Social categorization can be especially pronounced in the context of social divisions; namely, in *divided societies*' thus, enhancing **faultiness**, increasing in-group favoritism by the majority members while impeding the creation of positive group atmosphere and thereby mitigating the benefits of diversity. We further contend that such disruptive effects are due to the reciprocal influence of individual level biases and limitations and social construction of intergroup power relations (Desivilya Syna & Rottman, 2012). The next sections explicate the processes motivating the multi-level combined effects of inter-group conflicts and diversity in *divided societies*.

A *divided society* implies deep inter-group splits penetrating through the society, with each social group featuring distinct cultural, religious and political identities (Hargie, Dickson, & Nelson 2003). Divided societies are characterized by "mutually contradictory assertions of identity in which one identity is validated or defined by suppressing another identity, making it difficult to presuppose any reciprocity of interests among groups" (Schaap, 2006: 266–7). Protracted national conflicts constitute rather extreme examples of a divided society with the most emphasized long-term consequences. The current article focuses on this phenomenon as it is based on an Israeli case which has evolved in such a context.

Previous research pointed at a host of negative ramifications of protracted conflicts on individual motivation and well-being, on interpersonal perceptions and group relations (Coleman 2004; Syna Desivilya 2004; Desivilya & Yassour-Borochowitz 2010; Friedman & Desivilya 2010). Continuous intergroup discord has a destructive effect on inter-group relations due to accumulative negative changes in attitudes, feelings, motivations, and behavior. Such protracted conflict gradually intensifies, often erupting into violence and

leading to perceptions of intractability: persistence and pervasiveness of the disputes, irreconcilable goals, threatened existential needs and escalation (Bar-Tal, 2011).

At the motivational level, each side adopts a highly competitive, intransigent stance, perceiving the conflict as a 'zero-sum game'. In the emotional realm, parties' feelings towards one another gradually change from anger to overall antagonism, often turning to hatred inflamed by vengeance. In the cognitive modality, adversaries rely on stereotypes and selective perception, disproportionately weighing negative information while discounting positive aspects. Increasingly negative perceptions of the other side breed mutual distrust. At the behavioral modality, adversaries encounter mounting difficulties in communication (Syna-Desivilya 2004; Bar-Tal, 2007; 2011).

The harmful transformations at the individual level seem inescapable due to universal human biases and limitations in processing the social world, termed by social psychologists *bias blind spot* or *meta bias* (West, Meserve & Stanovich 2012) and by Mitroff & Silvers (2010) as *errors of third and fourth kind*. Essentially, both formulations point at the inherent difficulty of individuals to think critically.

In parallel to the transformations at the individual level, changes also evolve at the group and the overall social context, reflected in rising ethnocentrism and groupthink (Syna Desivilya 2004). Each group tends to believe that its own goals are just, whereas the opponent group's goals are illegitimate (Bar-Tal, 2011). Groupthink symptoms include extreme within-group conformity and suppressed dissent. At the community level, a polarization effect gradually develops, namely, individuals and groups tend to join one of the rival camps. In addition there are manifestations of mounting mutual animosity experienced by both sides and a tendency towards sustaining a culture of conflict (DesivilyaSyna & Yassour-Borochowitz 2010; Bar-Tal 2011).

Despite the protracted conflict, Jews and Arabs in Israel interact on a continuous basis, maintaining interdependence and inter-group relations in various spheres of life. One of the central questions pertains to the impact of the Israeli-Palestinian conflict on the nature of work relationships between Jews and Arabs in the state of Israel (Desivilya Syna & Rottman 2012). The current article examines this issue, focusing on a case study of nationally and ethnically diverse nurses' teams. Citizens of Israel of varied national, ethnic, religious and cultural backgrounds have been working in joint medical teams in hospitals and communities, providing health-care to diverse patients' population. The interactions of such medical teams with patients have been maintained for many years in the context of the protracted Israeli-Arab conflict, yet the impact of such reality on their relationship and service

quality has not been systematically studied. Jewish and Arab medical workers have experienced all phases of the protracted Israeli-Palestinian conflict, including the most intense escalation stages (wars, terrorist acts and the two intifada uprisings). Thus, this case demonstrates an exceptional social phenomenon of health professionals from two adversary groups working in joint teams, treating patients from both groups even at times of violent conflict episodes. Maintaining social justice while managing diversity of work teams and delivering health-care services in the shadow of protracted national conflict that constitutes a significant challenge. Yet, research concerning the perceptions and actual coping patterns with such a complex reality has been scant. Hence, the current research intended to taper some of these gaps. It explicated the impact of organizational diversity in divided societies on the dynamics and performance in demographically heterogeneous work teams. Drawing on the literature concerning diversity in work teams (van Knippenberg *et al.*, 2011), among the potential factors that presumably account for the dynamics in diverse work teams of special interest, are individual level factors such as members' emotions towards teammates (notably empathy), mutual trust and joint professional identity. Group level elements are also significant; these include perceived intra-team support and intra-group cohesion especially in face of adverse events related to the protracted national conflict. The research has also examined the subjective outcomes of the dynamics within diverse teams such as individual members' perceptions of social justice. The major questions revolved around the **ramifications of diversity in the context of protracted conflict on team climate, patterns of engagement with diversity**, in particular the capacity of the national minority and various ethnic groups to express their **authentic voices**, and its impact on intra-team **cooperation**.

METHODOLOGY

The current study constitutes the initial phase of a research program; namely, a pilot study, which employed a qualitative methodology. **The participants** were 12 nurses, members of nationally and ethnically mixed medical teams who work in public medical centers in the Northern region of Israel. The **research tool** was an individual, semi-structured interview conducted with nurses, members of mixed medical teams. The findings reported in this paper are based on interviews with 3 Muslim nurses, one Druze nurse, one Christian nurse and 7 Jewish nurses (3 of them are immigrants from the former Soviet Union and one of them maintains religious life style). The nurses were asked to provide a narrative description of an intra-team conflict episode, which was followed by questions probing their views on the following issues: the climate in diverse work team, communication patterns and cooperation,

the impact of diversity on the team functioning (medical care), issues associated with their social identity, a sense of discrimination, strengths and weaknesses of nationally and ethnically diverse teams and, diversity management at their work organization. They were also asked about the team's functioning at times of violent incidents associated with the protracted conflict (terrorist acts of Palestinians or Israel Defense Forces military acts against Palestinians). All of the nurses gave their consent to participate in the study and were promised confidentiality. The interviews were conducted face-to-face by the second author of this paper and took place at the participants' workplace. The average interview duration was one hour and a half. The interviews were audio-taped and transcribed verbatim. Content analysis was performed based on the principles of qualitative research. The data were analyzed in three main stages: in the first, "open coding", reading each interview from beginning to an end to get an initial impression of the emerging main topics. Then a mapping analysis was conducted - laterally compiling the data. The third phase involved going back to the interviews in order to accomplish a focused analysis designed to identify the interviewees' attitude to concepts or topics emerging from the professional literature (e.g., perceptions of diversity, internal team conflicts, etc.) (Shkedi, 2003; Strauss & Corbin, 1990).

FINDINGS

We present the major findings of the pilot phase of the research program, which examines the internal dynamics in diverse work teams. The results underscore the hidden aspects of such processes, such as construal of intra-team work relations among members representing different national and ethnic social groups.

The major themes which have emerged from the interviews refer to the climate in a diverse work team, communication patterns and cooperation, the impact of diversity on the team performance (strengths and challenges of nationally and ethnically diverse teams), the majority's versus minority's perspectives on discrimination at work, team functioning in crisis situations related with the protracted conflict and diversity management at the organizational level. The next sections present the findings organized in accordance with their thematic focus.

TEAM CLIMATE

The participants' responses suggest that national or ethnic diversity within the work team affects its climate primarily on occasions manifesting differences of opinions between nurses

from different social groups. The disparities are viewed as cultural in nature and tend to exacerbate inter-group tensions in the work team, which in turn impede the overall atmosphere and mitigate the motivation for cooperation. As put by one of the Arab nurses:

"When there are cultural differences, such as between Christians and Muslims, they quarrel and the result is bad, they do not talk...do not want to work on the same side...there is an atmosphere of discomfort...you do not feel comfortable to work with someone you do not feel at ease..."

One of the Jewish and one of the Muslim nurses noted tensions arising from the cultural differences between nurses born in Israel (both Jewish and Arab) and nurses who are immigrants from former Soviet Union, as demonstrated in the following quotations: *"...They are cold, as if they don't have feelings, both towards peer nurses and towards patients...not as the nurses from eastern countries, such as Tripoli, Morocco, Iraq and the Israeli born, or Arab nurses; It makes unpleasant work atmosphere"; "They feel superior, patronizing, they think they know everything, they are not nice, do not talk nicely, I had few unpleasant situations with them... and the staff do not like to work with them..."*

One interviewee relayed a strong tendency of the nursing staff to interact with peers from the same social group: *"sub-groups, sub-groups within the team... let's say the Russians with the Russians, Yemenite with the Yemenite, Moroccan with Moroccan...it's very salient..."*. Such pattern of sub-groupings within a single team alludes to the phenomenon of *in-group favoritism* (Tajfel & Turner, 1986; Byrne, 1997) and the salience of *faultline* phenomenon (van Knippenberg *et al.*, 2011).

