeholder are following: 1. Serbia and Slovenia are ex-Yugoslav countries, bonded with close historical, cultural and economical ties, 2. Slovenia is one of top 10 foreign direct investors in Serbia in the period of 2001-2011 (Business Info Group, 2012), and 3. Slovenians are ranked as the most frequent visitors to Serbia (National Tourism Organization of Serbia, 2012). Stated factual reasons only emphasise the importance of investigating Slovenian perception of Serbia, as in the future Slovenians and Slovenia as EU member can play important role in advocacy of Serbia as destination brand. Building on the actual literature and identified literature gap our research has and having in mind immense economic importance of Slovenia and Slovenian residents for Serbia as a country, it would be important to examine and compare their perceptions with the perceptions of Serbian residents. The proposed research question can be framed as following: *What are the differences and similarities between Slovenian (external) and Serbian residents (internal) perception in relation to the elements of Serbian destination brand identity?*

3. METHODOLOGY

The phenomenon of brand is very complex; therefore the investigation of brand image has similar characteristics (Maurya and Mishra, 2012). Having this in mind, in order to address the issue of complexity, we have used an exploratory sequential mixed research method. The

features of mixed methods were fitting for the nature of problem we explored. Mixed methods approach is good for studying complex phenomena (Salehi and Golafshani, 2010) and has a broader perspective compared to mono-method research (Azorín and Cameron, 2010; Johnson and Onwuegbuzie, 2004). In our case mixed method had two phases: phase 1: Exploratory (qualitative) and phase 2: Confirmatory (quantitative). Exploratory phase included: selection of appropriate research context, Analysis of media content and focus groups, Convenience sampling with sample size of 50 and thematic analysis using nVivo 9. The main goal of this phase was to discover elements of Serbia brand image and help building instrument for phase 2. The second phase included survey research method (N=740, Serbian residents, and N=2228 Slovenian residents) with random sampling. Principal component analysis in SPSS 17.9 was applied for results analysis. The goal of second phase was to identify and confirm structure of Serbia brand image.

The questionnaire consisted of relatively large number of attitudinal questions on a frequent stereotype attitudes shared in the discourse of everyday communication, media, history and collective conscious of Serbs. This might appear as a radical and risky approach in the research design, but in the cases when researchers do not have previous study to refer to, or the phenomena of study is new, a start from the scratch seems inevitable. Attitudinal statements were collected within a period of 12 months from national media (TV and newspapers) and 10 focus groups. 4 different researchers were independently coding frequent issues regards perception of Serbia and the lists were than compared and convergences identified. Further inspiration for the questionnaire design was found in the work of Ristiano (2005) who provided theoretical framework consisting of generic elements of a country's brand identity. Thus, our initial questionnaire consisted of 7 clusters of questions: demography, brand culture, brand personality, brand character, brand symbols, brand name, and brand slogan related questions. We undertook pilot testing to test the questions and make sure that questions are appropriate and relevant. The questionnaire was pilot tested on a group of 160 examinees. Final list of issues consisted of 38 most frequent attitudinal statements on the image of Serbia and a number of socio-demographic questions. In the phase of confirmatory research, PCA was used in order to distinguish significant from insignificant brand image elements. To measure attitudes, 5-item Likert scale was used with *Strongly Disagree* - weight of 1, and *Strongly Agree* - weight of 5, as the scale anchors. Initial research was undertaken in order to capture attitudes of internal audience: Serbs living in Serbia and Diaspora. The same questionnaire was adapted and used for the research of Slovenian, external stakeholders' attitudes toward Serbia brand identity. The difference between initial

and adapted questionnaire is reflected in three important questions. First question, regards citizenship of examinees. Second question explores frequency of visits to Serbia, and the last question captures reasons for visiting Serbia. All of these issues were not relevant when we were exploring attitudes of internal audience – Serbian residents.

Our target examinees were Slovenian citizens, permanently inhabited in Slovenia. Surveying lasted for three weeks in November 2011. People were surveyed on-line and on the field. Existing email databases were used and potential examinees were emailed to participate in the survey. In order to avoid response bias through the on-line survey, only people older than 40 years were interviewed on the field in five major Slovenian cities – Ljubljana, Maribor, Celje, Kranj and Koper. Survey was completely anonymous, and examinees were not asked for any personal data. We found the topic was interesting for our prospects and many wanted to participate. Thus, it shouldn't be surprising that examined sample was more than twice larger from the projected sample. Many of respondents felt delighted to participate in a survey about Serbia.

After expiration of the surveying period, online survey was closed. Results were coded and inserted in the SPSS 17.0 software, which was used for statistical analysis. Following good practice of Palant (2005) and Malhotra (2007), prior to the data analysis, error screening and data cleaning was undertaken. After insuring that there are no missing values or values of the variables that fall outside defined ranges, it was preceded to the data analysis. Following statistical tools were used: (1) **Descriptive statistics** tools were used to capture average values on the examined issues. These tools were very helpful to extrapolate demographic profile of participants and their general impressions. (2) **Factor analysis**. Exploratory and confirmatory factor analyses were used. The aim of this tool was to reveal underlying structure (i.e. Serbia brand identity) and determine how many reliable and interpretable brand elements can be found within both of the examined groups.

4. FINDINGS

Final survey sample consisted of 2228 examinees, from which 2098 Slovenian residents permanently inhabited in Slovenia. The examinees were in average 40.56 years old (std. dev. 10.205, median 40, mode 35, range 15 to 76 years). Our research analyzed frequency of visits and main reasons for Slovenians to visit Serbia. The results showed that 42.4% of the sample visits Serbia once a year, and as the main reasons are listed: owning property in Serbia (38.5%), work (24.6%), and nightlife and fun (28.3%). In the terms of size, the group was

suitable for principal component analysis. According to the recommendation by Tabachnik and Fidell (2007) and Stevens (1996), it is comforting to have at least 300 cases or 150 cases, in the case when solutions have several high loading market variables (above .80). These conditions are met in both of our target groups (refer to the Table 1 and Table 2 for further details).

4.1 Serbia brand identity - Slovenian residents' perception

Prior to the performing of principal components analysis (PCA), the suitability of data for factor analysis was assessed. PCA was repeated 4 times with exclusion of attitudinal statements with communalities lower than .5. Finally, 15 attitudinal statements have left. Inspection of the correlation matrix revealed that all of the coefficients were equal to or higher than .3. This confirmed that dataset is suitable for the factor analysis. The Kaiser-Meyer-Okin value was .859 exceeding minimal required value of .6 whilst Bartlett's Test of Sphericity reached statistical significance of .00, supporting factorability of the correlation matrix. Principal Component Analysis (PCA) was performed used Oblimin rotation. PCA revealed presence of 6 components with eigenvalues exceeding 1, explaining 27.48, 11.09, 8.08, 7.28, 5.53, and 5.35 percentages of variance respectively. In order to determine optimal number of factors, parallel analysis (Monte Carlo simulation) was used and eigenvalues were compared with the eigenvalues given by the PCA (Pallant. 2005). Parallel analysis showed that 4 components have eigenvalues that exceed the corresponding criterion values for a randomly generated data matrix of the same size (18 variables x 2098 responses). The 4 component solution explained a total of 56.49% of the total variance of Serbia as destination brand. To aid in the interpretation of identified components. Oblimin rotation was performed (for the detail findings of PCA please refer to Table 1). The four brand identity elements emerged:

1. **Recommendable tourist destination** – 33.38% of total variance explained and this is the strongest brand identity element. It is not surprising that Slovenians described Serbia as hospitable country, with great cuisine on which Serbs can be proud of, beautiful nation, and as a country they would recommend to every foreign visitor. The roots for this kind of perception can be found in close positive relations between two countries, dating back at the time when they were a part of Yugoslavia.
2. **Development** – 13.14% of total variance explained. Serbia was found to be perceived as a drop behind European Union country, which relates with the fact that Slovenia is the only member of EU out of all ex-Yugoslav countries. Serbia was also described as

not modern and undeveloped country with low quality products. Turbulent and unstable Serbian past still reflects the safety of country.

3. **Rich national treasury** – 9.79% of total variance explained. Slovenians perceive Serbia as a country rich in archaeological sites, monuments, monasteries and natural beauties.
4. **Cultural heritage** – 7.46% of total variance explained. Distinctive Serbian cultural heritage, Slovenians relate with strong bonds with tradition and orthodox religion, reflecting vital place of church and celebrations in lives of Serbs.

Table 1: Serbia brand image perceived by Slovenians - Rotated Component Matrix for PCA with Oblimin rotation for 4 factor solution.

Attitudinal statement	Pattern / Structure coefficients				Comm.
	C1	C2	C3	C4	
Serbia is country of hospitality	.836	.045	-.042	.003	.666
Serbia has great national cuisine	.779	-.161	.057	.020	.590
Serbs are beautiful nation	.675	.063	-.020	.104	.539
I would recommend every foreigner to visit Serbia	.558	.252	.173	-.092	.535
Serbia can be proud with its national cuisine	.486	-.029	.268	.240	.564
Serbia is modern and developed	-.147	-.850	.036	.066	.695
Serbia is European country	.009	-.829	-.033	-.008	.666
Serbia is country with high quality products	.027	-.703	.097	.038	.556
Serbia is safe country	.394	-.552	-.050	-.081	.537
Serbia is rich in archaeological sights	-.126	-.043	.888	-.067	.710
Serbia is rich in monuments	.046	.057	.777	.089	.716
Serbia is rich in monasteries	-.001	-.087	.758	.088	.614
Serbia is rich in natural beauties	.190	.059	.692	-.077	.605
Church plays vital role in lives of Serbian people	-.098	.092	.021	.906	.741

	C1	C2	C3	C4	Total
% of variance explained	33.38	13.14	9.79	7.46	63.77
α	0.739	0.760	0.814	0.419*	
Mean	24.12	10.45	14.45	12.17	
Σ	3.693	2.643	2.727	2.030	

4.2 Serbia brand Identity: Residents' perspective

The surveyed residents (N=740) were in average 30.36 years old (std. dev. 9.969, median 27, mode 25, range 15 to 81 years). Prior to the performing of principal components analysis

(PCA), the suitability of data for factor analysis was assessed. PCA was repeated 3 times with exclusion of attitudinal statements with communalities lower than .5. Finally, 27 attitudinal statements have left. Inspection of the correlation matrix revealed that all of the coefficients were equal to or higher than .3. This confirmed that dataset is suitable for the factor analysis. The Kaiser-Meyer-Olkin value was .882, exceeding minimal required value of .6 whilst Bartlett's Test of Sphericity reached statistical significance of .00, supporting factorability of the correlation matrix. Initial PCA was performed used Oblimin rotation technique which suggested 8 factors/components. In order to determine optimal number of factors, parallel analysis (MonteKarlo simulation) was used and eigenvalues were compared with the eigenvalues given by the PCA (Pallant, 2005). Parallel analysis showed 6 components with eigenvalues exceeding the corresponding criterion values for a randomly generated data matrix of the same size (27 variables x 740 responses). Thus, we found that optimal factor number was 6. We facilitated another PCA and forced procedure to suggest 6 factors. The 6 component solution explained a total of 55.51% of the total variance of Serbia as destination brand. To aid in the interpretation of identified components, Oblimin rotation was performed. The 6 brand identity elements emerged (for the detail findings of PCA please refer to Table 1.):

1. **People** – 25.54% of total variance explained. It was found that people are the most significant brand identity element. Despite the life in a country burdened with problems, Serbian people enjoy and celebrate life with the sounds of Serbian folk music. They are talented for sports, curious and good looking.
2. **Obsolescence** – 8.75% of total variance explained. Serbia was found as a country that falls behind modern world and current trends. Serbia was also described as mainly rural, under-developed and non-European country.
3. **Negative media bias** – 7.01% of total variance explained. Negative media bias seems as the outcome of long years of conflict in the region and role of Serbian people in these misfortunate events. Serbia and Serbs were usually presented in foreign media as “bad guys” and initiators of civil war in Yugoslavia. Despite the fact that Balkan conflicts are more than a decade behind, Serbian media picture is still considered to be negatively biased and not authentically presented in the domestic in foreign media.

4. **Recommendable tourist destination** – 4.99% of total variance explained. Serbia was found to be hospitable country, with great cuisine and glorious history, recommendable to every foreign visitor. This is also a point of self-reference as respondents identify themselves with the role of a good host which is a part of Serbian cultural matrix.
5. **Rich national treasury** – 4.72% of total variance explained. Serbia is perceived as rich in archaeological sites, monuments, monasteries and natural beauties. Even though aware of national treasury, it would be interesting to examine how many of these places are in the reality visited by Serbian residents.
6. **Cultural uniqueness** – 4.5% of total variance explained. Serbia is described as a country with distinctive culture, where tradition, countryside and church play vital roles in the everyday life of Serbian people.

4.3 Comparison of Slovenian and Serbian perception

Thorough examination of the results gained from Principal component analysis of both external and internal stakeholders, allow us to assess the current position of Serbia as a destination brand. Several differences and similarities in the perception of both examined groups were extracted. First found difference reflects the number of brand identity elements influencing Serbia brand image. Slovenian residents outlined four elements, mostly positively associated with Serbia brand image: Recommendable tourist destination, Development, National treasury, and Cultural heritage. On the other side, Serbian residents approached this issue in more detailed manner, and depicted six elements: People, Negative Media Bias, Obsolesce, Tourism destination, National treasury, and Cultural uniqueness. According to Hankinson (2007) and Hudson & Ritchie (2009), observed inconsistencies in the perception of Slovenian and Serbian residents can be related with positive and negative elements linked with destination brand identity, attitude towards destination and previous overall experiences. Having this in mind, it is not strange that Slovenians perceive Serbia as a

favourable tourist and business destination, evoked by emotions generated during previous experiences and visits to Serbia.

Further detailed analysis of brand identity elements content was applied in order to explore key decision making criteria favouring future advocacy of Serbia as a destination. The results showed that both Serbian and Slovenian residents perceived Serbia as a recommendable tourist destination, rich with national treasury and cultural heritage, but also as an underdeveloped country. Serbian residents had more detailed approach identifying People and Negative Media Bias as influential factors affecting Serbia brand image, while Slovenians did not even recognized People as valuable Serbia brand identity element. Several authors (Phillips & Schofield, 2007; Freire, 2007) argue that perception of local people is important component of destination brand identity. Therefore, cheerful, hospitable, and successful people should be incorporated into future Serbia branding strategy.

Lastly, our research also identified certain similarities affecting Serbia brand image. Future branding planners should have in mind that Serbia was perceived by both groups as an underdeveloped, rural, and not European country. Also, both groups agreed that Serbia is a hospitable country, with great national cuisine, rich in national treasury (archaeological sites, monasteries, monuments, and natural beauties), see Exhibit 1. Therefore, stated elements should be used as points of difference when creating destination branding platform, formulating strategy, and shaping external perception of Serbia as a brand.

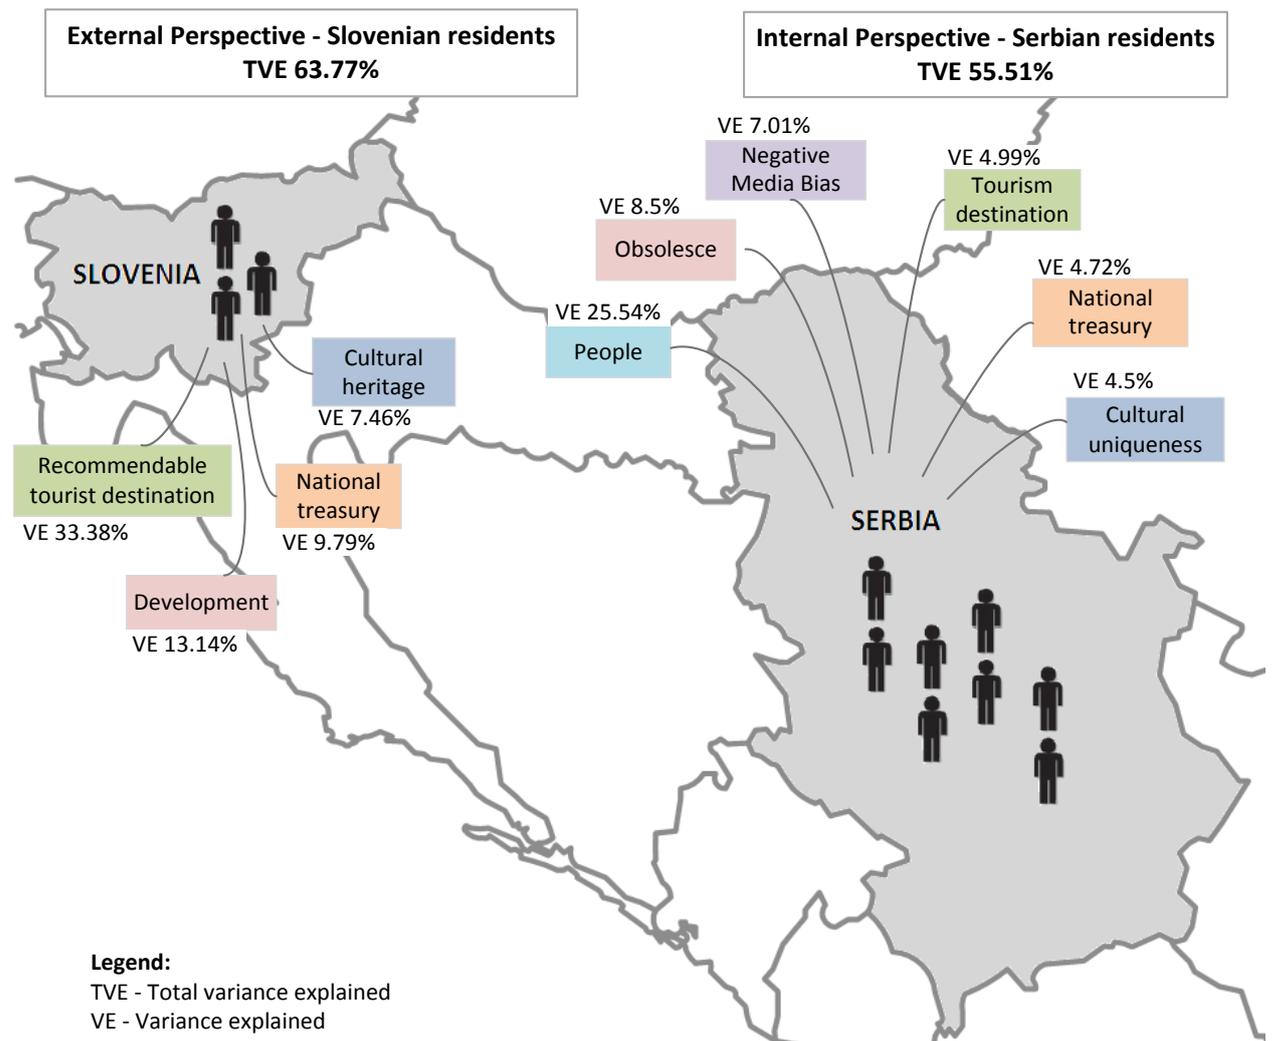

5. CONCLUSION

Addressing the research question stated at the beginning of the paper and in accordance with findings of our research, important differences and similarities in the perception of Slovenian residents (external) and Serbian residents (internal) exist. Slovenian residents identified four elements of Serbia brand identity: Recommendable tourist destination, Development, National treasury, and Cultural heritage. Whilst, Serbian residents approached stated issue in more detailed way, outlining six elements of Serbia brand identity: People, Negative Media Bias, Obsolesce, Tourism destination, National treasury, and Cultural uniqueness. Onwards, both groups created their perception based on different points of view. Though not so long ago Slovenian residents have been a part of a same country with Serbia, today are playing an important role as investors, economic partners and visitors to Serbia. Therefore, Slovenian mostly positive perception of Serbia as a brand is driven by previous experiences and visits to Serbia. Never the less, close relations between two countries and past without conflict led to

the absence of negative media bias influence on perception creation. All stated fact are essential for development of future branding platform of Serbia, because Slovenia should be considered as valuable stakeholder in advocacy of Serbia as a destination brand. Finally, both groups match opinion that Serbia is a great place to visit, recommendable tourist destination, rich with national treasury and unique cultural heritage. Results of previous studies (Hall 2002; Popesku et al., 2010; Novcic et al., 2012) are in accordance with findings gained from our research, confirming Serbia as a meeting place of cultures, hospitable country, with great national cuisine, rich in national treasuries, featuring hospitable, cheerful and successful people. Stated elements should be integrated into future Serbia branding strategy. Besides, branding planners should have in mind another valuable fact extracted from our study. Serbia was perceived by both groups as an underdeveloped, rural and not European country. Also, presented results could be effectively incorporated in Gilomre's (2001) diamond shaped branding framework, revealing core competences of Serbia as a brand.

Our study has several limitations that need to be highlighted. Firstly, sample in Slovenia is much larger than sample in Serbia, which is in contrast to population in examined countries. On the other hand sample size of both groups satisfies necessary statistical criteria set for exploration of a like phenomenon. Secondly, results analysis did not consider separately perception of Slovenians that have visited Serbia and those that have not. Thirdly, in order to get realistic external perception of Serbia as a brand, future research should explore attitudes of other stakeholders important for Serbia.

Having in mind that Slovenia is one of the most important direct foreign investors in Serbia, and that Slovenians are ranked as most frequent visitors to Serbia, future direction of the research should focus on identifying specific needs and touch points interesting to this group, in order to create specially tailored branding strategy in order to shape image of Serbia as a brand. Following this premise branding planners at national level would be able to create a destination brand platform, consisted of unique brand identity elements, which will differentiate country of Serbia from competitors in the Balkans and Europe.

FACING A FINANCIAL CRISIS – THE CASE OF SPANISH RESTAURANTS

Bremser, Kerstin¹; Alonso-Almeida, María del Mar²

ABSTRACT

The research is situated in the field of crisis management in the tourism industry. The purpose of the study is to detect crisis readiness of Spanish restaurants. Restaurants feature rarely as object of analysis in crisis management studies. In 2008, shortly after the beginning of the current financial crisis, a survey was conducted among 291 Madrid restaurants with a response rate of 62 %. Results indicate that restaurant owners / managers fear financial crisis more than other forms of crisis. A financial crisis is considered to be more damaging for the business since it lasts longer and impacts the business more than other types of crisis. Furthermore, it could be confirmed that size is a good predictor of crisis readiness. Larger restaurants did engage in formal crisis planning. Age did not prove to be a predictor of formal crisis planning. However, older restaurants are likely to have lived through a crisis and adjusted accordingly by adapting their internal organization.

Keywords: Restaurant; Crisis; Financial Crisis; Hospitality Industry; Crisis Readiness; Crisis Preparedness; Anti-Crisis Planning; Crisis Management; Spain.

INTRODUCTION

The study looks at the Spanish restaurant industry in 2009, one year after the beginning of the financial crisis. Bars and restaurants form an important part of the Spanish culture and are abundant. Due to the mild climate in winter and the hot long summer periods, social life in Spain often takes place outside, either in bars or restaurants or on the

streets since homes are often small and considered part of family life and thus not for outsiders (Graf-Riemann, 2011).

The study encompasses two different lines of research: Crisis management and services industries, especially tourism. References are also made to literature focusing on crisis management in small businesses. During the last years many studies in the tourism sector have focused on crisis management given that the amount of critical events increases (disasters, health threats, terrorist attacks, and economic crisis) and proper management becomes important. Examples for studies focusing on crisis management in the tourism industry are: Henderson (2007), Huang and Min (2002), Enz et al. (2011), Cooper (2005), Alonso-Almeida and Bremser (2013). Crisis management in the tourism industry focuses mostly on hotels. Restaurants feature mainly as object of analysis for performance or marketing related studies (Kim and Kim, 2004, Yuksel, 2002).

The study contributes to literature in the two fields of crisis management and analysis of restaurant business. Whereas crisis management literature has analysed the situations of hotels extensively, restaurants have been neglected. Thus, the paper can also help restaurant owner or managers to gain valuable insights. The remaining research is structured as follows: the next section presents the literature review and develops three hypotheses. Section three introduces the research methodology. In section four the findings will be discussed. In addition, section four develops insights for restaurant managers and shows the limitations of the study as well as giving indications for future lines of research.

LITERATURE REVIEW

In order to install crisis management, businesses have to show a certain degree of crisis readiness. (Faulkner, 2001), p. 137 has analysed the work of several authors and indicated that the key elements of a crisis are:

- “a triggering event, ...
- high threat, short decision time and an element of surprise and urgency;
- a perception of an inability to cope among those directly affected;
- a turning point, when decisive change, ..., is imminent. ...;
- characterized by ‘fluid, unstable, dynamic’ situations.”

Although they cannot be stopped, their impacts can be limited by effective crisis management. Since a crisis is so broadly defined it is no longer a question if a business is hit by a crisis, but rather when it will happen and how well the company is prepared in order to cope with the crisis (Kash and Darling, 1998). Often, tourism is affected due to the side effects of a crisis. Terrorist attacks aimed to disrupt public life (e.g. Madrid Metro bombings) will stop travellers from visiting the spot if the reaction of the authorities is considered to be inadequate (Pizam and Fleischer, 2002). Health threats (e.g. SARS) force governments to close their country to visitor groups from entire regions (Messe Basel, 2003). Natural disasters can destroy tourism facilities and the negative media coverage afterwards might keep tourists from travelling to the destination (Henderson, 2005). Economic crisis reduce spending power and force tourists and locals to stay at home in order to save money (Sausmarez, 2004). Even though the root cause of the event differs, similar measures have to be taken in order to combat it. Companies are especially aware of recessions because their financial advisors (banks, investors) demand provisions for "lean" years. In addition, natural disasters, terrorist attacks or health threats are considered to be difficult to prepare for. Especially small businesses define crises as something that affects cash-flow and therefore fear a financial crisis (Herbane, 2010). Given that the fall of Lehman Brothers led to global contagion and thus increased awareness of an upcoming crisis, the first hypothesis is postulated:

H1: Restaurants, that fear an economic crisis most, are less worried about other forms of crisis.

There is scant research available on restaurants in crisis times. However, some researchers have in general looked upon success factors for restaurants. Thus, as Parsa et al. (2005, p. 306) conclude from their literature review and subsequent analysis of US restaurants: "The longer a company is in business, the less likely it is to fail". Age and experience do have an important influence on the survival rates of restaurants (Camillo et al., 2008). An economic crisis is to some extent comparable to a start-up situation. Financing has to be found, demand calculated, reactions from the competition are unknown, the personal situation of the managers / owners changes (very often restaurants are independent businesses including family members of the owner working there). In order to survive a crisis, crisis planning is essential. However, research has shown that companies only start planning, after they have already survived a previous crisis.

The literature researching the relationship between crisis preparedness / crisis readiness and age / prior crisis experience starts out with Reilly (1987). Crisis readiness in her

definition encompasses the existences of crisis plans in the organization. She finds weak support for her hypothesis that prior crisis experience is positively related to subsequent crisis planning. Her study was not restricted to the tourism industry but contained a large number of significantly different industries. Restaurants were not included. Thus, it remains untested if the statement holds true for restaurants as well. Later, another study by Carmeli and Schaubroeck (2008) that also covered a variety of industries and sizes confirmed her results.

Failure rate is highest during the first year of existence. Subsequently, failure rates fall since businesses become accustomed to the ups and downs of the economic cycle, the action of the competition and manage to establish a successful value proposition to their customers. As Herbane (2010) notes, this situation is applicable for British SME. Approximately 30 % fail within their first three years of existence, the first year being the hardest. These observations hold also true for Spain. According to the national statistics institute INE (Instituto Nacional de Estadística, 2012), of all companies founded between 2001 and 2009 approximately 20 % failed during their first year of existence. Failure rates declined to ca. ten percent in the second and third year respectively. They fell significantly afterwards. However, between four and five years after their foundation, only about half of all companies survived. Here, small businesses were especially hard hit. More than 99% of all failed companies had less than ten employees, 63 % had no employees at all. Unfortunately the INE does not disclose information for sectors. Henceforth, it will be concluded that the situation in the restaurant sector is comparable to the national average. These numbers clearly show the necessity of crisis plans or crisis management in all types of businesses. Given that crises are frequent and survival cannot only be based on luck, a second hypothesis is postulated:

H2: Older restaurants are more ready for a financial crisis than younger ones.

Apart from age which is a sign of experience (either in the form of general business experience or specific crisis experience), size is also expected to be a predictor for the existence of crisis plans. Spillan and Hough (2003, p. 406) state: "[...] small businesses with their limited resources are especially vulnerable to the catastrophic consequences of crisis events." Herbane (2010) also confirms the low degree of crisis preparation among small businesses compared to larger one. Generally speaking, larger companies have more resources (financial as well as manpower) available that can be directed at foreseeing critical events and plan accordingly. In addition, larger corporations that are organized as chain restaurants can provide central crisis planning to the benefit of the individual restaurant

manager. The correlation between size and crisis preparedness has already been tested in the tourism industry, but not for Spanish restaurants. Reilly (1987) investigated 79 different companies of different industries in the US, however, did not include restaurants. Rousaki and Alcott (2006) surveyed hotel managers in the UK and Pennington-Gray et al. (2011) questioned managers from three different segments of the tourism industry (lodging, attractions, and promotions). They all detected differing degrees of positive correlations between size and crisis preparedness. Hence, size should be a predictor of crisis planning in the Spanish sample:

H3: Larger restaurants are more ready for a financial crisis than smaller ones.

METHODOLOGY

The survey was conducted in 2008. In total 291 Madrid restaurants were surveyed and 180 valid responses collected (response rate 62%) which represents a high response rate for this type of study (Malhotra, and Grover, 1998). Data were collected by the use of student interviewers who contacted restaurant owners or managers. Madrid was chosen as a location because being the capital of Spain it benefits from leisure as well as business travel. Thus, results of the study will be comparable to other Southern European capitals that share the same characteristics (e.g. Lisbon, Rome). This research is conducted as a descriptive analysis. The 180 restaurants in the sample are, on average, 18.3 years old and have a seating capacity of approximately 114 places which is considerably larger than the national average of 60.8 places (Fundación Hostelería de España, 2013).

In order to test hypothesis 1 (Restaurants, that fear an economic crisis most, are less worried about other forms of crisis), interviewees were asked to judge which of the following four threats they considered to be worst for their business: natural disaster, health threat, terrorist attack or economic crisis. Results can be found in table 1.

Table 1: Crisis events judged to be most damaging for the business

<i>Recession</i>	150	83
<i>Terrorist attack</i>	13	7
<i>Health threat</i>	21	12
<i>Natural disaster</i>	21	12
<i>Critical event</i>	<i>Frequency*</i>	<i>Percent*</i>

*Several answers possible

As can be seen from table 1, by far the majority of respondents judged recessions as most damaging for their business. Subsequently, a descriptive analysis using Pearson's correlation coefficient was conducted in order to see how the considerations about different critical events are related to each other. The results are displayed in table 2.

Table 2: Correlation between economic crisis and other critical events

Terrorist Attack	-0.336**
Health threat	-0.348**
Natural Disaster	-0.441**
<i>Critical event</i>	<i>Pearson's correlation coefficient</i>

**Statistically significant at the 0.01 level

As can be seen from table 2, a statistically significant, negative correlation exists between economic crisis and other critical events. In addition, those restaurant managers and owners also stated that economic crises are larger than other critical events and affect the business most.

In order to test hypothesis 2 (Older restaurants are more ready for a financial crisis than younger ones), the interviewees were asked to give their opinion on several statements concerning crisis planning and crisis experience. Answers could be given on a five point Likert scale. Responses were correlated with age of the restaurants. All significant results can be seen in table 3.

Table 3: Correlation age / size of restaurants and crisis planning

The company disposes of an anti-crisis plan	0.135	0.229**
The company prepared for the crisis by taking internal measures	0.070	0.242**
The company has lived through other financial crisis and survived	0.178*	0.161*
The company learned from	0.161*	0.204*

other crisis and made adjustments within the organization		
<i>Statement</i>	<i>Pearson's correlation coefficient (Age)</i>	<i>Pearson's correlation coefficient (Size)</i>

**Statistically significant at the 0.01 level *statistically significant at the 0.05 level

The results from table 3 show that no correlation exists between an anti-crisis plan and age. However, it shows clearly that older restaurants are more likely to have experienced another crisis in the past and therefore adjusted their organization accordingly. Thus, hypothesis 2 can be supported partially. Whereas no formal plan exists, some actions have been undertaken due to previous experience.

Last, hypothesis 3 (Larger restaurants are more ready for a financial crisis than smaller ones) was tested using the same method as hypothesis 2. The results are displayed in table 3 as well. Here, strong support is found for the hypothesis. Larger restaurants do have crisis plans and prepare for a crisis by taking internal measures. Additionally, the results show clearly that larger restaurants dispose of crisis experience and learned from that experience. This leads to the acceptance of hypothesis 3.

DISCUSSION OF RESULTS AND CONCLUSIONS

As the statistical analysis of the previous section showed, hypothesis 1 (Restaurants, that fear an economic crisis most, are less worried about other forms of crisis) can be supported. Literature has so far not researched this phenomenon. However, the result is not surprising. Recessions are part of the economic cycle and recur frequently with varying intensity and duration. They only change in severity. Thus, companies are prepared to make adjustments. Other forms of crisis come suddenly as a singular event and occur with a lesser frequency. Moreover, literature shows that the impact of a recession is longer lasting than of other types of crisis (Enz et al., 2011).

Contrary to literature, the study found only partial support for hypothesis 2 (Older restaurants are more ready for a financial crisis than younger ones). Whereas the restaurants did not dispose of formal plans, they had experienced previous crises and adjusted their organization accordingly. It seems that age in the restaurant business is not a good predictor

of formal crisis planning. It remains to be tested if this is a general characteristic of the restaurant industry or a specific characteristic of the sample. Reilly (1987) investigated the relationship between crisis preparedness and prior crisis experience. Her construct of crisis preparedness includes "Organization's quick response ability" (Reilly, 1987, p. 81). It seems as if older restaurants do have a certain degree of crisis readiness without writing down specific crisis plans. Crisis plans seem to reside within the personal knowledge of the restaurant's manager, a situation quite common for small businesses or family-owned establishments. Future research will have to test if crisis experience is a better predictor for crisis plans than age.

Hypothesis 3 (Larger restaurants are more ready for a financial crisis than smaller ones) could be supported. This finding is in line with literature. Larger restaurants are able to free resources and establish tools like strategic management or crisis management. If they belong to a chain, they can also rely on headquarters' resources in order to support their own planning processes. They are therefore better equipped to deal with the current financial crisis. Here, for the future it could be interesting to differentiate between large independent restaurants and chain restaurants.

Restaurant owners and managers can draw important conclusions from this study. The results show, that older restaurants are more likely to have experienced a crisis before. Among entrepreneurs and owner-managers of small businesses there exists a tendency not to prepare for critical situations since it is expected that the own business will not be hit (Herbane, 2010). However, results show that financial crisis or recessions are abundant and have to be mastered during the years in existence. Thus, restaurants owners or managers should from the beginning include crisis management in their business plan. In this context, managers will have to be creative to include not only foreseeable events in their planning (computer failures, power failures) but also larger threats (recession, terrorist attack).

In addition, entrepreneurs wanting to open a restaurant business can also learn from this study. The results show that size is a predictor of crisis readiness. Thus it might be helpful to open a franchise business or join an existing restaurant marketing association in order to benefit from the knowledge of the group instead of opening an independent restaurant.

Given the limited geographic area in which this study is performed, the study does have some limitations. The results might not be applicable to restaurants in other locations within Spain. The Spanish restaurant industry differs considerably among the regions. Whereas in

the coastal areas large restaurants directed at foreign tourists prevail, the restaurants of the interior regions are generally smaller and directed at local tourism (Fundación Hostelería de Espana, 2013). Thus, the financial crisis will most likely affect restaurants catering to domestic tourists more than those offering their services to foreigners. An increase in the geographical coverage of the study to the entire country or capitals of other countries could offer further valuable insight.

The survey study method only gives a snapshot of a restaurant's situation during the crisis. Larger data series are required to detect the long-term effects of a crisis. Surely, the prolonged duration of the financial crisis in Spain (2008 – present) will magnify some of the results. Already today, bankruptcies and foreclosures in Spain are high; unemployment rates are at record height and influence consumer spending negatively. Domestic spending is at extremely low levels which affect restaurants severely. Especially small businesses throughout the country are hit hard.

This study focuses entirely on restaurants in Madrid. Research has included hotels to a large degree, travel agencies or tour operators that also belong to the tourism industry are not included covered as much. Surely, interesting findings would result from an analysis of those sectors of the tourism industry during crisis periods.

ABSTRACT

In the actual scenario characterized by new and ever-changing dynamics of the global market, firms need to quickly and timely anticipate competitors' next moves, monitor market tastes, adapt their products and properly communicate their positioning. The history of many luxury brands is linked to a family, though they may have changed ownership over time. The products often remain faithful to the style impressed by the family and when it does not happen, the risk is to lose enamel. Since this phenomenon has not been thoroughly investigated, this research aims at investigate the relationship between family and products in the luxury sector, in order to understand if and how, the family affects the success of the company. We have interviewed 19 family businesses operating in the luxury sector discovering that the involvement of the family and its essence are deeply anchored in the core business of the company.

Keywords: luxury; family firms; product; new product development; entrepreneurial approach

INTRODUCTION

Family businesses operating in the luxury segment compete in a particular context, in which the advantages and disadvantages of the family model clash and face particular challenges. In this framework the competitive advantage resides not so much in the price as in the quality of product, the ability to innovate, the adherence to the trends of the moment and, also, the time to market (Mosca, 2010). All of these variables create a reputation that becomes more important in family businesses because product's brand is not only linked to the company, but also to the family and its people, becoming part of a larger system (Ferda, 2010;

Montemaggi and Severino, 2007). Moreover, the commitment of family members in the business is very high and also their level of involvement in the decision making process with regards to new products: a single error in introducing a product in the market could ruin forever the brand reputation and the family image (Saviolo and Corbellini, 2009).

The main difference between companies that successfully survive for decades or even centuries and those who fail often lies in the ability to seize opportunities and changes taking place in the market, and to correctly manage company and family dynamics: ownership, business and family, in order to create a competitive advantage hard to imitate (Pearson et al., 2008; Bresciani et al., 2013).

LITERATURE REVIEW

Define family businesses is a hard task. However, the European Commission has put forward a unique definition (2007), in order to ease the process of data gathering and comparison, both within the same country and among different sectors. At the same time, the analysis of the different definitions proposed by different authors over the years has lead Aiello and Donvito (2006) to identify a number of common elements that characterize luxury goods. According to the authors, luxury is described mainly by the following attributes: Status (the superior status that an object confers to the owner/user), Emotion (self-realization with the property of the good), Qualitative Excellence (in materials or innovation), Aesthetic refinement (design), Exclusive (very few customers in number), Rarity (reduced availability of the product), High Price (sacrifice made for purchase), Tradition (craftsmanship or style), Investment (durability).

In addition, further three types of effects that luxury goods exercise on consumers were proposed by Vigneron and Johnson (1999) and Brioschi (2000). They are based on consumers' buying motivation and are: a) the Veblen effect (see Veblen, 1899), b) the "snob" effect and, c) the "bandwagon" effect. Summarizing these effect it is possible to affirm that three main reasons pushing consumers to buy luxury goods and they are: publicly display their wealth, feel unique and be part of an exclusive community.

Moreover, the concepts of "Veblen", "Snob" and "Bandwagon" were further described by Vigneron and Johnson (1999) believing that there are motivations and behaviours of an alternative "personal" nature, from within the consumer.

However, luxury products typically refer to tangible product categories such as transportation, real estate, household items, artwork, clothing accessories, food, healthcare products as well as intangible services such as a private club membership, sports leisure projects, or professional services (Kaufman et al., 2012).

The family business luxury industry, the entrepreneurial orientation and the role of new product development

Worldwide spending in luxury product rose by 13% in 2010, 10% in 2011 led by Emerging Markets (PwC, 2012) pushing total luxury goods revenues to an estimated € 212 billion (Bain and Company, 2012). This is the third year in a row of double-digit growth for the personal luxury goods market over the € 200 billion.

In Italy, more than 90% of the firms are family ones (Pratesi, 2008) and some recent research (e.g. CERIF, 2011) estimated that family businesses produce nearly 70% of the total GDP of the country. More specifically, according to the “Osservatorio AIdAF-Unicredit-Bocconi” (2011), among medium and large enterprises operating in the luxury segment in Italy, around 80% are controlled by an entrepreneurial family. The peculiar features of most of family-owned fit almost perfectly with the competitive logic of hard and soft luxury approaches; so, the unique bundle of resources family firms own implies the potential to provide an advantage over non family firms in luxury-related industries.

Italian family firms have a very strong culture of good standing, quality and brand (Attanzio, 2011). They have some key characteristics: they are managed by a limited group of people, their decisions are made quickly (Miller and LeBreton-Miller, 2005), the final approval on a new product is often given by the family members who is leading the company (Bertoldi et al., 2011) and so in a more rapid and effective way than that of new product development committees in public companies (Mussati, 2008).

Recent literature has shown that entrepreneurial orientation is positively related to innovation (Rhee et al, 2010; Pérez-Luno et al., 2011) and to firm performance (Rauch et al., 2009).

According to the literature, the entrepreneurial orientation is mainly characterized by three dimensions (Kreiser et al., 2002; Matsuno et al., 2002; Rauch et al., 2009): proactiveness

(Kreiser et al., 2002; Lumpkin Dess, 1996), innovativeness (Lumpkin and Dess, 1996; Wang, 2008), and risk taking (Miller and Friesen, 1978; Clausen and Korneliusen; 2012).

In fact, an entrepreneurial firm has been defined as a firm that “engages in product market innovation, undertakes somewhat risky ventures and is the first to come up with proactive innovations, beating competitors to the punch” (Miller, 1983). This leads to higher product innovativeness, product development speed, customer-focused performance and financial performance (Chen, Li and Evans, 2012).

As previously mentioned, in the luxury world the product brings with itself a number of intrinsic messages that its owner wants to communicate to the others. At the same time, the values of the family are often embodied in products since the company and the brand represent a single entity in the consumer’s mind. Thus, the product is filled with symbolic meanings and this is why the new product development process is fundamental to the growth and longevity for the company’s success, family business or not, over time (Crawford and Di Benedetto, 2006). The launch of a product which turns out into a success creates several advantages for the company, more than anything else that can happen (Tardivo et al., 2011).

Within the company, the product development process is managed by product development experts. In small companies or in family businesses, mainly, the inputs for the creation of a new product come from the entrepreneur's personal vision of the market (Calabrese et al., 2002). The entrepreneur considers him/herself to be a manager with transversal competence and wants to be the protagonist of all the fundamental moments of the process, from the first step to final authorization.

RESEARCH QUESTIONS

The luxury sector is dominated – in Italy – by family businesses. Being a family business means to have some competitive advantages but also critical dynamics to manage. There is a growing interest in studying the product development process in family businesses: some researchers studied the role of the family in the new product development (NPD) process of small family businesses (De Massis et al., 2011), while others focused the attention on the process that lead family businesses to choice new products and how to maintain the entrepreneurial vision inside the company (Bertoldi et al., 2011). But few researchers

investigate the role of family businesses and their entrepreneurs in the luxury market: for this reason authors decided to study the relationship between family members, luxury and products.

In particular, the research questions that authors try to answer are the following:

- “In which way families are involved in the product development process in the luxury sector?”
- “Which are the key success factors for family businesses operating in the luxury sector?”

Authors try to understand the degree of involvement of families in the most important process of the business, in order to observe the differences and to extrapolate common elements that can represent sources of competitive advantage. Secondly, authors want to understand the key success factors that family businesses operating in the luxury market apply in order to thrive in a hypercompetitive and global market, by being always in step with the times and entering the market with successful products.

RESEARCH METHODOLOGY AND DESCRIPTION OF THE SAMPLE

The methodology adopted in this paper is qualitative; in fact, the phenomenon investigated is linked with a complex social context. Family businesses are companies in which the interaction between the three spheres – family, business and ownership – creates special dynamics among family and non-family members involved in the company. So, in order to study and understand these dynamics the most suitable approach, as suggested by Yin (1984), is the qualitative one. Starting from the fact that our objective was to deeply understand the factors that facilitate entrepreneurs and families in having success in the luxury market and, how they manage the product development process, we started to collect data through interviews.

TABLE 1. Description of the sample

Firm	Year of establishment	Production	Number of employees	Number of family members involved	Turnover category
a	1911	Mosaics	5	2	0-1 M€
b	1988	Cat and dog food and supplies	5	3	0-1 M€

t	1938	Billiards	15	2	NA
u	1959	Carpets	8	3	NA

Source: personal elaboration

In conducting the interviews we used a questionnaire divided in three sections: 1. General questions on the family and the firm; 2. Family and firm values; 3. Product development process. More or less ten questions in each section were proposed.

The sample identified was composed by 19 Italian family firms interviewed during a special conference on Family and Luxury Business held in Verona. Data collected were processed, analyzed and combined with available bibliography, companies' documents and internet websites; the data-triangulation is useful to validate and integrated all the information coming from different sources (Olsen, 2004).

The sample seems to be heterogeneous but thanks to the most general question of the interview guide's first section was possible to collect a number of interesting information about four aspects: geographical area, intergenerational transfer, generation at the head of the company and turnover; more information on the sample are described in table 1.

RESULTS

Information and data obtained have been collected in a single database in order to put light on common features and dichotomies. The results often varied from firm to firm, this is due to the heterogeneity of the sample considered.

The most part of the sample is composed by family businesses at the first generation (9 out of 19), while the others reached the second (6 out of 19) and third generation (4 out 19) experiencing the trans-generational process. These results can have an influence on the dynamics between the three spheres -family, business and ownership- and, in part, they can justify the way in which relationships between relatives are regulated. In fact, from interviews emerged that the relationships between family members are regulated by formal family agreements only in three companies. In the other cases, tasks and succession processes are managed through oral agreements and/or practices rooted.

The first common results observed was the leadership role of family members inside the company: in all the companies the CEO is a family member and only in two cases he is supported by external managers. In these two cases the relationship between the family and the external management were formal: everyone played his role with accountability, consistency and correctness.

The second common trend with regard to our first research question, and the most interesting one, is that the majority of the companies performed internally all the phases of the product development process. The phases in which family members are mostly involved are the idea generation and the product design, while the level of commitment is lower in market research and production. These data suggest that family members are placed where the core competencies of the company reside. The final decision on the launch of a product into the market lies always in the hands of the family.

On average, 35% of the companies think that the contribution of the entrepreneurial orientation of the family in the development phase of the product accounts for the 90%; the 29% of respondents think that the family contribution accounts for the 100%, while the 24% believe that accounts for the 50%, while a smaller percentages think that the family is influential by 70-80%.

Finally, from the analysis of these results it is possible to underline the higher degree of involvement of family members in the product development process and, the level of power in the hand of the family: it has always the final approval on products. It seems that just the family has the necessary competences and the right intuition, the instinct to recognize successful products.

The second part of the interview was used in order to understand the key success factors for family businesses operating in the luxury sector.

Through a deep analysis of the interviews was possible to identify common features and, in particular, were identified three main factors:

- Pursuing high product quality and other shared values: all the entrepreneurs stated that the quality is an essential characteristic of luxury products but, they also underlined that quality has to be paired up with other values. The first value is the *product prestige*: a set of features such as design, cost, fashion, etc.; secondly, the *innovation inherent in the good*: not only in the product but also in the manufacturing process. Often due to the different academic education successors have shown an impetus toward innovation. The innovation in the family businesses is mixed up with the essence of the family tradition. The third value, *the quality of finished products* of design and manufacturing that is never left up to fate, but is based on a careful choice repeated overtime. Suppliers are often kept by the new generation thanks to personal relationships based on mutual trust. Finally, the fourth is the *tradition*: the second or third generations have never subverted the company's soul but have only introduced incremental improvements. Oftentimes, even after the intergenerational process, the past generations remained present to support new managers and make sure that tradition is respected.
- Maintain an high level of control (by the family) on the product development process: owners are the ones who design products, and the final approval is always left to family members. This trend is even stronger when the firm is at the first generation: the companies operating in the clothing sector were the most recently established. Within them, family control is very powerful because the entrepreneurial activities stem from the founder's idea⁶ and in the first operating years with the family are the ones with the necessary know-how, creativity, knowledge. Therefore they have the absolute power on deciding products to be launched on the market. As the company grows, both in terms of experience and size, more and more people possess the necessary know-how to create new products. However, the final green light on every project is always given by a family member.
- Preserve the family tradition as a competitive advantage on the market. All the family businesses interviewed deemed the family and their entrepreneurial orientation of the family members as fundamental to the business success. First of all, family members are living the company since the childhood; moreover, the family component is highly

important for clients, in fact family members put themselves in first line every time they place a new product on the market. So customers believe that, being fully responsible for every success or failure of their own brand, they strive to create quality products in line with market expectations.

CONCLUSIONS

The analysis of the data collected allows authors to state that the level of involvement of family members in the product development process is very high. In fact, from the interviews emerged that the family is always involved in the process and, above all, is the final decider on the launch of new products into the market. Moreover, in the majority of the companies is recognized that the contribution of the entrepreneurial orientation of the family is fundamental in the product development phase and, probably, is one of the key factors for having success in the luxury market.

From the point of view of the entrepreneurs and/or family members seems clear that in order to have success there are three main factors to remember and to transmit to the company. These three common features, regardless of the companies' sectors, are: pursuing high product quality and other shared values, maintaining a high level of control on the production process with the involvement of the family and, finally, keep alive the family tradition as an added value in order to have a competitive advantage in the market.

In particular, with regards to the first common feature, the ethical dimension in luxury family businesses is extremely important, and should be implemented in daily operating activities and in relations with all stakeholders. This sense of ethics and fairness toward the market must be translated in the quality and prestige of the products as a fundamental component in order to maintain reputation and family tradition. Interviews clearly show that family ownership reach excellence for special care in product quality and focus a strong attention in details. Family businesses continue to accumulate and transfer knowledge through the "continuity of his legacy through time and generations" and develop talent with passion for the product.

This research presents, therefore, some managerial implication. In fact, it clearly shows that entrepreneurial orientation of family members promote the successful marketing of new products and, in line with part of the existent literature, highlights that the high degree of involvement of family members in the new products development process is a key factor for maintain the success. In addition, the research provides to luxury family firms some common guidelines in order to achieve success. The common guidelines emerged could help firms to

take the right managerial decisions in a growing business that, however, could lead firms to quickly lose their competitive advantage.

This research shows some common trends and opens the way for more extensive research, both nationally and internationally, to confirm the results identified and/or to add new insights to identifying characteristics of luxury family businesses, in order to achieve definitive results. In particular, it would be interesting to interview a larger panel of companies in order to identifying peculiar characteristics of each sector of luxury especially in those sectors that in this research were mentioned only marginally. Thus, it would be interesting to examine whether and how the values identified in this work may find a different effect in the different areas and why. Moreover, from a quantitative point of view, it would be interesting to analyze the performance of family businesses in which the family owns the product development process and the ones in which external managers own the process.

ABSTRACT

In the actual scenario firms not only produce and sell, but increasingly also develop goods and services outside their home countries. Moreover today, it seems to be the rule, not the exception, that these firms have R&D activities at different locations inside and outside their home country. In the recent years the interest in the developing Asian countries has grown a lot and firms from almost all over the world have considerably extended their R&D activities in the developing Asia.

The goal of this paper is to show R&D internationalization activities of firms from Italy in Asian developing countries. We use a dataset of 500 Italian firms with international R&D units in order to understand whether companies follow a knowledge augmenting or knowledge sourcing strategy.

The results show a positive relation between the choice to settle R&D units in Asia and the sale of innovative products in Asia; in this sense the conclusion is that these firms follow a knowledge exploiting strategy, establishing their whole innovation value chain to developing Asian countries.

Keywords: R&D, R&D internationalisation, knowledge augmenting strategy, knowledge sourcing strategy

INTRODUCTION

The quick growth in international R&D since the last decade of the last century has attracted the attention of researchers, policy makers and managers.

In the actual scenario firms not only sell and produce, but also develop services and goods outside their own countries of origin. So, it is normal, and commonly accepted, to think that firms, especially multinational enterprises (MNEs) have R&D activities at different location both in their home countries and in foreign countries (Bresciani and Ferraris, 2012).

Moreover, enterprises from different continentals have extended a lot their R&D activities abroad, and they are emerging new players from emerging economies i.e. China, India, and other Asian countries, which are becoming year by year more attractive for MNEs.

Due to numerous factors internationalization of R&D has become more important year by year; it is possible to think to the innovation in information and communication technology, to the globalization, to the iper-competition, all factors which affect a global spread of R&D units across the world (Friedman, 2006; Karlsson, 2006; UNCTAD, 2005).

The most cross border R&D units are settled between developed countries. In the last years, however, the internationalization of R&D units has characterized also new geographical areas of developing countries, especially East Asia (Edler, 2008; von Zedtwitz and Gassmann, 2002).

The structure of the paper follows this methodological approach. The next section undertakes a literature review towards defining the terminological context of innovation, R&D and drivers of R&D internationalization. The following section develops the hypotheses. Subsequently, the research methodology is presented, followed, finally, by the research results and conclusions, along with some discussion and directions towards further research.

R&D AND DRIVERS OF R&D INTERNATIONALIZATION: THE CONCEPTUAL FRAMEWORK

Nowadays, the world is characterised by innovation, globalization, iper-competition, the shortening of technology products life cycles, and the rapid generation and commercialisation of new technologies (Tardivo et al., 2011).

Generally speaking, MNEs develop their own R&D activities following a process of three different phases (Hakanson, 1990): (a) establishment of a centralised hub of laboratories, i.e. a central unit which produces all the most important innovations; (b) a polycentric stage of a decentralised federation of laboratories, i.e. a group of R&D units performing different task; (3) R&D in the parent company, with more autonomy.

Florida (1997) found evidence that R&D was a heterogeneous process. He means that the sources of innovation changed from sector to sector, so that laboratories tended to emulate and learn from US approaches to R&D organisation and management.

As a consequence, from a specific point of the normal evolution of the developing of R&D activities it is possible to speak about “internationalisation of R&D activities”.

According to Kuemmerle (1999) R&D can be classified into (i) the Home-Base Exploiting R&D (HBE) and (ii) Home-Base Augmenting R&D (HBA), according to the objectives of the different strategies. In the first case, affiliates are established in the host country in order to use the specific advantages of that environment, and in the second affiliates’ activities are used to gather new abilities in knowledge and capacities. The latter kind of R&D activity is usually developed near universities and the former is generally developed near firms or significative markets.

HBE facilities usually have a closer proximity to their objective than HBA affiliates. HBE activities, in fact, need to interact actively with clients and other firms and are concentrated on specific knowledge which exists inside firms. On the contrary, HBA requires specific know-how usually located beyond the firms’ frontiers.

DEVELOPING HYPOTHESIS

Both innovation and internationalisation of R&D in developing countries are still a new but increasing phenomenon. Empirical studies based on company surveys show different results regarding firms’ R&D strategy in developing Asian economies, whereas case study evidence points to the increasing importance of knowledge augmenting strategies. As we know, in the Home-Base Exploiting R&D (HBE) affiliates are established in the host country in order to use the specific advantages of that environment, while in the Home-Base Augmenting R&D (HBA), affiliates’ activities are used to gather new abilities in knowledge and capacities.

So, the aim of our research is to evidence whether firms with international R&D follow a knowledge augmenting or knowledge exploiting strategy.

Following Mangelsdorf and Schmiele (2009), we did not ask firms for the strategy of their R&D units; we decided to use the relationship between the sales of innovative products and establishing R&D units in Asia. Firms with HBA, in fact, use the knowledge from developing

countries to develop new products in the headquarters; then they will sell this new products in the developing countries (with or without the development of selling activities in the developing countries). For these reasons, it is possible to formulate the following hypotheses:

Hp 1: Italian firms conducting R&D activities in Asia following a HBA strategy sell new products in developing countries.

On the contrary, firms adopting a HBE strategy customize products to local demand using the foreign R&D units abroad. The main consequence is that the firms sell this products in the local market, but not in other countries. For these reasons, it is possible to formulate the following hypotheses:

Hp2: Italian firms conducting international R&D activities following a HBE strategy sell new product in Asian countries but not in developed markets.

Moreover, in order to better analyze the propensity to have international R&D activities we add other variables which follow the models from Dunning (1981), Hollenstein (2005), Rammer and Schmiele (2008), and Mangelsdorf and Schmiele (2009). In this sense:

- we consider innovation activities in developing Asia countries. The presence of innovation activities, in fact, may mean that firms establish their whole value chain in developing Asia, while on the contrary the absence of innovation activities may suggest just independent R&D units transferring knowledge to the head quarters.

- we consider export intensity in developing Asia countries. The presence of high level of exports, in fact, may mean the attempt to reduce the risk of international R&D (Rammer and Schmiele, 2008); of course we expect a positive influence.

- we consider the number of R&D in other countries. As firms internationalize R&D first to developed countries and later to developing ones, the propensity to establish R&D units in Asia increases with experience; of course we expect a positive relation.

- we consider innovation activities in developed countries. As firms raise their international activities with experience, we expect that firms establish R&D units in developing Asia if they have still develop innovation activities in developed countries.

- we consider company size (employees per firm in logarithm) because the propensity to internationalize R&D activities increases with the number of employees per firm.

- we check for industry dummies considering low-tech, medium-tech and high-tech manufacturing as well as services which are developed (Mangelsdorf and Schmiele, 2009) on the base of NACE codes.

PRIMARY RESEARCH METHODOLOGY

The research was conducted on 500 Italian firms selected from AIDA, a database of company accounts, ratios, activities of more than 700,000 Italian companies; moreover, the research employs data from the last Italian Innovation Survey (2010), which covers innovation activities of the Italian enterprises with at least ten employees operative in industry and services. In particular, the survey collects information about new or significantly improved goods or services (product innovations) and new or significantly improved processes, logistics or distribution methods (process innovations), as well as about organizational and marketing innovation. Most questions refer to product and process innovations: to this regard, the survey provides a wide and articulated set of indicators on innovation activities, innovation expenditure, public funding, sources of information for innovation, innovation co-operation and innovation objectives.

The survey is part of the EU Community Innovation Survey (CIS), carried out on a two-year basis (from 2004 onwards) by all EU Member States and candidate countries, plus Norway and Iceland.

Table 1: Dependent and Independent Variables

Variable	Indicator
Dependent Variable	
International R&D in developing Asia	1 if a firm plans (in 2009/2010) or already

	conducts (in 2008) R&D activities in the following countries: China, India, Indonesia, Malaysia, Singapore, South Korea, Taiwan, Thailand; 0 otherwise
Independent Variables	
<i>R&D Strategy</i>	
Selling of innovative products in developing Asia	1 if a firm sells innovative products in developing Asian economies; 0 otherwise
Selling of innovative products in developed countries	1 if a firm sells innovative products in developed economies (North America, Europe); 0 otherwise
<i>Absorptive Capacity</i>	
R&D intensity	Share of R&D expenditure from sales
Continuous in-house R&D	1 if a firm conducted in-house R&D continuously in 2009-2010; 0 otherwise
<i>Innovation value chain</i>	
Innovation activities in developing Asia	1 if a firm successfully introduced innovations in Asia (construction/ conception of new products, manufacturing of new products, implementation of new processes)
<i>Experience</i>	
Export intensity	Share of exports from sales
Number of R&D activities in other countries	Number of R&D locations abroad per firm
Innovation activities in developed countries	1 if a firm successfully introduced innovations in developed countries (construction/ conception of new products, manufacturing of new products, implementation of new processes) by 2008; 0 otherwise
<i>Firm Size</i>	
Firm size	Log. No. employees in 2008
<i>Industry Dummies</i>	
Industry dummy 1	Low-tech manufacturing
Industry dummy 2	Medium-tech manufacturing
Industry dummy 3	High-tech manufacturing
Industry dummy 4	Services

The model of analysis applied by this research is the one used by Mangelsdorf and Schmiele (2009).

The sample has been restricted to all the innovative firms with the head quarter in Italy which carry out R&D activities in foreign countries. In this way it is possible to compare the effects of internationalisation drivers of different countries.

Dependent and Independent Variables

The information of the dependant variables derives from the last Italian Innovation Survey (2010), which asked firms for their innovation activities outside Italy. So, the survey contributes to the variables to test our hypotheses as well as the control variables described above. Table 1 puts in evidence the description of our dependent and independent variables.

PRIMARY RESEARCH RESULTS

This section presents the results of the analysis. Using a probit model estimation in order to estimate the probability that the observation falls into a specific one of the categories (in our case the impact of a change in the independent variable on the firms' probability to locate R&D units in developing Asian economies) it is possible to show the results as in Table 2. The pseudo R-square (0.59) confirms that the model is acceptable. These results are in line with those of Mangelsdorf and Schmiele (2009), so we can affirm that Italian firms strategically act in the same way of the German ones.

Regarding our main hypotheses, we can now affirm that HBE firms sell innovative products in Asia but not in developed countries and that HBA firms do not sell innovative products in developed countries. So, we have to reject the hypotheses 1 and confirm the hypotheses 2. Those firms selling innovative products in developed countries, in fact, have a lower propensity to settle R&D units in Asia; at the same time, firms with international R&D activities in Asia sell innovative products on that market. The conclusion is that firms with international R&D activities in developing countries follow a HBE strategy. A possible explanation is that the competition of developing countries is often the result of the relocation of MNEs production more than the consequence of a domestic innovativeness strategy; in other words, the foreign R&D in developing countries is often the result of an adaptation of the existing products to the foreign local market (Kumar, 2001).

Table 2: Result of probit model

Variables	Marginal effects	z-value
<i>Probit Estimation: Dependent Variable: International R&D in developing Asia</i>		
<i>R&D Strategy</i>		
Selling of innovative products in developing Asia	0.443*	1.69
Selling of innovative products in developed countries	-0.571***	-2.65
<i>Absorptive Capacity</i>

Firm size	-0.0139	-0.35
<i>Industry Dummies</i>		
Industry dummy 1	0.244	0.76
Industry dummy 2	0.578**	2.38
Industry dummy 3	0.562**	2.23
Industry dummy 4	-2.451***	-6.67
No. of Observations	500	
Pseudo R Square	0.59	

Level of significance: ***<0.01, **<0.05, *<0.10.

Although we can not affirm that the presence of R&D activities in Asia depends on the absorptive capacity of the firms (both the variables R&D intensity and Continuous in-house R&D are not significant), another interesting result is that firms settle their innovation value chain in developing Asia countries. This means that the higher is the firms R&D activities the higher is the propensity to have research activities in Asia.

In a certain sense this result is also confirmed by the necessity of experience with international R&D; firms with an high number of R&D activities in other countries, in fact, rise the propensity to settle R&D in Asia.

Moreover, we did not find any evidence about the influence of firm size – employees per firm on the propensity to settle R&D activities in developing Asia. This is a very interesting result because it means that the internationalization of R&D represents an opportunity for all the different dimension scale of enterprises.

Finally, for industry dummies we found a positive influence by both medium-tech and high tech manufacturing firms.

CONCLUSION

The goal of this paper was to investigate R&D internationalization activities of firms from Italy in Asian developing countries using a dataset of 500 Italian firms with international R&D units in order to understand whether companies follow a knowledge augmenting or knowledge sourcing strategy.

In particular, as innovation and internationalisation of R&D in developing countries are still a new but increasing phenomenon, we decided to investigate the case of firms which set up R&D units in developing Asia from advanced countries.

Empirical studies based on company surveys show different results regarding firms' R&D strategy in developing Asian economies, whereas case study evidence points to the increasing importance of knowledge augmenting strategies. So, the aim of our research was to evidence whether firms with international R&D follow a knowledge augmenting or knowledge exploiting strategy.

The results of the probit model put in evidence that HBE firms sell innovative products in Asia but not in developed countries and that HBA firms do not sell innovative products in developed countries. As we stated before, in fact, those firms selling innovative products in developed countries have a lower propensity to establish R&D units in Asia; at the same time, firms with international R&D activities in Asia sell innovative products on that market. The conclusion is that firms with international R&D activities in developing countries follow a HBE strategy.

From an operational point of view this means that firms with international R&D activities in developing countries customize their products and services to the local markets.

Our findings, moreover, are in line with the most empirical literature. For example, we agree with Mangelsdorf and Schmiele (2009), who found that the investigated German firms followed a knowledge exploiting strategy and were attracted by market opportunities. At the same time, in the same way by Rammer and Schmiele (2008), we found that Italian firms internationalize R&D as the consequence of a process which permit them to move their products from the domestic market to the foreign markets. Finally, we agree with Belitz (2006), as we evidenced that Italian firms internationalize R&D activities in order to adapt their product to the foreign markets.

The findings are by extrapolation universal for developing markets, but especially valid for the Italian firms which are internationalizing their R&D activities in developing countries.

Italy, in fact, is characterized by clusters based on the flexible specialisation between a large number of SMEs sharing a complementary technological specialisation in a territorial network of common norms and values. This competitive framework has been, until recently, a source of advantages both for the firms belonging to this network and for the foreign countries where these networks have emerged (Rossi et al., 2012). However, the main source of this competitive advantage, the possibility to share the costs of learning and innovation in a territorial network, is close to being exhausted. The main reason is that the extension of the network is insufficient to metabolise the degree of complexity generated by the global process of interaction between people, institutions and firms. The local network of shared norms and values has become a barrier to local knowledge creation because it constrains interaction rather than leveraging it across geographical boundaries (Bresciani et al., 2013).

³Pforzheim University, lilit.vardanyan@gmx.de

ABSTRACT

Purpose: The appropriate calculation of the cost of equity capital remains the central pain point in modern finance, management accounting and value-based management. This problem is especially emphasized in privately held companies, where dominating capital market oriented methods (e.g. CAPM, APT) don't apply. The paper aims to summarize and present solutions and methods to calculate the cost of equity capital for private companies.

Design/methodology/approach: The paper is mainly based on literature review. Authors' deductions are provided by arguing or criticizing existing literature. Furthermore, an attempt is made, where possible to propose solutions and give practical solutions to those issues, where literature shows deficits or gaps.

Findings: Results of literature review indicate that cost of equity capital can be derived either by deploying appropriate adjustments in methods applied for listed firms or by implementing other subjective approaches. When making adjustments for private companies, already complex methods (e.g. CAPM) become even more complicated and time-consuming. Thus simple subjective judgments of financial analysts, the management or the entrepreneurs in private firms can deliver much more reliable results than series of doubtful formulas.

Research limitations/implications: Authors' suggestions and deductions are yet to be proven in practice or by further studies regarding implementation of cost of equity capital calculation alternative methods in private companies.

Originality/value: The paper addresses the obstacle of calculating cost of equity capital for private companies. It proposes a summary of existing methods, practical calculation guidelines as well as their shortcomings.

Keywords: literature review, cost of capital, private companies, cost of equity capital, WACC, CAPM validity, value-based management.

INTRODUCTION

In company valuation as well as in value-based management (VBM) the cost of capital (COC) is one of the key elements (AIR 2010, p. 800) and in the meantime it is one of the central problems in the value-enhancement analysis (Herter 1994, p. 89). COC is the profit that investors have to give up instead of investing elsewhere. It has two elements in it: a) the timing of the expected returns and b) the risk of alternative investments (Young and O'Byrne 2001, p. 162). That is why it is used as the discount rate for projecting present values of the future cash flows in valuation theory, for calculations in value-based management metrics (e.g. Economic Value Added, Shareholder Value) as well as a hurdle rate for accepting new investments (Stewart 1991, p. 431). The effectiveness of VBM measures highly depends on the accuracy of the calculation of the capital costs (Männel 2006, p. 83). Studies show that the difficulty of calculating the COC is in determining the requirement of return of the equity holders – cost of equity capital (CEC) (Geginat et al. 2006, p. 7). The estimation of the cost of equity is difficult because there are many uncertainties to consider (Britzelmaier 2009, p. 73). This is true for all companies, but is highly emphasized for private companies. The reason is that the calculation of CEC for publicly listed companies is possible with established mathematical models such as Capital Asset Pricing Model (CAPM) or Arbitrage Pricing Theory (APT), which however base on the condition of stock market listing. This is a condition, which naturally is absent for private companies.

Existing literature on cost of equity capital focuses on calculation methods for large companies, which also still demand further research. In individual cases the CEC is addressed for SMEs or private companies, but existing literature lacks in overview which calculation methods are valid for private companies. Moreover, a practical link is often absent in the literature. The objective of this paper is to summarize and present solutions and methods to calculate the cost of equity capital for private companies. In doing this, this paper will critically analyze the validity of the most common CEC calculation method, namely CAPM for private companies. As the CAPM-derived methods for private companies are highly questioned, other methods are analyzed and presented. Although this paper does not include specific cases and is based on literature review, it is the intention of the authors to

provide a practical guide for financial analysts and controllers to have an overview and a guideline in order to be able to calculate the cost of equity capital for private companies.

FUNDAMENTAL PRINCIPLES OF COST OF CAPITAL

Background and Weighted Average Cost of Capital

There are basically two approaches to the cost of capital – subjective and objective estimation. According to the decision oriented valuation principles, the COC is derived from the subjective decision making of individual investors (Pape 2010, p. 107 and Pereiro 2002, p. 101). In finance theory, however, an attempt is made to objectify the COC, thereby the COC represents the opportunity cost of a particular investment under the consideration of risk aspects (Ballwieser 1994, p. 1380 ff. as cited in AIR 2010, p. 801 and Bühner and Sulzbach 1999, p. 239). The capital providers expect a certain compensation – a minimum rate of return – for the opportunity cost of investing their capital in a particular company instead of others with an equivalent risk (Khadjavi 2005, p. 85, Pereiro 2002, p. 100, Pape 2010, p. 107 and Copeland et al. 2000, p. 201).

The capital costs are represented by the expectations of debt holders regarding interest payments and expectations of equity providers regarding dividend payments or stock price profits (Britzelmaier 2009, p. 69). In the classical finance theory the COC represents the business risk. However besides the business risk in COC, the financial risk also plays a major role, mostly through the capital structure component in the most common cost of capital formula – the Weighted Average Cost of Capital (WACC) (Coenenberg and Salfeld 2007, pp. 74-75).

Studies show that most companies (83%) use WACC for the calculation of the cost of capital (Britzelmaier 2013)(Geginat et al. 2006, p. 13).

Formula 1: Weighted Average Cost of Capital

$$WACC = \frac{Equity}{Equity + Debt} \times C_{Equity} + \frac{Debt}{Equity + Debt} \times C_{Debt} \times (1 - Tax Rate)$$

where C_{Equity} and C_{Debt} are the costs of Equity and Debt Capital, respectively.

Whereas all components of WACC can be calculated relatively easily and don not prepare complications in the practice, the cost of equity capital is the pain point of the formula.

The determination of the capital structure follows either a) by calculating the actual capital structure with market or book values of debt and equity or b) by applying the target capital structure. In general the actual market values of debt and equity are recommended to be used and not the actual book values, as the market values show how much it would cost to raise the same capital today – opportunity approach of raising capital (Young and O’Byrne 2001, p. 163, Vishwanath and Krishnamurti 2009, p. 230). Applying the market value of equity is clearly better because of the increasing meaning of the intangible assets which are referred to as hidden reserves. Many intangible assets are not activated under the existing Generally Accepted Accounting Principles (GAAP), thus resulting in divergence of the market and book values of the equity. As the book value of the debt usually does not vary so much from its market value, it can be used instead of the market value (Tappe 2009, p. 112). Whereas the market value of equity for publicly listed companies can be calculated by multiplying the number of outstanding shares with the stock price on the date of calculation, the market value of equity for unlisted companies is quite difficult to calculate (Hostettler 2002, p. 24).

Instead of using actual values of debt and equity (regardless book or market) to determine the weighting ratios, the target capital structure can also be deployed in the WACC calculation. This recommendation is made mainly for the valuations for long-term periods in order to avoid short-term changes in the market value of the securities or other short-term financing activities and mainly for private firms (Copeland et al. 2000, pp. 203-204, Britzelmaier 2009, p. 69). The implicit assumption under this approach is that even though the current capital structure differs from the target, future financing decisions will bring the capital structure closer to the target (Young and O’Byrne 2001, pp. 163-164). The target capital structure method is also recommended because of its calculation easiness, especially for not listed companies. This also solves the so called circularity problem for private companies, which arises due to the need of cost of capital as a discount rate during the calculation the market value of equity (Tappe 2009, p. 112). In theory the circularity problem can be solved with iterations methods, where mathematically all possible scenes are played until the relevant capital structure is found (Pape 2010, p. 111). In practice it is not easily applicable, so that the target capital structure can be used instead (Pape 2010, p. 111).

Furthermore, the determination of the cost of debt and the tax rate can follow relatively easily. The cost of debt can be derived either a) by dividing actual debt interest payments over the average debt (Dörschel et al. 2009, p. 228 ff.) ; b) by using the contractually agreed interest rate or c) implementing the actual market rate of return in the case of bonds (Töpfer

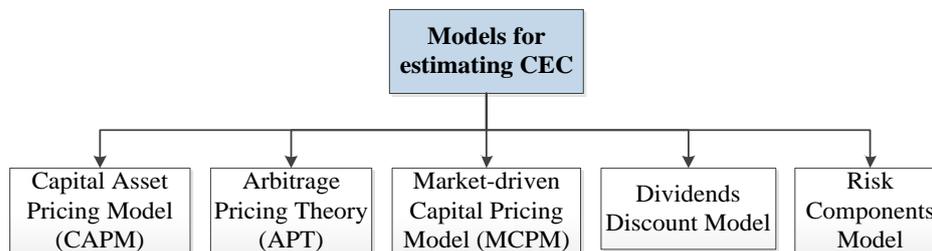

and Duchmann, 2006). The tax rate is considered in the WACC formula because of the so called tax shield effect. The tax shield effect occurs because the interest payments for debt are tax-deductible, i.e. the more interest payments the company has, the less tax it pays on the income (Young and O'Byrne 2001, p. 164). Therefore, the more the company is leveraged (more debt), the more effect has the tax shield on the WACC. The tax shield in WACC formula is considered under the assumption of a fictive only with equity financed firm (Hostettler 2002, p. 50). Usually a normalized country specific company tax rate is used.

The remaining component, the cost of equity capital is the main focus of this paper so it will be discussed separately in the next section.

Alternative Approaches of Cost of Equity

The following figure illustrates the different models which have established in the literature and practice for calculations of cost of equity capital:

Figure 1: Possible Models for Estimating Cost of Equity Capital

Source: Based on Britzelmaier (2009), p. 73

In general from all the presented methods, only CAPM (with further model enhancement), the Risk Components Model can be considered for private companies. This is due to the lack of existence of stock prices as required for CAPM, APT, MCPM and DDM Models. Being the most widely used method for CEC calculation CAPM builds and therefore a separate section is devoted to this method.

Capital Asset Pricing Model (CAPM)

The most common used method⁷ of estimating the CEC is the CAPM, a capital market and portfolio theory model developed by Sharpe, Lintner and Mossin based on Tobin's and Markowitz's models (Tappe 2009, p. 105, Pratt and Grabowski 2010, p. 103). This model has been developed especially to determine the CEC for publicly listed companies because there are normally numerous investors and it is complicated to calculate a single expected rate of return for unknown investors. The solution has found in observing the capital market behavior through this model (Young and O'Byrne 2001, p. 165). It considers the return from a risk free investment and a market premium. With the help of the Beta factor the systematic risk of each security relative to the market portfolio is brought into calculation.

Formula 2: CAPM Model Formula

$$r_{(Equity)} = r_{(Risk-free)} + (r_m - r_{risk-free}) \times \beta$$

where r_m is the rate of return of the market portfolio and therefore $(r_m - r_f)$ is the market risk premium of the equity; β is called market Beta or Beta factor

A number of assumptions are laid under the CAPM model which brings some limitations (Pratt and Grabowski 2010, p. 113 and Perridon and Steiner 2007, p. 255). Normally the yields of long-term government bonds with "best credit rating" are considered for $r_{(risk-free)}$ (Bark 2011, p. 10). The 30-year and 10-year government bonds are mostly recommended in the literature as they are relatively easily determinable in the practice. For the calculation of the market premium $(r_m - r_f)$ the required return of the market portfolio can be calculated ex-ante or ex-post by trying to estimate the future or by extrapolating historical development to the future, respectively. Both approaches have their proponents and critics (Copeland et al. 2000, p. 216 ff.). Usually a market index, such as EuroStoxx, DAX, S&P 500 is considered.

The bottom line is that except for company-specific β factor, all other components of CAPM can be calculated regardless whether the company is publicly traded or not.

The Beta factor is normally calculated using historical market data by regressing the stock's return against the return of a stock index (e.g. DAX Index) (AEU 2002 p. 2338). Mathematically it can be also calculated by dividing the covariance of the stock in subject and the market portfolio to the variance of the market portfolio as shown in the formula below (Dörschel et al., 2009).

⁷ About 2/3 of the firms examined determine their CEC with CAPM (Geginat et al. 2006, p. 14).

Formula 3: Beta Factor

$$\beta = \frac{Cov(r_e; r_m)}{Var(r_m)}$$

where $Cov(r_e; r_m)$ is the covariance between the return of the equity and the market and $Var(r_m)$ is the variance of the return of the market.

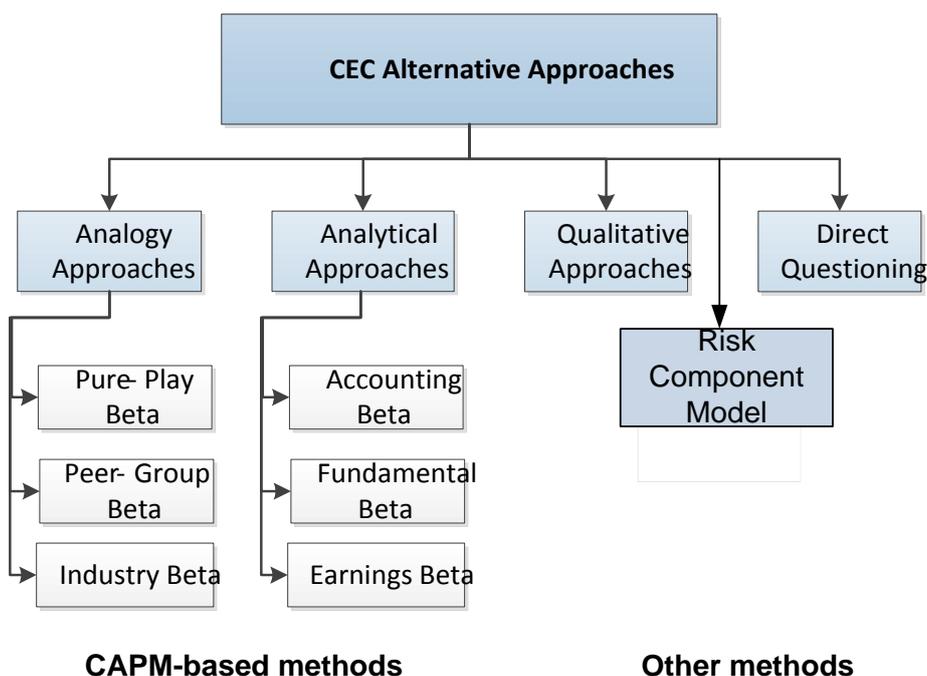

For companies that are not publicly traded, the decisive factor β becomes a problem as the relevant capital market figures cannot be derived (Günther 1997, pp. 166 ff.). Hence CAPM is not valid for private of companies without further adjustments or by using other alternatives (Vélez-Pareja 2005).

COST OF EQUITY CAPITAL FOR PRIVATE COMPANIES

Overview of Alternative Approaches

Being the most common method of calculating the CEC, CAPM is supposed to objectively estimate the CEC from the market. However, many scholars heavily criticize the model regarding its anticipated objectivity and claim that discount rate is a completely subjective parameter and that no formula can yield to better results than a simple subjective judgment (Pereiro 2002, p. 101). This is especially true for privately held companies where the direct calculation of CAPM does not apply anyway due to lack of historical stock prices for the computation of the Beta factor and the not fulfillment of the CAPM assumptions. Especially the SMEs or even large family owned companies are often publicly not listed and the estimation of risk-adequate capital costs is the largest critic of VBM concepts in such companies (Tappe 2009, p. 108). Nevertheless, financial analysts and practitioners have developed methods which allow the estimation of the CEC for such cases which are summarized in the following figure (Geginat et al. 2006, p. 20, Bufka et al. 1999, p. 118 and Britzelmaier 2009, p. 80):

Figure 2: CEC Calculation Methods for Private Companies

Source: Own Illustration based on Geginat et al. (2006, p. 21), Michels (2008), p. 81

These methods are not only useful for privately held companies, but also for company divisions of publicly listed companies. Often the risk of divisions is not the same as the overall group risk and the individual cost of capitals need to be calculated.

Analogy Methods (Comparable Company Approach)

The first and in practice most commonly used cluster of CAPM-derived CEC is referred to as the Analogy Methods, which was initially suggested by Van Harde and then tested by Fuller and Kerr to estimate the divisional CEC. The Analogy Methods or also referred to as comparable companies' approach (CCA) are the most common methods of calculating Betas for private companies. Here the Beta for the company in subject is approximated from that of a single listed comparable firm (Pure-Play Beta), or alternatively from several comparable firms (Peer-Group Beta) or from the industrial average (Industry Beta) (Geginat et al. 2006, p. 21 and AWFMU 2004, p. 250). The implicit assumption is that the risk of the unlisted company is the same as that of the comparable listed ones and therefore the risk can be derived from the market (Bühner and Sulzbach 1999, p. 239). The Betas calculated from Analogy Approaches are sometimes referred to as bottom-up Betas (Damodaran 2002, p. 933).

Pure Play Beta

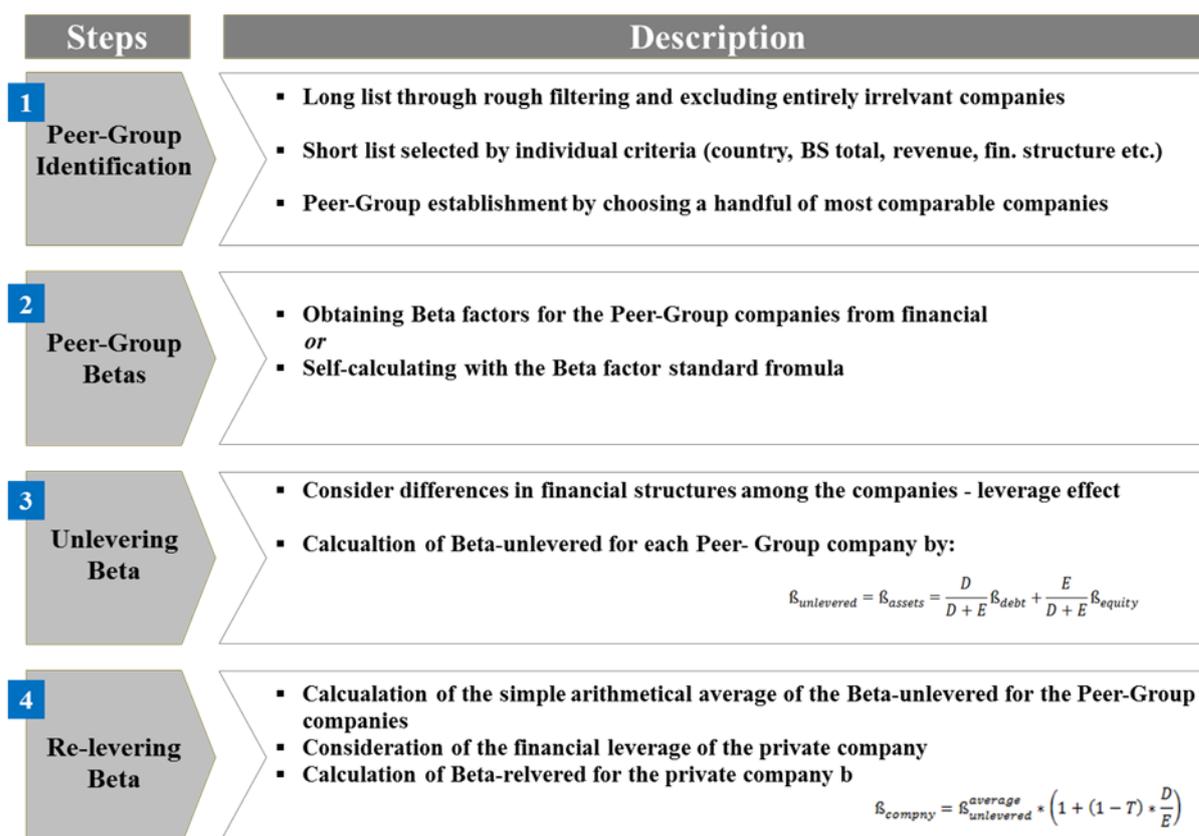

The original model of Van Herde suggested to proxy the unlisted company to a single comparable listed company. However due to special statistical effects this method is not recommended (Bark 2011, p. 127). The estimation error for a single company is higher than for a portfolio of companies. This why the method was expanded to include more than just a single company. By using Peer-Group or the Industry Beta the standard estimation error decreases (Bowman and Rush 2004, p. 3). Moreover, finding a very similar company can often be problematic (Erhardt and Bhagwat 1991, p. 62). Thus for practice the pure play method is not recommended.