COMMUNICATION PATTERNS AND COOPERATION

Akin to the impact of diversity on team climate, internal communication processes and cooperation may be disturbed as a result of conflicts among team members belonging to diverse social groups. This is more likely to happen following extreme events, such as a terrorist act, and medical care of the victims (or the perpetrators). However, according to the interviewees, usually communication and cooperation among staff in diverse teams are quite effective. The common goal of providing high quality care to patients facilitates such constructive interactions. It creates a joint team-identity, which serves as a framework for organizing and coordinating behavior (Hinds and Mortenson, 2005). Arab and Jewish nurses were quite unanimous in their views about communication and cooperation in their respective diverse work teams. As put by the pilot study participants:

"Each nurse comes from different culture and has different values, but our work is different, we need to be cohesive, have consensus... we work for the patients, it's not a private business, we are here to help

others and work here in cooperation even though each nurse has different mentality..." ; "There is cooperation all the time, morning and evening... For example if I work with a Druze male nurse, it's obvious he takes care of the men... I don't have to tell him anything..."

THE IMPACT OF SOCIAL DIVERSITY ON WORK PERFORMANCE

The interview responses seem to suggest that social diversity is reflected in somewhat different functioning amidst various social groups, which can be attributed to culture-bound customs and norms.

One of the Arab respondents relayed an event which in her view had adverse impact on a patient and indirectly on the team performance:

"I worked with a Russian nurse... I care not only for the patient but also for his or her family, it's 90% of a cure. Family members have to feel that their loved one is in good hands... There was an old woman dying and her daughter wanted to stay with her, but the Russian nurse would not let her... she argued with her, she had no feelings. If she was more emphatic, putting herself in the daughter's shoes, she would have acted differently... Things like that interfere with the team functioning, but can help in treatment when the family trusts you...All this results from cultural differences..." (M1).

The findings indicate that the intra-team diversity not only affects the patients but it also negatively influences its own members and their work performance. The employees contend that the internal differences lead to interpersonal tensions and conflicts which impede their functioning at work. One of the nurses described an incident with a physician from a former Soviet Union demonstrating such an adverse impact on work relations:

"I don't agree that you treat this patient now. I will arrange for someone else to take care of her and this will solve this issue. You will not interfere with my job"; This Russian physician, she does not like that I communicate with her through messenger, that I enter her office. She simply does not like any contact. She always says that I just waste her time..."

The respondents reported both strengths as well as challenges in nationally and ethnically diverse teams. Most posited that diversity fosters culture-sensitive care through enhancement of inter-cultural understanding. It also promotes high quality care by matching treatment and care with the culture-bound norms and needs of patients from various cultural backgrounds, as put by one of the interviewees: *"Because we have patients from different cultures if we have a nurse from the same culture as the patient, she understands the patient's behavior, why he behaves that way, for example is hysterical, shouts..."*

Diversity can also contribute to tailoring work schedules; namely, matching the work shifts in accordance with the national, ethnic or religious holidays. Another significant strength of diversity, noted by the interviewees was broadening their perspectives on various care-related issues. By contrast, the main drawback of diversity, indicated by the study participants, was mounting likelihood of conflicts and tensions as a consequence of discordant outlooks. The latter result lends further support to findings obtained in prior studies on work team diversity (Desivilya & Palgi, 2011b; Desivilya, 2008).

Another challenge arising from social diversity in teams purports to the use of language at work. The interviewees claimed that there is a very strict norm precluding use of any language other than Hebrew in the work context, as manifested by the following citation: *"Look, it's very disturbing when you come in and three people stand together and two of them are always talking (foreign language). I understand that it's easier for them to converse in their own language but it's uncomfortable for me, and for anyone else that walks by and does not know what you are talking about. For all I know you may be talking about us and it's extremely uncomfortable for the rest of us."*

In other words, speaking "foreign language" in the work-team setting conveys a message of insensitivity and lack of consideration, being impolite and disrespectful of other group members. Therefore most of the respondents have argued that it should not be allowed. In line with Foucault's (1994) arguments, language symbolizes power relations, allowing to exclude and marginalize less valued team members, engender a sense of injustice and distrust in turn mitigating motivation for cooperation (Tyler, 2012).

SENSE OF EQUALITY VERSUS DISCRIMINATION IN DIVERSE TEAMS: NATIONAL MAJORITY AND MINORITY PERSPECTIVES

The findings revealed that issues associated with a sense of equality versus discrimination appear quite significant in diverse work forums, manifested at various arenas, as depicted below.

Patients' attitudes and behavior. Several respondents indicated cases of patients' racist attitudes and discriminatory behavior as a result of membership in different social group. Some of them reported that people occasionally refuse to accept medical care from members of "the other group". This issues were noted only when care was provided by an Arab nurse as manifested in the following quotation: *"...one day a patient approached an Arab male nurse in a clinic in a kibbutz and told him something ...that he got a job in a clinic because only Arabs work*

there...I told him (the Arab nurse) as I tell each of the new nurses – Arabs or Russians that they have to 'swallow a frog' when they come to work in a kibbutz... later they became familiar with him, the fact that he is an Arab... but he is an extraordinary nurse..."

Implicit discrimination. Minority members also reported personal experiences of discrimination as medical personnel reflected in their perceived inability to voice criticism, especially towards superiors, fearing sanctions, as put by an Arab participant:

"There is one nurse in my team, an Israeli born Jew... This is personality, this is a character, she has no fear, once she told the head nurse that she is a liar. I as an Arab cannot tell such a thing, because I know that the next day I am out..."

Not surprisingly Jewish nurses viewed discrimination from a majority perspective: they felt pressure not to get involved with criticism towards their minority counterparts, concede in conflict situations in order to avoid accusations of racism and discrimination, thus preserving intact work relations, as expressed by one of the Jewish nurses: *"Concerning a Muslim employee, she is also Muslim, when she notices that he evaded working she got angry at him, no reservations; I cannot allow myself to get angry at him. I know that he will right away say it's discrimination... I need to be careful..."*

Delayed promotion. Seemingly unfair promotion of Arab employees was another area of discrimination pointed by some of the interviewees, as expressed by a Jewish nurse: *"There was a male nurse that was angry in the hospital... He claimed that the management wouldn't promote him to be in charge of the entire department. I couldn't believe my ears. The common knowledge is that they (the Arabs) are only twenty percent of the staff, we had then over the twenty percent that are in high level positions, managing and in charge of various departments. I do not think it's discrimination."*

Most respondents argued that the formal rules and regulations preclude discrimination acts. Hence, by and large they viewed most of the management and work practices as fair and equal for all employees, regardless of their socio-demographic background. Albeit, this perception markedly changed when a specific event or case was narrated, revealing a gap between the desired and actual state of affairs, as put by one of the Arab nurses:

"If there was a culture sensitivity there, they would have built something, some small room for Muslim population to pray... instead of going to pray at the lawn outside the hospital. They can find a corner in each department to pray, and add to it a small carpet, but it does not exist."

In-group solidarity versus out-group alienation. Some respondents argued that here is solidarity and mutual support among employees of a similar ethnic or national origin. However, this internal sense of solidarity breeds perceptions and feelings of alienation and

inequality among employees of different ethnic and national origin (out-group) as manifested in the following quotation by an Arab nurse.

"The Russians...at work they are creating groups of their own. They are very protective of one another, they are a kind of clan or tribe that defends themselves against everyone else, and are not allowing anyone to join this club of theirs. It is not allowed to hurt someone in their group, it is forbidden to talk about them. They're constantly protecting everyone in their group."

Majority-minority relations in diverse teams. The findings point at two kinds of "majority": a **quantitative** one, which reflects the number of members belonging to a national majority within the team; and a **leading/normative majority**, namely a dominant group which sets the normative orientation of the team (regardless of their actual size) and constructs its actual dynamics. The former – quantitative - majority refers to immigrant nurses from the former Soviet Union, whereas the latter – normative- majority pertains to Jewish Israelis (born in Israel or old-timers). The normative majority in most cases succeeds in imposing its will on the other groups, at times resorting to harsh measures such as direct or implicit threat. The following excerpt from an interview with a senior Jewish nurse - a department head - concerning her conversation with one of her Arab subordinates, demonstrates the argument. The minority member made a feeble attempt to voice her consternation with respect to her superior's discrimination of an Arab nurse while favoring a Russian nurse. This endeavor was utterly silenced. Similar tendencies were identified in Clair *et al.* (2012) study which was conducted in demographically diverse work settings.

"She wanted to talk and was crying heavily. She does not want to leave the department, she did not mean to say it...I told her: Look a person is expected to be somewhat logical, even if you have an opinion, not to express it. And don't start accusing one party. I think that if we speak openly in the State of Israel you know exactly what happens in contrast with any other place in the world. No complaint can be accepted on moral or democratic grounds...So let's not get into it because you are wrong all the way and you are very judgmental. You weren't there so you have no right to judge people. We don't judge what happened there. But you judge a person? She said that she was wrong and apologized that things really got out of control. That's it, she understood. The truth is she really made an effort not to talk around others, and around her there was also no talking. They knew how to take a distance in this case."

TEAM FUNCTIONING IN CRISIS SITUATIONS RELATED TO THE PROTRACTED CONFLICT

The interviewees contended that violent incidents associated with the protracted national conflict, aggravate tensions, thereby impeding team functioning. Interestingly, when the acts of aggression constitute a war with potentially negative consequences for all social groups in Israel (majority and minority alike), a fleeting solidarity between the national groups tends to develop, however leaving intact some legacies of the intergroup strain. Most cases of either party's violence (Israeli or Palestinian) generates markedly tense team atmosphere, considerably mitigating intergroup tolerance, in turn impeding motivation for cooperation. The following citations from the interviews' responses exemplify such difficult experiences of nurses in diverse teams: *"I feel tensions, I feel we refrain from talking, some employees boil inside and later burst on another issue, not the violent incident..."; "... we try not to look at each other, to hide these things, not to bring your personal feelings to work, there is no place for politics, you cannot be detached from your feelings, it's very difficult, you have difficulty to concentrate, but you do it, you do your work..." ; "...These tensions between Jews and Arabs burst during violent events, like war, terrorist acts..."*

DIVERSITY MANAGEMENT AT ORGANIZATIONAL LEVEL

All of the study participants argued that their work organization has hardly dealt with the general issue of social diversity in medical teams, and specifically has not addressed its consequences, reflected in the toils of a daily practice. Furthermore, they maintained that department managers by and large prefer to evade direct confrontation with diversity-related issues of the workforce. They opt to sustain seemingly harmonious work relations ("*industrial peace*"). The following quotations substantiate the passive stance of the management concerning diversity-related issues: *"The organization, I am not sure the management is aware, knows anything. My superior knows, but he hardly deals with the problems... since I am an experienced nurse I am expected to manage these issues..."; Here it is difficult, I am expected to solve these problems, to ignore the racist thing...for example we had this Moroccan Jew patient, we had to put a Druze patient in the same room, he refused, said he cannot be with a Druze in the same room..."* Evading direct engagement of diversity issues, not only does not alleviate the tensions, but enhances a sense of frustration and bitterness, which in turn may hasten escalation of intergroup conflicts, harming intra-team work relations, as documented by Ramarajan and Thomas (2010).

DISCUSSION AND CONCLUSIONS

The current study revolved around the ramifications of diversity in the context of a divided society, saturated with protracted national conflict, on team climate, patterns of engagement with diversity, in particular the capacity of the national minority and various ethnic groups to express their authentic voices. It also explored the impact of diversity in the specific inter-group context on intra-team cooperation.

The case of diverse nurses' teams described in this article corroborates the underlying assumption that management of diversities in divided society, in particular those ridden by protracted intergroup (national, ethnic and religious) conflicts, poses a formidable challenge for organizations. Notwithstanding the contribution of positive interdependence among diverse groups to collaborative efforts in the organizational arena, as was demonstrated by the current case, hidden aspects stemming from the legacies of prolonged national discord, impinge on the parties' relations and pose barriers on engaging "otherness" encapsulated in diversity and in societal divisions. This quandary is embedded in both, universal individual obstacles such as bias blind spot as well as construction of power by social institutions (Desivilya Syna & Rottman, 2012; Kristeva, 1991; Schaap 2006; West, Meserve & Stanovich 2012).

Such complex reality requires concerted efforts by organizations in order to cope with these largely latent difficulties to address "otherness" in organizations, foreshadowed by deep schisms such as protracted conflicts. These efforts include shifting hidden traces of exclusion, de-legitimation, silencing of voices and discrimination to the front of the stage, developing critical consciousness, education and training in "shadow negotiation" (Clair et al. 2012; Desivilya Syna, Rottman & Raz, 2012; Foucault 1994; Hansen 2008; Kolb 2004). In line with Kristeva's (1991) arguments, organizational efforts need to confront and overcome the separatist tendencies, acknowledge and respect the "strangeness" in others and in ourselves. As contended by this scholar when "otherness" becomes social, it is amenable to shaping in the direction of flexible society, which is not secluded within nationality, religion. Mixing of nationalities is accompanied by shedding-off of their political and social structures, thus ranging from voluntary cooperation to self-management, always keeping in mind that preserving dignity for ourselves should be matched with similar efforts with regard to the other. Such arrangement allows cosmopolitanism dwelling within national state or as labeled by Kristeva (1991) – having a coordinated diversity rather than uniform society.

The findings of the current study clearly show that hardly any of the above approaches and practices suggested above, have been enacted in in major health care centers. Nurses

operating within mixed team structures and providing health care services to a diverse patients' population are largely left to their own devices in coping with diversity in the context of deep social and national schisms.

Despite the meager evidence of engaging diversity at the organizational level, the current study seems to suggest that nurses working in mixed-teams by and large cope quite effectively in their daily practice, often taking advantage of the benevolent angle of diversity; namely, the *variety* element, such as tailoring care to cultural needs of the patients (Desivilya, Rottman & Raz, 2012; van Knippenberg, *et al.*, 2011).

Yet, cultural and social disparities do also leave adverse traces on intra-team work relations. Working in a mixed team-setting often enhances the salience of social categorization, amplifying faultlines, exacerbating the impact of differential perceptions with regard to patients and the nature of care, which in turn cause anger verging on animosity, disrespect, tension and alienation. Such feelings mitigate the motivation for cooperation among diverse team members. These findings corroborate previous research (Desivilya & Yassour-Borochowitz 2010; Friedman & Desivilya 2010; van Knippenberg, *et al.*, 2011). By contrast, when the work is performed in homogenous sub-groups (in-group), both the intra-group relationships as well as the actual functioning tend to improve according to the nurses' perceptions. This result also lends further support to the evidence obtained in previous investigations (Desivilya & Yassour-Borochowitz 2010; Friedman & Desivilya 2010).

The evidence collected in the current study indicates that the nurses' construction of their daily practices within diverse settings and in the context of deep social and national schisms, reflect a dynamic workplace environment. Diversity indeed affects their working routines, impinging on the team climate, communication and cooperation tendencies. Specifically, it changes diverse team members' capacity for inter-group tolerance, mutual understanding and motivation for cooperation, but its impact is usually moderate when the external socio-political environment is relatively tranquil. However, when a violent event occurs as a result of the persistent national conflict the intra-team the impact of diversity is magnified thereby transforming the intra-team relations quite dramatically. There is a growing polarization between members of the two national groups, in turn mounting difficulties in sustaining full-fledged contact. The salience of faultlines intensifies much further in comparison to tranquil periods (van Knippenberg *et al.*, 2011). Thus, members of the national majority and of the national minority tend to embrace clear national identity, clinging to their in-groups. The predicament of the minority is much greater as their voices tend to be completely silenced

(Clair *et al*, 2012; Desivilya, Rottman & Raz, 2012). The necessary work functions remain intact, but the overall atmosphere becomes highly tense (Desivilya, Rottman & Raz, 2012).

As diversity and social divisions constitute one of the fundamental features of the contemporary societies and consequently also of organizations and workplaces, the question still remains how to engage such complexities in order to materialize Julia Kristeva's (1991) quest of 'coordinated diversity' and dwelling in peace with "otherness." Based on the pilot study, we can conclude cautiously that nurses living in a divided society and employed in diverse workplaces vacillate among various modes of coping: in quiet periods manage to distill similarities and embrace shared identities, while in crisis situations resorting to avoidance and distancing from out-group members, while holding to their separate national identities. Although the difficulties of the national minority members loom larger, members of the national majority also experience the strains of the complex work reality. Future research needs to probe in greater depth the intricacies and fluctuations in the mixed-teams dynamics in an attempt to elucidate the potential mechanisms for mitigating inter-group alienation and destructive tensions, instead enhancing the collaborative tendencies through greater organizational social justice and shared identities (Tyler, 2012).

ABSTRACT

Purpose: The purpose of this research is to evaluate the strategy process within SMEs. Based on those findings the research seeks to develop a strategic framework (BSC strategy process framework) to reflect the activities that SMEs perform during the strategy process.