Peer-Group Beta

So by using Peer-Group the standard estimation error decreases meanwhile decreases the comparability among the proxy companies to the private company (Bowman and Rush 2004, p. 3), but meanwhile the comparability among the proxy companies to the private decreases (Bowman and Rush 2004, p. 3).

As the Peer-Group approach is the most widely used here the standard approach of the Peer-Group calculation is demonstrated:

Figure 3: Calculation Steps for Peer-Group Beta

Peer-Group Identification (Step 1)

One approach of determining the Peer-Group is to establish what is called a long list of the listed comparable companies through rough filtering criteria. The long list excludes entirely irrelevant companies (Geginat et al. 2006, p. 22). Then through individual selection criteria the relevant short list is created. The possible criteria might include the country, BS Total, financing structure, asset intensity and structure, sales revenue, sales growth, EBITDA, number of employees, product portfolio, composition of the sales (Geginat et al. 2006, p. 22 and Herter 1994, p. 117). Then the Peer-Group of the most comparable companies is established.

This step is the most crucial as it requires subjective judgment as to which companies should be included and which excluded from the Peer-Group and this will affect the outcome of the Cost of Equity. In the first step it should be attempted to find comparable publicly listed firms having similar operating activities as the firm in subject. However, occasionally private companies have very specific business models and the number of similar companies can be very limited so that finding such companies might be much harder as thought at first sight. In

this case, financial analysts can rely on the experience and knowledge of the management. The management can be asked to name comparable publicly listed companies, which are influenced from the same market forces as the valuated private company. This approach is beneficial especially for those private companies, which are family owned and the founders have been highly active in the management since decades and so their knowledge and expertise is first-hand and should be profited from.

In the selection of the Peer-Group the companies should be thoroughly chosen. Companies which had their IPO earlier as 1 year ago are generally not recommended to be included as it will affect the Beta calculation by statistically distorting the results. Internet source such as Yahoo Finance can be a very helpful practical tool to find comparable companies as they offer such information at hand. Additionally short profiles for each company can be obtained from Finance internet sources in order to examine their core competencies and to compare it with the private company. Generally, the more companies are included the better are the statistical properties of the estimated (Bowman and Rush 2006, p. 2). When the private company has a very specific business the number of comparable companies is limited anyways, further selection criteria cannot be implemented (e.g. company size, revenue, country etc.). Normally the more the size of the private company approximates the size of the comparable companies, the less biased is the method. Therefore it is recommended to consider the size effect in CCA method for Beta calculation (Bowman and Rush 2006). Normally if the private company is smaller as the peers, this will result in underestimating the Betas. Gross revenue is usually used to compare the companies.

The geographical area is also essential for determining the Peer-Group (Geginat et al., p. 27). Even if the operating activities of the firms are the same, the presence in different geographical areas might result in different unsystematic risks (Erhardt and Bhagwat 1991, p. 62). A further limitation in Peer-Group composed from companies from different countries as that of the private company represent effects from foreign exchange rates, which are not considered in this model. Here a further assumption must be made that foreign exchange rates don't have an essential influence. This can in fact be true for those companies which are globally active and anyhow affected by the same currency effects.

Peer-Group Betas (Step 2)

After the relevant companies have been identified, the Betas of these companies are required. Beta factors can be obtained from different financial sources such as Bloomberg or Yahoo Finance. Otherwise the Beta factors for the selected companies are calculated with the

standard formula. The problem of obtaining the data from financial sources is that the Betas of all the selected companies need to be found in one source; otherwise they will not be comparable. This is because the CAPM model does not give any calculation specification in. Even though the Beta factor has established to be a benchmark financial measure, Betas from different sources might alter depending on the time period chosen for the calculation, the market index as well as the frequency of the returns in the regression model. Here it is to point out once more, that there is no right or wrong, it is just a matter of subjective input of the required data by the financial analyst carrying out the valuation.

Unlevering Betas (Step 3)

When using the Analogy Approaches, normally the capital structure of the private company will be different from the comparable ones (Bark 2011, p. 127). As the financial risk significantly effects the Beta, i.e. the more leveraged the company is the higher will be the Beta, the leverage effect has to be eliminated for calculating the company Beta (Süchting 1989, pp. 367-369 as cited in Herter 1994, p. 102).

Despite which Analogy Method is chosen (Pure Play, Peer-Group or Industry) the Beta taken has to be unlevered and then re-levered using the debt to equity ratio and the tax rate for the company subject for calculation.

The most common formula for unlevering is the following (Michels 2008, p. 82 and Herter 1994, p. 103):

Formula 4: Unlevering Beta

$$\beta_{unlevered} = \beta_{assets} = \frac{D}{D + E} \beta_{debt} + \frac{E}{D + E} \beta_{equity}$$

In the practice however, this relation is complemented with two further assumptions: 1) the β_{debt} is zero, i.e. the debt is risk-free and 2) tax rate is not affected from the capital structure (Serfling and Marx 1990, p. 426 ff. and Copeland 1990, p. 264 as cited in Herter 1994, p. 103). Under these assumptions the following equation for the equity Beta can be derived for a company, which is fully financed with equity⁸:

⁸ When a “no-debt” company is assumed, then the tax shield effect has to be considered as well. The logic is the same as with tax shield consideration in WACC.

Formula 5: Unlevering Betas of the Peer-Group⁹

$$\beta_{unlevered} = \frac{\beta_{equity}}{1 + \frac{D}{E}(1 - T)}$$

After the unlevered Betas for the Peer-Group have been calculated it is necessary to calculate the average Beta of the Peer-Group. Generally geometrical, arithmetical or median averages can be used (Geginat et al. 2006, p. 22), however mostly simple arithmetical average is calculated. This is done to obtain one single unlevered Beta in order to be able to in the re-levering formula.

Re-levering and Beta Calculation (Step 4)

After determining one single unlevered Beta for the Peer-Group (Step 3), the final step is to calculate and re-lever the Beta for the valuated company considering its financial leverage using the following formula:

Formula 6: Re-levering of the Beta for the Company

$$\beta_{company} = \beta_{unlevered}^{average} * \left(1 + (1 - T) * \frac{D}{E}\right)$$

However, the consideration of the leverage effect can lead to over- or underestimation of the CEC (Fuller and Kerr 1981, p. 1002, Schlegel 2011, p. 108 and Bowman and Rush 2004, p. 2). Thus one should be cautious when using the Analogies Method and the plausibility of the CEC should be proven with other calculation methods.

Another problem in CAPM-derived CCA calculation can arise when the company in subject is in a country, where market capitalization is relatively low. This is the case for many European countries, which compared to Anglo-Saxon countries are mainly bank financed. This prepares the difficulty of finding Peer-Group companies in the same country. In this case data from e.g. USA can be employed (Herter 1994, p. 117). However this challenges the comparability of the companies in terms of exchange rates and business environment.

Industry Beta

Although the Industry Beta improves the statistical method, an additional assumption is implicitly made that the systematic risk within the same industry is the same (Herter 1994, p.

⁹ There are several formulas for re-levering the Betas, mainly depending on the financing structure (fixed book value or market driven value of debt) (Fernandez 2006). However, the most common approach is here presented (fixed book value).

104). Moreover, in specific cases it might also be difficult to place the company in one particular industry. Thus the Peer-Group Method from the Analogy Approaches is considered more plausible and unless it is impossible to calculate, then it is recommended to use the Industry Beta (Pape 2010, p. 201). The Industry Betas can be obtained from various financial sources. Once the Beta is available, the methodology of transforming Industry Beta into the company's Beta is the same as in the case of the Peer-Group Beta starting however with the 3rd step – unlevering of Industry Beta.

Analytical Approaches

In these approaches it is attempted to find a relationship between accounting-based measures of systematic risk and the market-based systematic risk measures (Erhardt and Bhagwat 1991, p. 61 and Bufka, et al. 1999, p. 116). It is thereby assumed that the accounting data are influenced from the same events and information as the market price data (AF 1996, p. 552). The underlying approaches are the Earnings Beta, the Accounting Beta and the Fundamental Beta.

In Earnings Beta, the changes in quarterly earnings of the private firm are regressed against changes in quarterly earnings for an equity index (S&P 500, DAX etc.) to estimate the Beta factor (Damodaran 2002, p. 930).

Formula 7: Earnings Beta

$$\Delta Earnings_{Private Firm} = a + b\Delta Earnings_{Equity Index}$$

The slope of the regression – the parameter b – is the Beta for the firm. The limitation of this approach is that the private firm's earnings are usually available only on one year basis, which will result in limited statistical power. Moreover, the mismatches resulting from accounting principles among firms might lead to wrong Betas (Damodaran, 2002, p. 930). In the case of the Accounting Beta approach more than one accounting measure is taken into consideration. The principle is however the same as that of the Earnings Beta. The Fundamental Beta approach tries to find specific characteristics of the firm, which have a relation with the systematic risk. Many researchers have tried to find a relation of various measures of publicly listed firms to that of private firms in the attempt to estimate Betas for private firms. Such measures can be earnings growth, debt ratio, company size, foreign income or dividend payout. The weakness of this approach is that it is assumed that the Beta

factors of different companies would react the same way on the changes of these fundamental factors (Damodaran, 2002, p. 933 and AF 1996, p. 552 and references there).

The Analytical Approaches are generally plausible models, but the calculations are complex and not easily applicable in practice. However, the main issue in these models can occur when the company in subject has experienced a great external growth through acquisition in the prior years. Often the acquisitions are done gradually and the consolidation decisions have a legal or tax background. This can significantly distort the regression results of the analytical methods as these models require a large amount historical data, preferably quarterly financial measures, which can be statistically biased.

Validity of CAPM-derived Methods for Private Companies

As discussed in the previous chapter, the most common way of estimating CEC for private companies is by using Analogy Approaches. This methods allow to calculate the Beta of a private company and thus also the CAPM. But can this CEC be applied to private firms without hesitation? In this part the plausibility of market derived calculation of CEC is proven. As it was emphasized before, the Betas calculated with these methods can be under- or overestimated. But here the overall model of CAPM for the purposes of private companies is questioned. In order to prove the plausibility of CAPM, in the first place the model's underlying assumptions are proven and the question is raised whether or not CAPM can be applied when these assumptions diverge greatly for privately held companies. The deviation of the CAPM assumptions for private companies is summarized in the Table below:

Table 1: Divergence of CAPM Assumptions for Private Companies

CAPM Assumption	Divergence from CAPM	Effect on CEC
Risk-aversion of the investors	Entrepreneurs are generally considered more risk taking	-
Perfect diversification	Entrepreneurs are underdiversified	+
Investors are price takers (minority interest holders)	Entrepreneurs hold the controlling packet of their company	-

CAPM Assumption	Divergence from CAPM	Effect on CEC
Perfect marketability and divisibility	Entrepreneurs cannot sell their equity at any given time to a certain price	+
Systematic and complete information	Information is symmetric compared to publicly listed firms	0/-
Neither transaction and information costs nor taxes	For private firms the information costs are high	+

Source: Based on Khadjavi (2005), p. 202. Michels (2008), p. 29 and Balz and Bordemann (2007)

Risk-aversion

Usually the entrepreneurs behave all but rational and risk averse on behalf of their investment decisions regarding their choices of the tradeoffs between risk and return (Young and O'Byrne 2001, p. 167 and Khadjavi 2005, p. 2). CAPM neglects the individual risk appetite of the entrepreneurs and thus a CAPM-derived CEC for private companies is to be critically seen (Behringer 1999, p. 94 as cited in Tappe 2009, p. 108). Not the expected return of the market is of relevance but rather that of the entrepreneurs. It can be assumed that the entrepreneurs are less risk-averse (Tappe 2009, p. 108-109). This would mean that they are ready to take more risk without compensation of adequate return. Consequently the assumption of CAPM that for higher risk investors require higher return is not fulfilled. This results in having a lower expected rate of return from the side of the entrepreneurs as it would have been with same risk for normal market investors.

Perfect diversification

The major assumption under the CAPM model is that the investors are diversified. For closely held companies such as family owned companies with limited shareholders, the owners are normally underdiversified, i.e. they don't or cannot invest in any desired

portfolio. As the diversification is not achievable, market-derived CAPM for unlisted companies is heavily criticized (Herter 1994, p. 116). Furthermore, especially the family owners have all their assets in the company and it is highly unlikely that they have invested in other not to the family business related projects (Balz and Bordemann 2007, p. 8, Damodaran 2002, p. 930 and Herter 1994, p. 116). This results in requiring higher risk due to the additional unsystematic risks, which the entrepreneurs are undergoing (Balz und Bordemann 2007, p. 2 and Khadjavi 2005, p. 154). The owners are exposed not only to the market risk, but to the whole risk in the firm. As a result it can be argued that the capital market driven CEC for underdiversified companies should be neglected as they are underestimated (Herter 1994, p. 116).

If the investors are not diversified, it's necessary to consider and evaluate a specific risk and the individual risk preference of the entrepreneurs. However, the definition and foremost the quantification of such specific risk and its differentiation from the systematic risk is neither clear nor easy to determine. Thus, in many cases the costs of trying to do such measurements will exceed its benefits. To avoid further complication, the determination of the expected CEC for a not diversified shareholder can ultimately follow by the entrepreneur or his financial analyst. In this case, the market-derived CAPM can serve as the starting information basis with the help of which the investor decided how strong he wants to adjust for specific risk he is undergoing (Herter 1994, pp. 118-119).

However, the diversification problem can be solved when the market Beta is adjusted. After this adjustment the Beta is called *Total Beta*. If used in the same concept the standard and not adjusted Beta is referred to as *Raw Betas*. The formula of the adjustments is as follows (Damodaran 2002, p. 671):

Formula 8: Total Beta

$$\beta_{Total} = \frac{\beta_{Asset}}{\rho_{jm}}$$

where β_{total} is the Beta unadjusted for diversification and ρ_{jm} is the correlation of the asset to the market.

In the case of unlisted companies, the correlation coefficient of the comparable companies is taken into the calculation (Damodaran 2002, p. 671). However, one should consider this adjustment very carefully.

In the first place, the higher risk resulting from underdiversification can be compensated by more active and committed management of the family owners¹⁰. However, it should be also mentioned that in the case of family owned businesses, the owners might be risk-averse in the sense of being afraid to lose the business. In such cases careful risk management, diversification through financial instruments (hedging) and avoidance of high risk projects can even result in lower risk for such families (Khadjavi 2005, p. 180). Thus, a clear conclusion regarding the diversification and risk averseness of family owned firms cannot be drawn and case-specific information is to be considered. Nevertheless, in most of the literature entrepreneurs are generally considered not to be fully diversified and being risk sympathetic compared to capital market investors (Kratz and Wangler 2005, p. 171).

Price takers

Entrepreneurs are not price takers in the sense of CAPM (Tappe 2009, p. 109). They hold the controlling packet in the company and therefore manage the company the way they wish. Therefore the assumption that the investors are price takers is also not fulfilled. It is assumed that this somewhat reduces the risk (Bucher and Schwendener 2007, p. 345). It is often argued that these reductions are balanced out with the absence of marketability of privately held shares (Khadjavi 2005, p. 200).

Marketability and illiquidity

Private companies lack marketability and illiquidity. Moreover, compared with public companies private companies have more difficulty to raise additional debt or equity capital from organized capital markets (Pratt and Grabowski 2010, p. 587). Therefore, it is assumed that the cost of equity would normally be higher for the private company and an adjustment to the CEC should be made. Due to the lack of fungibility, i.e. the impossibility of withdrawing the invested capital from the company again at any time, the CEC has to be increased. However, the relevance of the fungibility adjustment is only justified in the case of possible intention to sell the company. The illiquidity adjustments are also to be neglected when this is not expected. The underlying principle to this approach is that only the expected risks are to be taken into calculation (Dörschell et al. 2009, p. 258). Moreover, even if such a general adjustment were to be made, it is almost impossible to determine a justified amount

¹⁰ A correlation has been found between higher risk and higher return of such companies which can be attributed to 1) High dependency of the equity holders makes them work harder on the company success and 2) Owners require higher returns on the investment projects because of the higher risk (Khadjavi 2005, p. 180).

of adjustment. Empirical studies have tried to find some approximation, nevertheless studies are partially very controversial and the fixed adjustment is to be rejected.

Systematic and Complete Information

In CAPM it is assumed that the investors will require additional returns due to the principal agent information asymmetry. In case of private and family owned companies the principal and the agent are one person, so that this reduces the capital costs (Khadjavi 2005, p. 201). Nevertheless, in case of integration of third-party managers, the information asymmetry can also occur in private companies (Tappe 2009, p. 109).

Transaction costs and taxes

This assumption is not realistic neither for publicly listed nor for unlisted companies. In the real world there are transactions costs as well as taxes which will bring to requiring higher capital costs. Especially for privately held companies the transaction costs are high (Michels 2008, p. 29).

Other Methods

Besides the above discussed issues regarding lack of fulfillment of CAPM assumptions for private companies, there are further specific characteristics which encourage the other methods of CEC. First of the entrepreneurs of private companies are usually described to be following not only monetary goals. The so called meta- or personal goals, e.g. the consciousness to family business tradition, reputation, prestige, social recognition and etc., also have an impact on the valuation. This is sometimes referred to as emotional or family value (Bucher and Schwendener 2007, p. 345). Whereas market derived models assume purely monetary oriented investors, entrepreneurs' other preferences might result in sacrifice of short-term returns in order to secure long term business existence. This can even result in a negative cost for equity in the short-term, which under the market driven models would be nonsense (Khadjavi 2005, pp. 180-181).

The models (e.g. CAPM, APT) for calculating the cost of equity were introduced in order to calculate the cost of equity for publicly listed companies, where the number or the identities of the investors are normally vast. From capital market observations driven calculation cannot be completely left out from consideration. Sometimes even if the entrepreneurs are to be asked their expectations, their answers might be partially too vague (e.g. "we want as

much return as possible”) (Young and O’Byrne 2001, p. 165). Therefore other methods should be applied when calculating the cost of equity for private companies. Three methods are here presented and discussed, which are not based on capital market estimations. This can be quite plausible in practice especially when the above addressed problems with the commonly used mathematical methods (esp. CAPM) are taken into consideration. Moreover, many authors claim that formula cannot deliver better results than just a simple subjective estimation of the CEC (Pereiro 2002, p. 101).

Risk Components Model

In this model the cost of equity is calculated by adding different company specific risk components to the risk-free rate of return. Thus, in contrast to CAPM, unsystematic risk is also considered by taking different factors into the calculation. Hereby the basic risk free rate is increased or decreased with subjective estimations. Gleißner has developed a model for determining the adjustment to the risk free rate, which is based on the subjective evaluations from the company and not the investors from the market. Various risks are determined and with the budgeted date of the company through simulation (e.g. Monte-Carlo-Simulation) the risks are aggregated and added (Gleißner 2005 (a), pp. 27-37 and Gleißner 2005 (b), pp. 217-229).

This method is considered to be a quite plausible method especially for closely-held companies, for which due to the underdiversification the unsystematic risk is relatively high. Although this model is suitable for not listed companies sound planning data and high qualified analysts within the company will be required to be able to conduct a reasonable assessment of the CEC. The latter conditions are not always given and can be a further challenge for smaller companies.

Qualitative Approaches

In contrast to CAPM-derived models, these approaches are not based on estimating CEC based on objective comparable data, but rather attempt to subjectively estimate the relevant risk indicators (Bufka et al. 1999, p. 118).

There are various scoring models, the most famous of which are the BCG and the Fuquana Inst. Method.

Figure 4: Cost of Equity Capital Estimation with BCG Matrix

Criteria	Characteristics					High Risk	
	Low Risk	1	2	3	4		5
Controllability of the profits	Low external influences						Strong external influences
Market	Stale, without cycles						Dynamic, cyclical
Competitors	Few, constant market shares						Many, variable market shares
Products/Concepts	Long lifecycle, not substitutable						Short lifecycle, substitutable
Market entry barriers	High						Low
Cost Structure	Low fix costs						High fix costs

Legends: 1=not so important
5=very important

Source: Own illustration based on Bufka et al. (1999)

In the BCG method the CEC for unlisted firms or divisions is derived by comparing and adjusting the CEC of the whole company, which is listed and the CEC can be calculated with CAPM. With the help of 6 criteria, the subjective judgment of the managers is required to estimate the divisional CEC (Lewis and Stelter 1994, p. 81 ff. as cited in Bufka, et al. 1999, p. 118). The Fuqua Ind. method is similar to the BCG Method and uses 14 instead of 6 criteria. The BCG method is considered as a better approach because the criteria used in BCG are more general. The study of Bufka et al. (1999) indicated that the estimation of the CEC with the BCG method has a better explanation relation with the Beta factor as the Fuqua Ind. method, especially for homogenous companies.

If the BCG method is used of unlisted companies, a starting CEC can be applied, which can for example be the average CEC of the industry and then through scoring and normalization, company specific CEC can be calculated. Alternatively, the Beta can be estimated with the help of the scoring model, by assuming the mean value of the scoring the Beta=1 and then by adjusting it according to the respective risk (Herter 1994, p. 109).

For the Qualitative Approaches the management of the company in subject can be questioned and their subjective judgments of the company's risks are taken into consideration. The main problem of scoring models is the starting point of the adjustment. In scoring models the criteria are used to compare the risk, i.e. cost of equity with another company. These models are more adequate for determining the divisional/ or subsidiary cost of equity in case the overall cost of equity for the parent company is already determined. In this case with the help of scoring, one can determine whether the divisions have a higher or lower risk compared to the parent, and adjustments can be carried out. On the contrary, for estimation of the CEC for the private company a very similar company's CEC has to be found. In practice this can be

difficult, as it is the case with the Pure-Play method in terms of finding a company similar with the risk portfolio, having the same regional activities and being public.

A further problem of the qualitative approaches is the weighting proportion of each risk criteria. It's questionable that each of the risk categories would lead to the same change in the CEC. Existing literature recommends using the same weighting for each of the category. Here it is proposed to ask the managers also to evaluate the importance of each of the category and through scaling this can be normalized and the weighting proportions of each of the category can be adjusted.

Figure 5: Determination of Weighting each Criteria of the BCG Matrix

How important do you consider each of the categories for the development of your business?

	1	2	3	4	5
Controllability of the profits					
Market					
Competitors					
Products/Concepts					
Market entry barriers					
Cost Structure					

Legends: 1=not so important
5=very important

A further challenge of scoring models is the determination of the deduction and the increase of the basis value and determination of the basis value itself. Therefore, often this is done in approximation and is therefore very subjective (AF 1996, pp. 556–557).

Direct Questioning

Besides capital market derived approaches the cost of equity can be estimated with the help of so called “Individual Approach” or “Direct Questioning” (Weber et al. 2004, p. 52). Analogy Approaches can serve as an orientation tool. According to this model direct questioning of the entrepreneurs, independent from capital markets is applied in all the cases where it is possible. Important for this approach is the consideration of the risk-aversion of the entrepreneurs and their underdiversification (Tappe 2009, p. 110). It can be generally assumed that the entrepreneurs are more risk-friendly, thus require fewer premiums for the higher risk. Here the opportunity cost of capital does not play any role (Tappe 2009, p. 206). If there is more than one owner, the expected return of each owner can be weighted according to their equity share to arrive at an overall cost of equity capital (Khadjavi 2005, p. 195).

Table 2: Cost of Equity by Direct Questioning (Example)

Shareholders	Part in Equity	Expected Return	Weighted
Shareholder 1	55%	7,5%	4,1%
Shareholder 2	24%	9,2%	2,2%
Shareholder 3	16%	5,0%	0,8%
Shareholder 4	5%	7,5%	0,4%
Total expected return on equity			7,51%

The company owners can be asked to give their expected return on the invested capital. In order to better explain the plausibility of their answer additional questions can be prepared to proof their risk appetite.

In the classical finance theory the cost of equity is higher than the cost of debt, as the equity holders are liable in case of bankruptcy. This is not the case for family owners, as the equity is seen as a controllable capital. Therefore the equity cost can be even lower as the debt costs (Bühler 2005, p. 9). As risk is a very subjective measure, there is no universal understanding how the risk appetite could be precisely measured. Nevertheless, to compare the risk appetite of private company owners, the shareholders can be asked to choose one out of three investment alternatives. The investment alternatives with different probabilities of occurrence and returns can be suggested. An example of such questioning is presented below:

Table 3: Investment Alternatives

Investment alternatives			Answers			
	Return	Prob.	Shareholder 1	Shareholder 2	Shareholder 3	Shareholder 4
Alternative 1	15%	10%		X		
Alternative 2	10%	60%	X			
Alternative 3	5%	90%			X	X
Expected Return			1,5%	6,0%	4,5%	6,0%

CONCLUSION

This paper contributes to the literature, which argues that capital market derived methods though rooted for calculation of cost of equity capital in listed companies, may not be the best approach for private companies. Subjective approaches of cost of equity capital can be applied in case of private companies saving further assumptions and complexity in already doubtful and assumption flooded finance formulas, the most common of which is the CAPM. Whereas the Beta factor can be adjusted in numerous ways in order to be applicable for

private companies, the authors challenge such approaches. Whereas it can be argued that the suggested subjective methods will be biased and therefore are useless in finance calculations, we argue that CAPM either does not deliver unbiased and objective calculation methodology and far most not for private companies. If the financial analysts are able to make the notion of cost of equity understandable and transparent to the company owners and the management, together a reasonable cost of equity capital and thus cost of capital can be agreed upon. Most importantly, CEC should consider the business and finance risk of the company and represent the expected return on the invested equity by the entrepreneurs.

Further related research topics can be empirical studies of private companies and their perception, acceptance and use of cost of equity capital. Furthermore, case studies of hands-on calculation of CEC for companies from broad business spectrum would help this research field.

MECHANISMS OF (DE)CERTIFICATION: UNDERSTANDING HOW CONFLICTS UNFOLD IN ORGANIZATIONS

Brodeur , Louis-François

HEC Montréal, Canada, louis-francois.brodeur@hec.ca

ABSTRACT

This research proposes an exploration of the making and unmaking of legitimacy by the means of a qualitative case study of an extreme case of contention between a challenging student union (SU) and an incumbent administration (MU) of a large research-intensive university (Patton, 2002; Eisenhard, 1989) based on a wide range of documents such as minutes from meetings, strategic plans, newspaper articles, reports and six extensive semi-directed interviews. In the nine month episode over 80 significant events were registered and shown to uncover mechanism. From a recurrent set of similar events, we identify the mechanism of (de)certification as the “validation of actors, their performance, and their claims by external parties, especially authorities” (McAdam et al., 2001:316), while decertification is the withdrawal of validation. We first find that this mechanism is central in the making and unmaking of legitimacy in an episode of contention. Second, we observe a transfer from an initial position where an incumbent’s legitimacy emanates from external sources to an internal source of legitimacy. Finally, we hypothesise that *legitimacy equilibrium* is a heuristically fruitful concept, making sense of this transfer from external to internal legitimacy.

Keywords: social movements, contention, legitimacy, mechanism, certification, process

INTRODUCTION

A few years ago, a Montreal student union organized a campaign against the administration of their university to protest a fee hike. Disruptive actions followed firm statements, bitter discussions, threats and accusations. In itself, this is not an unusual story. Comparable

protests have occurred regularly in many higher education organizations such as Cambridge, NYU, and UC Santa Barbara, and many others have experienced similar turmoil. What makes this case special and worthy of research is its conclusion: after a fierce campaign, the administration and the student union leaders negotiated and came to an agreement that would end the struggle.

This conflict, we argue, was about much more than finances. It was also about something much more intangible than budgets. The legitimacy enjoyed through a set of relationships by the administration and the student union was at stake. The importance of legitimacy for institutions is not new (Deephouse & Suchman, 2008; Meyer & Rowan, 1977; Singh, Tucker, & House, 1986; Suchman, 1995). Neo-institutional theory asserts that “[o]rganizations that incorporate societally legitimated rationalized elements in their formal structures maximize their legitimacy and increase their resources and survival capabilities” (Meyer & Rowan, 1977, p. 352). Legitimacy is particularly important for the institutional sector, comprising, among others, schools and higher education organizations, because of their hazy technology and intangible goals. Traditionally, legitimacy is acquired through an alignment of organizational- and field-level culture. It “is a generalized perception or assumption that the actions of an entity are desirable, proper, or appropriate within some socially constructed system of norms, values, beliefs, and definitions” (Suchman, 1995, p. 574).

The research question guiding this project is: “What are the mechanisms surrounding the making and unmaking of legitimacy in the midst of contention?” To go deeper into the workings of legitimacy, that is to provide a rich and grounded understanding that moves beyond the proverbial organizational black box, this project adopts a constructionist perspective (in that construction is a social and collective activity) on legitimacy (Patton, 2002). It focuses on how it is constructed by actors inside and outside higher education organizations. This research project is coherent with appeals from the practice perspective to focus on research in organizations “explaining social phenomena in a processual way without losing touch with the mundane nature of everyday life and the concrete and material nature of the activities with which we are all involved.” (Niccolini, 2012, p. 9). It is also congenial with an “‘inhabited institutions approach’ that focuses on (1) local and extra-local embeddedness, (2) local and extra-local meaning, and (3) a skeptical, inquiring attitude.” (Tim Hallett & Ventresca, 2006, p. 214).

The conflict between the student union and the administration of Metropolitan University (MU) over a new fee raised important issues around legitimacy in a highly institutionalized

context: parties disturbed relations with different stakeholders, appealed to their membership and mobilized to discredit the adverse party. The focus on an intense conflict instructs us on institutional mechanisms that guide the making and unmaking of legitimacy in similar organizations, experiencing lower levels of conflict. The epistemic logic of the case study is that an intense case of conflict will render "clearly observable" a phenomenon that would have been more difficult to perceive in normal situations (Patton, 2002; Eisenhard, 1989). Concretely, I present an intra-organizational retrospective qualitative case study of a nine-month conflict between a student union (SU) and the administration of Metropolitan University (MU), a large Canadian research-intensive higher education organization, over the imposition of a new fee to students. As a new principal was taking office, a decade of government austerity had put a strain on MU's finances and the new administration was confronted with a sizable deficit. Yet, the administration still considered it crucial to develop information technologies and implemented a fee on students in order to finance technological improvements. The trigger for this conflict was the unilateral decision of the administration to implement the fee. In reaction, the SU led a political campaign comprising a vast array of tactics up until the adoption of a negotiated agreement between the administration and SU over the fee. More than 80 events, some of which were instigated by the MU administration and others by the SU, are related to this conflict. These events ranged from meetings and negotiation sessions to disruptive actions and public relations strategies. This case represents a "rich oppourtunit[y] for exploring the role of movements within existing institutions and organizations" (Schneiberg and Lounsbury in Sage: p. 657).

Below, I first present a review of institutional theory and how recent research has approached the making and unmaking of legitimacy. The method section is also rooted in the notion of mechanism. I will follow with the presentation of the case study organized around the concepts of certification and decertification and I will draw conclusions in the discussion.

LR: INSTITUTIONAL RESEARCH ON CONFLICT

This institutional analysis research is anchored in the sociology of contention (McAdam et al., 2001). The foundational idea of institutional analysis is to find explanations for lower order phenomena in higher order elements (Schneiberg & Clemens, 2006). In this sense, the sociology of contention's aim is to uncover the mechanisms structuring episodes of contention (Tsoukas, 1994). The socio-political understanding of contention points toward phenomena of "(1) claim making and (2) strategic interaction involving (3) the deployment of

commitment, coercion, and compensation as incentives for supporters, allies, rivals, and objects of claims" (Charles Tilly & Tilly, 1998: 232). Understanding conflict as processes of organizational contention means studying organizational conflicts as "simply politics by other means" (McAdam, 2003: 282).

The introduction of social movements concepts in organizational theory has been used to make sense of a growing number of phenomena: the concept of free space explains the adoption of new practices in hospitals (Kellogg, 2009); identity movement helps explain the diffusion of new cuisine (Rao, Monin, & Durand, 2003); external challenges to organizations can be used to explain the transformation of the biotech industry in Germany (Weber, Rao, & Thomas, 2009); contestation helps to explain the variation of stock market (King & Soule, 2007; Soule & King, 2007); dialectic process can be used to explain innovation in the information technology sector (Hargrave & Van De Ven, 2006) and how activism influences corporate social activities (den Hond & de Bakker, 2007). Yet, social movements' blind spot seems to be conflict within organizations (Arthur, Mariel, & Arthur, 2008; Clemens & Minkoff, 2004; Davis, McAdam, Scott, & Zald, 2005; Schneiberg & Lounsbury, n.d.; Scott, 2010). Moreover, while anchored in an institutional perspective, the issue of legitimacy is rarely addressed directly.

Some classics of institutional theory have approached the issue of management of legitimacy. Oliver (1991) addresses issues of legitimacy as an independent variable. The dependant variable in the study of organizational response to environmental pressures is the likeliness of adoption of specific strategies. Oliver makes two contradictory hypotheses which are relevant to our research projects. First, he proposes that organizations in search of legitimacy are likely to acquiesce more than to compromise, avoid, defy or manipulate the environment. Second, he proposes that organizations having multiple constituents, such as universities, are less prone to acquiesce than to mobilize any other strategy. This hypothesis on organization with multiple constituents seeking legitimacy is unclear. A second contribution in the field is Suchman's (1995) seminal piece, where he offered advice to organizations looking to restore legitimacy. He asserts that they have three courses of action: "(an) offer normalizing accounts, (b) restructure, and (c) don't panic." (Suchman, 1995, p. 598). While very actionable, these suggestions do not explain the phenomenon at stake.

Literature on certification provides another entry point on issues of legitimations. Graffin & Ward model certification as a "third-party quality signal". One such signal was tested in the voting on admission of players to the baseball Hall of Fame (Graffin & Ward, 2009; Rao,

1994). A similar approach can be found in Rao's research, where certification is acquired through contest in the automobile industry. He defines certification contests as: "credentialing mechanisms that invest organizations with cognitive validity, create a status hierarchy, and build the reputations of organizations." (Rao, 1994). In both cases, certification takes place through a competitive process, that to say that the winner of a contest, either by vote or by merit, acquires legitimacy.

Finally, Hallett (2010) has studied how recoupling school policy and practices with board expectations in order to maintain legitimacy has created turmoil and delegitimation from the internal constituency. The author does so by "bringing work activity, social interaction, and local meaning-making back into the picture" (ibid. 2010, p. 66), contributing to an inhabited understanding of the *ugly* effect of recoupling processes on legitimacy. Following his lead, we intend to adopt an inhabited perspective on the making and unmaking of legitimacy during a contention episode inside a higher education organization.

At the organizational level, we know that legitimacy is a matter of concordance with wide social expectations (Deephouse & Suchman, 2008; Meyer & Rowan, 1977). Even if this is so, we know that organizations have the opportunity to act strategically in reaction to different types of pressures (Oliver, 1991) and that once they have lost legitimacy, it is possible for them to regain it (Suchman, 1995). We also are aware that different social processes such as contests distribute legitimacy through the mechanism of certification. Finally, an ethnographic account informs us on how recoupling can cause turmoil which, in turns, affects legitimacy (T. Hallett, 2010). What still remains to be explored is the concrete making and unmaking of legitimacy during an episode of contention inspired by an inhabited perspective on institutions.

THEORETICAL FRAMEWORK : MECHANISM OF CERTIFICATION AND DECERTIFICATION

To follow this research agenda on the making and unmaking of legitimacy, we borrow from a socio-political perspective and capitalize on research in the sociology of contention (McAdam, Tarrow, & Tilly, 2001). This perspective does not understand conflict as the result of structural strains or inadequate individuals. Earlier research often analyzed similar events in a cognitive lens as the product of anomy, abnormal individuals, episode of collective madness or in a sociological perspective as the results of conflicting norms, structure or institutions (Clemens & Minkoff, 2004). "Roughly translated, [sociology of contention

understands conflicts] as collective political struggles” (McAdam et al., 2001:5). This distinction is crucial as we recognize strategic actions and agency. In a nutshell, we argue that contention is best understood as equipped with the notion of mechanisms of certification and decertification. Certification and decertification are mechanisms that help explain contentious episodes. Certification is the “validation of actors, their performance, and their claims by external parties, especially authorities” (McAdam et al., 2001:316), while decertification is the withdrawal of validation. Following Stinchcomb’s definition of mechanism, these are explanatory devices that operate as modest pieces of theoretical understanding and that contribute to institutional theory. Mechanisms of decertification and certification at the individual and group level are applied to institutional theory at the organizational and field level.

METHODS

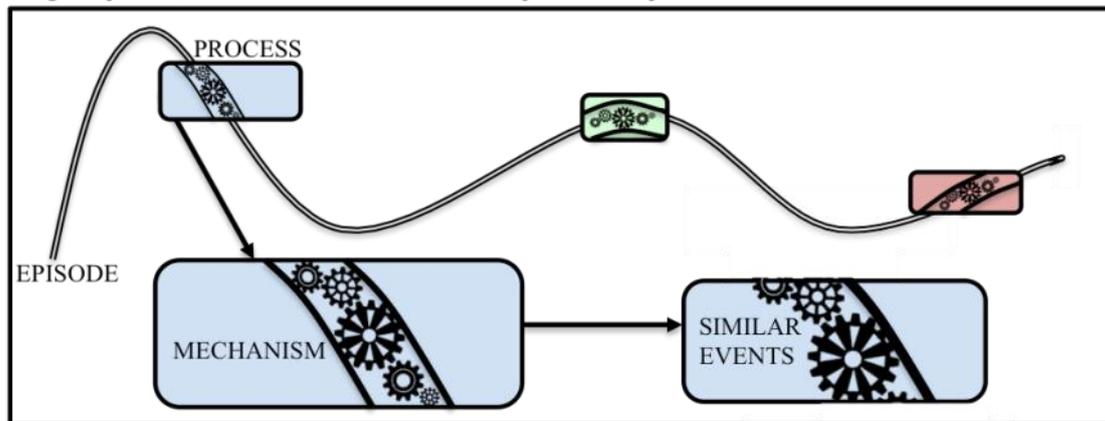

I opted for a qualitative research design to explore contention in a university because it provides rich insights into a phenomenon previously neglected by researchers (Yin, 2012) and because it provides opportunities for theory-building (Eisenhardt, 1989; Eisenhardt, 2007). The point of this research is to “go beyond simply documenting that variables are statistically related to explain the underlying process that make it so: not just finding that a watch runs when you wind it, but prying off the back to display the cogs and wheels that make it happen (G. F. Davis & Marquis, 2005)” (Davis, 2010: 17). This qualitative research takes the form of a retrospective case study of one episode of contention inside a higher education organization. The episode of contention between the administration of MU and the student union represents an extreme example of conflict (Patton, 2002; Eisenhard, 1989). Focusing on an extreme event enables one to perceive with richness and clarity a phenomenon that appears with less intensity in daily organizational life.

Mechanisms as units of analysis

The sociology of contention contains a research agenda centered on the notions of episodes, mechanisms and processes. This approach asserts that understanding episodes requires a look at smaller units: mechanisms and processes. Mechanisms are: “1) independently verifiable and independently give rise to theoretical reasoning, 2) they give knowledge about a analysis at a “lower level” of another theory, 3) they increase the suppleness, precision, complexity, elegance, or piece of scientific reasoning which is an independently verifiable component process [...] 4) while respecting the social reality” (Stinchcombe, 1991).

Ontologically, this entity produces and orders social reality (Tsoukas, 1994). More concretely, *episodes* are discrete collective claims making action. Crucial portions of these episodes are mechanisms and processes. *Mechanisms* refers to types of recurrent sets of *events* “that alter relations in similar ways” (McAdam et al., 2001:24). *Processes* are linked *mechanisms* acting together with certain regularity. To borrow a musical analogy, events are like notes drawn on a piece of paper. Mechanisms are like motifs or phrases: a grouping of notes/events repeated with some resemblance and regularity. Processes are like movements and episodes are like symphonies.

Fig. 1 Episodes, mechanisms and events in the explanation of processes

Epistemologically, this perspective acknowledges the contingency of the social world and promotes an interrogative attitude toward what we can know. Knowing mechanism does not signify predictive capability. Mechanisms are not laws and do not make the same universal claim to validity. Unveiling a new mechanism is like “add[ing] a new item to our repertoire of ways in which things happen” (Elster, 1989: 10). Predictability in social matters is constrained by cognitive capability and the contingent aspect of social affairs. To pursue the musical metaphor, from just a few notes or a few phrases, one cannot extrapolate a whole symphony. Yet, this does not mean that we can have no knowledge of the world; a motif is music just as uncovering a mechanism is a theoretical contribution.

Collection of data

The choice of terrain was motivated by some prior knowledge of the organization, the accessibility of the data and the intense conflict that occurred. The main steps of the research process were as follows. The first step was to gather the archival data from the SU and the publicly available data from the MU administration. I then proceeded to 6 one-hour interviews to provide more detailed information on the episode. The informants were key players in the episode, had intimate knowledge of the events and were willing to share behind

the scenes information not available in documents and public records. I focused on a large question and then on probes (Patton, 2002). The knowledge of the unfolding of events from the documents was used to probe and orient the interview with the informants and help the recollection of events. I also took the opportunity to test my understanding of the events. The interviews lasted around one hour and were recorded, then transcribed. Early in the planning of this study, it appeared important to provide a balanced view of the episode. To do so, I assured the participation of individuals from the MU and from the SU. The same balanced view has served as a guide while collecting data. This, in our view, mitigates the possibility of a special bias in the rendering of the episode.

Collected data

More precisely, the data from the SU include minutes from meetings, strategic plans, budgets, student newspaper articles, etc. I was granted privileged access to the archive of the SU and the help of an archivist. The minutes from meetings comprised very rich details of events since they included detailed accounts of every meeting for every elected official of the SU and its purpose. Indeed, student representatives provided a detailed report of their actions every three weeks. Also, the strategic plans (3) included calendars of actions that, when cross-referenced with discussions and other data such as budgets, provided a reliable catalogue of events. Internal documents from the MU administration were more difficult to obtain, but information was available through organizational newspapers, websites, official minutes from meetings, official registries and reports. For a detailed list of collected documents, refer to the table 2. This list of documents only includes the relevant data subsequently analyzed. The relevant document data collected comprised more than 200 pages and required exploring more than 1000 pages from archived documents and numerous web pages. This study is complemented by six one-hour semi-structured interviews. The interviews included main actors who negotiated the agreements and their political advisors from both sides of the conflict. Everyone was closely associated with strategizing activity and present for critical decisions (see appendix 2).

As any qualitative study, one would hope for more data and richer details. Yet, this research provides authentic and valuable insight on a difficultly accessible, under-researched phenomenon. First, informants' willingness to participate should be underlined. As key players in the conflict, they share detailed information. This level of access and of franchise was only possible because of prior relations of trust with the informants. While the number of interviews might appear limited, it should be noted that the very large access to

documentation and the restricted number of strategists puts this limitation into perspective. This is even more true since our focus was on events, not perceptions, and that there was strong inter-reliability among the informants even if they were from opposing parties in the contention.

Analysis of data

The analysis of data followed multiple steps. First, I produced an event catalogue for the episode from this rich data, organized chronologically (Tilly, 2008). An event catalogue is “a set of descriptions of multiple social interactions collected from a delimited set of sources according to relative uniform procedure”(Tilly 2008: 47). The identification of these events in a catalogue is the first step in identifying mechanism. More than 80 events were identified as crucial to the unfolding of the episode. From the event catalogue, I proceeded to reconstruct the episodes and identify its main actors using a narrative strategy (Langley, 1999). The catalogue of events and the narrative reconstruction of the episode were therefore used as guides to conduct the interviews, helping informants' recollection and guiding probes. The interviews were recorded, transcribed and helped provide a more detailed narrative of the episode. From a recursive and iterative analysis of the catalogue of events, I identified a subset of central events as either certification or decertification. From the 80 relevant events constituting the event catalogue, 38 were characterized as either decertification or certification. These are central events from the narrative presented in this paper. I used visual mapping (Langley, 1995) to make sense of this analysis in a process perspective.

CASE: AN EPISODE OF CONTENTION AT METROPOLITAN UNIVERSITY

The contention pitted a student union against the administration of a large research university, Metropolitan University (MU). On the part of the administration, the object of the claim was to collect additional fees to implement information technologies. On the part of the student union (SU), the claim was to withdraw the new fee imposed by the administration.

The administration's claim, championed by the vice-principal, proposed to the executive committee and endorsed by the board of governors, was strongly rejected by student representatives. During a meeting with the administration, the president of the student union warned that they would fight the fee until the administration would reconsider its decision. As SD, who was present at the meeting, recalled: “They wanted it [the conflict], they

understood what was going on. They wanted to see what we were able to do.” (SD/SU) From this meeting, which occurred in February, up until the signature of an agreement, almost a year later, an important contention opposed the two parties. This conflict's leitmotiv is a battle over the validations of different actors throughout the episode. The making and unmaking of legitimacy by mechanisms of certification and decertification by challenger (SU) and incumbent (MU) characterized the episode.

Metropolitan University's strategic actions of decertification

During the contention, the MU administration was more reactive than active. As one informant from the administration recalled, it was not very important to them, while “for the students, it was a big issue and they were right. For the university... we were talking about 10 million, on a budget of 500 million... we didn't talk about it every week. It wasn't... we didn't wake up in the morning thinking ‘the fee...’..and for no one... not even for [the vice-principal in charge of the project]. So it was like the gadfly... it was tiring” (AC). Consequently, the involvement of MU at first was not very strong and SU wanted to come to an agreement. The refusal to negotiate and to find common ground greatly affected SU: “I was always worried that MU would stop being an interlocutor or stop talking to us... because in a campaign, what's most difficult... We always had the idea to reach a common ground...so we couldn't [burn] bridges. We had to maintain an open channel of communication” (SD/SU). But at some point, this common ground appeared to be slipping away: “There was a difficult period where you had the impression [that you have] had [little] impact on the institutions, few ears at the media level... sure it was a difficult time, a lot of questioning...” (SD/SU). This affected the relations between the SU and its members, the students. The administration's refusal affected the SU's credibility.

As the issue became more important, the MU's administration decided to make an appeal to expertise and referred to a special committee to evaluate the fee. In one sense, it was answering one claim by the SU to justify to the MU community the imposition of the fee. The SU had argued that economies could be made by rationalization of the inefficient direction of technology. The administration hired outside experts to evaluate the efficiency of the direction in question. Once again, appealing to experts denied the SU the status of an actor with the same legitimacy. The SU was aware of this tactic. Collegial meetings were the occasion for the administration to exclude the SU from participating as relevant stakeholders, affecting the relations between the SU and the community. But the relations between the SU and the community, including students, were also affected by opinion pieces published by

members of the administration. In response to the claims of the SU for the abolition of the fee, articles were featured in MU newspapers with titles such as “The fees are absolutely necessary” (in the organizational newspaper), authored by a vice-principal. There, it was argued rationally to the community that there was a need to update pedagogical material for the 21st century: “Thirty years ago, when I was a student we learned using books. Today, the modes of transmissions of knowledge changed and we are in the multimedia era,” said one vice-principal.

Finally, twice during the episode, the MU administration threatened to sue the SU, potentially affecting the relations between the SU and its members, the community and the society at large. Both times, the threats occurred in reaction to strategic actions perpetrated by the SU. One in particular put a strain on SU: “I remember a meeting with the head of security, the vice-principal to students affairs et the principal’s cabinet chief... and there were some actions committed [that were] on the verge of legality... and I felt it was important to... that in this meeting I had the opportunity to maintain an image of partner, of collaboration” (JP/SU).

Student Union’s strategic actions of decertification

Confronting a mostly silent opponent, the SU multiplied the actions against the MU administration, targeting some of its multiple relationships: to the MU community’s, to the students, to donators and to the outside community in general. Initially, the strategic actions aimed the relations between the administration and the students or the community comprised of professors and employees aimed to inform and gather support: “September was to inform our students, make sure they were on board, adopt a strategic plan, advertise outside, make the issue known... but it was also a phase to get the support from other groups with whom we shared multiple committee that we could use as lever.” (SD/MU)

Not satisfied with the community, the SU would also target the outside community and the prospective students. Every year, a recruitment team from the administration would visit colleges to promote MU to future students. Students from MU would follow the team in charge of recruitment as they travelled to colleges across the province and inform the prospective students about what MU was doing: “this irritated the rectorship....not to the point to show a sign of openness to negotiation... but we knew it disturbed them...” (SD/SU). This was also acknowledged by the administration. Public actions in general had a strong effect on the administration: “it disturbed a lot... because people were saying... “now it’s too much.. as long as is it’s between us, a demonstration or at the collegial assembly... articles in

the local newspaper, it's in the normal order of things... prospective students, that could have long terms consequences" (AC/MU).

The SU always maintained political relationships with the government. Lobbying the government was very effective in this situation. One informant from MU shared that: "When you receive a call from [the] minister's office because they met with the students and the minister wants answers, some clarifications... and the minister.... she held her ship tight!" (AC/MU). At this point, the MU administration could not really act as if nothing was happening.

Among the multitude of actions, two stood out as particularly disrupting and led to threats to sue from the MU administration: a direct action in the administrative offices and an advertisement in a national newspaper. The SU never claimed responsibility for the disruptive action, yet it was interpreted by the MU administration as coming from them. Incognito, a small group of students drove next to the IT department, opened the back-door of a white van and ran toward the IT direction with small cardboard boxes. Once the doors of the offices opened, they threw the content of the boxes inside quickly and fled the scene. The day's work was interrupted in the IT department when they realized that the masked students had thrown live mice inside the offices. The mice were used as a computer analogy in order to direct appeal to the IT department and to draw attention to the fee that the administration wished to levy. This action had unforeseen consequences. Indeed, the use of animals in research-intensive organizations is strictly regulated. Such use of animals on MU's property provoked reaction from a granting agency, which requires strict norms to be upheld when experimenting on animals.

The agency threatened to withdraw their permission to use live animals for experimenting at MU. This led to a meeting between the MU administration and the SU where the prospect of legal action was put on the table. The SU's representative, while denying any involvement, guaranteed not to repeat any similar action. Knowledge of this action made its way to members of the SU. A heated debate between the SU and its members led to the adoption of a proposition to never use or condone actions involving live animals.

At the end of the campaign, the SU published an advertisement in a national newspaper that denounced the fee. One of the particularities of the advertisement was that it borrowed aspects of the MU administration's public relations campaign. The colours were the same, the disposition and graphics were almost identical and the motto followed the same patterns as the MU administration's campaign. If the two-page advertisement was read quickly, one

could have mistaken it for the MU administration's own ad. The threat to sue was grounded in intellectual property provisions. "The publicity in the newspaper, we were shocked because they took, if I remember correctly, I don't know how they did it, but they took MU's logo and they distorted it... this is legally protected...it was during recruitment period and we were particularly [sensitive] to... how to say... the publicity, that hurt" (JF/MU). The advertisement put forward the claim that going to MU would cost more than anywhere else.

The reaction to both these actions was strong. One informant from the MU administration said: "we started to take care of it when students really raised their voice and took actions. [...] This is when people started to talk about it and say "we can't let this get ugly like this... we have to take action. We have to take care of it" (AC/MU). "[Before] we had no time to lose [with SU]. But then that... the symbolic action on campus.... The animals... the animals, that's what we found the most difficult" (JF/MU). This was enough to bring them back to the negotiation table.

Certification

Everybody knew that it could not continue this way and that it had to end. SD recalled saying to the administration: "We must find a way out...You must find a way out and I know that you have one. You have pressure from the board of governors...Lets find a solution that reassures everyone" (SD/SU). This echoed the administration's worries. But until the very end, nothing was certain: "He [AC] candidly told me: 'We are wondering if we didn't already pay the political price for the fee'" (JP/SU). Maybe that late in the conflict, no deal was better than a deal.

The objective was to come up with a negotiated agreement that both parties agreed upon, that would be proposed to the SU members and voted on and approved by the MU's executive committee and board of governors. JF and AC were present at the table for the administration and JP and SD for the SU. The agreement in itself was to be a mid-way compromise or, as actors within the contention from both sides called it: an "honourable agreement" (JP/SU, SD/SU, JF/MU). It answered both the worries of the SU regarding the mandatory fee and those of the administration looking for a way to finance technological improvements. Moreover, it was conceived as a way to establish a framework for dealing with future issues regarding fees. The principal aspect of the deal was that the fee would be voluntary rather than mandatory, it would be slightly less than initially proposed, and there would be a collaboration between the administration and the union and a promise of closer collaboration between the administration and the SU

After a few sessions of negotiation, the SU agreed to present and to recommend the negotiated agreement to their members. Following the SU's approval, the administration would present it to the board. For the SU, this meant discussing the agreement in their executive council, comprised of nine student representatives. As informants from the SU shared, they were mainly happy to have a negotiated agreement to present to their members. They had been looking for an exit strategy for some time now. This was one, and, in their opinion, a good one.

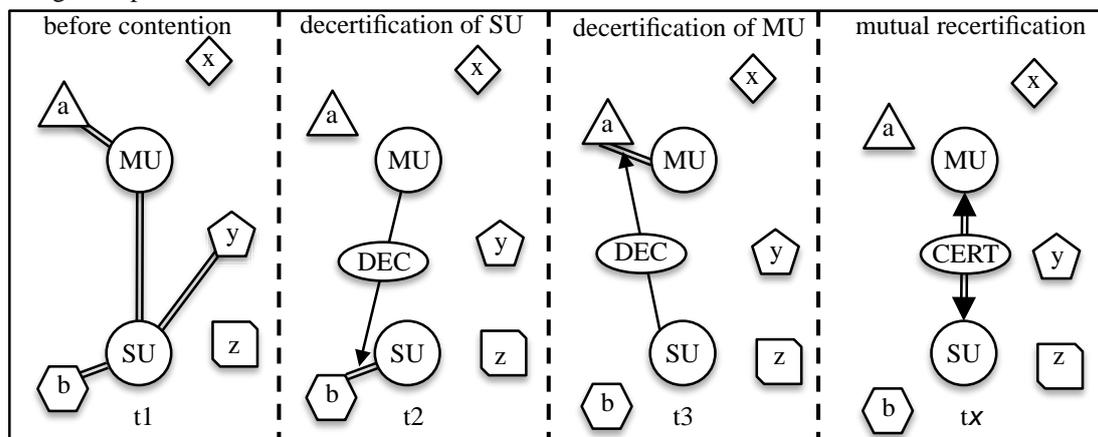

The next step for the SU was to present the negotiated agreement to the members in the assembly. The members were representative of more than 80 student associations present on campus. This also went well. There were a few discussions, but the students finally ratified it. In the end, "People were just happy to have an exit strategy... everybody was happy... we knew that it was vital for the organization... otherwise it was hard seeing any future with the rectorship" (SD/SU). Among elements in favour of the ratification, the opportunity to opt out of the fee for individual students and the presence of a 50/50 student administration committee to manage was looked upon favourably. For the administration, "the idea of the committee [...] instituted a legitimization process by which students put their hand on the wheel, politically that's what I was interested in. We had a place where we could talk about things and put forward [ideas] and convince the students of the necessity of these fees" (JF/MU). A similar process occurred on the side of the administration: the negotiated agreement was presented to the executive council, adopted and presented to the board of governors. This went quickly and without trouble. The administration expected a low number of students to opt out in the end as the agreement prevented the SU from promoting opting out. Therefore, MU would be able to finance its technological projects.

The signature of the agreement signalled the end of the conflict. It reinstated both parties as legitimate interlocutors. By accepting the bargained agreement, the board of governors provided legitimacy to the relations between the administration and the student union, reinstating the administration as a legitimate actor. The same is true on the other side of the contention. The adoption by students of the agreement certified the relations between the SU and the administration, reinstating the SU as a legitimate actor. As such, it was a form of certification. Looking back on this episode, one informant recalled: "All in all, it was a good campaign... just as there were others and just as there will be others and there will be some in the future and there was some before" (AC/MU).

Analytical presentation of events

This description of the contentious episode is the product of a narrative strategy (Langley, 1999). It was necessary to help us provide meaning to a large number of actions, but the bulk of the data was in the form of documents and the research strategy mobilized a catalogue of events (Tilly, 2002, 2008) to provide a process and practice-oriented, -situated and -inhabited perspective. Using catalogues of events is a form of synthetic strategy taking the form of a table, making explicit “who” has done “what” affecting “which relation” (see appendix 3 and 4). From the rich account of the episode provided by the narrative strategy and the detailed account of the synthetic strategy, we constructed a visual mapping of the episode (Fig 2).

Fig.2: Representation of decertification and certification in contention

The representation identifies three specific moments: before the contention, during the contention and after the contention. The first one is characterized by taken-for-granted relations between actors. The contention, the second moment, includes decertification efforts from the SU and the MU administration and problematizes relations between actors through actions of decertification. The administration took for granted its relations with prospective students, financing bodies and the society at large, yet these were hindered, respectively by following the MU recruitment team in colleges, the action involving mice and the publication of advertisement in journals. Finally, the conclusion of the episode is symbolized by the signature of an agreement between the MU administration and the SU and by the presentation of the agreement to the members of the SU and to the board of governors of the university.

DISCUSSION

Two issues appear particularly relevant in this case study. The first one relates to the central position of mechanisms of (de)certification in contentious episode. Second, the unfolding of

this event shows how legitimacy is gained from internal and external sources and how this can be explained through the notion of legitimacy equilibrium.

Centrality of (de)certification

Mechanisms of certification and decertification are central to understanding the conflict opposing the SU and the MU administration. These mechanisms enabled the interpretation of 38 out of the 80 events constituting the conflict. But more than a numerical importance, the mechanism of (de)certification points toward important moments when legitimacy was at play and to specific events characterizing the making and the unmaking of legitimacy, when actors aimed at relations providing legitimacy to the other party. It was the case when the SU disrupted public events or organized symbolic actions on campus. It was also the case when both parties looked for an *honourable agreement*, meaning one that had value beyond the simply ending the conflict. This agreement had to provide legitimacy to both parties. Analytically, these mechanisms uncovered a link between a set of strategic actions undertaken by the parties in the conflict and legitimacy. The links between what people do in organizations and the making and unmaking of legitimacy opens the organizational black box and is the virtue of an inhabited perspective on legitimacy. Not only does our focus on mechanism of certification and decertification illustrate episodes of intense conflict, but in organizations experiencing less intense forms of conflict such as resistance, tension or disagreements, mechanisms of (de)certification might provide some analytical clarity. Indeed, even in more benign forms of conflict, legitimacy is at stake because (de)certification is likely to be a central mechanism.

Are certification and decertification the only mechanisms in the making and unmaking of legitimacy in contention? If that would be so, their identification would not be as valuable a contribution; contention would simply be another label for decertification. We believe different types of mechanisms are available in contentious episodes. While this research only focused on the most prominent, we can imagine other mechanisms such as "making pay the price", where the actions are directed toward an economic goal. In such cases, tactics such as work-to-rule, boycott or even vandalism could become the base of action and their aim would be not to decertify but to affect the organizational bottom-line. We can also think of a mechanism such as "making an example" at play in conflict where one promotes his points of view by acting as he wishes the other party would act. Respecting a strict ethical rule in decision-making or helping particular charities could be an example of such a mechanism. The number of such mechanisms is not finite as they most likely vary between groups and in

time. What is central here is how (de)certification is a key mechanism in the making and unmaking of legitimacy in contention.

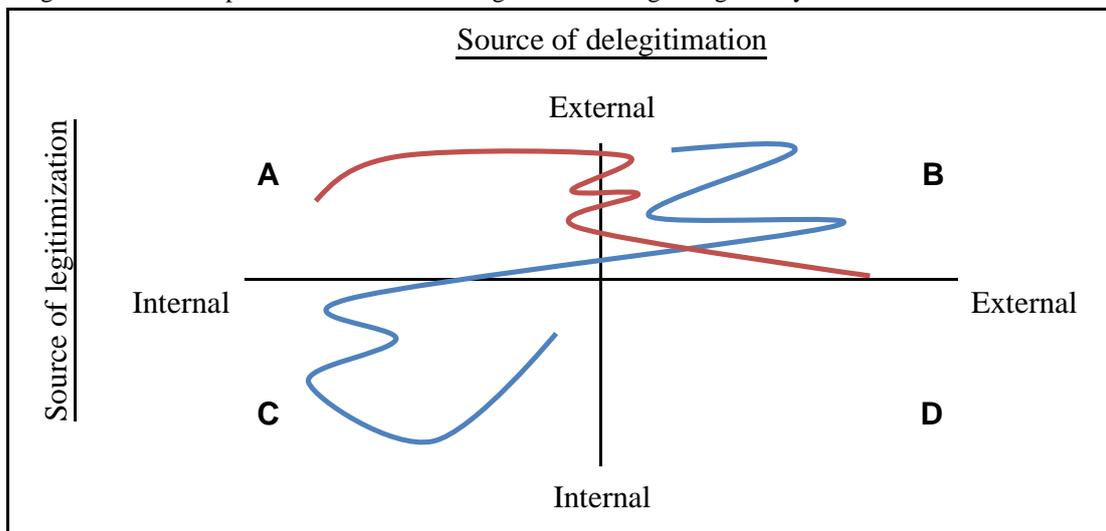

From external to internal legitimacy

Legitimacy is not something like capital or material resources, it is the product of relations (Deephouse & Suchman, 2008, p. 54). Mechanisms of (de)certification targeting relations are central features to understanding how legitimacy is lost and gained during contentious episodes. In the contention, the MU administration and the SU targeted relations providing legitimacy to the other party. The student union, for example, enjoyed legitimacy from the wider social system by conforming to laws and from the wider academic community by convincing them of the value of their cause. Both relations were the subject of attacks during the episode, first by threatening the SU with litigation for actions committed by the students and second by the vice-principal addressing the issue in the organizational newspaper explaining the new fee in the hope of convincing the community that it was a good idea. Yet, these two events of decertification can be differentiated by the source of their threat to legitimacy. In the first case, the legitimacy is external and in the second case it is internal. External legitimacy is enjoyed when “organizations hav[e their] actions endorsed by powerful external collective actors (Stinchcombe, 1968) and develop [...] strong relationships with external constituencies” (Singh et al., 1986, p. 174). Internal legitimacy stems from the fact that some organizations (some might say all organizations) are not unitary. Some organizations at least might be considered plural in the sense that they are composed of different groups with sometimes divergent goals (Denis, Langley, & Rouleau, 2007; Hardy, 1991, 1996). By the fact of their pluralism, relations between the different actors inside the organization are possible. It is therefore possible to think of an internal constituency providing internal legitimacy, and not only of the coordination process (Singh et al., 1986) or the technical core (Meyer & Rowan, 1977) traditional to the institutional literature. In sum, this research takes Deephouse & Suchman’s affirmation that “[s]ources of legitimacy’ are the internal and external audiences who observe organizations and make legitimacy assessments (Ruef & Scott, 1998: 880)” very seriously (2008, p. 55).

These distinctions between internal and external sources of legitimacy make it possible to adopt a process perspective and to observe the variation of the source of legitimacy during the episode of contention. So far we have posed two variants, internal and external, and two mechanisms linked to legitimation processes, certification and decertification. In this case, it is possible to observe two movements. The first one is the passage from an external source of

threat to an internal one, in the development of the contentious episode. It is also possible to observe a change from an external to an internal source of legitimacy. This translates very approximately in blue for the MU administration and red for the SU into figure 3: a movement starting in the B quadrant and finishing in the C quadrant for MU and a movement starting in the A quadrant and moving to the B quadrant.

Fig.3: Processual representation of the making and unmaking of legitimacy

A process perspective on the event illustrates how the incumbent relied initially on external legitimacy and, following the threat, how it converted it into internal legitimacy. Indeed, decertification was used at the outset of the conflict by the SU and the MU administration, getting more and more intense, while certification was used to end the conflict. Decertification affected the legitimacy enjoyed by both organizations and certification, which took the form of the signature of a negotiated agreement between the parties, provided legitimacy. This translates into a very actionable recommendation for incumbent organizations experiencing conflict or tension. The tension will affect the external relations providing legitimacy to the organization. To regain legitimacy, incumbents need to turn towards their constituency and focus on the relations between the different groups in the plural organization.

This leads us to a working hypothesis regarding the relationship between legitimacy and organizations. By the transfer from external legitimacy to internal legitimacy by the incumbent resulting from a contentious episode, it is *as if* internal legitimacy came to replace external legitimacy lost during the episode of contention. It is, I hypothesize, *as if* the incumbent required a certain amount of legitimacy to function properly and in the event that it loses legitimacy, the incumbent needs to find the equilibrium of legitimacy. In the case of a

pluralist organization, since internal actors can also be a source of legitimacy, it is possible to turn inward to these relations instead of trying to repair affected outside relations.

CONCLUSION

Is this legitimacy we are speaking of or some proximate concept? In a recent assessment on legitimacy in organizational institutionalism, the authors assert “that legitimacy is fundamentally a property of forms or populations, rather than of self-defined groups (à la status) or individual firms (à la reputation)” (Deephouse & Suchman, 2008, p. 62). Abiding to this definition strictly, one could dismiss it as not being about legitimacy because it focuses on incumbents and challengers and their relations providing legitimacy through mechanisms of (de)certification. In between organizations and the fields lays individuals, groups and other organizations. Going into the making and unmaking of legitimacy involves taking these into account. This level of detail is an integral part of the story on how legitimacy is managed. The case explored is neither about status (it is not a question of agreement, of ranking or of membership) nor reputation (it is not a history of expectation). It is truly a question of legitimacy in an inhabited perspective (T. Hallett, 2010; Tim Hallett & Ventresca, 2006).

While this research is still preliminary, it points towards interesting research avenues, notably in the exploration of the different processes and trajectories of legitimacy as well as other mechanisms that help explain the making and the unmaking of legitimacy. More research is needed to expand our understanding of these mechanisms and confirm the working hypothesis of the transfer from external to internal legitimacy in incumbent organizations and the proposition of a *legitimacy equilibrium* for organizations.

INTEGRATION OF FASTER PLATFORM INTO EDUCATION PROCESS OF ECONOMIC INFORMATION SYSTEMS

Bucko, Jozef¹; Vejačka, Martin²

¹Associate professor, Department of Applied Mathematics and Business Informatics, Technical University of Košice, Faculty of Economics, Slovakia, jozef.bucko@tuke.sk

²Assistant professor, Department of Applied Mathematics and Business Informatics, Technical University of Košice, Faculty of Economics, Slovakia, martin.vejacka@tuke.sk

ABSTRACT

Digitalization and modern trends nowadays in the business increase requirements on the information skills and knowledge of workers. Effective use of information technology plays a key role in a successful business. In our opinion the main role of the universities is education of students in this area. Thanks to combination of theory and practical skills to work with IT in enterprising, students have better opportunity to apply themselves successfully in the labor market. The part of the process of education at the Faculty of Economics of the Technical University is the education of subject Economical Information Systems. In this subject students learn how to establish the small virtual firm and to do the business by using electronic communication, e-shop and e-banking. Weakness of the course is the absence of e-accounting. The main goal of project FASTER (Financial and Accounting Seminars Targeting European Regions) founded by EU is to develop an innovative on-line educational platform in order to facilitate the flow of existing practical knowledge produced in the daily routine of financial services of enterprises, banks & public sector. The aim of our paper is to show the possibility and the importance of integrating the FASTER platform into the educational process of the course Economic Information Systems at our faculty.

Keywords: ICT, e-Laboratory, virtual firm, accounting, e-learning, FASTER

INTRODUCTION

Digitizing everyday reality is modern current trend. The amount of information and the increasing demands of their fast processing lay greater demands on the introduction of advanced information and communication technologies (ICTs) and their effective utilization.

This trend is fully reflected in particular in business where information and its quick processing delivers competitive advantage and cost savings (Bucko, Delina et al., 2005). Keeping the growing trend of ICT use increases the demand for employees, their information literacy, the ability to adapt to new processes and procedures misleading in society and practical skills to work with the new complex and demanding software and information systems (Bucko et al., 2003).

In the flood of new information and procedures for employees are forced to study the new rules and to learn new skills and knowledge. In the process of learning plays an important role the administration of new knowledge and efficiency of learning, when we remember 10% of what we read, 20% of what we hear, 30% of what we see, 50% of what we see and hear, 70% of what we discuss with others, 80% of what we experience personally and 95% or what we teach others (Dale, 1969). In the process of gaining the new knowledge is the most effective in a virtual environment, which is trying to emulate the real environment. In such a training environment it is possible to acquire skills based on own experience by trying new software, processes and activities, use of new technology and so on.

Such an environment is also e-Laboratory (or virtual laboratory) of electronic business in which we teach the subject Electronic Information Systems (EIS) at the Faculty of Economics since 2006. The main objective of this course is to prepare our faculty students for electronic business environment in the Slovak Republic. The development of e-Laboratory was supported by several national projects and the construction lasted several years (Bucko, 2005). The accounting module of the e-Laboratory has undergone many changes during development and is still in development. Its further development can be influenced FASTER project, in which our faculty participates as a researching partner.

The FASTER (Financial and Accounting Seminars Targeting European Regions) project develops an innovative on-line educational platform in order to facilitate the flow of existing practical knowledge produced in the daily routine of financial services of enterprises, banks and public sector. Interactive web-based educational applications and case studies on real accounting situations provide accumulated knowledge in forms suitable to non-formal, practical learning, serving both Erasmus and Leonardo Da Vinci strategic objectives (FASTER consortium, 2012). The courses are in 5 languages, while accounting, taxing, legislative differentiations between nations are spotted. FASTER is a two year project (2011-2013) funded by the EU. During the first year the requirement analysis was completed with the participation of 133 academics, 1030 graduates and undergraduate students, 176 people

interested in vocational training and 97 employers who replied to the FASTER interviews and online questionnaires. In total, requirement analysis gathered 1528 online replies to questionnaires and 64 replies to interviews. Participants in the requirement analysis considered as very important:

- The usefulness of an on line platform in teaching accounting and analyzing accounting information.
- The use of new technology in developing accounting skills.
- The help of new technology to streamline processes.
- The innovative idea of having an on line job seeking environment and mechanism that can match employers and job seekers in the accounting profession.

The FASTER project is in its second year. The end product of the project is the development of the web-based FASTER platform in five languages. The FASTER platform consists of Educational material, Resources (bibliographical sources and glossary) and Job seeker part (Pařová, 2012). Participation in the FASTER project is a good opportunity to push further the development of electronic laboratory, particularly it could support accounting module, which is currently in the e-Laboratory least developed.

THE EDUCATION OF ECONOMIC INFORMATION SYSTEMS

The development of learning environments e-Laboratory was based on initiatives eEurope and eEurope+ reflected in the strategic objectives of the company in the country. Mainly the aim to provide flexible and competitive labor force, respectively potential business staff able to succeed in the global economy, to enable people to benefit from that computer science and ICT brings. Especially high-quality education in this area is very important in Europe to ensure the permanent knowledge innovation of the population. The main objective of our e-Laboratory trainer was to support on-line learning of modern forms of electronic business and its management. E-Laboratory facilitates students and future potential managers of small and medium-sized businesses the understanding the economic linkage of business information system with e-commerce solutions, electronic payment systems and electronic banking.

E-Laboratory presents how to effectively integrate management information systems, e-commerce and electronic payment systems used in a market environment. The laboratory

provides students with access to databases, the possibility of work in analyzing the efficiency of business and gradually other areas of e-business, trade, investment and risk management.

The main objectives of e-Laboratory can be summarized as follows:

Practical demonstrations and presentation of the possibilities of information and communication technologies support development and deployment of information systems in small and medium-sized businesses.

Simulate real conditions of business life cycle in a competitive environment.

Present the benefits of e-commerce and its ties to traditional commerce.

Demonstrate the benefits of the use of electronic payments and e-commerce links and electronic banking with economic information system of the company.

Through learning simulation allow management, monitoring and evaluation of own firms in the market environment.

Explain the benefits of a joint database and electronic data interchange.

Improve the ability of managers of small and medium-sized companies to formulate the requirements for an information system to understand, monitor and effectively change the business and work processes, evaluate the effectiveness of changes.

Emphasize and explain the basic assumptions of the safety of electronic forms of doing business with a particular focus on electronic signature and corresponding legislation.

The e-Laboratory is used in education process of subject of the Economic Information Systems (EIS). This subject is an optional course for undergraduates in third year of their studies at our university. It is intended for students in fields of Business Informatics and Finance, Banking and Investment.

The main asset of the EIS in educational process at faculty is the practical experience with doing business gained by students during course completion. The course consists from founding and managing of a small trade company. Students must pass through all stages of setting up of their firm and the first year of its existence. The course lectures tend to have consultation character with aim to clarify some details of necessary processes. All basic information is provided via LMS Moodle and students do not need to be present at school in the time of the courses. All tasks can be done through the Internet distantly, but still students welcome direct cooperation with the teachers. Lecturers specializing in given areas provide lectures about the completion of the tasks.

The education process of the course Economic Information Systems is supported and realized by using the multiple information systems. The most of information systems necessary for education in EIS (excluding only LMS Moodle) are components of e-Laboratory of electronic business (see following Σφάλμα! Το αρχείο προέλευσης της αναφοράς δεν ρέθηκε.).

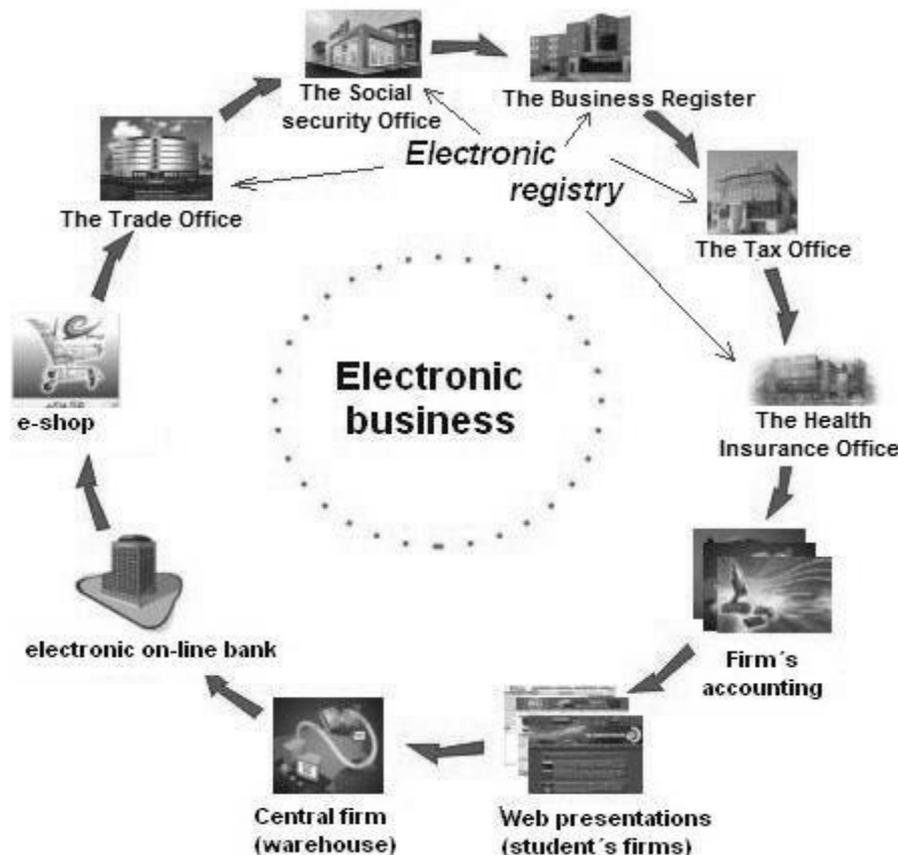

Figure 6: Scheme of e-Laboratory of electronic business

The e-Laboratory is comprising from following systems:

- Online banking system - donated to the Faculty of Economics for the educational purposes by firm UNICOM. Solution of virtual bank was originally developed for use in praxis in real bank, so it provides full functionality, even with support of digital signature for purposes of authentication.
- Accounting system – various accounting software solutions were used during recent years (own web accounting solution, Stormware Pohoda), but currently is used only MS Excel as medium for recording of bookkeeping information. Main reasons for

frequent changes of accounting software are expensive licenses, objectionable functionality of educational versions and problems with usage by students from home.

- Electronic registry – represents virtual public administration offices and supports electronic communication with them.
- Certification authority – used for management of certificates of digital signatures used in electronic communication with virtual public administration offices.
- Electronic shop system – own system for setting up and management e-shops for providing possibility of trade between virtual firms (students' and central wholesale firm managed by lecturers).

The Learning Management System (LMS) Moodle contains all information and materials necessary for course completion, but it is not part of e-Laboratory. The realization of the EIS is based on the students' knowledge from multiple already completed courses (e.g. Marketing, Management, Civil and Industrial Law, Accounting, Informatics, Taxes and Taxation Policy, Electronic Services in Banking). During the completion of EIS course students acquire practical experience in following cases:

- Establishing a virtual firm – each student of EIS course have to establish own virtual trading firm according to Slovak legislation. They must send applications to virtual public administration authorities (see e-Laboratory scheme on Figure 6) via electronic registry. Applications must be signed by their digital signatures acquired at faculty's certification authority. Lecturer in the role of public administration authority replies in form of electronic confirmation of registration in case of correct application was sent. Knowledge from subjects Civil and Industrial Law and Taxes and Taxation Policy is useful students in this part of course.
- Preparing a business plan – during establishing firm students should prepare business plan of their company with regard of future actions in their business including management and marketing strategy and trade plans. Business plan has to be uploaded by student into LMS Moodle. Students use skills gained in courses of Management and Marketing.
- Creating the company's website – students create website representing their firms and place it on the Internet (space on webserver is provided by e-Laboratory). It should contain basic information about firm, its legislative documentation and e-shop. Students in this case need knowledge from Marketing and Informatics.

- Creating an e-shop and its continual management – students sell their goods through e-shop between themselves. E-shop is only trade channel in this course and its basic solution is provided by virtual laboratory. Students can personalize it and manage all attributes (e.g. connection to their bank accounts). Student's e-shop can be filled only by buying in central e-shop managed by lecturers. Students could use their skills gained from Informatics, Management and Marketing courses.
- Opening an account in the virtual e-bank – students by electronic application demand creation of accounts in virtual bank provided with virtual credit of 200 000 EUR. They must continually repay first several installments of credit provided during course. Virtual money serves for buying goods for further trading at e-shops and students must use Internet banking interface. Knowledge from Banking and Electronic Services in Banking courses is useful in this part.
- Trading the virtual goods – is main activity of students' firms. Trades are conducted between the students' firms and faculty firm or between students' firms only. Main aim is to create a profit at the end of accounting year thanks to right pricing of goods. Knowledge from courses of Marketing, Management and Electronic Services in Banking is useful in this part.
- Recording all events into accounting – students have to record properly all relevant operations into the accounting including end-of-year operations. MS Excel is used for these purposes currently. Students need skills gained in courses of Accounting and Taxes and Taxation Policy.
- Strategic study and evaluations of their business – students evaluate their business actions and prepare strategic study about future plans of their firms. Skills from Management and Marketing courses are necessary in this part.
- Analysis of the information system – is final task in EIS course where students choose one of the systems used, analyze it, summarize the users' requirements and provide the suggestions for the changes and improvements. Knowledge from Informatics is necessary in this part.

Final feedback is provided by students on the Economic Information Systems course after its completion to gain information for course improvements. These feedbacks together with average points acquired by students in each task are valuable for inspiration of course enhancement.

ASSESSMENT OF THE ECONOMIC INFORMATION SYSTEMS COURSE

The course of Economic Information Systems is taught in the third year of bachelor's degree field of study Finance, Banking and Investment (FBI). Teaching process is supported with above described e-Laboratory since 2006. Given course is optional to study and the number of students differs. Its study involves several arduous tasks, so students who chose this subject are among the better students in third grade of their studies. Since 2010 the subject is also taught in the study field of Business Informatics (BI) at Faculty of Electrical Engineering and Informatics, where students are more experienced in informatics, but they lack the basics of accounting.

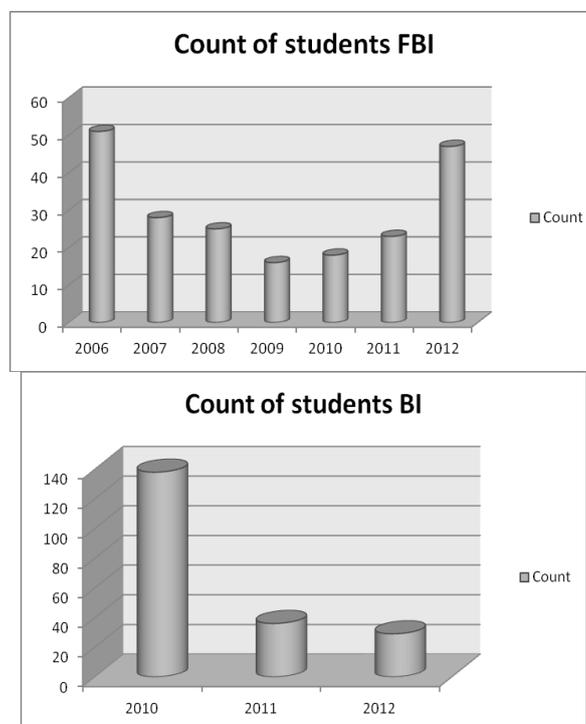

Figure 7: Counts of students in both fields of study: Finance, Banking and Investment (FBI) and Business Informatics (BI)

Together students might gain evaluation in sum of 100 points, but evaluation and range of some task differs according to their field of study (see following table).

Tasks	Finance, Banking and	Business Informatics

	Investment	
Website	10 points	10 points
E-shop	15 points	15 points
Establishing the firm according to legislation	10 points	20 points
Business plan	15 points	15 points
Accounting	25 points	20 points
Evaluation and strategic study	15 points	10 points
Analysis of the information system	10 points	10 points
Total	100 points	100 points

Tab. 1: Maximum evaluation of each task according to field of study

In the task of establishing the firm students in Business Informatics field of study have to use electronic signature for signing the necessary electronic documents. Students of Finance, Banking and Investment do not sign documents electronically. In contrast, when recording all events into accounting Finance, Banking and Investment students should demonstrate greater proficiency and also evaluation of this task has higher weight than in case of Business Informatics students.

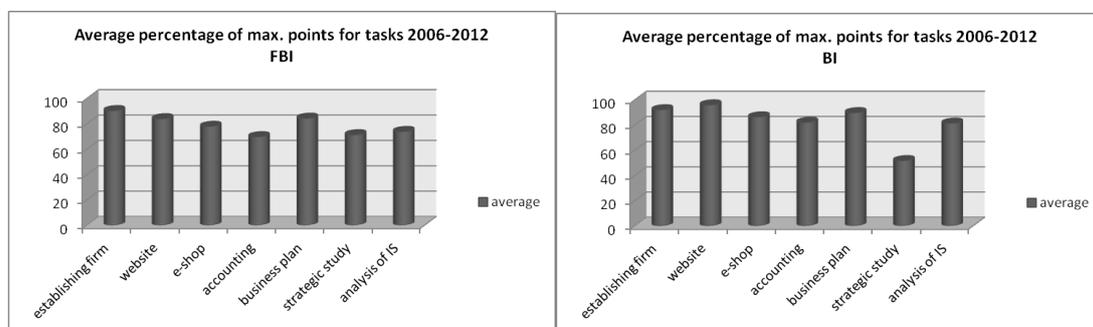

Figure 8: Average percentage of acquired points from maximum points in each task in both fields of study: Finance, Banking and Investment (FBI) and Business Informatics (BI)

During the teaching of this course in several years e-Laboratory has evolved and this fact mirrored even in evaluation of students and their points acquired.

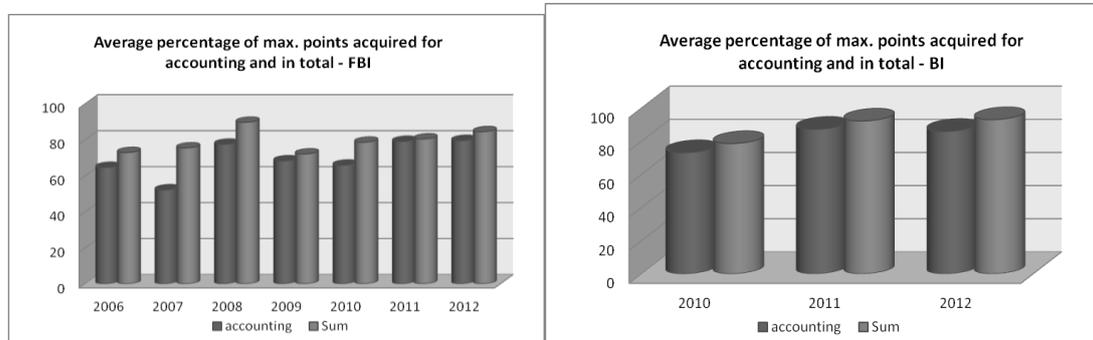

Figure 9: Average percentage of points acquired for accounting task from maximum points in both fields of study: Finance, Banking and Investment (FBI) and Business Informatics (BI)

The above charts show, that in 2007 students were less successful in the accounting task because there was implemented a new and imperfect accounting module in e-Laboratory, which allowed simple bookkeeping of small firm by web application created by lecturers team. In 2008, the total points total acquired increased, while the use of web accounting application was abandoned and bookkeeping was realized only through MS Excel. The decrease in acquired points occurred again in 2010, when the students had to process the virtual business accounting with software "Pohoda" from local software developer STORMWARE. The move proved to be problematic, so next year we reduced complexity of this task since the year 2011 and virtual accounting is again realized through MS Excel.

All evaluations show that points acquired for accounting tasks was lower than average of all tasks. The reason is the lower level of knowledge and preparedness of students to keep in a particular practice area of virtual company. Despite the fact that the students completed the accounting course before EIS course, their knowledge is more theoretical and cannot be practically applied to their tasks in a specific software (Mihók et al., 2000), as it is necessary in virtual company in course of EIS.

This result can be partially attributed to the number of tasks that students must accomplish during the course and the fact that the course is more focused on a demonstration of modern

electronic systems such as e-banking and electronic payment systems, e-commerce, as well as the use of electronic communication and electronic signature.

Ensuring the achievement of better results in the field of accounting is possible integration of the on-line platform of FASTER project, which is devoted to accounting and its objective is to educate users in the field. The FASTER platform is designed directly to support education in accounting and provides practical examples and self-testing in the field of accounting to help students better prepare to manage the accounting of a real small firm.

CONCLUSION

Digitalization process has penetrated all sectors of human activity. Implementation of a full transition to electronic communication, accounting in electronic form, e-commerce and other routine business processes is not possible without adequate knowledge of the users. A range of innovative and successful practices was not introduced into practice just because of their refusal by users (Révészová, 2012). The solution to these problems is to introduce a virtual learning environment, similar to e-Laboratory described in the article that allows students to apply their learned theory in practical training activities. The results of the evaluation of the course and points acquired by students for tasks in course of Economic Information Systems during the years 2006 to 2012 show need of improvement in the field of accounting. It will be implemented in the future integration of online FASTER platform. We expect that the students' results in accounting task will improve in the following academic years and also increase students' success in labor market and entrepreneurship.

ACKNOWLEDGEMENT

This work has been kindly funded by the European Commission through the LLP Project FASTER: Financial and Accounting Seminars Targeting European Regions (No. 518894-LLP-1-2011-1-GR-KA3-KA3MP). We also wish to acknowledge our gratitude and appreciation to all the FASTER project partners for their contribution during the development of research presented in this paper.

THE EMERGENCE OF HRM TOOLS IN R&D PROJECTS AT COMPETITIVENESS CLUSTERS: ANALYSIS AND INSIGHTS IN THE LIGHT OF ACTOR-NETWORK THEORY

Calamel, L.¹; Sanseau P. Y.²

¹Grenoble Ecole de Management, Ludivine.calamel@grenoble-em.com

²Grenoble Ecole de Management

ABSTRACT

French competitiveness clusters have existed officially for about seven years. In these competitiveness clusters, employees from different organizations work together, often through collaborative R&D projects. This new system raises questions for HRM at several levels, including what types of HRM tools are introduced and used. In joint projects in particular, several questions arise: What tools are being developed and what purposes they are used for, who is driving their introduction and how is this being done?

The research presented here was conducted longitudinally over three years on two collaborative projects running at a global competitiveness cluster located in France. Our paper presents an analysis of these collaborative projects in the light of Actor-Network Theory (ANT) (Callon, 1986a; Latour, 2005, 2006). The aim is threefold: to provide analytical insights on the interactions between actors and "translation" operations, identify HRM tools used in collaborative projects and finally point out the contributions of the analytical framework used.

Keywords: HRM tools, competitiveness clusters, actor-network theory

INTRODUCTION

French competitiveness clusters have now been in existence for a little over seven years (Chabault, 2010). They are similar to traditional cluster-type networks, the difference being that the Central Government has a hand in developing them (Defélix et al, 2006), while traditional clusters are formed by local actors. Competitiveness clusters bring together various actors outside their own organizational structure (Culié, 2009; Pichault, 2002). The originality of this new form of organized regional network is to bring together all actors present locally, in a purposeful system supported by the Central Government, along an

industrial value chain to ensure competitiveness through innovation (Bories-Azeau et al., 2011; Mendez and Mercier, 2006). In reality, a competitiveness cluster combines within a single geographic area, businesses, research centres, training organizations and government agencies "engaged in a partnership designed to create synergies around innovative projects conducted jointly, targeting one or more given markets".¹¹ In competitiveness clusters, employees from different organizations work together on joint R&D projects. These employees all have very different statuses, pay scales, work schedules, tasks and cultures (Calamel et al, 2012). Joint R&D projects have a paradoxical form of management: on the one hand, they are the obvious and natural mode of operation in this type of strategic partnership, but on the other, the actors who are involved often find along the way that the working context is highly specific, and the traditional levers and incentives do not really serve. Whatever the type of partnerships, they require very specific managerial techniques (Segrestin, 2004).

Twelve of the 71 competitiveness clusters accredited by the French Government are in the Rhône-Alpes region, one of the most dynamic economic areas in France. Micronano, one of them, currently has more than 200 members from industry, research and higher education and local and regional governments, focusing on micro-nanotechnologies and embedded software intelligence.

It seems difficult and rather ambitious to conduct concerted human resource management (HRM) actions within competitiveness clusters. How can HRM tools structurally located in the context of a single employment relationship be adapted to share configurations between multiple partners? How can joint HRM tools be developed for a collaborative R&D project?

This paper attempts to answer these questions based on a longitudinal study conducted between late 2008 and early 2012 in the Rhône-Alpes region, on two collaborative projects at the Micronano competitiveness cluster. This research aimed primarily to identify and capitalize on HRM tools present within the R&D projects.

After presenting how the human dimension is addressed within competitiveness clusters (1), we discuss the contribution of Actor-Network Theory, (2) we briefly present the methodology used (3), and then we use the Actor-Network Theory framework to analyse two collaborative R&D projects in which shared HRM tools have been used. (4) In conclusion, we point out the contributions of the analytical framework used for HRM.

1. COMPETITIVENESS CLUSTERS AND HRM: AN ESSENTIAL ALLIANCE

Competitiveness clusters present a clear managerial challenge (1.1). However, the specific nature of the human resource problems is difficult to identify in collaborative R&D projects (1.2).

1.1. Competitiveness clusters: a clear managerial challenge

The purpose of competitiveness clusters is to promote the emergence of collaborative R&D projects among the members (industry, universities, etc.). Each member must be positioned on one or more collaborative projects, contributing its technological expertise. The cluster leadership must provide administrative support to these inter-organizational project teams, by creating management systems.

The first studies available on competitiveness clusters examine different dimensions, including their organizational structures, governance and conditions of formation (Gomez, 2009; Chabault, 2010); their territorial roots (Fen-Chong, 2006; Barabel et al., 2009; Gosse et al, 2010); and the reality of their innovation potential (Mendez and Mercier, 2006; Fallon et al, 2009). Other researchers explore their economic efficiency (Duranton et al., 2008), as well as their impact on innovation and employment (Pichault, 2002; BCG & CM International, 2008, Calamel et al, 2013).

From a more managerial perspective, Mendez and Bardet (2009) raise the question of the role of governance practices in the development of cooperation capacities, saying it involves combining differentiation and integration (Holmqvist, 2003). Gomez (2009) indicates the theoretical reasons that make this type of governance difficult, pointing out two major problems: 1) the difficulty of establishing property rights on the joint output of a competitiveness cluster; 2) the objectives of the stakeholders that cannot be achieved by pursuing joint profits. These challenges demonstrate the value, pointed out by Ferrary (2009), of inter-organizational coordination as a factor for success (Bouty et al. 2012). Managing collaboration in clusters is also a topic studied by various researchers (Calamel et al, 2012; Wannemacher et al, 2012) who observed the first HRM systems or tools seeking to make partnerships between different organizations coexist peacefully and to facilitate the joint work of people not covered by the same employment relationship. They try to shed light on organizational learning issues in hybrid, cluster-type organizations, especially within collaborative R&D projects involving multiple actors.

1.2. HRM within clusters: challenging questions

By their very nature, competitiveness clusters pose a series of questions on how to engage the employees as stakeholders in collaborative projects. *"Human resources management in a cluster is not simple: the people involved have widely differing statuses and cultures (researchers, entrepreneurs, employees), and most of the people associated with the cluster are not managed or paid by the cluster"* (CM International et al., 2008, p. 105). The employees belong to completely different organizations, ranging from start-ups, to SMEs, large corporations, public laboratories, universities and government agencies. They are engaged in projects for periods varying from a few months to several years. Their contribution may be full-time or part-time, while continuing to work on other programs within their 'home' organization. They may work physically in their home organizations, be moved into a unit of one of the project partners or brought together into a single technology platform. Beyond these objective differences, the actors' perceptions of their career prospects within clusters are also very different (Culié, 2009). How is it possible to motivate people with such different positions, when they continue to be paid under the compensation system of their home organization? Could inter-organizational group bonuses be one solution?

The question raises the possibility of human resources management tools shared across several organizations, which, though they work together, nonetheless have their own specific interests and strategies. In this perspective, Tixier (2009) examines the skills management methods developed within competitiveness clusters, and raises this question: what are the challenges and risks of their institutionalization? Some collaborative projects have considered but not yet implemented it. Similarly, the professional evaluation procedures remain those of the home organizations, although in this case, the opinion of the employee's project manager may also be sought. And what about the value systems specific to each organization, which the project members convey? Private sector employees and civil servants from different organizations working together do not have the same work schedule, or the same paid holidays, or the same pay for the same job. This non-exhaustive list of differences shows the magnitude of the HRM challenges to be addressed in competitiveness clusters and joint R&D projects. The specific nature of the HRM problems in competitiveness clusters and collaborative R&D projects is difficult to identify.

2. ANALYTICAL FRAMEWORK: ACTOR-NETWORK THEORY

Actor-network theory offers a fresh positioning, initiated in the field of social sciences. Callon and Latour were the first to delve into how science is produced and specifically the construction of scientific facts in the laboratory (Latour and Woolgar 1979, Latour, 1987). The premise was to analyse science in action or "science in the making" rather than science already done. In "science done" the facts are considered as black boxes that are not open. The fact is clear to all and is a foundation that one can build on without risk. In contrast, in "science in the making", the emphasis is placed on the construction of the essential facts leading to the emergence of a new theory or concept. One considers through the "fact" that which is constructed in the laboratory in the interactions and exchanges between human and non-human actors.

In this posture of "science in the making," relationships are placed at the heart of the construction process of scientific knowledge. This process is not seen as a purely technical, cognitive process, but as a process of *interessement* in which the actors are encouraged to interact with others in an attempt to convince them of their vision and their definition of the situation. The individual or collective actors position themselves as spokespeople; they "translate" their intentions and try to enrol new actors. Relations between actors are built through successive translations operations. Innovations can be seen as the result of translation operations (Callon, 1981.1986, Latour, 1987).

Actor-network theory is widely used in the fields of social sciences (Latour, 1987; Callon, 1986 a, b), anthropology (Strathern, 2004), organizational theory (Gheradi & Nicolini, 2005, Fox 2005), information systems (Cho et al., 2008; Mitev, 2009), and management sciences (Lowe and Koh, 2007; Alcouffe et al., 2008; Dreveton and Rocher, 2010; Weppe, 2011).

Actor-network theory or sociology of translation aims to analyse the phenomenon of change, how change is managed and any inherent difficulties (Delvaux et al., 2011). However, according to (Latour, 1988) it is important to be present during the construction of a management tool in order to experience its changes through the interactions between actors and tools, or as appropriate, to understand, through their reconstruction, the mechanisms and issues that led to this construction. This translation process can be performed in four main steps: *problematization*, *interessement*, *enrolment*, *mobilisation of allies* (Callon, 1986 a, b; Latour, 1987, 2005).

3. RESEARCH METHODOLOGY: ETHNOGRAPHIC IMMERSION IN TWO R&D PROJECTS AT A COMPETITIVENESS CLUSTER

Our present research is part of a research project conducted by a team of researchers funded by the Rhône-Alpes region. This project aimed to identify emerging HRM tools in the twelve competitiveness clusters in the region, and within two collaborative projects at the Micronano cluster.

As support for this research, we conducted an extensive study on two specific collaborative projects carried out at Micronano. Three series of interviews were conducted between 2008 and 2012. The purpose of these interviews was learn more about the emerging and existing HRM tools in the clusters, or lack thereof, and to study changes in how the human dimension was addressed in two R&D projects.

These two projects were officially launched in 2007, with a planned duration of at least 4 years. The teams were formed by the leaders of each project and the HR departments at the lead organizations with the agreement of the partners.

Box 1: Brief description of the R&D projects studied

<p>Project A</p> <p>Objective: Improve energy efficiency by creating a smart electrical panel</p> <p>Duration: 48 months</p> <p>Total effort: 127 people/year</p>	<p>Project B</p> <p>Objective: Developing new generations of electronic components used for embedded software</p> <p>Duration: 60 months</p>
---	---

To study the first months of operation of these two projects, initial research was conducted in late 2008 and early 2009 through semi-structured interviews, fourteen on Project A and six on Project B. These twenty interviews focused on the launch of the projects, their evolution, and the management practices throughout their first year.

The interviews were conducted with a diverse sample of employees involved in the project, representing different partners at different levels of responsibilities, in order to get different points of view: the project manager, sub-project leaders, and simple participants. A second series of interviews was conducted in 2010 and the last one in 2011/2012. The people we met and the questions we asked were essentially the same, with some variations depending on the progress of the projects.

4. ANALYSIS IN THE LIGHT OF ACTOR-NETWORK THEORY

This section aims to analyse two collaborative R&D projects using Actor-Network Theory. Using this analytical framework, the idea was to identify, through the four main stages, namely problematisation, interessement, enrolment and mobilization of allies, the roles of the different actants and determine whether these two projects could be considered successful or not (Callon, 1986 a, b; Latour, 1987, 2005). This analysis also aims to identify the HRM tools used to facilitate or strengthen the project, if any.

4.1 Project A, or how to create meaning for a multi-partner team with widely varying interests

Joint R&D projects are the keystone of competitiveness clusters. Through these joint projects, french organizations are expected to innovate and be more competitive on the global market. The first project discussed here is called Project A. The main objective of this project, carried out at the Micronano competitiveness cluster, was to improve energy efficiency by developing and creating a smart electrical panel.

1. Problematisation, or how to understand the interests of each party

Within this collaborative R&D project, various actors from completely different organizations and worlds coexist.

- The partners, who are represented by all the organizations working on the project, whether private or public. The organizations can be start-ups, very small entities, SMEs, large corporations, public research centres, university research laboratories, etc. The project partners have a common goal: make the project a success in order to benefit from it, depending on their orientation: this may be in number of products sold on the market, number of publications in recognized journals, etc.
- The project manager, who must strive to make this rather disparate microcosm coexist and must see the project through to completion, that is to say, produce the deliverables expected and defined by the funders.
- The competitiveness cluster leadership team, who accredited the collaborative project. This team plays an important role since it is the link between the project manager and the funders. It also helps to form the full team of partners for the project.
- French and European funders, who provide the funds and who check the progress of the project regularly.

- An outside consultant, present at the launch of the last sub-project, to create and strengthen the sense of belonging to a team with a common vision.
- Finally, the project itself is identified as an actor. The issue of energy efficiency is central in a context of a latent economic crisis and a shortage of fossil fuels within a few decades.

The central question that the project manager must address from the outset is the following: how to ensure that the twelve partners coexist and work together, given that they have diverse origins, different and sometimes conflicting organizational and research cultures, and with potentially different objectives with respect to their participation in the competitiveness cluster and project A in particular.

2. Interessement schemes

In the case studied, one entity, represented by the manager of the collaborative project, tries to rally the other units in order to move the project forward in the same direction. He is responsible for the project divided into six sub-projects. He has already launched the first 5 and must implement the last one. Having received some feedback about a lack of common vision from the group of researchers who observed the launch of the first 5 sub-projects, the manager is considering putting together an event (a kind of team-building day), with the help of the competitiveness cluster leadership team, as well as the HRM from the company where he is employed.

By setting up an event to launch the last sub-project, he would potentially bring together the actors involved in the project, and even beyond. The goal is to show the partners that an action is being taken to unite and make them stronger and more able to move quickly on the project. Thus, the manager of the collaborative project is positioned as a "translator" and earns the recognition of the others. The proposed interessement scheme is supposed to lead to alliance building and enrolment.

3. Defining the roles

The goal is to create a sense of cohesion in order to move the project forward quickly so that the products (smart electrical panels) can be introduced on the global markets and French innovation can be showcased. However, team cohesion is not so easy to obtain. The project manager must negotiate with the partners themselves and convince them of the value of a team-building event. He must prove to the partners the real value of participating.

It is interesting to note that it was at this time that the presence of the researchers who studied the collaborative project and reported the lack of a common vision to the project manager was taken into account. Initially, the role played by the researchers was not taken into account, especially because it was supposed to be non-existent. However, along the way, the researchers studying the project and meeting with key actors (project manager, leadership team, partners, etc.) were assigned a role. It was no longer just the role of observer, but also a role of co-constructor.

4. The mobilisation of allies, or how to create a common vision.

Interviewed just before this team building day took place, the manager responsible for this new sub-project (2010) had high hopes for the event: *"In accordance with the overall project manager, during this session, the goal is to work and define the criteria for success of the project, to get to know one another, learn how to work together and create a climate of trust, learn how to handle the arrival and departure of partners, have common goals, etc."* What really happened? Did the partners participate in the event? What do the funders who accredited and funded the global R&D project think?

It would appear that this team-building day was a success. The feedback we got during interviews with various actors was very positive. It would appear that this action helped to unite the team: *"I am very pleased to have participated in the day, I'm less afraid."* (Engineer, 2010). The consultant had the partners work on their skills and the transversality of their skills with respect to the project. They were able to discuss their ways of working and identify the skills they lacked for the project. When the partners presented their skills and knowledge of the subject, they realized that they had complementary capacities. Because the partners knew each other better at the launch of the project, they were able to express themselves and share openly about sensitive topics during the project. One partner (2010) stated that *"this day was very welcome, because we realized that even if we work together for several half-days, we don't really know each other, and this was an opportunity to get to know aspects other than professional, it's much easier to work together afterwards, we dare to tell each other things straight out"*.

In the end, it appeared that the team building day was a great success according to the actors in this project, whom we met a few days after the event, and then again a year later. An engineer (2011) explained to us: *"I'm sure we worked faster thanks to this day, because we know each other."* It enabled them to share and communicate more quickly, which saved time in the implementation of the project. They understood what was at stake and each partner became

aware of the skills of all the other partners. The actors didn't wait for several weeks before speaking to one another, because they already knew each other. Tools were created to optimize their discussions. They were able to share values and a global vision of the project and the team.

In addition, the actor who played the role of translator was the project manager. He played a key role, namely to build trust and unite the team of the last sub-project through the team-building event. The event helped infuse a spirit of shared vision among the various partners from very different backgrounds and orientations. This very positive situation enabled them to meet the deadlines imposed by the funders of the project. All the project deliverables were delivered on time.

4.2 Project B, or how to try to create meaning through the idea of a group bonus

The objective of Project B was to develop new generations of electronic components used for embedded software.

1. Problematisation

Because of equipment requirements and because the work was carried out in a cleanroom, project B had only two partners: a small micro-electronics firm and a large public research centre.

The public research centre has a very strong orientation towards research, development and further consideration of what is developed in the laboratory, whereas the SME's objective is clearly to sell an effective new product recognized by customers. According to the project manager (2008), the research centre *"has a culture of customer satisfaction but which corresponds to a 'best effort' commitment, its objective is to try to understand things. [The SME, however] has a must stronger performance commitment. I think that their understanding of the competitive environment is the same but the concepts of time and results are not."*

This project has only two partners, yet the differences between them seem to be fairly significant. The major problem of project B is the disparity in corporate cultures and HR management systems between the two organizations. The central question that arises is the following: how do we move forward and develop a project together even though our origins and activities are so different?

The challenge is to make clear from the outset the purpose of the product, regardless of the type of organization, whether business or research. One participant of this project (2011), from the public research centre, agrees, saying: *"If we had assessed the final applications of the product, that might have helped bring the people together in a stronger way. (...) The absence of a considered approach hinders collaboration"*.

And not only do the two partners have different orientations and objectives, but their corporate cultures and HR actions also are different. They do not have the same recruitment process, or the same career development and management system, or the same compensation system, or the same work organization or schedule. And yet, they know perfectly well that they must go through an 'obligatory passage point': their collaboration and cultural rapprochement is necessary for the project to succeed.

2. Interessement and roles

Each partner is aware of the magnitude of the challenge facing them. But ultimately, given the gulf separating them, few actors enter into action. The actor who is the most motivated to decompartmentalise the partners, oriented "business" vs. "research" respectively, is the Director of Human Resources of the private enterprise. He first attempted to convince his counterpart at the public research centre of the value of establishing a group bonus common to both organizations, to unite the actors and make them feel as if they belonged to a project and a common entity.

But the proposal ran into several obstacles. According to the project manager, there were cross-cultural difficulties, compounded by another more institutional problem involving forms of payment (2009): *"There is a problem when [the company] gives out project bonuses to its employees. They exist [at the research centre] but it is very rare: one or two every ten years!"* During the project, and in the course of our interviews, the project partners spoke bitterly about the differences in working hours and paid holidays for some, compensation and working conditions for others. The HRD of the company realized this, and tried to initiate a movement to bring the partners' systems more into line. He ran up against too much bureaucracy and complicated paperwork at the public research centre. His counterpart had no discretionary powers and had to comply with the culture of the organization.

3. Enrolment and mobilisation of allies

Enrolment was not able to work. The main lever designed and proposed for the enrolment of the actors, namely the creation of a group bonus to motivate and reward the project partners,

was unsuccessful. Still, the project was a resounding success at the scientific and commercial level. Despite a few months' delay, the deliverables were produced correctly and the product was introduced on the market. Several papers were published. Neither of the orientations favoured by partners (business vs. research) was abandoned. The difficulty was to bring together actors around a common project, even though they did not have the same compensation or the same working hours, etc. However, it is interesting to note that most of the actors interviewed said they did not want to take part in another collaborative R&D project, mainly because of these cultural differences.

CONCLUSION

This paper has provided insight into the process of "translation" of two collaborative R&D projects. We have seen that the translation phases differed greatly from one project to another, the actors took different paths, and the principal translators in the two cases studied faced a number of pitfalls and obstacles.

We can draw several lessons from this analysis in the light of Actor-Network Theory:

- It is interesting to note that the actors, both in project A and B, were aware of the challenges and agreed on the "obligatory passage points." This first step in the translation process was critical because it enabled the two projects to get off the ground despite the obstacles and challenges, be they organizational, strategic or technical. Another important dimension was the emergence in both projects of a "translator" recognized by the other actors, who focused on the progress of the project and sought out multiple solutions to the problems inherent in the project. Without a principal translator, intersement and enrolment do not seem possible, and the project is nipped in the bud.
- This theory allows us to consider all project actors, and the project itself is an actor and simply a medium or an objective. Far from focusing only on power plays and the stages of an organizational situation, Actor-Network Theory provides a very enlightening vision of the situation. Thus we see that in Project 2, the project itself becomes a central actor/actant that overcomes the failure of the intersement and the type of translation that could have ensued. The critical importance of the project turned the tide in a situation that was compromised, and probably "forced" the actors to set aside the cultural and organizational gulf separating them.

- In the case of technical projects such as projects A and B, attempts at intersement emerged largely around the field of HRM between actors and tools. As regards actors, the HRD, Project Managers and HR consultant spearheaded the initiatives and action. As regards tools, communication techniques and processes focusing on personal interactions and compensation schemes were used. Again, Actor-Network Theory provides insight into the families of actors/actants in action, and the processes and steps that emerge during the life of a project. In both cases studied, the field of HR played a prominent role and showed its strong potential in the field of organizational analysis. Moreover, it was clear from the outset that these two collaborative projects raised HRM issues that would have to be addressed sooner or later. As regards partners, they should be recruited based on a consensus between project leaders (regardless of their home organizations). As regards human resource incentives, it was difficult in the short term to harmonize these practices. In collaborative R&D projects, it is important to create conditions where diverse practices can coexist peacefully without causing antagonism or bringing the project to a standstill. Other research conducted in this area concurs, in particular (Calamel et al, 2012).
- HRM tools do not seem to be prevalent in joint R&D projects. And yet they appear to be critical for processes carried out at the beginning and end of such projects, such as recruitment, skills development, career management, etc. Further research is being carried out in French competitiveness clusters on these aspects and will in the medium term confirm or refute these findings.

ABSTRACT

The aim of the paper is to analyze if and how national culture impacts on corporate's environmental strategies. The Organizations and the Natural Environment literature recognizes the introduction of environmental protection as a driver of corporates' competitive advantage, and identifies several drivers of corporate environmental proactivity.

While most of literature focuses the analysis on the broader issue of Corporate Social Responsibility and analyses the effect of national culture on Corporate Social Performance, only a few studies focus on the relationship between national culture and environmental proactivity, employing national environmental indicator rather than firms' performance scores. In addition, these studies – based on Hofstede's framework – do not analyse culture's impact on company's environmental behaviour, but only the relationship between national culture and the overall national environmental performances.

Our paper aims at missing this gap, investigating the linkage between national culture and

Corporate environmental proactivity, by using a specific index: the carbon disclosure score (CDS). In order to consider the effects of national culture on organizations, we base our analysis on the GLOBE's cultural dimensions, which give us the possibility to consider more up-to date measures, and also to consider a wider range of values with respect to Hofstede's model.

Keywords: Environmental Performance, National Culture values, GLOBE's cultural dimensions, CDS.

1. INTRODUCTION

The trade-off existing between achieving an high and sustainable economic growth, and keeping an high environmental standard is nothing new. At the organization level, the environmental protection has become an important issue since pollution and natural resources' depletion represent a wide source of costs. Companies may play a significant role in the reduction of man activities' impact on natural environment also promoting a more ecologically sustainable world.

During the last years the Organizations and Natural Environment (ONE) stream of research has focused the attention on the linkage existing among environmental protection, business management and strategy. One of the main topics of interest indeed is the corporate development of proactive environmental strategy, which ideally represents the last stage of convergence between firms' environmental effort and management practices (Hunt and Aster, 1990). It is defined as a strategy aimed at reducing the environmental impact of firms' activities, and at managing the interface between business and the nature beyond imposed compliance (Sharma, 2000; Aragon - Correa and Sharma, 2003).

A proactive environmental strategy is characterised by the presence of four basic elements (Delmas *et al.*, 2011): a) environmental reporting; b) operational improvements; c) organisational changes; d) regulatory proactivity, all factors connected to a higher attention towards Environmental protection. Some researcher have particularly underlined that the introduction of environmental protection at firm level could be used to reach a competitive advantage. The reduction of inefficiencies and the rationalization in the use of natural resources are important sources of cost reduction, and the environmental attributes of products and services (Orsato, 2006; Porter and Van der Linde, 1995) are used for marketing differentiation.

Across countries, firms do not show the same inclination towards environmental protection, neither towards proactive environmental strategies. Firms are actually conditioned by the different environmental regulations of their home and host (Ambec and Barla, 2006; Majumdar and Marcus, 2001; Rugman and Verbeke, 1998), and by the stakeholders' pressure that they face (Gonzales-Benito and Gonzales-Benito, 2006; Buysse and Verbake, 2003; Madsen and Ulhøi, 2006; Garcés-Ayerbe *et al.*, 2012).

Connected to the last driver, the level of firms' ethical attitude seems to be one of the most important factor of corporate environmental proactivity (Paulraj, 2000; Bansal and Roth, 2000). In presence of strong ethical motivations, related with the 'right thing to do', environmental protection becomes an important matter into organisations. Ethics is related to

values, strictly embedded with both national and organizational culture. National culture has been defined as "...patterns, explicit and implicit, of and for behaviour acquired and transmitted by symbols, constituting the distinctive achievements of human groups" (Kroeber and Kluckhohn 1952, p. 13). It shapes the orientation of individuals to take sustainable initiatives and to translate them into strategic goals and managerial practices.

The most of literature focuses on the effects of cultural values on the broader issue of Corporate Social Responsibility (Ho *et al.*, 2012; Parboteeah, 2012; Ringov and Zollo, 2007), while only few studies have specifically analyzed the relationship that occurs between the national culture and the corporate environmental proactivity. In particular, these studies (Park *et al.*, 2007, Husted 2005) employ national environmental indicators, without focus on this connection at organization level.

In order to cover the gap of existing literature, we formulate the following research question:

RQ: Does national culture impacts on corporate environmental proactivity?

The paper is articulated as follows: the first section presents the theoretical background highlighting the main literature on the topic, and develops the hypotheses; section 2 describes the dataset and variables; section 3 presents the result of the analysis, while the last section explores the implications and limitation of the analysis.

2. THE IMPACT OF NATIONAL CULTURE ON CORPORATE ENVIRONMENTAL PROACTIVITY

Cross-cultural studies have analyzed the influence of national culture on company's social responsibility from different viewpoints, employing as their basis Hofstede's (Husted, 2005; Park *et al.* 2007; Ho *et al.* 2012) or GLOBE's (Ringov and Zollo, 2007; Parboteeah *et al.*, 2012) cultural dimensions.

Despite previous analysis used different models, they assumed that the different sets of values, beliefs, attitude and moral, rooted in the national culture drive individuals on their choices and actions. Therefore, national culture is strictly embedded at the corporate social or environmental behaviours and some cultural dimensions are more likely to support these initiatives than the others.

In order to understand how the national culture affects corporate environmental proactivity and, consequently, firms' inclination to implement a proactive environmental strategy, this paper considers GLOBE's cultural dimensions.

The Global Leadership and Organizational Behavior Effectiveness Research Project (GLOBE project) is a multi-phase, multi-method project, involving 62 countries, grouped into ten cultural clusters, in order to analyze in depth their different cultures. Cultural contexts are examined through nine dimensions: power distance, uncertainty avoidance, in-group and institutional collectivism, performance orientation, assertiveness, future orientation, and humane orientation, which explain the different perception and acceptance of leadership within each context (House *et al.*, 2002):

Each dimension is studied at two levels considering both 'as is scores' – that is what middle manager think about their culture in a certain moment – and 'should be scores' – that is what middle managers think about how their culture should change to improve.

We considered GLOBE's dimensions, instead of Hofstede's ones (Husted, 2004) for several reasons. Hofstede includes a more limited number of dimensions, and his model is less up-to-date than the GLOBE project. Having a higher number of dimensions helps to investigate the relationship between culture and corporate environmental proactivity, because of the possibility to include cultural values, which are much related to the inclination towards a proactive environmental strategy. In addition, the GLOBE project has been already used in other similar analysis, even if the investigated variable was not the Carbon Disclosure Score – considered as a proxy of corporates' proactive environmental strategies – but other factors, such as the inclination to support sustainability initiatives (Parboteeah *et al.*, 2012) or sustainability values and performances (Rinkov and Zollo, 2007).

Ringov and Zollo (2007) explore the effects of national culture on environmental performance and use both Hofstede's and GLOBE's cultural dimensions. With regards to Hofstede's dimensions, they hypothesize a negative effect of power distance, individualism, masculinity, and uncertainty avoidance. They found out that power distance and masculinity are significantly negatively associated with firms' social and environmental performance. But they didn't find support for their other hypotheses. In order to verify their hypotheses, the authors repeated the analyses by considering four of the nine GLOBE's dimensions: power distance, uncertainty avoidance, gender egalitarianism (as a proxy of countries' inclination towards femininity), and in-group collectivism (as a proxy of countries' low inclination towards individualism). Once again, they got to similar results: a) Power distance has a negative and significant effect on firm social and environmental performance; b) gender egalitarianism (a proxy for a lack of masculinity) has a positive and significant effect; c) collectivism (an inverse measure of individualism) and uncertainty avoidance do not have any effect on environmental performances.

Parboteeah *et al.* (2012) decided to consider different cultural dimensions and excluded three of the nine GLOBE's dimensions: power distance, in-group collectivism, and gender egalitarianism. According to them, these three dimensions are not relevant to understand sustainability: a) Power distance refers to hierarchical expectation of distribution of power within a society and is not seem relevant to understand sustainability. b) In-group collectivism is also not relevant to understand sustainability as it refers to the degree to which people show loyalty in their family. c) Gender egalitarianism reflects preference for gender roles and is not necessarily relevant to understanding sustainability.

The authors consequently focus on performance orientation, assertiveness, institutional collectivism, uncertainty avoidance, and future orientation. They hypothesize that performance orientation and assertiveness should be negatively related to the inclination towards sustainability initiatives, and that institutional collectivism, uncertainty avoidance, future orientation, and humane orientation should be positively related to it. They thought that the other GLOBE's cultural dimensions did not have any relationship with sustainability. Although Parboteeah *et al.* (2012) decided to focus on specific dimensions, we think that all of them are useful to explain specific values of national culture. Therefore, we decided to consider all the nine dimensions, and to focus on "should be" scores. 'Should be' scores measure how the culture should be according to individuals' wishes. They refers to the future and are consequently useful to understand which kind of relationship exist between culture – meant in terms of values more than behaviours – and specific phenomena, such as corporate environmental proactivity.

Our main hypothesis is therefore:

H1: Cultural values impact on corporate environmental proactivity, and particularly on carbon disclosure score.

More specifically, relying on the main literature, we suppose the existence of a linkage between Carbon Disclosure Score and each of GLOBE's cultural dimensions.

Given that high levels of power distance are associated with polarization and low employee involvement in decision-making processes, we expect that power distance do not push towards a stakeholder-oriented approach and is consequently negative related to CDS. On the same hand, Cohen *et al.* (1996) highlight that people from a high power-distance culture are more likely to view a questionable business practice as ethical than people from a low power-distance culture.

Performance- oriented cultures value results, competition, and materialism (House *et al.* 2004), while low-performance-oriented societies focus on harmony with the environment (House *et al.* 2004). We consequently expect that performance orientation is negatively related to propensity to support sustainability initiatives.

Regarding assertiveness, House *et al.* (2004) underline that in assertive societies, people tend to be competitive, value success, and think of others as necessarily an opportunistic way. Such values and beliefs may also encourage individuals to behave in a self-interested and unethical manner to succeed, and consequently expect assertiveness to be negatively related to CDS.

In collectivistic cultures, people rely on membership in groups (e.g., social class, community, religion, and/or family) for identity and status. People's actions are concerned with what is the best for the goals of the group through sharing, cooperation, and group harmony. In this sense, in collectivist society people should be more likely to perceive sustainability as an important societal goal. We consequently expect a positive relationship between institutional and in-group collectivism, on one side, and CDS, on the other.

Future orientation is defined as "the degree to which individuals in organizations or societies engage in future oriented behaviours such as planning, investing in the future, and delaying gratification" (House *et al.* 2002, p. 6). According to the authors future-oriented people are more inclined to strategic planning and long-term strategies and should consequently be positively related to support sustainability initiatives.

Humane orientation is the degree to which individuals in organizations or societies encourage and reward individuals for being altruistic, generous, caring, and kind to others (House *et al.* 2004). In societies with higher humane orientation, people tend to consider others important, and it seems reasonable to expect this dimensions to be positively related to CDS.

Gender egalitarianism refers to women's role within society, and to a society's inclination to accept that women have position of powers and same rights as men. Given the strong influence of different social constructs on this dimensions and also the difficulty to relate it with corporate environmental proactivity, we expect gender egalitarianism to have no influence on CDS. In same way, given the results of both Parboteeah *et al* (2012) and Ringov and Zollo (2007), we expect that uncertainty avoidance is not significantly related to CDS. Actually the possibility to implement environmental proactive strategies requires an inclination towards change which can not be natural in uncertainty-avoidant societies. At the same time, however, the possibility to preserve the environment is a way to preserve

harmony, which is something strongly related to uncertainty avoidance. That is, even from a conceptual point of view, uncertainty avoidance does not seem to have a unilateral effect on firms' inclination towards environmental proactive strategy neither on CDS.

Therefore, consistent with these consideration we hypothesize that:

H1a: Power distance, performance orientation, and assertiveness are negatively related to CDS.

H1b: Humane Orientation and Collectivism are positively related to CDS.

3. DATA AND MEASURES

3.1. Dependent variable

The analysis is concentrated on the evaluation of national culture's effect on environmental proactivity rather than environmental performance.

Considering the complexity of the definition of environmental proactivity, finding an effective indicator is not easy. Christmann (2000) has already revealed that data on firms' environmental practices and the cost reduction due to the implementation of green practices are not available from public and global database.

Previous researches used qualitative measures based on mail surveys of a specific samples of companies or environmental indicators provided by institutional agencies. Others used the presence of EMS as a measures of proactivity.

Consistent with the definition provided by Delmas *et al.* (2011), the measure of environmental disclosure is a proxy of environmental proactivity.

Following these considerations, the paper employs the company's carbon disclosure score (CDS), measured by Carbon Disclosure project (CDP) as dependent variable.

Every year, CDP asks to the Global 500 companies to measure and report what climate change means for their business. During the 2011, 81% (404) of corporations answered to the CDP questionnaire. A score (from 0 to 100) is applied to most of the company responses to CDP, which are assessed for disclosure and performance.

Low CDS (< 50) indicates limited or restricted ability to measure and disclose risks and opportunities that came from carbon emissions. The companies which gain this score show a compliance attitude towards environmental -or more precisely carbon- problems. It does not

indicate poor performance but a low score is assigned to companies that provide insufficient information to evaluate performance and could be considered inactive to climate change. Vice-versa high CDS (>70) indicates a more deep involvement into climate change issue: companies identify into climate change management a tool to reach a strategic advantage.

In this companies "senior management understand the business issues related to climate change and are building climate related risks and opportunities into core business" (CDP,2011 pp.22).

3.2. Explanatory variables

This research focalizes the attention on the role of national culture into shape corporate environmental proactivity using the GLOBE project cultural dimensions.

As already highlighted by House et al. (2002), a high correlation exists among the nine cultural dimensions. In order to overcome contradictions, we made indeed a Principal component analysis considering all the cultural dimensions. We got three main components explaining the 73,443% of the variance (Table 1).

Table 1: Results of PCA: Total Variance Explained

Component	Initial Eigenvalues			Extraction Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
1	2,834	31,491	31,491	2,834	31,491	31,491
2	2,214	24,595	56,087	2,214	24,595	56,087
3	1,562	17,357	73,443	1,562	17,357	73,443
4	,803	8,918	82,362			
5	,585	6,503	88,865			
6	,448	4,978	93,842			
7	,258	2,862	96,704			
8	,160	1,781	98,485			
9	,136	1,515	100,000			

Table 2: Results of PCA: Component Matrix

	Component		
	1	2	3
PD	-,327	,792	,021
UA	-,551	-,402	,591
FO	-,006	-,190	,929
COLLI	,622	,470	,436
COLLII	,241	-,775	,014
PO	,841	,156	,229
ASS	-,466	,563	,323
HO	,578	-,356	,039
GE	,849	,315	-,001

As table 2 shows, each main component is differently correlated with the nine dimensions, and each component is more significantly correlated with some dimensions than others. The first principal component (COMP1) is negatively correlated with Power Distance (PD), Uncertainty Avoidance (UA), Future Orientation (FO) and Assertiveness (ASS), and positively correlated with Institutional Collectivism (COLL I), In-group Collectivism (COLL II), Performance Orientation (PO), Humane Orientation (HO), and Gender Egalitarianism (GE). The most significant correlations are those with GE (+), PO (+), COLL I (+). The three cultural components revealed by PCA are the explanatory variables of the study.

As a result, we formulated our second hypothesis:

H2: COMP 1 is positively related to CDS

The second principal component (COMP2) is positively correlated with PD, COLL I, PO, ASS and GE and negatively correlated with UA, FO, COLL II and HO. The most significant correlation are those with PD (+) and COLL II (-). As a result, we formulated the following hypothesis:

H3: COMP 2 is negatively related to CDS.

The third component (COMP3) is negatively correlated with GE, and positively correlated to the others. However, it is significantly correlated only with FO (+). As a result, we formulated the following hypothesis:

H4: COMP 3 is negatively related to CDS.

We tested our hypotheses through a statistical analysis developed using IBM SPSS 19 Statistic software. The raw sample included 500 companies contacted by CDP report. A screen of the sample has been developed, in order to evaluate the presence and the availability of the necessary data. The final sample includes only those companies that responded to CDP's questionnaire and that distinctly belong to a specific country, which is included in the GLOBE project. It is composed by 362 companies from 28 different countries: Australia, Brazil, Canada, China, Colombia, Denmark, Finland, France, Hong Kong, Germany, India, Israel, Italy, Japan, Malaysia, Netherland, Russia, Singapore, South Africa, South Korea, Spain, Sweden, Switzerland, Taiwan, Thailand, Turkey, United Kingdom, USA.

3.3. Control variables

In order to confirm the relationship between national cultural dimension and company's environmental proactivity, we introduced two control variables: revenues and longevity. The selected two variables had been identified by the extant literature as relevant drivers for firms' environmental proactivity. These are: company's revenues as proxies of firm's dimension (Benito and Benito, 2006); company's age (Hass, 1996; Kolk and Mauser, 2002).

Data have been collected from Businessweek (2011).

4. ANALYSIS

To test our hypotheses, we calculated the bivariate correlations between the principal components derived from the GLOBE's dimensions, Companies' Carbon Disclosure Scores, Revenues and firms' longevity (Table 3).

According to our results, the Carbon Disclosure Score is positively but insignificantly correlated with COMP1 (0,081) and negatively correlated with COMP2 (-0,106 *p-value* < 0,05) and COMP3 (-0,220; *p-value* < 0,01). Moreover there is a positive significant correlation between the score and the logarithm of Revenues at 2011 (0,206; *p-value* < 0,01) and firms' longevity (0,086; *p-value* < 1,01). As a result H2 is not confirmed.

Table 3: Correlations and descriptive statistics

	Mean	Std. Deviation
CDS	69,65	18,430
REVENUES	23,8472	1,10375
LONGEVITY	87,36	115,214

	COMP1	COMP2	COMP3	CDS	REVENUE S	LONGEVIT Y
COMP1	1					
COMP2	0	1				
COMP3	0	0	1			
CDS	0,081	-0,106**	-0,220***	1		
REVENUES	-0,033	-0,055	-0,123**	0,206***	1	
LONGEVIT Y	0,104**	0,017	-0,092*	0,086*	0,109**	1

Notes: ***. Significant at 0,01 (2-tails); **. Significant at 0,05 (2-tails) ; * Significant at 0,1 (2-tails)

In addition, we developed two regression functions (Table 4). The first function considers the impact of cultural principal components on Carbon Disclosure Score, while the second model considers also the effect of the control variables (logarithm of revenues at 2011 and firms' longevity). Results of model 1 show that COMP2 and COMP3 have a negative impact on CDS, with a good level of significance. In model 2, with the inclusion of the control variables, the significance of the analysis increases (R-square=0,100). As a result, H3 and H4 are confirmed. In addition, both company's longevity coefficient (LONGEVITY= 0.07) and Revenues (REVENUES= 2,925) positively affect firms' proactivity score even if the introduction of control variables reduces the effect of principal components on CDS. Thus, statistical analysis demonstrates the effect of national culture on firms' proactivity score, but this effect is moderated by firms' size and longevity.

Table 4: Regression results

Variable	Model	
	1	2
COMP1	1,489 (0,941)	1,517 (0,933)
COMP2	-1,961** (0,941)	-1,795* (0,929)
COMP3	-4,060*** (0,941)	-3,592*** (0,937)
REVENUES		2,925*** (0,851)
LONGEVITY		0,007 (0,008)
Constant	,	-0,706 (20,264)
Observations	362	362
R-Squared	0,066	0,100
F-Statistics	8,485**	11,504**

Robust standard errors in brackets
 ***. Significant at 0,01 (2-tails); **. Significant at 0,05 (2-tails); * Significant at 0,1 (2-tails)

5. DISCUSSION

The analysis provides evidence that national culture exerts an important role on companies' environmental proactivity.

In particular, COMP 2 is negatively related with CDS, thus in particular is negatively linked to PD, ASS, and less to Institutional Collectivism. In addition, it is positively and significantly dependent on In-group collectivism.

COMP 3 is significantly and positively dependent on FO, UA, and less on Institutional Collectivism. As a consequence, these dimensions have a negative impact on CDS. However, the effect of UA is still difficult to understand, given that it has an inverse effect on COMP 2 and COMP 3, which are both negative related to CDS.

Therefore, hypothesis 2 and hypothesis 3 are confirmed, while hypothesis 4 is not supported because the coefficient is not significant even if is correctly signed.

As a result, according to our analysis, hypotheses H1a and H1b are only partially confirmed. Power Distance and Assertiveness are negatively related to CDS, while Performance orientation impacts only on COMP1, which does not show a significant correlation with CDS. For what concerns H1b, Humane orientation is positively related to CDS, but the weight of

HO on COMP 2 is not high. Collectivism's effects on CDS depend on the contrary on the kind of collectivism. Institutional collectivism has a negative but low impact on CDS, while In-group collectivism has a high positive impact on CDS. That is norms and rules have only a limited impact on firms' inclination to environmental proactivity, while the feeling of belonging to the group and individuals' inclination to consider the group's interests behind the individual ones play a big role.

6. CONCLUSION AND LIMITATIONS

Nowadays, environmental problems are receiving more and more attention at firm level. The environmental proactivity is considered an important tool for gaining a competitive advantage by helping to reduce costs or increase differentiation. Although the interest towards firms' environmental proactivity and the drivers of this attitude, only a few contributions are given on the effects of national culture on corporates' environmental proactive strategies. Most of literature focuses on Corporate Social Responsibility, and on Corporate Social Performance. On the contrary, our paper aims at investigating to what extent national culture impacts on Corporate environmental proactivity, by using a specific index: the carbon disclosure score (CDS).

We investigated the effects of national culture, by focusing on cultural values and particularly on GLOBE's 'should be' scores. We decided to use the GLOBE project because it's the most up-to-date model and because it includes many cultural dimensions, offering the possibility to investigate different cultural factors.

We found out a linkage between culture and CDS, but according to our analyses only a few cultural values strongly impact on corporate environmental proactivity: power distance, assertiveness, and in-group collectivism. The statistical analysis partially confirms indeed our main hypothesis about the influence of cultural values on environmental proactivity.

Our analysis contributes to understand the influence of national culture on CDS, and gives several contributions: on the theoretical side, the results open to a deep analysis of the predicted relationship among variables, since different results are presented. It can provide fertile areas for future research as it offers a number of points of departure for deeper considerations.

From a managerial standpoint, the study of the cross-cultural differences could affect the effectiveness of environmental practices at both intra and inter organization levels.

While interesting, our results suffer of important limitations, too. The analysis should consider the industry of firms, in order to verify if the kind of activities affects the linkage

between culture and corporate environmental proactivity. In additions, some dark shapes on cultural dimensions impel the necessity to consider other measure of cultural values.

Nevertheless, the lack of environmental indicators to measure corporate environmental proactivity constitutes the main limitation of this kind of study. The lack of synthetic measure of proactivity can be the cause of the different outcomes within these researches.

Future steps of research will consequently focus on the influence of industries and on further analysis on more reliable cultural and environmental indicators.

ABSTRACT.

Although the great attention given to business model in the last years, no contribution has been found with respect to the effects of family corporate governance components (namely, ownership & control, management, family interests & values) on business model choice. This paper provides a theoretical framework aimed at investigating whether any relationship exists between family corporate governance and business model choice. Henceforth, it analyses some preliminary case studies on Tuscan (Italy) wineries in order to test the conceptual model proposed. The empirical cases show that different business model choices are available to family firms. Future studies are needed to generalize results.

Keywords: *Family business, Business model, Corporate governance, Family involvement*

INTRODUCTION

Is there a missing link between business model choice and corporate governance in family firms? In the last decades, scholars have increasingly focused their attention on business model (Lambert and Davidson, 2012) and family business topics (De Massis *et al.*, 2012). Nevertheless, to our knowledge, no contribution so far has coupled the interests belonging to

the two streams of research, neglecting the influence that different family corporate governance components (namely, ownership & control, management, family interests & values) may have on business model choice.

In the literature on business models many definitions have emerged, all sharing the basic idea that a business model (BM) represents the way a firm can create and capture value (Zott *et al.*, 2011). Several authors have explored how BM can allow the firm to better exploit technologies or to obtain superior performance. More recently, researchers are focusing on BM evolution, investigating how firms can reach competitive advantage by innovating and changing their BM (Demil and Lecocq 2010). In explaining firm performance, BM designs have been used with respect to certain industries, but research on them is only at its early stages (Lambert and Davidson, 2012).

On the other hand, family business literature has focused its attention on several strategic management topics such as “*goals and objectives, strategy formulation and content, strategy implementation and control, management and ownership, organization performance*” (De Massis *et al.*, 2012: 8), often comparing these elements with respect to family vs. non-family firms (Zahra *et al.*, 2004).

Although the large number of contributions generated in each field (i.e. the BM and the family business literature), no research has investigated so far the relationships among them. This can be due to the fact that, when speaking about family businesses, scholars often imply the coincidence of the family firm with a specific type of business model, the “family business model”, ruling out *de facto* the possibility that family firms may apply different business models.

This paper wants to address this point and look at possible linkages between the two literatures above mentioned. First, we carry out a literature review both on the streams of business models and family business corporate governance. This helps us to identify the relevant variables to build our theoretical framework. In order to test our conceptual framework, we present our preliminary empirical results derived from a case study research conducted on some Tuscan (Italy) family wine firms. Finally, results, limits and further research are discussed in the last section.

LITERATURE REVIEW

Business model

Academics and practitioners have mainly focused business model's conceptualisation (Teece 2010; Chesbrough 2010). Although a general accepted definition does not exist (George and Bock 2011), it is widely acknowledged that a BM explains how value is created and captured by firms (Amit and Zott 2001; Davey *et al.* 2011; Johnson *et al.*, 2008). The recent literature review by Zott *et al.* (2011) has stressed the need to consider the BM as a unit of analysis, distinguishing it from other related concepts such as 'strategy' and 'tactics' (Magretta 2002; Zott and Amit 2008). Moreover the analysis of BM's dynamics is still scant (Willemstein, Van der Valk and Meeus, 2007; Demil and Lecocq 2010; Johnson *et al.*, 2008). For our purpose, we adopt Pucci *et al.* (2013)'s definition: "*a business model is a systemic representation of the combination of strategic, organizational and technological firm's activities, of the way they shape firm's relationships within its reference context and of the relating financial structure, with the scope of explaining how the firm is able to create and capture value*". This definition allows us to define the three activities and decision blocks, namely business strategy, business organization and technology management constituting a BM. Lately, attention has been given to BM designs. Amit and Zott distinguish four business model designs, namely the 'efficiency, aimed at achieving transaction efficiency, 'complementarities', based on the bundling of goods, activities, resources, or technologies, 'lock-in', aimed at retaining stakeholders, and 'novelty', referred at new ways of conducting exchanges, ones (Amit and Zott, 2001; Zott and Amit, 2007). In the same vein, but using Porter's generic strategy and two variants, Chatterjee (2013) distinguishes 'efficiency-based', 'perceived-value based', 'network value, or loyalty-based", and 'network efficiency based' types of BM designs. Pucci *et al.* (2013) also suggest three ideal types¹² of BM, namely 'new product development oriented' BM, 'organizational processes efficiency oriented' BM, and 'marketing management oriented' BM, that result from the intersection of the three different activities and decision blocks of a firm.

Moreover exogenous (e.g. social and institutional environment, type of sector where the firm operates, market trends), as well as endogenous factors to the firm (e.g. firm's

¹² Baden-Fuller and Morgan (2010) suggest that, when referring at business model concept, researchers should not use neither the terms 'types' (and consequently, 'typology') or kinds (and consequently, 'taxonomy'). They argue that a more appropriate term is that of Weber's 'ideal type'. In fact, "*the ideal type concept will help to develop our skill in imputation in research: it is no 'hypothesis' but it offers guidance to the construction of hypotheses. It is not a description of reality but it aims to give unambiguous means of expression to such a description*" (Baden-Fuller and Morgan, 2010: 161).

dimension, degree of district or cluster embeddedness, firm life cycle) have been identified as influencing the BM ideal type adopted (Osterwalder *et al.*, 2005; Pucci *et al.*, 2013).

A separate focus concerns the relation between corporate governance and BM. As anticipated, the majority of studies on BM have focused on strategic management aspects (Zott *et al.*, 2011). Only sporadically, the proprietary level (ownership and control) is considered as one of the BM components (Donath, 1999; Morris *et al.*, 2005, Tikkanen *et al.*, 2005). Coherently with most of the literature and the definition here adopted (Pucci *et al.*, 2013), in this paper the corporate governance is considered as a factor endogenous to the firm which could influence the business model choice, but is not integral part of the BM structure.

Corporate governance in family firms

Many definitions of *family business* can be found in literature (Carr and Sequeira, 2007; Miller *et al.*, 2007; Dematté and Corbetta, 1993; Corbetta 1995; Songini 2006). In this paper, we adopt Chua *et al.* (1999)'s definition where "*the family business is a business governed and/or managed with the intention to shape and pursue the vision of the business held by a dominant coalition controlled by members of the same family or a small number of families in a manner that is potentially sustainable across generations of the family or families*" (Chua *et al.*, 1999:25). Moreover, we suggest that family involvement should be taken into consideration during family businesses analysis, family involvement being one of the factors that mainly differentiate among family firms (Astrachan, Klein and Smyrniotis, 2002).

Astrachan and Shanker (2003) use three levels of family involvement to develop as much operational definitions of family firms: 1) a broad definition includes firms with some family participation in the business and control over its strategic direction; 2) a mid-range definition includes those cases in which the founder or descendant of the founder is involved in the day-to-day operations and intends for the business to remain in the family; 3) the narrowest definition includes only those businesses in which multiple generations of family members are directly involved in the day-to-day operations.

In the family business literature, corporate governance has been studied from different perspectives. Four theories are the most referred (Gubitta and Giannecchini 2002; Siebels *et al.* 2012): the agency costs theory, the stewardship theory, the resource based view and the new theory of property rights.

According to the agency (costs) theory (Jensen and Meckling, 1976), there are opportunistic behaviors between the agent, which represents the management and the principal, who coincide with the ownership. The separation of the management from the ownership causes agency costs such as free-riding and shirking costs and creates information asymmetries. Principals can reduce these problems controlling and monitoring agent's conduct or through incentivizing mechanisms. Jensen and Meckling (1976) suggest that agency problems can be reduced by making the owners directly participating in the management of the firm, that is owner-managed firms have lower agency costs. A study conducted by Schulze et al. (2001) shows that privately held, owner-managed firms are exposed to agency threats, originated by personal rivalries and self-control problems. Applied to the family firms this translates into asymmetric altruisms and self-control problems of the parents which make family managers behave as agents. Agency problems might not exist in the case of a sole family owner-manager, but they can exist in the presence of many family managers and a principal owner (Chrisman et al., 2007). In order to overcome these agency problems, Chrisman et al. (2007) suggest family managers should be monitored and given incentives through compensation.

Alternative to agency theory, the stewardship theory suggests that *"family managers, regardless of ownership, will generally behave in the organization's best interest... [due to] subordinate personal goals to family goals"* (Chrisman et al., 2007: 1030). Supporters of this perspective argue that, in a firm with a stewardship culture, competitive advantage can arise from collectivistic attitudes, psychological commitment, and trustworthy behaviors (Eddleston et al., 2012). Agency and stewardship theories refer to the role of managers in achieving firm goals, but differ in their assumptions about the motivations of managers (Chrisman et al., 2007). According to the agency theory, owners and managers have conflicting goals, while from a stewardship perspective, family managers are intrinsically inclined to value owners' interests as much as their own (Chrisman et al., 2005). To sum up, if on the one hand agency theory focuses on the importance of monitoring and control, on the other the stewardship perspective relies on participation, long-term orientation and the importance of building a skilled human capital (Eddleston et al., 2012).

Another relevant theoretical reference is the resource based view, which stresses how family business owns a unique bundle of resources, referred as the *"familiness"* (Habbershon and Williams, 1999), deriving from the interaction between the family and the business. Family business resources alone are not able to build a competitive advantage: they need to

be strategically managed. Sirmon and Hitt (2003) identified four family business resources, namely 'human capital', 'patient capital', 'social capital' and 'survivability capital'. The authors add to these latter the governance structure as a further resource that can lead to competitive advantage.

Finally, the new theory of property rights (Gubitta and Giannecchini, 2012) is a new perspective applied to family business literature and defines a governance model on the basis of three main factors. First of all, the managerial team is selected on the basis of managerial skills and identity; then, it is important to involve non-family members in strategic decisions and governing boards; finally, the contractual incompleteness deriving from the inability to define beforehand all the duties and actions, is filled by trust. Gubitta and Giannecchini (2002) assert that *"in family business, governance receives the family imprinting and becomes a synthesis (sometimes a compromise) between the family values and the business rules, reflecting all of the critical steps in organizational development: the delegation process of managerial activities and the creation of a managerial style, the involvement of the family members in the management bodies, the entrepreneurial succession process, and the opening of equity capital to third parties"* (p. 278).

As suggested by the aforementioned considerations, family corporate governance is a multidimensional concept, whose analysis is influenced by different theories and perspectives. Since we recognize that each one gives a specific contribution to a deeper understanding of the topic, this paper integrates all these perspectives in defining the family corporate governance components.

THEORETICAL FRAMEWORK

From the literature reviewed two main considerations emerge. On the one hand, business model literature is shifting its attention from definitional problems to a "taxonomy\typology" of business models designs (Amit and Zott, 2001; Chatterjee, 2013; Pucci et al., 2013; Zott and Amit, 2007). Despite that and to the best of authors' knowledge, a classification of BM has not been applied yet to family firms whose BM has been considered so far as a "black-box" and "homogenous" across firms. On the other hand, despite the many theoretical perspectives, an holistic framework is missing in family business literature, which defines a clear typology of corporate governance and their related determinants. This article develops a theoretical framework aimed at "connecting the dots", that is we look at whether different family corporate governances, influenced by the different level of involvement and participation shown by the family, affect the BM choice.

We adopt the three more general business model ideal types developed by Pucci et al. (2013):

1) New Product Development-oriented BM (NPDo): this configuration results from the firm's knowledge application and its capacity of accessing and exploiting new external knowledge (Gilsing, Lemmens and Duysters 2007; Markard and Truffer 2008) in a continuous counterbalance between technological activities of exploitation and exploration (March 1991), coherent with the firm's strategic vision. This ideal type stresses a diversification strategy through the introduction of new products \ services;

2) Market Management-oriented BM (MMo): this results from the combination of firm's own assets and resources, activities configuration and supply chain management in order to better satisfy its customers, exploit better existing markets or enter new markets, establishing more innovative and efficient relationships with them (Kohli and Jaworski 1990). Firm focuses on strengthening internationalization processes, on researching distribution channels or retail efficiency or on enhancing communications strategies;

3) Organizational Processes-oriented BM(OPo): this ideal type results from the focus of the firm in exploiting internal (complementary) resources and competences or implementing relationships with partners in order to improve efficiency in terms of both technology applied to processes and transaction costs savings due to the synergies that arise from coordination/integration, learning and reconfiguration of firm's processes (Teece, Pisano and Shuen 1997; Williamson 1981).

The aim of this paper is to understand whether the family corporate governance can have an influence on the business model choice. On the basis of the literature reviewed, and specifically integrating the agency (cost) theory, the stewardship theory, the resource-based view and the new theory of property rights, we defined family corporate governance as made by three components: the "ownership & control", the "family interests & values" and the "management". These components derive from the main theories behind corporate governance depicted by the literature reviewed.

Ownership & Control. The ownership & control dimension refers to who owns and controls the firm. Ownership is defined as "voting shares or voting power over a trust" and "when the parent or parents own 50% or more, they are considered in control" (Ward and Dolan, 1998:305-306). In literature several ownership configurations exist, but one of the most popular describes the three stages of the ownership evolution: the owner managed, sibling

partnership, and cousin consortium (Gersick et al., 1997). As generations inherit the business, the ownership can be further divided and this can lead to a more difficult control of the family business. Moreover, it can happen that during the succession process, an heir sells its share. This component is affected by both the RBV and the new theory of property rights.

Family interests & values. The family interests & values are derived from the stewardship theory.. Miller et al. (2008) suggest that stewardship manifests itself in three forms in the family-owned business: assuring continuity, creating a community and creating a strong connection. Continuity refers to the willingness to assure longevity of the firm (Siebels et al., 2012), and it is revealed by an emphasis on research and development of new offerings, attention to the business reputation and emphasis on increasing the market share (Miller and Le Breton Miller, 2005; Miller et al., 2008). Community relates to the creation of a collective corporate culture through employee training, giving to employees broader jobs and more responsibilities, creating a flexible, inclusive structure. This leads to the fact that people will be more motivated to stay in the firm for longer. Connection refers to the building of strong connection with external stakeholders that can help the firm. It is disclosed by a personal oriented approach to marketing and a narrowly targeted group of customers.

Management. The management dimension is particularly linked to the agency theory. According to the agency theory, in family firms the owner is the principal, and the manager is the agent. If the family firm has a sole family owner-manager, no agency costs exist: there is an alignment between principal-agent goals. Once the management is not on the sole owner, two situations can be drawn: the management is given at and \or shared with another family member; the management is given at and \or shared with non-family members. In the first case, if high trust and shared values exist among family members, unlikely create problems. On the other hand, agency costs arise in case of conflicting goals in the family, or from opportunisms or self-control problems. In the case of non-family members, agency costs exist, but can be mitigated by monitoring and incentives. We propose three main structures of the management dimension: a close structure when only family members manage the family business; a mixed structure when both family and non-family members are involved in the management; an open structure when only non-family members manage the family business. These three structures are quantitatively measurable through the percentage of the family members over non-family members.

Increasing attention has been given by literature on the so called “professionalization” of management phenomenon (Chua et al., 2012; Dekker et al., 2013;

Kline and Bell, 2007; Perren et al., 1999; Songini, 2006; Stewart and Hitt, 2012). The adoption of a professional style of management can depend on: (1) the generation in charge (Beck et al., 2011; Klein and Bell, 2007); (2) the absence of qualified family members who want to be involved in the management (Chua et al., 2003); (3) the occurrence of a critical event, such as marriage, divorce, childbirth, employment, retirement and death (Aldrich and Cliff, 2003).

Literature distinguishes three main ways for professionalizing family firms (Dyer, 1989): (i) by professionalizing the members of the owning family; (ii) by professionalizing the non-family employees currently working in the business; (iii) by bringing in outside professional management talent. Due to the evolutionary and incremental changes of the first two types, literature has more focused on the last one: employing one (or more) non-family manager(s) is considered in fact a revolutionary and disruptive change in doing business (Dyer, 1989).

In line with these contributions, in this paper we consider the “outside-in” professionalization of management. We suggest that family corporate governance influence the choice of a business model ideal type (figure 1).

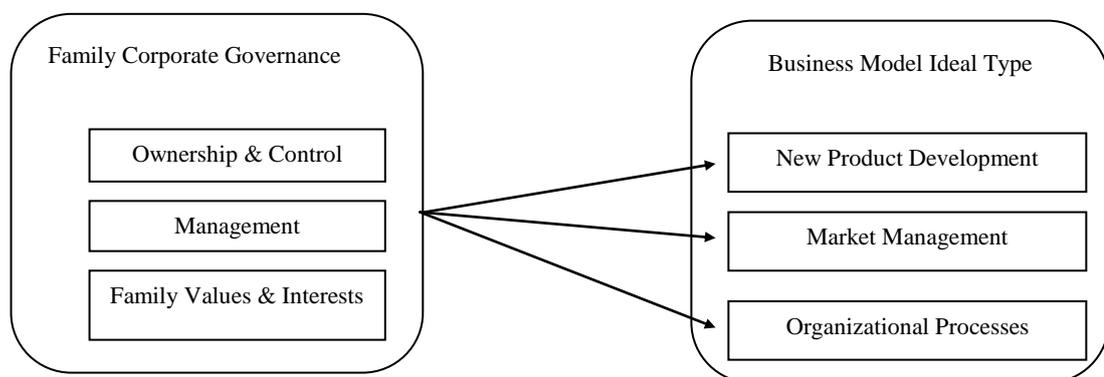

Figure 1: *Conceptual framework*

EMPIRICAL FINDINGS

The sector studied is that of wine. This choice relies on two main motives. First, the wine sector is largely considered a low tech-, traditional sector. Business models have been usually studied in high tech sectors. Second, the majority of wineries are family businesses, often long lasting family businesses. In table 1 the wine family businesses interviewed are depicted. Due to difficulties in finding completely open managed family business, and this is one of the limitations of the study, we present here only close and mixed management structures.

		Management	
		Closed	Mixed
Business Model	NPD	DarComp	PonComp
	MM	TempComp	PriComp
	OP	BerComp	FreComp

Table 1: *Family Business analyzed in Tuscany*

“DarComp” is a start-up company. The owner, Angela Dar, is a young family entrepreneur who is developing a NPD-oriented BM, overcoming the old type of production mainly focused on bulk wine and cost efficiency. The production is going to change, increasingly focusing on bottling of high quality wine through a new organic production and on the construction of a new winery. The firm is trying to improve the innovation process in two ways: by using her father’s companies’ complementary assets (Dar family owns many firms) and by creating synergies with local actors (other firms and the Chianti Classico Consortium; connection with a university to develop new agronomic and productive knowledge). “DarComp” is at its early stage, but the owner knows the company’s strengths will rely on product differentiation and diversification, looking at new wines, such as rosé or sparkling Chianti Classico. This company is a synthesis of tradition and modernity. Tradition since the family values and interests have been transmitted from the first- to the second-generation. Modernity since the first generation has recognized the need of leaving part of its control and ownership to the next-generation, so that the younger family member can become an entrepreneur and build her own company.

“TempComp” is a small company completely family managed. The owner, Leo, began to run the firm in 1992, succeeding to his father. To date, the firm is run by Leo, his wife and an employee who is sitting-by-Leo in order to learn the secrets of wine making. Family values and interests rely on the importance of maintaining the property, but overall

Leo wants to be useful in boosting local development and he is responsible of a local wineries' association. Leo has constantly invested in both production efficiency and research, but today his main concern is about marketing. In 2004 Leo funded a research which made him discovering the characteristics of a unique winegrape, the tempranillo, available since centuries only in the small municipality of San Miniato, a small town near Pisa. but at those times not officially recognized by the Chianti's Production Regulation: Leo uses the tempranillo vine variety in implementing the yield of his vineyard. Tempranillo is suitable for certain types of soil where Sangiovese, the main wine grape used in producing Chianti, yields worst. The main resource in the family business is Leo's wife, the marketing manager. According to Leo, although the quality of wine is important, communication and promotion are to date the most important and fundamental strengths of the family firm: *"In this moment, the most important thing is the communication [...]. To sell directly wine to final consumer is difficult and limited to those living near the winery. However, it is important to know the importers outside Italy and we travel a lot going with them to their clients. Moreover, the web through its social networks, is disruptively changing how to sell"*.

"BerComp" is one of the family companies owned by Dar family. Dar are two brothers and possess three companies: a digger company, the core family company, a green-service company that focuses on providing services to local wineries such as planting vineyards, and "BerComp", a winery. The business model applied by "BerComp" is the OP-oriented BM. In fact, the family business focuses on reaching organizational process efficiency by using the other family companies' complementary assets. The company's value offering has by far consisted in cask wine and bottled wine. The family interests pursued are linked to the willingness to grow and make synergies among proprietary assets. In particular, as the "DarComp" case has shown, the first-generation entrepreneurs are willing to make second-generation responsible for their own business, leaving it the control of part of the assets owned.

At the end of 2011 the brand "PonComp" and the main factory in Tuscany were bought by a US corporation, while the vineyards remained under the control of LMN family. This brand, founded at the end of XIXth century, represents part of the history of the Italian oenology. The firm has been controlled since 1910s by LMN family which has been the pioneer in the export of Chianti wine in the world. The family interests rely on maintaining the ownership on the estates, but at the same time to preserve the family values of attention to traditions and to social environment. Recognized its limits, the family gradually left the

management to non-family members and, at the end, decided to sell the brand. In doing this, however, it made sure of sharing its values, founded on continuous innovation in the respect of tradition, with the new management.

“PriComp” belongs to DEF family, an Italian aristocratic family. The estate “PriComp” belongs to DEF since XV century but until 1980s, the family did not manage the firm, since DEF family had numerous estates and was not able to be physically present in each of them. Since 1981, due to succession motives, Pri DEF became the owner and the manager of “PriComp”. In early 1990s, Pri made process innovation investments in order to minimizing risks and costs. Although wine remains the core product, more recently, “PriComp” has diversified its activity through farm holidays services. Moreover, since the end of 2011, a non-family export manager has been responsible for marketing activities and management. To date the company is present on more than 60 countries and it is mainly pursuing a market management oriented business model. This is well expressed in Pri’s words: *“Today the strength is in the export. [...] The priority is to reach the North Star. Once the organization has been stabilized, goals and priorities are focused on the promotion and the extension of the selling network and countries”*. The values and interests of the family rely on the preservation of the estate and on giving the family imprinting to the products. What is important is the way the owner is able to find new products rooted in the tradition. It is the owner who decided, although he is helped by external managers. Managers are like football players. The owner is their coach.

GHI is one of the oldest Italian aristocratic families. GHI’s winery “FreComp” story began in 1950s when Pluto, second-born of Sempronius, became the family leader and manager of the agricultural and wine production. The decision of dividing the managerial part from the property has been done in light of future succession. Two separated entities were created: “GreComp” ed “FreComp” (totally owned by “GreComp”). GHI family still owns and controls the wine family business. A mixed participation of family and non-family professional members in the management of the company is in course. The business model pursued by the family business is a OP-oriented BM. “FreComp”, in fact, diversifies its value offering providing both multiple wines and also services (several restaurants and wine bar has been open around the world), but its main concern is to assure a guaranteed income for the family shareholders. This is pursued with the effort in consolidating the company’s position. GHI family is interested in shared comparison and evaluation among all family members. Its values rely on the willingness to maintain separated the real estate used by the

industry from the individual personal properties. These motives lead the owner to introduce succession pacts.

The cases presented show that different family corporate governance structures exist for each business model ideal type, but a deeper investigation is required in order to understand possible patterns among them.

DISCUSSIONS AND CONCLUSION

This paper proposes to investigate whether a missing link exists between business model choice and corporate governance structure in family firms' studies. The connection has been neglected on the one hand by the business model literature, which considers the corporate governance as integral part of the firm's business model; family business literature, on the other hand, has completely bypassed business models conceptualization, identifying the family firm as a business model in itself and focusing its attention on ways to capture and create value depending on intrinsic characteristics of the family business.

We draw on evidences emerged in the two streams of literature, i.e. the business model and the family business fields of research, and integrate them with the different types of governance structures that can characterize a family firm. In this way we provide two main contributions. On the one hand, at the theoretical level we conceptualise that different business models can be linked to different family corporate governance structures. On the other hand, the empirical cases, although not complete since we have not been able to find open management, provide a first qualitative support of the model proposed, in view of a wider international comparative analysis. Moreover, to our knowledge, this is the first study applying business models concepts to the wine sector. As suggested by the case studies provided, different business model choices are available to family firms. However this work represents the first step of a wider research project and further evidences must be provided in order to validate our proposal. Future research shall be able to look at patterns between business model choice and family corporate governance, and possibly to link them to family business performance. The theme merits further developments, as it should be of interest for both academics and practitioners.

THE ROLE OF ART IN LUXURY MANAGEMENT

Chailan, Claude

IUM – International University of Monaco, cchailan@monaco.edu

ABSTRACT

Our overall goal is to examine the nature of this relationship between art and luxury brands, particularly the similarities, differences, complementarities or conflicts between the different modes de liaison linking art and luxury brands. By mode de liaison we refer to the type and nature of the relationship between an artist or an artistic event and a luxury brand.

The data come from the study of publicly available data from companies who are members of the Comité Colbert in France and the Altgamma Association in Italy. . It is considered that both countries represent up to 55% of worldwide luxury goods sales, and it was therefore logical and reasonable to focus on luxury brands from these two countries.

A careful study of the artistic initiatives of each member brand in the two associations allowed for the identification of four modes de liaison between luxury brands and arts. These four modes de liaison are: artistic mentoring, business collaboration, foundations, and patronage.

The research demonstrates that luxury brands are seeking to transfer the distinctions they convey towards a set of inimitable values by migrating to a more sophisticated and more elitist ensemble of codes, and that art is ideally suited to this migration, because its access is complex and its understanding difficult for outsiders. Art de facto moves the exclusivity associated with luxury to a higher, more inaccessible level and more difficult for competitors to copy.

Keywords: Arts, Brand management, Luxury goods and services, Art and Luxury

1. INTRODUCTION

Over the last twenty years the market for luxury products and services has grown dramatically with an estimated sales of more than 200 billion Euros in 2012 representing an increase of +7% over 2011, and forecasts of 250 billion Euros in 2015 (Kapferer and Bastien, 2009; Altgamma, 2012). The evolution of some companies is even more impressive: For instance, in 1977 Louis Vuitton was a family business with sales of 10 million Euros but nowadays invoices €6 billion per year.

During the same timeframe art has become a major component to this evolution because art allows being out of the ordinary (Fillis, 2010) at a time when the proliferation of signs, commoditization and massification of luxury (Nueno and Quelch, 1998; Thomas, 2007) require luxury brands to distinguish themselves from and beyond the mere product. As stated by Patrick Thomas CEO of Hermès¹³: "*... I am wary of the paradox of luxury: The more one is desired, the more one grows, but the more one grows, the less desirable*".

While the worlds of art, fashion and luxury are growing closer together every day, a key question which thus arises is the need to better understand the links between art and luxury brands.

Within this context of mutual enrichment between art and luxury brands, we examined the diversity of the relationships which can exist between luxury brands and art because a clarification of these relationships could expand knowledge in luxury brand management including its strategic dimension (Riezebos, 2003; Berthon *et al.*, 2007).

2. ANALYSIS

We have chosen to study the links between art and some of the main French and Italian luxury brands. For historical reasons, these two countries represent the largest portion of the world's luxury goods. The data come from the study of publicly available data from companies who are members of the Comité Colbert in France and the Altgamma Association in Italy. These two associations unite most of the key players in the luxury field in each country, with very strict membership criteria. Moreover, membership is by co-op nomination, providing a guarantee for brands who are already members that any new members will uphold the standards in place. Alone, the 75 luxury houses of the Comité Colbert hold a quarter of the global luxury goods market with a turnover of 39 billion dollars and 115,000 employees in France.

We have identified a total of 152 luxury brands, either product- or service-oriented, of which 76 are members of the Comité Colbert while 76 are Altgamma Association members<. Then, for each of the remaining brand we researched if they were engaged in any initiatives connected to the arts. Table 1 summarizes the data resulting from this analysis.

¹³ Feb. 2011

Table 1: Analysis of the number of luxury brand members from Altagamma or Comité Colbert and their involvement in artistic initiatives.

	ALTAGAMMA in number of companies	In %	COMITÉ COLBERT in number of companies	In %
Total number of brands who are members of the association	76	100%	76	100%
Of which are not luxury goods or services-oriented or are redundant	14	18%	13	17%
Total number of luxury brands	62	82%	63	83%
<i>Of which have no specific arts-oriented linkages</i>	26	34%	32	42%
Total number of luxury brands with arts-related actions	36	47%	31	41%

67 luxury brands representing 44% of all the brands member of both organizations are engaged in an action related to the arts. This percentage rises to an average of 55% (58% for members of Altagamma marks and 49% marks for the members of the Comité Colbert) of all the luxury brands which are member of the two associations, i.e. more than a luxury brand has developed some systemically institutionalized link with art.

In a second phase, we looked at which brands were connected to which arts-related initiatives.

A total of 106 links between luxury brands and art have been identified (52 for Altagamma members and 54 for Colbert members). This figure is higher than the number of luxury brands involved in arts because one brand may intervene in one or more artistic fields. For instance Gucci is offering some patronage, artistic collaboration too and also created a foundation. In the same vein Cartier has a foundation and is also patronising some artists.

A careful study of the artistic initiatives of each member brand in the two associations allowed for the identification of four modes de liaison between luxury brands and arts. These four modes de liaison are: artistic mentoring, business collaboration, foundations, and patronage. Table 2 synthesises this information:

Table 2: Categorisation of the links between luxury brands and art

	ALTAGAMMA <i>in number of companies</i>	<i>In %</i>	COMITÉ COLBERT <i>in number of companies</i>	<i>In %</i>
Number of arts-related initiatives made by these luxury brands	52	100%	54	100%
<i>Of which:</i>				
Artistic collaboration and commercial creations by artists	25	48%	18	33%
Patronage	18	35%	21	39%
Foundations	7	13%	8	15%
Support to creation and artistic mentoring	2	4%	7	13%

3. INTERPRETATION: : ABOUT THE CONSUBSTANTIALITY BETWEEN ART AND LUXURY

From a traditional perspective, luxury is made even more luxurious because it is unavailable to everybody else (Wetlaufer, 2001; Silverstein and Fiske, 2003).

However, this traditional vision clashes with significant evolution in the luxury universe (Wiedeman *et al.*, 2007) over the course of the past fifteen years, characterized by two complementary factors.

The first factor is the growing potential of an upper-middle class who is achieving a certain level of financial comfort, particularly in developing countries. This upper-middle class now possesses resources and can tap into a financial surplus which may easily be reutilised in purchasing products with strong symbolic value – luxury products – thus permitting them to move from financial comfort to true social recognition.

The second factor is the recent emergence of true multi-national luxury companies – such as LVMH, Kering, Richemont – which due to their size and their economic visibility (stock value for example) self-generate their own need for steady sales and profitability growth; even if they are not willing to recognize it as such.

The conjunction of these two factors in some ways makes the traditional luxury model (based on rather drastic management of rarity with price as a major adjustment variable) obsolete.

For this reason, luxury brands seek to transfer the distinctions they convey towards a set of inimitable values by migrating to a more sophisticated and more elitist ensemble of codes, more difficult to understand by external stakeholders.

Art is ideally suited to this migration, because its access is complex and its understanding difficult for outsiders. Art de facto moves the exclusivity associated with luxury to a higher, more inaccessible level and more difficult for competitors to copy.

As stated by Fillis (2011), *“Today’s business realities have impacted heavily on the arts”* and a large number of companies in the luxury sector use art to increase their brand’s notoriety at the international level. The more luxury brands democratise themselves, the more they need art so as to preserve a certain distance with the non-luxury world, and thus maintain a distinct image and thereby source of creating value and margin.

Art is less an object for advertising communication than luxury brand’s vehicle for luxury itself. Its introduction brings about interference within borders and hierarchies resulting in luxury consumers seeing themselves elevated to the ranks of art amateurs. As such art introduces a contribution of symbolic and aesthetic values destined to neutralise risks from the industrialisation of luxury. Using art to create a dramatic setting at the heart of a luxury brand contributes to the metamorphosis of the merchandise’s profane character into sacred value.

The relationship between art and luxury is thus proportional to the increasing ease of access to luxury products and services, as the essence of the luxury brand exists much more by the distancing environment and experience it creates, promotes, and maintain.

In this manner, the juxtaposition of a luxury brand with arts allows a company to generate a long-lasting sustainable competitive advantage and make the luxury brand model difficult to copy due to its idiosyncratic nature, and because it is a powerful generator of causal ambiguity (Weick, 1976; Orton and Weick, 1990). When the bonds between arts and a luxury brand are so intense, it becomes impossible to determine if art is in and of itself a source of competitive advantage, or if the results it generates are not themselves the origin of the luxury brand’s perceived values.

THE GOVERNANCE OF 'COLLECTIVE' STRATEGIES FOR INTERNATIONALIZATION: SMALL BUSINESSES IN THE ITALIAN WINE SECTOR*

Ciasullo, Maria¹; Festa, Giuseppe²

¹Business Economics and Management, University of Salerno, Italy, mciasullo@unisa.it

²Business Economics and Management, University of Salerno, Italy, gfesta@unisa.it

ABSTRACT

The Italian wine sector is dominated by small businesses, which due to reduced demand for domestic consumption, are required to access international markets for survival and growth. By virtue of their limited size and the consequent scarcity of resources, inevitably, the feasibility of collaborative strategies on the part of the various manufacturers - not always facilitated by profound differences - has to be evaluated.

Our study therefore proposes to investigate in the first instance whether it is possible to successfully activate 'collective' strategies of internationalization for small wineries and, secondly, to define what the main factors of cohesion in such collaborations might be. The research, in particular, has focused on the case study of the 'Enoteca Provinciale di Salerno', chosen because it works as a relationship facilitator in a territory which has at the same time both much in common with many other areas (as concerns the fragmentary nature of wine production) and differences compared to many other areas (in terms of wealth of tourism, sightseeing, history, and culture in general).

The study attempts to demonstrate that collective strategies of internationalization for small wineries are not only possible, but also far-sighted, as in the case of the 'Enoteca Provinciale di Salerno'; in addition, one of the most important factors of cohesion is the promotion of the territory in general, with relevant implications, both scientific and managerial. The research, of an exploratory nature, provides interesting insights for further contributions as a follow-up to empirical research, already in progress, on the population of the wineries, members of the Enoteca.

* This paper is the result of a collaborative study on the part of the authors. More specifically, the paragraphs "Introduction", "Networks of Relations in the Internationalization of Small Businesses", "The Connector in Internationalization Networks" and "Research Objectives and Methodology" are the work of Maria V. Ciasullo; while the paragraphs "The Case Study of Enoteca Provinciale di Salerno", "Research Results, Implications and Developments" and 'Conclusion' are the work of Giuseppe Festa.

Keywords: Wine sector - Small business - Internationalization - Wine marketing - Terroir - Collective strategies - Network - Support services.

INTRODUCTION

In wine markets, if on the one hand increasing sales (at least for Italian wineries) on foreign markets (Mele and Russo Spina, 2008) is inevitable, on the other, it is of paramount importance to define collaborative forms of cooperation in order to survive and compete within the scenario of international dynamics of wine production (Chetty and Wilson, 2003; Green et al., 2003; Dana and Winstone, 2008; Muecke, 2008).

The steady reduction in domestic consumption of wine, in fact, has pushed Italian wineries to take into account the internationalization of their products. Exporting, is no longer considered an opportunity, but a real necessity (Italy, in fact, exports more than 50% of its production - Ismea, 2013). This state of affairs however is not immune to problems, both in quantitative and qualitative terms.

As concerns *quantity*, Italy remains the first exporting country in the world for quantities (millions of hectoliters) while for values (millions of euros), Italy is second only to France (Ismea, 2013). However, in recent years the country has had to face a more aggressive policy on the part of other countries, especially those of the New World, and continental Europe (Spain in particular). As regards *quality*, Italy is historically linked to its numerous *ampelographic* varieties, declined in infinite combinations with each *terroir*, making it extremely complicated to recognize Italian wines abroad.

With international competition in mind however, it is as well to remember that continental Europe (Italy in particular; perhaps with the exception of France) has never shone for marketing capabilities on the wine markets, contrary to the New World, which is much more proficient in the promotion of its products (Resnick, 2008). The delay, in the case of Italy, can most probably be traced to the infinite variety above mentioned, together with the poor – often completely absent – capacity for aggregation between companies (Raimondi, 2004; Cesaretti et al., 2007).

On the other hand, the New World, in order to overcome the lack of a solid albeit antique winemaking tradition (at least compared to Italy and France for example) has imposed on

international markets, thanks to decisive marketing capacities, a taste defined as 'international', based mainly on the 'drinkability', often of good quality, of the *allochthonous* grape varieties (now also defined 'international'), such as Merlot, Cabernet Franc, Cabernet Sauvignon, Syrah, Pinot, Chardonnay, Sauvignon Blanc, often not contextualized within a specific *terroir*.

Therefore, the strategic opportunity of success of Italian wines on international markets would seem to depend on the following trade-off: a focus on the aggregation of wineries, dropping the identity of often unique products, both in terms of quality and personality, achieving scale and / or experience economies; a focus on the extraordinary wealth of the *ampelography* (varieties and clones) and the geography (denominations and *terroir*) of the national wine heritage (Rea & D'Antone, 2010) difficult to communicate because hyper-fragmented but at the same time fundamental. Investing in the enhancement of national wines inevitably means managing complex micro-productions characterized by the following structural constraints:

- small size of most firms, which leads to the necessity for reflection on the specific features of small businesses, particularly with regard to the lack of adequate financial resources and managerial skills;
- consequent fragmentation of the sector;
- intrinsic differentiation of the offer, at the same time both strength and weakness of small wineries (Corrado & Odorici, 2009);
- consequent poor control of distribution channels, due to lack of strong bargaining power in the hands of producers in the light of such limited dimensions;
- entrepreneurial individualism, result of short-sighted pride, characterized by mistrust and the reluctance to establish strong relationships with a collaborative working valence (Rossi, 2008). Some authors believe that the main element of competitive discrimination resides particularly in cognitive and cultural aspects (Zanni, 2004): in Italy, as often happens, an entrepreneurial structure, characterized by a generalized overlap between proprietary and managerial functions, together with the highly centralized and autocratic character of the entrepreneur, is oriented towards production rather than towards strategic, managerial and commercial components and therefore often unable to acquire the knowledge, skills and experiences, necessary to support adequately the dynamics of company development.

Given the relative scarcity of resources and the physiological aversion to engage in collaborative strategies of development, wineries often find themselves in difficulty as concerns planning, on the sole basis of internal forces, their lines of expansion into foreign markets. Internationalization in the strict sense of Italian wineries is generally limited (Pomarici and Boccia, 2007), while other authors (Mastroberardino, 2002; Zanni, 2004; Zaghi and Troilo, 2006) believe that the competitiveness of Italian wine in the world is crippled by the lack of a truly international strategy for growth and development, especially considering the managerial shortcomings of the sector.