Design/methodology/approach: The research approach is abductive that consists out of two stages. First a conceptual model is deduced from the literature which is validated against the findings from the interviews in the SME. The second stage induces a strategic framework to conduct strategy within an SME setting based on the findings that were deduced. The research strategy is based on a single case study

Findings: The strategy process that the SME uses is messy; it is not systematic; it is not sequential and is not clear. It was found that they carry out a very ad hoc implementation of strategic activities. Based on these findings, a revised conceptual model is presented, which shows the 'strategy implementation phase' receives most frequently attention, while the SME is least involved in 'strategy formulation'.

Research limitation/implications: The main limitation of this research is that the BSC strategy process framework has not been implemented and tested within a SME environment to find out how effective it is in practice. A practical limitation of this study is that to operationalize this strategy framework, a SME has to operate as an effective team.

Practical implications: Strategists within SMEs could improve the way they conduct their strategy by following the strategy process outlined in this article including the strategic activities. SME strategists are encouraged to use the suggested strategic framework for this purpose.

Original value: The study offers an innovative approach to understand how SMEs perform the strategy process through a case study. This research suggests a strategic framework such that SMEs can overcome their difficulties in performing strategy. The research approach is innovative because it critically examines the literature based on a case study and uses those findings through crystallisation as a basis to justify why SMEs should adopt the strategic framework.

Keywords: SME, Deliberate Strategy, Emergent Strategy, Strategy Formation Strategy Process, Strategy as Practice, Post-Processual Strategy, Balanced Scorecard(First, Second, and Third Generation), Quality Function Deployment, Strategic Framework, Business Tools, United Kingdom, Moderate Constructionism, Crystallization, A Single Case Study, Qualitative Analysis, Deductive Approach, Inductive Approach, Abductive Approach, Semi-Structured Interviews, Thematic Analysis And An Enumeration Approach.

INTRODUCTION

The research aim is to understand the strategy process within SMEs, and to strategic tools for SMEs. According to Beaver and Prince (2004) SMEs have increased by 50% over 25 years, account for half the workforce, and 35% of the UK economy (Lou et al., 2011). In EU and USA, SMEs represent 99% of organizations (Burke and Jarratt, 2004). However, SMEs are not conducting strategic activities (Wang et al., 2007) a 'fact' which is primarily due to ignorance of the strategy process (Augustine et al., 2012).

LITERATURE REVIEW

Strategy Process

Strategy process stages	Stage 1		Stage 2	Stage 3		
	Deliberate approach	Stage Emergent approach	Deliberate and Emergent approach	Modern strategy process (activities based view)		
				Processual	Strategy as practice	Post processual
Time period	1960s – 1980s	1970s – 1990s	1980s – 1990s	1990 – 2000	2000s – Current	2007 – Current
Strategy process focused	Deliberate content focused	Emergent content focused	Deliberate and Emergent process focused	Emergent process focused	Extension to emergent process focused	Emergent practice focused
The Main Authors	(Chandler, 1962, Ansoff, 1965, Learned et al., 1965, Andrews, 1971)	(Johnson et al., 1998, Mintzberg et al., 1986, Mintzberg and McHugh, 1985, Mintzberg and Waters, 1985, Porter, 1980)	(Andersen, 2004a, Andersen, 2004b, Hart, 1992, Christensen and Donovan, 2000, Mintzberg et al., 1996), (Shrivastava and Grant, 1985, Nonaka, 1988, Wooldridge and Floyd, 1990)	(Mintzberg et al., 1998, Pettigrew, 1992, Pettigrew et al., 2003, Van de Ven, 1992, Whittington, 2001)	Jarzabkowski (2003), (Jarzabkowski et al., 2007, Jarzabkowski and Paul Spee, 2009, Jarzabkowski and Whittington, 2008, Jarzabkowski and Wilson, 2002, Whittington, 2006)	(Chia and MacKay, 2007)

Three strategy dimensions are *process*, *content* and *context* (Pettigrew, 1997, Chakravarthy and White, 2002). Originally, strategy focused on *content* (*strategic plan*). Long-term strategy formulation (deliberate) is criticized for lacking flexibility (Whittington, 2001); this lead to 'emergent' strategy, that deals with unplanned situations. Emergent strategy enables non-tangible factors (Boyd and Reuning-Elliot, 1998), i.e. political and contextual factors. To mediate between the deliberate and the emergent strategies, *strategy formation* bridges the gap between long-term planning and emergent strategy. Processual strategy focuses on actors and contextual aspects of strategy which emerged from market (Porter, 1998) and resource based strategy (Barney, 2001). Processual strategy its absence of micro activities is criticised (Johnson et al., 2003, Regnér, 2008) leading strategy as practice to focus on practitioners, practices and praxis (Whittington, 2006). Increased focus on practices evolved into post processual (Chia and MacKay, 2007).

Table (1): The Anatomy of strategy process stages There is no academic consensus regarding the strategy process phases. The debate questions if environmental analysis is part of formulation phase (Dudzevičiūtė and Peleckienė, 2010). Four phases are identified (e.g. Acur and Bititci, 2004), which are: environmental analysis, formulation, implementation, and evaluation including emergent strategy.

Strategies follow sequential iterative processes through these four phases. The process starts with analysis of the environment, internally and externally in relation to the market place (Côté et al., 2005). This is followed by strategy formulation, critical to the success of any strategy and performed through *strategic planning* (O'Regan and Ghobadian, 2002). This phase is usually the pitfall for SMEs (Baker et al., 1993). Strategy implementation depends on the quality of formulation. Critical success factors for implementation are cited in the literature (Aaltonen and Ikävalko, 2002, Atkinson, 2006). Measurements metrics are emphasised for importance during implementation enable strategy revision. Implementation leads to evaluation during which it can be determined whether further iterations of the strategy process are required (Côté et al., 2005). Emergent strategy is initiated through reformulated during on-going implementation.

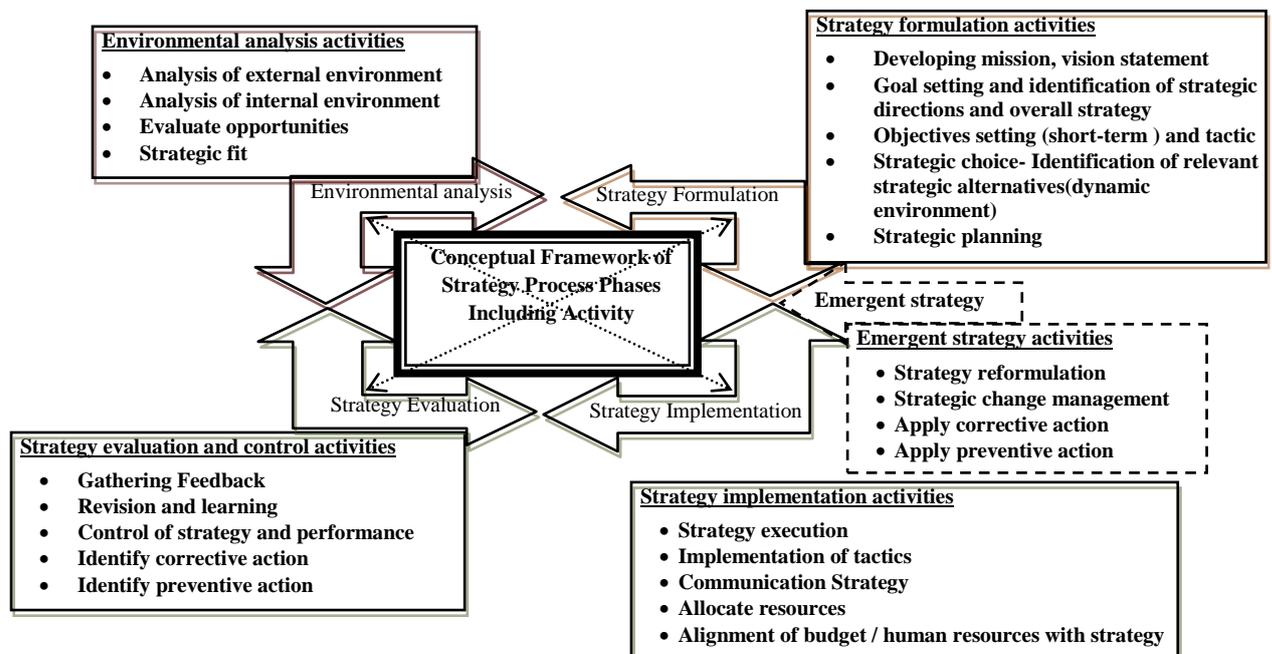

The Phases of strategy process and tools for their conduct

Revision of literature found researchers to identified *tools* useful in conducting strategy formulation, implementation and evaluation (Ghamdi, 2005). Tapinos et al. (2011) recognized a gap in the literature with insufficient research on strategic management tools to support the strategy process. Furthermore, the surveys that investigate strategic management tools are so

wide, diverse and inconsistent, it's hard to draw any conclusions at all (Jarzabkowski and Wilson, 2006).