Therefore, the opportunity of outlining a theoretical framework on the subject would be justified, not only to analyze and interpret the strategic behavior of wineries in the processes of international development, but also and above all, to identify potential organizational structures, suitable for sustaining and supporting commercial proposals on foreign markets. One possible solution might be merely to invest in aggregation operations: the question however posits on the way to retain product identity (or rather, the identity of the wine producer) within such relations of cooperation.

In this sense, cooperation (or what we could call '*coopetition*') would seem to have a huge potential in terms of enhancing local specialties, to gain a satisfactory economic-commercial positioning on international markets. In terms of method, a solution can be found in the aggregation of enterprises for promotion of the territory, as our analysis of the 'Enoteca Provinciale di Salerno' case study clearly reveals.

NETWORKS OF RELATIONS IN THE INTERNATIONALIZATION OF SMALL BUSINESSES

In the context of internationalization strategies, the literature has identified 'new forms of internationalization' or relative 'relational methods', highlighting on the one hand their more structured rather than commercial status and on the other, their flexibility compared to hierarchical organizational scenarios. For instance, the reticular perspective (Johanson and Mattson, 1988) interprets markets as networks of relationships among enterprises.

In perceiving the lack of resources and information as a key constraint in the various stages of internationalization, this theory proposes a phased approach, although not deterministic, especially for small businesses with a limited knowledge of foreign markets (Jolly et al., 1992; Knight and Cavusgil, 1996; Oviatt and McDougall, 1997). Therefore, interesting implications

emerge relative to the analysis of 'networks', a crucial factor for better understanding and addressing the issue of internationalization strategies for small businesses.

One strategic option in this sense, can be identified in the collaborative relations among businesses (Hagedoorn and Dysters, 2002; Eisenhardt, 2002; Lawrence et al., 2002). The minimum common denominator of potential strategies of cooperation is the centrality of the relational dimension among the different actors involved that encourage synergies not only in terms of scale, experience and scope economies, but also in terms of exploitation of other resources, shared via reticular configurations with a collaborative, cooperative and/or *coopetitive* nature.

The progressive loss of company viability, in a highly complex and globalized world, has led to consolidated, competitive cooperation, achieved through the establishment of close relations relative to more extensive chains, even of competitors, capable of initiating processes of international development characterized by high flexibility and reversibility. Some authors believe, more specifically, that a network-oriented approach represents one of the entrepreneurial ways that small businesses should be run with major efforts to compete on international markets, by minimizing the limits related to their size and favoring the process of internal learning (Håkansson and Snehota, 1995; Madhok, 1997; Rutashobya and Jaensson, 2003).

In this perspective, the ability of businesses does not reside exclusively in the internal resources, knowledge and capabilities, but particularly in the identification and exploitation of synergic opportunities with partners (Achrol, 1997; Doz and Hamel, 1997; Sarkar et al., 2001). The evolutionary trajectories taken by such small businesses should therefore be interpreted to the effect that through the construction of vertical (suppliers and customers) and horizontal networks (with competitors), they have benefited from access to resources not available internally, by getting, at the same time, a critical mass of skills, that are relevant to international competitive positioning (Zucchella and Maccarini, 1999; Lipparini, 2002).

However, the logics of the network, to be truly multiplicative, requires that among the nodes of the network, knowledge exchange and resource sharing are activated, if possible even in terms of sensitive information about research, production, marketing and so on, which, because characterized by a high distinctive potential, often result as jealously protected by firms (Rullani, 2009). Sharing knowledge, however, can become an incentive for further

development and innovation, with significant effects in terms of value generated by the continuity of relationships.

Consequently, networks are a source of competitive advantage if they assume a strategic (Gilmor et al., 2000; Carson et al., 2004) and proactive (Achrol, 1997; Sarkar, 2001) dimension, in particular in the operating environment of small businesses. As concerns the strategic element, openness to relationships of trust, more extensive collaborations (in / between / among sectors), allow businesses to access to important cognitive resources in a stable way, with the possibility of activating more structured processes of international growth in terms of market orientation, distribution channels, communication, and organizational assets. The pro-activity of the networks, however, depends on the greater or lesser awareness of the actors of their 'belonging' (Pellicano and Ciasullo, 2010) to a system of relations and on the consequent ability to activate specific connections in considering the company not as an isolated entity, but as an interactive and flexible component of a system.

In the field of entrepreneurship studies, how connections (as formal and / or informal links) evolve during the life of the business is also shown (Falemo, 1989). In particular, the ability to develop structured relationships with other organizations, characterized by strong strategic importance, seems to be manifest in the phase of growth and development of the enterprise life cycle, while in the start up phase networking activities are reactive and personal for the most part (Granovetter, 1985).

The way in which a small winery, necessarily oriented to some forms of internationalization, can take advantage of the opportunities of collaboration (and in particular of 'networks') with competitor wineries would be interesting to study and how, although in *coopetition*, each firm retains its own identity in terms of varieties, clones, denominations and *terroir*. Before achieving an 'institutional' functioning of such collaborations, in an n-tuple form, it might be useful, especially in the early stages (on the basis of the previous consideration, almost assimilating in a certain sense networks to enterprises), to count on a sort of 'guarantee' effect, often of a personal (or, consequently, associative) nature.

THE CONNECTOR IN INTERNATIONALIZATION NETWORKS

The adequacy of the relational and reticular perspective in interpreting the processes of internationalization of wineries must be analyzed taking into account above all, the territorial component, as a factor that can facilitate or otherwise, the structural or cultural attitudes to

internationalization on the part of businesses. Facing the complexity of the competitive environment (and in particular the social, economic and institutional constraints of the international context in which enterprises of the fragmented and sometimes pulverized wine industry operate), the ability to create a system of relationships with public and private institutions of the territorial system plays a fundamental role to enable the enterprises in the supply chain to access a wider range of resources, so as to facilitate the processes of international development.

Research conducted on a national basis (Pomarici et al., 2007; Migliaccio et al., 2008) suggests that the network can be used as a privileged instrument for establishing, maintaining and developing stable relationships over time, making it possible to start joint projects, up to the point of sharing, in some cases, business risks. A significant example in this sense, is the 'collaboration' (or '*coopetition*') between the Italian cooperative firm Caviro (the first Italian group for basic wines) and the French firm Val d'Orbieau (the fifth wine group in France), based on the exchange of know-how for the optimization of organizational processes, joint purchases and actions in common for the development both of marketing intelligence and to contrast the competition from New World countries (Ismea, 2005).

Therefore, partnerships can aggregate for access to new markets, gaining real forms of joint internationalization of production or distribution. This phenomenon is still limited quantitatively speaking, but very significant in qualitative terms: consequentially, we have on the one hand the need for innovative business strategies and on the other, the necessity for new forms of governance designed to achieve them concretely.

In this perspective, a particularly important role is played by entities that vehicle liaisons and coordination in terms of connections to networks of relationships (Burt, 2005). Such entities, normally public /private, by facilitating the circulation of information flows and knowledge, encourage cooperative action thanks to the activation of fiduciary mechanisms. These reside primarily in their guarantee function relative to the effective working of the network, by avoiding 'particular' positions and stimulating ongoing planning and guidance in the decision-making processes for each components of the network. Entities in their function of facilitators and connectors of large relational and reticular systems to support within broader internationalization strategies, need to possess specific characteristics:

- stable, durable and 'reliable' participation in the local-foreign relations system; an active part of a dense social network (Granovetter, 2004);

- components of local networks, but possessing the appropriate communication codes to enable them to interact with facilitators / connectors of other countries;
- a functional 'open' system of relations, establishing not only durable, but also permeable connections to enhance the strength of 'weak' bonds, by means of which new information, new knowledge, new skills, new experiences, new contacts and further new relationships can be acquired;
- capacity for interconnecting strictly economic initiatives with others of a non-economic nature, to help strengthen the social roots of an economic system (mainly, but not only, territorial) to increase the opportunities for relationships in order to enhance the value of the connections to favor the development of new knowledge. Such an approach could be easily adapted to a 'collective' strategy (Astley and Fombrun, 1983) consisting in a network, the objective of which would be mainly to develop initiatives for promotion and for territory marketing, capable therefore of enhancing a given territory and projecting the same in the international competitive arena. In other words, devising business paths capable of binding a winery's image to territories and local systems, well defined and characterized by traits that highlight the will to work on a idea of territory, active and identity-laden, as a result of co-evolution and sedimentation processes (Magnaghi, 2010), on the one hand by strengthening the local roots of the winery and on the other by rendering the territory globally visible.

From the point of view of individual wineries, such a configuration could provoke the renouncing of a portion of decision-making autonomy, to achieve a potential harmonization of interests with those of other actors in the network. According to this view, enhancement projects require governance mechanisms to foster synergistic collaborations and coordination processes through project management for the harmonious development of enterprises and territory.

In a customer-based perspective (Busacca, 1994; Cantone, 1996), enterprises in the network can be considered beneficiaries of a commercial system with a solid image, based on shared values and characterized by a precise competitive positioning (Franch, 2002). Such distinctiveness, represented in a symbolic, experiential and cultural perspective, can act as an undoubted amplifier of attractiveness in the global consumer behavior.

Therefore, in the context of the wine sector, the need emerges to establish connectors capable from an integrated and systemic logics perspective, on the one hand of encouraging forms of networking among local businesses and other categories of stakeholders, both public and

private, operating in the domestic and international field, and, on the other, of supporting appropriate coordination mechanisms including support for services that represent a point of reference for the realization of investments. In this direction, therefore, we argue that interesting opportunities for study are emerging.

RESEARCH OBJECTIVES AND METHODOLOGY

Evidently, the internationalization of small wineries becomes the only obvious choice not simply one of the potential strategic options. Inevitably this leads to 'collective' strategies, characterized by strong collaboration, given the evident inability of a small winery to cope with the challenges of internationalization – which, however, seems inescapable – on its own.

Our research focuses on the issue (widely debated in the literature, but not practiced in real business and especially difficult to apply in the wine sector) of collective strategies of internationalization. We reason about the need for small wineries to become consolidated in foreign markets, together with the opportunity to differentiate themselves from their competitors, i.e. other producers in the wine industry belonging to the same territory. This implies at least two research questions.

Can small wineries, limited as to production quantities and profoundly different in the individual expression of the offer, collaborate in promotion on foreign markets without losing their specific corporate identity? (first research question).

If so, what factors of cohesion can such companies invest in for a 'coopetition' relationship, addressed not only to the generic 'foreign' market, but in particular to single and specific foreign markets? (second research question).

As to the research methodology, having a mainly exploratory intent, we attempt to verify how the literature has identified in the 'network' the critical point for better understanding and addressing the internationalization strategies of small businesses. At the same time, the fundamental role played by entities engaging and supporting businesses in cohesive processes of growth and consolidation on the international markets is highlighted. Subsequently, by means of a case study methodology, an empirical investigation is put in place with the object of analysis the 'Enoteca Provinciale di Salerno'. By means of the case study approach, starting from the two research questions, as a preliminary step, we attempt to verify from the perspective of the collective reference organism, whether there is the

disposition of small winemakers towards internationalization and collective strategies, rendering visible at a subsequent stage, the enablers or impediments to their implementation.

Inevitably, the results of the study are limited to the context of the survey ('Enoteca Provinciale di Salerno') with the relative disadvantages in terms of extension of applicability while advantages concern a better understanding of the problematic issues and / or perspectives of a specific territorial context (Yin, 2005). As emerges, however, the territory of Salerno, when compared with other Italian wine regions presents at the same time, particular traits and traits in common which characteristics are both significant in the analysis of any case study.

THE CASE STUDY OF 'ENOTECA PROVINCIALE DI SALERNO'

After an initial trial period starting in 2003, on the 15th of December, 2008 the 'Enoteca Provinciale di Salerno' was officially founded; operations started in 2009 and to date (2013) it numbers 37 members of which 35 are wineries (other members are the Provincial Administration of Salerno and since the end of 2011, the Chamber of Commerce of Salerno). The Enoteca is a public-private association, whose mission is the promotion and enhancement of the wines of the province of Salerno, by virtue of "... actions aimed at communicating the excellences of the territory and the development of tourism promotion in the territory" (we thank Mr. Ferdinando Cappuccio, President of the 'Enoteca Provinciale di Salerno', for his kind cooperation given).

In the province of Salerno, in particular, there are actually only wineries characterized by small production: Bruno De Conciliis (about 250,000 bottles), followed by Raffaele Marino (about 120,000), Marisa Cuomo (just over 100,000) and Luigi Maffini (100,000) (data from 'Enoteca Provinciale of Salerno', 2013). Also because of the limited business dimensions, virtually all of the wineries in the area (except for very few businesses waiting to join) have found it useful to aggregate within the Enoteca, in order to share experiences, projects and resources, in terms of internationalization, the latter aspect being of particular interest in the context of this work.

Although we have described internationalization as a necessity for survival and development for the wine industry, going abroad evidently, is not easy, because costs – at best in 'investments' – are higher than those needed to operate on the domestic market. This scenario affects above all small businesses, distressed from a financial point of view, especially in

times of recession and credit crunch. Costs are even more incisive when management of the investment is on an ongoing basis (in terms of strategies, programs, processes, etc.) as opposed to one-off initiatives).

Internationalization - Third Countries: Canada, Brazil, Shanghai, Qatar, Argentina, China, Russia and Countries of the Former USSR.

So far, internationalization actions developed by the Enoteca (and therefore in a broader sense 'collective' for member wineries) have focused on the 'Programs for the promotion of Italian wine in Third Countries', governed by AGEA, for promoting abroad not individual brands and products, but in general wine of the Salerno area (whose main and most characteristic grape varieties are Aglianico, Piediroso and Tintore for the reds, and Fiano, Biancuzita and Biancolella for the whites). In particular, in these programs the Ministry of Agriculture and Forestry Policies (MIPAF) has funded 50% of the total expenditure and the Regional Administration of Campania 20%, with the remaining 30% paid by the promoter (i.e., the Enoteca, along with the wineries participating in the project).

It should be noted that AGEA is an acronym for 'Agenzia per le Erogazioni in Agricoltura - Agricultural Payments Agency' (see www.agea.gov.it), that is the Organism for Coordination and Payment in Italy of funding for producers, in terms of aids, grants and awards, made available by the EAGF (European Agricultural Guarantee Fund) and EAFRD (European Agricultural Fund for Rural Development). For 'third countries', we intend nations not part of the European Union.

The initiatives of 2011 and 2012 (both leveraging on the 2010 Call) were aimed in particular at two countries, Canada (2011) and Brazil (2012) respectively. The choice was made in consideration of two fundamental aspects: the growth rate of the economies in question (in the macroeconomic sense) and the rate of growth of exports of the Italian wine sector to these countries.

The actions, more specifically, were aimed at affirming the image, and attraction on the market of wine from Salerno, from an institutional perspective to promote wine coming from the territory in general (through print ads and TV production of multilingual promotional material, development of incoming / outgoing service activities and wine casting) rather than to promote its sale on an individual or collective basis.

Of the two countries covered by the action of internationalization, Brazil has definitely proved itself the most interesting. Firstly, because it is a rising economic nation, with evident ongoing development of disposable wealth and consequent demand for goods with a high added-value, Canada on the other hand is administratively based, as regards the import of wines, on a monopoly which certainly does not facilitate the smooth entry of the wine flow to the country.

In addition, wineries from Salerno generally have an average quality / price ratio, which normally is an attractive proposition for wine consumers. In Brazil, in the Italian wines segment there is very aggressive price-based competition, especially with Lambrusco; in terms of benefits for the wine from Salerno, however, the Brazilian market, as a consumption system, is changing fast: if until the recent past any Italian wines, merely because 'Italian', were absorbed indiscriminately, now the Brazilian market is beginning to be more selective, thus benefiting offers of higher quality and distinctiveness.

In Canada and Brazil institutional relations were held respectively by the Italian Chambers of Commerce of Ontario and Sao Paulo, with home based support in Italy for planning and implementing from the Provincial Administration of Salerno and in particular, from the Offices dealing with Production Activities. In both cases it was possible to establish relations with many buyers, while in Canada there were buyers interested in orders relating both to quantity and quality, in the case of Brazil, thanks to the Canadian experience, meetings were held with buyers especially interested in the quality of the product for trading in particular through two main distribution channels: restaurants (mostly Italian) and wine-shops (most of all, 'gourmet').

Since 2011, moreover, there has been official collaboration with Intertrade, a Special Agency (for internationalization) belonging to the Chamber of Commerce of Salerno, which has proved fruitful for at least two reasons: its undoubted competence and skills in organizational / administrative terms and greater (if compared to the Enoteca) availability of financial resources to respond to potential opportunities deriving from Calls. In particular, by virtue of Intertrade it has been possible to activate 1) the AGEA 2011 fund (in 2012) for Switzerland and Shanghai; and 2) the AGEA 2012 fund (to be carried out in 2013 and 2014) for Qatar (because of its elitist tourism system), Argentina (because of the large Italian community), Russia and other countries of the former USSR.

Again in 2013 / 2014, in addition, the Enoteca, due to the action of the Provincial Administration of Salerno, will have access to the AGEA 2012 fund for Brazil and China.

Other projects abroad: Denmark.

In 2010 and 2011, pursuant to specific collaboration with Coldiretti and Intertrade, the Enoteca participated in a multiple project, which aimed to enhance various food products of the Salerno area, including in particular, wine, cheese, tomatoes, anchovies, tuna and coffee. Denmark was chosen as the foreign market for this promotion campaign because several businesses (associated with Enoteca or otherwise) had had previous experience with Denmark, working and investing in that market: therefore, it was natural to return for a follow up of the promotion action, at the same time involving other producers of the territory in the initiative.

Results and implications of the actions of internationalization.

Even for small wineries, like all those affiliated to the Enoteca, it is essential to work in foreign markets. In fact, even though volumes, sales and margins might be limited, in any case proportionately, important results have been achieved for small business, which necessarily have to compete on several fronts (commercial, organizational, administrative, and so on). Other benefits arising from internationalization affect the image building of the territory (which leads to the image building of wines and brands), the acquisition of experience in international contexts and processes, without neglecting more 'cynical' benefits: in fact, the payments from abroad, almost paradoxically, are often safer than Italian payments, that nowadays are at rather unsustainable levels of sufferance.

The collective actions of marketing, in the specific case of the 'Enoteca Provinciale di Salerno', has worked primarily as a 'battering ram', i.e., to facilitate entry to international markets, in order to raise product awareness, enriching, especially in the case of wine, the contribution of the *terroir*. These initiatives, were mainly limited to an initial phase, postponing to a later stage fundamental individual commitment on the part of individual businesses.

As regards the governance of the collective action of internationalization, it should be specified that Enoteca, even though providing coordination facilities, offers only a service of

temporary support for participating wineries, its role being that of 'facilitator / connector'. Downstream, as mentioned previously the drive of individual wineries is necessary. In any event this is possible above all by virtue of the ongoing improvement of entrepreneurial and managerial skills.

In short, the mission of Enoteca is the promotion of wine and wineries of the province of Salerno and the organism intervenes only when no specific business role in the strictest sense is involved. Accordingly, it works as an 'institutional' organism, in the broadest sense of the term, for all the businesses in the wine sector of the territory of Salerno.

Moreover, this initial task, concerning the promotion of the territory at international level, has already encountered considerable difficulty in the communication of the brand 'Salerno', which suffers greatly in terms of visibility, although it is a strong tourist attraction on the domestic market (this is, in fact, a very common problem abroad for a large number of Italian territories, above all in the South of Italy). Fortunately, for the territory of Salerno in general, brands such as 'Amalfi Coast', Amalfi, Positano and Paestum are more likely to do well, their geographic and symbolic appeal are important factors for territorial development, in addition, meta-elements are also competitive: for example, the reference to Campania (and therefore also to the territory of Salerno) as 'Vigna Felix' (from the Latin 'Campania Felix') and the Mediterranean Diet, historically identified with the territory of Cilento in the famous Seven Studies by Ancel Keys and in which the contribution of wine, especially red wine, in small quantities, is crucial.

In this 'ideal' apposition there is the rationale for the selection of the 'Enoteca Provinciale di Salerno' as a case study. The territory of Salerno, in fact, is populated by small wineries (a characteristic common – 'typical' – for many other Italian regions of wine), but fortunately also very attractive, thanks to its rich heritage in terms of landscape, art and culture in general (feature not so common – even 'unusual' – for many other Italian wine territories) and, thus can be considered an 'extreme case' (Eisenhardt, 1989).

Also in terms of collective strategies, in this case concerning trade in a narrow sense, the potential of the *bundle of products*, on which the Enoteca is at present working by means of which foreign buyers can obtain a simplified 'offer'. The bundle would in fact, consist of an intelligent mix of the wine produced by the wineries belonging to Enoteca, with their particular quantitative and qualitative characteristics.

Finally, it is worthwhile pointing out that at present, in the specific case of the 'Enoteca Provinciale di Salerno', there does not seem to exist other forms of aggregation for wineries in the territory. The Provincial Administration was the entity that proposed the creation of Enoteca (and continues, as a member, to play an important supporting role) and Intertrade, the Special Agency of the Chamber of Commerce of Salerno, works closely with Enoteca as the Chamber of Commerce is also a member. The only other form of aggregation planned is the Consortium, at present still in a start-up phase.

RESEARCH RESULTS, IMPLICATIONS AND DEVELOPMENTS

The study has highlighted that collaboration between small businesses in the strategies of internationalization is not only possible (as in the case of the 'Enoteca Provinciale of Salerno'), but also profitable, as long as it leverages on a factor of cohesion that would be clearly beneficial, consisting, in this case, in the promotion of the territory on international markets. The Enoteca, in effect, considers itself a facilitator / connector of collaborative relationships between member wineries, when their purpose is merely the promotion of the territory, having a role in this sense of planning, coordination and guarantee towards the collaborating parties.

The analysis, in terms of scientific implications, highlights the importance of networks among small businesses in the wine sector, with subsequent auspices, in this particular case study, of further project developments. It seems very beneficial, in fact, that the network can collaborate with other institutions and enterprises of the territorial system (with reference to other typical food products, but also to tourism, environment, culture, as already happens naturally), considering promotion of the territory from a wider vision in terms of the wine supply chain.

In addition, a follow up to our research, which is already in progress, focuses on the proactive collaboration among wineries, investigating in particular the perception of the small entrepreneur in the wine sector on the importance and feasibility of collective strategies of internationalization, highlighting also the factors, needing correction or encouragement to enable a greater degree of receptivity on the part of the governing body towards paths of internationalization, in which, as mentioned previously, there is automatically a loss of some decisional autonomy, but at the same time, also a clear business opportunity. This study aspires to having a positive effect with respect to actions of more effective territorial governance, and in this context, the collective bodies of reference for the wine sector

(Chambers of Commerce, Consortia, 'Enoteche Provinciali', etc.) could further legitimize their natural role as meta-organizers, in order to better project and implement collective actions of international marketing, for the creation, obviously each within its own field of competence, of a network of specialized services for internationalization (Cafaggi & Iamiceli, 2008), especially as regards knowledge-intensive business services, extremely critical success factors for international networks.

In fact, penetration, consolidation and establishing of firms on foreign markets are instrumental goals constantly at the center of territorial development policies. The latter require implementing through coordinated actions in support of an integrated communication system and underpinned by studies on the peculiarities of consumer segments in different countries, as well as on the offer of the most aggressive competitors at national and international level; by encouraging relationships with appropriate operators of the distribution sector; and so on. Moreover, several studies have already demonstrated the importance of country reputation as a competitive advantage in the internationalization processes of communication and distribution of wine (Zen & Fensterseifer, 2011), indicating interesting trends for development in terms of reputation building of a territory (Ciasullo & Festa, 2012), or 'region', intended as an area with a particular vocation for wine.

In managerial terms, in the same way, although from a quite different perspective, the opportunity / necessity emerges for small wineries to develop a greater awareness of the evaluation and adoption of collective strategies of internationalization, in order to benefit from the evident advantages deriving from their relative economies. In commercial terms, in fact, thanks to scale and experience economies, productions from the same territory can be aggregated to deal with bulk orders, to increase negotiating power versus the large-scale retail trade or to cut the cost per business of communication campaigns abroad; in relational terms, in addition, the benefits of scope economies can also be enjoyed where the sharing of information, knowledge and relationships can enable management to deal with risky or profitable scenarios with greater awareness (and lesser cost).

CONCLUSION

The research attempts to investigate the opportunity / necessity of internationalization for small businesses in the Italian wine sector (principally because of a decrease in domestic consumption of wine), together with the supposed difficulty of reconciling both highly fragmented and very specific productions, when aggregated in any form of cooperation,

rendered necessary because of the limited size of individual wineries. In this sense, we believe that the study, using a methodology structured on a literature review applied to a case study, can respond to two research questions, providing evidence that 1) it is possible to activate effective collective actions of internationalization even when the aggregation process concerns very different producers and / or productions, and 2) the main factor of cohesion in such actions that would bring together small wineries (very different one from the other) and not alienate them is territorial identity, especially with regard to territory communication.

In this sense, a significant role can be played by 'third party' organizations, especially when they have an associative nature (in this case study, the 'Enoteca Provinciale di Salerno') clarifying that the interest pursued by collective actions (of internationalization, specifically) is not restricted to the specific interest of individuals but to all the members involved. In a later stage of territory promotion, however, the internationalization strategies of the wineries will need to be supported by adequate services in order to encourage a commercial follow-up to the communication actions on territorial identity.

The study, in short, proposes to provide a potential contribution to the identification of an organizational strategy solution (in this case, collaboration agreements, implemented by networks) to support the internationalization of small businesses in the Italian wine sector, finding in territory promotion a valuable asset. In actual fact, together with the ongoing search for quality, the propulsive engine of the Wine Renaissance of the late 1980s in Italy; the planning of a convenient quality / price ratio, inevitable on international markets; constant dialogue with the distribution system, too often overlooked and / or endured with resignation by small wineries; for foreign markets wine communication above all is becoming increasingly strategic which at the end of the day, by its very nature, is mainly communication expressing the *terroir* of the wine, a fundamental common resource for wineries.

ABSTRACT

Although the study does not indicate a significant relationship between the brand use of Facebook pages and consumer purchase intention, it seems there is an impact of Facebook presence on brand image which is an important factor relating to increased sales and brand survival in a competitive international environment. The study indicates that there is a correlation between respondents who frequently visit their Facebook account and those who often visit company brand pages on Facebook. The study investigated the impact that social networks have on developing and maintaining company brands. Two similar questionnaires were developed, one for consumers (269 respondents) and another administered to companies (42 respondents) to study a firm's social network site from their and the consumer's perspective. When asked about other social network sites where they had profiles/brand pages consumers' and company's responses were similar. It was interesting to note that both consumers and companies responded that the content of the Facebook brand page is the most valuable feature indicating that companies recognize the importance of content and are responding to consumer's needs in the network.

Keywords: brand image, company image, social networks, Facebook

INTRODUCTION

Social networking site (SNS) is the term used to describe sites such as Facebook, MySpace or Twitter (Taylor, Lewin, and Strutton, 2011). Boyd and Ellison (2007) define SNS as web-based services that allow three main functions to individuals: the construction of a public or semi-public profile within a bounded system; the articulation of a list of other users with whom they share a connection; and viewing and traversing their list of connections and those made by others within the system. Boyd and Ellison (2007), Joinson (2008) and Ellison, Steinfield, and Lampe (2007) argue that Facebook users are registered in the social network looking

for people with whom they have an offline connection and not looking for new friends. According to OberCom (2012) 97,3% of respondents that use social networking sites have a Facebook profile and 59,2% of respondents believe that company interaction and brand association in social networking sites are important to them.

Keller (1993) states that consumer's knowledge of brands is defined through brand awareness and brand image. Thus, it is important to clarify the concept of brand equity. The American Marketing Association defines brand as "a name, a term, a design, symbol or any other features that identifies one seller's good or service as distinct from those of other sellers". Keller (1993) defines brand equity based on consumer as the differential effect of brand knowledge on consumer response to the marketing of a brand. Word-of-mouth (WOM) is important aspect of social networking sites as it is what gives the site its power through the viral nature of WOM. Kozinets, Valck, Wojnicki, and Wilner (2010) define WOM as an intentional influencer of consumer to consumer communication through professional marketing strategies. Reece (2010) defends that consumer generated media, as social network communication, has a great popularity level, due to the emotional need that people have of being heard. However, Treadaway, and Smith (2010) argue that Facebook marketing is not a quick process, because developing and convincing followers, fans and friends to convert into consumers and brand ambassadors takes time.

Carter and Levy (2011) argue that companies are beginning to integrate social networks as a part of their marketing strategies, communication and consumer service. Pempek, Yermolayeva, and Calvert (2009) compare Facebook communication to traditional media communication, where the presented information reaches a lot of viewers at the same time. Social networks (SN) have the opportunity to effect the branding paradigm in a broad way as a brand can be created or adapted through SN consumer generated content (Lim, Chung, and Weaver, 2012). Edelman (2010) defends that relationships created in the social environment are determinant in consumers purchase decision. Although there has been no standard procedure to measure a brand fan importance there is agreement that a brand fan has intrinsic value (Millard Brown and Dynamic Logic, 2011). This study is focused on the social network site (SNS) Facebook and its relationship with the development, and maintenance, of brand image as well as its impact on consumer purchase decisions.

CONCEPTUAL MODEL AND HYPOTHESES OF STUDY

Facebook has approximately one billion users (Dinheiro Vivo, 2012), and 23% of its users access their account five or more times a day (State of Search, 2012). A Netsonda study (2011) about company presence on Facebook indicates that 56% of respondents like company brand or product pages and the results indicate this number is increasing. State of Search (2012) statistics indicates that 47% of North-Americans considered that

social networks are a major impact on purchase behavior. Treadaway and Smith (2010) consider that social media have a great power when it comes to influencing their users. Lim, Chung, and Weaver (2012), however, believe that it is consumer WOM to be the major influence effecting consumer SNS behavior and not the company postings. Edelman (2010) also believes that it is the relationships which are created in a social environment that are determinant in the purchase decision.

Lim, Chung, and Weaver (2012) found that social media sites could influence a consumer depending on whether the individual had a positive or negative reaction to a company's social networks site. Individuals who had a positive experience report being pleased with the brand. However when the site experience was negative consumers reported a negative reaction to the firm's brand.

The results of these studies lead to the following consumer (c) hypothesis which related to the consumer questionnaire sample:

cH1: Consumers visits to a firm's Facebook are directly related to visits to the company brand page site.

cH2: Consumers that have a positive perception of the company brand pages on Facebook tend to increase their purchasing volume.

Company social network sites can be considered to be company/brand communities (Keller and Kotler, 2012). In these communities consumers are brands "friends" and interact with others who share similar beliefs about the brand image (Harden and Heyman, 2009). This provides the opportunity for a firm to manage its brand image, encourage and foster supportive dialog and in doing so, increase consumer loyalty (Carter and Levy, 2011). These observations led to three company/brand (b) hypotheses which related to the company/brand sample:

bH1: Company/Brand sites that interact more with consumers are those that update Facebook page more often.

bH2.1: Consumers that have a more positive perception of a firm's Facebook pages will tend to increase their purchase volume.

bH2.2: Consumers that have a more negative perception of a firm's Facebook pages will tend to decrease their purchase volume.

METHODOLOGY

To test the hypotheses H_1 , H_{11} , H_{21} , and H_{22} , four Spearman's correlation coefficients were calculated; and to test Hypothesis H_2 a chi-square test was performed. Correlation analyses and a chi-square test were performed on a sample of 269 consumers and 42 mass marketing brands. The hypotheses were considered significant when a statistical level of p equal to or less than 0.05 was obtained. A non-probabilistic sample based on convenience was used for consumers. Brands were chosen according to the rankings: (1) Socialbakers – Facebook brand pages with more fans in Portugal - and (2) FbRankPt – Facebook Portuguese brand pages ranking.

BRAND SELECTION AND PARTICIPANTS

The study featured 42 mass marketing brands in the Portuguese market. A message was sent to all brands that had at least 50 thousand fans on their Facebook pages. A total of 170 brands were contacted, 129 via a post on their Facebook wall and 41 via private message. Private messages were only sent to brands who didn't allow consumers to publish on their wall. Ninety seven brands responded to the wall post or the private message, but only 42 responded the questionnaire.

A Facebook event was created so that consumers' sample were able to answer the questionnaire. Three thousand and fifty three invitations were sent to Facebook users and 269 Facebook users responded to the questionnaire. The respondents' age ranged from "less than 18 to 45" to "54 years old".

SURVEY INSTRUMENT DEVELOPMENT

Two questionnaires were developed: one for brands and other for consumers. The questionnaires were built using mainly closed answers, even though there were some open-ended answers. Consumer respondents rated items using a four-point Likert scale, while brand respondents rated items using a five-point Likert scale. The data results were treated on IBM SPSS 17.0 and Microsoft Excel 2010.

DATA PROFILE

Consumers sample ($N=269$) included 181 (67,3%) females and 88 (32,7%) males and Facebook users were mainly under the age of 18 to 24 (73,6%) and 25 to 34 years old (20,4%). Most of the individuals had an undergraduate degree (44,2%) or were in college (32,7%). Table 1 provides a general result of consumers sample profile:

Table 1. Consumers Profile

Demographic Variables	Sample Profile
Sex	Female (67.3%)
	Male (32.7%)
Age	Less than 18 years old (1.1%)
	18 to 24 years old (73.6%)
	25 to 34 years old (20.4%)
	35 to 44 years old (3.3%)
	45 to 53 years old (1.5%)
Table 1 continued:	6 th grade (0.4%)
Academic Qualifications	9 th grade (0.4%)
	12 th grade (5.6%)
	At college (32.7%)
	Undergraduate Degree (44.2%)
	Postgraduate Degree (16.7%)

Brands sample (N=42) included 42 mass marketing brands. Table 2 presents each brand and its business sector.

RESULTS

CORRELATIONS

A Spearman's correlation coefficient was calculated to test the first hypothesis of the consumer sample (cH1). Not all respondents were included in this analysis (N=249). The correlation found between "consumers visit to their account on Facebook" and "the accompaniment consumers do to brand pages" was $-.129$, $p=0.042$, resulting in a correlation between the two variables and cH1 was confirmed.

A qui-square test was calculated for the second hypothesis for consumer's sample (cH2). $X^2(269)=6.7, p>0.879$, with 12 degrees of freedom. cH2 was rejected ($p>0.05$). As such, it is indicated that

consumers who develop positive perceptions regarding brand pages on Facebook tend to increase their purchase volume.

Table 3 provides the general results for these two correlation analyses.

Table 3. Hypothesis Testing Results for Consumers Sample

Hypothesis	Statistical Test	Associated Probability	Results
HC1 -Consumers visits to a firm's Facebook site is related to the accompaniment they do on brand pages.	Spearman's Correlation Coefficient	$p=0.042$	$p \leq 0.05$ H1 accepted
HC2 - Consumers that have a positive perception of brand pages on Facebook tend to increase their purchasing volume.	Qui-square Test	$p=0.879$	$p > 0.05$ H2 rejected H0 accepted

Three additional Spearman's correlation coefficients were calculated to test the three hypothesis of the brands sample. Not all respondents were included in bH1 analysis (N=40). The correlation found between "brands interaction level with consumers" and "how often brands update their Facebook page" was -.214 with an associated probability of $p=0.186$. The result was no correlation between the two variables was determined ($p > 0.05$) and bH1 1 was rejected, This suggests that brands that interact more with consumers are not necessarily those who update their Facebook page more often.

Not all respondents were included in bH2.1 analysis (N=36). The correlation found between "brand purchase volume increase" and "the increase of positive brand image/associations by consumers" was 0,245

with an associated probability of ($p=0.150$). The result is that no correlation was found between the two variables ($p>0.05$) and b H2.1 was rejected suggesting that, from brands point of view, there is not a relationship between a consumer's positive perception of Facebook brand pages and consumer's intention of increasing purchase volume.

Not all respondents were included in bH2.2 analysis ($N=34$). The correlation found between "the decrease of brand purchase volume" and "the increase of negative brand image/associations by consumers" was -0.2 with an associated probability of $p=0.257$ so bH 2.2 was rejected. The study indicates that from brand's point of view consumers that have a more negative perception of brand pages on Facebook do not tend to decrease their purchase volume. Table 4 provides the general results for these three correlation analyses.

Table 4. Hypothesis Testing Results for Brands Sample

Hypothesis	Statistical Test	Associated Probability	Results
bH1 - Brands that interact more with consumers are those that update more often their page.	Spearman's correlation coefficient	$p=0.186$	$p>0.05$ H1 rejected H0 accepted
bH2.1 - From the brands' point of view consumers that have a more positive perception of Facebook pages tend to increase their purchase volume.	Spearman's correlation coefficient	$p=0.150$	$p>0.05$ H2 ₁ rejected H0 accepted
HB2.2 - From the brands' point of view consumers that have a more negative perception of Facebook pages tend to decrease their purchase volume.	Spearman's correlation coefficient	$p=0.257$	$p>0.05$ H2 _x rejected H0 accepted

DESCRIPTIVE STATISTICS

In addition to the formal hypothesis testing a descriptive statistical analysis was performed which provided information about consumer and brand habits on Facebook, consumer buying behavior, and brand image. Both questionnaires had similar questions which made comparisons between samples possible. Consumers and brands habits on the social network Facebook, consumer buying behavior and brand image and associations were analyzed.

CONSUMERS AND BRANDS HABITS ON FACEBOOK

To better understand Facebook consumer and brands habits questions about the date of creation of the profile/brand page, the frequency of profile/brand page visit/update, the existence of profiles in other SNS and the most valuable features on a Facebook brand page were asked. Results were similar for the first three questions. Although brands are aware that the most valuable feature for consumers on a Facebook brand page is its content, they seem to believe prizes, contests or hobbies promoted by them are very important to consumers which was not confirmed by the consumer's questionnaires results. Table 5 provides results of the comparison between consumers and brands habits on Facebook. Only the highest results obtained through the questionnaires were considered.

Table 5. Comparison Between Consumers and Brands Habits on Facebook

	Consumers	Brands
Profile Page creation on Facebook	3 years (35.7%)	3 years (45.2%)
Frequency of profile/brand visit/update	Daily (96%)	Daily (92.9%)
Other SNS used	Youtube (26.7%)	Youtube (33%)
	Twitter (17.5%)	Twitter (33%)

	Google+ (16.5%)	Google+ (8%)
Most valuable features on a Facebook brand page	Page content (33.8%)	Page content (33.8%)
	Interacting with consumers (27.5%)	Prizes, contests or hobbies promoted by the brand (23.8%)
	Refresh rate of the page (26.4%)	Interacting with consumers (21.4%)
	Prizes, contests or hobbies promoted by the brand (10.4%)	Refresh rate of the page (2.4%)

Consumer Buying Behavior

Consumers were asked about changes in their consumer buying behavior after starting to follow a brand page on Facebook. Brands were asked about the perception they had about changes in the consumer buying behavior after they started to follow a brand page on Facebook. Consumers questionnaire results showed that most of them had no changes in their purchasing behavior (84.8%). However, brands seem to believe consumers increase their purchase behavior after following brands on Facebook (88.1%). The results are in Table 6:

Table 6. Consumer Buying Behavior

	Consumers	Brands
Changes in consumer buying behavior	No changes in purchasing behavior (84.8%)	Increase in purchase behavior (88.1%)

BRAND IMAGE/ASSOCIATIONS

Consumers were asked about changes in their brand image/associations after starting to follow a brand page on Facebook. Brands were asked about the perception they had about changes in the consumers' brand image/associations after they started to follow a brand page on Facebook. Consumer's questionnaire results showed that most of consumers discovered unknown brand features that have a positive influence in their brand/image perceptions of the brand (70.6%). Brands questionnaire results were similar to consumers and showed that brands think their brand page on Facebook has a very positive impact on consumers brand image/association (31.7%). The results are in Table 7:

Table 7. Brand Image/Associations

	Consumers	Brands
Changes in brand image/associations	Discovered unknown brand features that had a positive influence (70.6%)	Very positive influence (31.7%)

CONCLUSIONS

Five hypotheses were tested through a Hypotheses Test measuring correlations between variables and chi-square test. Two of those hypotheses were calculated through the consumer's sample and the other three using brands sample. The only hypothesis that was valid was cH1 as the other four hypotheses were rejected. cH1 was confirmed indicating that there is a correlation between respondents who frequently visit their Facebook account and those who often visit company brand pages on Facebook.

cH2 for consumers and bH2.1 and bH2.2 for brands were similar in format but cH2 was designed to investigate the consumers' perspective and bH2.1 and bH2.e were designed to investigate the information from the company's viewpoint. The objective of cH2 was to understand if there was a correlation between

respondent's positive perceptions after visiting company product brand pages and the if there was an increase in the purchase of that brand after becoming brand fans on Facebook. bH2.1 and bH2.2 questioned if there was a relation between consumers' perception and their purchase behavior from the company product brand perspective. As these hypotheses were rejected there was no demonstrated relationship between the variables. bH1 for brands sought to establish a relation between the update frequency of a company brand page on Facebook and the level of interaction between brands and consumers on that page. bH1 was rejected further indicating that no relationship was demonstrated between the companies that more frequently update their specific Facebook brand and those that interact the most with their consumers on their pages.

Most of the questions in the consumer and company brand questionnaires were similar which permitted a direct comparison of these questions. For example, the response to how long a firm had had a Facebook profile/brand page most companies and consumers responded three years. This data corresponds to the social network movement in Portugal as according to data a Marktest study (2010) in 2009 the most used SNS among the Portuguese was Hi5 however in 2010 Facebook became first in popularity among Portuguese users.

Consumers and brands responses were also similar when asked about the frequency of profile/brand page visit/update as

Both samples had a majority of responses stating "daily". This corresponds to a Netsonda study (2011) about Facebook and brands in Portugal which showed that 80% of respondents were always connected, or connected more than once a day, on Facebook.

When asked about other social network sites where they had profiles/brand pages consumers' and company's responses were similar. YouTube, Twitter and Google+ were the most popular alternatives which indicated that companies locate social network sites in those networks most used by consumers. This result, however, does not correspond to data presented by OberCom (2012) where most of respondents answered Hi5 and Google+ after Facebook and not YouTube or Twitter.

Pempek, Yermolayeva, and Calvert (2009) note that young adults spend most of their time on Facebook observing its content instead of creating it. In line with this finding was that both consumers and companies responded that the content of the Facebook brand page is the most valuable feature. This indicates that companies are noting the importance of content and are responding to consumer's needs in the network.

Edelman (2010) argues that the purchase decision process has been changing along the years and that the relationships established with the brand can have an important role in the product or service acquisition moment. This was not consistent with the data in the study as there were differences between the results of

the company and consumer responses relating to changes in consumer buying behavior. Consumer's stated they had no changes in their purchasing behavior after being a Facebook company brand fan. Companies, however, stated that they believed that consumers had an increase in their purchase behavior after viewing the company brand site. In 2011, most of North-American citizens (88%) argued that SNS had no impact in their purchase behavior and, after a year, 47% of the consumers stated that SNS had the major impact in the purchase behavior (State of Search, 2012). A Nielsen study (2012) asked respondents of four regions in the world (Asia/Pacific, Europe, Middle East/Africa and Latin America) the probability of making a purchase choice within the next year based on products comments in social media sites on a list of 14 products/services categories. In all categories the Europeans registered less purchase probability.

Lim, Chung, and Weaver (2012) argued about SNS positive influence on consumers if they were satisfied customers and the negative influence if they are unsatisfied. In a Netsonda study (2011) results showed the consumer's opinion about a brand had improved after following it on Facebook. This was consistent with study findings as both consumers and companies agreed that Facebook pages influence the firm's brand image/associations in a positive way.

BRANDING OF SUSTAINABLE CLOTHING

Coleman, Bethany; D'Souza, Clare

School of Marketing, Hospitality and Tourism, La Trobe University, Australia
School of Marketing, Hospitality and Tourism, La Trobe University, Australia,

ABSTRACT

To address sustainability and its conceptual foundations which are taken as self-evident; issues such as production, overall economic activity, materialism, distribution or technology highlight a need for environmental consumption. Firms need to innovate their thinking from a strategic level by offering sustainable products. The purpose of this study is to investigate the extent to which sustainable brands affects generation Y consumer's intention to purchase. The research investigate a sample of over 200 responses. The hypothesis: *There is a direct and positive relationship between sustainable branding and generation Y's intention to purchase sustainable clothing* was tested. Chi Square analysis was used to analyse the data. The study generates empirical evidence which suggests that generation Y while they are not aware of sustainable brands would purchase sustainable brands for clothing. Finally, managerial inferences are drawn that concern strategic brand management.

Keywords: sustainable clothing, generation Y, brands, intention to purchase

INTRODUCTION:

In light of environmental degradation, global warming, over consumption and increases in pollution rates, there has been call for an increase in sustainable activities and behaviours. This results in demands for both micro and macroeconomic policy decisions (D'Souza & Taghian, 2010). In addition, the solution to environmental degradation and over consumption not only calls for drastic changes in consumer behaviour to offset high consumption levels, but a need for cleaner and more efficient technologies is called for as the amount of consumption will always be prevalent within society as a whole (Oskamp, 2000). The literature demonstrates that while the growing population wil consume and pollute, innovative technology in green products can bring about a change. To address sustainability and its conceptual foundations which are taken as self-evident; issues such as

production, overall economic activity, materialism, distribution or technology highlight a need for environmental consumption. Thereby putting pressure on Firms to innovate their thinking to a sound environmental based offerings.

There is substantial amount of literature covering environmental consumption (Schlegelmilch et al, 1996; Van dam & Apeldoorn, 1999; Heiskanen & Pantzar, 1997; Schaefer & Crane, 2005; D'Souza and Taghian 2010). Although sustainability with regard to consumer products has been extensively researched throughout past and current literature, the development of the literature within sustainable clothing is an emergent topic in marketing and fashion research. Green purchases have not yet extended to this category of industry (Gam, 2011). Against this backdrop, the purpose of this study is to investigate the extent to which sustainable brands affects generation Y consumer's intention to purchase. There is limited research undertaken on sustainable brands. Within marketing literature, the majority of sustainable research (Karp, 1996; Schlegelmilch, Bohlen & Diamantopoulos, 1996; Follows & Jobber, 2000; D'Souza & Taghian, 2010) has studied the overall effect of environmental concern and purchase intentions in the context of household cleaning products, the recycling of paper, glass and plastic and energy consumption. However, there has been little empirical research addressing the use of textiles such as sustainable clothing (Domina & Koch, 1999; Morgan & Birtwistle, 2009). With a high demand for cheap fashion, the fast fashion clothing market has significantly grown. The research identifies an increase in purchase behaviour, with tendencies to keep clothing for a shorter period of time (Morgan & Birtwistle, 2009). The fashion cycle is relatively short and with each season new fashions emerge. According to Mintel (2007), there has been an excessive growth within fast fashion retailers worldwide, and these stores are recognized to create impulse buying, this increase in fast fashion has led to consumer's purchasing and disposing of large quantities of clothing toward landfills. In Australia, data obtained by the Australian Bureau of Statistics in 2010 suggest that the growth of waste generated per person has increased dramatically as a result of Australia's fast growing, materialist intensive society. With a strong dependence on landfill since 2007, Australia's rate of waste deposit increased by 12 percent with 21.3 million tonnes of waste deposited to landfill (Australian Bureau of Statistics, 2010).

. The phenomenon of fast fashion has grown, the literature projects that this concept will continue to remain as an environmental impediment in the foreseeable future (Mintel, 2007). The lifecycle analysis of clothing is harmful to the environment due to the synthetic nature of the materials

used in most clothing garments, they are not easily recyclable and consumes far more energy resources (Morgan & Birtwistle, 2009). Studies in the area of sustainably produced fashion show there is still a lack of knowledge in terms of consumer's wants and needs, resulting in low levels of sustainable consumption as consumers are more interested in their personal fashion needs than the environmental effect the garment poses on the environment (Joergens, 2006; Niinimaki, 2010). According to Meyer (2001) and Gam (2011) there is a lack of sustainable purchases within the apparel industry due to higher costs and decreased purchasing choices, with aesthetic and functional disadvantages. Many consumers lack knowledge of sustainable clothing and are uncertain about the actual environmental benefits.

SUSTAINABLE FASHION

Encompassing a wide variety of branding literature (Aaker, 1996 ; de Chernatony & Riley, 1998; Grace & O'Cass, 2002; Hartmann, Ibanez, & Sainz, 2005), is the notion of brand identity and brand value. The process of delivering a clear brand identity to consumers holds a high strategic importance within marketing strategy, in order to successfully create a high brand value (de Chernatony & Riley, 1998; Hartmann et al, 2005). In the view of Aaker & Joachimsthaler (2000), brand identity uses associations through the product to connect and create relationships with target consumers, generating value through emotional, functional and self-expressive benefits. Developing as a business and marketing imperative, brand equity has also emerged displaying the need to understand brand associations (Grace & O'Cass, 2002). To achieve this Keller (1993) suggests the use of a customer based brand equity strategy, which allows marketers to understand how their marketing strategies improve the value of their brand, emphasizing the importance of creating a differentiated effect, generating brand knowledge, awareness and consumer responses.

Sustainable clothing can be defined as clothing designed and produced for long term usage, causing little environmental impact and manufactured within ethically stable production systems, sustainable clothing makes use of eco-labeled and recycled materials (Joergens, 2006; Niinimaki, 2010). Sustainable fashion targets only a niche market, as garments do not always reflect the broad styles and lifestyles of consumers. McCracken (1988) states that clothing is a high involvement product as consumers buy clothing to create an identity and take possession of a style that best suits themselves. Clothes satisfy a wide range of consumer needs as they work to protect, define personal roles and help individuals express themselves

displaying a certain lifestyle (Meyer, 2001). It has been found that there are only minor differences in clothing preferences between males and females, where preferences are guided by an individual's fashion orientation (Meyer, 2001). According to Belleau, Nowlin, Summers & Xu (2001) an individual's fashion orientation is explained through attitudes, interest and opinions toward fashion products. Gutman & Mills (1982) suggested four factors that influence a consumer's fashion orientation are as follows: (1) Fashion leadership; (2) Fashion interest ; (3) Importance of being well dressed; and (4) Anti-fashion attitudes

Having an understanding of consumer's clothing preferences and purchase behaviours is imperative when effectively marketing sustainable brands in a retail fashion environment. As seen above there are vast differences in the way consumers treat fashion. Those fashion oriented consumers are more likely to seek further information about the garments; they have an increased curiosity of sustainably labeled apparel, and may ultimately have a greater propensity to purchase sustainable clothing (Gam, 2011).

Price sensitive consumers respond differently to purchasing environmental products. Despite the environmental concern of many consumers within the apparel industry, consumers are faced with a large volume of low cost clothing tempting consumers to purchase unsustainably (Niinimaki, 2010). According to Joergens (2006) sustainable purchases will only occur within the market if there is no added cost for the consumer, this includes higher prices and loss of quality and sacrifice to their ideal self. Sustainable clothing is generally sold at a higher price than mainstream garments due to the production process that is associated with the brands (Niinimaki, 2010). If consumers are price sensitive, it can pose a limitation on their decisions. As stated above, price is a dominant factor when consumers make purchasing decisions, and if this is the case then with low-cost, low- quality clothes in the market, it is hard to encourage consumers to purchase sustainably, if they would trade off on price. Secondly, sustainable fashion also faces low levels of awareness within society and although consumers are aware of the environmental issues being faced, sustainable clothing is a relatively new concept (Gam,2011), though. ethical and sustainable brands had emerged in the retail industry for several years and implemented by organisations such as People Tree, Gorman and Levi's. These sustainable brand leaders hope to bring new attitudinal changes toward sustainable fashion, gaining interest and awareness within fashionable consumers (Joergens, 2006). Thus the research hypothesis can be stated as follows:

H1 -There is a direct and positive relationship between sustainable branding and generation Y's intention to purchase sustainable clothing

Individuals categorized as generation Y are consumers born between the years of 1977 – 1994, making the age of respondents falling between 17 – 34 years (Martin & Turley, 2004; Foscht, Schloffer, Maloles & Chia, 2009; Noble et al, 2009). Due to the heterogeneity of the segment, the study explores a sub-section of generation Y consumers: participants between the ages of 18 - 30. Recent studies exploring generation Y purchase decisions have tended to divide generation Y into two subsections, with the majority of research taking high priority toward the older sub -section of generation Y (Martin & Turley, 2004; Noble et al, 2009). It is the purpose of this study to gain an understanding of the purchase decisions within sustainable clothing on generation Y consumers. Individuals selected to participate in this study have been chosen based on qualifying characteristics of generation Y. Respondents asked to complete the survey are between the ages of 18 – 30 years are enrolled in university or beginning their full time working careers. Several generation Y consumers are currently completing their tertiary education or have started their primary working life (Heaney, 2007). Those attending University are widely accessible through scheduled lecture and tutorial sessions and being the most technologically savvy generation, Y consumers are those who have begun working careers and are widely reachable through internet specific techniques.

DATA COLLECTION STRATEGY

Due to the exploratory nature of this research within consumption of sustainable clothing, a quantitative based methodology is used to gain statistically significant relationships between the psychological variables and product attributes affecting intentions to purchase sustainable clothing. A self-administered questionnaire (paper based and online copy) is used for the data collection method. This allows the respondent to complete the questionnaire without the aid of an interviewer (Bryman, 2008). Survey research works well to collect primary data, specifically for the project at hand and is typically used to describe and identify target markets, customer attitudes, purchasing patterns and decisions (Zikmund, Babin, Carr & Griffin, 2000).

A self-administered survey is used as this technique provides a quick, inexpensive, efficient and accurate means of assessing information about a population (Zikmund et al, 2000). The use of questionnaires is one of the most popular methods for data collection in academic

research as many advantages are displayed through this process. Mann (1988) states, when employing a large sample size, surveys work as a very efficient tool when addressing a wide variety of topic areas, displaying information in a standardized and meaningful way when evaluating the findings. However, due to the high reliance on the actions and participation of respondents in the completion of a survey, issues with response rates and response bias can occur (Zikmund et al, 2000). This can present a disadvantage when generalizing findings, as data may not display a valid or accurate representation of the population. Notably, response bias is an issue as environmental concern and environmental behaviour questions may be answered in a false manner. As participants often answer with what they believe to be the most socially acceptable response (Zikmund et al, 2000), response bias was accounted for during questionnaire development, ensuring questions were not worded in a leading manner.

Based on previous studies the questionnaire has been established using appropriate scales all of which display adequate cronbach's alpha to ensure high validity and generalizability of findings (Maloney, Ward & Braucht, 1975; Schwepker & Cornwell, 1991; Stern, Dietz & Kalof, 1993; Schlegelmilch, Bohlen & Diamantopoulos, 1996; D'Souza, Taghian & Khosla, 2007; Kilbourne & Picket, 2008; Niinimaki, 2010). This research forms a part of a larger survey. Using a 5 point likert scale, respondents are asked to answer questions in a format of; (1) strongly disagree, (2) disagree, (3) neutral, (4) agree, (5) disagree. This was then collapsed into three: disagree, neutral and agree.

Prior to administering the questionnaire to students, a pilot test was conducted to ensure that the questionnaire instructions were adequate for the respondents and easily understood (Bryman, 2008). The pilot test identified how well the questions flowed and if any questions were not necessary or adding value to the survey (Bryman, 2008). The questionnaire was given to students prior to scheduled tutorial sessions commencing. Before students were asked to complete the questionnaire, the purpose of the study and applicable conditions were explained to students ensuring they were aware that by completing the questionnaire they were giving consent to be involved in the research. To gain the sample size required for the study, the process was done within numerous sessions. In the online survey, an exact copy of the paper-based questionnaire was created in an online format using Qualtrics; an industry leading provider of online survey software. Using social media as a communication tool, the online survey was sent out to individuals between the ages of 18- 30 who are currently completing a university degree, or have commenced their working careers. Once students

completed the questionnaire, paper based questionnaires were personally collected and filed, and online questionnaires were filed within the Qualtrics software program to adhere to confidentiality and privacy principles. A total of 210 completed surveys were collected within the current study, 199 surveys paper based copies of the questionnaire were completed while 90 surveys were completed via the online survey software; Qualtrics.

Cronbach Alpha test shows the reliability of a scale and specifies how free the scale is from random error (Pallant, 2010). According to Hair et al (1987) the statistics should have a minimum level of 0.6. However dependent on the number of items within a scale, a small number of items in a scale (less than 10) can provide quite a small Cronbach alpha value. The Cronbach alpha value for the variables tested was .616. In turn, Babbie (2005) states that validity refers to the extent to which the empirical measures adequately reflect the real meaning of the concept under consideration. Three types of validity exist; Convergent, Discriminant and Nomological (Hair, Anderson & Tatham 2006). This study assessed evidence for nomological validity of the scale. Several scales used within the questionnaire were adapted and are consistent with those previously used by other researchers, therefore ensuring nomological validity.

Chi square tests are non-parametric and it is used to establish whether the variables are statistically independent or if they are associated (Coakes and Steed, 2001). Coakes and Steed (2001) provide three assumptions: one is that observations should be randomly sampled, each observation should be independent and none of the expected frequency should be less than 1 and no more than 20% of the expected frequencies should be less than 5. The sample size of over 200 is considered large for a chi square test. If the sample size is small, chi square would give inaccurate results.

BRANDING AND INTENTION TO PURCHASE

To understand the significance of branding alongside the intention to purchase sustainable clothing, a Chi Square Analysis was conducted. The data was analysed through SPSS. The original data was transformed to coded data. The three variables that were tested were also coded as 1= disagree, 2= neutral and 3= agree. The three variables were based on branding attributes: preference of sustainable brands over conventional brands, the extent to which

consumers switch between brands, and the last variable awareness of sustainable brands to purchase. These were used to answer the following hypothesis:

Three hypotheses have been formulated

- a. There is a significant association between the intention to purchase sustainable clothing and the preference to stay with a sustainable brand over a conventional brand
- b. There is a significant association between the intention to purchase sustainable clothing and brand switching
- c. There is a significant association between the intention to purchase sustainable clothing and awareness of sustainable brands

A cross tabulation table with a contingency coefficient was developed. The statistical significance (p value) of a result shows the probability that the observed relationship occurred by chance. The required level of significance for all analyses identified was $p < .05$. The magnitude of the associations and differences were also examined and reported using Cramer's V (Gall, Gall, & Borg, 2003). The data was analyzed using the chi-square test. The use of the cross tabulation chi-square test was used, as it makes no assumptions about the underlying distribution of the data (George & Mallery, 2007). Chi-Square is calculated by collecting the observed values for each and examining the differences between the observed and expected values. The main assumption of the chi-square test was not violated, as all cells had an expected frequency of more than 5. Notably, since the $df= 4$, anything above 0.35 has a large effect size (Cohen 1988, pp.75-107). It can be seen that all the other variables show little if any effect size. Thus the strength of the correlation between the two variables at hand are weak. The required level of significance for all analyses identified was $p < 0.05$ (Gravetter and Wallnau, 2004).

The survey also yielded personal information regarding participant gender, age and Australian annual income. Demographic variables have been separated into categories, discussing the data in reference to their associated frequencies tables and histograms. From the 210 questionnaires completed, 41% of the participants were male, consequently 58% participants were female. A Chi Square Test was performed to analysis the association

between gender and intention to purchase sustainable clothing. Associations are deemed significant if the Pearson Chi – Square p value are between 0.00 and 0.05. The relationship was deemed insignificant $\chi^2 = 2$, $p = 0.429 > 0.05$. Therefore, no significance was found between male’s intention to purchase sustainable clothing and female intention to purchase sustainable clothing

Table 1:

Hypotheses	Pearson Chi -Square	Effect size – Cramer’s V
a. There is a significant association between the intention to purchase sustainable clothing and the preference to stay with a sustainable brand over a conventional brand	$\chi^2 (4, N=210) = 10.182$, $p = .037$	0.156
b. There is a significant association between the intention to purchase sustainable clothing and the extent to which consumers switch from a brand to try something new	$\chi^2 (4, N=210) = 13.510$, $p = .009$.	0.180
c. There is a significant association between the intention to purchase sustainable clothing and awareness of sustainable brands	$\chi^2 (4, N=210) = 9.560$, $p = .049$.	0.152

H_a is supported as there was a significant positive association between the intention to purchase sustainable clothing and the preference to stay with a sustainable brand $\chi^2 (4, N=210) = 10.182$, $p = .037$. The Effect size of 0.156 shows a weak association between variables.

H_b is supported. There was a significant positive association between the intention to purchase sustainable clothing and the extent to which consumers switch from a brand to try something new $\chi^2 (4, N=210) = 13.510$, $p = .009$. Effect size of 0.180 shows there a weak association between variables.

H_c is supported. There is a significant association between the intention to purchase sustainable clothing and awareness of sustainable brands $\chi^2 (4, N=210) = 9.560$, $p = .049$. With an effect size of 0.152 the association displays a weak strength between the two variables

DISCUSSIONS

As such, findings of this study can be beneficial to managers and sustainable strategy development by providing a deeper insight into the underlying psychological variables of generation Y consumers. An enhanced representation is provided of generation Y consumers and the level of environmental concern, allowing sustainable communication strategies to effectively target those younger consumers who are more inclined and willing to purchase sustainable clothing, by strongly focusing on their environmental concerns.

This prediction was confirmed displaying a significant relationship between the two variables. Findings of this thesis support the results of Pickett- Baker & Ozaki (2008), who showed how branding strategies can transform rational reasoning into emotional preferences, shifting consumer attitudes toward more sustainable purchases. Hartmann et al (2005) also stated that sustainable branding had a significant effect on an individual's emotional dimension. When linking back to the current research, this concept can be accepted, as a majority of respondents agreed with the statement "I believe a sustainable brand is a socially acceptable clothing brand". This shows the effect branding can have on purchase behaviour. If positioned correctly, a sustainable brand can be extremely successful within the segment of generation Y consumers, if quality is not compromised and is sold at a price affordable to generation Y consumers.

Although a significant relationship was present between sustainable branding and the intention to purchase sustainable clothing, this relationship was only weak, displaying a small effect on intentions and therefore actual purchase. This can be attributed to generation Y's knowledge of sustainable brand. A large proportion of the sample was not aware of sustainable clothing brands available to them and the overall concept of sustainable clothing. Hence, further research is needed in the field of sustainable branding, consumer knowledge and awareness of sustainable brands. This places further implications on marketers to create a higher awareness of sustainable clothing brands and the benefits associated with sustainable purchases. Effective branding strategies can have a dramatic effect on consumer's affective domain, transforming rational reasoning into emotional preferences, hence shifting consumer attitudes toward more sustainable purchases (Pickett-Baker & Ozaki, 2008). A sustainable brand has specific product attributes and related benefits to the environment holding perceptions of an environmentally sound purchase (Hartmann et al, 2005). Displaying environmentally sound product benefits, a sustainable brand should be positioned in a strategic manner to ensure the brand identity and value are actively communicated toward the target market (Aaker & Joachimsthaler, 2000). To be commercially successful within the retail market it is imperative for marketers to communicate sustainable brand attributes,

creating a differentiated brand through can develop a competitive edge through strategic marketing (Hartmann et al, 2005).

IMPLICATIONS TO PRACTITIONERS

This places implications on manufacturing procedures and marketing communications. For generation Y consumers to actively purchase sustainable clothing, a high level of quality needs to be ensured. Manufacturing processes need to guarantee that quality garments are being produced; this may come at a higher cost but is likely to result in increased purchases of sustainable clothing in the long run thus resulting in diminishing cost of returns.

Findings of this study provide marketers with an understanding of the effect branding attributes play in the purchasing decisions of generation Y consumers. Marketing strategies can appropriately target the generation Y segment, and communicate sustainable clothing to suit their psychological values and the way they perceive product attributes. From this study it can be seen that an importance is placed on sustainable branding. Therefore, this allows for sustainable clothing companies to create garment's corresponding to the needs of the segment ensuring that appropriate characteristics are met. These findings provide marketers with the opportunity to create communication strategies that appeal to those who have a tendency to have environmental attitudes and values.

In addition, sustainable brands could create value for businesses. These brands also enhance social responsibility thus creating competitive advantage. The only issue that would arise is brand loyalty as loyal customers may not prefer to shift to alternate brands. It would serve a niche market.

LIMITATIONS

Throughout the study conducted, a number of limitations were identified. These are useful when identifying recommendations for future research. Although all was done to obtain accurate and valid findings, the use of a convenience sample provided an imbalance of age and gender. From an analysis of the results it can be seen that an uneven variation of age was obtained. Prior to research a sample consisting of respondents aged 18 – 30 was anticipated. However, majority of the respondents included were aged between the years, 18 – 20 and 21 – 23, this displays a positive skew in participant age. This is due to the large sample of university students used. Although this poses limitations in terms of generalizability, the study gives a good representation of the younger subsection of generation Y consumers.

Therefore for future reference, research should use university students as a small segment within their sample to gain a larger variation of participant age. The concept of representation also applies to gender as the study had more female respondents than males.

Response bias also poses limitations toward the current study as participants can often answer a question in a false manner or in a way in which they think is preferred. This is an issue to take note of as environmental concern and environmental behaviours questions tend to suffer from bias with participants responding with the most socially acceptable option. Although, this issue of leading questions was accounted in questionnaire development, whether response bias occurred within in the study cannot be known.

CONCLUSIONS

The results contribute to sustainability and fashion literature in a marketing context, proving marketers with an understanding of the sustainable branding for clothing affecting generation Y consumer's intention to purchase. Several conclusions can be made based on the results of this study, one being that generation Y consumer's psychological variables, such as environmental concern are very influential in their purchasing decisions. Secondly, this study identified generation Y consumers holding significant environmental and sustainable values. By identifying the driving forces influencing the sustainable purchases of generation Y consumers, marketing managers and key stakeholders are able to better predict consumer intentions. Although further refinement and research is required, to identify if this intention leads to actual sustainable purchase behaviours, marketers now have a platform, stating the underlying themes in sustainable consumption providing a clear insight into the decisions of generation Y consumers. This can contribute to the development of successful marketing strategies ensuring the transformation of sustainable clothing into a mainstream retail market of sustainable fashion.

ABSTRACT

Research on innovation is continuously improving and the academic debate on innovation is hugely wide and alive. Following the work of some eminent scholars (see among others Hauser et al., 2006), we will focus on the issue of marketing innovation conceived as an incremental innovation in marketing that upgrade the benefits (substantial price or functional) to users. This paper means to perform and analyze the determinants of marketing innovative behaviours in wine SMEs by performing an explorative study of the Apulia region, in southern Italy. The paper wants to answer the following research questions: which drivers promote marketing innovative behaviours among SMEs? A mixed approach has been adopted in research designing (Yin, 1998) and particular attention has been paid to research strategy triangulation and multiple data source selection when building the case. A web based survey has been submitted to a sample of 100 wineries and 63 responses have been collected. Data once collected have been analysed and integrated with secondary data previously collected. The paper is structured as follows: in the first part a literature review on marketing innovation and innovation in general and in the wine industry is provided; secondly methodology and hypothesis are presented. Then the case study is introduced. After the data analysis section implications and conclusions are drawn.

Keywords: Marketing innovation, Wine business, Strategy triangulation, Innovation, Customer orientation, Market orientation, Competitive advantage, Web Survey

INTRODUCTION

The wine industry is facing global challenges that are shaping the competitive environment. Italy has seen a changing competitive scenario: new competitors from non EU states (Chile,

Australia, South Africa, etc..) are threatening the Old World's relative market share and new trends in consumption and demands are transforming the business. A new hedonistic lifestyles led to an increase in consumption of other types of beverages and the simultaneous shift in demand towards the Protected Designation of Origin (PDO)/Denomination of Controlled and Guaranteed Origin (DCGO) wines. This demand is favoured by an increase in the consumption outside the home and the accentuation of the hedonistic function of prestigious wines. Furthermore as the demand for convenience foods increases, consequently the quality of such products becomes more important (Buckley et al., 2005). Through the food-related lifestyle (FRL) instrument authors have demonstrated both rural and urban consumers are more responsive toward new food products and show a preference toward the same salient factors: price, quality, taste, health issues, and nutritional composition (Cullen and Kingston, 2009). Somewhat hedonistic goes to do with the experimental creation of wine label too; furthermore new wine consumers in the 19 to 22 year-old segment are much more likely to choose wine based on package features than based on product features, such as producer and country-of-origin (Elliot and Barth, 2012). Nevertheless, Italy must face a high fragmentation on the productive side that does not facilitate small scale wineries to emerge. Apulia, a region in the Southern Italy, has a long history as a wine producer, but the local wine industry has to face serious market challenges in order to compete with emerging countries. Since the first efforts paid for upgrading wine quality and for promoting the local food and wine production at a national and international level, this region has adopted a policy oriented to support local wines and to create new appellations. Apulia is trying to move from a low quality positioning to a higher quality production. Marketing innovation could help wineries to market themselves. Generally innovations to diversify wine farm production are less frequent (Borsellino et al. 2012) and background research on marketing innovation in wine is very limited. This paper aims at filling this gap. It investigates the determinants of marketing innovation and intends to highlight the relationships between marketing innovation and market orientation, consumer orientation, customer orientation, strategic intent and market positioning. Understanding under what conditions marketing innovation is more likely to happen would provide important insights for evaluating which are the optimal conditions for the successful adoption of marketing innovations; consequently marketing innovation can play a key role in the wine business development and can be a useful tool to help winery to adapt to evolving needs and demands. The present paper has been designed and carried out within the following Integrated Projects of Food Chain (IPFs), measure 124 of the Rural Development Program of Apulia Region (EAFRD), in the wine

sector: Vitis, Nord Wine, Sud Wine. An explorative case study based on multiple observations is therefore presented. Our case focuses on a specific area of Apulia, since the wineries interviewed produce wines with the appellations of origin Locorotondo, Castel del Monte and Nero di Troia. Background research is provided in order to support the hypothesis to test. Therefore an explorative case study is presented. Findings and implications are drawn. Conclusions close the paper.

BACKGROUND RESEARCH

Marketing Innovation

Research on innovation is extremely wide and explores different aspects of the issue by adopting various approaches and perspectives. One of the challenges scholars must face is the availability of studies and the wide range of approaches that have been adopted: a scholar who move towards this research issue must deal with an impressive number of definitions available in the literature (Garcia and Calantone, 2001), an inner dichotomy (Wang et al., 2005) and a variety of categorizations (i.e: technical/administrative; product/process; radical/incremental) that underline that this field of study is so deeply permeated by an evolving dynamism and a high complexity. As we have already observed, the complexity of the issue is reflected in the measurement of the adopted methods: if at the earliest stages of the research in the field, innovation was measured by considering a few variables, today, as pointed out by some scholars (Wang et al., 2005) research designs take into account a wide number of variables. In this paper we will explore a specific issue of innovation, that is marketing innovation. Although it is recognised the importance that marketing innovation plays in the achievement of firm's competitive advantage, scholars (Chen, 2006; Augusto and Cohelo, 2009) underline that there is a limited research in this specific issue. From the literature it emerges how marketing innovation has been often examined as an issue related to other research issues and it has been rarely investigated as an isolated concept: the lack of specific studies and the difficulty in isolating marketing innovation from the other variables under investigation have fostered a sort of confusion on the research issue. Marketing innovations represent "ways in which companies can develop new ways of marketing themselves to potential or existing customers. Marketing innovations should not be confused with market innovations that, according to John and Davies (2000), are concerned with activities such as the entry into new markets (Halpern, 2010). Marketing Innovation has been classified as a type of incremental innovation (Grewal and Tansuhaj, 2001); other authors

consider marketing innovation as part of business methods innovation (Chen, 2006). By recovering the aspect of perceived novelty (Rogers, 1998) and users' benefits (see among the others Dosi, 1982; Henderson and Clark, 1990), we can define Marketing Innovation as an incremental innovation in marketing that upgrades the benefits (substantial price or functional) to users. Nevertheless, marketing innovation has too often been misunderstood with market orientation (Halpern, 2010). Market orientation mainly focuses on the ability of the firm to understand consumer's needs and to respond to market pressures. Market orientation has been considered as a general strategic orientation that might facilitate new product development (Augusto and Cohelo, 2009). Thus market innovation is influenced by market orientation, but, although linked, the two concepts are slightly different. Insights emerging from background empirical research on marketing innovation are limited and hard to be generalised. Nevertheless background research provides some useful inputs for our study and more specifically for defining which are the determinants of marketing innovation within the wine industry and which variables should be observed. From the literature it emerges the relationships between Marketing Innovation, Marketing Orientation and Competitive Advantage Creation: marketing orientation influences marketing innovation that has a primary role in the building of competitive advantage (Naidoo, 2010). Empirical researches have been carried in the field of SMEs to highlight how variables are related (Naidoo, 2010). Other scholars in their empirical studies have outlined the conditions under which Marketing Innovation is more likely to happen: size and position of the company influence the type and the strength (or the ability to resist to imitation) of Marketing innovation (Chen, 2006). Following the definition of marketing innovation previously provided, marketing innovation should be considered as an effective tool for emerging in a market. Due to the intrinsic ties that marketing innovation has with marketing orientation we should suppose that there is a linkage between the type of strategy chosen for achieving competitive advantage, the segment of customer served and marketing innovation. There has been an extensive academic debate about the importance of business orientation and firms' capability for the achievement of superior performances (see among the others, Jaworski and Kohli, 1993; Lumpkin and Dess, 1996). Empirical researches have shown the linkages between innovation and marketing and firm's competitiveness (O'Cass and Viet Ngo, 2011), and market orientation and firm's performance (Hult and Ketchen, 2001). Thus there is no doubt about the role that innovation plays in firms competitive positioning and, more specifically, about the importance of marketing in achieving a superior competitive advantage. An

element of novelty to investigate is the linkage between the type of competitive advantage sought by firms and the willingness to introduce marketing innovation

Innovation and Marketing Innovation in wine

As some authors have observed (Voelpel et al., 2006), many wineries owe their industry leader positioning to a savvy mix of knowledge and innovation: the growth of some companies and the reshape of the wine industry (with the emerging of *negotiants* and New World business models) is much more explained by innovation and knowledge rather than by physical resources. Thus the importance of innovation for the development of the business, the wine business has to face some constraints and resistance to innovation and marketing innovations. First of all the characteristics of the business must be taken into account when exploring innovation. Researcher who approach the issue of innovation and marketing innovation in wine can't leave out of consideration the inner features of the business, since it has been demonstrated that innovation is influenced by sector dynamics (Malerba, 2007). This perspective is supported and reinforced by the studies carried in the field of agricultural innovation that bestow a primary role to business features (see among the others the works by García-Martinez and Briz, 2000; Grunert et al., 1997). The wine business is heavily regulated: local and European codes control inputs and processes; wineries are not free to mix grapes or blend wines as they prefer, if they want to use appellation of origin on their labels. Also packaging is settled by appellation standards. As it can be guessed it is extremely difficult to find out some radical examples of innovation in wine. Furthermore, we are talking about an agricultural business (Jenster et al., 2008) that is facing a "seismic shift" (Aylward, 2003) in global consumption and production. Wineries have tried to find new ways to reach new consumers and increasing sales, especially in times where new competitors are just around the corner and market pressure gets higher. Wineries perceive the importance of pursuing product differentiation by improving the so called augmented product dimension (Jennings and Wood, 1994). Marketing innovation could be a useful tool for achieving an effective differentiation strategy. Background research on marketing innovation in wine is limited. Some insights may come from researches that explore how companies have improved changes in marketing and packaging for meeting customers' expectations (Santini et al., 2006). From a preliminary analysis of the literature it emerges that research on innovation is focused on a few topics: some studies investigate the dynamics of innovative behaviours among wineries by exploring the role that location might have on firms' orientation towards innovation (Gilinsky et al. 2008); other researches provide insights about consumers perception of innovations (see the study on packaging by Atkin et al., 2006; Marin

et al. 2007); much research focuses on the role that clusters and networks have on the adoption and the development of innovative behaviours (Giuliani et al., 2008; Giuliani and Arza, 2009). The literature suggests that Marketing Innovations have progressively found a diffusion among wineries, in order to be able to adapt to the evolving market or consumers' needs or to pursue a differentiation strategy (Santini et al., 2006). Besides the importance covered by marketing innovation in wine, there is a research gap about this issue. In order to understand the main features of marketing innovations in wine, we have performed an analysis on the main professionals websites (WineBusiness.com; Vines and Vine; Harpers) with the aim of creating a list of the tools implemented by marketing and sales departments in the industry for marketing wines. **Σφάλμα! Το αρχείο προέλευσης της αναφοράς δεν βρέθηκε.** represents the main marketing tools adopted by wineries over the last decade. A brief description of some selected packaging innovations is also provided by 2. With an introduction of minor packaging innovations, sustainable too (Conte et Al., 2013), companies can be facilitated in marketing themselves and can be able to: improve the info provided to consumers; make people feel much more comfortable with wine; help wineries to reach new segments of consumers or new markets that pay a particular attention to some specific aspect of consumption, production or packaging.

METHODOLOGY AND HYPOTHESIS

The complexity of strategy as a research issue requires researchers to deal with mixed approaches and hybrid research designs (Harrigan, 1983). From the debate on the methodological approach to investigate strategy it emerges the need of a "customization" or adaptation of existing research methods (see among the others, Harrigan, 1983). This paper is an explorative case study. The research design has been structured in order to follow the principles outlined by eminent scholars (Eisenhardt, 1989). In particular we have been extremely careful to ensure research triangulation (Eisenhardt, 1989; 2007); in order to preserve the explorative feature of the case, we have combined multiple data sources (Gersick,

Marketing and Sales Tools

Type	Brief Description	Resource Requirements
Website	Websites that host company info. The Web is a great tool for achieving notoriety among consumers and visitors.	The company has to make an initial investment for buying the web domain; the amount of money required for managing a website depends on the degree of outsourcing of the website and to the type of website that the company wants to realise.
Newsletter	Newsletters are sent by email to a list of customers or professionals that agreed to receive information and news from the company. Usually contain info about the winery and its products, the vintage, events, etc..	The company has to invest time and HR for building a database of customers that agree to receive the newsletter, and for writing news.
Wine Club	A winery wine club ships wine to customers' door once/twice (or more) per year according to the type of service selected by the customer. As a reward the customer can have free access to wine tasting or events in the winery or discount; rewards vary according to the type of membership selected. Payment is in advance	Winery wine clubs are used by wineries for enhancing customers' loyalty and developing direct sales (Santini and Faraoni, 2008). Winery Wine Clubs need a high initial investment in terms of development of a proper offer and an adequate promotion of the new marketing tool.
Wine Events	Events hosted in the cellar. Wine Events are events that take place at the winery; this category includes tasting, concerts, art exhibitions, conferences, book presentations, etc...Also special sales, could be considered as wine events.	The cost of this marketing tool depends on the aims the company wants to pursue.
Wine Education	Wine training organized by the company on a regular basis, in order to make consumer more comfortable with wine. Consumers who take part can gain info about: how wine is made; how wine should be tasted and stored; the area or the country where wine is produced; food and wine	The target and quantity of internal resources that the company aims to reach influences the amount of financial resources that might be employed.

pairing.

Telemarketing	Telemarketing sales. In the countries where there has been a development of commercial TV it can represent an interesting way for marketing products.	The initial investment is high. The impact on finance depends on the type of broadcast the company wants and on the geographical coverage.
Brokers /agents	Agents or Brokers selling wine. A network of brokers or agents represent an effective tool for selling wine abroad, especially for small companies who don't have resource for visiting personally foreign countries.	Through brokers and agents companies can operate in the Ho.Re.Ca. channel. The investment is relatively low and in general the company pays a percentage to the agent according to the volume sold.
Mobile App	Application for mobile phone. Mobile Apps have been released on the market for facilitating knowledge circulation and extending the relationship between wineries and final consumers.	The wine has seen an impressive quantity of mobile apps that can provide info about wine tourism, wine purchase, wine pairing, etc..
Social network and web 2.0	Employment of Social Network and web 2.0 for reducing the distance company - consumer. Facebook and other social networks are often used for cultivating customer relationships	This tool is not a universal remedy for establishing a profitable relationship with final users. A professional management should ensure a profitable growth.

INNOVATIVE PACKAGING

Screw caps: this type of closure not only helps to reduce the risk of a bad storage of wine, but also makes wine tasting easier, since no other tools are required for opening a bottle and the act of drinking is released from the ritual of uncorking. Screw caps are sought by a consumers because they make wine easier and help in maintaining wine after it has been opened.

Bag in Box: as well as screw caps Bag in Box help to maintain wine longer. This package is particularly appreciated in some Northern Europe countries that tend to import wines whose package is eco friendly; some market segments are particularly interested in Boxed wines, as they represent an answer to some of their needs (see Santini et al., 2006).

Glass Top: glass top is useful for reducing the risk of damaging the quality of wine during storage; it represents – as well as cork with silicon, silicon cork and screw cap- an alternative to the traditional cork. Glass top is also eco friendly and it represents an incentive for those

consumers that seek for green oriented products when they buy wine.

Can and aluminum bottles: They are 100% recyclable. Wine in a can is slowing getting a diffusion outside US; aluminum is seen as a novelty in wine. Pros are the lower weight of the aluminum bottle if compared to the classical glass bottle and the waste disposal process. Cons are the unit cost and the aversion of consumers towards this kind of package.

RFID: RFID can be employed for monitoring sales and storage. A large employment of RFID has been done for logistic purposes; companies are also employing RFID for monitoring traceability.

QR Code: Qr Code are finding a diffusion also in Europe and are extremely useful for providing extra info about the company or the wine to consumers. Qr Code can be easily placed on the label.

Table 4 - Marketing and Sales Tools and Innovative Packaging

1988) that have also been proven to reinforce substantiation of constructs and hypothesis (Eisenhardt, 1989). In particular we have been extremely careful to ensure research triangulation (Eisenhardt, 1989; 2007); in order to preserve the explorative feature of the case, we have combined multiple data sources (Gersick, 1988) that have also been proven to reinforce substantiation of constructs and hypothesis (Eisenhardt, 1989). Background research have shown the importance of combining qualitative and quantitative approaches in case study research (Yin, 1998); this paper has been designed to combine secondary data to the primary ones collected through a survey. The survey has been carried by using tested items scales that have emerged from the literature review. More specifically, the workflow has followed the following steps: firstly a desk research has been carried in order to provide evidences and insights for defining variables to investigate. Then, secondary data have been collected according to the specificities emerging from the academic literature, in order to illustrate business features and context characteristics that have been proven to influence firm's innovative behaviours. In particular, for describing the business context we have followed the insights emerging from Zeithaml and Fry (1984). The next step was to submit a survey. A web-based survey has been employed: given its accessibility, web based survey have been frequently used in field research (see among others, Gilinsky et al., 2008). Before submission the survey has been tested. On the basis of insights emerging from background research the following Hypothesis have been formulated:

Hp1: Companies where management is actively involved in seeking for innovative marketing ideas have a strong Market Orientation.

Hp2: The degree of management willingness to introduce Marketing Innovation varies according to the way strategy is crafted.

Hp3: Companies that show a high customer orientation are those where managers are strongly committed to seek for innovative marketing ideas.

Hp4: High degree of managerial attitude towards Marketing Innovation is more likely to be found in companies with a strong Competitor Orientation.

As well as for innovation (Ravichandran, 1999) it is widely recognised the difficulty in achieving a widely employed method for measuring marketing innovation. Empirical researches carried in the field of marketing innovation (Naidoo, 2010) have provided us with some insights for selecting variables to observe and item to test in the survey. The variables observed and the related scales are displayed in Table 22.

Variable	Item	Scale
Marketing Innovation [MI]	Management actively seeks innovative marketing ideas.	Agreement (1-7)
	Improvements in product design are readily accepted.	Agreement (1-7)
	Improvements in product promotional activities are readily accepted.	Agreement (1-7)
	Improvements in product pricing are readily accepted.	Agreement (1-7)
	Staff are penalized for new marketing ideas that do not work	Agreement (1-7); R
Competitive Strategy [CS]	New marketing ideas are perceived as too risky and are resisted	Agreement (1-7); R
	With regard to competition, my firm is always ahead in the use of innovative promotional strategies (Differentiation)	Agreement (1-7)
	With regard to competition, my firm is always ahead in the use of innovative pricing strategies (Differentiation).	Agreement (1-7)
	My firm distinguishes itself from competition by means of the quality of its products(Differentiation)	Agreement (1-7)

	My firm emphasises cost reduction in all its business activities (Cost Leadership)	Agreement (1-7)
	In my firm, the production process changes all the time with the goal of constantly reducing production costs (Cost Leadership)	Agreement (1-7)
	My firm invests mainly in large projects to realise economies of scale (Cost Leadership)	Agreement (1-7)
	In my firm, cost is the most important consideration in the choice of a distribution system (Cost Leadership)	Agreement (1-7)
	In my firm, cost is the most important consideration in the choice of a distribution system (Cost Leadership)	Agreement (1-7)
	My firm tries to force competitors out of the market by good cost control (Cost Leadership)	Agreement (1-7)
	My firm produces one single unique product (Focus)	Agreement (1-7)
	My firm targets a specific, limited part of the market with its products (Focus)	Agreement (1-7)
	My firm's strategies are driven primarily by customer satisfaction.	Agreement (1-7)
	My firm's strategies are based on understanding customer needs.	Agreement (1-7)
	My firm's strategies are driven by its beliefs about how it can create greater value for its customers.	Agreement (1-7)
Customer orientation [CO]	The customers' interests are one of the key priorities of my firm.	Agreement (1-7)
	My firm carries market research with customers at least once a year to assess the quality of its products.	Agreement (1-7)
	My firm incorporates the extent to which its customers are satisfied with its products as part of its quality assessment.	Agreement (1-7)
	If my firm finds that its customers are	Agreement (1-7)

	dissatisfied with the quality of its products, it immediately takes corrective actions.	
	My firm rapidly responds to competitive actions that threaten it in its industry.	Agreement (1-7)
	My firm is very well aware of its competitors.	Agreement (1-7)
	My firm is more customer-oriented than its competitors.	Agreement (1-7)
	My firm competes primarily by adopting a strategy of product differentiation.	Agreement (1-7)
Competitor Orientation [Co.O]	My firm's product(s) are the best in the business.	Agreement (1-7)
	My firm is quick to respond to significant changes in its competitors' pricing.	Agreement (1-7)
	My firm regularly monitors its competitors' marketing efforts.	Agreement (1-7)
	If a major competitor were to launch an intensive campaign targeted at export markets, my firm would implement a response immediately.	Agreement (1-7)

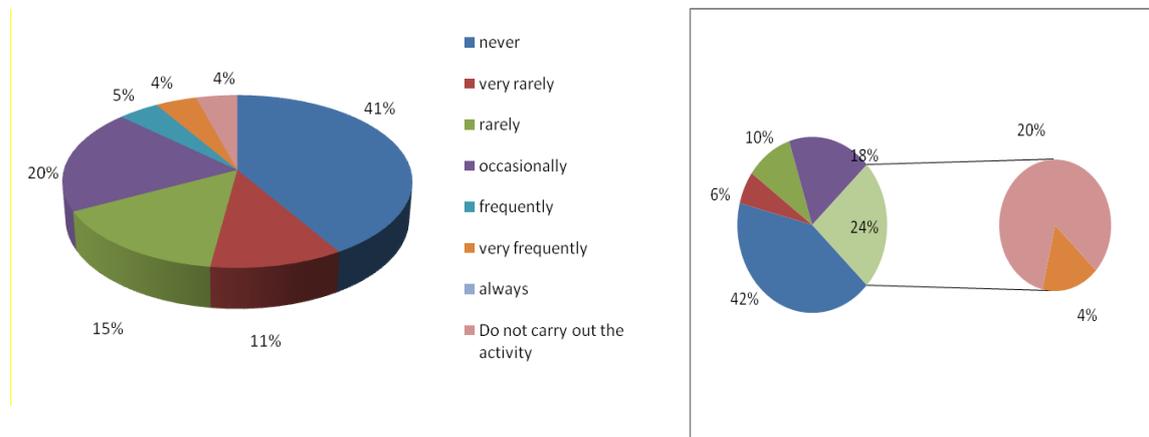

Table 2, The variables selected (note: R stands for Reverse Scale)

THE CASE STUDY

Apulia is located in Southern Italy and has a long history as a wine producer, but the local wine industry has to face many challenges for emerging in the competitive scenario (Costa et al., 2013). In 2012 the total Apulian wine production represented the 13.6% of the total wine produced in Italy (ISTAT). Apulian wine production dramatically fell down (according to ISTAT -8% in the period 2011 – 2012) together with a impressive reduction of hectares of Vineyards. Local producers are experimenting difficulties in selling their wines and this is confirmed also by the growth of must sales (Contò et al., 2011; 2013). According to MIPAF, Apulia is getting through a transition phase, trying to move from a low quality positioning to a higher quality production (Baiano et al., 2013): in Italy Apulian bulk wines are known because they were used for blending and reinforcing wines with lower alcohol content. Many efforts for supporting and improving the local food and wine production have been spent

over the last years in order to upgrade Apulian products image; policy makers and institutions, together with producers and other stakeholders are committed to promote local productions both on the domestic and international markets. New appellations have been introduced in order to control wine quality and to improve sales through the potential benefits arising from appellations. Nevertheless the challenges that Apulian wineries must face are various: first of all they must be able to face a fierce competition happening both at a national and international scale that is fostered by the global economic and financial crisis. European policy has dejected smaller wine producers (*Confagricoltura*) whose only lifeline is to find a rescue in niche strategy. Thus niches are getting overcrowded and it becomes challenging to emerge in a competitive landscape where there is a mass of good quality wines available on the market released by small scale wine producers. In this scenario marketing innovation would help. Apulian wine industry represents for all the reasons above described an interesting case to observe. An explorative case study based on multiple observations is therefore presented. Our case focuses on a specific area of Apulia. The explorative study have been designed and carried out within the following Integrated Projects of Food Chain (IPFs), measure 124 of the Rural Development Program of Apulia Region (EAFRD), in the wine sector: *Vitis*, *Nord Wine*, *Sud Wine*. These wineries sells their brands under the following appellations of origin: *Locorotondo*, *Castel del Monte*, *Nero di Troia*. Therefore, the criteria used for identifying the sample of firms to be interviewed are: 1. certified quality wine production (DOP); 2. wine produced by indigenous grape variety that are *Nero di Troia*, *Aglianico*, *Bombino Bianco e Nero*, *Verdeca*, *Fiano*, *Pampanuto*. We have collected data through a web based survey and then analysed the inputs of 63 respondents whose in majority were owners (39.4%), followed by Sales Managers (24.2%), General Manager (10.6%) and then winemaker (10.61%). The 63 wine companies examined are l.t.d. companies (42,6%) and another relevant percentage (27,9%) are '*aziende agricole*' that according to the Italian law are in general relatively small and whose main trait is agricultural production. Many companies are family businesses (17 out of 63) and 6 companies are in the third generation of family business and other 6 are older. As regards the production's dimension of the firms, most of them (24%) produced more than 1 million of bottles in 2012 (these firms export their wine in the most important global markets) and 17% of the interviewed wineries produced less than 50.000 bottles, mainly for the domestic market and so on. The wineries interviewed do not tend to outsource: the majority manages the vineyard by itself (77,2%) and is in charge of other activities such as pressing (80,7%), bottling (84,7%), logistic (90,7%). Outsourcing is more frequent in marketing activities: the 42% of the companies interviewed manages direct

marketing activities by their own or are in charge of social media marketing (39,5%). 40% of respondents entrust never to external experts promotional marketing activities; 4% does not carry out the latter activities and 20% does not carry out even direct marketing activities (graph. 1-2).

Graph. 1 and 2 - Outsourcing to external experts of promotional marketing activities (on the left) and direct marketing activities (on the right)

It should also be underlined that 47,2% do not employ ecommerce for selling their products, 15% does not use social media and 10 % does not have a developed direct sale channel. These data are crucial in order to investigate the issue of marketing innovation. Companies compete in different market segments, but none of respondents offers icon wines; as expected, inc. firms focus production only on upper price segments: Premium (5-7 €), Super Premium (7-14 €), Ultra Premium (14-150 €) whose percentage value (33%) is higher than the others juridical forms. Cooperative winery produce in majority wine in Popular Premium (3-5 €) segment. Companies give more importance to customers segments such as traditionalists and baby boomers; the 76% of the companies consider the latter as the most important segment for their sales today and almost 80% of the companies estimate baby boomers as the most important market segment for future sales). Companies in general don't show some tendency to change their preferences towards the market segments they have chosen. In order to outline the diffusion of marketing and sales tools and packaging innovations we have asked wineries info about what they do and how they market their products. Results are shown in Figure and a synthetic overview of marketing and sales tools is provided in Fig. 2.

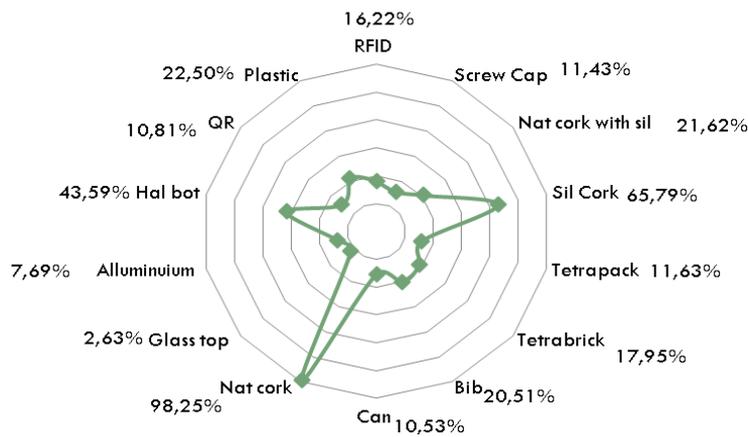

Figure 1 - Diffusion of package innovation within the population examined (% is calculated on the number of valid responses)

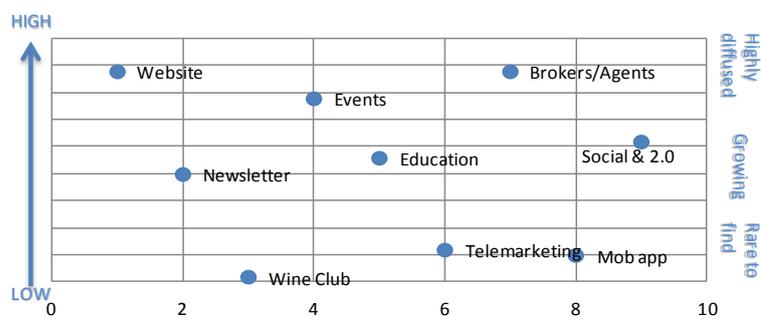

Fig. 2 - Diffusion of Marketing and sales tools in the population of wineries observed (on the Y axis the number of wineries that adopt the marketing solution proposed)

FINDINGS AND IMPLICATIONS

Data analysis has been performed by using SPSS software. The small size of the sample has not allowed to carry out PCA analysis. Nevertheless, we have been able to perform a correlation analysis with the aim of highlighting significant relationships between the variables selected. Correlation matrix shows most of Pearson's Correlation values among different items of the variables (see Table 2) that are significant at the 0.01 level (2-tailed). Generally, from the data it emerges that the companies where management is much more involved in seeking for innovative marketing ideas are those whose strategy is crafted on competitors (Pearson's Correlation values equal to 0.533 and 0.635 at the 0.01 level). Thus, in our analysis competitor orientation in strategy making plays a key role in defining managerial attitude towards marketing innovation (with a Pearson's Correlation value equal to 0.558 at the 0.01 level). Although data show a positive and significant relationship between

customer orientation and managerial attitude towards marketing innovation, customer orientation plays only a secondary role in the formulation process of innovative marketing ideas by managers. A Pearson's Correlation value equal to 0.772, significant at the 0.01 level, highlight the strong relation between Marketing Innovation and Customer Orientation; in particular, those companies that are more likely to accept changes in product designing are those where management is highly involved in seeking for new marketing ideas. In other words marketing innovation finds a breeding ground in those companies who perceive the importance of product designing as part of the innovative process. Thus all the five hypothesis are confirmed.

Findings cannot be discussed in relation to existing literature, as background research on marketing innovation in wine is very limited; in fact this paper aims at filling this gap. We can underline that this work fits with the insights by other researchers that have explored firms' improved changes in marketing and packaging for meeting customers' expectations (Santini et al., 2006). Academic and practical implications are related to the advantage for wine marketers to understand the competitive environment for identifying who are the true competitors (Vrontis et Al., 2011a). Further changes suggested to wine practitioners includes concentrating on native grapes which offer optimum results, developing quality, using better marketing and promotional techniques (Vrontis and Thrassou, 2011) and savvy mix of innovation to reach industry leader positioning (Voelpel et al., 2006). In conclusion, marketing innovation could help wineries to market themselves if the way strategy is crafted.

CONCLUSIONS

Over the past few years, the wine business have been changing at a pace that has left many wine firms unable to adapt to a constantly modified environment (Vrontis et al., 2011a). The first important conclusion is evident from past researches: quality (Hejmalová and Šperková, 2011), and innovation (Garcia et al., 2000) conceived in several ways and concepts, are the new watchwords of agriculture and so wine sector. This insight has been reinforced through the explorative case study of this research. Marketing innovation could be a crucial driver to face the new challenges of the wine business being an useful tool to help winery to adapt to evolving needs and demands. A management seeking innovative marketing ideas has a key role in strengthening this driver. This paper has several limits; firstly the relative small sample has limited the statistical analysis to be performed. Secondly, the number of variables

selected doesn't provide a full overview of marketing innovation, but focuses on the role of management in the innovation process. Besides the limits, that are those typical of explorative research papers, this paper has the merit to provide some insights about marketing innovation and to inputs for further researches.

ABSTRACT

This study explores the characteristics of Italian foreign direct investment (FDI) in India and aims at filling the gap identified in the literature (i.e. a lack of empirical studies on Italian MNCs internationalizing in India) by providing an exploratory study on this issue. By the end of the Eighties most internationally oriented companies had realized the urgency of moving into the Far East. Italian MNCs are part of this trend. It is therefore important to fill the above mentioned gap for the possible implication both under the managerial and under the theoretical perspective. In particular, different questions need basically to be asked and answered, such as “Why do Italian firms invest in India (motives of FDI)”, “Role of the subsidiary in the international network of the Italian MNC” and “Its value chain configuration”. In order to investigate the research questions, a unique database of Italian firms that invested in India was created. The first empirical confirmation we collected was about the low number of Italian companies with subsidiaries in India. In terms of internationalization goals it emerges clearly from the research that the main target is market seeking. In order to acquire that market share Italian companies have organized their subsidiaries as partially independent companies, adopting a typical “multidomestic” approach customizing products and services to the local needs and demands. Moreover, the industry fragmentation suggests that so far only the best in each class have approached India.

Keywords: India, internationalization, FDI, MNC.

INTRODUCTION

By the end of the Eighties most internationally oriented companies had realized the urgency of moving into the Far East. Italian MNCs are part of this trend. The growth and potential of Asia have been obvious for a while, but what changed were the barriers to foreign companies: Asia as a whole was opening up to the outside. Of all the Asian countries China has made the strongest effort to entice Western companies to invest in their country, while at the same time providing the largest market (in terms of population) in the world. By the end of the Nineties every company that wanted to be a serious global player had some sort of presence in China. In 1996 developing countries received inflows of 130bn USD in direct investment, China received 42bn (the largest share), and India only got 2.5bn (Athreye and Kapur, 1999). For a number of reasons, India was overlooked until a few years ago, however it still is – especially by Italian companies – when compared to any other BRIC nation.

This aim of this paper is to analyze the extent and the characteristics of the internationalization process of Italian companies going to India. More specifically, we try to understand the reasons behind internationalization decisions in India, the strategic goals associated with them (i.e. manufacturing vs. commercial), the role played by the Indian subsidiary and its value chain configuration. In particular we try to understand whether the value chain reflects closely that of the parent company or if it is influenced by the local needs. Therefore the decisions that impact the business model configuration (Onetti et. al., 2012) are investigated: make vs. buy, and international value chain configuration (longer vs. shorter).

The purpose of this topic seems to be extremely relevant for different reasons:

- The relevance of Indian market among relatively large emerging economies;
- Lack of literature on Italian companies that internationalize to India;
- The choice to focus the attention on the FDI.

With respect to the first aspect, India represent an interesting case of rapid growth and internationalization witnessed during the past two decades (Pradhan, 2011; Zheng, 2009). India-EU relations have grown substantially in both quality and depth in the last few years. India's engagement with the EU in trade grew steadily up until the economic crisis of 2008/2009. Looking at data from Ministry of Commerce & Industry (2009-2010) it is easy to see how EU represents a 20% share in India's total exports, followed by the United Arab Emirates (13%), USA (11%) and China (7%). However, analyzing the country wise cumulative FDI inflow in India (data from Ministry of Commerce & Industry, period 2000-2011), while EU (27) represent 20% of the overall amount the Italian share is about 1%.

With respect to the second aspect, the literature background analysis presented in the second part of the literature review, shows a substantial gap of empirical studies on Italian MNCs internationalizing in India. While many scholars have carried out several empirical studies on Italian MNCs operating in foreign markets, we find out only two studies dealing with Italian MNCs in India.

As regards the choice to focus the attention on the FDI – disregarding other important methods of internationalization – is based on the following evaluations: Foreign Direct Investments represent, by their own nature, irreversible choices in the short term and can therefore be considered as a good proxy of the companies employing such medium to long term strategies; FDIs are traditionally mentioned in literature (Caves 1971; Dunning 1981; Johanson and Vahlne, 1977) as an evolved and mature form of internationalization, indeed they show a strong commitment towards the company's international strategy.

For all the above reasons, studying the FDIs can help understanding the trends and strategies in companies' internationalization.

This paper is structured in three main sections. The first one contains a comprehensive literature review on internationalization process and highlights a substantial gap of empirical studies on Italian MNCs internationalizing in India. In the second paragraph, the methodology is discussed and the main features of the sample are presented. In the third section, results are pointed out. Some managerial and research implication complete the paper.

I. LITERATURE REVIEW

Internationalization of firms has been a key issue in international business studies for a long time. Internationalization has been defined as the process of increasing involvement in international operations across borders (Welch and Luostarinen, 1988). Calof and Beamish (1995) defined internationalization as "the process of adapting firms' operations (strategy, structure and resources, etc.) to environments" (p. 116). According to Cavusgil (1984), internationalization is an ongoing process determining the ongoing development and change in international firms in terms of scope, business idea, nature and extent of activities and organization principles.

As regards to the first question we posed "Why do Italian firms invest in India (motives of FDI)", the literature examining the motivations for FDI is considerable. Several theories and

models has been developed in the field of international business in the years that have had a fundamental impact on researches and writings/academic contributions. Starting from the pioneer studies of Dunning (1958) and Vernon (1966) and proceeding to analyze more recent studies, it is possible to notice how the research object has shifted from foreign investments to the internationalization process and multinational firm organization/management. The early studies carried out in the Sixties and in the Seventies analyzed the environmental factors and institutions that could provide a proper context within which MNEs can operate. This is considered as a macro approach to internationalization where the research focus is represented by countries and industries rather than firms (Kindleberger, 1969). On the opposite, the micro-economic/industrial organization theory, suggests that foreign direct investments are made to further capitalize on the ownership of some of the firm's unique assets (Hymer, 1960/1976; Caves, 1971). Later on, during the Seventies and Eighties, scholars research's interest shifted to the managerial and strategic issues related to MNCs' management. With the firm as the primary unit of analysis and management decisions as the key variable, these studies provide further insights on management challenges associated to international business. First of all, the Eclectic Paradigm Theory proposed by Dunning (1976) offers an holistic framework that identifies the important factors influencing the decision to carry on production in a foreign country. Referring to Dunning (1993), it is possible to identify market seeking FDI's; resource/asset seeking FDI's and efficiency seeking FDI's. The first one relates to the size and potential growth (also in terms of opportunities offered by neighbor countries) of the FDI's hosting country. Resource factors mainly refer to possibility for the MNC entering the hosting country to access to specific raw materials and/or to skilled and educated workers and/or to local technology. Efficiency seeking motives, on the contrary, leverage on advantages related to access to low cost workforce and/or materials or, more in general, to the opportunity to increase firm's profitability by reducing operative costs.

As regards subsidiary's role, after the seminal work of White and Poynter (1984) subsequent research has been conducted on subsidiary's role and strategy. The literature referring to this issue often used the terms "subsidiary's role" and "subsidiary's strategy" as interchangeably (Birkinshaw and Morrison, 1995). Studies related to this issue often comprise also the analysis of the activities performed by the subsidiary and therefore its value chain. Focusing on the roles that subsidiary can play within the MNC's overall strategy, it is possible to identify different typologies. According to Birkinshaw and Morrison's classification (1995), which integrates most prior studies, it is possible to identify three different types of subsidiaries taking into consideration the geographic scope, the range of value adding activities

performed, the level of autonomy in taking decisions. The first type refers to “the local implementer”, which is a subsidiary mainly servicing the hosting country’s market performing the entire range of value adding activities of the headquarters (according to Whyte and Poynter’s definition, 1984, this subsidiary can also be defined as a “miniature replica”). This type of subsidiary mainly adapt global products of the MNC to local market needs (typically a multidomestic strategy). The second one is “the specialized contributor”. Some of the activities performed by this type of subsidiary are of particular specialization. We can say that they specialize on a narrow set of value activities that are tightly coordinated/interdependent with the activities performed by other subsidiaries belonging to the MNC’s international network. Whyte and Poynter (1984) also define this subsidiary as “product specialist” depending on the range of value added activities performed. Moreover, Porter (1986) define their strategy as “pure global”. The third type, “the world mandate” characterizes a subsidiary working with the HQ to develop and implement strategy (Roth and Morrison, 1992). The subsidiary’s activities are integrated at worldwide level, but personally managed by the subsidiary. Jarillo and Martinez (1990) define this subsidiary as characterized by global integration and local responsiveness.

Referring to the configuration of the activities of the value chain, Porter, in his seminal work of 1985, identifies four well known different international strategies according to the coordination/interrelation of those activities within the MNC and among the different subsidiaries. According to such a framework, he proposed four types of strategies: “high foreign investment with extensive coordination among subsidiaries”, “simple global strategy”, “export based strategy with decentralized marketing” and “country centered strategy by multinational or domestic firms operating in only one county”. Bartlett (1986) proposed a slightly different approach taking into consideration coordination among subsidiaries and degree of adaptation to each national context. He identifies therefore three types of organization, each implementing a different strategy: global organization, multinational and transnational organization. While Porter’s framework analyzes strategic characteristics of industries, the approach of Bartlett is more firm specific. According to the latter, in fact, a company can implement different strategies in each subsidiary that best fit MNC’s overall strategy. Moreover, Jarillo and Martinez’s study on Spanish MNCs (1990) concentrate on two dimensions of analysis, i.e. geographical localization of activities (if activities such as R&D, purchasing, manufacturing, marketing are performed in the country) and the degree of integration of those activities performed at overall group/MNC level. According to this approach, a subsidiary can follow an “autonomous” strategy (if it carries

out, independently, most of the value chain activities), a “receptive” strategy (if it carries out in the hosting county few value chain activities, i.e., only marketing&sales or only manufacturing) or an “active” strategy (if it acts as a “node” of an integrated network of subsidiaries performing different activities within the group they belong to).

Concluding, nowadays, the choice of methods of doing business abroad is now much wider than in the past and such a choice can be customized to the specific needs of the internationalizing firm. Under this point of view Born Globals (McDougall and Oviatt, 1994) are to be considered as an emerging important phenomenon that should not however obviate/underestimate the importance of incremental learning through stages, even for the most experienced MNCs.

Identified gap in literature

To clearly show the identified substantial gap of empirical studies on Italian MNCs internationalizing in India, we performed a literature background analysis on the most relevant literature in international business. The results are wrapped-up in this paragraph. While many scholars have analyzed the process of internationalization of Italian firms in several areas, just two up-to-date studies deal with Italian MNCs in India. The first one is an exploratory study made between 2004 and 2005 that analyzes the internationalization process of a sample of Italian companies to India (Friso and Gattai, 2005). The second one, more recent, is a business case analysis of an Italian software SME off-shoring its R&D activities in Bangalore (Angeli and Grimaldi, 2010).

Analyzing researches performed on FDIs and foreign companies located in India, we found different kind of studies that can be categorized as follows:

- Internationalization, to India from other countries (considering both exploratory generic studies and researches on specific MNCs management related aspects) mainly from: Germany (Welge, 1994; Becker-Ritterspach, 2005, 2009), Sweden (Jansson, 1982), Denmark (Baark, 1985; Hansen et al., 2011), Netherlands (Lieten, 1987), Korea (Pant, 2003; Park, 2004, 2011) and Japan (Horn et al., 2010). Moreover, it is possible to find in-depth business case analysis on US, Japanese, Danish, British, Swedish and Korean MNCs located in India (see among the others: Singh, 1979; Singh Rathore, 2008; Sinha, 2004);
- Comparison between FDIs in emerging countries: India FDIs vs China or Brazil (see, among the others: Asakawa and Som, 2008; Zheng, 2009; Vivoda, 2011);
- Localization of FDIs in India and factors influencing such choices (see, among the others: Chalapati Rao and Murthy, 2011; Megha and Nunnenkamp, 2010).

Moreover, recently, scholars have been starting to investigate issues related to FDI from India to other countries (for example, see the recent study of Jain (2011) on operation of Indian firms in the U.S).

The present research work aims at contributing to fill this gap in the literature, providing an exploratory research on the internationalization of Italian companies to India.

II. OBJECTIVES DATA AND METHODOLOGY

On the basis of the theoretical framework previously described, we focused the analysis on a sample of Italian MNCs that carried out investments in India. In particular we try to provide evidence of the strategic goals associated with the investment in India (i.e. manufacturing vs. commercial), of the role played by the Indian subsidiary and its value chain configuration.

Population

In order to investigate the research questions, a unique database of Italian firms that invested in India was created. Data was sourced from the Italian Institute for Foreign Trade (ICE), branches of Italian and International Chambers of Commerce operating in India, Embassy and Consulates, and several foreign and Italian entrepreneur associations. The total amount of presumably existing Italian firms from the mentioned sources was 141¹⁴. The database has then been checked and validated to keep out of the analysis the companies no longer active. The survey was conducted in 2011. Over the course of two months all the companies (141) with a reported phone number were called to ascertain if they were still in existence and their current address. The result was a database of 60 active Italian enterprises.

A questionnaire was developed with the goal of eliciting answers from the managers of the Indian subsidiaries. In order to verify and test the questionnaire's suitability for the task a number of professionals working in related fields were contacted: a) an Indian full Professor working in International Marketing; b) an Italian lawyer who has worked and lived in New

¹⁴ The number of Italian companies in India is indeed far from clear. One critical variable in evaluating the overall number of companies is how a company with multiple subsidiaries in India is counted. It is not always clear from the sources what is their methodology. We have opted to count a single legal entity with multiple locations as one company only. This is most likely why some sources report a higher number of companies. Among the latter, the largest database found in the research was of Pantheon, a financial consulting company working in Italy and India: according to Pantheon 400 Italian companies working in India were reported. This database however is not public and no way was found to verify its content and validity. The Italian Trade Commission and the Indo-Italian Chamber of Commerce were however available to provide their database, the total amount of presumably existing Italian firms from the mentioned sources was 141.

Delhi and has extensive knowledge of Italian companies going to India, c) an Italian consultant, CEO of the Indian subsidiary, who has lived in Mumbai for over four years. With their help two companies were identified to which we initially submitted the questionnaire in order to ascertain its validity. The two companies were then excluded from the sample. Some questions were modified, some deleted and some added. The resulting final questionnaire was subsequently sent to the identified companies along with a cover letter in which an appointment for a personal interview was asked for with the local branch manager. All the questionnaires and interviews were eventually conducted with either the local General Manager or a Board Director or a top manager (in larger companies).

Forty seven large, medium, small and micro companies out of the previously identified firms replied to the questionnaire. An additional 18 were discarded for one of the following reasons:

- the company had changed ownership and was no longer held by Italian shareholders. Either the Italian parent company had changed ownership and become part of a larger multinational non-Italian group or the local Indian partners bought out the subsidiary entirely, in such cases when a Joint Venture was in place;
- the replies were not meaningful;
- the company was a representative office or was just engaged in consultancy services with no manufacturing or distribution.

An answer rate of about 19% was obtained, which is quite similar to the average of the best international surveys (Harzing, 1997). Considering the large number of questions in the questionnaire and the complexity of some of them, the achieved result may be considered satisfactory. All the findings on the 27 remaining companies are reported and any relevant findings analyzed with regard to the size and the industry of the companies. The most relevant features of the responding companies are summarized in the following paragraph.

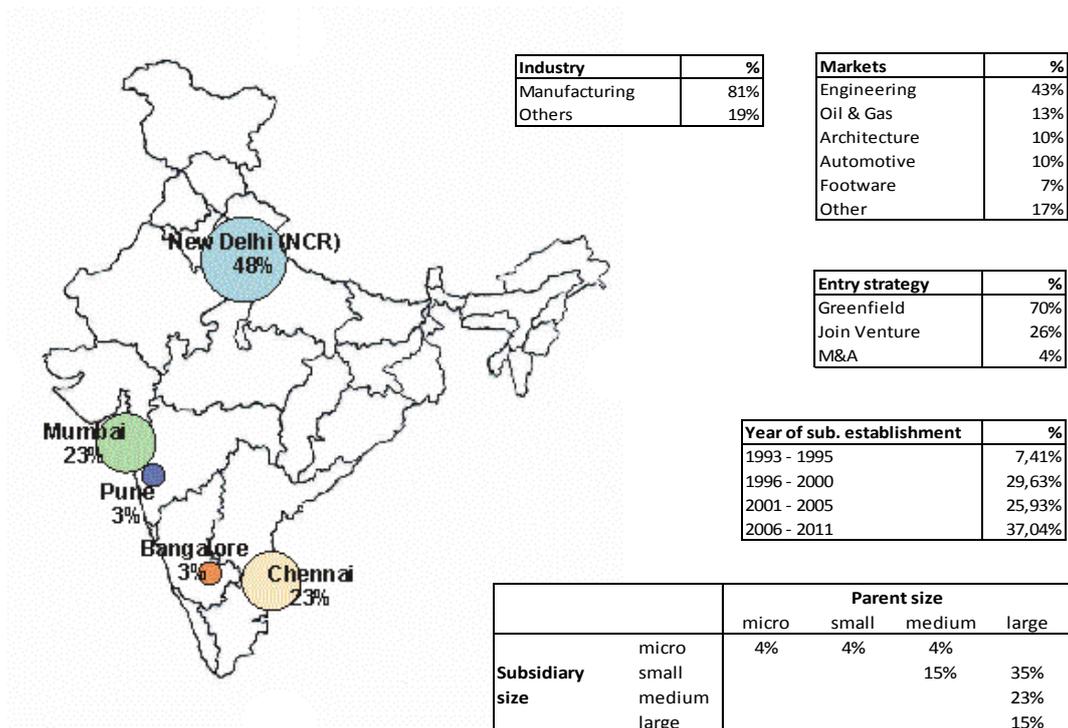

Sample description

There is apparently no peak in Italian companies deciding to move to India. Starting from 1993, almost every year one company of the validated sample was established. The only slight exception being 2008. However what stands out is that all of the companies found were established after the 1991 liberalization laws.

Most of the companies in the sample are manufacturing companies (81%), some of them, the largest ones, are also providing services to their clients. The Engineering market (43%) is by far the most represented. Looking at the size of the parent companies, the large ones are the

absolute majority of the sample. However, looking at the size of the Indian subsidiary, there is a clear prevalence of small companies. And only 15% of the sample has reached a large size. The geographic distribution of the sample companies was entirely around the main Indian cities. An analysis conducted on the original database of 141 companies revealed that the sample is very consistent with the supposed addresses of the initial database. The most relevant features of the investigated sample are summarized in figure 1.

Figure 1: Sample description

III. RESULTS DISCUSSION

Strategic goal

One legitimate expectation when the research started was to find companies outsourcing the manufacturing process to India – due to the very low cost of labor (in 2005 the hourly compensation in USD was 0.63\$ for “production workers” and 0.91\$ for “all Employees”, see Sincavage et al., 2010) – and shipping the manufactured goods to the target markets of the parent companies, without necessarily targeting the Indian market. As it is the typical case for many Italian companies that have been internationalized in Eastern Europe (Onetti and Majocchi, 2002). On the contrary it was discovered that all the companies in the samples

moved to India with – among others – a “market seeking” approach, i.e. with the specific goal of getting a slice of the growing Indian market. This approach is also consistent with the “pull view” (Reid, 1981) since the choice of the target market is not only driven by the current size of the target market, but more specifically by its growth potential.

This could be interpreted as a shift from the previous trend of moving to low cost countries only in order to exploit the lower labor costs. Internationalization decisions seem therefore to follow a “looking for the market” strategy. A question to be further addressed is whether the target market for Italian companies going to India is represented only by India or by the other growing Far East economies.

Our research shows how no respondent specifically indicated the rest of APAC as a target. There are several reasons behind the focus on India that have emerged, once again, more during interviews with the Italian managers than with the Indian subsidiaries:

- The Indian market is huge and most companies try first to consolidate the local market before considering a move to the neighboring countries (Vernon, 1966; Johanson and Wiedersheim-Paul, 1975; Johanson and Vahlne, 1977);
- As previously mentioned, India is not part of the China-Asean agreement (ACFTA) and that is still an important obstacle when exporting from India to most of the Eastern countries;
- In some cases the local Indian manager was not aware of the future plans for the subsidiary or not willing to share them with us.

International network

One of the variable that cannot be left aside is the international experience and the extension of the Italian MNC international presence (Vernon, 1966; Johanson and Wiedersheim-Paul, 1975; Johanson and Vahlne, 1977; Bartlett and Ghoshal, 1989 and 1991; Doz, Santos and Williamson, 2001). This could help in better understand the other objective of the research i.e. the role of the subsidiary in the MNC.

Following the analysis of the findings the respondents have been classified into three groups:

- A) in this group companies were categorized whose only international experience so far is represented by India: India represents their first experiment at internationalization;
- B) in this group companies with 2 - 8 foreign subsidiaries were placed;
- C) which is composed by companies that have over 15 subsidiaries worldwide.

All the groups are represented in the sample, but the global companies belonging to group C are not the majority. As shows in table 1, it appears that Italian companies, although with

some delay, have recognized the importance of the Indian market and have started moving to India regardless of their international experience and size. This represents an interesting result. In fact, the challenges posed by a difficult environment, such as India, may be too much for companies with no international experience. Similarly small corporate size could represent an additional obstacle. As highlighted by Johanson and Vahlne (1977) entering foreign markets (particularly “geographically” and “culturally” far from the domestic one) requires fixed investments that might be prohibitive for small companies. Therefore, these results seems to partially contradict the gradual approach to internalization à la Johanson and Vahlne (1977) and confirm the most recent theories about born global companies (Oviatt and McDougall, 1994; Knight and Cavusgil, 1996).

Table 1: International experience per Parent size

Network	Parent size			
	Micro	Small	Medium	Large
A	4%	4%	4%	8%
B	-	-	15%	27%
C	-	-	-	38%

Source: own calculations.

Notes: The percentage is calculated as follows: No. of companies of a specific size belonging to a specific group /total number of companies.

It is quite clear that large international networks belong only to large Italian companies. It is not however true of the opposite. Not all the large Italian companies of the sample have an extended network. As a matter of fact 45% of the large Italian parent companies belong to group A or B.

Role and Value Chain structure of the subsidiaries

Following the results of the strategic goals it appears that 100% of the sample perform sales in India, while “only” 85% have a manufacturing activity in the country. Once again this is quite uncharacteristic of Italian internationalization into low labor cost countries (Cotta Ramusino and Onetti, 2006). As shown by Berra et al. (1995), Majocchi and Zucchella (2003), typically the opposite is more common situation (cost saving).

Table 2: Subsidiary’s role per subsidiary size

	Micro	Small	Medium	Large
Manufacturing	75%	77%	100%	100%

Sales	100%	100%	100%	100%
Other	25%	-	-	25%

Source: own calculations

Notes: *The percentage is calculated as follows: No. of companies of a given size reporting a specific role/total number of companies of that size.*

Table 3: Subsidiary's role per parent size

	Micro	Small	Medium	Large
Manufacturing	100%	-	100%	84%
Sales	100%	100%	100%	100%
Other	-	100%	-	5%

Source: own calculations.

Notes: *The percentage is calculated as follows: No. of companies of a given size reporting a specific role/total number of companies of that size.*

Only a few of the smaller Indian subsidiaries do not perform any manufacturing activity, but only sales. In some cases (approximately 5 companies) the manufacturing was performed in order to export to neighboring countries as well. However the findings from the data collected were not clear enough to allow for a certain classification of the phenomenon.

Looking at the distribution over the dimension variable, it can be noticed that the only companies not doing manufacturing in India belong to large parent companies. The explanation might reside in the fact that these companies already have an important and established international manufacturing network in place. Referring to Jarillo and Martinez (1990) this results can indicate that the subsidiary is following a "receptive" strategy.

Also as expected, in most cases the subsidiaries have a shorter (67%) and sometimes different value chain (37%). In some instances the value chain is as long as the parent company (19%) but different in content (i.e. activities performed). The "different" value chain stems frequently from the need to adapt and customize to the local market. For instance, the parent and subsidiary might both be involved in R&D and manufacturing (i.e. shoe soles as it is the case of a company belonging to our sample). While the Italian headquarters design and manufacture type A and type B soles, the Indian subsidiary manufactures type B but designs and manufactures a type C, customized for the local market. The same company reports the need to adapt to the local availability of rubber components and additives. Such example shows a strong orientation towards a "multinational" or "multidomestic" approach (Bartlett and Goshal, 1989), with local customization and independence. Additionally, materials and technical specifications can influence the local content as well. For instance a metal profiles

manufacturer, while using the same technology as the parent company, needs to work with different sizes and thickness. Therefore, part of the manufacturing process is different as the size and thickness of the metal sheet influences the working procedure, Quality Assurance and shipping and handling. Another company belonging to the Telecom business has had to adapt to local materials and costs. While the design of many (not all) of the products is the same, the materials had to be changed for sourcing and cost reasons. The typical high-grade industrial stainless steel used in Europe is AISI 304, however in India the AISI 202 is much more common (with a slightly different/lower content of nickel). While their performance is very similar, the cost of supplying 304 in India would make it more expensive than it is in Italy (due to the low volumes consumed in India), placing the resulting product completely out of the acceptable price range. Hence the need to adapt the technical specification to the local materials.

Size distribution shows that smaller subsidiaries are the ones reporting most frequently a shorter value chain (table 4). Which can probably be explained by their size compared to that of their parent company (always bigger).

Table 4: Subsidiary's value chain per subsidiary size

	Micro	Small	Medium	Large
Same	25%	8%	33%	25%
Shorter	50%	85%	33%	75%
Different	50%	23%	83%	-

Source: own calculations.

Notes: *The percentage is calculated as follows: No. of companies of a given size reporting a specific value chain/total number of companies of that size.*

Medium subsidiaries report most frequently a "different" value chain. This could be explained by the fact that medium subsidiaries are already established enough to have the same value chain as their parent companies, however they are also still small and flexible enough to be able to adapt to the local market needs. This data seems to confirm an evolutionary path for the subsidiary over time (consistently with the theoretical theories on the life cycle of the subsidiaries that were mentioned above): the longer the presence in the market, the wider the spectrum of activity and the bigger the autonomy of the subsidiary.

CONCLUSIONS

The objective of this research was to investigate the characteristics of Italian companies in India. Specifically we explored the reasons behind the internationalization choices and the role played by the Indian subsidiary and its value chain configuration.

The first empirical confirmation we collected was about the low number of Italian companies with subsidiaries in India. Based on official statistics the overall population of Italian companies in India ranges from 141 (source: ICE) to 400 companies (source: Pantheon). The empirical validation of the population that we performed during the research shows that the actual number of active subsidiaries of Italian companies is likely to be lower. This result contrasts with the strong growth of the Indian economy and therefore the huge opportunity that the country represents.

In terms of internationalization goals it emerges clearly from the research that the main target is market seeking. This approach is also consistent with the “pull view” (Reid, 1981) since the choice of the target market is not only driven by the current size of the target market, but more specifically by its growth potential. The entire group of respondents mentioned it as the main objective of their presence in India. Not a single company has moved to India simply to outsource the manufacturing to a low labor cost region. In order to acquire that market share Italian companies have organized their subsidiaries as partially independent companies, adopting a typical “multidomestic” approach customizing products and services to the local needs and demands. Following the results of the strategic goals it appears that 100% of the sample perform sales in India, while “only” 85% have a manufacturing activity in the country. Once again this is quite uncharacteristic of Italian internationalization into low labor cost countries. As shown by other scholars (Berra et al., 1995; Majocchi and Zucchella, 2003) typically the opposite is more common situation (cost saving). The analysis of the subsidiary’s value chain brings out that, in most cases, the subsidiaries have a shorter (67%) and sometimes different value chain (37%). In some instances the value chain is as long as the parent company (19%) but different in content (i.e. activities performed). The “different” value chain arises frequently from the need to adapt and customize to the local market. This data seems to confirm an evolutionary path for the subsidiary over time (consistently with the theoretical theories on the life cycle of the subsidiaries that were previously mentioned): the longer the presence in the market, the wider the spectrum of activity and the bigger the autonomy of the subsidiary.

Future research has to monitor the evolution of the internationalization process of Italian companies in India. If the process is going to grow more analysis can be developed: both quantitative (increasing the size of the sample) and qualitative (performing a longitudinal

analysis of the firms composing the sample). This would help both home and host countries/governments to understand what MNCs are doing in their countries, why and how they decide for such an investment/strategy. Of particular interest could be the analysis of the evolution of the autonomy level and role - along the life - of the subsidiaries, to be done performing a longitudinal analysis of the firms that compose the sample.

HEALTH LEAN MANAGEMENT AND CLINICAL RISK MANAGEMENT: A SYSTEMATIC LITERATURE REVIEW

Crema, Maria¹; Verbano, Chiara²

¹Department of Management and Engineering - University of Padova, Vicenza, Italy, crema@gest.unipd.it

²Department of Management and Engineering - University of Padova, Vicenza, Italy, chiara.verbano@unipd.it

ABSTRACT

Nowadays healthcare context needs to afford increasing costs due to aging population, more advanced technologies, inefficiencies and medical errors. These costs cannot be afford any more by the government, considering the international crisis and the pressure to the spending review, that have caused a reduction of the public health care resources. On the other hand, quality must be guaranteed, not only because patients are even more exigent and they claim high quality, but also because of quality accreditation standards required and basic ethical principles. A central problem is to assure high efficiency and high quality level at the same time, and therefore it is crucial to control and reduce wastes and errors in healthcare environment, as they increase costs and decrease health quality. In medicine, errors management is still in developing and managerial tools and practices are needed to identify, analyze, treat and monitor clinical risks. The intention of this paper is to conduct a systematic literature review in order to investigate connections and overlaps between health lean management, focused on performance improvement through waste reduction, and clinical risk management, to understand if and how these two approaches can be combined together to pursue efficiency and quality simultaneously.

Results highlight an emerging research stream, highly understudied, with many useful theoretical and practical implications also for the whole society.

Keywords: clinical risk management, clinical process, health lean management, hospital management

INTRODUCTION

During the last decade, the healthcare sector has been characterized by two contradictions. First of all, the costs of medical care have been increasing due to an aging population and more use of advanced technologies in healthcare, but also to inefficiencies and medical errors that occur in hospitals (Pocha, 2010; Printezis & Gopalakrishnan, 2007; OECD, 2012). On the other hand, the need of governments to reduce the public spending has forced public hospitals to reduce wastes in order to cut costs (Stuckler et al., 2010). Moreover, nowadays customers are more exigent, and the quality levels have to be guaranteed following the quality accreditations standards; thus, researchers and physicians are interested in understanding how to reduce healthcare costs without impacting negatively on patient safety.

Quality in healthcare can be defined as 'the degree to which health services for individuals and populations increase the likelihood of desired healthcare outcomes and are consistent with current professional knowledge' (Rowell, 2004); however, a more recent definition from another point of view defines quality as 'doing the right thing at the right time, in the right way, for the right person and having the best possible results' (Agency for Healthcare Research and Quality, 2001).

In order to achieve a high level of quality, according to a Clinical Risk Management (CRM) perspective, all the risks should be identified, analysed, treated and monitored (Verbano & Turra, 2010) to avoid the 'dark side of quality' (Vicent, 1997).

Many studies have focused on the implementation of CRM (e.g. Kavalier & Spiegel, 2003; Kumar & Steinebach, 2008; Trucco and Cavallin, 2006; Verbano & Venturini, 2011), which can be defined as an approach to improving quality in healthcare that places special emphasis on identifying circumstances which put patients at risk of harm, and on acting to prevent or control those risks. The aim is to both improve safety and quality of care for patients and to reduce the costs of such risks for healthcare providers (Walshe & Dineen, 1998). According to Floreani (2005, p. 227), from a more practical point of view, CRM can be defined as the system of guidelines, protocols, steps, organizational and clinical procedures adopted by a hospital to reduce the probability that events and actions, that might potentially produce negative or unexpected effects on the health of patients, occur.

However, CRM is not the only approach implemented to improve the quality level of health care; in fact, from manufacturing industries, other practices are proposed with the aim of achieving high quality. These are quality methodologies such as PDSA (plan, do, study, act), lean management, six sigma, Quality function Deployment Matrix, ISO 9000, Total quality

management and various other business management strategies (Varkey et al., 2007; Benitez et al., 2007; Kruskal et al., 2012; Joint Commission on Accreditation of Healthcare Organizations, 2006). In particular, six sigma is a methodology that provides businesses with the tools to improve the capability of their business processes (Yang & El-Haik, 2003), aiming at perfection in order to reduce clinical errors (Vanker, 2010; Johnstone et al., 2003). The other quality methodology that is receiving increased interest both in academic and in management is health lean management (HLM), which can be defined as a managerial approach, to identifying and eliminate waste while improving flow of activities to maximize value to the customer. This methodology considers standardization and specification of work processes, organization of work in such a way that unexpected events are easy to spot, and deployment of activities that find and fix mistakes (Ohno, 1988; Womack & Jones, 2003). With the intent of combining the advantages of six sigma and lean management, some hospitals have implemented 'lean six sigma', aiming to achieve speed and efficiency improvements and reduction of variation (Veluswamy & Price, 2010; Martin, 2007; De Koning et al., 2006; Yeh et al., 2011).

Although all these research efforts are aimed at increasing the quality and the safety of patients in hospitals, the number of errors that are reported for the hospitals are still high (National Priorities Partnership, 2008; Schwappach, 2011).

During the past, errors were attributed to physicians, but most of the authors (e.g. Kohn et al., 2000; Reason, 2000; Institute of Medicine, 2001; Novis, 2008; Berte, 2004) stated that errors are due to failures of the processes (inefficiencies/problems in the system and process organization) that should be improved.

In order to avoid medical errors, people should work in better conditions where the right barriers (procedures, protocols, process control, controls at the points of risk and administrative controls) should be erected in order to implement more reliable systems (Reason, 2000; Kohn et al., 2000). For achieving this aim, the clinical processes have to be analysed using methodologies of business process analysis to detect high risk situations. Lean management, as a business management strategy, comprehend a set of principles, practices and methods for analysing, designing and managing processes (Schweikhart & Dembe, 2009); thus, it can be considered for the purpose of medical error avoidance.

In particular, since 2002, lean management has been adopted in an increasing number of health contexts (De Sousa, 2009; Laursen, 2003; Mazzocato et al., 2010) as a solution to achieve productivity, cost, quality, and timely delivery objectives, reducing any wastes of overproduction, over-processing, transportation, inventory, movement, waiting and defective

products, that are the typical wastes of hospitals (IHI, 2005; Bush, 2007; Jimmerson et al., 2005). Nonetheless, Holden (2011) underlined that further research seems necessary in order to study this issue, in particular regarding the assessment of lean management's effects on patient safety and quality outcomes. Moreover, Pawlickj et al. (2008) claimed the need to clarify the concepts of quality, errors and how to report errors. More researches are requested also to better understand how a process can be performed without making it prone to errors and the effects of lean on patient safety (Pawlickj et al., 2008; Holden, 2011). Also Vincent (2001) stated CRM is just one facet of quality improvement and in future the connections between CRM and other quality improvement systems need to be made more explicit and meaningful.

Considering the definition of HLM provided, some connections with CRM emerged just from it. Lean management facilitates reduction in health care costs, while its main benefit is that it supports the clinical process analysis and it could provide an approach that contributes to clinical error reduction, achieving the CRM objectives. To investigate this extent, the aim of this paper is to systematically review the academic literature.

METHODOLOGY

In order to analyze rigorously the existent literature, a systematic literature review has been conducted, following the indications of Denyer & Tranfield (2009), Pawson (2006), Denyer et al. (2008) and Brereton et al., (2007). The literature review questions were formulated based on CIMO (context, interventions, mechanisms and outcomes) approach, as follows:

- Are there any connections/overlaps between health lean care management and clinical risk management in hospital environment? If yes, which are the connections and the outcomes?
- Can lean healthcare management help/support CRM in hospital environment? If yes, how?

Next, the protocol for the systematic literature review has been generated including the following steps: a) Conceptual discussion of the problem; b) Literature review questions; c) Search strategy; d) Paper selection criteria; e) Single paper analysis; f) Descriptive analysis of the extracted database; g) Synthesis and content analysis.

The third step has been carried out using academic databases: Business Source Premier (EBSCO), Compendex (Ei Village 2), Inspec (Ei Village 2), Web of Science (ISI) and PubMed. The keywords employed for this searching phase are reported in the second column of table 1, where also the results of the search strategy are synthesised.

Search strategy	KEYWORDS	Web of Science (ISI)	PubMed	Business Source Premier (EBSCO)	Compendex (Ei Village 2)	Inspec (Ei Village 2)
	CRM "AND" lean health care	9	16	0	1	0

	lean patient safety "WITHOUT" obesity body	156	49	16	7	4
TOTAL	600	606	66	53	23	

Tab. 1 – Results of search strategy.

For the paper selection phase the following criteria have been adopted: exclusion of duplications and papers that from the title and the abstract were not useful to answer to literature review questions (obtaining 157 papers), exclusion of conferences proceedings, opinion papers, lecture notes and papers with only 1–3 pages, papers with no references (as they are not sufficiently authoritative), and non-English language papers, as they lack international impact (obtaining 116 papers).

Reading full text, papers were selected based on CIMO, cutting the papers whose context was not that of health care providers, such as hospitals (C) and including papers which consider lean health care and its relationship with clinical errors (even if they are only mentioned in the results or in the objectives) (I-M-O).

The resulting database (47 papers) has been studied.

For the single paper analysis the aspects recorded are: Citation, Authors, Title of the paper, Year, Keywords, Principal theme, the name of the Journal, Impact Factor and H index of the journal, Research methodology, Aim of the paper, Results, Author background, Context of applicability, Notes about key concepts, Number of authors and the Country.

A descriptive analysis and then a content analysis have been conducted on the papers obtained.

DESCRIPTIVE ANALYSIS OF THE EXTRACTED DATABASE

For the descriptive analysis journals, authors, countries, time trend and research methodology have been investigated and the results are presented in fig. 1 and fig. 2.

For journal evaluation four main databases have been used (ISI, SCOPUS, ABS - Association of Business Schools, CNRS - Comité National de la Recherche Scientifique) and other three databases (SCIENTOMETRIC, ERA - Excellence in Research for Australia, ABDC -Australian Business Dean Council) have been considered to evaluate journals that were not listed in all the four main databases. On the base of the four rankings so obtained for each journal, final journal evaluation have been obtained using 5 quality levels defined in fig.1: Gold*, Gold, Silver, Bronze, Copper.

Fig. 1 illustrates the distribution of the papers based on the quality level of the journal in which they are published, and also the authors evaluation, obtained summing up the journal evaluation of each paper written by an author divided by the number of authors.

Moreover, descriptive analysis reveals that papers are distributed in many journals, authors are mostly physicians and only few scholars have written more than one paper.

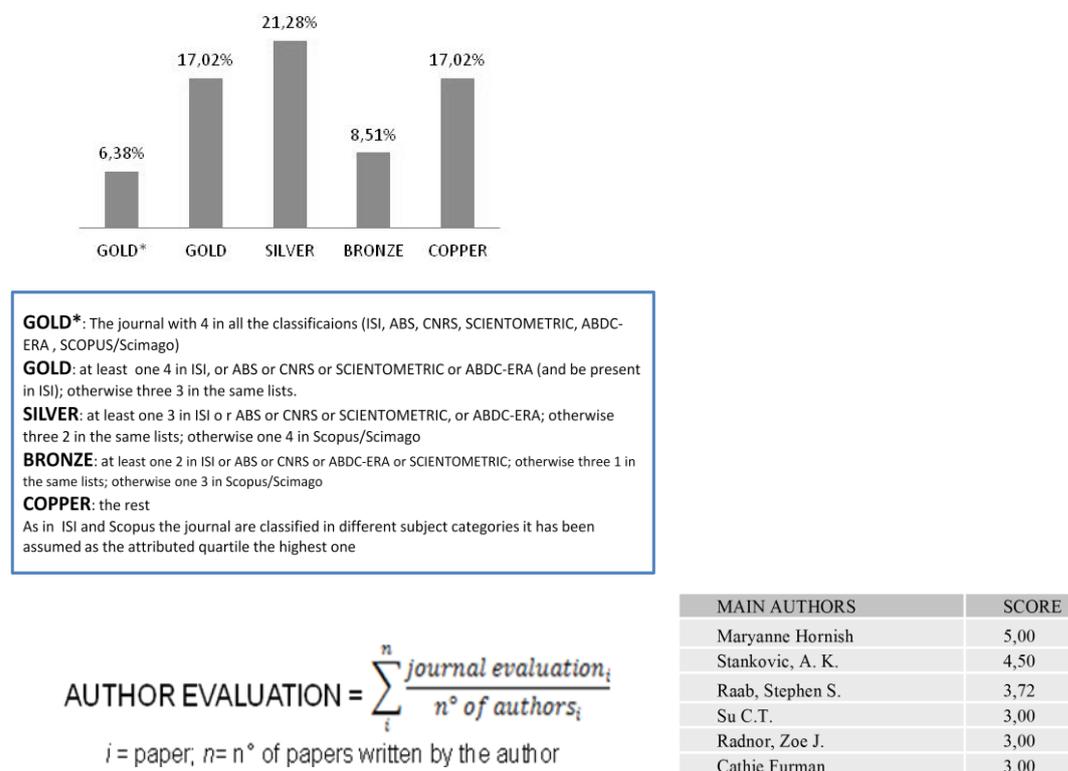

Fig. 1 – Journal and author evaluation

In fig. 2 time distribution of the papers demonstrates a positive trend from 2004 and 2012 for this young research theme.

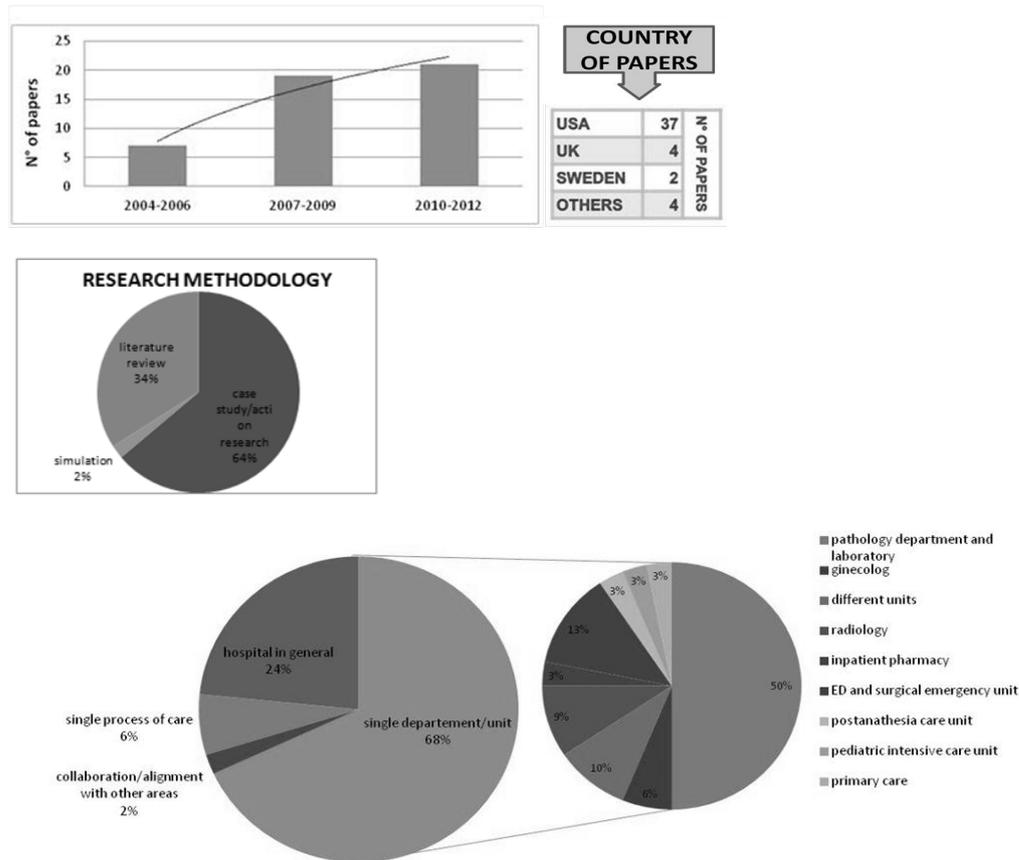

Fig. 2 – Time and country distribution, research methodologies and context of applicability

This is confirmed also by the absence of survey research methodology in the papers analyzed, while case studies and action research are preferred.

Researches come mostly from USA, UK and Sweden and, as the context of applicability is concerned, most of the papers consider single areas (department or unit), overall pathology Department and laboratory and Emergency Department.

CONTENT ANALYSIS AND RESULTS

In order to answer to the literature review questions a content analysis has been carried out. In tab. 2 papers are classified inserting in the central column papers with at least one objective of HLM and one of CRM (first row), at least one methodologies of HLM and one of CRM (second row) and that achieve at least one result of HLM and one of CRM (third row); in this column also papers with respectively common objectives, methodologies and results are included. Therefore, it can be observed that most of the papers adopt at least one method of HLM and one of CRM to pursue at least one objective of HLM and one of CRM, even if the

entire CRM process is never adopted, considering just some CRM phases and only to pursue partial objectives of CRM.

Tab. 2 – Papers classification based on objectives, methodologies and results.

In the right column there are two papers pursuing only CRM objectives. In particular the first (Biffel et al., 2012) aims to define and implement risk assessment (central phase of CRM process) and the second (Kim et al., 2010) intends to improve and understand error analysis and reporting. Both of them, implementing lean and CRM methodologies achieve also results of HLM.

Papers on the left column (first row) focus only on HLM objectives, such as reducing waste, increasing productivity and reducing costs. Using just HLM methodologies, or both HLM and CRM methodologies, they obtain also partial results of CRM (quality of care improvement and safety).

Finally, among papers pursuing HLM and CRM objectives, three papers (left column, second row) achieved partial CRM results using only HLM methodologies, and other three papers (left column, third row) achieved just HLM results, failing in CRM or common objectives.

This first analysis demonstrates there is a two way arrow between HLM and CRM, meaning that HLM methodologies support CRM and some methodologies that are typical of CRM contribute to achieve also some HLM results.

A further analysis regards only the papers in the central column of table 2:

- Most of them (55%) pursue efficiency objectives: time, costs and waste reduction, productivity enhancement, workflow/process improvement, processes streamlining, work environment improvement, scheduling improvement, better use of resources/capacity.
- Few papers aim to improve the management of demand peaks (differentiation of demand) or of volume peaks (2% and 5% respectively).
- The majority of the papers pursue common HLM and CRM objectives, such as quality improvement (48%), safety enhancement, error detection and reduction (90%). Among objectives, length of stay and customer satisfaction are low considered (2% and 5% respectively).
- As CRM objectives is concerned, 10% of these paper focus on effective personalized care, patient centered care and improved patient care and only 5% focus on compliance with healthcare standards.

Content analysis demonstrates that the objectives of papers are fragmented; only few of them pursue three or four objectives, while none of them pursue all HLM or all CRM objectives.

Nevertheless, it should be noted that there are first partial attempts to take advantages from the synergies between HLM and CRM.

Papers analyzed adopt jointly different methodologies, belonging to both HLM and CRM approaches, even if CRM methodologies are less used and only single and separate activities of CRM process are performed.

CONCLUSION

Papers in literature focus mainly on analysing how lean management can be implemented in order to save money and increase the efficiency of the processes. However, these objectives should be achieved ensuring an improvement, or the same level of healthcare quality and safety, compared to what was reported before lean interventions.

The systematic literature review carried out confirms that no studies focus on the relationship between HLM and CRM .

The results of the conducted analysis permit to answer the two systematic literature review questions. Solving the first question (Are there any connections/overlaps between HLM and

CRM in hospital environment? If yes, which are the connections and the outcomes?), it should be observed that in most of the papers there are objectives, methodologies and results that are related to both HLM and CRM approaches. In particular, a lot of papers pursue common objectives, apply common methodologies and obtain common results of both approaches, in most cases regarding quality and safety improvements. These “double-sided” results are usually achieved accidentally, without a declared intention, adopting only methods that mostly belong to one approach, even if some common methodologies are considered.

To answer the second literature review question (Can HLM help/support CRM in hospital environment? If yes, how?), it has to be noted that pursuing only HLM objectives and/or adopting HLM methodologies, some partial results of CRM are achieved, but also CRM objectives and methodologies of both approaches can lead to partial HLM results, such as efficiency improvement. Therefore, a two way arrow between HLM and CRM emerged; in particular, there are HLM methodologies that can be used to support CRM, mostly in risk identification and risk treatment phases.

From content analysis the following gaps emerged from literature review:

- Few studies focused on a whole process of care instead of a single unit/department.
- No studies consider the entire CRM process, even if partial objectives of CRM are pursued and some CRM methodologies are adopted, considering often only specific phases of CRM process.
- Understudied objectives are: improvement of demand management and customer satisfaction, reducing the length of stay, achieving other CRM objectives besides safety and quality improvement.
- Fragmented objectives are pursued one by one, instead of following an integrated approach.

In synthesis, this research has demonstrated that literature not properly investigates how the key concepts of HLM and CRM are linked, and how lean management can be used to achieve objectives of the CRM, and the implementation of CRM process. The contribution of this paper is the introduction of a new research stream that studies how to improve health care management combining HLM and CRM approaches. From a practical point of view, based on the results of this research, physicians should consider the possibility to adopt HLM also as an approach to enhance quality, in addition to reduce costs. The opportunity to develop an integrated methodology that include both HLM and CRM tools and practices could be considered in order to stop adopting the two approaches separately and to start discussing how

to manage clinical processes obtaining at the same time all possible benefits in terms of costs, quality and safety.

Possible future research could map the experiences on the field (not published and therefore not analyzed in this paper), in order to deeply understand how lean methodologies can be applied to prevent medical errors of clinical processes and, finally, to grasp lessons on how to exploit synergies emerged. Many useful implications can be derived from this emerging research stream, especially in this period of economic recession, in which improving the performance of healthcare organization becomes necessary in a context of decreasing resources. Moreover, the implementation of managerial tools and practices belonged to HLM and CRM combining these two approaches could concentrate the efforts into an improved clinical process management with the final aim to increase patient safety and guarantee continuous quality improvement, soaring patient satisfaction and hospital reputation, contributing to create a better society in terms of healthcare.

ACKNOWLEDGEMENTS

ABSTRACT:

In the last few years the agriculture sector has shown a significant slowdown due to economic crisis. On the one hand, the reduction in the purchasing power of households has determined a decrease in the demand for food and agricultural products, on the other hand, there has been a reduction in the income of the farmers. This has inevitably led to implement business strategies to counter the exponential reduction in profitability required to survive in an increasingly competitive environment. The literature on corporate strategies is particularly large, however, the majority of authors identify competition and cooperation as “the driving forces” for economic and social progress (Hurta and Hilda, 2007).

The aim of this paper is to verify if a co-opetition can represent a strategy for the success of small fruits companies operating in Sicily. The study carried out through a two step framework showed, on the one hand, that the co-opetition is an opportunity for the entrepreneurs in the start-up and in the distribution phases, and on the other hand, that the low propensity to invest in the small fruits sector by horticultural producers in the region, leads consequently to a non-profitable market.

Keywords: Co-opetition, Small fruits sector, Sicily.

INTRODUCTION

The present scenario, strongly characterized by unstable and uncompetitive markets, has implications for an increasingly negative impact on the enterprise system and alliances could certainly represent, in this context, a valuable tool in order to give companies a strong

competitive position. Generally, alliances are accepted by managers as "*modus operandi*" but "*ob torto collo*" as they see in them the appearance of a "loss of leadership".

The existing literature on co-opetition is fairly recent, Ray Noorda, in fact, introduced in 1980, this new strategic approach, adopted, then by enterprises which is expressed through a collaboration between competitors. Conceptually, this relationship, may be seen as a "bizarre strategy" because joining two diametrically opposed concepts: cooperation and competition, two terms that, perhaps, they can hardly get married. In fact, Coy (2006) defines this relationship like "sleeping with the enemy". The paradigm of co-opetition then pushes companies to collaborate and to be simultaneously competing with the aim of improving the economic performance (Bengtsson and Kock, 2000; Brandenburger and Nalebuff, 1996; Gnyawali and Madhavan, 2001; Lado et al. 1997). The co-opetition has found application in many areas such as health care (Barretta, 2008 Le Tourneau, 2004; Peng and Bourne, 2009), air transport (Garrette, et al., 2009, Oum et al. 2004), automotive (Gwynne, 2009; Segrestin, 2005), tourism (Kylanen and Rusko, 2011; Kylanen and Mariani, 2012). The agro-food industry has not remained free from this "*modus operandi*" where such cooperative behaviors may be of interest both in horizontal and vertical relationships both at company level and at the level of the organizational structures over business (Walley, 2007; Walley and Custance, 2010) . The types of co-opetition described in the literature appear heterogeneous and strongly influenced by the intrinsic characteristics of the product and the target market. In the food sector, however, the available literature seems strongly directed to the analysis of different forms of organization and governance of markets rather than to the development of themes aimed at identifying behaviors and strategies intra or inter companies (Frisio et al., 2012). The co-opetition could be seen as a tool to internationalize small businesses, having as result the possibility to win large markets (Dana et al. 2011). The existing literature also provides a summary of the results of the competition that appears in contrast, in fact there are some unsuccessful experiences (Park and Russo, 1996), that's why some consider this strategy potentially harmful (Hamel, 1991), others see it as detrimental to alliances (Kim and Parkhe, 2009). In contrast, other studies suggest this co-opetition can have a positive effect on the performance of the market (Luo et al. 2007) and on innovation (Belderbos et al., 2004; Quintana-Garcia and Benavides-Velasco, 2004; Tether, 2002) .

The aim of this study is to verify the presence, within the meager segment of small fruits in Sicily, of cooperative behaviours considering, at the same time, the propensity of farmers to invest in the sector of small fruits and the willingness of adoption of cooperative business strategies between companies under study. In addition, it will be identified and assessed the

role of institutions, particularly the Region of Sicily, in the definition of strategies for the organization of agricultural offer addressed to the realization of nets to corporate autonomy rather than towards the constitution of "unique" subjects, strong and with hierarchical structure (Frisio et al, 2012).

The work contributes to the knowledge of the sector of small fruits in Sicily in relation to the attention that has recently been addressed by the Regional Government and to check whether a cooperative strategy, already established in other sectors, can also represent an opportunities for growth for this sector.

The paper is organized as follows. After a description of the importance of the sector of small fruits in Italy and in Sicily, we describe the methodological approach used to achieve the aims of the research. Below it is a description of the results and the discussion of the same. The work closes with some brief considerations.

THE ITALIAN SCENARIO OF SMALL FRUITS

In the last decade, in Italy, the interest in the sector of small fruits has taken an increasingly significant role as the official statistics FAO show. In fact, as shown in Table 1, the amount of recorded land, in the period (2001-2011), has had an increase of about twenty-three times, from 431 hectares in 2001 to 9.926 hectares in 2011

Tab. 1- Small-fruited Area (hectares) in Italy (2001-2011)

	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011

In particular, the species that has the greatest impact is represented by the Raspberries, the surface of which passes from 179 hectares in 2001 to 300 hectares in 2011. The other species, show, over the decade, an increase of the planted areas where, specifically, the species Currant shows an increase in fact it has doubled from 58 hectares in 2001 to 100 hectares in 2011. In terms of production, there has been, over the decade, the same trend, with a produced volume, in 2011, of about twenty-two times greater than in 2003. We move, in fact, from 3,938 tons in 2001 to 89,141 tons in 2011 (Table 2). As for the surfaces, even the

productions, excluding always the category "Berries Nes", that's the Raspberries species that has the most of volume, in fact, with 2,000 tons in 2011, it intercepts the 48,30% of the total product, showing an increasing trend during the whole considered period. In tail in order of importance, the Blueberries, for which, although over the decade there has been a decreasing trend and it intercepts, in 2011, con 1.441 tons, 34.80% of the total product

* Other berries not classified

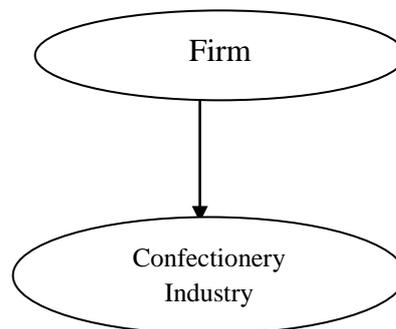

The picture just described gives a glimpse of significant room for growth in the sector. From official national statistics (ISTAT), the distribution of Italian areas and production for regions, reveals a higher concentration in the regions of northern Italy, primarily the Trentino Alto Adige followed by Lombardy and Piedmont, while for the scenario of Sicily, in spite of the climatic conditions in some particularly favorable area, there are no statistical data on area and production. This aspect is related to the lack of significance that currently the sector plays in Sicily. However, by surveys conducted by the research team, there were recognized ten companies producing small fruits, mainly located in Eastern Sicily, which represent the statistical universe of reference in this study.

THE SICILIAN SCENARIO OF SMALL FRUITS

The universe under study is composed of ten companies located in the western and eastern Sicily, two are in the town of Campobello di Mazara, in the province of Trapani, and they are cultivated in a protected environment, the remaining eight companies, cultivated in the open field, fall within the territory of the Nebrodis, a mountainous area in the province of Messina,

which represents the ideal distribution area for growing these fruits in terms of soil and climate. For these distribution areas, located at about 800 meters above sea level, the cultivation of small fruits is an important opportunity income. By the investigations carried out, it emerges, a value of PLV, for 1,000 square meters, in soilless cultivation, amounting to € 9,000 and, in the field, a PLV equal to 1,900 euro per 1000 square meter. The sample investigated is characterized by small production companies that, together, will inform a total area of 4.7 hectares for a total production in 2012, amounting to about 185 tons. The cultivated species are raspberries, currants, blueberries and blackberries. These companies are run by entrepreneurs with an average age of 37 years who have undertaken the cultivation of small fruits due to the push by the Region of Sicily, who intended to pursue the development of this sector in Sicily through a loan that guaranteed an aid able to support the initial investment costs and ensuring technical advice during the entire production cycle. The sales market of products thus obtained, follows a system of short chain ,in fact, they are sold directly to local confectionery industries business (Fig 1).

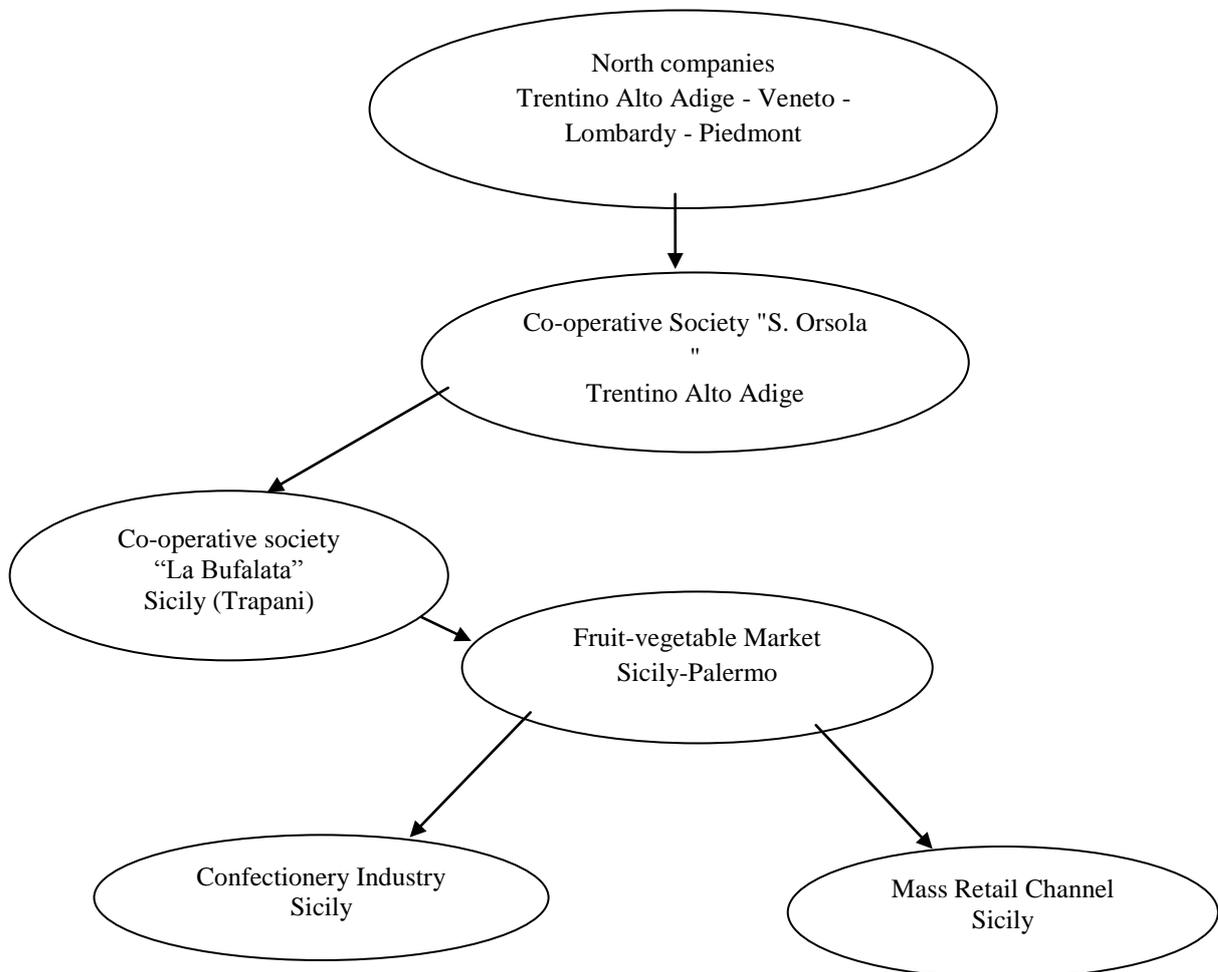

Fig.1 Small fruits chain in Sicily

It is, unfortunately, a volume of production unable to meet the demand of the regional market, as the reality of small fruits in Sicily is still in initial phases. The main Sicilian market supply, is represented, in fact, by the productions from the regions of Northern Italy and the countries of South America that are intercepted, specifically, by the cooperative society "S. Orsola ", located in Trentino Alto Adige, which channels the productions in different regions of Italy, and then follows the path of fruit marketing to various confectionery industries or regional supermarkets (Fig 2), satisfying the market demand for ' entire year. This is an aspect which is of particular importance in an era in which the culture of seasonality, it is significantly different than that of the past. In particular, in Sicily, there is a cooperative that

serves as a link between the cooperative "S. Orsola " and the fruit and vegetable market of Palermo which is the main regional platform for small fruits.

Fig 2 organization scheme of the small fruits sector

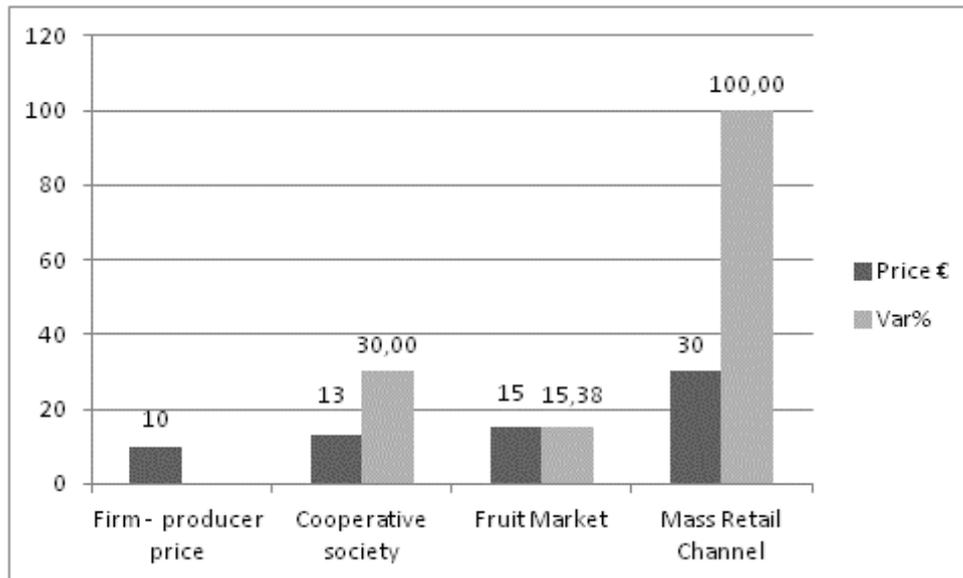

It's clear, however, as the wide structure of the supply chain, involving many actors has as consequence, the formation of particularly prohibitive price especially on the fresh market of the product (Fig. 3).

In fact, the changes of the prices are significant along the production chain. Specifically, the selling price popped by employers amounts to about 10 €/ Kg The product is sold in boxes mixed (blackberries, currants, raspberries and blueberries) 1 kg, consisting of 8 trays of 125 g each, and they are sold to cooperative society engaged in a rise of about 30% at the time of sale of the product to the fruit and vegetable market which, in turn, it sells at a price of 15 euro/kg (+15.40%) in pastry shops and department stores, the latter , specifically, increasing

customs sales prices in an amount equal to 100% with a price of about 30 euro/Kg, addressing a small number of target consumers.

Fig 3. Percentage change of small fruits price in the production chain Sicilian

Source: our processing based on direct interviews

METHODOLOGY

In order to reach the research's aim we have contacted all the 10 Sicilian firms that make the production of small fruits the core business of their activity.

The interview was conducted using a questionnaire containing 12 open-ended questions addressed to capture qualitative information relating to the forms of horizontal integration, relationships upstream and downstream of the production phase and the main problems of the sector.

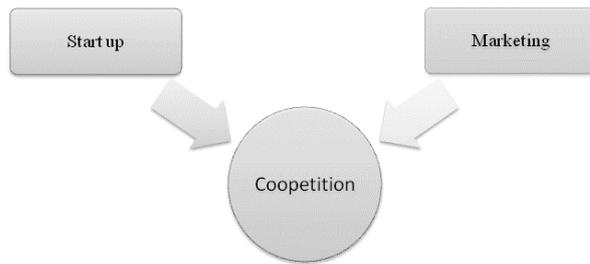

In addition, in order to assess the propensity to invest in this product segment, we have carried out a telephone interview through a semi-structured questionnaire to 30 fruit growers in Sicily, not employed, at the moment, in the production of small fruits and operating in areas where the soil and climatic conditions are suitable for the cultivation of small fruits. We have chosen the 30 most important companies of wild strawberries, in relation to the strong similarity with the agro-technical of the small fruits. To these entrepreneurs were asked, first, if they knew the specific production characteristics of the market and the health of the sector and, based on the response, the questionnaire followed two different routes. Specifically, in the case of knowledge of the sector, the questionnaire wanted to estimate the propensity to orient production towards the berries and then to establish competitive strategies with other

businesses. For those who were not aware of the peculiarities of the sector, after a brief presentation of the most significant segment of small fruits, it was estimated the will to invest and to cooperate in the fund. Finally, it was also asked what could be the role of institutions in supporting the development of cultivation. In particular, the questionnaire consists of a first part aiming to highlight the strengths and weaknesses of the sector (SWOT Analysis), in order to shed light on at the same time, opportunities and possible threats of the sector under study, that could serve as an incentive for entrepreneurs to start this productive activity, followed by a second part to assess the propensity of farmers, working and not in the industry, to invest in the sector of small fruits and to adopt business strategies by identifying cooperative production phases where such a strategy might be more efficient. This will allow you to understand the future direction of entrepreneurs operating in the region.

RESULTS AND DISCUSSION

From the interviews carried out with small fruits farmers it has been possible to deduce in time of production that the cooperation may represent an interesting strategy to overcome some obstacles. The group of entrepreneur interviewed claims to be willing to cooperate in the stages of the purchase of seedlings and the marketing phase (Fig. 5). Indeed, as emerge in other studies carried out in the Sicilian fruits and vegetables sector, the main constraints for the enterprises success is linked to the high level of the provision costs of nursery materials and the complex distribution system (Schimmenti et al., 2011). Also the co-operation through common marketing strategies, often too expensive for small fruits companies, could contribute to increasing the competitiveness of them. Therefore, to cooperate in the purchasing phase of seedlings can be an opportunity to reduce the high costs of initial investment which involves the cultivation of small fruits. One possible solution, according to the interviewees, could be the creation of a common nursery from which we could supply, without the need to resort to nurseries in Northern Italy and in Northern Europe. Other solution could be a strategy that allows entrepreneurs to create a regional productive reality and a commercial hub that could have a greater impact on the main markets to which to allocate the production.

Figure 5 – Phases diagram identified for an effective co-operative strategy

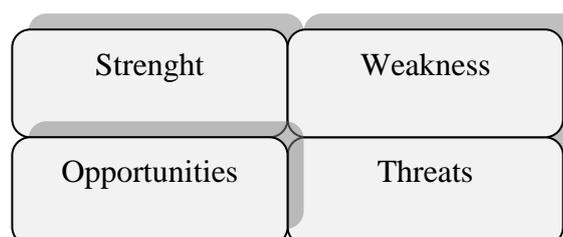

In reference to the group of thirty Sicilian fruit entrepreneurs, it was estimated the propensity to invest in small fruits sector in order to understand the future production scenarios. By the conducted interviews we can see the majority will not to invest in this area, regardless if it is supported by a possible support of public institutions. Specifically, only one out of thirty entrepreneur said he had filed in the past for funding aimed at supporting the initial investment for the cultivation of small fruits. The rationale for this categorical attitude is due, in almost all cases, to market problems. According to the respondents, in fact, it does not exist, in Sicily, a significant market of small fruits for the reasons already explained above. Some of the entrepreneurs surveyed also said they had had previous experience in the cultivation of these fruits and not to be more willing to invest in this sector because of the difficulty in placing the productions in the regional market for the high perishability of fruits.

SWOT ANALYSIS

From the survey results it has been possible to develop a SWOT analysis (Fig. 4), which is essential to highlight the strengths and weaknesses of the sector of small fruits in Sicily. The same analysis is been important to identify the stages of production where co-opetition can be an interesting strategy, and finally evaluate the propensity to invest by Sicilian fruit entrepreneurs.

Figure 4 - SWOT Analysis

In particular, the SWOT analysis shows that the most interesting trait of this sector is represented by the nutraceutical properties and health benefits of the product, accompanied by a market demand growing, high profitability of crops both in protected cultivation and in open field. Between the weaknesses emerges a strong entrepreneurial individualism, a cultural factor that does not allow to appreciate the fresh product, the purchase price of the seedlings that represents the voice of the more expensive of production, for which most entrepreneurs have expressed their willingness to collaborate with other businesses, high perishability of the product, and finally the problems of marketing.

The opportunities foreseeable for the future, are based on the important potential of development of the sector, on the new market opportunities both domestically (center-south) and abroad. The international market competition is considered, among the possible critical (Threats) for the future, so that the imported products may steal some market share.

CONCLUSIONS

The main contribution of this study has been, first, to know the strengths and limitations that characterize the sector of small fruits and to inquire about the existence of cooperative strategies within the same market, using, in particular, empirical data between agricultural producer groups operating in Sicily.

Although the investigations have not emerged, at present, the cooperative attitudes, in a future perspective, this study has highlighted the willingness, by the entrepreneurs to adopt business cooperative strategies aimed at the reduction of production costs, identifying, specifically, the phases of the production process more expensive. Specifically, it has emerged from the survey carried out, that the purchase of propagation material and the marketing phase of the product are the steps that fit best to such business strategies although, to date, the structure of the industry in terms of area and production, is such as to prevent the implementation of these strategies.

The low propensity to invest by the interviewed entrepreneurs, can be attributed mainly to market problems, a solution to this problem might be to invest in marketing efforts using, for example, the specific nutraceutical features and health benefits that these fruits have, educating the consumer, and step by step you may catch a glimpse at the growing in the sector, where the cooperative strategies could represent an interesting opportunity for Sicilian farmers.

ABSTRACT

In the last few years the wine market has been affected by a deep structural transformation due to the entry in the world productive scenario of new competitors and for changing of the demand not only at geographical level but also for more and more orientation of consumers towards the quality wines. This transformation has involved even the Italian wine sector, that takes in the international wine scenario a significant importance, both in terms of supply and of the weight on the world wine export. The competitiveness analysis of Italian wine in the main partner countries, carried out through the application of the Vollrath index, show different scenario depending on the wine categories considered. In general results reveal an increasing competitiveness in some markets, such as Asiatic (especially for bottled wine and sparkling wine), East Europe (mainly for sparkling wine and cask wine) and North European countries (especially for cask wine), which do not have a viticulture tradition and where the acknowledgement of the health characteristics of wine and of the product as an expression of an Italian lifestyle are strategic factors for the success of Italian wine. Contextually, emerges a disadvantage in traditional markets (France) and in new producing markets (USA). In this context is necessary to consider the peculiarities of each market that differ in terms of dimension, culture, purchasing power, through the adoption of focused strategies.