One tool that has been frequently cited is the Balanced Scorecard (BSC) of Kaplan and Norton (1992). In particular, the formulation and implementation phases are seen as areas where it may have a particular role to play (Mendes et al., 2012). BSC has had, it is claimed, a significant impact on strategy formulation, others argue that it makes an organization distinct in strategic terms (Tapinos et al., 2011) . According to others, BSC enables performance measurement (Lawrie and Cobbold, 2004), and double loop learning (Sisaye and Birnberg, 2010, Rauffet et al., 2010) particularly for the evaluation phase. Also, it is claimed that BSC improves two way communication (Aaltonen and Ikävalko, 2002) between strategic and operational management (Atkinson, 2006).

Figure (1): The conceptual framework of strategy process

Over the three generations (Lawrie and Cobbold, 2004, Lawrie et al., 2006, Morisawa, 2002, Speckbacher et al., 2003, Guthrie and Yongvanich, 2011, Soderberg et al., 2011) of the BSC (Types I, II and III) itself, it has incorporated improvements to support its development as a performance measurement tool (Barnabè, 2011, Pongatichat and Johnston, 2008, Shulver and Lawrie, 2009). It has evolved into a strategic management perspective. Ultimately, some identify, it has become a tool for managing organizational change with the inclusion of a strategy map. See Table 2 for a summary of the claims.

Table (2): the evaluation of BSC

Type	Characteristics
Type I BSC	Financial and/or non-financial measures Grouped into perspectives
Type II BSC A strategic management system"	As for Type I BSC with added cause-and-effect relationships and some or all of the following characteristics: <ul style="list-style-type: none"> • Strategic objectives or strategic measures • Targets and action plans • Linkage between measures and organization's reward system • Linkage between strategy and the budgeting process and the scorecard used as a basis for evaluating potential investments and initiatives
Type III BSC The final Balanced Scorecard is known as framework for a strategic management system and organizational change	As for Type II BSC plus some or all of the following characteristics: <ul style="list-style-type: none"> • An analytic and information system designed to support strategy review • A process for learning and adapting the strategy in which managers validate (determine whether new strategic opportunities have emerged) and refine strategy

Source: Adapted from: (Lawrie and Cobbold, 2004, Lawrie et al., 2006, Morisawa, 2002, Speckbacher et al., 2003, Guthrie and Yongvanich, 2011, Soderberg et al., 2011)

Integration of BSC with other strategic management tools

The current study reviewed and evaluated the strategy process to understand how it was conducted within an organization. The research found through this evaluation of the strategy process that several limitations existed, not least the lack of formalization of process and the tools used. In conducting the review, it was observed that the case organization used several tools – as is recommended by some literature (Tapinos et al., 2011). The tools used included an informal SWOT analysis, scenario building, cost/benefit analysis and business case development, though often at the level of individual elements and not in an integrated way.

To further develop the case organizations strategy process, a context-driven revision of the BSC model was developed. This was identified as a suitable vehicle to be a more comprehensive and more formal approach, while still being in line with management expectation and experience. BSC is also one of the main strategy tools used in the strategy process elsewhere (Ahn, 2001, Atkinson, 2006). Therefore, the review and revision focused on other strategy management tools to support this approach: formal SWOT analysis, combined with the Quality Function Deployment approach were selected to support the BSC, with the aim of helping to overcome the limitations identified in the BSC in the literature (Barad and Dror, 2008, Koo, 1998). The literature review showed that these tools may be able to improve the BSC and this would help to overcome those limitations.

BSC cannot decide strategy or make a choice of strategic direction. SWOT analysis provides a better understanding of the internal and external environment of the organization, which

clarifies the strategic direction. Moreover, SWOT analysis helps the organization to understand the strengths and weaknesses that drive its strategic priorities (Papalexandris et al., 2005). The implementation of SWOT analysis helps to formulate strategies for the organization (Kaplan et al., 2008, Fernandes et al., 2006). The internal and external perspectives are analysed by a SWOT analysis from which the results (specific objectives) are placed in the strategy map, thus linking individual objectives into the BSC perspectives (Quezada, 2009).

Another important limitation of the BSC was found in its linkage model, the strategy map. However, there was no clear explanation of how the strategy map approach should be applied, or the detailed steps of the method. Based on the literature review, the QFD approach could perhaps make the strategy map more robust and reliable; a strategy map can be brought into action through QFD. Also, QFD provides integration between top-level objectives and operational level activities, which the BSC lacks. This would potentially enable a strategy plan produced by the BSC to be more effective, and therefore the strategy process could be implemented more efficiently by including the QFD strategy management tool in addition of the BSC.

Table (3) shows some examples for conclusion of the analysis of the previous literature review (theoretically or empirical) of the integration of BSC with SWOT analysis and/or QFD.

Table (3): Overview of the literature review of strategic tool integration

METHODOLOGY

Research paradigm

The research adopted the moderate constructionism paradigm, on the basis that the researcher does not seek a universal truth, instead the researcher seeks to build up a multi-faceted community view (Järvensivu and Törnroos, 2010). Because epistemologically knowledge is mutually constructed between researcher and interviewees, a subjective ontological reality is formed. The research approach is abductive (Dubois and Gadde, 2002) through deduction of the conceptual model for the strategy process from the literature, this conceptual model is validated through falsification using the findings of the case study. This is followed by the induction of the suggested BSC strategy process framework for SMEs, based on the research findings (Elo and Kyngäs, 2008). Within this research paradigm a qualitative approach was adopted, which is reflected through the research methods (Patton, 2001, Bryman, 2012, Roshan and Deeptee, 2009).

Research Aim Objectives and Questions

The aim of this research is twofold: it seeks to understand the strategy process within SMEs; and it aims to generate a strategy framework [using the BSC framework with other strategic tools (QFD and SWOT analysis)] to support SME management in the creation of a coherent strategy process.

Research objectives

- To identify from the literature what is known about the strategy process, especially in relation to SMEs.
- To utilize a dynamic process view as an approach to clarify activities, strategy tools, techniques and methods in the SME strategy process.
- To develop a framework incorporating BSC and other business tools (SWOT analysis and QFD) to connect and carry out the strategy process.

Research Questions

Research Question 1: What is the strategy process and how does it operate within the SME?

In order to answer this broad research question, the researcher has first to answer two further research questions, which are:

Research Question 1a: what are the key strategic activities in the SME and how are these performed?

Research Question 1b: Which strategic tools are used in the SME during the strategy process?

Research Question 2: How may a BSC strategy process framework [along with other business tools (QFD and SWOT analysis)] be used to support the strategy process in SMEs?

Research methods

The research strategy is based on a single case study. The nature of the case study is explorative (Yin, 1994). Only a small number of studies have investigated the strategy process within SMEs. The research investigates a single holistic unit, as it treats the SME under observation as one unit (Yin, 2003), which is intrinsic (Stake, 2005, cited by Gilstrap, 2008 , p.2). According to Järvensivu and Törnroos (2010), the usage of a single case study is coherent within the research paradigm (Moderate Constructionism), in which a single case study is often used.

It was decided that a single case study would be appropriate based, on the type of case study (exploratory), its very nature (intrinsic) and the purpose for which the case study is applied (to understand the phenomena). The findings derived from the research actors are jointly constructed, which implies they are subject to context and the actors' community view. The primary data collection techniques to obtain the depth for this single unique case study is through interviewing the five key actors within the SME. This was supported through the use of archive and textual materials, supported by observation.

The research methods in the present study are divided into two sections. These are the data collection and data analysis methods. For the collection of data an interview was conducted with five of the key actors in the SME who held information relevant to this study. Once the data was collected through the interviews, it was analyzed through joint both *thematic analysis* and *Enumeration methods* (Data analysis process). Data analysis process is through joint both *thematic analysis* and *Enumeration methods*. *Thematic analysis method* involved the coding according to the themes (strategy process phases and activities) and its interpretation. *Enumeration method* determined the frequency with which each code phase and code activity for the strategy process was mentioned by a respondent. *Crystallization* enables a researcher to validate findings within a single case study, and seeks to obtain all the dimensions of the research in a similar way to a crystal, that is able to reflect light in all directions simultaneously. Crystallization was found to be suitable for the research based on the views of Järvensivu and Törnroos (2010). Crystallization takes into consideration that there is no universal truth. It was achieved through a multi-dimensional exploration of the data, based on the knowledge that the findings were subjective, and this offers a way in which a form of validity may be established.