Keywords: Wine industry; Competitiveness; International trade; Italy

INTRODUCTION

Over the last few decades the wine market has been affected by a deep structural transformation due to globalization and mounting international competition (Berneti et al., 2006). On the one hand, the entrance of new countries on the world productive scenario, whose role is continually strengthening, set beside the traditional wine producing countries

of the “Old World”, such as France, Italy and Spain, has led to an overall geographical reconfiguration of the productive scenario. On the other hand, the demand for wine has also registered a geographical change with a fall in the traditional market, in line with social changes that have occurred through time, and an increase in new consumer markets. Contextually, preferences and customs associated with wine consumption have changed with a general decline in the quantity of wine sold and an increasing orientation of consumers towards quality wines apt to satisfy more complex needs than purely gastronomic ones, the function of which is enriched with experiential, symbolic and hedonistic elements (Nosi, 2012). In 2007, a deep economic and financial crisis was added to this changing process of the world wine market; a crisis that involved indiscriminately all economic sectors and, among them, that of agriculture and food, until then characterized by a strong resilience ability compared with other sectors. In the international and European scenario, Italy is the undisputed leader in the wine market, both in terms of supply, increasingly oriented towards designation productions (ISMEA, 2012), and export, absorbing in 2011 about $\frac{1}{4}$ of world export (OIV, 2012). Furthermore, Italy has one of the longest and most important traditions, producing a great variety of wines from a number of geographically different regions (Bernetti et al., 2006). Wine is, in fact, one of the most representative products of the ‘Made in Italy’ food productions, that, thanks to its high quality and marked distinction, has contributed to the strengthening of the reputation of Italian products in the world as an offer of excellence, strongly tied to the territory (Carbone and Henke, 2012).

The aim of this paper is to analyze the competitiveness of Italian wine on the international market, with specific reference to sparkling wine, bottled wines and cask wine of less value, in relation to their weight in the more general context of agri-food trade. In particular, we intend to verify the changes in Italy’s competitive position during the period 2000-2012, related not only to structural changes of the sector, but also to the entrance into force in 2009 of the new common organization of the market in wine, and to the deep economic and financial crisis in Italy and in the world.

After outlining the reference frame of the Italian wine sector as seen on the wider international scenario, this work will illustrate the working method used to respond to the aims of the research. Then, the results of the analysis of the competitiveness will be described and discussed. The paper ends with some final remarks by the Authors’.

LITERATURE REVIEW

The deep structural changes that have characterized the world wine market in the last few decades have fomented a growing research interests in exploring the dynamics of the competitive position of individual countries in the world market and their main determinants. In that sense, Cusmano et al. (2010), through a comparative analysis of two emerging countries, such as Chile and South Africa, and a long established Italian wine region, such as Piedmont, highlight that the success of new world producers is linked both to investments in process of technological modernization and in their ability to adapt quickly to global demand changes. Ewert (2012) and Van Rooyen et al. (2011) observe, respect to the South African wine sector, the strong influence of regulation and support of government policy on the sector' competitiveness. A Similar result is achieved by Doloreux and Lord-Tarte (2012) in their study on the Canadian wine market.

Other studies, carried out through a competitiveness analysis using specific indicators based on the principle of comparative advantage, show the main factors contributing to the failure of the sector. These, can be depend, as for Portuguese wine (Fortuna sets per., 2007), from bottlenecks in the phases of production, processing, bottling/labelling and distribution, or as emerges for Bosnia and Herzegovina wine sector, from a low consumption of wine (Ivankovič et al., 2005). The same authors emphasize the importance of investment in critical phases of the supply chain, in order, as assert Ivankovič et al. (2005), to improve production efficiency, wine quality and marketing.

On the other hand, several Authors, focus on the role of innovation strategies in enhancing the companies competitiveness on the market. In that sense, Fernandez et al. (2011) reveal, in their analysis on the Spanish wine market, a positive relationship between a formal technological innovation strategy and the competitive advantage. Also Leenders and Chandra (2013) found that a green innovation strategy has a positive impact in terms of business performance mainly when firms use more direct sales channels.

With regards to the Italian sector, Corsi et al. (2013) analyse the positioning of the Italian wines in Asian markets and show that China and South Korea are two potentially interesting markets due to the perception of Italian wine as a status symbol, showing, however, the need to investment especially in the promotion phase. In fact, as assert Bernetti et al. (2006), differentiation strategies and the combination of tradition and innovation are the keys to the success of Italian wine in the world.

THE ITALIAN WINE SECTOR IN THE INTERNATIONAL SCENARIO

Italy takes on a role of relevant importance on the international wine scenario, with a concentration in 2011 of 10.2% of surface under vineyard, and 15.7% of the world wine supply, preceded only by Spain and the United States, and 24.4% of the world export, proving itself as the main exporter (OIV, 2012) (Table 1).

Countries	Vineyards surface (mha)		Wine production (mhl)		Wine consumption (mhl)		Wine exporters (mhl)	
	2000	2011	2000	2011	2000	2011	2000	2011
Argentina	2.6	2.9	4.5	5.8	5.5	4.0	1.4	3.1
Australia	1.8	2.3	2.9	4.2	3.6	4.8*	5.2	7.1
Chile	2.2	2.7	2.4	3.9	3.0	4.1*	4.4	6.7
China	3.8	7.4	3.8	4.9	4.7	7.0	0,1	0.1*
France	11.6	10.6	20.6	18.7	15.3	12.3	24.9	14.2
Italy	11.6	10.2	18.4	15.7	13.6	9.4	24.3	24.4
South Africa	1.6	1.7	2.5	3.6	3.1	4.1*	2.3	3.6
Spain	15.7	13.6	14.9	12.6	6.2	4.2	14.3	22.4

World	7,847	7,585	280,000	265,000	225,665	244,306	60,300	99,400

Table 1 - World vitiviniculture scenario (value in %)

* 2009 data

Source: Own calculation on International Organisation of Vine and Wine (OIV) data.

The dynamics registered in the period 2000-2011 confirm the change of the world competitive scenario which had begun some decades earlier, marked by a reduction in the market shares held by the main European producers who, nevertheless, continued to maintain leadership in the world market, in favour of emergent producers, particularly China, Chile, Australia and the USA, who have appeared more recently on the global competitive market, but where there are lots of large size firms which have achieved good performances and high market shares, while applying targeted marketing policies (Vrontis et al., 2011).

In Italy, according to the VI General Census of Agriculture (ISTAT, 2011), the sector counts 383.6 thousand companies stand on a surface of 632.1 thousand hectares; compared to the census data of 2000, there is, on the one hand, a decrease of 52% in the number of productive units and of 11.9% of surfaces under vineyard, and, on the other hand, an increase of average investment per company, which went from 0.9 to 1.6 hectares. This data show an important process of transformation more and more oriented towards the aggregation and specialization of companies which operate in the sector.

On the basis of annual data on cultivation (ISTAT, 2013), viticulture in Italy in 2011 covered a surface of 762.1 thousand hectares, of which well 88.7% (675.8 thousand hectares) addressed to the production of wine grapes, registering in the period studied a contraction of 7.9% of the wine grape production investments (Table 2). A central role in reshaping the productive surface has been played by the regime of grubbing-up, introduced in 2008, with EU Regulation No 479/2008, relating to the reform of the common organization of the market in wine. The latest data given out by the Ministry of Agriculture, Food and Forest Policy, led to the grubbing-up of more than 20.5 thousand hectares, with the 2008/09 and 2009/2010 period (MiPAAF, 2013). The new regulation, apart from tending towards a greater equilibrium between supply and demand, also through other measures such as the application of quotas to grape production or the disposal for wine which is distilled into potable alcohol, also intends to increase European producers' competitiveness in foreign markets and preserve the relationship between product and territory in a perspective of safeguarding the environmental, cultural and social patrimony of rural areas.

	u.m.	2000	2011	Var. %

Wine consumption per capita	Liters	54.05	38.17	-29.4

Table 2 - Market balance for the wine sector in Italy (2000-2011 period)

Source: Own calculation on ISTAT and OIV dat

In relation to supply, wine production in 2011 reached 4.2 million tons (48.4% red wine, 47.4% white wine and 4.2% must), registering a contraction of 22% compared to 2000, to the value of 1.9 billion euros, equal to 3.7% of the value of agricultural production at basic prices, marking a contraction in the same period of 8.5%. Wine supply concerns significantly all the Italian regions in which viticulture extends over deeply diversified environments, from coastal plains to high altitudes (Malorgio et al., 2011). The multiplicity of plantation environments, and also varietal differences on a regional basis, find their widest expression in 521

designation, of which 330 Protected designation of origin (PDO), 73 Controlled and guaranteed designation of origin (DOCG) and 118 Indication of geographical origin (IGT) (INEA, 2012). The strong orientation towards quality improvement, both of the basic raw material and of the finished product, but also of some intangible characteristics, attributable in particular to the *terroir*, has in many ways been a forced choice for many productive realities in Italy, especially as far as international competitiveness is concerned.

As regards to consumption, in Italy the trend registered on the international market is confirmed, with a contraction of purchases which decreased from 30,800 hl in 2000 (45.05 litres per capita) to 23,000 hl in 2011 (38.17 litres per capita) (OIV, 2013). In fact, the part of population consuming wine has decreased, but, above all, styles of wine consumption have changed, from wine as an energetic product to a product for occasional consumption linked to special situations, or cultural consumption for connoisseurs (ISMEA, 2012). This tendency is also highlighted by the increasing amount that Italian families spend for this product categories.

Referring to trade, which will be discussed in detail in the next chapters, Italy showed a positive trade balance in 2011 that attested at more than 4 billion euros, in particular, due to the exportation of bottled wine, recording in the period in question an increase of 81.9%.

The process of the change of the Italian wine sector has also involved distribution channels, in which the increasingly centralized role of the large scale distribution (LSD) is confirmed. On the basis of the latest data diffused by Mediobanca, there is a progressive weakening of market shares held by LSD, which represent the main selling means, above all, for basic wines, from Ho.Re.Ca. channels and wine shops and bars, mostly oriented towards the sale of “icon wine”, in view of a strengthening of sales through wholesalers and other channels which include on-line selling (I numeri del vino, 2012).

MATERIAL AND METHODS

In the economic literature, several approaches have been developed to measures of international competitiveness based on trade data. The advantage of using the trade data is that, as suggest Frohberg and Hartman (1997), demand and supply responses are considered simultaneously and that costs of marketing and transport are taken into account.

In this paper, Italy's competitive performance is assessed for the wine products on the international market, by analysing bilateral trade flows and market shares and making use of specific indicators based on the principle of comparative advantage. Although these indices are not dynamic, as suggest Trail and da Silva (1996), their trend it is more important for explain the competitive advantage.

The first two indices used are the Export market share (EMS) and the Import market share (IMS), for outline the structure and geography of trade in wine products, that are expressed as:

$$EMS = 100 (X_{ij}/X_{iw}) \quad IMS = 100 (M_{ij}/M_{iw})$$

In the formula, X and M stand for exports and imports, j and w for the region, whilst i is the product. Market shares are expressed as values from 0 to 100; thus, a value of zero indicates that the exports (or imports) of a given product i from a given country j are nil; whilst a value of 100 indicates that the entirety of export (or import) of product i is carried out by country j .

The third index used in this paper, is the Relative Trade Advantage (RTA) proposed by Vollrath (1991) as alternative specification of revealed comparative advantage and which is derived by Balassa's index, from which differs for the removal of the double-counting of country and product, for which it has been much criticised. The RTA, obtained from the difference between the Relative Export Advantage (RXA) and the Relative Import Advantage (RMP), shows positive (or negative) values if the country in question has an advantage (or disadvantage) in its competitive position for trading in product i .

$$RTA = RXA - RMP$$

Specifically, the RXA expresses the export share for product i of a given country in the market j compared to the share held for other products; the index has a higher (or lower) unit value if the country's has an advantage (or disadvantage) in its competitive position for exporting product i . In the formula, X stands for exports and M stands for imports. The indices i and n relate to categories of products, whilst j and r relate to region.

$$RXA = \left(\frac{X_{ij}/X_{ir \neq j}}{X_{nj \neq i}/X_{nr \neq i}} \right)$$

There is a similar index for imports, the RMP, which expresses the import share for product i of a given country in the market j compared to the same share held for the remaining products; this indicator is greater (or less) than 1 if the country in question has an advantage (or disadvantage) in its competitive position for importing product i .

$$RMP = \left(\frac{M_{ij}/M_{ir \neq j}}{M_{nj \neq i}/M_{nr \neq i}} \right)$$

Vollrath, in addition, proposes a new version of the index (RC) in which the Relative Export Advantage (RXA) and Relative Import Advantage (RMP) are expressed in logarithmic form, but this of limited use where trade flux is limited or nil (Havrila and Gunawardana, op.cit.).

The RTA index has been applied in a number of studies to analyse revealed competitive advantage of various sectors of different countries (Traill and Da Silva, 1996; Frohberg and Hartmann, 1997; Havrila and Gunawardana, 2003; Fertő and Hubbard, 2003; Bavororà, 2003; Ascianto et al., 2008; Crescimanno and Galati, 2012). Regarding the wine sector, the Vollrath index was applied also to analyze the international competitiveness of wine production in Bosnia and Herzegovina (Ivanković et al, 2005) and in the Slovak Republic (Hambalková, 2006). In particular, as opposed to the traditional approach, in this paper the RTA index is used to capture Italy's competitive advantage with respect to the individual world partners and the trade intensity ties between the partners.

For the competitiveness analysis of Italian wine we have analyzed the trade on the basis of the data concerning export and import money flow taken from the data base of Italian National Institute of Statistics (ISTAT, 2013) and in the 2000-2012 periods. More in detail, the analysis of the Italian wine competitive performance has been carried out taking into consideration, on the one hand, the trade flows concerning the 6-digit classification of the harmonized nomenclature (HS6), relative to the three commercialized typologies of wine - sparkling, grape wine in pack ≤ 2 liters (bottled wines) and grape wine in pack > 2 liters (cask wines, of less value, although it is not possible to establish a unique relationship in this sense), and, on the other hand, the agri-food trade concerning the 2 digit classification of the nomenclature Ateco 2007, relating both the products of agriculture, forestry and fishing and food, beverages and tobacco products.

RESULTS AND DISCUSSION

Structure and dynamics of Italian wine trade

Wine is one of the main products of Italian agri-food export. It covered 14.2% of foreign sales on average 3 year period of 2009-2011, which has not changed significantly with respect to the first 3-year period of reference. On the contrary, it has little weight on agri-food importation (0.7%).

In the triennium 2009-2011, wine export reached on average a value of 3.9 billion euros, registering, compared to the triennium 2000-2002, an average annual increase of 4.2%, partly ascribable to a large spread of wine consumption also in those Countries not associated with viticulture traditions (Gerolimetto and Mauracher 2009). In the same period, imports increased but at a less dynamic rate (+2,8%) with an average value of 264.8 million euros. The registered trend, therefore, have determined an increase in trade balance, which is attested at 3.649.3 million euros, and an increasing of trade specialization, as emerges from the analysis of normalized trade balance, which moved from 85.8% to 87.3% between the two triennium of reference.

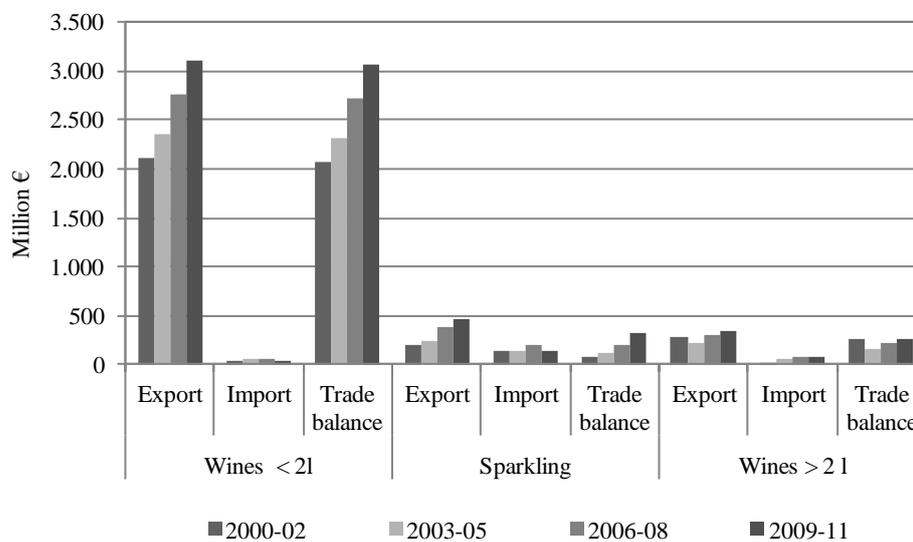

Figure 1: Dynamics of Italian wine trade

Source: Own calculation on ISTAT data

Sales abroad concern mainly bottled wines (79.4%), followed by sparkling wines (11.8%) and cask wines (8.8%). Among these three categories of wine, sparkling wine registers the best performance (+10.7%). However, as far as imports are concerned, the purchase of sparkling wine prevails (51.5%), even though cask wines have a considerable weight (30.4%), the purchase of which registers an average annual increase rate of 19.2%. Imports of bottled wine are more reasonable (18.1%).

The analysis of the Export and Import market shares trend (EMS and IMS), referring both to wine on the whole and to the three categories considered in this paper, has allowed to highlight the change in the trade structure.

Analysis of EMS shows how, in the triennium 2009-2011, three markets absorbed more than half the value of Italian wine exportation, particularly Germany (21.9%), which is the biggest wine importing market in the world (Nosi, 2012), the United States (21.2%) and the United Kingdom (12.1%), even though there are some differences in the types of product. In fact, while the USA and United Kingdom are more oriented towards the purchase of bottled wine and sparkling wine, Germany is the main purchaser of cask wine (Table 3). Other important target markets are: Switzerland (6.4%), which purchases all three categories of wine, and Canada (5.9%), interested mainly in cask wine. The evolution of market shares in our reference period highlights a progressive reduction of German shares in bottled wine and sparkling wine, compared to an increasing bearing of the cask wine category, and the United States in the three types of wine (even though there is a rise in the export value in both countries). The presence of wine in the United Kingdom is increasing, especially the sparkling wine category, ever more appreciated in spite of the financial crisis that in the last few years has led to a reshaping of purchases (Baccaglio, 2011). Moreover, positive dynamics are recorded in the bottled wine category in Russia, thanks to the 2006 closure of the Russian border to Georgian and Moldavian wines, and also in Canada, Denmark and China, which represent the new consumer markets, and for cask wines in the Czech Republic. The increasing demand of wine above all from the Chinese market is due to a change in the way Chinese consumers approach foreign products. They see wine as a convincing substitute of the traditional alcoholic drinks such as rice wine or sorghum and maize drinks (Mitry et al., 2009), for its benefits to health which have also contributed to the increase in consumption and to the culture of wine in the Asiatic Country (Corsi et al., 2013). On the other hand, shares held by Japan have decreased, where Italy is the second supplier, after France, of bottled wines (16.0% in 2011) and the third supplier of sparkling wine (9.0%) (Centro Interdipartimentale per la Ricerca in Viticoltura ed Enologia, 2013).

Table 3: Export market share (EMS)

Source: Own calculation on ISTAT data

As far as imports are concerned, France is the main supplier market (61.7%), especially for sparkling wine (96.5% of the value of sparkling wine bought by Italy) and of bottled wine (48.9%), followed by American (17.8%) and Spanish (10.4%) markets for the purchase of, above all, cask wines (Table 4). Among the other markets, the German and Portuguese ones have great importance as suppliers of bottled wine.

The evolution of IMS shows a contraction of French market shares, which has decreased by 18.1% because of the sudden reduction of purchases of cask wines from it, and of Portuguese shares, a consequence of the reduction of the weight of bottled wines. Conversely, an increasing importance of the USA (17.1%) and Spain (+5.2%) is recorded among supplier markets, mainly for the cask wines category. In our period of reference, there is a market diversification which rose from 39 in 2000 to 50 in 2011.

Table 4: Import market share (IMS)

Source: Own calculation on ISTAT data

Competitiveness of Italian wine in the main partner countries

The Relative Trade Advantage index has been determined for the three items which make up the wine category, in order to evaluate the competitive advantage or disadvantage of Italy with respect to its main commercial partners and its relative evolution during the reference period.

Taking into account the multitude of information, and in order to make the reading of the results and of the trend registered easier, the countries were classified into 8 groups in relation to the evolution of the index value between the two triennium of reference, according to the following proposed in the table 5.

As for sparkling wine, relative to the main trade partners, a positive high index value with Russia (5.2) was seen, considering that 8.0% of the Italian agri-food export value in this

market is made up of sparkling wine and that the same market absorbs 8.3% of Italian sales of sparkling wine in third country markets, with Brazil (2.4), whose high index value is due to the net specialization of Italy in the export of this product, and with the United States (2.3), in which the Italian advantage is, rather, due to a higher grade of penetration of the Italian product on the market. Values above the unit are also shown in Portugal (2.1), due to the net exportation benefit, and in Switzerland (1.5).

Group	Definition	Indices combination
I	Increase of the competitive advantage	$+RTA_{2009-11} > +RTA_{2000-02}$
II	Decrease of the competitive advantage	$+RTA_{2009-11} < +RTA_{2000-02}$
III and IV	Transition from competitive advantage to competitive disadvantage	$-RTA_{2009-11} < +RTA_{2000-02}$
V	Increase of the competitive disadvantage	$-RTA_{2009-11} > -RTA_{2000-02}$
VI	Decrease of the competitive disadvantage	$-RTA_{2009-11} > -RTA_{2000-02}$
VII and VIII	Transition from competitive disadvantage to competitive advantage	$+RTA_{2009-11} > -RTA_{2000-02}$

Table 5: Adopted classification

Other markets where values are above the unit are Canada, Australia and China, for the net advantage of Italian exportation, and United Kingdom and Austria, as a consequence of the high shares of sparkling wine absorbed by such markets compared to Italian exportation on the whole. The competitive advantage with Germany is more moderate, in spite of the fact that it is the main target market of sparkling wine in terms of value, considering that the same product absorbs a relatively modest share of Italian agri-food export. In the reference period, as figure 2 shows, the competitive advantage with Russia increased -where the Italian product is increasingly appreciated even though only by wealthy consumers who associate its consumption to an Italian lifestyle-, but also with the United Kingdom -where Italian

sparkling wine signals a continuous growth in the last few years in spite of the effects of the financial crisis on the English wine market-, China, Denmark and, to a lesser extent, Switzerland and Canada (Group 1). Among these, the Chinese market offers remarkable opportunities. In fact, in spite of a fast growth of local wine production in the last few years, the per capita production of wine remains relatively low and is not enough to satisfy domestic supply, thus making the importation of wine necessary in the light of the expected rapid growth of per capita consumption (Mitry et al., 2009). Moreover, while local wines tend to satisfy daily wine consumption, more demanding consumers see wine as a status symbol and hence tend to buy imported wines (Corsi et al., 2013). However, the competitive advantage over Portugal and Brazil, has diminished (Group 2), as a consequence of a contraction in the Italian exportation market share which has been absorbed by the two markets, both with reference to sparkling wine and the agri-food as a whole, but also over the United States, Australia and Japan. There are negative index values with France (-6.3), considering that it is the main if not the only supplier market, being the undisputable leader in the world market of the product at issue (Carbone and Henke, 2010), disadvantage which has increased as a consequence of an growing dependence on the part of Italy.

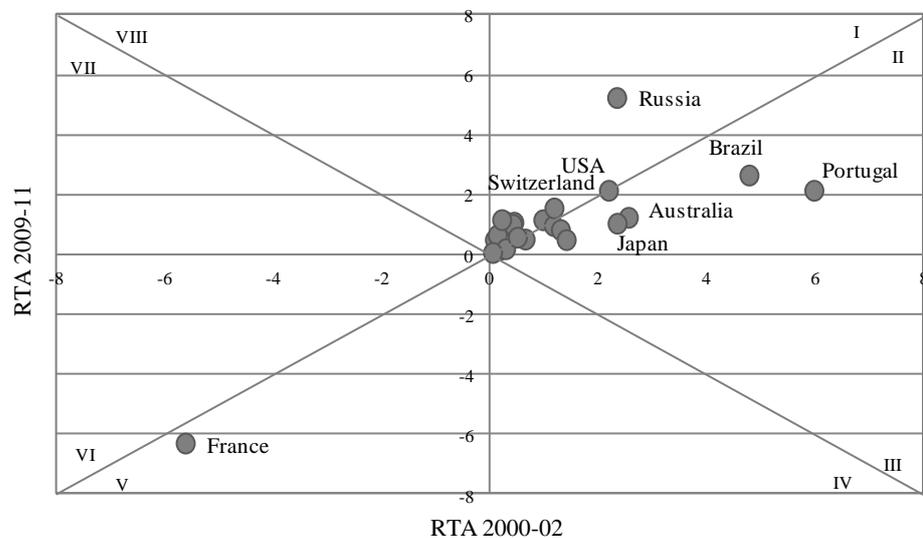

Figure 2: RTA of sparkling (2000-02 and 2009-11)

Source: Own calculation on ISTAT data

For bottled wines the calculated results of indicator of RTA show a high index value with a competitive advantage for Italy in Canada (5.1), United States (3.3), Denmark (2.6), Brazil (2.0), Ireland (1.9) and China (1.7), as a consequence of the high weight of these categories of wine on Italian agri-food exportat in these markets, with shares that reach 39.4% in Canada

and 18.4% in China. In our reference period, Italy strengthened its competitive advantage on all these countries, except Brazil which belongs to Group II, due to an increasing weight of these products on Italian agri-food export destined to satisfy the demand of these markets (Figure 3). The increasing competition in the Asiatic markets, and in particular China for bottled wines, is tied to a sustained growth in the consumption of premium and super premium wines in the same markets, thanks to consumers who have worked abroad or a foreign workers resident in China (Corsi et al., 2013). However, high negative index values with Portugal (-19.7), Japan (-11.7), Chile (-4.8) and France (-3.1) are seen. The result in Japan is linked to the higher weight that these categories of wine take on within agri-food import compared to that assumed in the context of exportations. As has already emerged from the analysis of the market shares, Japan is a privileged partner for Italian wine exportation, which finds consensus among local consumers, thanks to a sound wine culture and a growing curiosity on the part of Japanese consumers towards Italian quality products (Corsi et al., 2013). During the 2000-02 and 2009-11 period, as Figure 3 shows, the Italian competitive disadvantage with Portugal, Chile and Japan decreased as a consequence of a lesser degree of penetration of this category of wine by the above-mentioned markets and a lesser weight of the same product on agri-food import. On the contrary, the competitive disadvantage with France (Group 5) increased for the growth Italian demand for French wines.

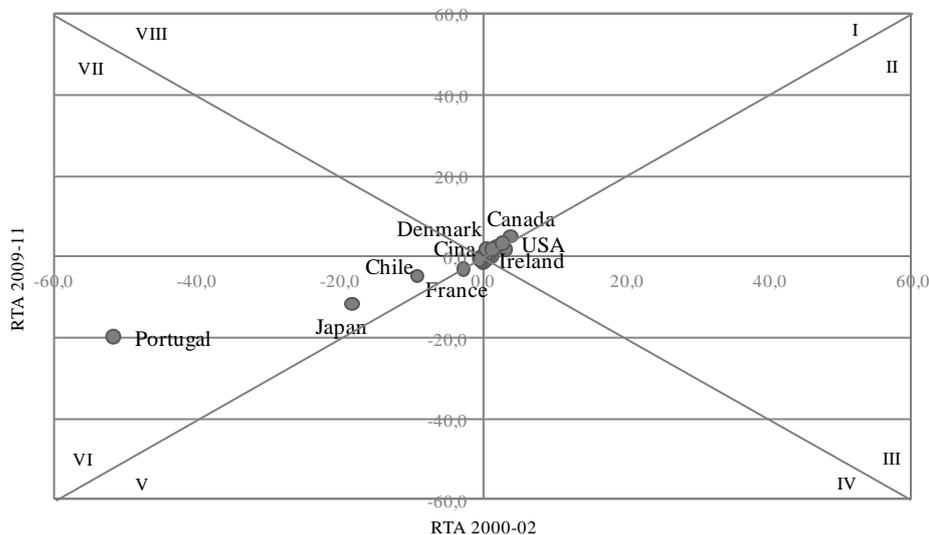

Figure 3: RTA of Wines in bottles ≤ 2 l (2000-02 and 2009-11)

Source: Own calculation on ISTAT data

Finally, regarding the value of the RTA index for cask wines and compared to the main trade partners, Italy shows a competitive advantage with Hungary (4.4), the Czech Republic (4.2)

and Norway (3.9), although they are markets which absorb relatively modest exportation shares of this type of wine, but assume a heavier weight for agri-food exports. Positive index values are recorded also with Germany (1.9), considering that the German market absorbs 37.9% of Italian exportation of this category of wine, Switzerland (1.6) and China (1.5), as a consequence of a net advantage in the exportation of cask wine in these markets. The dynamics registered during the reference period highlight countries such as Romania, Norway and Hungary (Group VII and VIII) with whom Italy improved its competitive position as a result of a greater degree of penetration of the Italian product on such markets, whereas in the first triennium it presented a competitive disadvantage (Figure 4). The competitive advantage with Germany and the Czech Republic (1 Group) increased, while the same advantage decreased with Switzerland and China, as a result of a reduction of the weight of this typology of product within agri-food production. The analysis highlights a marked competitive disadvantage with the United States (-34.0), with whom Italy worsens its position, turning from a weak competitive advantage in the first triennium to a marked disadvantage in the triennium 2009-2011, linked to the weight of these products in the import value of agri-food products. The trend observed could be linked on the one hand to the growth of surface under vineyard and of wine production in North America (Nosi, 2012), and on the other hand, to a recent tendency which links stronger flows of cask wines to greater economic and environmental sustainability (ISMEA, 2013). To a lesser extent, a competitive disadvantage with Spain (-2.7) is observed as a result of a growing penetration in the Italian market. The Iberian country, together with Australia, in fact, showed greater dynamism at an international level with considerably growing flows in this sector of the market (Carbone and Henke, 2010) thanks to increased production in the last few years, tied to the coming into production of recently planted vineyards.

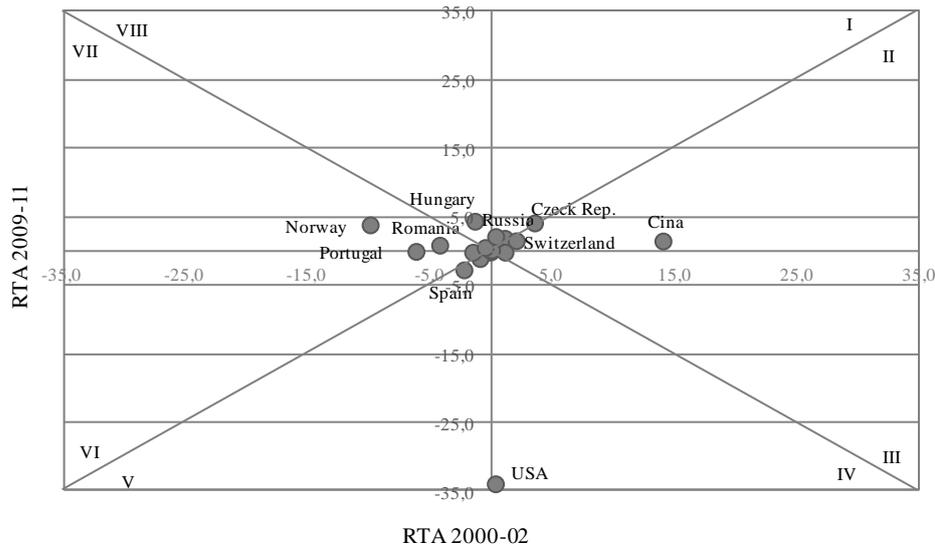

Figure 4: RTA of wines in conts > 2 l (2000-02 and 2009-11)

Source: Own calculation on ISTAT data

CONCLUDING REMARKS

The results of the present study show how Italy seems to have managed to seize the opportunities offered by the recent change of the international wine market, progressively opening itself to foreign countries, not only in the traditional consumer markets but also in the emerging ones, thanks to its ability to satisfy a diversified demand more and more oriented towards quality products also in the recent period of crisis.

In particular, the analysis carried out via the application of the Vollrath index to the bilateral trade of Italy with its main trade partners, as well as evaluating Italian competitiveness, it has highlighted, indirectly, the degree of appreciation for Italian wine with respect to the agri-food industry as a whole. More specifically, an increasing competitiveness has been identified in some markets which do not have a viticulture tradition, where there is inadequacy of local production to satisfy domestic demand, and where the acknowledgement of the health characteristics of wine as an expression of an Italian lifestyle are strategic factors for the success of Italian wine.

The competitive challenge can act on two sides: on the one hand, the achieve of new consumer markets that represent $\frac{1}{3}$ of total world consumption, and, on the other hand, the maintenance of traditional partners through the offer of better quality wines. Consequently, it is necessary to consider the peculiarities of each market of reference that are different for dimension, culture, and purchasing power. It is important the adoption of focused strategies

and without disregarding obstacles linked to promotion and distribution and also to the knowledge of the complex system which regulates the commerce.

ABSTRACT

During the past few years, changes in competitiveness have generated new and variable risks. These risks have considerably impacted companies' aptitudes to create value. Consequently, management accounting and management professionals, particularly management accountants, are stressed by these environmental changes.

The *main goals* of this research are: i) to understand if a further change in management accounting and in the role of management accountant is required, and ii) to highlight the main direction of this change, with particular attention to risk management as a new variable.

The *method* used in this research is an empirical and comparative analysis based on explorative case studies. These case studies included seven companies listed in the Italian "public utilities" market sector, which represents the third sector in terms of capitalization in the Italian Stock Market Exchange. The analysed companies represent the 78,7% of the Italian "public utilities" sector, in terms of capitalization (*datum* referred to 2011). The choice of the companies is due to the fact that they have undergone extensive changes in response to their political, legislative and economic environments and are now subject to regulations, which have significant effects on both their strategic planning and management control systems, as well as on their risk management systems.

In our *discussion* of the results, we designed an explorative theoretical model, which considers the expected change in management accounting and in tasks and functions, skills, competencies, knowledge and abilities of management accountants. In particular, by adopting institutional theory, we researched the development of the

evolving roles for management accountants from performance controller to performance and risk controller.

1. INTRODUCTION

The environmental trends of the last decade have been characterised by features that are difficult to identify from previous times. The process of market liberalisation, especially between developed and developing countries, began in the second half of the 1970s and it has recently completed its first major milestone as globalisation has become a recognised event. Companies now operate in an economic environment that spans the globe. The process of technological innovation, begun in the 1990s and mainly due to developments in Information and Communication Technology (ICT), has supported this unstoppable phenomenon.

Market globalisation, however, has quickly turned into a “global crisis” that has affected consumption, industrial production and, consequently, social welfare. In the current framework, value creation *has become* much more difficult, especially for those companies in developed countries. In particular, companies must now face the new and changing risks generated by this competitive environment. Environmental variables such as decreasing consumption, high unemployment, well-informed customers, high competition and continuous changes are difficult to manage. In this context, it is inevitable that managers must make quick decisions in situations of high uncertainty and risk.

Our main hypothesis (*HP1*) is that this external context is creating conditions for institutional changes in management accounting that follow several often-interrelated directions. The least explored, in both the literature and practice, is likely also the most urgent: *the integration of management accounting with risk management*. Consequently, we hypothesised (*HP2*) an *evolving role of the management accountant*, who would accept the challenge of enriching the traditional role with new intra-organisational relations, functions, tasks, skills and knowledge, even as they maintain the role’s most fundamental traits.

Therefore, the *aims* of our research are:

- to understand if a further change in management accounting and in the role of management accountant is required;
- to highlight the main direction of this change, with particular attention to risk management as a new variable.

Our analysis contributes to the extant literature as it reveals a further specific direction of change for management accounting and, consequently, for management accountants, which goes toward the integration between performance and risk planning and monitoring. In particular, we explored the new tasks and skills that should enrich the management accountant's traditional role. Only if management accountants are able to accept and impose a new role for themselves by integrating performance controlling with risk monitoring will the change be successful for the organisation and improve the decision-making process beyond simple legitimisation and institutional isomorphism.

In the following section of the article, we firstly analysed the literature on changes in management accounting and the challenges for management accountants, with particular attention to the key tenets of *institutional theory* that inform our research. In this section there is also an analysis about the main literature concerning the Enterprise Risk Management (ERM), as this system represents the hypothesised direction of change for management accounting. Then, in the third paragraph we illustrated the research methodology. The results of our research are presented in the fourth paragraph, followed by the fifth one in which we engaged in a discussion of our findings. In the last paragraph we concluded and underlined the limits and the possible implications of our research.

2. THEORETICAL BACKGROUND

2.1. Management Accounting Change

The majority of the literature from the last twenty years has described management accounting systems as essential tools for business strategy formulation and implementation (Shank, 1989, 1996). These tools must be able to measure a wide range of strategic variables on a long time horizon and integrate economic and financial indicators with non-financial indicators by following the logic of cause-and-effect links (Bhimani and Langfield-Smith, 2007; Bromwich and Bhimani, 1994). Management accounting systems have taken the form of a mechanism to monitor management's long-term strategic decisions. With this assumption

about the function of management accounting systems, there is an awareness of the difficulties of implementing a strategy and independently translating it into operational terms based on the effectiveness of the strategy itself (Kaplan and Norton, 1996, 2001, 2004). Indeed, even if a company's top managers formulate excellent long-term strategies, they often have serious difficulties in implementing them, as the organisation struggles to translate strategic objectives into daily operations. To develop a strategy that creates value is an art that can hardly be realised through rigid conceptual schemes. After the formulation of a strategy, the real difficulty lies in implementing it and communicating it to the whole organisation (Brusa, 2007; Kaplan and Norton, 2006, 2008).

The difficulty is not in describing the "tangible" elements of a strategy that are measurable by financial parameters (e.g., capital requirements for planned investments), but rather, it is in describing the "intangible" elements such as knowledge management, which grows with human resources, experience, skills and capabilities; information technology that supports the enterprise and connects it with its customers and suppliers; and the organisational culture that encourages innovation, problem solving and continuous improvement (Argyris, 1993; Davenport and Glaser, 2002; Edvinsson and Malone, 1997; Kaplan and Norton, 2004; Nonaka, 1991; Nonaka and Takeuchi, 1995; Nonaka and Toyama; 2003; Nonaka et al., 2000; Sveiby, 1997).

These elements are essential to creating value, but it is difficult to measure their contributions with traditional management control system methods (financial control), because their impact on financial results is indirect rather than direct and operates along a chain of causal links that is more or less long and complex. Moreover, the value of these factors depends on the strategic context in which they are used. In this case, they have only potential because there is no related trading market. In addition, the intangibles create value only when they are combined with the tangible elements of a company.

The role of a managerial system should therefore be that of an instrument to implement strategy and the system should translate the conceptual roles of the strategy's tangible and intangible elements into operational terms. It is important to expand the boundaries of traditional control systems to create a strategic management system (or strategic control), that is, an advanced control system that oversees the real achievement of strategic objectives in the short term.

Most studies on the changing role of management accounting (Cooper, 1996; Kaplan and Norton, 1996) have focused on more technical aspects of new control practices, such as strategy maps, business models and cost accounting systems (e.g., BSC and ABC). Through the identification of a map for each strategy – a so-called *strategy map* – top management defines a logical structure that highlights the expected results in the short and long term and the critical success factors necessary to achieve these results (Kaplan and Norton, 2001, 2004). After the map for a strategy is identified, it has to be translated into a set of financial and non-financial *balanced* performance indicators that are causally interrelated. The company indicators are then discussed, translated and adapted within the appropriate parameters, including the specific targets for each responsibility centre and taking into consideration the peculiarities of the organisational structure. The strategy is then pursued by employees operating at the various levels of the organisation on a day-to-day basis. This means that the balanced system of objectives and parameters must be communicated and translated into operational terms that establish specific goals for all areas of the company. In addition, the overall company results and the results of the responsibility centres should be consistently monitored with an appropriate evaluation system and rewarded in an incentive system (Kaplan and Norton, 2006, 2008).

Strategic initiatives and related projects should be identified and their financial and human requirements should be specified to achieve the approved target for each indicator. The financial and human requirements for strategic projects should be authorised and embedded into a company's annual budget. To do this, the budgeting process should be split into two different elements: the *strategic budget*, aimed at managing *strategic objectives* in both the long and short term (discretionary programs), and the *operational budget*, aimed at managing the *efficiency objectives* of the different responsibility centres and the various control objects (Kaplan and Norton, 2001).

Several studies show that change in strategic control systems should be adequately supported by the use of business information systems (Scapens and Jazayeri, 2003; Scapens et al., 1998). These studies underline the benefits of improving these systems, but they also highlight the possible limitations of using these tools, which are primarily defined by the conceptual reliability of data and the potential disconnection between functional areas (Culasso, 2004).

Other researches have considered the effect that the change in management accounting has had on the role of the management accountant and observed how the role should evolve from *bean counter* to consultant on all aspects of corporate business, as a so-called *business analyst* or

business partner, while maintaining the most traditional tasks and traits of the *pessimistic scorekeeper* that characterised the role of controllers in past decades (Baldvinsdottir et al., 2009a, 2009b, 2009c, 2009d; Bhimani and Keshtvarz, 1999; Johnson, 1992; Johnson and Kaplan, 1987; Parker, 2001; Roslender, 1995; Roslender and Hart, 2003; Scapens et al., 2003). This focus has led, at least in theory, to a redefinition of the management accountant's and CFO's roles, so that they require a greater engagement in business processes management, a strong attention to strategic and historical information, a decentralisation and dissemination of accounting knowledge (economic and financial) to operational managers, with a re-characterisation of the efficiency control of their activities (Burch, 1994, 2000; Kaplan and Norton, 2004).

There are also studies, that were inspired both by the New Institutional Sociology (new institutionalism) and the Old Institutional Economics (old institutionalism) (Di Maggio and Powell, 1991), which have focused on the social and institutional aspects of the change in management accounting. These studies investigated the importance of internal and external organisational and business context analysis and the conflict and resistance that often threaten the success of the on-going changes to techniques and processes of strategic planning and management control (Burns and Baldvinsdottir, 2005; Burns and Scapens, 2000; Burns and Vaivio, 2001; Coad and Cullen, 2006; Collier, 2001; Covalski et al., 1996; Di Maggio and Powell, 1983, 1991; Granlund and Lukka, 1998; Hussain and Hoque, 2002; Lukka, 2007; Ma and Tayles, 2009; Modell, 2001; Scapens and Jazayeri, 2003; Seo and Creed, 2002; Tsamenyi et al., 2006; Yazdifar et al., 2008).

There are few academic authors who have dealt with management accounting change, especially regarding the integration of management accounting, corporate governance and risk management (Busco et al., 2005, 2007a, 2007b; Collier and Berry, 2002; Kaplan, 2009; Kaplan et al., 2009; Kaplan and Mikes, 2011a, 2011b; Paladino et al., 2009; Parker, 2001; Power, 2009; Scholey, 2006). Indeed, despite the fact that all businesses are forced to communicate their strategic intentions about risk and efforts necessary to increase business efficiency, there has not been enough attention paid to how planning and control systems should be integrated with those of risk management and corporate governance in the creation of the "new" management accountant role (Bhimani, 2009).

2.2. *Institutional theory in management accounting research*

Recently, many researchers have adopted institutional theory in order to analyse management accounting change. These researchers consider accounting structure and processes as social practices. Even if they adopted different analytic perspectives, it would be possible to define their approaches as *institutional management accounting research* (Burns and Baldvinsdottir, 2005). Institutional management accounting research includes research inspired by new institutionalism, or New Institutional Sociology (NIS), and by old institutionalism, or Old Institutional Economics (OIE) (Burns and Scapens, 2000; Burns and Vaivio, 2001; Covaleski et al., 1996; Granlund, 2001; Granlund and Lukka, 1998; Hussain and Hoque, 2002; Lukka, 2007; Seo and Creed, 2002).

In particular, management accounting research inspired by NIS illustrates how, in addition to internal efficiency and effectiveness needs, changes in planning and control systems are often motivated by changes in the general environment (e.g., political, legal, economic, cultural, technological and social changes) and changes in institutions and phenomena (e.g., rules, habits, routines, norms and culture). When applied in management accounting research, the new institutional theory considers management accounting change to be an instance of *institutional change* (Burns and Baldvinsdottir, 2005). An organisation embodies institutional requirements and becomes isomorphic with a set of norms, practices and routines. The isomorphism can be (Di Maggio and Powell, 1983):

- coercive, when an organisation accepts that it has to change in response to formal and informal political and regulatory pressures (legitimation);
- mimetic, when an organisation accepts that it has to change to improve its success and it copies more successful organisations;
- normative, when an organisation accepts that it has to change to conform to rules and practices developed by professional groups.

In contrast to criticisms that NIS is excessively deterministic, OIE instead considers the above factors as related to intra-organisational relationships between actors or to cultural and political processes concerning the legitimacy, power and interests of private actors involved in the change (Burns and Scapens, 2000; Burns and Vaivio, 2001; Granlund, 2001; Granlund and Lukka, 1998; Lukka, 2007; Seo and Creed, 2002).

In previous literature, there have also been some efforts to integrate themes suggested both by old and new institutionalism (Collier, 2001; Ma and Tayles, 2009; Modell, 2001; Yazdifar et al., 2008) and the consequential adoption of *hybrid* frameworks (Di Maggio and Powell, 1991),

which represent a fusion between old and new institutionalism and use a double lens in order to explain organisational change:

- at the macro level, considering political, regulatory, cultural and market pressures;
- at the micro level, considering underlying, intra-organisational power relations.

Indeed, hybrid frameworks consider external changes and organisational actions, as well as the different interests and capacities of the human actors, as though they are important drivers of organisational change. In this article, we adopt a *hybrid institutional theory* because we intend to argue that a successful organisational change - a change that improves the value creation of a company and its durability across a long time horizon - is the result of interplays between institutional forces and intra-organisational power relations. We propose that complying with the political and regulatory environment (coercive pressures and legitimation), following the influence of professionals (normative pressure and professionalisation), or acting according to market forces probably will not generate a successful change if there is not an adequate mobilisation of power inside the company. In other words, institutional pressures create the need for organisational change (Tsamenyi et al., 2006), but endogenous forces are required to adequately implement it.

2.3. *Enterprise Risk Management*

At the beginning of the new millennium, the global economic environment, which had already begun to change radically as a result of market globalisation, was the driving force behind the surfacing of new risks to companies; the global environment promoted the development of a new doctrinal approach to manage risk (a *proactive* approach) with the goal of improving business performance and creating value. Therefore, many of the factors that drive the diffusion of more "modern" risk management tools are exogenous in origin. This means that these factors derived from the economic environment (due to the globalisation and relocation of production) and the political-legal environment (as a result of the legislative evolution and codes of corporate governance).

In recent years, a new methodology for risk management called Enterprise Risk Management (ERM) has emerged in literature and in practice (COSO, 2004). This approach promotes the integration of business areas and transversal risk management and it places the control

activity of the uncertainty factors within the strategic planning phase (Liebenberg and Hoyt, 2003).

Despite the declared goals of ERM, some researchers and managers keep describing risk management as a *costly compliance exercise* (Collier et al., 2006, 2007), because this model, usually implemented to satisfy the legislation on corporate governance and internal control systems (which has mainly affected companies listed on regulated markets), has still difficulty in improving long term value for companies. Consequently, some researchers and managers deny that the benefits of risk management exceed the costs.

Certainly, the adoption of a model of risk management is initially financed to ensure the following (Culasso, 2009):

- greater respect of rules and regulations in the entire company structure and, therefore, a fuller application of the principles and values at the heart of the economic activity;
- dissemination of true information outside of the company structure, avoiding the risk of transmitting to the market false or incoherent information.

These two elements, however, are not necessarily antithetical to value creation. It is important to note that risk management is not only useful to "get by", without contributing to value creation, and that it does not necessarily compromise value creation because of the cost of implementation. Quite the opposite is true: when management is responsive to effectiveness and efficiency criteria in the short term, but its actions are based on unethical behaviour, the company's ability to survive over time and to safeguard its own value is compromised. In the absence of rules and laws, firm durability could be compromised. For the same reasons, in the long term, the environment rewards those companies that, using good information, have been shown to have strong ethical values and an effective system of risk management. Therefore, the compliance exercise should be translated over time into a reduction of the specific risk factor of the firm assigned by the market (Sharpe, 1964) and an increase in firm value.

Therefore, it is useful to recognise some important limitations of the use of the ERM model, rather than intrinsic ones, because the limitations may be harbingers of failure. Indeed, because the main existing framework for risk management begins with the important consideration about the need to integrate risk management policy with strategy formulation and strategic planning, it seems to be reasonable that this requirement is not fully

implemented, even if managers have understood the potential of risk management in generating and protecting value (Culasso, 2009). Essentially, the risks are initially conceived of as part of some strategy; then, however, the risk is rarely continuously verified, even in the short term with the evolution of binomial strategy–risk. The missing link is the continuous updating of the strategy's validity and, at the same time, of its associated risks.

This is mainly attributable to two facts related to the intra-organisational power relations (Collier et al., 2007):

- on the one hand, the risk manager or, in general, the person responsible for the determination of risk, too often acts like a bureaucrat, in accordance with rules and procedures, without worrying about managerial and organisational issues;
- on the other hand, the role of the management accountant is quite marginal to the risk management process. It is assumed that the controller plays support functions, but s/he is not involved in the logics underlying the measurement and control of risk.

Reports prepared by the risk manager usually do not include reference to the parameters of company performance and at the same time, there is no trace of integration of strategic planning (e.g., business performance measurement and models such as *Balanced Scorecard*) and management control (budgeting and reporting) with the risk factors and risk indicators elaborated during the risk management process (Berry et al., 2005).

The controllers are the first to admit their "forced exclusion" from the risk measurement process while recognising a potentially significant role in risk management. Instead, the other employees with leading roles in the risk management process (such as the risk manager and the internal auditor) believe that risk and risk management should not to be included in the tasks and responsibilities of the management accountant (Collier et al., 2007). This means that risk management, without the support of management systems to make it operate effectively, does not always go beyond the tasks of ensuring compliance and information transparency.

Despite the new approach to risk management, therefore, many problems must still be faced to undertake this "holistic" method. In particular, an issue that should be considered relevant both in theory and practice is the organisational structure of a firm and its operational mechanisms that guard against general economic risk. Specifically, addressing this issue means trying to clarify how to measure the particular risks faced by a company and how to balance target performances with these risks. In particular, the problem is how to integrate

risk management with management accounting, or how to include risk indicators within the system of strategic planning and management control (Culasso, 2009; Kaplan, 2009; Kaplan et al., 2009; Kaplan and Mikes, 2011a, 2011b). The tools of strategic planning and management control should embrace the logic and techniques of risk management to ensure that all of the responsibility centres in the firm follow a systematic pattern in their decision-making process. This procedure should affect the analysis and evaluation of potential risks related to strategy implementation initiatives, with the knowledge that all organisational units of the company also have responsibilities with regard to this effort. The strategic planning systems and the management control systems should introduce not only performance indicators but also risk indicators to better understand risks and opportunities continuously and with constant updating. At the same time, however, risk management should be able to balance the natural need of the management to understand new opportunities and the related risks. This requires the risk manager to devote attention managerial and organisational issues.

If management accounting does not evolve in this direction, it encounters two possible problems (Berry et al., 2005):

- the so-called "risk of control";
- the so-called "illusion of control".

With regard to the "risk of control", too often the implementation of a risk management model is driven more by the need for compliance and good relationships with various stakeholders than by a genuine belief in the need to monitor risks to protect company value. This is partly attributable to the complex national and international regulatory framework with laws, regulations and conduct codes. Even if this environment has allowed the diffusion of risk management and its logic to companies and in the literature, it has complicated the possibility of having a true system to manage the risk.

Thus, risk management could be only a bureaucratic answer to a rules-based need. It could be that the introduced models of control are excessive because they impose compliance with certain requirements that become "mandatory" for managers. The different decision makers may have little space to manage the company properly, especially in dynamic environments, and this could cause an increase in risk rather than a decrease, due to the lack of flexibility in the plans and budgets to seize new opportunities. The risk is to overemphasise *hyper-control*, or the fact that the person who controls is in turn controlled, without considering the effective functionality of the system itself. This is called "risk of control".

Regarding the phenomenon of the "illusion of control", the controls implemented during the risk management process could lead to an unjustified "belief" that all the uncertain events are well managed. In this way, hazardous and unanticipated conditions may arise, or opportunities could be missed.

3. RESEARCH METHODOLOGY

3.1 *The research method*

As indicated in the Introduction section, in our research we formulated two correlated hypotheses:

- *HP1*: the external context created conditions for *changes in management accounting* and the most urgent direction of change is the *integration of management accounting with risk management*;
- *HP2*: the change in management accounting could be successful only if *the management accountant role evolves*, accepting the challenge of enriching the traditional tasks and skills.

In order to verify our hypotheses, we expressed the following research questions (RQs):

- *RQ1*: is it required a new *management accounting change*? Is it correct to affirm that the most urgent direction of change is the integration between management accounting and risk management?
- *RQ2*: should *management accountant's role* be considered as an intra-organisational condition, which will enable the successful management accounting change? And what are the necessary functions and features of this role considering the main direction of change of management accounting?

The *research method* used is a qualitative mixed method, as it integrates deductive and inductive perspectives. In particular, we firstly used the case studies method to answer to *RQ1* and *RQ2*. This method, although it is in part affected by subjectivity and it is often criticized for lack of statistical reliability and validity, excels especially when it is necessary to understand a complex issue (Yin, 1984) and it can develop expertise and strengthen what is already known through previous research. The analysed case studies can be defined as explorative (Ryan et al., 2002), because our research didn't aim to assume some generalizations or definitive conclusions, but to verify our hypotheses concerning the need

of change in management accounting and in management accountants' role and the main direction of change.

The tool adopted in the case studies is the interview. This tool has advantages such as flexibility, environmental control, the order of questions, the completeness, the response from the interviewees definitely concerned, but it has also disadvantages such as time, the influence of the less standardized and the formulation of the questions. The interviews were semi-structured to be kept within the main question area but still open the possibility to get the interviewees own ideas and feelings. The interviews included also some questions to verify the good quality of answers. We interviewed selected respondents, to verify the opinion of management accountants regarding:

- the *status quo* of management accounting systems in their companies;
- the expected or potential change in management accounting systems in their companies;
- the expected or potential changes and challenges to the management accountants' role in their companies.

Secondly, our research adopts *institutional theory*, in particular to answer to the RQ2, not with the intention of formally testing it, but rather to support our theoretical model of the successful directions of change for management accountants' role. The key tenets of institutional theory that inform our research are that management accounting is more than a technical system and that change in management accounting is embedded in institutional change. Particularly, institutional theory is adopted in our article to explain the hypothetical dynamics of change in management accountants' roles, considering the dynamics in terms of power relations as they are created by the intra-organisational condition and as they complement the exogenous drivers that create successful change and generate, preserve, improve and deliver value. Change in management accounting toward risk management is a response to the effectiveness and efficiency needs required by the new competitive market, the regulatory environment (coercive pressures) and the professional and normative pressures that characterise today's economy in developed countries (Di Maggio and Powell, 1983). However, we also consider that, in addition to exogenous drivers of change, endogenous organisational power relations are significant components in the effective improvement of management accounting. It is imperative to examine the interaction between institutional forces, market forces and intra-organisational power relations in order to understand the dynamics of change. This implies that top management should mobilise

power to implement effective and integrated management accounting tools, making changes to the management team and to the management accountant's role in the process. Top management should appoint powerful and influential management accountants to promote the use of the new management accounting systems and the management accountant's role should be enriched by new functions and tasks. To achieve successful organisational change and, in particular, successful management accounting change, it is necessary for coercive and normative pressures, as well as market forces, to interplay with intra-organisational power relations.

3.2 *The sample*

The case studies that constituted our sample included seven leading companies listed in the Italian "public utilities" market sector, which represents the third sector in terms of capitalization in the Italian Stock Market Exchange (the 18% of the global capitalization of Borsa Italiana in 2011), after Banks (21,6%) and Energy¹⁵ (19,5%). Furthermore, the seven companies analysed represent the 78,7% of the Italian "public utilities" sector, in terms of capitalization. The choice of the seven companies is supported also by the Eisenhardt's approach to case study research, which argues for the use of more than a single case. She concludes that "between 4 and 10 cases usually works well. With fewer than 4 cases, it is often difficult to generate theory with much complexity, and its empirical grounding is likely to be unconvincing, unless the case has several mini-cases within it" (Eisenhardt, 1989).

The public utilities sector—which is different from posts and telecommunications and from public transport—was composed of the following sub-sectors:

- Energy
- Water
- Gas
- Renewable Energy
- Environmental Hygiene (wastes, maintenance of public areas, purification and sanitation, etc.)
- District heating.

(¹⁵) The name of the sector has subsequently changed in Petrol and Gas, that better represents the composition.

The selection of the case studies was made concentrating on all the companies in the *FTSE sector: Italian Public Utilities Services*, that is, eighteen companies and groups were chosen in this first round of selection. However, the list has subsequently changed due to new listings, de-listings, or mergers between companies.

Successively, we eliminated the following companies from the original sample:

- subsidiaries of a holding company listed in the same sector, because firm policies relating to planning, control systems and risk management (which constitute the primary objects of the research) are set by the holding company;
- private companies, because we chose to focus on state-owned companies, for reasons of sample homogeneity (the vast majority of privately-owned utility companies operate in the Renewable Energy sub-sector because of the high investments required for infrastructure in Energy, Water, etc.) and because of the significant effect that the nature of government control has on them.

Therefore, ten companies were included in the final sample.

As a first step we contacted the investor relations directors to explain them the aims of our work, to identify the most appropriate respondents at each company and to obtain their contact information. Subsequently, a letter of introduction that contained an explanation of the research and a brief explorative questionnaire was sent to the potential respondents identified by the director of investor relations.

Seven state-owned companies declared to be interested in our research and accepted to be interviewed, and seven interviews were conducted in 2011. A large percentage of the respondents were leaders of strategic planning and management accounting or CFO at their company, with the exception of one risk manager, and all of them reported to have relatively short tenure with their company or experience that did not exceed five years.

The companies have from 800 to approximately 6,500 employees and, in five cases, are *multi-business* or *multi-utilities* (energy, water, gas, renewable energy, waste cycle, heating, lighting, maintenance of public areas, etc.).

The *choice of the public utilities sector* was motivated by the fact that, in the last decade of the last century, companies in this sector were impacted by a deep change in institutional (political and regulatory) environment and market competition, including the introduction of liberalisation and privatisation. Tsamenyi et al. (2006, p. 410) observe that, "...Perhaps no

industry has attracted as much attention in terms of change in recent years as the utility sector". Several Western public utilities sectors have undergone an important reform process to make them more efficient, and this process has introduced new competition rules. In Italy, the first round of reforms was introduced in the 1990s with the specific goal of cutting costs and reducing state deficits. Although free-market competition has not been completely established in this sector, liberalisation and privatisation have had a significant effect on efficiency and on organisational change aimed at more proactive management systems.

In addition to having to comply with national and EU laws, the companies operating in this sector are particularly subject to the regulations on internal control systems and corporate governance, which were first introduced in USA at the end of the 1980s¹⁶ and subsequently developed around the world (in 2004 the so-called *Transparency Directive* was approved by the EU), to guarantee more transparency to the market and investors, greater compliance with laws and regulations and increased strategic success for the listed companies. Due to the fact that the purpose of the Internal Control is to support managers and monitor risks, these regulations have introduced the ERM methodology and have forced listed companies to implement the risk management process and structure in order to improve the assessment and the control of new risks. Therefore, regulatory, political, cultural and environmental pressures have caused significant changes in the public utility sector, exerting effects on both the strategic planning and management control systems, as well as on risk management systems.

4. RESULTS

As we explained in the Research Methodology section, in case studies we investigated the opinion of management accountants regarding: i) the *status quo* of management accounting systems in their companies; ii) the expected or potential change in management accounting systems in their companies; iii) the expected or potential changes and challenges to the management accountants' role in their companies.

⁽¹⁶⁾ In 1987, driven by corporate scandals and failures in USA, the Treadway Commission published the Report on Fraudulent Financial Reporting, which contained a policy concerning corporate governance.

The results from the interviews showed that among the companies there were advanced management accounting systems, supported by integrated enterprise information systems, even if these systems were not completely integrated with the risk management tools.

We observed that in all companies there was a specific office of management accounting (in five cases, this person was directly below the CFO); in three cases, this office had more than ten employees and in two cases it had more than twenty employees.

In all cases, there were company objectives (both long-term and short-term) that were compared with company performance monthly and management control had its own formalised procedures and prepared monthly reports. Reports were issued to the following offices (Chart 1):

Chart 1: Responsibilities Centres

Top management	7/7	100.00%
SBU Managers (*)	7/7	100.00%
Functional Managers	5/7	71.43%
CFO	7/7	100.00%

Source: own elaboration

(*) SBU stays for Strategic Business Unit.

Managers were charged with specific goals and were evaluated and rewarded on the annual achievement of results. The reports were characterised by a certain complexity because they were articulated with regard to different business dimensions or objectives (Centres of Responsibility, Services, Projects, Customers, Distribution channels, Geographic areas, Activities and processes, Business areas). The reports contained both financial parameters and non-financial indicators (quantitative and qualitative). This demonstrates that the analysis conducted by the management accountant and addressed to operational managers was characterised by multidimensionality and complexity, even though the reports included measures of business risk in only in two cases.

In six companies, in addition to traditional instruments of management control (budgeting and cost accounting), innovative tools for performance measurement and strategy implementation (activity based management, process management and balanced scorecard) were used. In all of the cases the tools allowed managers to monitor the current operations in

order to achieve strategic goals. Even though the balanced scorecard approaches were used in only four cases, all of the companies were aware of the cause-and-effect relations that connect the short-term financial perspective with the other, long-term perspectives (customer satisfaction, business processes and intangibles).

We also asked if companies had implemented "integrated" operating information systems (such as enterprise resource planning or ERP) and management decisions support systems. The answers demonstrated that the level of advanced computerisation was high with regard to both operational transactions and business intelligence tools.

Then, we analysed the structure (organisational and technical), the activities and the process of risk management to understand how this was undertaken and whether it was integrated with the strategic planning and management accounting tools and processes. In six companies there was a specific risk management office, which had more than ten employees in one case. In one company, risk management activities were executed directly by the CFO. The locations of the risk management office in the organisational structure were as follows (Chart 2):

Chart 2: Risk Management Office

Below the CFO	1/6	16.67%
Below the CEO	1/6	16.67%

(*) SP stays for Strategic Planning and MA stays for Management Accounting

We found that in four cases, the risks associated with the processes were mapped, estimated, evaluated, treated and their trends were monitored and communicated to the market; however, there was not a strict correlation between these activities and performance. Indeed, risk parameters were measured in connection with the performance parameters only in one case. It seems that although risk factors were often considered at the beginning of the planning phase, only some companies continued paying attention to risks and continuously

verified, in the short-term, the evolution of the binomial strategy-risk during and at the end of control processes.

Risk management was considered by five companies to be among the managerial systems that should be formally and substantially integrated with management accounting. In other words, the respondents affirmed that it would be very important that management accounting changes toward the full integration with risk management processes, structures and tools, in order to improve the companies' durability. To the direct question about the main expected or potential direction of change for risk management, all of the respondents confirmed that the integration with risk management could be this direction.

Most respondents considered critical events (six respondents), board and top management (six respondents) and laws and regulations (five respondents) to be the strongest drivers for the introduction of risk management in their companies. This means that the implementation of risk management is usually top management's response to extraordinary and negative events or regulatory calls to improve corporate governance. For this reason, there is still resistance at the operational level against exploiting the full benefits of risk management, not only in terms of compliance and transparency but also in terms of value creation.

In five cases the strategic planning and management accounting directors were involved in risk estimation and evaluation activity and in three companies they were involved in risk reporting and communication. However, each respondent (also in the case in which the respondent was the risk manager) underlined the importance of improving the involvement of management accountants in risk management activities, especially in the definition of risk management goals and in the risk monitoring and reporting activities.

Though companies used different approaches, in all companies the respondents affirmed that in their company there was coordination between the strategic planning and management accounting directors and employees involved in risk management. However, in only three cases was that coordination adequately formalised and not "ad hoc"; in only two companies risk parameters were identified in planning and control reports. However, in only one case there was an effective integration of performance and risk parameters.

Next, we asked whether managers believed that it would be useful to create a corporate board (top management, management accountant and risk manager) to share information about performance and risk and whether they thought that risk management could, from the strategic and managerial perspectives, be better used. The answers are shown in Chart 3:

Chart 3: Integration by corporate board

Yes, it is necessary to achieve common goals and then ensure better monitoring of performance, and to predict, evaluate and enable risk management actions	2/7	28.57%
Yes, it is necessary to have a more integrated view of risks and to have a more structured exchange of information	1/7	14.29%
Yes (not justified)	1/7	14.29%
No answer	1/7	14.29%
<i>Presence of a similar unit in the company:</i>		
Top management participates in risk commissions for specific types of risk and in risk management committees	1/7	14.29%
The corporate board sets out to monitor market risks and define the hedging strategy. It is being launched in the energy risk management project, which involves several managers in addition to CEO, including the director of finance, the director of planning and control, the director of administration, the director of management control, the director of risk management, the director of internal auditing and the director of legal services	1/7	14.29%

Source: own elaboration

At the end, the majority of respondents affirmed that top management had an important responsibility in sponsoring new power relations in their companies, characterised by a higher involvement of management accountants in the risk management activities, and considered as a *conditio sine qua non* to achieving a successful organisational change.

The management accountants' role, in the opinion of the majority of respondents, is seen as a *business analysts'* role, with a proactive involvement in the main operational processes of the company. In any case, they are favourable for a greater participation of controllers in risk management activities, in particular in the planning and reporting phase of risks and performances.

For this reason, the main characteristics that a management accountant should have are, in the opinion of all respondents:

- the ability to analyse management decisions, identifying and highlighting both *strategic variables* and *risks*. To achieve this goal, it is necessary that management accountants gain a high level of knowledge and familiarity regarding company processes, activities and internal resources. In particular, this familiarity is necessary with regard to the processes of business

development, the supply chain processes, the sales and customer service processes, the human resources processes, etc.;

- the skills in relationship and diplomacy, which would fulfil the coordination task, an essential ingredient for integration between management accounting and risk management;
- the knowledge of the main technical and logical mechanisms of ICT and information systems, as they generate and manage different information flows, that are at the basis of the management accounting and risk management tools.

5. DISCUSSION

The results of the empirical analysis confirmed our research questions (*RQ1* and *RQ2*), underlining the need of a further change in management accounting and in the role of management accountants.

Indeed, in the analysed case studies, institutional change and new regulatory requirements motivated organisational change. Subsequently, organisational change influenced the change in management accounting and in risk management systems. Advanced management accounting systems have been implemented, integrated ERP and business intelligence tools now support the decision making process and enterprise risk management processes and tools have been adopted. At the same time, the findings suggest that more change is possible, especially efforts to integrate management accounting and risk management systems (*RQ1*). As Collier et al. (2007) observe, "...risk has shift from being considered tacitly to being considered more formally and ...(there is) expectation that this trend will shift markedly to a more holistic approach with risk being used to aid decision-making". In addition, the results confirmed that the role of management accountants should acquire new tasks and skills and that the management accountants' role seems to be from *performance* controller to *performance and risk* controller (*RQ2*).

Consequently, we proposed an evolution model for management accounting toward risk management and, drawing on institutional theory, we identified a new role for management accountants. With particular reference to *RQ1*, to overcome the limits of risk management it is necessary to start a new from the operative mechanism of strategic control, ensuring that this system and the person who manages it are also effective "drivers" of risk management in the company. Risk management and strategic control should be a "unique system" in practice, referred to as the "Integrated Model of Risk Management and Strategic

Control" (Culasso, 2009). Essentially, the "Integrated Model of Risk Management and Strategic Control" implies the following:

- integrated and balanced performance and risk measurement systems (technical structure);
- integrated responsibilities among risk managers, internal auditors and management accountants (organisational structure) and integrated risk management and strategic control processes (phases and time).

In particular, focusing our attention on the first point, which represents the most tangible management accounting change, the tools of strategic control should integrate with risk and its parameters, implementing an "integrated" performance measurement system that includes the output contained in the reports from risk management process. These results should be achieved through three different actions:

1. The first action is including some indicators about risks that were considered extremely dangerous in the evaluation phase of risk management, but not properly transferrable or financially coverable, in the tools of performance measurement to attract the attention of managers. This first level of indicators should allow for "balancing" performance with the possible risks associated with pursuing a critical success factor. This could be a first approach to validate the goodness of a deliberate strategy, weighted by its internal and external risks.
2. The second action is including in performance measurement systems parameters related to the emerging or "bottom-up" critical success factors, which are often unknown to the top managers but well-known by operative employees in the firms and their related risks. Often, during the risk self-assessment phase of the risk management process, those bottom-up new opportunities and risks become known and it is very important to communicate them to the top management in a formalised manner. In this way, the transfer of knowledge would create the opportunity to evaluate the goodness of a strategy over time while considering organisational learning (Mintzberg, 1989, 1994), new opportunities and new risks.
3. The third action is the inclusion of some indicators in the tools of performance measurement that monitor the effectiveness of the "Integrated Model of Risk Management and Strategic Control".

The first and second categories of actions have mainly *facilitating* and *informational purposes* because they should allow those responsible to capture, using the indicators and the measures of risk, that which we could define as key risk indicators (KRI's) (Gilad, 2004; Martelli, 2005; Scandizzo, 2005), which are analogous to the key performance indicators (KPI's) (Johnson and Kaplan, 1987), any internal or external changes that promote strategic reformulation and the consequent tactics and operational choices. Of course, subordinate to this aim is also an *evaluation* and *influencing purpose* because managers should be evaluated on the degree achievement with regard to these indicators and subsequently rewarded. The third category of action focuses on *evaluating* the risk management approach in an "integrated" way.

With particular reference to *RQ2*, drawing on institutional theory, integrating risk management and strategic control tools requires sponsorship by top management and coordination among the different subjects involved. For management accountants, this means that they should adopt a broader function, enriched by some of risk management tasks:

- supporting the top management in identifying the critical success factors and designing the strategy map, taking into consideration the *risks* identified during the risk management process;
- supporting the top management to identify the performance and *risk indicators* for each critical success factor, implementing a measurement system of comprehensive and integrated parameters, and understanding and exploring the information about firm risks and new opportunities identified during the risk management process;
- preparing and disseminating guidelines for the whole structure about the design of the different performance and *risk* measurement systems for each organisational unit, operational plans and budgets and coordinating the design of these systems;
- monitoring the actual results in terms of performance and *risk* indicators, both of the firm and of the various organisational units, analysing the causes of possible deviations and proposing corrective actions and updates;
- producing and disseminating the global corporate reporting and managing the communication of performance and *risk*.

Similarly, risk managers and internal auditors should be responsible for carrying out the fundamental phases of identification, description, estimation and evaluation of risks and new

business opportunities, in addition to more technical consulting for risk treatment. In particular, risk managers and internal auditors should work continuously with top management and management accountants to build the integrated model of *performance* and *risk* measurement, identifying the related KRI for each KPI. This means that risk managers and auditors should abandon their traditional bureaucratic approaches to risk and enrich their knowledge of the critical success drivers of their company.

Finally, the integration can be achieved only if there is coordination between the process of risk management and the process of strategic control. That is, considering the time axis, it is necessary that the different phases of the two processes are strictly correlated, and the output of the first phase becomes the input of the following and *vice versa*.

The changing role of the management accountant is moving towards the consolidation of several important competencies (knowledge, skills, abilities and commitment), such as at least the following:

- the ability to logically analyse management decisions and a high level of knowledge and familiarity regarding company processes, activities and internal resources;
- the skills in relationship and diplomacy;
- the knowledge of the main technical and logical mechanisms of ICT and information systems.

This means that management accountants should increase their intra-organisational power and that top management should influence and support this empowerment process. The intra-organisational power relations are interplayed with the institutional pressures (political, regulatory, cultural) and the market forces (new competition and new risks) to understand the organisational change and, in particular, the change in management accounting.

6. CONCLUSIONS

In conclusion, the empirical analysis seems to confirm our beginning hypotheses and answer to the previous research questions:

- *management accounting systems* should be enriched by new functions and features, necessary to survive in the new competitive environment. Indeed, a further change in management accounting is required, especially for those companies

that are operating on listed market. The most urgent direction of change is the integration between management accounting and risk management (RQ1), especially regarding the integration between *key performance indicators* and *key risk indicators*;

- *management accountant's role* can be considered as an intra-organisational condition, which will enable the successful management accounting change. Without the involvement of management accountants in risk management activities, indeed, risk management is often only a costly compliance exercise. The necessary features of this role are a high level of knowledge and familiarity regarding company processes and internal resources, skills in relationship and diplomacy and the knowledge of the main technical and logical mechanisms of ICT and information systems (RQ2).

Our analysis contributes to an understanding of the potential management accounting change and of the changing role of management accountants, with regard to the interplay between managerial systems, as it reveals a further specific direction of change which goes toward the integration between performance and risk planning and monitoring. In particular, we identified new functions and abilities that should be integrated in the management accountant's traditional role.

Our work, however, is limited, as the empirical analysis concerns only one sector with few companies. Future development of this line of inquiry would include a broad survey and longitudinal empirical case study analyses. Furthermore, it could be interesting to analyse in deep details the tools and the processes of the Integrated Model of Management Accounting and Risk Management.

⁴Department of Management, University of Turin, Italy, elisa.giacosa@unito.it

ABSTRACT

Our article compares the performances of the Family Firms (FF) with the ones achieved by the Not Family Firms (NFF), considering the family as a relevant variable in managing the efficiency and the effectiveness of the business. In particular, after distinguishing Italian listed FF on one side and Italian listed NFF on the other, having considered the board composition and the ownership articulation, we compared the economic and financial results achieved by the two groups, in order to understand if there was a relevant difference and which were the causes. Consequently, the main goal of this study is underling the importance of the family variable in the effects on performance (Miller, Le Breton-Miller, Lester and Cannella, 2007).

Furthermore, another goal of the article, strictly correlated to the previous one, is to verify if there is a distinction within the FF, in terms of organizational and institutional features, considering the different economic and financial performances. In particular, we were interested in understanding if the size of the companies, expressed in terms of i) number of employees, ii) assets quantified in the balance sheet and iii) revenues measured in the income statement, was a proxy variable of the complexity of the firm, and for this reason a significant element to be considered in addition to the presence of the family in the board.

Keywords: family firms performance, family firms size, family firms capitalization

1. INTRODUCTION

As someone affirms, the economy of the countries around the world keeps to be dominated by family firms, especially in Europe, Asia and Latin America and for this reason the importance of family firms in the economic and social environment and, consequently, in the literature is duly recognized (Astrachan and Shanker, 2003; Claessens, Djankov and Lang, 2000; Faccio and Lang, 2002; La Porta, Lopez-de-Silanes and Shleifer, 1999; Morck & Yeung, 2004).

In the studies about family firms, a relevant issue of the last twenty years concerns the corporate governance, with a particular focus on the relationship between the owners, the board of directors, and the CEOs (Keasey et al., 2005; Monks and Minow, 2004) and on the confluence between family and business (Neubauer & Alden, 1998). Different theories are usually adopted, as the Agency Theory, the Contingent Approach, the Life-cycle Approach, the Stewardship Theory and the Social Capital, in order to investigate the relation between the corporate governance and the performances (Vighneswara, 2011). In particular, the attention is focused on the composition of the board of directors and its influence on performances, even if it is not sufficiently clear how board composition affects firm performances.

Our article compares the performances of the Family Firms (FF) with the ones achieved by the Not Family Firms (NFF), considering the family as a relevant variable in managing the efficiency and the effectiveness of the business. Dyer (2006) refers to the family as “the missing variable in organizational research” and he warns that “failing to use the family as a variable in organizational research can lead to incomplete or misleading findings” (Speckbacher and Wentges, 2007). In particular, after distinguishing Italian listed FF on one side and Italian listed NFF on the other, having considered the board composition and the ownership articulation, we compared the economic and financial results achieved by the two groups, in order to understand if there was a relevant difference and which were the causes.

Consequently, the main goal of this study is underling the importance of the family variable in the effects on performance (Miller, Le Breton-Miller, Lester and Cannella, 2007). This topic is particularly significant in Italy, because the family firms phenomenon is widespread in our Country, as well in Europe, in which “the context is characterized by high ownership concentration and the presence of family groups that remain in control of a significant number of firms, in contrast to the less amenable American and Anglo-Saxon markets” (García-Ramos, García-Olalla, 2011).

Furthermore, another goal of the article, strictly correlated to the previous one, is to verify if there is a distinction within the FF, in terms of organizational and institutional features, considering the different economic and financial performances. In particular, we were interested in understanding if the size of the companies, expressed in terms of i) number of employees, ii) assets quantified in the balance sheet and iii) revenues measured in the income statement, was a proxy variable of the complexity of the firm, and for this reason a significant element to be considered in addition to the presence of the family in the board. This is due to the fact that we observed how in the Italian stock market the FF listed in the FTSE MIB index (large capitalized companies) achieved different financial performances than the ones listed in the STAR index (medium capitalized companies).

This article has the following structure. In the second paragraph the theoretical background about the FF is analyzed, with particular attention to the main issues of our paper. In the third paragraph the research method is outlined, as well as a description of the sample. In the fourth paragraph the findings and the discussion of the results are presented. Finally, in the fifth paragraph, conclusions and implications of the study are given with the limitations of the research.

2. THEORETICAL BACKGROUND

2.1 Defining family firms

Family firms play an important role in economic activities worldwide and contribute to creating wealth and jobs, with reference to both narrow and broad definitions of family business (Astrachan and Shanker, 2003). The quantification of family businesses in the United States and Europe is the subject of several studies (Colli, Perez and Rose, 2003; Corbetta, 1995; Larner, 1970; Neubauer and Lank, 1998; Shanker and Astrachan, 1996; Sluyterman and Winkelman, 1993) and in the last years increasing attention have been given to family businesses. Several recent studies have reported and stressed that in Continental Europe, Asia, and Latin America the vast majority of publicly traded businesses are family controlled (Claessens, Djankov and Lang, 2000; Faccio and Lang, 2002; García-Ramos, García-Olalla, 2011; La Porta, Lopez-de-Silanes and Shleifer, 1999).

A family business is often defined as the initial phase of the process of constitution of a company, that involves about one or two generations before becoming a public company. However, it is not that easy to find a definition for the expression “family business”, and

ambiguities persist in the literature. The editorial note of the first issue of *Family Business Review* asks: "What is a family business?" (Lansberg, Perrow and Rogolsky, 1988). People seem to understand which is meant by these words, but when they try to give a precise definition, they quickly discover that the phenomenon is indeed very complex (Hoy and Verser, 1994). The question continues to be asked because in the literature several different definitions are given for family business, also because different criteria were used to classify family firms. In particular, following the criterion about ownership and control, these are the possible definitions:

- a family business is a "firm in which significant voting rights or ownership is controlled by a member or members of a single family" (Barnes and Herson, 1976);
- it is possible to define a firm like family when the share of capital is owned by a single family (Alcon, 1982; Lansberg, Perrow and Rogolsky, 1988);
- in a family business, one or more families having kinship or similar ties are the owners of the full risk contributed capital (Ferrero, 1980);
- in a family business, one or more families linked by kinship or similar ties or by strong alliances contribute with full or limited risk capital, personal or collateral guarantees or managerial skills; these families own a full risk capital share that entitles it to controlling the business even without the absolute majority of the capital (Corbetta and Dematté, 1993).

If the criterion used to define the family business is the number of family members involved in its management, criterion emphasised even in recent times (Di Mascio, 2008), these are the possible definition:

- a family business must be owned and managed by members belonging to one or more families (Stern, 1986);
- in a family firm there must be at least two family's generations involved in its management (Ward, 1988), also with the aim of conveying managerial skills to the next generation (Churchill and Hatten, 1987).

In recent years, the definitions for family business have been based on a mix of criteria related to the ownership and control (Smyrniotis, Romano and Tanewski, 1998).

According to other authors, an enterprise is classified as a family business if (Chua, Chrisman and Sharma, 1999): i) at least 50 per cent of the shares are owned by the family, and the family is responsible for the management of the company, ii) or at least 50 per cent of the shares are owned by the family, the enterprise is not family-run, but the CEO perceives it as a

family business, iii) or family ownership is less than 50 per cent, the company is family-run, the CEO perceives it as a family business and a venture capital or investment company owns at least 50 per cent of the shares.

In our work we used a mix criterion in order to identify the family business sample, that is:

- a control participation in the capital by the family/ies;
- the presence in the Board of at least one family member.

Our criterion well reflects the Italian context.

Independently by the criteria chosen, in all definitions there is an evident interaction between the family, considered as an entity, its members and the activities performed by the business (Miglietta, 2009).

The relations between family and enterprise are determinant for the firm survival and to the value creation: the family has as its main goal the maintenance and support of its members, and this is the reason the family invests its own resources in the business activities, based on entrepreneurial values (Bertini, 1995; Catturi, 1995; Coda, 1988; Sorci, 1986; Vergara, 1986), which are also inspired by tradition, unity and affection (Salvato, 2002; Ward, 1997). Both the family and the business are motivated by a series of shared values, among which there are the continuity of the economic activity (Coda, 1988; Giannessi, 1960; Onida, 1954; Zappa, 1957) and the value creation (Catuogno, 2006; Cuccurullo, 2006; Tiscini, 2006).

2.2 Family firms performance

The literature also focused on the analysis of the performance achieved by the family businesses.

Relevant studies conducted in the US show that publicly traded FF have higher Tobin's q values and higher return on assets than comparable NFF (Anderson and Reeb, 2003; Villalonga and Amit, 2004), demonstrating also that family ownership reduces the classical agency problem between managers and shareholders.

In addition, Anderson and Reeb (2003) find a positive effect associated with family ownership that starts to taper off at around 30% of ownership, and Villalonga and Amit

(2004) find higher valuation of FF when the founder serves as CEO or as Chairman of the board.

Analysing the results obtained by Anderson and Reeb (2003), it emerges that FF outperform than NFF in the ROA, in particular the economic performance of large listed family businesses is higher than the economic performance of public non-family companies; in addition, the performance achieved by medium sized family businesses, both listed and non-listed, are higher if compared with non-family companies of the same size (Culasso, Broccardo, Giacosa and Mazzoleni, 2012).

Anderson and Reeb (2003) underline also that the relation between family ownership in large public firms and firm performance is not uniform across all levels of family ownership, in particular when families have the greatest control of the firm, the potential for entrenchment and poor performance is the greatest.

In contrast with the previous theory other studies have shown that the presence of a family in the ownership affects negatively business performance (Faccio, Lang and Young, 2001; Volpin, 2002). In particular Faccio et al. suggest that the problems of the firms analysed, East Asian firms, are related to corporate governance and to the political-regulatory environment.

In addition, some authors have asserted the neutrality of family ownership to economic performance, in absolute terms or in terms related to the share of capital held by the family (Sciascia and Mazzola, 2008).

In the literature it is possible to find also some studies that have focused the attention on the differences among performances between family companies led by their founders and FF not led by their founders (Adams, Almeida and Ferriera, 2003; Barontini and Caprio, 2006; Cucculelli and Micucci, 2008; García-Ramos, García-Olalla, 2011; Villalonga and Amit, 2006), while other researches focused on the analysis of the performance achieved by family businesses being in their second or third generation, observing a destruction of value (Pérez-González, 2001; Villalonga and Amit, 2006).

Another aspect analysed in some studies about family firms and performance is the size. A study conducted in Taiwan examining 786 public family firms (Chu Wenyi, 2011), besides to underline that family ownership is positively associated with firm performance and that this positive association is strong particularly when family members serve as CEOs,

shows that the association between family ownership and firm performance is stronger in small- and medium-sized enterprises (SMEs) than in large companies.

In this direction another study (Gonzalez, Guzman, Pombo, Trujillo, 2012) examined 523 listed and non – listed Colombian firms. This research shows that FF exhibit better financial performance on average than NFF when the founder is still involved in operations, although this effect decreases with firm size, suggesting that some kinds of family involvement appear to make firm growth expensive.

3. METHODOLOGY

3.1. *The sample*

We considered a sample of companies listed on the Italian stock market, included in the FTSE MIB and STAR indexes. FTSE MIB is the main benchmark index of the Italian stock market and it captures about 80% of the domestic market capitalization. FTSE MIB measures the performance of 40 large capitalized Italian primary and with high liquidity companies and it seeks to replicate the broad sector weights of the Italian stock market. STAR index, instead, is dedicated to 67 medium capitalized companies of the Italian stock market, having market capitalization between 40 million and 1 billion of Euro and respecting the followings features: i) high transparency and communicativeness, ii) high liquidity (no less than 35% of float), iii) Corporate Governance aligned to the international standards.

Our aim, in considering this sample, was to test the following research questions in companies that represent the Italian excellence, both large capitalized companies (FTSE MIB) and medium ones (STAR). We also analyzed separately the first sample (FTSE MIB) and the second one (STAR), in order to verify if there was a relation between the capitalization and the performances.