ANALYSIS AND DISCUSSION

Introduction

The analysis within this section has evaluated the responses from the actors within the study and categorized them according to the phases and activities of the strategy process. To better understand this analysis it is further discussed in light of some of the finding within the literature of SMEs. This provides an insight into the SME and weights up the findings to determine how effective the SME is at performing strategy according to the strategy process.

Environmental analysis phase

Within this study it was found that the more senior managers are involved in environmental analysis through the SWOT analysis. It was found that the focus is very much on technology to gain competitive advantage within the marketplace (with politics, economics and social factors largely ignored). Eternally the key factors seem to be the customer. Although the SME has limited ability in evaluation of opportunities based on internal strengths and external opportunities, extensive work has been done towards finding strategic fit between internal and external environments. This led the SME to understanding the difficulties to find an opportunity that they can take advantage from due to a lack of resources which is typical for SMEs.

		Analysis of External Environment	Analysis of Internal Environment	Evaluate opportunities	Strategic fit	Strategic tools
Actors	Operations and Board Director	<ul style="list-style-type: none"> • Planning ahead through customer communications • Improved customer satisfaction 	<ul style="list-style-type: none"> • Limited resources means that opportunities must be selected carefully 	<ul style="list-style-type: none"> • Apply internal resource to external opportunities 	<ul style="list-style-type: none"> • Communication with customers to plan ahead 	<ul style="list-style-type: none"> • Informal/ Intuitive SWOT • Cost benefit
	Business Development Director	<ul style="list-style-type: none"> • Importance of technological developments 			<ul style="list-style-type: none"> • Searching for new opportunities based on internal competencies 	<ul style="list-style-type: none"> • Analysis used informally • What if scenarios and risk analysis are used to evaluate opportunities
	Business Manager	<ul style="list-style-type: none"> • Decision-making based on market threats and opportunities • Environmental analysis is an on-going activity 	<ul style="list-style-type: none"> • Internal analysis through discussion and based on external changes • The analysis results are weighted to determine their importance 		<ul style="list-style-type: none"> • Increase profit through new opportunities 	

Strategy formulation phase

Determining the direction of the strategy was found to be mostly a senior management role through setting goals and objectives. In terms of strategic choice the SME is very much driven by available market opportunities with low risk as a key factor. The actual planning is mostly

focused on allocation of resources especially IT and the key planning tools used are business cases and action plan. With regards to strategic planning it was found that the SME is ahead of the game as most SMEs are not performing strategic planning (Wang et al., 2007), especially in the area of IT which is found to increase organisational performance ((Prasad et al., 2012).

	Development of mission and vision statements	Setting goals	Setting objectives	Strategic choice	Strategic planning	Strategic tools
Actors	Operations and Board Director		<ul style="list-style-type: none"> • Provide public sector services 	<ul style="list-style-type: none"> • Objectives defined in action plan 	<ul style="list-style-type: none"> • Presentation of business cases 	<ul style="list-style-type: none"> • Outline action plan for business cases /IT security plan • Key resource in planning is IT
	Business Development Director	<ul style="list-style-type: none"> • Five to twenty year vision • Establish reliable IT infrastructure 	<ul style="list-style-type: none"> • Project cost and benefits must be approved • Increase customer service standards through IT 	<ul style="list-style-type: none"> • Strategy must be approved by fiancé department • Reduce risk when possible 	<ul style="list-style-type: none"> • Business case proposals for strategic choice 	
	Business Manager		<ul style="list-style-type: none"> • Directors specify long-term goals 	<ul style="list-style-type: none"> • Increase awareness of short-term objectives among staff • IT objective to enable day-to-day operations 		<ul style="list-style-type: none"> planning through resource allocation
	IT manager	<ul style="list-style-type: none"> • Stay updated 		<ul style="list-style-type: none"> • Ensure 100% IT uptime • Meet user requirements 	Not choice, just seize opportunity	IT security plan
	Communication and marketing manager			<ul style="list-style-type: none"> • Align IT with business operations • Review IT purchasing plan 	<ul style="list-style-type: none"> • Less risky choices 	

Strategy implementation phase

The SME was found to be most involved in the implementation of strategy. This is mostly through allocation of human resources, IT and budget management. Each of these is found to be closely related as they attempt to reduce resource usage to minimise the expense. Within the literature resources are the key obstacle for SMEs to implement their strategy. The SME executes its strategy through the implementation of tactics. IT was found the most central tactic to most of the strategies implemented by the SME. Although multiple communication channels have been identified, lack of communication and poor communication existed within the organisation. Furthermore, the SME does not use strategic tools for the implementation phase.

	Alignment with Human Resources and Budget with Strategy/ Allocate Resources Activity	Strategy Execution Activity	Implementation of tactics Activity	Communication strategy Activity	
Actors	Operations and Board Director	<ul style="list-style-type: none"> • Development of human resources • Cost reduction in area of IT 		<ul style="list-style-type: none"> • IT used as a tactic for day-to-day operations • IT as a tactic to reduce budget 	<ul style="list-style-type: none"> • Feedback provided during meetings or in private
	Business Development Director	<ul style="list-style-type: none"> • Understanding of HR requirements • Training program • Meeting sales and marketing targets • Re-use IT to meet strategic objectives • Financial investment based on return on investment 	<ul style="list-style-type: none"> • Diversify into private sector • Strategy formally implemented when bid is successful • IT used to implement strategy • Directors decide when strategy is implemented • IT to measure strategy performance during implementation 	<ul style="list-style-type: none"> • Marketing and telesales services as a tactic to increase customer base • Sales and marketing as a tactic to increase revenue • IT as a tactic to meet strategic objectives 	<ul style="list-style-type: none"> • Formal communication to implement strategy • Strategy communicated to staff for execution
	Business Manager	<ul style="list-style-type: none"> • Resource allocation depending on internal ability and market conditions 		<ul style="list-style-type: none"> • Cost reduction tactics 	<ul style="list-style-type: none"> • Weekly feedback meetings
	Communication and marketing manager	<ul style="list-style-type: none"> • Cash flow of day-to-day operations 	<ul style="list-style-type: none"> • Provisioning of services to public sector 	<ul style="list-style-type: none"> • Marketing research as a tactic to understand customer needs 	<ul style="list-style-type: none"> • Discuss progress on a weekly basis
	IT manager	<ul style="list-style-type: none"> • Qualified staff to take advantage of IT • Unqualified staff • Inefficient budget management • IT resources to support the business functions 	<ul style="list-style-type: none"> • Digitalize business processes • Strategy is executed when directions communicate it with managers 	<ul style="list-style-type: none"> • Software packages as a tactic to achieve short and long-term objectives • IT as a tactic to meet business requirements 	<ul style="list-style-type: none"> • Lack of communication causes poor communication

Strategy evaluation phase

	Control of Strategy and Organization Performance	Gathering Feedback	Revision and Learning	Identify Corrective and Preventive Action	
Actors	Operations and Board Director	<ul style="list-style-type: none"> • Project implementation evaluation • Quarterly monitoring meetings • Measurement of departmental performance 	<ul style="list-style-type: none"> • Internal feedback at meetings • Sales stats discussed monthly • Quarter annual review 	<ul style="list-style-type: none"> • Revision of the business process • Quarterly progress evaluation meetings 	<ul style="list-style-type: none"> • Improve strategy execution (SE8)
	Business Development Director	<ul style="list-style-type: none"> • IT systems risk evaluation • Weekly strategy performance meetings 	<ul style="list-style-type: none"> • Obtain customer feedback • Feedback through questionnaire 	<ul style="list-style-type: none"> • Learning from staff feedback questionnaire 	<ul style="list-style-type: none"> • Reduce risk of IT system down time • Evaluation for continues improvement
	Business Manager	<ul style="list-style-type: none"> • Weekly strategy control meetings • Raise awareness of short-term objectives • Strategy control through performance measurement • Review implementation results 	<ul style="list-style-type: none"> • Measure organizational performance 	<ul style="list-style-type: none"> • Strategy progress revision • Market research and competitive analysis for strategy revision • Evaluation through monitoring results 	<ul style="list-style-type: none"> • Identification of communication problem
	Communication and marketing manager	<ul style="list-style-type: none"> • Balance sheet and survey to measure performance • Customer feedback collection • Strategy evaluation with project data and feedback 	<ul style="list-style-type: none"> • Monitoring customer requirements and satisfactions • Collect customer feedback 	<ul style="list-style-type: none"> • Improve services to increase customer satisfaction 	<ul style="list-style-type: none"> • Proactive decision-making
	IT manager	<ul style="list-style-type: none"> • Strategy control based on results 			<ul style="list-style-type: none"> • IT requirements forecasting

In the literature it was found that most SMEs do not exercise strategic control (Oakes and Lee, 1999). However, in this study it was found that the SME has implemented several measurement systems for monitoring. The literature nevertheless criticises SMEs for the lack of resources leading to the inability of monitoring (Tenhunen, Rantanen and Ukko, 2001 cited by Rompho, 2011), especially for the gathering of feedback. The SME even applied advanced techniques of strategy evaluation during the revision and learning through looking at corrective and preventive action which is rarely performed by SMEs (Murphy and Kielgast, 2008).

Emergent strategy

		Strategic change management	Strategy reformulation	Application of corrective and preventive action
Actors	Operations and Board Director	<ul style="list-style-type: none"> • Technological and economic factors • Formal steering group to review business cases 	<ul style="list-style-type: none"> • Reformulation depends on external environmental 	
	Business Development Director	<ul style="list-style-type: none"> • Economic and technological change • Improve organizational performance • Flexible strategic management to increase performance 	<ul style="list-style-type: none"> • Management meetings to improve business strategy 	<ul style="list-style-type: none"> • When possible corrective actions are applied • Preventive action to overcome problems

The SME in this study was found to not be very involved with emergent strategy activities, this when a strategy is being implemented. This is mostly through the management of change during the course of the strategy. It was found that this change in the strategy causes the requirement for changing the strategy through reformulation and aim to correct and prevent mistakes from happening. Although the SME is performing some of those activities, it is only to a limited extent and the actors with the SME are not completely conscious of this process taking place.

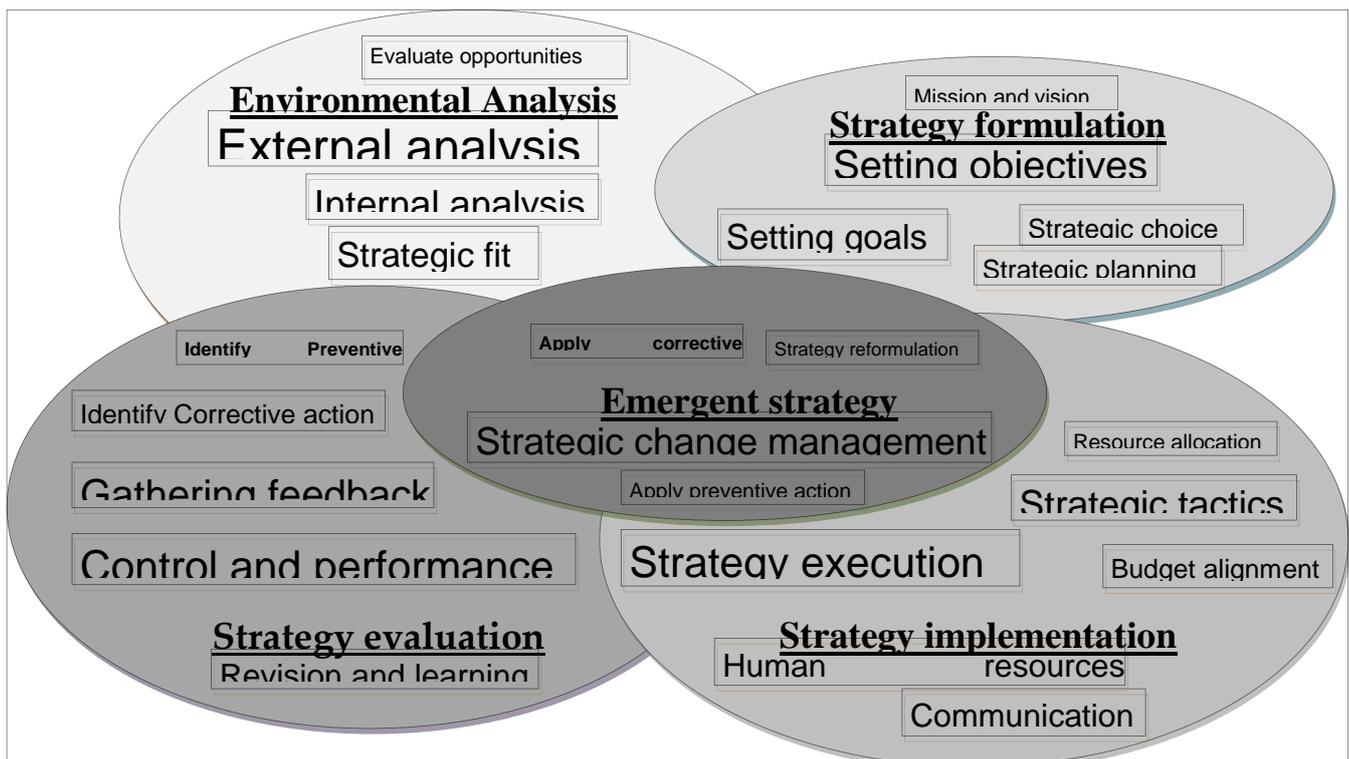

RESULTS

The research within this study started with the evaluation of the literature with the purpose of developing an understanding of how SMEs perform strategy, which is depicted in the strategy process conceptual model. Based on those findings, this research seeks to evaluate how an SME is engaged with the strategy process. It was found that the SME is involved in all the phases and activities described within the literature up to a certain extent. In the reviewed conceptual model displayed above a revised conceptual model (Figure 2) is presented of the

study that depicts in proportion by size the level of involvement that the SME has in each and every activity within the phases of the strategy process. The 'strategy implementation phase' receives most frequently attention, while the SME is least involved in 'strategy formulation'. Whilst the literature lays out a systematic, sequential process the picture presented of the case study SME is somewhat different. The process that the SME uses is messy; it is not systematic; it is not sequential and is not clear. The reasons for this may be summarized as follows:

- Ambiguous communication of information
- Inability to manage development, growth, and innovation without a flexible approach
- A lack of systematic methods for defining strategy
- Importance/seeking new opportunities
- Short-term cash flows
- High risk in the SME