Considering the sample of listed Italian firms of the FTSE MIB and STAR indexes, we excluded banks, insurance and other financial companies, as we wanted focusing on the industrial sector in order to achieve a satisfactory homogeneity. We also eliminated foreign industrial listed companies, as we focused our attention on Italian firms. The number of companies finally selected is equal to 80.

In our work we used a mix criterion with the purpose of distinguishing FF and NFF. Our criterion well reflects the Italian context. In particular, a FF is a company that has:

- a control participation in the capital by the family/ies;
- the presence in the Board of at least one family member.

In order to distinguish FF and NFF, we used data included in the “Corporate Governance Report” of each company published on the “Borsa Italiana” website.

Using this criterion, it emerges that the 80 companies of the sample are articulated in 55 FF and in 25 NFF, as shown in the following chart (Chart 1).

Chart 1. The sample

	Family Firms	Not Family Firms		FTSE MIB Family Firms	FTSE MIB Not Family Firms		STAR Family Firms	STAR Not Family Firms
Companies (No)	55	25		13	14		42	11
Companies (%)	68,75%	31,25%		48,15%	51,85%		79,25%	20,75%

Source: personal elaboration

It is interesting to observe as in the Italian Stock Exchange about 68,75% of FTSE MIB and STAR companies are FF. In the FTSE MIB index, that comprises large-capitalized companies, is about 48,15%, while in the STAR index, that comprises medium-capitalized companies, the FF are the 79,25%.

3.2. The research method

The main goal of this study is to analyze the relationship between the presence of a family in the board of a firm and its performances, distinguishing the listed Italian FF and the listed Italian NFF. Indeed, our hypothesis (H1) was that the presence of a family is an important factor in the effects on performances of a company.

H1: the family is a relevant variable that influences the firm performances

To reach the declared goal and to verify H1, a first research question was formulated (RQ1).

RQ1: Do the FF outperform in comparison with NFF? Are there some relevant differences between FTSE MIB companies and STAR ones?

To answer the RQ1, the mean of each financial and economic ratio achieved by the companies of the sample, considered for every financial year covered by the research, was

determined. The source of the data was AIDA database. The last 6 years (2006-2011) were the period considered by the analysis. Subsequently, we calculated:

- the 2006-2011 mean for each ratio;
- the 2006-2011 median for each ratio;
- the 2006-2011 standard deviation for each ratio.

Then, economic and financial performances were compared between FF and NFF. In particular, we first considered all the companies listed in the FTSE MIB and in the STAR indexes. Subsequently, the analysis compared the FF with the NFF respectively in the FTSE MIB and in the STAR index.

Considering the findings collected by answering to the RQ1, and in particular the information concerning the economic indicators, we observed that in the FTSE MIB index the NFF outperform than the FF, whilst in the STAR index it happens exactly the opposite. This element suggested us to formulate an important assumption and a correlated new hypothesis that was proud to be verified.

The *main assumption* was that there are two kinds of FF, the ones listed on the high capitalization index (FTSE MIB) and the others listed on the medium capitalized index (STAR), to which correspond two different organizational configurations.

The hypothesis (H2) was that, if the capitalization is positively correlated with the size, expressed in terms of i) number of employees, ii) assets quantified in the balance sheet and iii) revenues measured in the income statement, the presence of a family in the business is a relevant variable to achieve higher *economic performances* than NFF, *only* when the *size* of the company is not large. Indeed, the size of a company could be considered as a proxy of the complexity/diversification of the business, and influences the effects of the actions of the family in the company. If this H2 is verified, we'll be able to affirm that, when the FF have a not-large size, they outperform in economic results than the NFF with the same size, whilst, when the FF have a large size, they underperform in comparison with NFF with the same size.

In addition, about *financial performances*, the presence of a family in the business is a relevant variable to achieve higher results than NFF, *independently* by the *size* of the company (always positively correlated with the capitalization). Indeed, FF outperform than NFF in all financial ratios, both in FTSE MIB and in STAR index, with the exception of the debt ratio in the FTSE index. In any case, this exception could confirm our main assumption about the

existence of two configurations of FF and, in particular, it seems that FTSE MIB FF have specific financial requirements related to their business, covered by financial debts more than STAR FF and FTSE MIB NFF. At the same time, the size of the company seems to be a relevant variable, which influences FF *financial performance*. Indeed, STAR FF outperform then FTSE MIB FF, while this evidence is not true for NFF (all financial ratios of FTSE MIB NFF are better than STAR NFF, with the exception of fixed assets coverage ratio, and the specificity of the debt ratio that is equal in the two indexes).

H2: the size is a relevant variable in distinguishing the FF in two main configurations, with different economic and financial performances (debt ratio) in comparison to NFF with the same size and to FF of other size.

In order to demonstrate this hypothesis, we expressed RQ2.

RQ2: Is there a correlation between the capitalization of a firm and its size expressed in terms of i) number of employees, ii) assets quantified in the balance sheet and iii) revenues measured in the income statement ? If yes, how does the size influence the economic and financial performances of FF?

The aim of this question was to verify the existence of a positive correlation between capitalization and size, that permits us to understand the findings of the RQ1 as caused by the size and not only by the belonging of the companies to a specific index, with a particular capitalization (FTSE MIB with large capitalized companies and STAR with medium capitalized ones), also supported by the studies conducted in Taiwan (2011) and Colombia (2012), that reveal a stronger relationship between family ownership and firm performance in small and medium size enterprises than in large FF.

In particular, the Pearson correlation ratio was used to identify a positive or a negative correlation between capitalization and size. The source of the capitalization data was "Borsa Italiana" website and the source of the size parameters was AIDA database.

Due to the fact that we have adopted the Pearson correlation ratio (p) to verify our hypotheses, it is important to underline that:

- if $p > 0$ there is a direct correlation;
- if $p = 0$ there is no correlation;
- if $p < 0$ there is a indirect correlation;
- if $0 < p < 0,3$ the correlation is weak;

- if $0,3 < p < 0,7$ the correlation is moderate;
- if $p > 0,7$ the correlation is strong.

4. 4. FINDINGS

4.1. RQ1

About the RQ1 “Do the FF outperform in comparison with NFF? Are there some relevant differences between FTSE MIB companies and STAR ones?”, we compared the most significant economic and financial parameters between FF and NFF, in general and within each index (FTSE MIB and STAR), as showed in the following.

4.1.1 Economic results

Considering the economic indicators, the following ratios supported by literature (Baginski and Hassel, 2004; Ferrero, Dezzani, Pisoni and Puddu, 2003; Foster, 1986; Giroux, 2003; Helfert, 1997; Higgins, 2007; Ingram, Albright and Baldwin, 2002; Meigs, Williams, Haka and Bettner, 2001; Value, 2001) were adopted:

- ROA (Return on Assets);
- ROI (Return on Investment);
- ROS (Return on Sales);
- ROE (Return on Equity).

In the following chart, the economic performances between FF and NFF were compared (Chart 2).

Chart 2. Economic performance in FF and NFF

	Family Firms	Not Family Firms
Companies (No)	55	25
Companies (%)	68,75%	31,25%
Roa 2006	9,52	7,09
Roa 2007	9,50	7,24
Roa 2008	7,74	5,88
Roa 2009	3,87	5,74

Roa 2011	5,56	5,20
Roa - mean (2006-2011)	7,00	6,21
Roa - median (2006-2011)	6,77	5,99
Roa - standard deviation (2006-2011)	2,30	0,80
Roi 2006	12,60	7,39
Roi 2007	13,43	9,45
Roi 2008	11,33	10,21
Roi 2009	6,04	6,99
Roi 2010	8,75	8,02
Roi 2011	7,54	9,37
Roi - mean (2006-2011)	9,95	8,57
Roi - median (2006-2011)	10,04	8,70
Roi - standard deviation (2006-2011)	2,95	1,29
Ros 2006	10,53	7,38
Ros 2007	10,44	9,14
Ros 2008	8,67	5,84
Ros 2009	4,63	6,23
Ros 2010	7,57	8,30
Ros 2011	7,01	6,46
Ros - mean (2006-2011)	8,14	7,23
Ros - median (2006-2011)	8,12	6,92
Ros - standard deviation (2006-2011)	2,25	1,29
Roe 2006	11,06	12,91
Roe 2007	12,38	12,63
Roe 2008	9,51	10,14
Roe 2009	2,39	8,62
Roe 2010	7,06	7,64
Roe 2011	8,48	2,99
Roe - mean (2006-2011)	8,48	9,15
Roe - median (2006-2011)	8,99	9,38
Roe - standard deviation (2006-2011)	3,52	3,68

Source: own elaboration based on AIDA database.

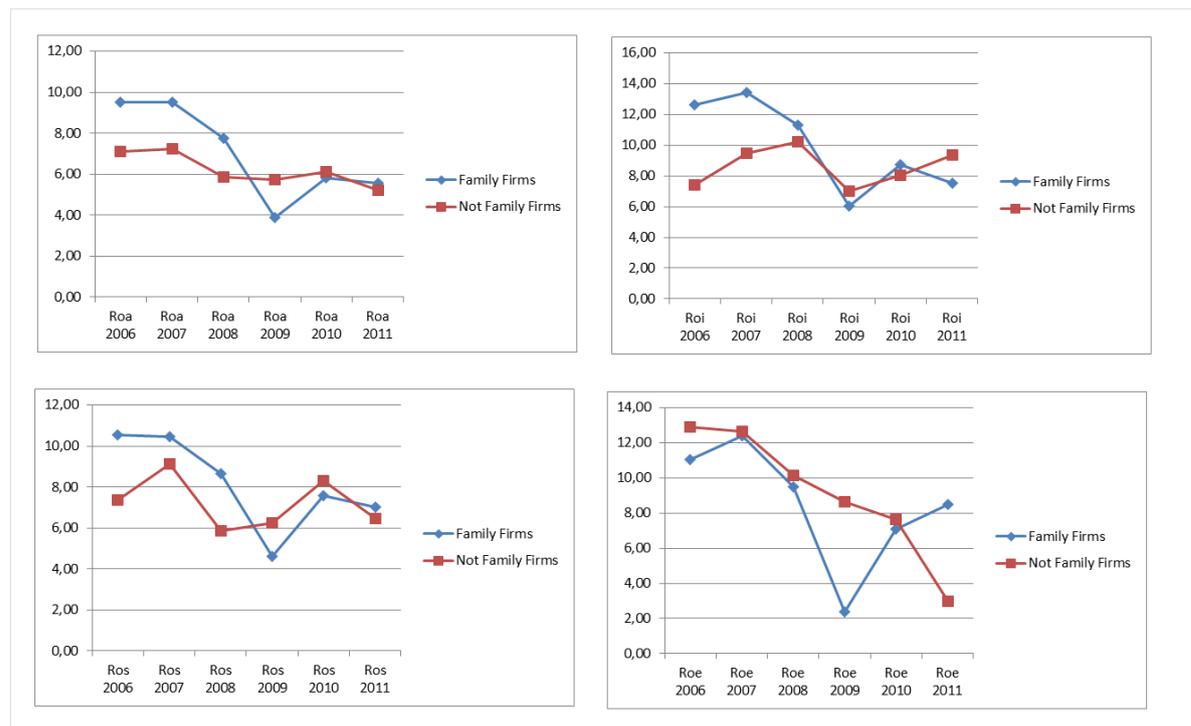

Evaluating the *economic performance*, and in particular considering the mean of each ratio (whose trend is confirmed by the median), it's clear that:

- NFF outperform in the ROE (9,15%) compared with FF (8,48%), due to the leverage effect of debt ratio, as it is confirmed in the following financial analysis;

- FF outperform in the core business, how ROI shows (9,95%), compared with NFF (8,57%). In addition, FF excel in ROS (8,14%) compared with NFF (7,23%), and in ROA (7,00%) compared with NFF (6,21%).

The following graph (Graph 1) underlines the behavior of the different parameters.

Graph 1 - Economic ratios trends in FF and NFF

Source: own elaboration based on AIDA database.

In particular, a decreasing trend during the 2007-2009 period for FF can be observed, more evident in 2008. If we analyse the average of the six years, ROE is higher in NFF, even if there has been a reduction in 2011. ROA, ROI and ROS are better in FF, in particular these companies excel in ROI ratio, despite the evident drop in 2009.

The median along the six years is aligned to the mean, even if the difference between FF and NFF is always greater.

We also calculated the standard deviation and verified it is much greater for FF in the case of ROA, ROI and ROS: therefore, it demonstrates a not steady trend in comparison with NFF.

We also compared in terms of economic performance FF and NFF included in the two different indexes taken into consideration, the FTSE MIB and the STAR index, how the following chart shows (Chart 3).

Chart 3. Economic performance in FF and NFF within FTSE MIB and STAR

	FTSE MIB Family Firms	FTSE MIB Not Family Firms	STAR Family Firms	STAR Not Family Firms
Companies (No)	13	14	42	11

Ros 2011	11,87	8,55	5,43	4,17
Ros - mean (2006-2011)	12,31	13,63	7,10	1,96
Ros - median (2006-2011)	12,28	14,15	7,20	2,28
Ros - standard deviation (2006-2011)	2,00	2,72	2,42	2,32
Roe 2006	12,07	17,55	10,85	8,98
Roe 2007	16,58	20,07	11,38	6,33
Roe 2008	14,54	20,93	8,28	0,11
Roe 2009	6,67	17,55	1,30	0,32
Roe 2010	9,89	14,15	6,32	1,12
Roe 2011	15,50	2,04	6,25	4,20
Roe - mean (2006-2011)	12,54	15,38	7,40	3,51
Roe - median (2006-2011)	13,31	17,55	7,30	2,66
Roe - standard deviation (2006-2011)	3,76	6,95	3,70	3,63

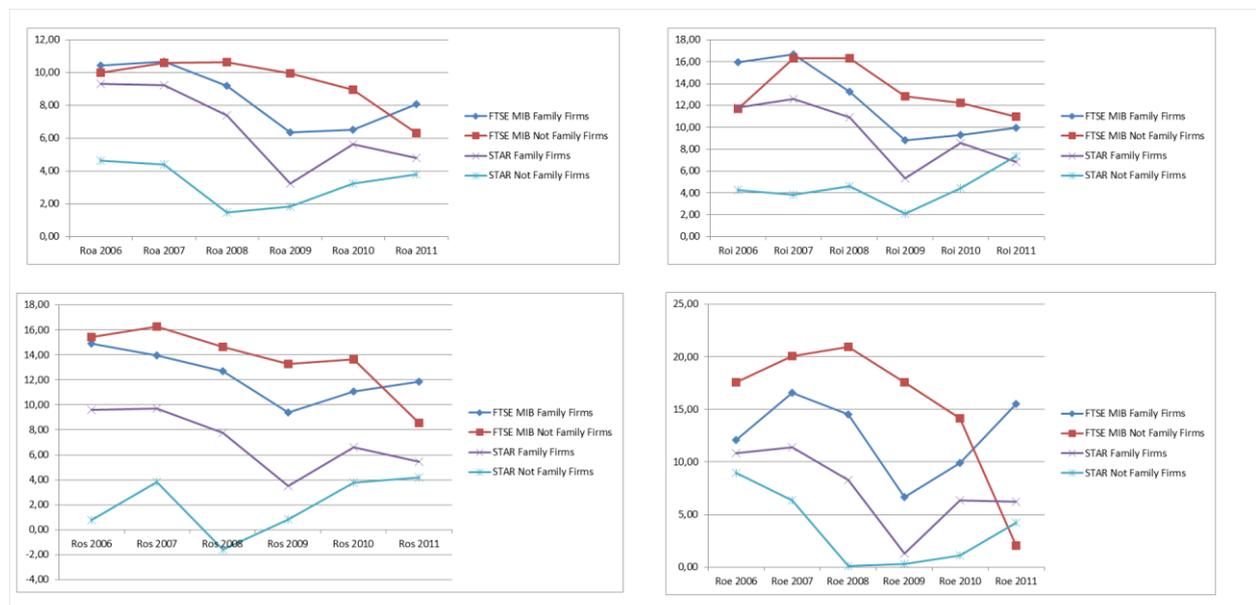

Source: own elaboration based on AIDA database.

Focusing the attention on the mean of each indicator of the previous chart (whose trend is confirmed by the median), it is evident that:

- on one side, NFF in FTSE MIB outperform in the ROE (15,38%), ROI (13,40%), ROA (9,41%) and ROS (13,63%) compared with FF, that is, the economic indicators of NFF are better than the FF;
- on the other side, FF in STAR outperform in the ROE (7,40%), ROA (6,60%), ROI (9,34%) and ROS (7,10%) compared with NFF, that is, the economic indicators of FF are better than the NFF.

It can be useful to observe the behaviors of the economic parameters, comparing FTSE MIB and STAR, looking at the following graph (Graph 2).

Graph 2 - Economic ratios trends in FF and NFF: FTSE MIB and STAR companies comparison

Source: own elaboration based on AIDA database.

Synthesizing, it is possible to observe an outperformance of the FTSE MIB firms in comparison with the STAR ones, in all the economic ratios, also if the trend is decreasing, both for FF and for NFF. This is a confirmation of the existence of the relation between the economic fundamentals and the capitalization of the company, that is, the higher the capitalization the higher the profitability.

Furthermore, we observed that in the STAR index the FF outperform in the economic ratios than the NFF, whilst in the FTSE MIB NFF outperform than the FF.

Concluding about economic performance, it is possible to affirm that:

- FF outperform in the core business (ROI and ROS) and in the return on assets (ROA), whilst the NFF outperform in the return of equity (ROE);
- FTSE MIB companies outperform than STAR ones;
- FTSE MIB NFF outperform than FTSE MIB FF;
- STAR FF outperform than STAR NFF.

It's also interesting to underline the performances variation into the considered period: in general, in 2009 the effects of companies' crisis situation are more evident in all economic ratios.

4.1.2. Financial results

Considering the financial ratios, the following parameters supported by literature (Baginski and Hassel, 2004; Ferrero, Dezzani, Pisoni and Puddu, 2003; Giroux, 2003; Foster, 1986; Helfert, 1997; Higgins, 2007; Ingram, Albright and Baldwin, 2002; Meigs, Williams, Haka and Bettner, 2001; Value, 2001) were analyzed:

- liquidity ratio;
- current ratio;
- debt ratio;
- fixed asset coverage ratio.

We compared financial performance between FF and NFF (Chart 4).

Chart 4. Financial performance in FF and NFF

	Family Firms	Not Family Firms
Companies (No)	55	25

Source: own elaboration based on AIDA database.

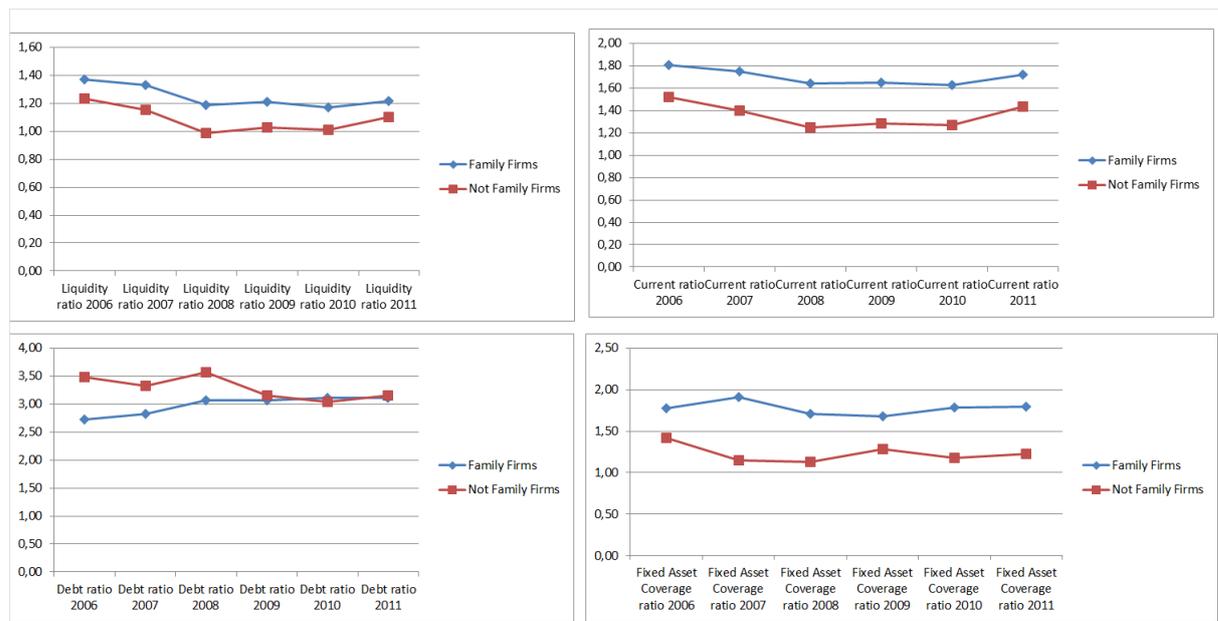

Financial performance is analyzed as following, focusing the attention on the mean of each indicator (whose trend is confirmed by the median), and in particular FF outperform in:

- liquidity ratio (1,25) compared with NFF (1,09);
- current ratio (1,70) compared with NFF (1,36);

- debt ratio (2,99) compared with NFF (3,29);
- fixed asset coverage ratio (1,78) compared with NFF (1,23).

The following graph shows the trend of the financial ratios (Graph 3).

Graph 3 - Financial ratios trend in FF and NFF

Source: own elaboration based on AIDA database.

The underlined trends by the graphs point out that FF outperform in all ratios than NFF.

Financial performances between FF and NFF are analyzed, in the following chart, also considering the differences between FTSE MIB and STAR indexes (Chart 5).

Source: own elaboration based on AIDA database.

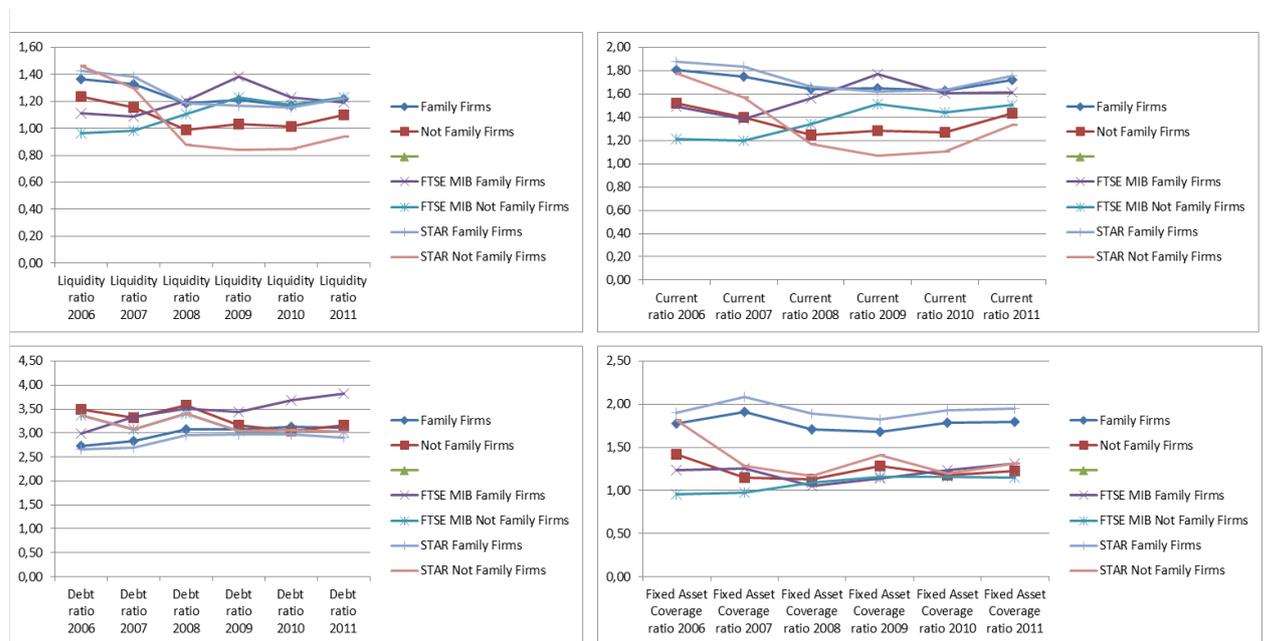

Some evidences in financial performance about FF and NFF are underlined comparing FTSE MIB and STAR indexes:

- FF in FTSE MIB outperform in the liquidity ratio (1,20) compared with NFF (1,11), current ratio (1,57) compared with NFF (1,37), and fixed asset coverage ratio (1,21) compared with NFF (1,08);
- NFF in FTSE MIB outperform in the debt ratio (3,16) compared with FF (3,46);

- FF in STAR index outperform in the liquidity ratio (1,26) compared with NFF (1,04), current ratio (1,73) compared with NFF (1,34), debt ratio (2,86) compared with NFF (3,16) and fixed asset coverage ratio (1,93) compared with NFF (1,37).

The trend behaviours of the financial ratios, comparing FTSE MIB and STAR, is shown in the following graph (Graph 4).

Graph 4 - Financial ratios trend in FF and NFF: FTSE MIB and STAR companies comparison

Source: own elaboration based on AIDA database.

By the analysis conducted, it is evident that:

- FF outperform in the financial ratios compared with NFF;
- STAR FF are the best companies of the sample in financial ratios, both comparing STAR FF with FTSE MIB FF and STAR FF with STAR NFF;
- FTSE MIB FF outperform in all ratios than FTSE MIB NFF, with the exception of the debt ratio.

4.1.3 Discussion RQ1

In answering RQ1, it emerged that:

- FF outperform in ROA, ROI, ROS, and in the financial ratios compared with NFF, while NFF outperform in ROE;
- FTSE MIB NFF outperform than FTSE MIB FF in all economic ratios, while FTSE MIB FF outperform in all financial ratios than FTSE MIB NFF, with the exception of the debt ratio;
- STAR FF outperform than STAR NFF in all ratios.

H1 was partially confirmed.

Considering the results achieved, and in particular the *economic performances*, we observed that in the FTSE MIB index the NFF outperform than the FF, whilst in the STAR index it happens exactly the opposite. At the same time, considering the *financial performances*, the STAR FF outperform both in comparison with FTSE MIB FF and with STAR NFF, while FTSE MIB FF outperform in all *financial ratios* than FTSE MIB NFF, with the exception of the debt ratio. This evidence suggested us to affirm that there are two groups of FF to which correspond two different organizational configurations:

- the FF listed on the large capitalized companies index (FTSE MIB);
- the FF listed on the medium capitalized companies index (STAR).

Adopting the theory that performances in FF are higher when family members serve as CEOs or as Chairman of the board and that the association between family ownership and firm performance is stronger in small-medium-companies than in large ones (Chu Wenyi, 2011), the FF listed on the FTSE MIB index are more oriented to act as family holdings and they are interested in the diversification of the activities to gain high profitability. The family in these firms generally is not involved in directly managing the business, and there is normally a duality between CEO (a manager) and chairman (a member of the family). These FTSE MIB FF underperform in economic ratios than FTSE MIB NFF. Vice versa, the FF listed on the STAR index, more focused on the traditional core business, in which the family is directly involved in managing the company, with executive members in the board and interested to push the innovation, outperform than STAR NFF.

Therefore, we expressed a new hypothesis (H2), that, if the capitalization is positively correlated with the size of the companies, the size of a FF will be a relevant variable that influences performances. In particular, we distinguished not-large (medium) FF from large FF and we considered the size as a proxy variable of organizational complexity and diversification, which contributes to justify the different economic and financial (to be precise,

only the debt ratio) performances achieved by the FF in comparison with NFF of the same size or with FF of other size.

H2: the size is a relevant variable in distinguishing the FF in two main configurations, with different economic and financial performances (debt ratio) in comparison to NFF with the same size and to FF of other size.

In order to demonstrate this hypothesis, we expressed RQ2.

4.2. RQ2

4.2.1. Results

About the RQ2 *“Is there a correlation between the capitalization of a firm and its size expressed in terms of i) number of employees, ii) assets quantified in the balance sheet and iii) revenues measured in the income statement? If yes, how does the size influence the economic and financial performances of FF?”*, the aim of this question was to verify the existence of a positive correlation, that permits us to interpret the findings of the RQ1 as caused also by the size and not only by the belonging of the companies to a specific index, with a different capitalization (FTSE MIB with large capitalized companies, and STAR with medium capitalized ones).

We correlated the capitalization of each firm, distinguished in FF and NFF, considered the mean of the period 2006-2011, with its size, expressed in terms of i) number of employees, ii) assets quantified in the balance sheet, and iii) revenues measured in the income statement (mean 2006-2011). Subsequently, we analyzed the same correlation within each index (FTSE MIB and STAR), distinguishing FF and NFF.

How the following table shows, it is possible to affirm that there is a positive correlation between capitalization and size, expressed in terms of i) number of employees, ii) assets quantified in the balance sheet and iii) revenues measured in the income statement.

If we look at the global sample (FF on one side and NFF on the other), the positive correlation is strong, independently by the presence of the family in the company.

The correlation is strong also in the FTSE MIB NFF and in the STAR NFF, and it is moderate/strong in the FTSE MIB FF and in the STAR FF companies (Chart 6).

Chart 6. Correlation between capitalization and size

	Capitalization (mean 2006-2011) (family firms)	Capitalization (mean 2006-2011) (not family firms)	Capitalization (mean 2006-2011) FTSE MIB (family firms)	Capitalization (mean 2006-2011) FTSE MIB (not family firms)	Capitalization (mean 2006-2011) STAR (family firms)	Capitalization (mean 2006-2011) STAR (not family firms)
Number of employees (mean 2006-2011)	0,79	0,78	0,60	0,73	0,67	0,72
Total assets (mean 2006-2011)	0,81	0,90	0,71	0,87	0,71	0,78
Revenues (mean 2006-2011)	0,75	0,98	0,64	0,98	0,63	0,79

Source: own elaboration based on AIDA and Bloomberg database.

4.2.1. Discussion RQ2

Concluding, we can affirm that the capitalization and the size of a company are positively and strongly correlated. Consequently:

- the *size* (as a proxy of the complexity/diversification of the business) is a relevant variable, which influences the FF *economic performance* (indeed, STAR FF, which are medium size and capitalized companies, outperform than STAR NFF, while FTSE MIB FF, which are large size and capitalized companies, underperform than FTSE MIB NFF);
- the *size* of the company seems not to be a relevant variable, which influences FF *financial performance* in comparison with NFF. Indeed, FF outperform than NFF, both in FTSE MIB and in the STAR index, in all financial ratios, with the exception of the debt ratio in the FTSE index (this evidence confirms our main hypothesis about the existence of two configurations of FF and, in particular, that the FTSE MIB FF have higher debt ratio than both the FTSE MIB NFF and the STAR FF, due to the specific financial requirements related to their business);
- the *size* of the company seems to be a relevant variable, which influences FF *financial performance*. Indeed, STAR FF outperform then FTSE MIB FF, while this evidence is not true for NFF (all financial ratios of FTSE MIB NFF are better than STAR NFF, with the exception of fixed asset coverage ratio, and the specificity of the debt ratio that is equal in the two indexes).

H2 was partially confirmed.

Indeed, referring to H2 and, indirectly, to our main assumption, we can conclude affirming that there are effectively two configurations of FF, in which the size is a relevant variable in achieving performances, and they are:

- the FTSE MIB FF, which are *large-size* companies;

- the STAR FF, which are *not-large size (medium)* companies.

The not-large (medium) FF outperform in *economic results* than not-large (medium) NFF, while large FF underperform than large NFF.

The not-large (medium) FF outperform in *financial results*, both comparing not-large (medium) FF with large FF and not-large (medium) FF with not-large (medium) NFF.

Large FF outperform in all *financial ratios* than large NFF, with the exception of the debt ratio.

Our H2 is partially confirmed and, in particular:

- the presence of a family is a relevant variable in *economic results* of a company, only if the size of the firm is not-large (medium);
- the presence of a family is a relevant variable in *financial results* of a company, *independently by the size*, with the exception of the debts ratio, for which the large-size FF underperform than medium FF.

How affirmed before, performances in FF are higher when family members act in a not large company as analysing the large FF (Chu Wenyi, 2011) it is noticed that:

- the family generally is not involved in directly managing the business;
- there is normally a duality between CEO (a manager) and chairman (a member of the family);
- the firm acts as family holdings, which aims to a diversification of their traditional business to gain high return on equity (ROE), using the financial leverage.

Due to these factors the return on the core business (ROI) is lower than in the NFF in which the family is directly involved (medium size companies).

On the contrary, the medium FF are more interested in the return of the traditional core business, through the development and the innovation of products and services. In these companies, the family is usually directly involved in managing the company, with executive members in the board. This consideration is confirmed, on one side, by an higher return of the investments (ROI) of medium FF than medium NFF and, on the other side, by a lower debt ratio of medium FF than medium NFF.

For this reason, the aim of the listing for large FF seems to be a money collection to improve the diversification of the business activities, in addition to the banks financings. On the contrary, the aim of the listing for not-large FF is usually a money collection to improve the traditional business through innovation, maintaining a low debt ratio.

5. CONCLUSION, IMPLICATIONS AND LIMITATIONS

The first research question (*RQ1*) of this study was to analyze the impact on performances caused by the presence of the family in the listed Italian companies (FTSE MIB and STAR indexes), in particular comparing the economic and financial results achieved by FF and NFF in the period 2006-2011.

Referring to *RQ1*, our analysis revealed that:

- FF outperform in ROA, ROI, ROS, and in all financial ratios (liquidity, current, fixed asset coverage and debt ratios) compared with NFF, while NFF outperform only in ROE;
- FTSE MIB NFF outperform than FTSE MIB FF in all economic ratios, while FTSE MIB FF outperform in all financial ratios than FTSE MIB NFF, with the exception of the debt ratio;
- STAR FF outperform than STAR NFF in all economic and financial ratios.

Subsequently, we formulated a new research question (*RQ2*), strictly correlated to the previous one, that was to verify if the size of the companies could be considered as a relevant variable in distinguishing the FF in two main configurations, with different economic (with particular attention to ROA, ROI, ROS and ROE ratios) and financial performances (with particular attention to debt ratio), in comparison to NFF with the same size and to FF of other size.

Referring to *RQ2*, we affirmed that:

- the presence of a family is a relevant variable in *economic results* of a company, *only* if the *size* of the firm is *not-large* (medium size FF or STAR FF);
- the presence of a family is a relevant variable in *financial results* of a company, *independently* by the *size*, *with the exception of the debts ratio*, for which the large size FF (FTSE MIB FF) underperform than medium FF (STAR FF).

Concluding, we sustained that there are two main configurations of FF, and that the distinction between them is essentially based on their size, expressed in terms of i) number of employees, ii) assets quantified in the balance sheet and iii) revenues measured in the income statement, that is always positively correlated with the capitalization. Each kind of FF (large size FF and not-large size FF) has specific effects on economic and financial performances, which can be generalized:

1. if a company has a *not-large size* (STAR index), the presence of a *family* is a *relevant variable* in achieving better economic and financial performances than NFF with the same size;
2. if the company becomes a *large-size* one (FTSE MIB index), the *family* presence becomes an *irrelevant* variable both on the *economic performances*, as the NFF economic results are better than FF, and on the financial leverage (*debt ratio*), as the FF have an higher debt ratio in comparison with large NFF and with medium FF;
3. the *family* presence is a *relevant* variable, *independently by the size*, on the *financial performances*, with the exception of the financial leverage (*debt ratio*).

This study, even considering other similar articles on the FF performances issue (Chu Wenyi, 2011; Gonzalez, Guzman, Pombo, Trujillo, 2012; Villalonga and Amit 2004), contributes to the literature on FF as it shows the effects on companies' performances caused by the presence of the family in the board, in strictly correlation with the size of the company as a proxy variable of organizational complexity.

Furthermore, the concerns of this research are pertinent for FF owners and for the regulatory bodies in order to understand and manage the effects caused by the size and the governance of the company on the financial and operative structure of the firms. We believe that considering our assumptions i) family owners can formulate more conscious and rational strategic intentions and initiatives, especially regarding the diversification and the growth of the business, even considering the risks correlated with these decisions and the effects on performances and ii) regulatory bodies can support, in a more concrete manner, the listed companies in their value creation process, especially looking at the need of integration between risks and strategic planning and control.

In addition, our article contributes also to investors' decisions making process, as it elaborates significant generalizations in order to identify which are the outperforming companies on the Italian listed stock exchange market.

This research presents some limits that can be summarized as follows:

- other external and internal causes with effects on performance trends are not considered (as, for example, the presence of executive members of the family in the board; the dividends policy chosen; the innovation and development strategy adopted; etc.);
- only listed companies (FF and NFF) are considered (we did not focus our attention on unlisted companies, even if it is very important to underline that the listed companies represent a sample, in which a certain homogeneity in terms of organizational and financial features can be observed);
- the selected firms belong to different industrial sectors, and consequently economic and financial ratios could be influenced by external and internal variables typical of the sector;
- the method adopted could be integrated with some econometrical models.

Further research will have the aim of eliminating these limits, in particular analysing the behaviour of the FF (large and not-large) in the dividends policy and in the innovation strategy, taking into consideration the existence of a correlation between the dividends policy and the innovation strategy on one side with the performances on the other.

ABSTRACT

In this study the main goals are the identification of the relational constructs related with the analyses of the inter-organizational relationship quality, the contexts more used in the researches regarding the type of market, relationships, and perspectives; the main findings of the researches in this century and the new avenues to explore in futures researches. The systematic literature review allowed us to select the most relevant articles analysed considering theory, methodology, key results, context, implications and future research. We also provide a framework representing the main constructs and dimensions used to measure the relationship quality, drivers and outcomes.

Key words: relationship quality, commitment, trust, long-term relationship, interdependence, cooperation, attachment, satisfaction, systematic approach

1. INTRODUCTION

What might be unthinkable a few decades ago is now a critical need for business competitiveness. Nowadays, the market promotes a global offer which ensures the goods and/or service quality, and also requires from all players in the supplier chain a faster, efficient and differentiated response. This reality stresses the awareness for the reciprocal and symmetric interdependence of the organizations to have access to expert knowledge and resources, which allow to complement its internal competences and increase its competitive performance (e.g., Hennig-Thurau and Klee, 1997; Dyer and Singh, 1998; Wulf et al., 2001; Walter et al., 2003; Kim, 2010; Zacharia, 2011; Hammervoll, 2012). Indeed, exchange relationship management is regarded as one of the most important strategic resources that is critical for business company success (Smith, 1998; Wulf et al., 2001; Powers and Reagan,

2007; Hammervoll, 2012; Johnson, 1999). Hence, it is not a surprise that producers, distributors, retailers, customers and even competitors join forces to co-create value solutions. Establishing, and retaining appropriate exchange relationships, and developing quality relationships results in superior and distinct advantages to both partners (e.g., Gummesson, 1997; Jap et al., 1999; Johnson, 1999; Vargo and Lusch, 2004; Cannon et al., 2010; Zacharia, 2011; Hammervoll, 2012; Rauyruen and Miller, 2007; Wagner, 2010; Nyaga, 2011).

Day by day, with the business environment becoming more competitive, a dyadic perspective of buyer-seller relations, or in another point of view supplier-customer relations, is increasing, which raises the awareness that for each partner to be successful, both should be concerned in sharing forces and working together in order to improve their joint performance and add value to their offers (Cannon et al., 2010). This means that the management practices implemented for one partner should be also perceived as effective and fair for the other partner (Kumar et al., 1995; Buzzell and Ortmeier, 1995; Gruen and Shah, 2000; Wulf et al., 2001; Wagner, 2010; Cook et al., 2011; Zacharia, 2011; Arranz and Fdez de Arroyabe, 2012; Terpend and Ashenbaum, 2012).

Despite the existence of several studies that address various aspects of the relationship between two partners in a business context, for example the work of Athanasopoulou (2009), there is still a lack of an understanding of the major constructs related to relationship quality in business to business and business to consumer research. Therefore, we intend to contribute to fulfil this gap using a systematic review, where the most relevant literature about this topic was analysed. The research goals are to:

- Identify the performance outcomes considered by a strategic RQ (Relationship Quality) management;
- Identify the key constructs used to measure the relationship and their positioning as RQ drivers, RQ core constructs or RQ outcomes;
- Identify the main findings of the research in this century and the new avenues to explore in futures researches;
- Differentiate the perspectives and the contexts used more in previous studies taking into consideration: type of market, relationships, and perspectives.

The value and originality of this study are related with the development of a framework showing the main constructs used to study RQ in different contexts as mentioned below in point 2.3. In fact, previous research already tends to focus on a partial perspective. In this manner, we are contributing with a new RQ framework of the existing literature, which could help future research and also influence management decisions.

The structure of this article is as follows: After the introduction of our topic research, a background of relationship and relationship quality concepts are presented, the methodology is described and the key results of the systematic review are provided. Finally, the conclusion and new avenues for future research are proposed.

2. BACKGROUND

2.1. *Relationship concept*

What is a relationship? Clearly it is not an occasional and singular transaction (Fournier, 1989), which means a discrete transaction or a simple vehicle for the exchange of goods, services or currency (e.g., Dwyer et al 1987; Jap 1999; Hammervoll, Trond 2012). A relationship can be defined as a unique set of practices and routines that support a relation exchange among organizations (Dwyer et al., 1987; Johnson, 1999; Rauyruen and Miller, 2007; Adams, 2012). Fournier (1989) highlights that this concept is understood in the interpersonal domain, in which interdependence between people is established, for whom the relation has some meaning. A relationship is constituted by a recurrent and reciprocal exchange established between parts that know each other, and that are in a continuous learning and adaptation of each other's context. The author also refers that the relationship developed is shaped by the context reinforced by three sources of meaning: the psychological, the socio-cultural and the relational evolvement. Hence, a joint response to an event affects and is also affected by a particular context in which they are embedded (Fournier, 1989; Dyer and Singh, 1998; Hammervoll, 2012).

Relational management represents the orientation or behavioural predisposition to promote and preserve close relationships (Crosby et al. 1990; Smith, 1998), and it could be developed in five different stages of a supplier-buyer relationship: Partner selection; Defining relationship purpose; Setting relationship boundaries; Creating relationship value; Relationship maintenance. Each stage is affected by different factors that influence RQ (Powers and Reagan, 2007). This requires a higher degree of attention by the managers to ensure the success and the long-term relationship of the partnership.

2.2. *Relationship Quality Concept*

Relationship quality (RQ) has been a topic developed in several researches. In the last decades, a few definitions emerged (e.g., Crosby et al., 1990; Kumar et al., 1995; Hennig-Thurau and Klee, 1997; Smith, 1998; Johnson, 1999; Jap et al., 1999; Bejou et al., 1996;

Palmatier, 2008; Nyaga and Whipple, 2011) (see Table 1). RQ focuses on the core essence of relationship marketing (Jap, 1999) and promotes a global measure to describe and assess the nature, climate, depth, health and wellbeing of the inter-organizational relationship, between buyer-supplier.

Table 1. Relationship Quality concepts

(Crosby et al., 1990, p. 76)	RQ is "an indicator of the health and wellbeing" of relationships.
(Johnson, 1999, p. 6)	More than characterize relations that are interdependent, the RQ "describes the overall depth and climate of inter-firm relationships."
(Jap et al., 1999, p.304)	"RQ as consisting of evaluations of various aspects of relationship – attitudinal, process, and future expectations."
(Kumar et al., 1995, p. 55)	"RQ as a higher order concept, implying that a better quality relationship results in a lower level of conflict as well as greater trust, commitment, expectation of continuity, and willingness to invest.
(Bejou et al. 1996, p.137)	RQ is defined as when "the customer is able to rely on the salesperson's integrity and has confidence in the salesperson's future performance because the level of past performance has been consistently satisfactory."
(Hennig-Thurau and Klee, 1997, p. 751)	RQ "can be seen as the degree of appropriateness of a relationship to fulfil the needs of the customer associated with that relationship."
(Smith, 1998, p. 4)	RQ "is a higher-order construct comprised of a variety of positive relationship outcomes that reflect the overall strength of a relationship and the extent to which it meets the needs and expectations of the parties. "
(Palmatier, 2008, p. 77, 85)	RQ " is a higher-order, holistic view of a relational exchange composed of multiple facets." RQ "capture the overall caliber of relationship ties and their overall impact on outcomes".
(Nyaga and Whipple, 2011, p. 356)	RQ "as a higher order construct that can be used to represent the overall value of a relationship, be it collaborative or arm's length."

Despite different proposes of RQ concept, we can view some common paths which raise a higher-order construct comprising of several distinctive, although related, constructs or dimensions (e.g., Dorsch et al., 1998; Wulf et al., 2001; Walters et al., 2003; Lages et al., 2005; Rauyruen and Miller, 2007).

2.3. Contexts

The literature review reveals studies in different market contexts with distinct approaches that stress different relationship dimensions (e.g., Lages et al., 2005; Rauyruen and Miller, 2007; Athanasopoulou, 2009). The more common and studied contexts are:

- First, the company is offering goods or a service;

- Second, in the channel distribution the participant could be a producer, manufacture/supplier, distributor/resellers or retailer;
- Similarly, a company could be working directly in a market place or in an industrial environment;
- Fourthly, the firms may work in a domestic market or in the export market, with importers;
- Fifth, working in a business-to-business market (b-to-b), business-to-consumer (b-to-c), both, or in a business network;
- Sixth, the study could promote the perspective of the seller, buyer or the dyadic relationship.
- Seventh, the relation could be on an interpersonal level, with employees or on an inter-firm level, between organizations.
- Finally, the relation can be analysed in a salespeople and/or customer perspective.

2.4. Systematic Literature review of RQ concept

Our study conducted a systematic literature review regarding high ranking journals and studies carried out mainly since 2000, focusing on dimensions and constructs connected with RQ constructs established between each two organizations of the distribution channel. The systematic literature review allows us to:

1. Carry out an exhaustive analysis of the existing literature that allows a holistic understanding of RQ concept.
2. Highlight, interpret and understand the differences and similarities among the studies in terms of context, content, theories and dimensions.
3. Identify and document the key RQ dimensions and/or constructs used in management practices.

3. METHODOLOGY

3.1. Search Strategy and Specification of the search terms/topics

This study applies a systematic literature review process, using an automated search, to collect information and identify, document, and conceptualize of all key analyses in those themes. The Web of Knowledge is the electronic data base used.

Using a combination of several keywords, which had in common the word “relationship”, the selection process of relevant research articles followed these steps:

- First, after the global results promoted by the topic search results, several filters were applied which allowed us to extract article titles that were irrelevant to the study.
- Second, after analysing titles of the selected group of the literature search, some were excluded as a result of not having any relevance to the focus of this study.
- Thirdly, to ensure the best-quality evidence and credibility, articles that were not published in journals classified with a superior rating in the Journal Quality List - Anne-Wil Harzing 2013, especially regarding the WU Wien Journal Rating, were excluded.
- Fourth, by analysing the abstract of the cited articles selected in the previous stage, a new group with significant topics to this study, was selected.
- Fifth, after a global analysis of each of the articles selected in the prior stage, a more restricted group with relevant literature emerged.
- Finally, as a consequence of the cross-references studies analysed, a few relevant and less recent studies were added.

In sum, the final selected studies are directly related with RQ. The construct could be presented, or not, in the title, but certainly it is developed in the abstract or content of the article. It is paramount that its findings propose at least one dimension/construct categorized in any of the three categories of variables, as drivers, outcomes or core constructs of RQ.

3.2. Quality Selection Criteria and Data Extraction

The collection of selected articles was an impartial cross-referencing. The quality selection criteria included: validity (how accurate is the study and information presented in articles to measure what we intend to investigate); reliability (the consistency and the degree of replication of the results and the possibility to generalize); credibility (with regards to articles published in well reputed journals worldwide); integrity (which can be regarded as how robust the research is and if it adopts, or not, rigor in the selected research process) (Collis and Hussey, 2003).

Due the fact that this study intends to identify the main RQ constructs, its drivers and outcomes, most of the literature on this topic has been developed since 2000, which represents 65% of all the articles. Regarding the selection criteria, Table 2 shows the various filters used as selection criteria in the screening process in order to define the more relevant literature.

Table 2. Selection criteria for the keyword search

Criteria	Filters - Screening Process	Articles identified
Selection Criteria		
Electronic data base	Web of Knowledge.	2170
Topic	Relationship distributor retailer Relationship distributor producer Relationship supplier retailer Relationship distributor retail Relationship buyer-supplier Relationship Quality

Language	English	
Research área	Business economics Operations research management science Social sciences other topics Psychology Communication International relations Sociology	
Year	2007-2012	1402
Year	2010-2012	849
Quality and credibility assesement		
Quality Journal List	WU-Journal-Rating (Stand: 3.6.2009) – Ranking: A+ or A	42

To ensure the quality of the selection, the articles extracted and analysed were published in the best worldwide journals classified in the first two ratings (A+ or A) of one of the main rating journal WIE 2008 – WU Wien Journal Rating May 2008, in its Stand: 3.6.2009. This journal rating is included in the Journal Quality List (JQL) (Harzing 2013).

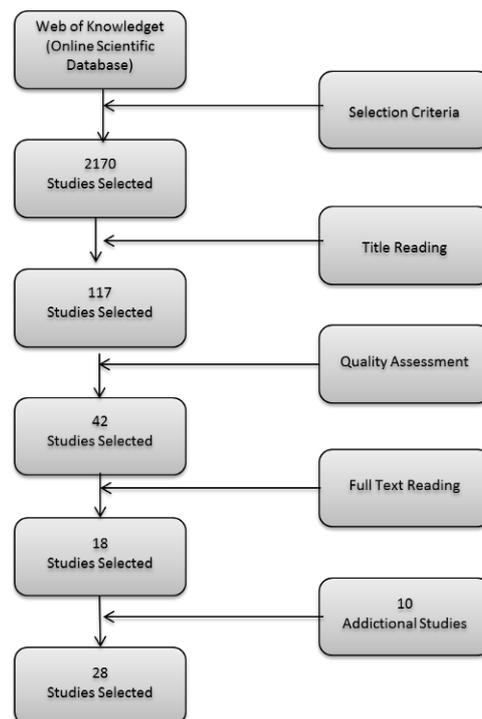

Table 3 shows the results for the keywords in the first stages of the screening process. As we can see, following the major keywords “Relationship Quality”, the second group of keywords with more results is “Relationship buyer-supplier”. This fact is related with the significant number of studies concerning the supply-chain topic. In the third place, the keywords “Relationship supplier retailer” appears in a significant number of studies, but less used in the more prestigious journals. The other keywords appear less in the main rating journals of the JQL.

Table 3. Results for the keyword search

key words	n° of refers/all dates	n° of refers 2007-2012	n° of refers 2010-2012	WU WIEN JR2009 A+	WU WIEN JR2009 A
Relationship distributor retailer	19	16	10	0	0
Relationship distributor producer	15	9	5	0	1
Relationship supplier retailer	116	75	48	3	10
Relationship distributor retail	5	4	2	0	0
Relationship buyer-supplier	488	306	180	1	17
Relationship Quality	1527	992	604	4	6
TOTAL	2170	1402	849	8	34

Despite the criteria used, the list of references in the articles selected was also checked, which allowed us to identify other studies outside the initially period of time (from 2007 until 2012). Figure 1 shows the different stages of the screening process and each result until the final group.

Figure 1. Screening Process

In this study, a developed data extraction form was used to extract the data from the selected studies and to document the data extraction process. After the last screening, a group of 46 articles emerged that were organised by its chronological development (from 1987 to 2012) for a deep examination. All the final studies selected, were analysed through a rigorous

comparison method. In order to systematize and document the data which resulted from the deconstruction of the selected articles, a data extraction form/comparative table was used (see Table 4 in appendix), which permits us to: document the selected process; reduce the possibility of human error; reduce the use of subjectively-driven selection criteria; reflect the differences and compare the similarities of the main lines of thought within the literature review; and help other researches that are interested in this field of study (Magarey, 2001; Tranfield et al., 2003; White and Schmidt, 2005; Athanasopoulou, 2009).

The extract form/comparative table is organized in several categories by the identification of the key elements produced by the study articles: authorship and journal identification; theory (based on the developed study); methodology; context of participants; key results; and future researches (see table 4 in appendix). Looking for archive consistency and reducing to the minimum the subjectivity, the results of the tables were rechecked, individually by the authors of this paper, against the selected articles.

Figure 2 shows a framework representing the main constructs used in the articles analysed as the core of relationship quality and also acting as drives and outcomes of RQ. Several constructs were analysed in different articles playing different roles in the flow drivers, the core concept and outcomes: commitment, trust, long-term orientation, cooperation, attachment and interdependence.

In a relational marketing view, the use of the partner-specific knowledge and the relational attributions are critical to forming high-quality relationships. The idiosyncrasy of this inter-organizational linkage produces mutual benefits for creating and appropriating value which sustain distinctive competitive advantages in the marketplace (e.g., Weiner, 1990; Moorman et al., 1994; Gummesson, 1997; Dyer and Singh, 1998; Jap, 1999; Johnson, 1999; Corsten and Kumar, 2005; Rauyruen and Miller, 2007; Payne et al., 2008; Bejou et al., 2008; Chatain, 2010; Wagner, 2010; Eberly et al., 2011; Zacharia, 2011; Nyaga, 2011; Hammervoll, 2012).

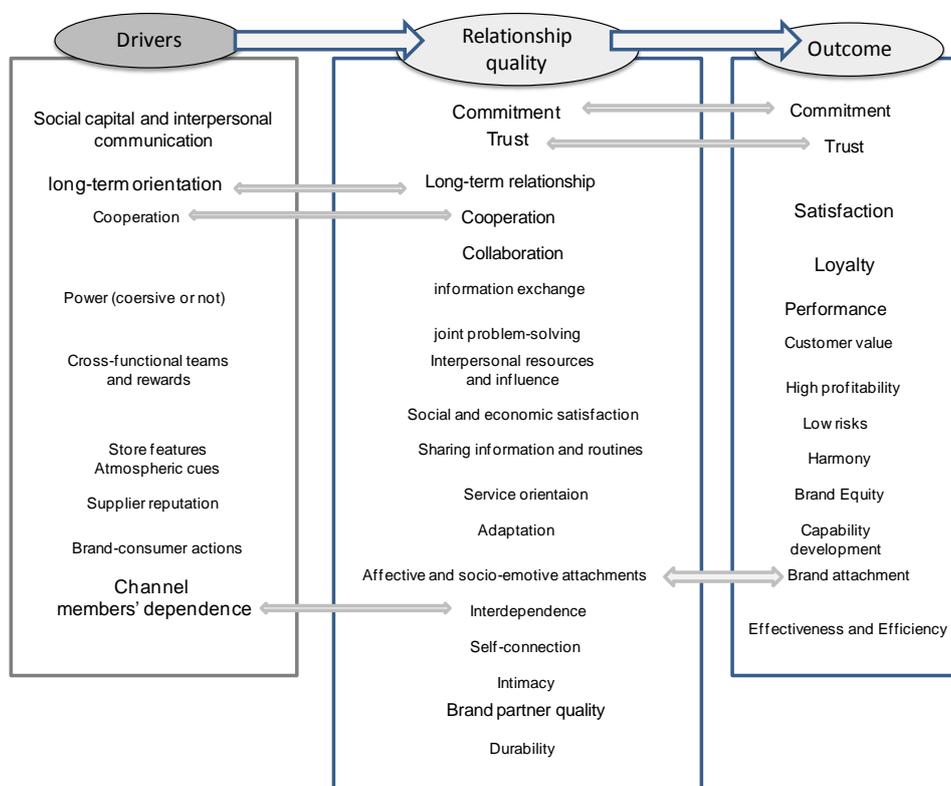

To ensure a valuable, strong and long-term relationship it is necessary to sacrifice short-term profits and bind the members to reap benefits accruing to the relation over the long run (Jap 1999; Cannon et al., 2010). Similarly, it is important that the outcomes provided by one part meets or exceeds the expectations of the other part (comparison level). Furthermore, in a global evaluation, those are considered better than alternatives offered in the market (Anderson and Narus, 1984; Hennig-Thurau and Klee, 1997; Adams, 2012)

According to Cruz and Liu (2011), the earlier the partners invest in their relationship, the more it increases the possibility to turn it more profitable. The value of a relationship transcends the economic asset (profit margins, cost reduction in production, logistic and

administrative), and also in another two fields: technical (sharing resources, reengineer process; innovation; goods inventory; reducing process cycle time) and social (reduction of risk and uncertainty, among others) (e.g., Buzzell and Ortmeyer, 1995; Cruz and Liu, 2011; Walter et al., 2003; Gummesson, 2008; Ballantyne and Varey, 2008; Zacharia, Nix and Lusch, 2011; Arranz and Fdez de Arroyabe, 2012; Mooi and Frambach, 2012; Lui and Ngo, 2012).

In conclusion, in a context where there is a paradigm change from transactional marketing to relational marketing, there is an increase in interest for the topic related with the management, development and evaluation of relationships (e.g., Gummesson, 1997; Hennig-Thurau and Klee, 1997; Wulf et al., 2001; Lages et al., 2005). The research literature raises three distinct concepts: Discrete Transactions (DT); Relationship Exchange (RE) and Relationship Quality (RQ). Yet, few present a clear distinction between the last two. DT refers to short-term exchange actions which are market drivers; RE characterizes exchange mechanisms that are close and are driven by the context of the interaction, its interdependence and norms (Dwyer and Oh, 1987; Lages et al., 2005; Ballantyne and Varey, 2008). RQ goes further and promotes a more profound overall assessment (Johnson, 1999). Based on a more recent service-dominant logic of marketing, both concepts coexist and demand collaboration practices with a new approach to developing business (Ballantyne and Varey, 2008).

Figure 2. Relationship quality framework

4. REMARKABLE CONCLUSIONS

In the present study, a thorough review of the existing literature on relationship quality drivers and outcomes has been conducted in order to identify the key constructs/dimensions to measure and analyze, used in previous research. Therefore, the main core key constructs/dimensions for RQ are: commitment, trust, long-term relationship, cooperation, collaboration, information and routine exchange, joint-problem solving, interpersonal resources and influence, social and economic satisfaction, service orientation, adaptation, attraction, interdependence, self-connection, intimacy, brand partner quality and durability.

In previous studies, we did not find a consensus concerning this topic. The dimensions and constructs depend on the context and tend to change over time. Nevertheless, the mentioned construct/dimensions seem to emerge as the most analyzed and applied.

Further research on this topic should go further in understanding the multi-relationships; how they evolve in time; how the dynamic of the process works (establishing and maintaining); how it could change depending on firm size; comparing profit and non-profit organizations; and how relationships depend on culture (county, region and organization) and leadership. In fact, most of the times the relationships are not only dyadic, instead they are triadic or in a word multiple.

A	Psychological Bulletin	Ajzen, I. and Fishbein, 1977	Social psychology	Theoretical study; Literature Review	Na	Na	A strong attitude-behaviour relationship is obtained only under high correspondence between at least the target and action elements of the attitudinal and behavioural entities.	Na	Na
A+	Journal of Marketing	Anderson, J. C and Narus, J. A, 1984.	Theory of interpersonal relations, that has come to be known as social exchange theory	Empirical study with quantitative data collect by questionnaires	Distributors of electronics components were selected as the respondent group for this study.	153 distributors	Relationships can be developed and maintained when a manufacturer provides outcomes that meet or exceed distributor expectations (CL), and that are superior to those available from alterative suppliers (CLait); Manufacturers can also improve benefits received by distributors through fostering meaningful communication with distributors ; When the outcomes from a given working relationship meet or surpass expectations, better distributor cooperation and satisfaction (from the distributor's perspective) results.	This research suggests that manufacturers need to consider in their strategy a channel positioning, that is, their offering with respect to the perceptions and needs of distributors. A basic delineation of study and research between industrial product and consumer product channels of distribution, and a basic delineation among the types of channel working relationships.	b-to-b Distributor- Manufacturer, from distributor/buyer perceptive Industrial context
A+	Journal of Marketing	Anderson, J.C. and J.A. Narus, 1990	Social exchange theory Inter-organizational exchange behavior	Empirical study with quantitative data collect by questionnaires	Manufacturer and distributor firm and manufacturer managers.	249 distributor firms and 213 manufacturer firms.	Relative dependence is found to be a significant antecedent of influence in the working partnership; The important consideration of the two social exchange constructs, which can be expressed managerially as out-comes compared with expectations and outcomes compared with	Longitudinal research could be directed at sets of "core" constructs, making possible better inferences about both their development over time and their causal sequence.	b-to-b Buyer and supplier/manufac turer perspective Industrial context

							alternatives.		
A+	Journal of Marketing	Crosby, L.A., Evans, K.R. and Cowles, D., 1990	Interpersonal relationship theory or relational theory	Empirical study with quantitative data collect by questionnaires	U.S. households between the ages of 25 and 44, who owned one or more whole life policies, and who were the household's primary insurance decider.	151 households	Sales opportunities depend mostly on relationship quality; Relational selling behaviours, and intensive follow-up contact generally produce a strong buyer-seller bond.	How does the seller's perception of relationship quality with the customer influence the nature of the dyad and relationship development? How is the domain of behavioural expectations pertaining to relationship quality established by dyadic participants?	b-to-c Salespeople in service contexts
A	Journal of Marketing Research	Kumar, N., Scheer, L.K. and Steenkamp, J.E., 1995	Interpersonal relationship perspective/theory or relational theory	Empirical study with quantitative data collect by questionnaires	Auto- mobile dealers in two countries— United States and Netherlands.	US; 417auto- mobile dealers Netherlands; 289 auto- mobile dealers	The authors find strong evidence that vulnerable resellers' perceptions of both distributive and procedural fairness enhance their relationship quality, although these effects are moderated by the level of outcomes and environmental uncertainty. Furthermore, procedural fairness has relatively stronger effects on relationship quality than distributive fairness	Explore whether channel partners base distributive fairness evaluations on equity, equality, or some other non(s); Examine when channel partners' fairness perceptions differ, under what circumstances criteria for the assessment of procedural and distributive fairness are shared by the channel partners, and whether such unanimity of perspectives is possible or important.	b-to-b Reseller's/buyer perspective Cross-cultural equivalence between countries: USA and Netherlands

QL J	Journal Brand	Author	Theory	Methodology adopted	Population features	Sample Size	Contribution - Key results	Implications for further research	Context
A+	Journal of consumer research	Fournier, Susan, 1998	Interpersonal theory Brand Personality Theory	Empirical study with qualitative interviews	Women consumer brands	3consumers	The present analysis suggests an alternative to the construct of brand loyalty in the notion of brand relationship quality. Brand relationship quality is similar in spirit to brand loyalty: both constructs attempt to capture the strength of the connection formed between the consumer and the brand toward a prediction of relationship stability over time.	Research dedicated to an exposition of the alternate relationship forms uncovered here, particularly in terms of the rules and expectations implied in their contracts, and the dynamic processes through which these are managed over time, would advance theory along needed lines; A related question concerns the actuality of the brand relationship: that is, to what degree is the relationship manifest in concrete encounters between partners known personally to each other.	b-to-c Consumer-brand context Brand relationship quality construct Consumer/buyer perspective
A	Psychology and Marketing	Smith, J.B., 1998	Social exchange theory	Empirical study with quantitative data collect by questionnaires	Members of the Purchasing Management Association of Canada	185 male and 181 female purchasing managers	The study was successful in demonstrating that similarity, particularly in terms of work attitudes, sex, and life stage play some role in facilitating relationship management behaviours and thus, indirectly, the quality of buyer-seller relationships.	Future research might fruitfully identify which work attitudes need to be shared to promote particular relationship management activities; Examine potential differences in male-male, male-female, female-male, and female-female buyer-seller relationships.	b-to-b Relationships between purchasing professionals and sales representatives. Buyer perspective
A	Journal of Business Research	Jap, S.D., Manolis, C. Weitz, B.A. 1999	Relationship Marketing	Empirical study with qualitative analysis	Retail buyers	7 buyer-seller interactions (meetings) involving the 4 key buyer-informants were observed and audio-taped.	The results suggest that relatively higher-quality relationships tend to exhibit more friendliness, less question asking, disagreement, and compliance behaviour as compared with lower-quality relationships	Examining the dynamic ordering or timing of some of the behavioural variables examined herein; Identifying various moderating and mediating variables in the communication/interaction process. ; Verify some of the extant conceptualizations of buyer-	b-to-b Buyers and sellers involved Retail buyer perspective Retailing context

								seller interactions empirically	
A+	Journal of marketing	Homburg, C; Hoyer, WD; Fassnacht, M, 2002	Contingency theory	Empirical study with quantitative data collect by questionnaires	Clothing and furniture retailers in both the United States and Germany	411 retailers Of these, 245 were from Germany, and 166 were from the USA.	In terms of managerial implications, our results support the view that a service-oriented business strategy has a positive impact on performance in the market and profitability.	Whether a service-oriented business strategy increases the service orientation of individual employees. In addition, the authors conceptualization of a service-oriented business strategy can be applied to other strategic orientations, such as the innovation orientation of a business strategy.	b-to-b Retail channel perspective Service context
A+	Journal of marketing	Corsten, D; Kumar, N, 2005	Relational Marketing theory Efficient consumer response (ECR)	Empirical study with quantitative data collect by questionnaires	Suppliers of major retailers	226 key accounts from a retailer suppliers.	Suppliers achieve greater economic performance and develop their capabilities in collaborative ECR relationships. Suppliers should be realistic about the sharing of benefits from ECR adoption if they want to avoid negative feelings associated with inequity.	Examine the retailer's perceptions of ECR adoption and the outcomes from ECR; This scale requires subsequent replication and refinement; The role of antecedents, focal construct, and moderating variables (trust and retailer capabilities) and their impact on outcomes would benefit from more stringent longitudinal studies.	b-to-b Supplier-retailer relationship perspective ERC

QL J	Journal Brand	Author	Theory	Methodology adopted	Population features	Sample Size	Contribution - Key results	Implications for further research	Context
A	Journal of management information systems	Son, JY; Narasimhan, S; Riggins, FJ, 2005	Social exchange Transaction cost theories	Empirical study with quantitative data collect by questionnaires	Suppliers with electronic linkages via EDI with a USA recognized retailer of home improvement supplies and materials	233 suppliers	Suppliers' cooperation with the customer, which is influenced by perceived uncertainty, trust, and transaction-specific investments, is found to have strong effects on EDI volume and diversity. Finally, the reciprocal investments are found to be an even more effective strategy when suppliers desire to keep a more cooperative relationship with the customer.	Seek to understand the underlying dynamics of a firm's participation in emerging forms of multilateral IOS (inter-organizational systems) networks such as Internet-based B2B markets. Develop a better understanding of firms' motivation for participating in the new forms of IOS networks and the strategic benefits of joining those networks. Replicate this study in other channel contexts or non-U.S. contexts	b-to-b Customer-Supplier Relationship Electronic trading perspective
A	Journal Business Research	Lages C, Lages CR, Lages LF., 2005	Relationship Marketing	Empirical study with quantitative data collect by questionnaires A scale development was adopted. The scale resulted from a combination of exploratory qualitative in-depth interviews, a review of the export marketing literature and survey pre-tests.	British exporting firms	111 firms	A better quality of the relationship results in a greater (1) amount of information sharing, (2) communication quality, (3) long-term orientation, as well as (4) satisfaction with the relationship. Relationship quality is positively and significantly associated with export performance.	Test the RELQUAL scale in other international settings to assess its stability across different samples and contexts. It is worth studying other types of relationship as a franchiser-franchisee. Develop a performance scale for the other side of the dyad—the importer.	b-to-b Relationship between the exporter and importer Supplier/seller perspective

QL J	Journal Brand	Author	Theory	Methodology adopted	Population features	Sample Size	Contribution - Key results	Implications for further research	Context
A	Journal of retailing	Ramaseshan, B; Yip, LSC; Pae, JH, 2006	Resource-based theory	Qualitative data and survey instrument	Department stores' relationship with their tenants	A random sample of 295 sub-tenants was drawn	The established power-satisfaction-commitment-performance framework is applicable to China, provided the firms exercise power with caution by taking into consideration of the collectivistic cultural context.	Test the external validity of the current study by replicating it in similar settings; Test the model in horizontal channel settings in the context of symmetrical store-tenant relationships, as cosmetic and store brands that are very strong and more equal in power.	b-to-b Department stores' relationship with their tenants; China's distributional channel context
A	Journal of retailing	Chung, Jae-Eun; Sternquist, Brenda; Chen, Zhengyi, 2006	Relation Marketing Theory	Qualitative data and survey instrument	Department store managers who have a title of Shiire (buying) or Shokin (merchandise)	250 department store managers who have a title of Shiire (buying) or Shokin (merchandise)	This study implies that Japanese retailers are expected to look out for the best interests of their partners, rather than continuously seek new partners, and, further, partners learn to negotiate differences rather than seek dissolution of the relationship.	Help to understand the next generation of strategic partnerships being formed in Western cultures.	b-to-b Japanese retailer-supplier relationships reflect the Japanese cultural trend
A	Journal of Business Research	Rauyruen, P. and Miller, K.E., 2007	Relationship Marketing	Empirical study with quantitative data collect by questionnaires	Australian Small to Medium Enterprises (SMEs).	306 buyers	Results show that all four dimensions of relationship quality influence attitudinal loyalty, however, only satisfaction and perceived service quality influence behavioural loyalty (purchase intentions). Most remarkably, results indicate that only the organizational level of relationship quality influences customer loyalty.	Future research design should consider including details of the customer contact point to clarify the nature of the relationship, for example, whether business customers have constant contact with account managers, sales persons, or even call-centre staff.	b-to-b Buyer-Supplier (employees/organization) Buyer perspective Service context.

QL J	Journal Brand	Author	Theory	Methodology adopted	Population features	Sample Size	Contribution - Key results	Implications for further research	Context
A	Journal of Business Research	Thomas Powers, William Reagan, 2007	L. Relationship Marketing	Empirical study with quantitative data collect by questionnaires	Purchasing managers within the United States	300 company buyers.	There was a significant difference in the importance of the factors across stages for the majority of the relationship factors investigated; Of the relationship factors that were found to have a significant difference across relationship stages: mutual goals, adaptation, trust, performance satisfaction, cooperation, commitment, and structural bonds	Examining suppliers evaluating buyers; Link the factors that influence buyer-seller relationships to a broader construct such as relationship quality as well as relationship dissolution; Various buying contexts; Factors that might contribute to restoring those relationships.	b-to-b Supplier/buyer relationship Buyer perspective Industrial context
A	Journal of international business studies	Su, Chenting; Yang, Zhilin; Zhuang, Guijun; et al. 2009	Embeddedness theory	Qualitative data and survey instrument	Suppliers and retailers of Chinese channel	395 matched supplier-retailer dyads	Interpersonal influence is an alternative channel communication mode. Managing channel relationships in emerging markets requires consideration of the intricacy of the economic and socio-cultural environments.	Replicate the findings of this study in other relationship-oriented cultures or countries; Additional research therefore should develop a dyadic model, calibrated on dyadic measures, to examine channel dyads' communication behaviours.	b-to-b Chinese marketing channel Supplier-retailer dyads perspective

QL J	Journal Brand	Author	Theory	Methodology adopted	Population features	Sample Size	Contribution - Key results	Implications for further research	Context
- add	European Journal of Marketing	Athanasopoulou, Pinelopi, 2009	Relationship Quality	Theoretical study; Literature Review	N.a.	N.a.	The framework provides firms with a guide to the factors that may affect the quality of their relationships with customers and helps them in developing effective relationship marketing strategies.	Focus future research more on services (both professional and retail) and on retail relationships (both in goods and services); It is a need for more multi-country studies in order to test whether cultural and other environmental or exogenous factors affect RQ; The nature of online relationships needs further studying; It is need more qualitative studies (case studies, interviews etc); Use this framework in the development of appropriate scales for future RQ related studies.	b-to-b
A+	Strategic management journal	Chatain, Olivier, 2010	RBV - resource-based view of the firm	Empirical study with qualitative data collect by observations	United Kingdom legal market using data on client-law firm relationships and law firm profitability for the period 2002–2005.	128 lawyer firms.	Added value, measured at the level of each buyer-supplier relationship, is a driver of relationship stability and supplier profitability. This suggests that suppliers with similar capabilities might enjoy different economic returns depending on the composition of their set of relevant competitors.	Further work could explicitly account for the endogeneity of the matching between buyers and suppliers.	b-to-b Buyer-supplier law services Service context

ABSTRACT

Application of technology in various service sectors is providing convenience in product delivery, access, increased productivity and performance. Public sector banks in India have implemented Internet banking so that their customers can avail retail banking services anytime and anywhere. However, it is also necessary for the service providers to know what customers perceive about their services. In this research paper a scale has been developed to measure perceived service of Internet banking. Further it has been judged whether perceived service is affecting customer satisfaction. Data from 499 customers of 5 leading public sector banks have been collected and analysed. Privacy has been found to be the most important factor in determining how customers will perceive the Internet banking service. Customers have shown a high preference for timely availability of the banking website also. Interestingly, customer satisfaction has been found to be affected by perceived services positively and significantly. The study identifies the areas where banking service providers should focus on to have more satisfied customers and to attract more customers towards Internet banking.

Keywords : *perceived service, customer satisfaction, Internet banking*

INTRODUCTION

Constructive uses of new technologies have always contributed positively towards improving standards of human life and the economy of a country. In today's business environment, organizations are well aware that to be competitive, they need to be highly responsive to the growing expectations of their customers. The proliferation and rapid advances in technology-based systems, especially those related to the Internet, are leading to fundamental changes in

how companies interact with customers (Ibrahim et al, 2006; Bauer et al., 2005; Parasuraman and Zinkhan, 2002). Application of technology is providing convenience in product delivery, access, increased productivity and performance. It is being used as the most powerful tool to augment the operational performance in terms of timeliness, accuracy, ease of operation etc. Technology, in particular, has been increasingly employed in service organizations to enhance customer service quality and delivery, reduce costs, and standardize core service offerings (Ibrahim et al, 2006; Lee and Lin, 2005; Bauer et al, 2005; Gounaris et al, 2005). Customers are frequently on move nowadays and expect a certain level of quality of service regardless of where and how they accessing the service. Many companies in the financial services sector have been quick to implement Internet capabilities, and electronic service is becoming a viable option for interaction between financial service providers and their customers (Rotchanakitumnuai, S and Speece, M 2003).

The challenging business process in the financial services forced the banks to introduce alternate delivery channel to attract customers and improve customers' perception and thereby customer satisfaction. Banks implemented Internet banking to offer their customers a variety of online services with more convenience for accessing information and making transactions. Customer satisfaction and customer retention are increasingly developing into key success factors in e-banking (Bauer et al, 2005).

Satisfaction is a person's feelings of pleasure or disappointment resulting from comparing a product's perceived performance (or outcome) in relation to his or her expectations (Kotler 2000). The proposition of Kotler (2000) is similar to Gronroos's (1982, 1984) conceptualization of service quality that 'puts the perceived service against the expected service'. In addition to the mediated impact of perceived performance via a comparison process, a number of studies have shown a strong direct link from perceived performance to satisfaction (Anderson & Sullivan, 1993; Oliver, 1993, 1994; Patterson, 1993).

This article, proposes to develop a scale to measure perceived service of Internet banking and to find the relationship between perceived service and customer satisfaction.

LITERATURE REVIEW

While defining Internet banking De Young (2001) states with the exception of cash withdrawals, Internet banking gives customers access to almost any type of banking transaction at the click of a mouse. Pikkarainen, Pikkarainen, Karjaluoto, and Pahnla (2004) defines Internet banking as an 'Internet portal, through which customers can use different kinds of banking services ranging from bill payment to making investments'. The use of the

Internet as a new alternative channel for the distribution of financial services has become a competitive necessity instead of just a way to achieve competitive advantage with the advent of globalization and fiercer competition (Flavián, Torres, & Guinalú, 2004; Gan, Clemes, Limsombunchai, & Weng, 2006). All banks using the Internet as an additional channel or a bank using only the Internet as delivery channel are now on equal footing to offer their banking services on the Internet and to compete for customers around the world. As Karjaluoto, Mattila, and Pento (2002) put it 'this could be the reason why the Internet is widely seen as the most important delivery channel in the era'.

Various research works have been carried out on electronic service (e-service) quality and customer satisfaction. Some researches relating e-service quality and customer satisfaction can also be found in Indian context.

Garvin (1987) introduced "aesthetics" as a quality dimension that addresses the consumer's subjective evaluation of how a product looks, feels, sounds, tastes or smells.

Zeithaml, Parasuraman, and Malhotra (2000) analysed web site features at the perceptual attribute level and categorized them into 11 e-SQ dimensions :

Reliability: Correct technical functioning of the site and the accuracy of service promises (having items in stock, delivering what is ordered, delivering when promised), billing, and product information.

Responsiveness: Quick response and the ability to get help if there is a problem or question.

Access: Ability to get on the site quickly and to reach the company when needed.

Flexibility: Choice of ways to pay, ship, buy, search for, and return items.

Ease of navigation: Site contains functions that help customers find what they need without difficulty, has good search functionality, and allows the customer to maneuver easily and quickly back and forth through the pages.

Efficiency: Site is simple to use, structured properly, and requires a minimum of information to be input by the customer.

Assurance/trust: Confidence the customer feels in dealing with the site and is due to the reputation of the site and the products or services it sells, as well as clear and truthful information presented.

Security/privacy: Degree to which the customer believes the site is safe from intrusion and personal information is protected.

Price knowledge: Extent to which the customer can determine shipping price, total price, and comparative prices during the shopping process.

Site aesthetics: Appearance of the site.

Customization/personalization: How much and how easily the site can be tailored to individual customers' preferences, histories, and ways of shopping

Loiacono, Watson, and Goodhue (2000) created WebQual, a scale for rating web sites on 12 dimensions: informational fit to task, interaction, trust, response time, design, intuitiveness, visual appeal, innovativeness, flow-emotional appeal, integrated communication, business processes, and substitutability. However, this scale's primary purpose is to generate information for Web site designers rather than to measure service quality as experienced by customers.

Using an online survey, Szymanski and Hise (2000) studied the role that customer perceptions of online convenience, merchandising (product offerings and product information), site design, and financial security play in e-satisfaction assessments. This study did not include aspects of customer service or fulfillment; rather, it dealt only with aspects of the web site. Furthermore, it measured satisfaction rather than service quality.

Yoo and Donthu (2001) developed a nine-item SITEQUAL scale for measuring site quality on four dimensions: ease of use, aesthetic design, processing speed, and security. As in the case of Barnes and Vidgen's (2002) WebQual scale, data for developing and testing SITEQUAL were gathered from convenience samples. Specifically, students enrolled in marketing classes were asked to visit and interact with three Internet shopping sites of their own choice and then evaluate each site. Like WebQual, SITEQUAL does not capture all aspects of the purchasing process and therefore does not constitute a comprehensive assessment of a site's service quality.

Wang and Huarng (2002) identified nine service quality factors that affect e-satisfaction through content analysis of online customer comments in their research. The identified factors are : (i) website design, (ii) competitive price of the product, (iii) merchandise availability, (iv) merchandise condition, (v) on-time delivery, (vi) merchandise return policy, (vii) customer support, (viii) e-mail confirmation on customer order and (ix) promotion activities. On the basis of these nine factors.

Wang (2003) assessed e-service quality via e-satisfaction in e-commerce globalization. The conclusion reached was e-service quality and e-satisfaction are the critical components in globalization of e-commerce. The study based on certain e-tailors of United States revealed a relatively low level of e-service quality.

Barnes and Vidgen (2002) developed a completely different scale to measure an organization's e-commerce offering, which they also call WebQual. This scale provides an index of a site's quality (customer perceptions weighted by importance) and has five factors:

usability, design, information, trust, and empathy. The scale is designed to be answered without a respondent needing to complete the purchasing process and is therefore a transaction-specific assessment of a site rather than a comprehensive evaluation of the service quality of a site.

Wolfenbarger and Gilly (2003) used online and offline focus groups, a sorting task, and an online-customer-panel survey to develop a 14-item scale called eTailQ. The scale contains four factors: Web site design (involving some attributes associated with design as well as an item dealing with personalization and another dealing with product selection), reliability/fulfillment (involving accurate representation of the product, on-time delivery, and accurate orders), privacy/security (feeling safe and trusting of the site), and customer service (combining interest in solving problems, willingness of personnel to help, and prompt answers to inquiries). Although two of their dimensions—security/privacy and reliability/fulfillment—show strong face validity and are highly descriptive of the items they represent, the other two dimensions appear less internally consistent and distinct. Web site design, for example, embraces aspects of in-depth information, level of personalization, selection, and speed of completing transactions. The factor called customer service contains items relating to the company's willingness to respond to customer needs, the company's interest in solving problems, and the promptness with which inquiries are answered. These dimensions, as well as other items that might be relevant to customer assessment of service quality on Web sites, need to be tested further.

On the basis of a comprehensive review and synthesis of the extant literature on e-SQ, in 2002 Zeithaml, Parasuraman, and Malhotra detailed five broad sets of criteria as relevant to e-SQ perceptions: (a) information availability and content, (b) ease of use or usability, (c) privacy/security, (d) graphic style, and (e) reliability/fulfillment. Availability and depth of information appear to be important because when users can control the content, order, and duration of product-relevant information, their ability to integrate, remember, and thereby use information improves (Ariely 2000). Ease of use appears relevant because Internet-based transactions are complex and intimidating to many customers. Privacy (the protection of personal information) and security (the protection of users from the risk of fraud and financial loss) have been shown empirically to have a strong impact on attitude toward use of online financial services (e.g., Montoya-Weiss et al. 2003). Graphic style—which embodies such issues as color, layout, print size and type, number of photographs and graphics, and animation—has also been shown to affect customer perceptions of online shopping (Hoffman and Novak 1996; Hoque and Lohse 1999; Schlosser and Kanfer 1999). Finally,

reliability/fulfillment has been cited as an important facet of e-SQ (Palmer, Bailey, and Faraj 1999; Wolfinbarger and Gilly 2003). In fact, Wolfinbarger and Gilly (2003) found that reliability/ fulfillment ratings were the strongest predictor of customer satisfaction and quality, and the second strongest predictor of intentions to repurchase at a site.

Based on the explorative study by Zeithaml et al. (2002), Parasuraman et al. (2005) provide the most comprehensive work on e-service quality. They empirically test a multiple item scale (E-S-QUAL) for assessing service quality of online shopping providers. Their findings correspond to the insights of their explorative study: two different scales are necessary to measure electronic service quality. The E-S-QUAL scale addresses core service quality aspects and consists of four quality dimensions (efficiency, fulfillment, system availability and privacy). Additionally, the E-RecS-QUAL scale is proposed to be relevant when customers face "nonroutine encounters" during the online-shopping process which are related to service recovery like product returns, dealing with problems, etc. (Parasuraman et al., 2005). This latter scale is composed of three quality dimensions (responsiveness, compensation and contact).

The literatures on e-service quality and customer satisfaction suggest : a) service quality and satisfaction has different construct though they are highly related concept. b) Researches regarding service quality and satisfaction constructs specific to Internet banking only is scares while many researches can be found in the domain of online retailing, general e-service etc. and c) Service quality determines customer satisfaction.

Depending on the findings of literature review and as per the objectives of the research two different constructs has been built : perceived service and customer satisfaction. To represent the full range of evaluative criteria of Internet banking service quality 9 dimensions have been identified which are "system availability", "site aesthetics", "ease of use", "technical performance", "reliability", "privacy", "trust ", "responsiveness" and "customization".

METHODOLOGY

Selection of the Banks

Almost all of the public sector banks in India have launched their Internet banking services, but very few of them have been able to attract customers towards this comparatively new banking channel. To get a more accurate idea about the prevailing service practices of Internet banking, the Indian public sector banks which have a high volume and value of RTGS and

NEFT transactions were chosen for this study. Five such selected PSBs are - State Bank of India, Punjab National Bank, Bank of Baroda, Union Bank of India and Bank of India. Selection of the banks has been done on the data provided in the official website of Reserve Bank of India (www.rbi.org.in).

Questionnaire

Items representing various facets of the 9 service dimensions were selected on the basis of the literature review. It resulted in the generation of 39 items approximately 4 items per dimension. Each item was recast into question to measure perceived service.

A questionnaire was designed for the Internet banking users to understand their perception level. The questionnaire had three sections : Section A : about the specific bank's performance on Internet bank services, Section B : about respondent's satisfaction by availing services offered by Internet banking, Section C : background of the respondent. As per the requirement of the study and to avoid ambiguity in analysis all the questions were framed positively. A five-point scale ranging from "Strongly Agree" (5) to "Strongly Disagree" (1), were used.

To have equality in measurement scale each customer rated the overall satisfaction of the corresponding bank on a 5-point Likert scale. The satisfaction construct was made up of 4 variables which measure the overall satisfaction of the customers of Internet banking. The associated questions were : Your overall satisfaction level with your bank's Internet banking services, Your overall satisfaction level with informational part of your bank's Internet banking services, Your overall satisfaction level with transactional part of your bank's Internet banking services, After using of the Internet banking your satisfaction has improved very much.

ANALYSIS AND FINDINGS

Test running of the questionnaire and generation of scale items

Data for initial 39-item instrument were gathered from a sample of 100 respondents in the city of Jaipur. The sample was judicially divided among male and female and included people of different age group, education level, income level and service categories. Screened and qualified respondents self-administered the questionnaire consisting of a 39 statements. This stage focused on: (1) fixing the instrument by retaining only those questions capable of discriminating well across respondents having differing quality perceptions about the bank in

several categories, and (2) examining the dimensionality of the scale by establishing the reliabilities of its components.

A reliability analysis was conducted by grouping the items according to the 9 a priori conceptual dimensions from which they were derived. Item total correlation for each of the parameter in each of these nine predetermined dimensions found to be quite high. Therefore after pilot survey no refinement in the scale was required. The values of coefficient alpha ranged from 0.837 to 0.961 across the 9 dimensions and there were no suggestion that deletion of certain items from each dimension would improve the alpha values. So, no items were deleted.

Table 1: Reliability coefficients for the Indian PSBs' Internet perceived service dimensions (in the pilot survey with 100 respondents)

Dimensions	No of items	P

The factor loading matrix for the expectation items in table 2 suggests a nine factor structure with loadings equally distributed on all 9 identified factors. Also for each of the factors the variables has the highest loading on that single factor only. The minimum loading found is .680.

FINAL SURVEY AND SCALE VALIDATION WITH NEW DATA

It was decided that the study will be carried out in four major metro cities of India as these places reflect a composite nature of population. This was done following the concept of quota sampling method. To decide the sample to be taken for each of the five pre-selected public sector banks and within four metro cities, number of ATM outlets of the banks in four metro cities has been collected. The assumption was ATM users are the prospective user of Internet banking as for Internet banking the customer should hold an ATM card of the respective bank. Percentage has been worked out to find out the ranking of the banks in terms of no. of ATM outlets in these five banks and four cities. The banks were not willing to share the list of Internet banking users due to security reason therefore this method was applied to select the customers. A total of 499 questionnaires were used for the final analysis.

The data was subjected to 2nd order confirmatory factor analysis using AMOS 19 to test the model fit and unidimensionality of scale items.

Item reliability

33 items whose R^2 values were equal or above 0.450 with were retained and 6 which were below this level were deleted. The model was run again for re-estimation and the final values are shown in table 3.

Table 3 : Standard regression weights of the P scores after removal of 6 identified items

	Item	Regression weights	R square value (item reliability)

31	PCS1	0.682	0.465
32	PCS2	0.683	0.466
33	PCS4	0.709	0.503

Convergent validity

To analyse the convergent validity the factor loadings and the average variance extracted were examined. Most of the indicators have loading from 0.6 to 0.9 which is in line with Bagozzi and Yi (1988). With this the average variance extracted was more than 0.5 (except one case) which is acceptable.

In this research the average variance explained by each construct of perceived service has been shown in table 4

Table 4 : Average variance extracted and composite reliability of perceived service construct

Assessing the model fit

The measurement model for perceived service confirms an acceptable model fit of data with chi-square=718.031, and degree of freedom = 486, CMIN/DF = 1.477 ; GFI (Goodness of fit)=0.919, AGFI (Average Goodness of fit)=0.907, CFI (Comparative Fit Index)= 0.968; NFI(Normed Fit Index)=0.908; RFI(Relative Fit Index)=0.901; TLI(Tucker-Lewis Index)=0.966; RMSEA(root mean square error of approximation)= 0.031 which shows unidimensionality of the factors.

Discriminant validity

Table 5 shows the AVE exceeds the squared correlations with the all the factors of perceived service thereby assuring discriminant validity of the nine constructs of perceived service.

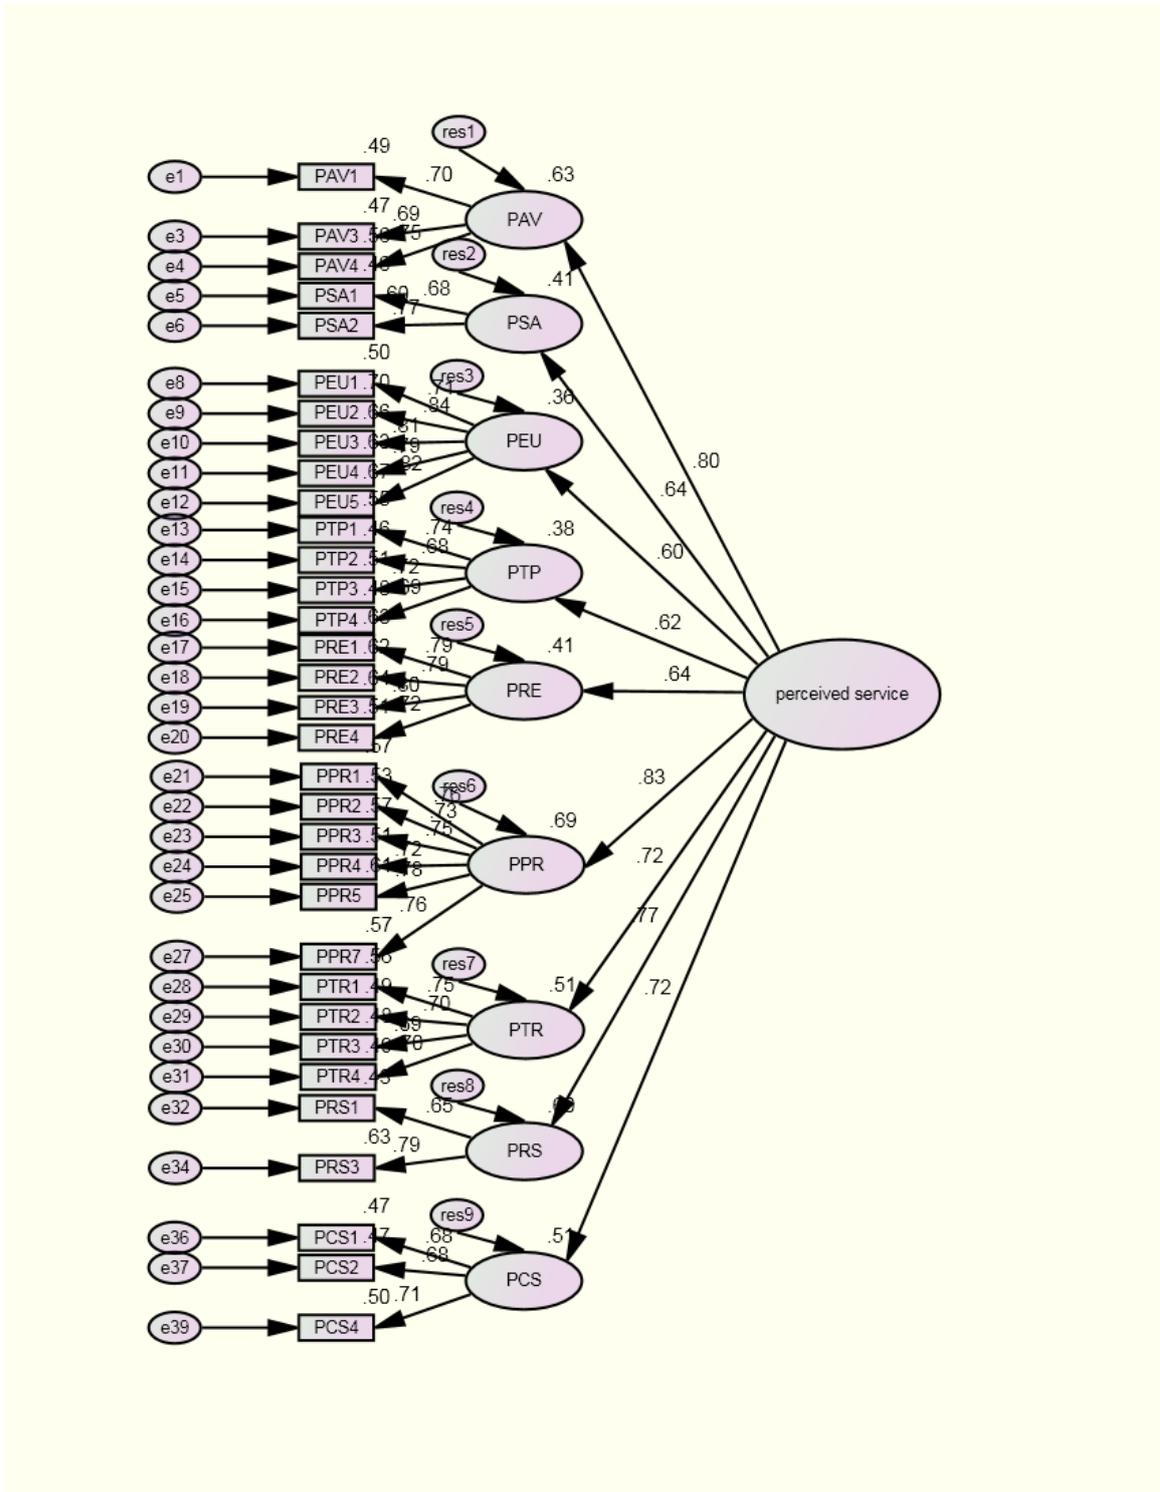

Figure 1: Perceived service construct

Customer satisfaction construct

In the satisfaction construct there are four items measuring the overall satisfaction level of the customers of Internet banking in a 9-point Likert scale. The satisfaction data was subjected to 1st order confirmatory factor analysis to test the model fit and unidimensionality of satisfaction scale item.

To check the individual item reliability within the satisfaction construct again R^2 values have been checked. The values of R^2 for the items measuring the satisfaction of the customers of Internet banking is shown in the table 13.

Table 6 : Standard regression weights of the satisfaction items

Item	Regression weights	R square value (item reliability)
SAT1	0.738	0.545
SAT2	0.800	0.640
SAT3	0.733	0.537
SAT4	0.699	0.489

In this construct the indicators have loading greater than 0.7 which is again in line with Bagozzi and Yi (1988). With this the average variance extracted is more than 0.5 (0.578) which is acceptable.

The measurement model for satisfaction confirms an acceptable model fit of data with chi-square=3.21 , and degree of freedom = 2, CMIN/DF = 1.609; GFI (Goodness of fit)=0.997, AGFI (Average Goodness of fit)=0.984 , CFI (Comparative Fit Index)= 0.998; NFI(Normed Fit Index)=0.996 ; RFI(Relative Fit Index)=0.987 ; TLI(Tucker-Lewis Index)=0.995 ; RMSEA(root mean square error of approximation)= 0.035

The model

A structural equation modeling technique was used to find the relationship between perceived service and satisfaction. The AMOS 19 program was employed for this purpose. It was found that perceived service of Internet banking has a direct impact on the customer satisfaction.

7 fit indexes which are commonly used in the literature ($\chi^2/d.f$, GFI, AGFI, NNFI, CFI, RMSR, RMSEA) were employed to test model fit. As the values in Table 7 reveal, the fit indexes of

the model are included in the values which are acknowledged in the literature.

Table 7 : Summary statistics of model fit

Fit indexes	Recommended Value	Observed Value
Chi-square/ degrees of freedom	≤ 3.0	1.430
GFI (Goodness of fit)	≥ 0.90	.912
AGFI (Average Goodness of fit)	≥ 0.80	.900
RMR (root mean square residual)	≤ 0.05	.018
CFI (Comparative Fit Index)	≥ 0.90	.967
NFI(Normed Fit Index)	≥ 0.90	.900
RFI(Relative Fit Index)	Close to 0.90	.892
TLI(Tucker-Lewis Index)	Close to 0.90	.965
RMSEA(root mean square error of approximation)	≤ 0.05	.029

Figure 2 shows the standardized path coefficients with their respective significance level.

Figure 2 illustrates the significant structural relationships among the study variables. The direct path Perceived service \rightarrow SAT is significant since the regression coefficient (β) is 0.544 with $p < 0.001$. The construct perceived service is composed of 9 latent factors "availability", "site aesthetics", "ease of use", "technical performance", "reliability", "privacy", "trust", "responsiveness" and "customization" which has standardized regression weight 0.790, 0.642, 0.616, 0.610, 0.650, 0.824, 0.707, 0.772 and 0.717 respectively and all with $p < 0.001$. It was observed that within the construct perceived service also all the components were contributing significantly.

The standardized regression weights of all the individual components within each of these nine components of perceived service are shown in table 8.

The results showed that perceived service of Internet banking which consists of 9 individual dimensions is affecting customer satisfaction positively and significantly.

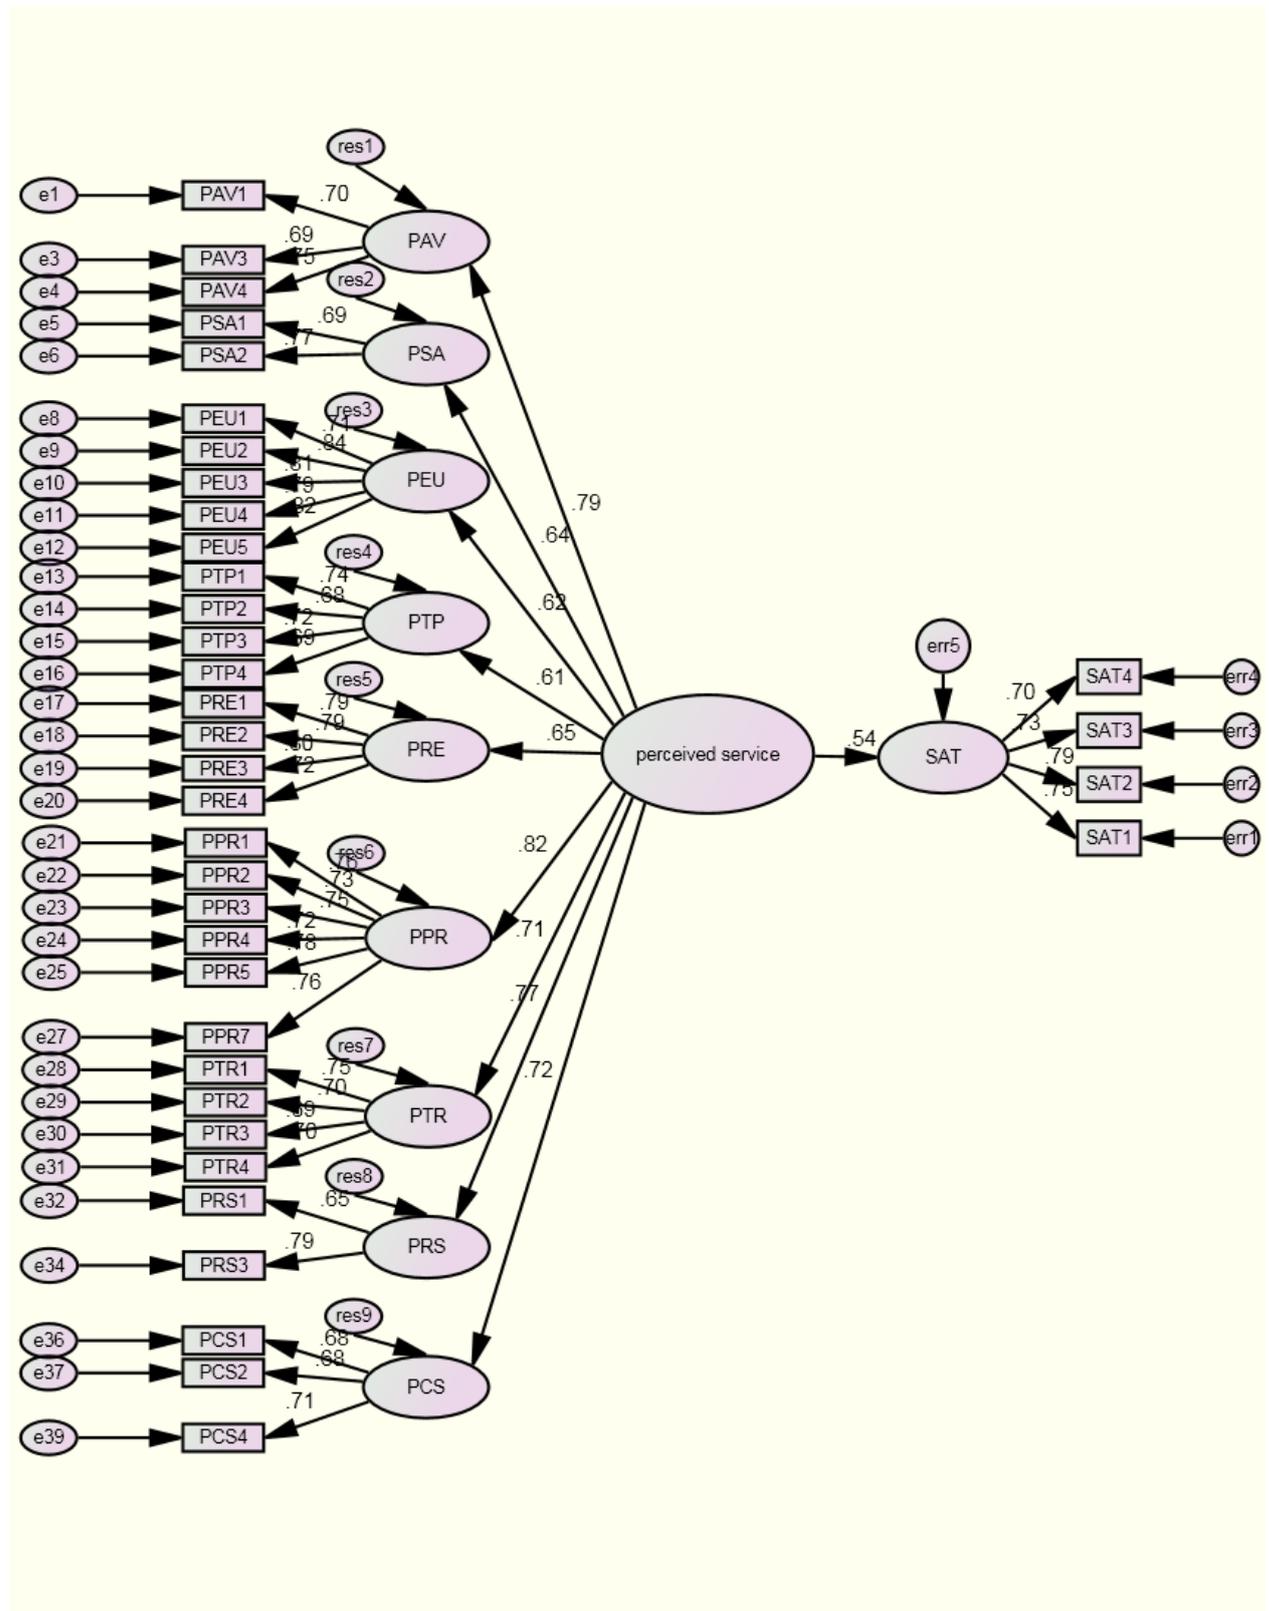

Figure 2 : The model showing perceived service of Internet banking determining customer satisfaction

DISCUSSIONS AND IMPLICATIONS

The objective of the paper was to develop a scale to measure perceived service and to derive the relationship between perceived service and customer satisfaction in the context of Internet banking service provided by the Indian Public sector banks. There are twenty five public sector banks in India but all of them have not been successfully promoted Internet banking services. To get an accurate information regarding the quality of Internet banking services five banks have been selected that have recorded highest amount of NEFT and RTGS transactions both volumewise and valuewise. Experienced customers of these five PSBs have been questioned to have an idea about how they perceived Internet banking service. The questionnaire had two parts. The perceived service part of the questionnaire was developed on nine predefined latent constructs, which were selected from the in depth review of earlier literatures in this field. The satisfaction part of the questionnaire was containing four questions on overall satisfaction level of the customers. A test run was conducted with 100 samples and reliability testing of all the constructs was carried out. The individual parameters in nine constructs had quite high loadings and no significant cross loading was observed. Therefore no modification in the construct structure was found to be required.

In the final survey a total of 499 data collected from the customers of five selected PSBs was analysed. From 39 initial items 6 items were dropped as they had a R^2 value less than 0.450. In the final structure of perceived service, privacy and availability were identified as the most important dimensions. Responsiveness, customization and trust were the dimensions which had found to affect the perceived service to moderate extent. Reliability, site aesthetics, technical performance and ease of use are the constructs which has the lowest weightage in determining perceived quality of service for Internet banking. The satisfaction construct was checked for convergent validity separately.

Perceived service construct and customer satisfaction construct was joined together to check the relationship between these two. The final model fitted well within the recommended value of various fit indices. Perceived service influences the satisfaction positively and significantly.

The research implies that customer satisfaction can be enhanced by providing better services to the customers. Special care should be taken to improve the service in those constructs of perceived service which has a very high loading such as privacy and availability of the banking

website. Privacy of the personal information and financial information is one of the most challenging areas where the service providers should give more emphasis for improvement.

For this they should implement latest web security mechanisms. Banks should also have effective fraud detection and fraud control mechanism in practice. Availability of the banking website is still major issue to the customers. Banks should improve on the network connection and load time of the banking website. Customers also perceive that banks should be responsive enough to rectify the mistakes in time and it should be done with minimum effort from customers' end. Banks should try to provide more customized service. This will also help the customers to be at ease even if they are not interacting with the bank personnel while availing retail banking services over Internet. The results also indicate that the online shoppers have matured and the technology has also been well adopted as the customers are giving more weightage for rectification and less for technical performance and ease of use.

LIMITATIONS AND FURTHER RESEARCH

The scale can be tested on any other sample by varying the selected banks. The banks were selected on the basis of their value and volume of RTGS transactions. No lists of Internet banking customers were available for the public sector banks. Some other PSB can have more number of Internet banking customers who are not engaged in transactions but they use the bank website for non transactional operations.

However, as the five selected banks accounted for high rate of RTGS and NEFT, therefore it may be assumed had a low incidence of problem encounters. There is thus a need to further examine the reliability and validity of the scale in the context of more diverse Internet banking websites that have a higher incidence of problem encounters and to refine the scale if necessary. The developed scale can be verified again by applying confirmatory factor analysis which will assure the explored dimensions of this research.

While developing the scale for perceived service, experiential aspects such as pleasure of using Internet banking without visiting the bank branch has not been kept within the scope of this study. This was not kept under the purview of this research because these items are customer specific and arbitrary in nature. However this leaves a scope for further study as what the customers actually want psychologically from using Internet banking may influence the perception of the service quality of Internet banking.

UNAUTHORISED BUILDING AND FINANCIAL RECOVERY OF URBAN AREAS: EVIDENCES FROM CASERTA AREA *

De Biase, Claudia¹; Forte, Fabiana²

fabiana.forte@unina2.it

1. URBAN ISSUES

“Even to the most casual observer, it has become apparent how over the last forty years the southern Italian cities have doubled their extension even when the central areas have not increased and the number of their residents has actually decreased” (Talia, 1998, p. 35).

Unfortunately, the settlement process is often linked to the phenomenon of unauthorised building, which continues to be a major cause of the disorder in the southern Italian cities and especially in our region and province.

In 2010, CRESME (Centro Ricerche Economiche Sociali di Mercato per l'Edilizia e il Territorio) recorded 26.500 unauthorised buildings, 18.000 of them were new. This is one of the highest rates of land consumption in Europe, accounting for 7,3% of the total area – only the Netherlands, Belgium and Luxembourg have been able to do worse, according to ISTAT (Report Legambiente, 15/3/2012). ISPRA (Istituto Superiore per la Protezione e la Ricerca Ambientale) also confirms this alarming situation, stating that between 1995 and 2009, about 4 millions of new houses were built in Italy, an increase over the past 15 years of 12% of the urbanized land and 4,800 hectares of land compromised forever due to building work.

Eventually, the Land Registry identified 1.081.698 urban housing units that have been never declared: about 34% of the cases are residential properties, but also include warehouses, garages, and workshops. “A good part of the million *ghost properties* are presumed to be illegal, in whole or part” (Report Legambiente, 15/3/2012).

* Although the work is the result of the joint contribution of the authors, Claudia De Biase has written the paragraphs 1 and 2; Fabiana Forte has written the paragraphs 3 and 4.

Unquestionably, the issue of unauthorised building is complex. There are different degrees of abuse and there have been numerous definitions of the phenomenon over the years. Generally, it is possible to distinguish between low unauthorised building (out of necessity), caused by the individual needs for homes “which is not provided for in time and adequately by plans and programs for the development of the municipalities” (Borri, 1985, p. 13) and high unauthorised building (speculation properly meant) caused by speculative factors, “aimed at contrasting every planning element and collective constraint of land use” (Borri, 1985, p. 13). Ricci (2003) introduced the concept of so-called micro-unauthorised building, which is, according to the author, one of the most common forms in our region. This category includes all those “... subtle changes that result in a distortion of the whole landscape” (*ibidem*, p. 107). Another concept is that of opportune unauthorised building, due to an economy based on illegal activities and “a culture of illegality that has ancient roots and current habits” (*ibidem*, p. 108).

Whatever the case, unauthorised building has a strong influence on urban planning: the saturation of empty spaces, the change of the urban weights of the different areas, the spread of non-urbanized zones, the different distribution of transport infrastructures, the total lack of planning standards, are just some of the consequences of this “phenomenon”.

As noticed by Abbate (2009), at first unauthorised building reveals itself in the South of Italy mainly by the building of accommodation destined for personal uses; in the Seventies, the phenomenon changes and a sort of speculative unauthorised building arises. This has been able to respond to the demand of accommodation that was not satisfied by public offering.

Up to now, unauthorized building strongly characterizes the South of Italy and it is a clear signal of urban development. The urbanization process does not deal only with the development of already existing big cities but it also concerns with new settlement and occupation of empty areas where the amount of unauthorized buildings is considerable (Garano, 1998).

Campania Region is one of the Italian Southern Regions with the highest rate of unauthorized building. In Campania, “in view of how much has been built, in 2011, unauthorised building works represented 13,4% of the total, 25.800 abuses, including units as well as the expansion of existing buildings or new non-residential buildings. From 2003, the year of the last building amnesty, to 2011, more than 258.000 cases of unauthorised building works, relating to new homes and extensions to existing buildings or new non-residential buildings were

realised, with an estimated turnover of €18.3 billion euro as reported by Legambiente” (Il Denaro, 2/11/2012).

One of the provinces with the highest percentage of unauthorized building is Caserta where, as already reported in the notes of the prefect in 1991, “unauthorised building has assumed alarming dimensions and gravity, with it being one of the ways to launder money by the local Mafia organizations and the structures built illegally and not registered being in the hundreds” (Report Legambiente, 18/12/2012, p. 3). In 2009, in the Caserta province, about 15.000 unauthorised buildings were ordered to be demolished, with 10,000 being in the Agro-Aversa area (Demolition office, the prosecutor's office of Santa Maria Capua Vetere). Moreover, in 2011, Legambiente estimated the presence of 41,361 “ghost properties, or parcels of land at risk”, just in our province (Il Denaro, 2/06/2011).

There are interesting data regarding the demolitions: in the city of Caserta from 2000 to 2011, of the 370 demolition orders issued, only 40 or 11% were actually executed. As underlined by Legambiente (2012) “alarming data indicating that the phenomenon continues to thrive throughout the region, devastating the landscape and feeding a chain of illegal cement, which revolve around not indifferent interests. Next to the *black hole* of demolitions, the results of the research show that there is a truly poisoned legacy of the previous building amnesties, represented by hundreds of thousands of outstanding requests, presented under the laws 47/1985, 724/1994 and 326/2003” (Report Legambiente, 18/12/2012, p. 2).

In addition to legal issues, unauthorised building, as previously mentioned, has, above all, a strong territorial impact. According to the Provincial PTCP (Piano Territoriale di Coordinamento Provinciale), approved in April 2012, about 12,000 units were realised without Prg (Urgan General Plan), of which 88% was made prior to the 1985 amnesty (Piano Territoriale di Coordinamento Provinciale of Caserta - Report, pag. 234). The highest concentration of these units is in the conurbation of Caserta, in particular, that of Aversa and along the Domitian coast.¹⁷

An interesting possibility for the recovery and redevelopment of these areas is LR 16/2004, which reintroduces the so-called “Plan for the recovery of unauthorised building works” (L. 47/85, L. 298/85).

¹⁷ As highlighted by the PTCP the worst case of unauthorised building works in the province is the town of Casal di Principe. According to the data in the table, it has a percentage of surface abuse of 35.5% of its total territorial expansion.

In fact, in accordance with current regional legislation, since 2004, municipalities in the drawing up of the PUC, are required to cordon off the unauthorised buildings (existing at December 31, 1993) subject of amnesty¹⁸ with the aim of:

1. realising adequate primary and secondary urbanization;
2. respecting the historical, artistic, archaeological, landscape and environmental as well as hydrogeological interests;
3. implementing a rational territorial and urban insertion of the unauthorised works (Art. 23, c. 3, LR 16/2004).

For the realization of these interventions, a new PUA can be expected, i.e. a recovery plan for the unauthorised buildings which, as set out by the law, may be intended solely for already authorised or expected to be authorised buildings (Art. 23, c. 6, LR 16/2004).

With this possibility offered by the regional law, unauthorised areas should, at first, be transformed into residential areas, equipped with the essential primary and secondary urbanization, and subsequently become an integral part of the urban context. The urban sprawl is, in fact, especially in the conurbation of Caserta and Aversa, a result, never programmed, of the constant abuse of the surrounding agricultural land.

As pointed out, the Provincial PTCP, "in the face of a relatively urbanized area, there is a significant impairment of the suburban territory" (Piano territoriale di coordinamento provinciale of Caserta- Report, pag. 185), determined also, and perhaps above all by widespread unauthorized building.

It is therefore evident that the PUA (implementing urban plans) is an attempt to establish rules for urban planning as well as ensure adequate planning standards. Undeniably, for any interventions on the unauthorised buildings to be carried out, the financial resources to be used must be those "arising from donations as well as the concession fees and penalties payable for the issue of certificates of permission in amnesty" (Art. 23, c. 4, LR 16/2004). The choice is due to a logic that "... cannot submit, without good reason, to those who have committed abuses to bear the brunt of the illegal conduct of others, as the recovery needs of the urban fabric must still be reconciled with the legitimate interests of all citizens" (T.A.R. Lazio Roma, sez. I, 05/04/2004, n. 3135).

¹⁸ Under the Law of 28 February 1985, n. 47, Chapters IV and V, and in accordance with the law of 23 December 1994, n. 724, Article 39.

2. UNAUTHORIZED BUILDING IN CASAL DI PRINCIPE: A URBAN ANALYSIS METHOD

In the province of Caserta, Casal di Principe, which is already famous because of organized crime, is one of the municipalities with the highest amount of unauthorised buildings (only the 30% of the total has obtained the building sanction). The municipality is placed at South West in the province of Caserta; it covers a surface of 23,26 Km²; the citizens are 19.336; and it is inside the district of Aversa. The municipality of Casal di Principe, however, shows a peculiarity: the main urban core of buildings starts from the built up area of Aversa and develops itself towards west and so toward the coast.

As already said, Casal di Principe is a municipality with a high rate of unauthorised buildings characterized by low levels of construction density and physical quality, by small parcels enclosed by cement paddocks or walls, by the fact that just one, two or three families live there, by the fact that the building are no taller that three floors, and by the presence of adjacent lots.

At the same time, Casal di Principe is also characterized by a strong deficiency of standard areas: the amount of planned public equipments should be 44,4 hectares while the amount of existing public equipments is 6,1 hectares.

The high presence of unauthorised building and the low presence of public equipments are the main features of this municipality.

The unauthorized buildings in Casal di Principe are concentrated in a specific area the "Area Agricola Semplice (E2)" of PRG. This area comprehends more than 60% of the total municipal area and it is destined to an agricultural use. In order to determine the percentage of unauthorized buildings we use a method based on:

1. the overlapping of the actual map of Casal di Principe (available on google maps) on the map of PRG zoning;
2. the localization of buildings that are unauthorized, or that got a building sanction or that are under preliminary investigation by Laws 47/85, 724/94 e 10/04(326/03);
3. the localization of building seized to racketeers;
4. the localization of ghost buildings.

Figure 1:The illegal buildings in Casal di Principe

In 2009, 789 are the unauthorized buildings (which represents the 11,94% of the total). The highest concentration is in the West area, towards Villa Literno. In Casal di Principe, 553 buildings have been authorized by three national laws - 47/85, 724/94 e 10/04 (326/03) – and so the 9,51% is regular.

Table 1: Buildings that got a sanction and that are under preliminary investigation in 2009

2009		
Laws	Number of buildings that got a building sanction	Number of building that are under preliminary investigation
L. 47/85	233	151
L. 724/94	272	119
L. 10/04	48	18

In 2013 the situation radically changes. The unauthorized process of building increases of 562 in just three years. In the end, the unauthorized buildings are 1.351 and they represent the 18,85% of the total. By adding 45 buildings that got a sanction, the percentage is 10,28%.

Table 2: Buildings that got a sanction and that are under preliminary investigation in 2013

2013

Figure 2.: The unauthorized buildings in Casal di Principe (2013)

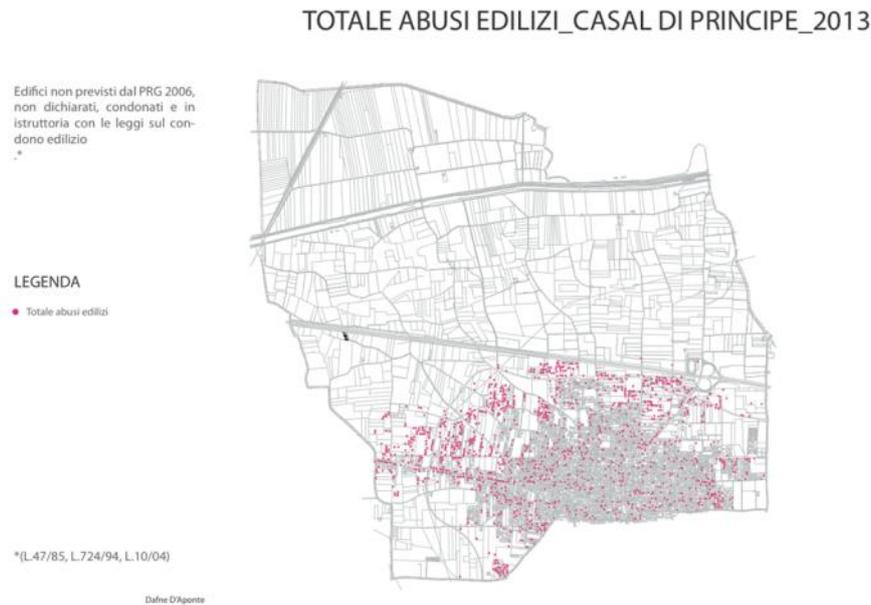

Figure 3: The unauthorized buildings in Casal di Principe and the buildings that got a building sanction (2013)

The study proceeds by underlining the number of abuses per each *Zona Omogenea* del PRG. As a result, there is a high density of buildings without planning permission in the following areas: rural, destined to manufacturing settlements, destined to commercial aims, and of public interest.

Table 3: Number of unauthorized buildings

4	F2 – Attrezzature pubbliche di interesse generale
22	G – Commerciale e di servizi
3	Attrezzature di interesse comune

Source: Personal elaboration by de Biase C. and D'Aponte D.

In the end, it is possible to affirm that 6,4% of existing building in the municipality of Casal di Principe are unauthorized. This rate grows up by 142 buildings at year that means it increase of a percentage of 19% each four years.

In order to provide a complete frame, it is very interesting to deal with the 81 buildings seized to racketeers (64 are buildings, 17 are firms). Thanks to the Cosenostre geo-blog (www.cosenostre.org) and to tables by Agrorinasce (www.agrorinasce.org; Centro Studi Fondazione Polis, Area Beni Confiscati, *I beni confiscati in Campania*, 2012) it was possible to localize only 29 seized buildings.

The seized buildings are different from the other ones. They have represented the power of racketeers. Their new use by public Institutions and society represents the lost of racketeers' power in their own area. This is a change that the racketeers do not accept so easily. However, the new use of seized buildings shows how legal society grows and develops itself in non-legal areas (www.cosenostre.org).

The last topic on which it is worth focusing deals with ghost buildings (Commi 8, 9 e 10 dell'articolo 19 del decreto-legge 31 maggio 2010 n. 78 convertito, con modificazioni, nella Legge 29 luglio 2010, n. 122), i.e. the buildings that have never been declared as existing. The ghost buildings are concentrated in the west part of the municipality, for which a specific recovery plan has been thought¹⁹. Out of 129 buildings, 33 have been built without authorization and they have not been declared and 1 is under preliminary investigation (Law. 47/85).

As for the ghost lots, institutions can act in different ways according to the *status quo* of each lot. If there are regular buildings in ghost lots, institutions must verify the regularity of the building according to the laws referred to the year of foundation and to the ones in force now. If the result is positive, the owner can have the amnesty authorization (*sanatoria*) and then the building is regular. If the result is negative, the building must be demolished.

If there are buildings waiting for regularization in ghost lots, the owners must wait for preliminary investigation. If the result is positive the building becomes regular; if the result is negative, the building must be demolished.

¹⁹ The recovery plan has been proposed by D'Aponte D. in her graduate thesis in Urban Planning under the supervision of Assistant Professor de Biase C., Faculty of Architecture, SUN.

In conclusion, Casal di Principe is a municipality with several criticalities that are linked to the non-respect of in force laws. Only through a recovery plan will be able to restore the rules and to make Casal di Principe a liveable municipality.

3. UNAUTHORIZED BUILDING, LOCAL FINANCE AND APPRAISAL ISSUES

According to the Italian legal system, Local Administrations (or Municipalities) - on the basis of territorial government rules – concern with planning and building matters and, above all, they have the faculty to transform urban areas. The right or permit to build is given under the payment of a correspondence public right, a concession fee or “*contributo di costruzione*”. This fee, corresponded to the Municipality, is inserted into the Municipal Budget, the tool that sets out the local government’s plan for revenue and expenditure for an annual or multi-year period. In last years “the importance of budgets has grown significantly as cities face increasingly difficult expenditure and revenue decisions in an environment of increased demands of services and infrastructure” (UN-HABITAT, 2009).

In the Municipal Budget, revenues are classified with “titles” (six titles) and “category”; the Title IV “Disposal of fixed assets, capital transfers from other governments and private entities” contain “concession fees and sanctions” (*permessi di costruire e relative sanzioni*) and in this title converge the monetary sanctions derived from the violation of the planning and building rules.

The sanctions are established on the basis of Presidential Decree No. 380/01, so called *Testo Unico dell’Edilizia*, that provides for building activities regulations. Particularly, three forms of sanctions are foreseen: 1) demolition; 2) pecuniary sanction; 3) free acquisition to the municipal assets. For the most relevant works (as new construction or building renovation) without permit, the penal sanction establishes the demolition; for less relevant works, there are pecuniary sanctions, which can vary from 516 euro up to the double of the increase of the building value resulting with the realization of the illegal works

The Decree No. 380/01 also establishes that if the interventions are realized without building permit or in a different way or in absence of statement of the start of works (*DIA - Denuncia Inizio Attività*) or differently from it, the responsible of illegal works or the actual owner of the building can obtain the permit “in sanatoria” or the retrospective building permit. This can happen if the intervention are in compliance with the planning and buildings rules in force

both at the time of the realization of the building and at the time of demand presentation. However, in order to get the “sanatoria” it must be paid an amount equal to the double of contribution of construction.

In this perspective, and considering the unauthorized building phenomenon (in Italy this phenomenon is very old and vast that three building amnesties, the last in 2003, could not solve the problem) the opportunity of financial recovery that could result from “oblations”, along with the concession fees and sanctions provided by law 16/2004, should not be underestimated (as has happened up until now), especially in light of the disastrous effects of the current economic recession on the budgets of local authorities, which are forced to deal with increasingly limited resources and an increasingly challenging internal stability pact.

In particular, in the regularization of unauthorized building, the Law of the Campania Region n. 10/2004²⁰ article 6 (size of the offering and concession fees, paragraph 3 and 4) already provides that the concession fees relating to unauthorised works under amnesty or “sanatoria” were increased by one hundred per cent of the amount established by current regulations and that the proceeds from this increase were primarily used by municipalities to meet the expenses necessary for the demolition of unauthorized buildings in their territories, as well as the implementation of measures for the redevelopment of unauthorised buildings.

With the Recovery Plan of Unauthorised Buildings, established by LUR 16/2004, the regularization process of unauthorized buildings takes a view of the whole and no longer a “case by case” perspective, facing the question in overall terms, or the urban and environmental redevelopment of entire urban areas²¹ and, especially, “suburban”, that in the province of Caserta, have developed everywhere, without any planning rule, in the total absence of urbanization and public services, frequently promoted by the expansion of the municipalities in peripheral areas for agricultural use. This last phenomenon recalls the serious question of the “consumption of territory” that nowadays is very relevant not only in Campania Region (Campos Venuti, 2013).

In order to implement the plan, “sanctions” play an important role, becoming a significant item of revenue and capital expenditure (or investment). In this context, analysis of the latest municipal budgets (as in the case of Casal di Principe) could help highlight both the

²⁰ RL 10/2004 “Rules for the regularization of unauthorized building pursuant to Legislative Decree 269/2003, as amended by art.32 conversion law 326/2003 and subsequent amendments and additions”.

²¹ Report of the Town Plan the Council of Sorrento prepared by the Head of Department IV of the City of Sorrento, Eng. G. Imperato under the guidance of Prof. Arch G. Riano (PUC approved by Executive Decree n. 502 of 18/07/2011).

effectiveness of this tool (if used) as well as the financial management capacity of local authorities (De Mare *et al.*, 2010).

The revenues from the issuing of “building permits” introduced by Presidential Decree no. 380/2001 (the former building permit introduced by Law 10/77) are restricted funds in the budget of the local authority (Forte F. 2007), to be used for the construction of primary and secondary urbanization works as well as the maintenance of the assets (subject to the provisions of the recent decree “Milleproroghe” which involves the use of the revenues for current expenses).

In addition to the revenues from unauthorised building works, law n. 662/96 introduced concession fees for the regularization of unauthorised buildings (Article 2, paragraph 48), registered in Title IV of the Revenues and intended: for the cost of investigating claims of right to rectify the situation; to anticipate the demolition cost of the works referred to in Articles 33 and 32 of Law no. 47/85; for the demolition of works that are not subject to the amnesty; interventions for urban and environment redevelopment; for the creation of primary and secondary urbanization works.

Assuming that the city “costs” and the resources available for the realisation of community facilities and services are scarce, if not minimal, as in the current economic situation, in the face of a growing problem which is that of unauthorised building “which has always distributed a wild urban revenue” (Tocci W., 2009) it is no longer possible to continue to ignore policy instruments that, in numerous municipalities in the province of Caserta (the data above highlights only part of the problem), may allow for the recovery of “liveability” for the community that is widely impaired .

In terms of unauthorised building and financial recovery, it is worth highlighting the effectiveness for tax purposes of the census of so-called “ghost” buildings started some time ago by the Land Registry (starting with DL 266/2006), i.e. a series of buildings never declared to the Land Registry, many of them illegal (houses, garages, basements, etc.), resulting in lost revenue for the State and municipality. According to the data of the Land Registry in Campania, there are about 295mila ghost properties, with the province of Salerno (105,228 properties) ranking first, followed by Naples (59,859), Avellino (55,161), Caserta (41,361) (see the case of Casal di Principe Municipality) and Benevento (33.86).

Finally, it is also worth taking into account the crime of unauthorised building in protected areas with landscape and environmental constraints (consider what has happened to the

UNESCO sites of the Royal Palace of Caserta, San Leucio and Carolino Aqueduct, that is one of the 23 Italian sites risking to lose the UNESCO brand for unauthorized building and degradation, Legambiente, 2011), in which the damages, in its various forms, are of particular interest from an appraisals (Manganelli, 2009).

The Italian Code of the Cultural and Landscape Heritage (art.167, Legislative Decree n. 42/2004) ascertains that, in case of violation of the obligations and orders, the transgressor shall be obliged to restore the cultural property to its original state at his own expense or “pay a sum equivalent to the greater amount between the damage caused or the profit derived through the transgression”. The sum is determined by the Municipality on the basis of an official assessment and shall be utilised for safeguarding purposes, works for reclamation of landscape values and the upgrading of deteriorated areas.

The sanction for the indemnity is assessed through a purely financial criterion. Several are the procedures used by municipalities in order to determine the value of illegal work: some of them are referred to cadastral value (established by *Agenzia delle Entrate* for property tax); others are based on the difference between the value of illegal works and the cost sustained for its realization; eventually, other procedures adopt criteria of pre-existent and old norms etc. The limit of these assessment procedures is the exclusion of the immaterial or intangible values that characterizes environmental and historical heritage. From an appraisal point of view, a more integrated approach for the evaluation of environmental damage occurs, in the perspective of the “total economic value” (De Francesco et al., 2012) or the “complex social value” (Fusco Girard, Nijkamp 1997).

4. UNAUTHORIZED BUILDING IN CASAL DI PRINCIPE: LOCAL FINANCE AND APPRAISAL ISSUE

With specific reference to the local finance in the Casal di Principe Municipality, it is interesting to analyze the Municipal Budget in the last years. It is composed by two main financial documents: the preliminary budget (*bilancio di previsione*) and the final budget (*conto consuntivo*). In the Title 4.05 “concession fees and sanctions” the two voices are indicated separately: the revenues deriving from this title in the last five years demonstrate a significant decrease, especially in the last year (see tab 1). In 2008 and 2009, the years with the most relevant revenues, the main amount comes from concession fees, not more restricted in the

investment expenditure for public facilities and urban recovery, but usable also for the current one.

Both revenues represent an important resource for the Municipality that, in 2011, felt in financial imbalance (as many others in Caserta Province). For the concession fees the Local Authority recently has also provided to the adjustment and updating of the fees with Municipal Resolution n.5/2013 that, highlighting the gap between the real costs of public facilities (very increased in the last years) and the charges, establish the updating of parametric schedules for primary and secondary urbanizations and for the construction costs. However, as for the sanctions, it is urgent and necessary to proceed in the examination of the demands for building sanction that are yet unsold. This kind of revenues, in a municipality characterized by a high concentration of unauthorized buildings and a scarce equipment of public facilities and services, could represent a significant opportunity to collect resources in the pursuit of “efficacy” and “efficiency” principles in the urban and territorial management.

Table 4: Casal di Principe Municipal Budget: revenues from “contribution and sanctions” from 2007 to 2012

Title IV. Category 4.05.1050 Contribution and sanctions	2012	2011	2010	2009	2008	2007
preliminary budget	€ 366.000,00	€ 1.000.000,00	€ 1.100.000,00	€ 1.350.000,00	€ 475.000,00	€ 475.000,00
final budget	€ 203.142,35	€ 338.143,29	€ 722.209,82	€ 911.762,35	€ 1.386.780,72	€ 583.870,08

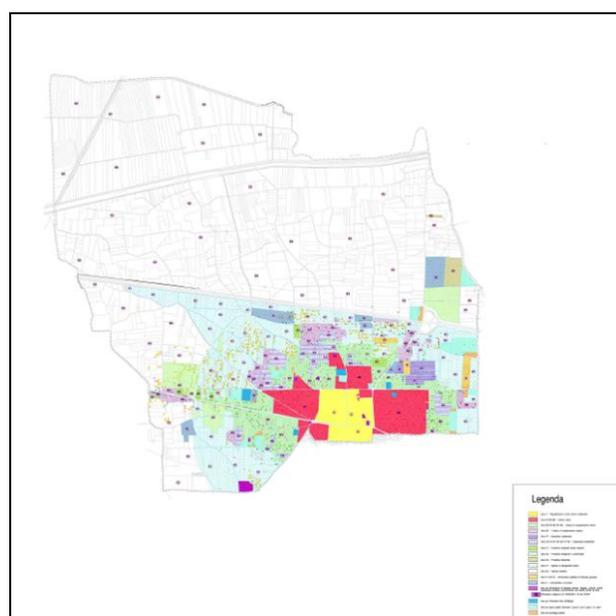

Source: personal elaboration on the basis of Municipal Budget data

Analyzing the Casal di Principe Municipality also in terms of market value of residential buildings, using the database for real estate market prices run by the Agenzia del Territorio (Land Registry), through OMI (*Osservatorio Mercato Immobiliare*, Real Estate Observatory), its possible develop some considerations. OMI database divides the national territory into homogeneous market level portions on the basis of shared characteristics (such as urban planning, social and economic aspects, provision of services, etc). Each municipality is divided into one or more areas (so called “OMI zones”) that are homogeneous in terms of price levels. For each zone a minimum and a maximum value are provided according to the type of use (residential, commercial, tertiary, industrial). With reference to maximum market values (generally the values from OMI are underestimated) for residential building in Casal di Principe, over the period 2012-2002, it is possible to deduce a trend that is not particularly dynamic and a modest market appreciation. The difference between central (B1, B2, B3, B4), semi central (C1, C2) and peripheral areas (D1) is very law. In this last area, indicated in the Master Plan as homogeneous zone D2 - productive, artisanal and commercial zone - several

unauthorized buildings are localized. The scarce transparency of the urban real estate market does not allow to distinguish among a market of legal products and a “submarket of illegal products”, object of sanctions and, indeed, of appraisal (Forte C., 1970).

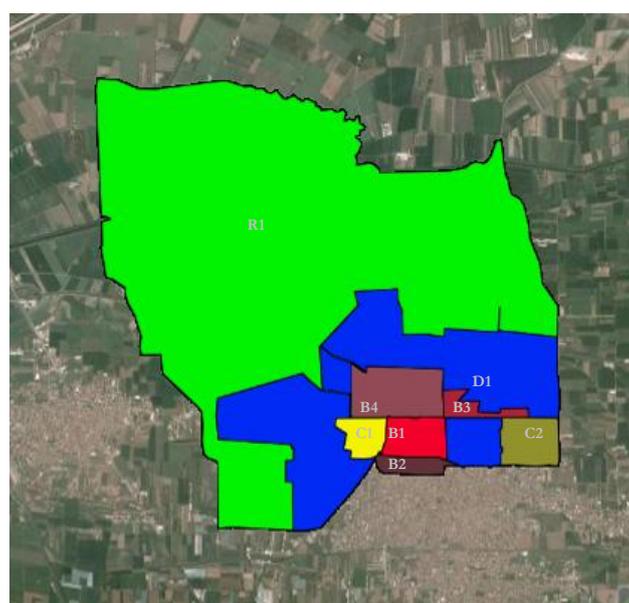

Also in the zone indicated in the Master Plan as Zone E (agricultural of urban safeguard) and by OMI as zone R: Rural (devoid in real estate assessment) – there is a high presence of unauthorized buildings that constitute a particular form of real estate submarket.

Source: Agenzia del Territorio

In sum, the unauthorized buildings phenomena in the Casal di Principe and in the overall Caserta Province results very serious. All the actions to contrast it, both at the urban planning and at local finance level, are possible only with a rigorous census and updating activities, nowadays ever more supported by GIS (Mattia et al., 2013).

Since 2010, in the monitoring direction for the fight to illegal interventions, the Campania Region operates with the on-line data bank CON.AB.ED (Contrasto Abusivismo Edilizio) and the Mistrals Project in collaboration with the satellite-monitoring center MARSec (Mediterranean Agency for remote Sensing and Environmental Control).

ABSTRACT

We analysed the performance of mature Portuguese firms that have been (partially) held by Venture Capital funds in the post investment phase, precisely four years after an exit occurred, to verify if the valuation of firms in maturity increased or decreased. Using a sample of 38 firms, aging more than 15 years, sold out by Venture Capital funds between 1995 and 2004, we evaluated the performance of these Firms through performance and sustainability indicators. We found evidence of growth in Sales, in Exports, in Book Value, in Headcount and a good coverage of ISO standards implementation. The valuation of the majority of firms increased using relative evaluation measures such as Sales Price Value and Book Value.

Keywords: Entrepreneurship; Venture Capital; Divestiture; Maturity.

INTRODUCTION

In this paper, we investigate the impact of Venture Capital as adding value partner to Portuguese firms in maturity stage, especially in traditional business activities, and test if whether or not this is an enduring impact, assessed by valuation increase of these firms after four years of an exit.

We chose this type of firms – companies in maturity – for two main reasons: (i) in Portugal, and in the time-frame 1995-2004, mature firms from traditional business activities tended to use Venture Capital to achieve growth and go international; (ii) there is a lack of research relating venture capital with this stage in the lifecycle of companies, however there is a variety of works revealing the positive impact of Venture Capital in entrepreneurship through firm performance in early stages of development.

To complement our analysis, we developed two surveys. Survey I was applied to managers of Venture Capital companies, managing one or more funds (VCs) to assess their perception on the result of the activities carried out with portfolio companies during the investment period. Response rate for survey I was expressive (66.7%). Survey II was sent to portfolio companies' managers but the rate of response was not representative and the data thus collected was not used to test variables.

THEORETICAL BACKGROUND

Gorman and Sahlman (1989), is a seminal work in the study of the (positive) effects of VCs on their portfolio companies. It sustains that VC managers supply effective support to their portfolio companies in the following areas, by order of importance: additional fund raising, review and support on strategy formulation, management team's recruiting and training, operational planning, and establishing contact with potential customers, suppliers and money lenders. According to Timmons and Bygrave (1986), VC networks comprehend both current and past portfolio companies, investors and other VCs. Rosenstein (1988), highlights the benefits of VC experience and its network resources to portfolio companies.

Busenitz et al. (2004), concluded that Venture Capital provides a feedback of constructive strategy in the decision-making process, leading to portfolio companies' better performance.

Factors influencing performance

Previous literature has tested different factors contributing to assess a positive impact of VCs on their portfolio companies. Cornelius (2005), investigated *top management quality* in VCs and observed changes in the north-American industry over the 15 years prior to the study. He concluded that present VC managers come mostly from the financial industry and hold MBA or equivalent degrees. These managers are more risk-averse than their predecessors and manage a growing number of portfolio companies given the increase in the average size of investment vehicles. White *et al.* (2007), took the portfolio companies' manager to support the association between a certain type of leadership for different growing phases of the company allowing them to rise up alert signs by phase of development. Sapienza and Korsgaard (1996), concluded that VC investors have a high level of *Confidence* and commitment towards entrepreneurs. Duffner *et al.* (2009), found out a significant and reciprocal relation between trust and success. Bottazzi *et al.* (2008), by analyzing the determinants and consequences of

VCs investors' pro-activity concluded that *VCs' managers with previous experience* in the business are more active in recruiting managers and directors, helping in fund raising and interacting with portfolio companies. *VCs' Network of contacts* made available to portfolio companies is of utmost importance in company's development, not only for purposes of capital return but also for purposes of management. For Shepherd and Zacharakis (2001a), Venture Capital is like an information tag about the capabilities of entrepreneurs' management team and evidence of trust in past relations with investors. Mäkelä and Maula (2006), suggested that international VCs have a positive impact in *Internationalization Strategy* which could be valuable to the company in terms of new venture's legitimacy in an unknown market. Maula *et al.* (2005), added that VCs are important to help portfolio companies getting new foreigner customers. Hsu (2004), concluded that entrepreneurs are prepared to accept a discount on their start-up's valuation if it makes possible to get VC investment with better *Reputation*. Gorman and Sahlman (1989), studied the variable *Communication* as an influencing factor in portfolio companies' performance and concluded that most managers spend more than half of their time monitoring their portfolio companies and the balance to decide on new investments and administration. Jääskeläinen *et al.* (2006), took a different approach on the attention given to portfolio companies relative to VC performance thus establishing a relation between investor's activities and VC performance. Hellmann and Puri (2002), approached the *Professional management models* and concluded that VCs are responsible for portfolio companies' upgrade in terms of management capabilities, at the level of Human Resources, Marketing and possibly General Management mainly through the appointment of a new CEO. It was also concluded that VC officers play a much wider role than the traditional function of financial intermediation. Sahlman (1990), considers that *Funding duration* is an influencing factor for portfolio companies' success because VC investments are typically long term's. Further, Gompers (1994) refers that a large number of projects take decades to return benefits and if funding suppliers don't have the same length orientation potential portfolio companies loose access to money. Niosi (2003), studied the *Exit option* and concluded that VCs look forward to close IPOs for their portfolio companies which is the best case scenario for both VC and portfolio companies in terms of valuation. Venture Capital is recognized to have an impact on portfolio companies' strategy of *Investment in Innovation and Technology* working as an influential factor on value added. In the US there is strong evidence that VCs' portfolio companies produce evermore valuable patents (Kortum and Lerner, 2000), innovating more frequently and achieve a higher professional level earlier (Hellmann and Puri, 2000; 2002) than non VC backed companies. Hellmann and Puri (2002) studied the

Expertise, Strategy, and Marketing supplied by VCs by measuring the time to market of portfolio companies and concluded that Venture Capital has a strong association with products successfully reaching the market. Venture Capital actually increases this probability in 79%. This proves that VCs play a fundamental role in portfolio companies' marketing performance. Our survey shows that VCs' managers believe the most important portfolio companies' post-exit performance factors to be, by order of importance: Top management quality; Confidence; Experience; VC contact network; Internationalization strategy; Governance model; VC reputation; Communication; Management model; Contract duration; Exit option; Innovation investment; Technology investment; Marketing and Strategy support; Influential level; Shareholding percentage.

Relative or comparative valuation

Damodaran (2012), sustains that despite the importance and discussion around the discounted cash flow method, or net present value, reality shows that most asset valuations are made by the relative valuation method, i.e, asset pricing is made based on the market transactional price for similar assets. Therefore, we used two of the more used multiples in relative or comparative valuation: *Price Book Value* and *Price Sales Ratio*.

Price Book Value (PBV) reflects the relation between company price and accounting valuation. According to Damodaran (2012), there are advantages in using these multiple-based methods because it is a relatively stable and intuitive measure of value that could be compared with market price and get a reasonable consistency from accounting standards allowing for comparison between similar companies, looking to abnormal valuations or undervaluation, and making valuation of companies with negative profitability.

According to Damodaran (2012), multiple revenue method or *Price Sales Ratio* (PSR) has received increasing attention from financial analysts resulting from its advantage over other ratios: Revenue figure is easy to attain even for companies with negative profitability and it is not significantly affected by accounting policies like depreciation, inventory, and extraordinary events. PSR is an interesting tool to examine the consequences of pricing policy changes and other corporate strategic decisions and also it makes much easier to compare companies from different markets and different accounting standards.

Sustained performance

The idea that increasing shareholders' value is the main purpose of a company has been increasingly criticized since corporate social responsibility and the best interests of tax payers became a major societal concern. Focusing on shareholders' value does not only help decision making for social issues such as employment and business ethics but also it could destroy companies' long term value thus diminishing shareholders' value. Edward Freeman's (1984) stakeholder theory is at the center of this debate trying to balance the best interests of all stakeholders. However, it acknowledges that companies must remain competitive, combining good financial performance with employee and customer satisfaction, with usefulness to society, and with solid ethical principles is an accomplished company. Companies today understand the importance of taking into account stakeholders' interests: suppliers, employees, community, customers, consumers, society, and environment. According to Waddock and Graves (1997), corporate social irresponsibility leads to negative financial consequences. According to Epstein and Roy (2001), there is a growing number of top managers acknowledging the relevance of formulating a strategy of corporate social responsibility. Nevertheless they believe is very difficult to put it into action. These authors mention structures like the Balanced Scorecard, ISO 14001, and environmental management systems (EMS) as patterns of such a strategy. Hillman and Keim (2001), studied the relation between social performance and financial performance to conclude that social performance depends positively on a financial performance consistent with a perspective of scarce resources and that financial performance depends on social performance, in harmony with stakeholders' efficient management theory. Marom (2006), believes that the complexity of the field and the existence of contradictory results call for a unified theory of the relation between social performance and financial performance. This author promptly rejects any pretension of finding a universal relation between these two types of performance. Nelling and Webb (2009), mentioned several surveys of statistical significance and non-significance between the two variables to sustain neutrality in the relation. Either way, these authors reject the hypothesis of social responsibility being a competitive disadvantage, meaning that it doesn't make any sense stating that social programs diminish financial performance, negatively affecting shareholders.

Hypothesis

Hypothesis 1: The valuation of firms in maturity stage that have been sold out by VCs is higher 4 years after the exit than it was in the exit moment.

Hypothesis 2: *Contract Duration* and *Shareholding Percentage* have a positive impact on the valuation increase brought by VCs to portfolio companies.

Data and Measures

In order to assess portfolio companies' sustained performance, we used financial performance ratios that were identified both in literature and in VCs' practical use.

Dependent variables

Market performance:

- Sales Growth (SG) and External Markets Sales Evolution (EMSE).

Financial Performance:

- EBITDA Evolution (EBITDAE), Cash Flow Evolution (CFE), and Book Value Evolution (BVE).

Sustainability:

- Headcount Evolution (HCE) and Number of Quality Certifications (NQC).

Variable assessment was made through growth percentages between fourth and fifth year after an exit occurred. Whenever companies were sold out between 1995 and 2000, we used growth percentage from 2005 to 2006. To assess External Markets Sales Evolution we used data from 2006 and 2007, for portfolio companies sold out until 2001 (more than four years after the exit). To assess Headcount Evolution we used data from 2006 and 2007 because we could not find it from 2005 whenever portfolio companies were sold out until 2001 (more than four years after the exit). Whenever portfolio companies were sold out in 2002 and 2004 we used data from the fourth and fifth year after an exit occurred. The choice of headcount figure as indicator of sustainability allowed us to assess employment level evolution in portfolio companies.

Independent variables

Based on literature review and VCs practical experience, we selected the following independent variables:

- Investment Contract Duration (ICD);
- Shareholding Percentage (SP).

To test the hypothesis we used regression analysis with 2 independent variables and 7 dependent variables.

Research method

We defined two different populations, one of them composed by VCs and the other composed by portfolio companies from 1995 to 2004, sold out until 2009. These firms were in maturity stage when they became part of a VC investment portfolio.

VC population was composed of 28 officially registered companies in Portugal.

Portfolio companies' population was defined as the firms that were totally or partially held by a VC and were in maturity stage (more than 15 years old) when they signed up an investment agreement. We did not control this population for investment contract duration or VC shareholding percentage.

Data collection

VCs:

Out of the 28 VCs, 19 were managing 51 venture capital funds and 9 did not have any registered fund. We excluded 4 VCs because they did not have any registered funds nor reported their headcount and investment portfolio. Therefore population was reduced to 24 VCs. Response rate to survey I was relevant, 16 answers or 66.7% of the adjusted population. These 16 companies managed 42 funds or 82.4% of all funds and had a market share of 73% in 2009.

Portfolio companies – 1995-2004:

In December 2004, at the end of the relevant 10 year period, 18 VCs had 100% of the money under VC management (678 million Euros). Therefore we got information from portfolio companies representing 80.0% of all firms that, from 1995 to 2004, had been subject of acquisition and exit operations. Portfolio companies' database from the period 1995 to 2004 contains 407 companies. We excluded companies displaying no activity when this research

was conducted which means a mortality rate of 30.7%, in line with other studies about this industry like Sahlman (1990). We also excluded foreign companies and merged companies.

Table 1 displays company aging, when the investment occurred:

Age (years)	Nº of companies
≤1	90
> 1 x ≤ 5	34
>5 x ≤10	48
>10 x ≤ 15	23
>15	60
TOTAL	255

Table 1 – Company aging

We then launched survey II to managers of these 255 portfolio companies. Out of the population of these 60 companies aging more than 15 years at the investment date, we excluded 10 firms that were still portfolio companies when the research was conducted and 8 that were sold out after 2004. Out of the 42 remaining firms, we could only access financial reports of the full period studied for 38 firms.

Populations and samples:

VCs – We used a sample of 16 firms that agreed to be surveyed representing 66.7% of the population. These companies had a market share of 61.5% in 2009.

Portfolio companies – We used a sample of 38 firms aging at least 15 years at the date of the investment agreement, out of a population of 60 firms.

Statistical procedures, tests and results

For VC sample we used frequency analysis, average calculation, mode, maximum and minimum analysis. We estimated the reliability of survey I through Cronbach's Alpha. Regarding portfolio companies, we used frequency analysis, average calculation, modes and medians. Relation between dependent variables was verified through correlation models. To estimate independent variables predictability we used linear multiple regression.

Cronbach's Alpha - To assure internal consistency of scales and subscales of Survey I, we used the indicator Cronbach's Alpha. All tests indicated a good or greater than good result. VCs' management answers related with VC functions, with nine subscales, proved greater value than 0.82; Factors added value, testing sixteen subscales, proved to be greater value than 0.94 and Portfolio performance, testing sixteen subscales, proved greater value than 0.97.

Correlation tests between the concepts of Performance and Sustainability - Conducted tests of correlation between the dependent variables, in three cases, returned correlation with statistical significance: A strong positive correlation ($r = 0.529$, $p > 0.01$) between the constructs EBITDA Evolution and Cash Flows Evolution. A moderate positive correlation ($r = 0.333$, $p > 0.05$) between Sales Growth and External Markets Sales Evolution. A strong negative correlation ($r = -0.775$, $p > 0.01$) between Book Value Evolution and External Markets Sales Evolution. The overall analysis did not show any correlations between the remaining variables. The strong positive correlation observed between the tests EBITDA Evolution and Cash Flows Evolution seems appropriate - since they are based on company results. Also, a moderate positive correlation between Sales Growth and External Markets Sales Evolution is normal with the External Markets Sales Evolution with higher percentage.

Regression Results - We used linear regression to estimate the influence of independent variables "Duration on Contract" and "Shareholding Percentage" on the variables Sales Growth (DV1), External Markets Sales Evolution (DV2), Cash Flow Evolution (DV3), EBITDA Evolution (DV4), Book Value Evolution (DV5), Headcount Evolution (DV6) and Number of Quality Certifications (DV7). Results are presented for significance tests Distribution of Student (or t test) and Lavene (or F test), with no statistically significant value for sig when $t \geq 0.05$ for a $p < 0.05$.

Significance of t:

Independent Variables	DV1	DV2	DV3	DV4	DV5	DV6	DV7
Contract duration	0.523	0.243	0.451	0.112	0.051	0.331	0.729
Shareholding Percentage	0.511	0.875	0.204	0.946	0.453	0.344	0.322

The result which lies closer to the value with statistical significance is the ratio of the dependent variable "Book Value Evolution" DV5 with the independent variable "Duration of the contract" with a significant value of $t = 0.051$.

Significance of F:

DV1	DV2	DV3	DV4	DV5	DV6	DV7
0.694	0.501	0.281	0.273	0.086	0.337	0.597

ANALYSIS AND RESULTS

VCs:

Firms and human capital - the 28 officially registered VCs have a total of 188 employees. The average number of employees per VC is 6.7 with a maximum of 30. Excluding those who referred to have none, the average raises up to 8.2 employees per company, in line with US VCs in 2008 which had an average of 8.5 employees. VC employees are highly qualified: 87.2% have at least bachelor's degree however we only got one PhD graduate. In our research, most employees (86.1%) are graduated in Economics or Business/Management. In terms of age structure, 79.0% of all employees have 25 to 45 years old. Regarding prior professional experience, 55.9% already worked in a different industry, 37.1% come from VC business and 1.4% have worked both in and out the industry. Taking experience in portfolio companies' industry, the mode (37.5% of all answers) is "some experience" however 56.3% consider important to have a good knowledge of their portfolio companies' business.

VC representative in portfolio companies - according to managers, VC representation is usually done through a portfolio companies' board member (100% of all answers) but rarely on an executive function. Considering the number of portfolio companies, 64.3% of all VCs have 6 or less; 14.3% have from 10 to 20, and the same figure for those having from 20 to 40 portfolio companies. Only 2 VCs have more than 40 invested firms (7.1%) and those are State owned funds. The average number of portfolio companies per VC employee is 2.2. The biggest VC owning 150 portfolio companies has an average of 5 companies per employee. Contact regularity with portfolio companies is, in 93.8% of all cases, equal or inferior to monthly and the frequency for performance control is monthly in 43.8%, and quarterly in 31.3% of all observations. Therefore, we have a combined frequency of 75.1% of all answers. Performance evaluation targets are based in 2 or more ratios in 93.8% of all observations. Two

of the mentioned indicators (Sales Growth and EBITDA), analyzed simultaneously or combined with other indicators, are quoted by 87.5% of all managers. The combination with Cash Flow is quoted by 68.8% of them all. According to 87.6% of all VC managers in the Portuguese market rarely or never there is a replacement of portfolio companies' management team. This data is not in line with a previous survey conducted in the US by Gorman and Sahlman (1989), where VCs in average replace 3 CEOs of all portfolio companies during the investment agreements. Considering the importance of VC manager's role in portfolio companies' performance, they consider it to be high, for the following purposes and in the following order: Fund raising; General management; Back-office organization; Product and marketing strategy; Market information; Innovation strategy; Information systems; EU grants; Technology. About exit clauses, answers about divestiture strategy in Portugal are not surprising and are consistent with all other surveys carried out in the past. Management Buy Out and Management Buy In are first and second most common options. Unsurprisingly, in the US the most desired exit is through an IPO. When we asked VCs if in their opinion an investment agreement with a VC does increase portfolio companies' valuation, 93.8% of all respondents said yes. When we asked them if they agreed that this valuation increase effect would last far beyond the divestiture date, 87.5% agreed or tended to agree.

Portfolio companies' performance after divestiture - when asked about portfolio companies' performance after divestiture, 75.0% of all VC managers said it was good. For the same question but considering a four-year time-frame after the exit, the figure decreases to 62.5%. However 31.3% of all respondents said they did not have that information. This result is mainly due to scarce information about portfolio companies after the exit, which means that many VCs do not keep track record of prior investments. When we asked them what performance ratios did get better after 4 years, they answered "Revenue" and "Book Value".

Portfolio companies:

Firms and human capital - Table 2 displays key figures to characterize this 38 company sample:

Type of firm	
Revenues (M€)	1.100,85
Average Revenue (M€)	28,97
Revenue – External Markets	74.6%

Headcount	11,325
Average Headcount	298.0
Business activity	
Agriculture	2.6%
Manufacturing	73.7%
Retail	2.6%
Services	21.1%

Table 2 – Sample's data (from 2008)

Out of these 38 companies in maturity stage, 28 are manufacturers in traditional Portuguese activities, also in maturity stage.

Considering the size of these portfolio companies:

- Headcount – 19 SMEs (50.0%), 14 Big Enterprises (36.8%), and 5 Micro Enterprises (13.2%);
- Revenues - 24 SMEs (63.1%), 9 Big Enterprises (23.7%), and 5 Micro Enterprises (13.2%).

If we take “firm’s age” when the investment agreement was signed some of them are surprisingly old. Sample’s average is 57.5 years-old with a maximum of 180 years-old and a minimum of 16 years-old. 19 firms (50%) were more than 51 years old.

Investment agreement with VC – Duration and Shareholding percentage - VC managers (66.7%) consider the investment agreement duration as an “Important”, “Very Important”, or “Fundamental” event for portfolio companies’ success after divestiture. In our model, we used it as an independent variable. Average duration in this sample is 4.53 years. Only one contract was set for 10 years. Regarding shareholding percentage, sample’s average is 15.3% (minimum: 0.2 %; maximum: 48.0%). Clearly, VCs do not wish to keep control over portfolio companies.

Portfolio companies’ sustained performance - To evaluate performance we used the previously referred indicators. These are used as drivers combining performance and sustainability indicators, also used in assets’ relative evaluation. When we used multiple-method valuation, these indicators are computed for purposes of calculation. Positive or

negative evolution in the chosen indicators shows variable direction for purposes of company valuation. We did not consider variations in the multiples themselves.

Sales Growth (SG) - Total revenues from sales for the 38 companies in this sample after four years of an exit shows a positive evolution of 10.4%. Twenty-four of them (63.2%) had an increase ranging from 0.6 % to 174.7%. One company (2.6%) had no variation and thirteen companies (34.2%) had a negative variation, ranging from -1.5% to -31.0%. We can therefore conclude that 65.8 % of all companies increased or maintained Revenues from Sales. Our survey results are consistent with this analysis.

Sales for external markets - This sample shows a positive evolution of 19.9% in this indicator. Twenty-nine companies (76.3%) actually sold for external markets. Out of those twenty-nine, 79.3% increased their sales to external markets, ranging from 0.5 % to 769.0%. Six of them (20.7%) experienced a decrease in this indicator ranging from -5.5% to -47.0 %. In the survey, 93.8% of all VC managers categorized "Internationalization Strategy during investment agreement" as "Important", "Very important" or "Fundamental".

Cash flow - We calculated the cash flow of all sample companies for forth and fifth year and concluded a negative evolution of -37.6%. Fourteen companies (34.0%) increased their cash flow, ranging from 8.9% to 2,081.8%, and twenty-four or 63.2 % decreased their cash flow, ranging from -3.0% to -22,500.0%. Again, results from our survey were consistent with this analysis.

EBITDA - Evolution on EBITDA displays a negative variation of 11.3% for this sample. Fifteen companies (39.5%) increased their EBITDA, ranging from 3.0% to 279.5% and twenty-three (60.5%) had a negative variation in this indicator, ranging from -2.2% to 431.3%. Survey respondents had a more positive view on EBITDA evolution.

Book value - We calculated book value for all companies in this sample and got a positive variation of 2.4%. Twenty-five companies (65.8%) increased their book value, ranging from 0.7% to 345.1% and thirteen (34.2%) had a negative variation, ranging from -0.5% to -502.0%. Both VC managers' perception and these calculations returned the same conclusions: the majority of companies "increased" or "maintained" their book value.

Headcount - Year four after exit returned 11,083 employees for this sample's companies and year five 11,128. This means a positive evolution of 0.4%. While twenty companies (52.6%) increased their headcount, ranging from 0.7 % to 320.0%, four of them (10.5 %) had no

variation at all in headcount figure, and fourteen firms (36.8%) decreased their employee base, ranging from -1.0% to -20.6%. Survey and calculations returned similar conclusions.

Quality certifications - Twenty-seven companies (71.1%) were certified in at least one of the ISO standards. Six companies were certified in two or more ISO standards. Twenty-six companies (68.4%) had NP EN ISO 9001 certification for quality management systems. Four companies (10.5%) had NP EN ISO 14001 certification for environmental management systems. Eleven firms (28.9%) had none.

DISCUSSION AND CONCLUSIONS

VCs' employee educational levels are adequate and their professional experience is convincing. Therefore, VCs seem adequately prepared to manage investment portfolios.

Portfolio companies' mortality rate (30.7%) is in line with international benchmarks and cannot be related with VC investment agreements. Portfolio companies' performance is generally positive: global amount of revenue from sales, sales to external markets, book value, and headcount, increased or stabilized between fourth and fifth year after VC divestiture. The number of exporting companies in our sample is quite impressive (76.3%). We actually believe that portfolio companies' internationalization should be subject of a deeper analysis. Global amounts for EBITDA and cash flow decreased between fourth and fifth year after divestiture. Considering two of the most used indicators in firms' relative or comparative valuation we concluded that Price Sales Ratio and Price Book Value would have at least a positive evolution for this sample's companies. Cash flow and EBITDA variables are used in corporate valuation through net present value (NPV), which we didn't do. According to Damodaran (2012), NPV analysis should not be used for assets whose cash flows are not positive or could not be reasonably estimated for future periods of time.

Hypothesis 1 was accepted because the valuation of firms in maturity stage at the date of VC investment which were later sold out, is superior after 4 years of divestiture. Three of the performance variables – sales growth, external markets, and book value – and one sustainability variable – headcount – had a positive behavior.

Regarding hypothesis 2, which seeks to establish factors influencing on the valuation increase produced by VC investment in the duration of the agreement with sustained performance, we could not find influential impact of selected independent variables – contract duration, and

shareholding percentage – on sustained performance dependent variables. We used linear regression, to estimate the influence of independent variables “Duration on Contract” and “Shareholding Percentage” on the variables Sales Growth, External Markets Sales Evolution, Cash Flow Evolution, EBITDA Evolution, Book Value Evolution, Headcount Evolution and Number of Quality Certifications. The result which lies closer to the value with statistical significance is the ratio of the dependent variable “Book Value Evolution” with the independent variable “Duration of the contract” with a significant value of $t = 0.051$. Therefore, H2 is rejected. However, we stress that independent variables’ selection was bounded by survey II’s low rate of acceptance.

Table 3 displays average results for each of the sustained development variables after four years of an exit (3 point Likert scale: 3 – increased; 2 – maintained; 1 – decreased):

Variables	Average
Revenues from sales	2.29
External markets’ sales	2.59
Cash flow	1.74
EBITDA	1.79
Book value	2.32
Headcount	2.16
Quality certifications	2.03

Table 3 – Sustained development

IMPLICATIONS AND FUTURE RESEARCH

This work brings new perspective on venture capital’s role on portfolio companies both in terms of time impact and activity impact. Future research could explore the role of Venture Capital in internationalization of Portuguese companies. The influence of Venture Capital for internationalization in all development stages deserves further study as it is a key issue for the development of the Portuguese economy.

THE CHALLENGE OF ENGAGING ORGANIZATIONAL DIVERSITY IN DIVIDED SOCIETIES: THE CASE OF ETHNICALLY MIXED NURSES' TEAMS

Desivilya Syna, Helena¹; Raz, Michal²

¹The Max Stern Academic College of Emek Yezreel, Israel, desiv@yvc.ac.il

²The Max Stern Academic College of Emek Yezreel, Israel, michalr@yvc.ac.il

ABSTRACT

This paper addresses the challenge of coping with organizational diversity in divided societies, saturated with protracted national conflict. It is based on a case study of nationally and ethnically mixed nurses' teams. The study attempted to explicate the nature of the challenge, patterns of engaging it and the consequences on team members' intra-team relations and collaborative interactions. The central insights that emerged from the research show that cooperation, teamwork and joint interactions of diverse employees indeed constitute a particular challenge in divided societies. The medical staff in demographically diverse institutions and in particular in diverse teams indicated intergroup biases, implicit discrimination and tensions due to the salience of social categorization and the faultline phenomenon. Such strains magnify in crisis situations, notably when violent incidents associated with the protracted national conflict, erupt. The study participants indicated difficulties in engaging diversity issues related to the national conflict, thus leaving them in a hidden sphere. The findings showed paucity of organizational level efforts to engage diversity and social divisions-related issues. Notwithstanding the complexities ingrained in diverse workplaces, saturated with social divisions, members of ethnically mixed teams by and large are capable of maintaining cooperative interactions and effectively perform their healthcare tasks. Engaging "otherness" remains a considerable challenge in diverse work-setting, especially when team-work constitutes the main work modality.

Key words: inter-group conflict, diversity, "otherness", a divided society, shared team goals, team cooperation.

INTRODUCTION

The 21st century features significant changes, reflected in a mounting diversification of the workforce and organizational membership due to globalization and immigration trends (Coleman, Selden, & Selden, 2001). Elucidating the consequences of social schisms on diversity-related processes and performance in organizations is deemed essential in this era, characterized by socio-political, cultural and economic complexities, competition and concurrent increasing interdependencies among individuals, groups and organizations, hence the need for collaboration. However, the ramifications of such transitions on organizational behavior aspects such as relationship dynamics, particularly interpersonal and intragroup cooperation, have largely escaped employers' and employees' awareness (Desivilya & Rottman, 2012; Desivilya, Rottman & Raz, 2012). We argue that such immensely altered societies present a significant challenge for organizations. The major query to be examined is how do social divisions (inter-group conflicts) in societies influence the construal of diversity at work and ways of coping with this phenomenon? This article examines the consequences of social divisions on coping with diversity in work organizations. To engage the contemporary complex developments requires a critical analysis of the concepts of diversity, intergroup protracted conflict and of diversity management practices. What does the concept of diversity mean? What does diversity management entail in the context of a divided society and how does it influence the recognition of diverse voices, their articulation capacities and cooperation among various ethnic groups within the team context?

The current article attempts to illuminate the experiences of diversity primarily through the national and ethnic minorities' lens (versus national majorities' eyes) as these social groups have been often excluded, delegitimized and discriminated against in the workplace (Clair, Humberd, Caruso, & Roberts, 2012; Clair, Beatty & Maclean, 2005; Coleman Selden & Selden, 2001). The paper focuses on the Israeli case of demographically diverse employees in health organizations, highlighting the latent aspects in the relationship dynamics among diverse individuals and groups in organizations, such as the elusive stereotypes and biases, repressed fears of the other and implicitly imbalanced minority-majority power relations. We assume that diversity has prominent impact on work-place climate, employee relations, and actual cooperation in conflict-saturated social environments, manifested especially in the mixed teams' work dynamics. This research attempted to extend the knowledge base concerning the impact of organizational diversity in divided societies on the dynamics and performance in demographically heterogeneous work teams. Specifically, it explored the nature of diversity implications on team climate, patterns of engagement with this phenomenon and on intra-team cooperation as construed by nurses in ethnically mixed teams.

THEORETICAL BACKGROUND

This section provides a brief overview of the central concepts and theoretical framework pertinent to the understanding of organizational diversity in the context of divided societies.

Diversity indicates variation in a wide range of group members' characteristics, including salient demographic features such as age, gender, race, nationality and ethnicity, and professional background and expertise (Mohammed & Angell, 2004). These scholars distinguished between surface-level and deep-level diversity. Surface-level diversity refers to the extent of demographic variation in a work unit, whereas deep-level diversity purports to disparities in personality, attitudes, values and capabilities. We embrace the construal of diversity as a group characteristic, focusing mainly on the surface level; namely, differences in demographic characteristics such as race, nationality, ethnicity, religion, gender and social class and other markers of social identity which have generated intergroup stereotypes, acts of oppression or discrimination (Ely & Roberts, 2008; Ramarajan & Thomas, 2010). Scholars of organizational behavior endeavored to elucidate the mechanisms underlying the influence of diversity on intra-organizational relations. Nationality and ethnicity constitute a significant component of diversity in contemporary organizations, affecting the capacity to manage internal relations and organizational performance (Desivilya & Palgi, 2011b; Friedman & Desivilya, 2010).

Harrison and Klein (2007) distinguished among three elements of diversity: **variety** (differences in information, knowledge and expertise), **separation** (differences in position or opinion among unit members, which reflect disagreement on a horizontal continuum), and **disparity** (differences in control of valued social resources such as pay and status among unit members which are distributed on a vertical continuum). The *variety* aspect of diversity accounts for the benevolent influence on organizational group functioning. Variety in members' characteristics (such as nationality or ethnicity) brings to the group a potential to view issues from different perspectives and consider greater array of options to solve organizational problems. In contrast with the positive effects of *variety*, *separation* and *disparity* elements of diversity tend to impede group functioning and obstruct its outcomes (Harrison & Klein, 2007).

The disruptive effects of diversity were explained by the theories of *social categorization* and *social identity* (Tajfel & Turner, 1986) and the notion of *faultline* (Lau & Murnighan, 1998). According to the *social categorization* and *social identity* model people tend to define and

distinguish themselves from others based on their group membership. Encountering individuals from different groups sets up the categorization process and gives rise to a tendency to form a more favorable image of one's own group in comparison to the image of individuals from dissimilar groups (*in-group favoritism*). In the context of nationally and ethnically diverse organizational groups, *in-group favoritism* may affect the internal climate and dynamics, making it more difficult for 'out-group' members to express their voices and exert influence.

The *faultline* model (hypothetical dividing lines splitting a group into subgroups and giving rise to polarization between in-group and out-group identities) refined the underlying mechanism accounting for the negative impact of separation and disparity in groups with diverse membership. Van Knippenberg *et al.* (2011) explained the contingencies underlying the negative effects of diversity in contrast with its positive impact, maintaining that the actual adverse influence of social categorization depends on its **salience**, rather than on the mere presence of differences. Thus, the negative effects of diversity tend to prevail when categorization salience is high, whereas its positive influence predominates when the work group adopts cooperative motivational orientation, team-identity and shared objectives, which in turn foster constructive interactions such as coordination and collaboration. As we argue later, the legacies of protracted national conflict **interfere** with the **development** of such **benign group climate**, instead accentuating **faultlines**; namely, promoting in-group favoritism by the majority members while dampening the advantages of diversity.

Ramarajan and Thomas' (2010) literature review indicated positive effects of diversity management on intergroup equality, intergroup relations and performance of diverse groups. They also specified the organizational level and individual level factors promoting benevolent outcomes, such as the positive influence of excluded groups' increased representation (minorities and women) in organizations, especially in positions of power and improving their career trajectories. Moreover, Ramarajan and Thomas (2010) showed that positive interactions among diverse group members and mutual perceptions concerning desirability of such intergroup contact tended to mitigate prejudice, negative attitudes and enhance inter-group liking. Other organizational scholars pointed at relational benefits of diversity as reflected in inter-group respect, openness, inclusion, minority members' sense of integration in organization and majority members' perception of uniqueness with regard to minority members (Brickson, 2000; Carmeli & Gittell, 2009; Dutton & Ragins, 2009).

Ramarajan and Thomas (2010) temper the positive outcomes of organizational diversity, arguing that the effects in each of the three domains are independent, consequently

intergroup equality may not necessarily be linked with positive intergroup relations or improved group performance. Research has yet not provided clear findings with respect to the relations among the three arenas.

Triana, Garcia and Colella (2010) showed that organizational support of diversity moderated the effects of perceived racial discrimination, consequently enhancing employees' affective commitment. However, this pattern of relationships may change for different ethnic or social groups. Ethnic or national minorities who have experienced frequent acts of discrimination and have a strong sense of ethnic or national identity, such as Afro-Americans, tend to interpret organizational efforts to support diversity as hypocritical. Such attitudes are conceivable in the case of Arab citizens in Israel, particularly when they work in joint teams, because such situations tend to enhance the salience of social categorization (van Knippenberg, *et al.*, 2011).