Figure (2): a revised conceptual model of strategy process

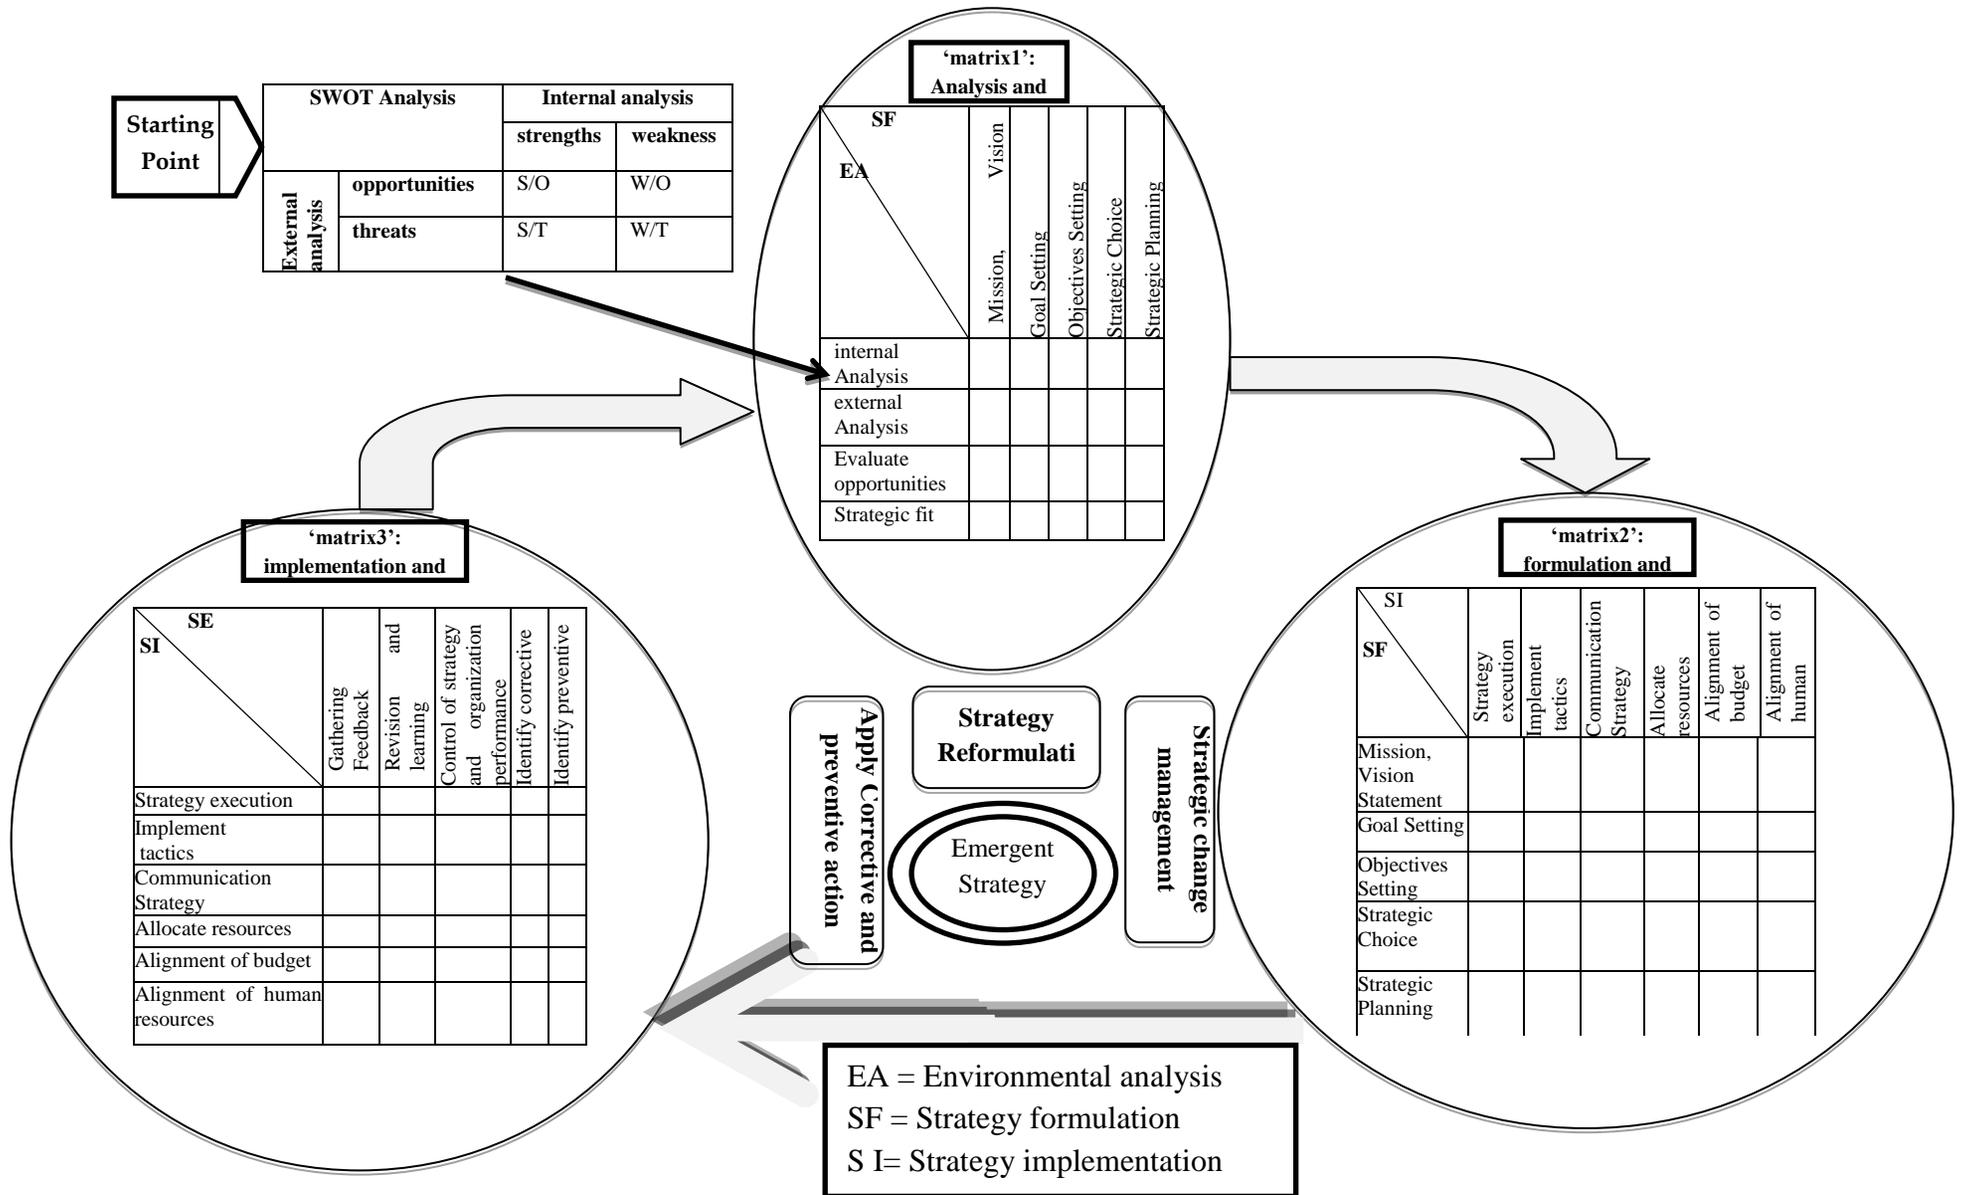

SUGGESTED FRAMEWORK AND FUTURE RESEARCH

Based on the answers to the research questions, a contribution is presented which includes an integrated framework of the BSC, SWOT analysis and QFD tools (Figure 3). Justification is grounded on the literature, and the analytical findings that demonstrate how the framework may improve the strategy process for SMEs by addressing inherent difficulties within the strategy process.

The strategy framework functions through feeding the results of the swot analysis into the QFD matrix. The QFD process enables all the phases of the strategy process through the BSC. The evaluation of the strategy is done via the BSC measurement KPIs. Emergent strategy is incorporated through iteration.

The results of this study may hopefully facilitate future research that can expand on its findings, be conducted in different sectors, both public and private

Figure 3: Suggested BSC strategy process framework

RESEARCH LIMITATION

The main limitation of this research is that the BSC strategy process framework has not been implemented and tested within a SME environment to find out how effective it is in practice.

CONTRIBUTION TO THEORY AND PRACTICE

This study makes several contributions to the body of knowledge for a strategy process as management theory and practice. The contributions are the conclusions drawn from the literature review; the conceptual model that was deduced from the literature; the methodological implementation of the research paradigm of moderate constructionism and validation through crystallization; and finally, a suggested BSC strategy process framework that is constructed to aid SMEs in performing the strategy process as outlined in this article, as flows:

First: The adoption and use of the BSC framework in SMEs for the strategy process is rare, and little research has been carried out. The adoption and use of the BSC framework for the strategy process (as phases and activities) in SMEs is new, with no prior evidence of research into this purpose.

Contribution to theory within this research lies in suggestion of BSC strategy process framework (see figure 3), which adds to theory and it also adds to practice. This framework is developed through the synthesis of existing theoretical research on the strategy process and strategic tools, with evidence gathered from the empirical study within the SME, in order to understand how the SME performed the strategy process, and whether any strategic tools may be used to support this process. Based on the practice derived from the present study and theoretical knowledge from the literature, a strategy framework integrating BSC with two other strategic tools (SWOT analysis and QFD) is developed in order to support the phases and activities of the strategy process.

Through this Suggested BSC strategy process framework, SMEs may deploy a systematic approach to strategy. Through this systematic approach, SMEs are enabled to manage their cash flow and reduce risk; this also means that the SME can better manage growth and innovation. The framework is also novel in the following aspects which may support managers in maintaining a coherent strategy process, by overcome limitations for the SME, as follows:

- Synthesis of process phases.
- Activities in each phase are highlighted and positioned.

- Tools related/ connected to activates and phases
- The possibilities of implementation are explicitly considered
- Unified process
- A flexible and coherent process

Second: The findings of the research within the SME allowed the validation of the conceptual strategy process model (see figure 1 and 2) in understanding how the SME perform strategy and which phases they go through implication to practice.

Third: The analysis of this research is unique and can be considered a contribution to knowledge, as it has not been seen in any prior literature. This was based on the methodology that was used. Within this research the researcher adopted a moderate constructionist paradigm, through which reality is socially constructed during the interviews between each interviewee and interviewer. To validate the results of the interviews the researcher used 'crystallization'. While crystallization is a known method, the method of application through which the results of each interview were categorized, according to the activities of the strategy process, is novel. This allowed a comparison of the interviewees and determined whether they had views which were compatible, or contradictory.

Fourth: A modified conceptual model of strategy process (based on the previous review of theoretical and empirical literature of strategy processes, see figure 2) is developed for SMEs.

IMPLICATION TO PRACTICE

The implementation of the devised BSC strategy process framework is complicated and requires well-educated strategic managers. This is one of the factors for which SMEs have been criticized in the literature. For a SME to be able to implement the BSC strategy process framework there are some prerequisites, which are necessary to the success of this framework for the strategy process. The key requirement is strong leadership within the organization, which could be defined as top level management, as well as chief executive support and involvement in the process. These leaders must have a distinct view of where they are driving the business, proper business acumen, and knowledge of strategy and relevant strategy tools, as they are the key people who take control of decision making and the strategy framework. Consequently, it is found in the evaluation of this research that it is important that the resources of the SME are well managed, and it is suggested that specific roles are allocated within the organization to deal with human resources and finance as well as other resources, depending on the nature of the business. This is necessary to effectively implement the suggested a BSC strategy process framework, as this is one of the key weaknesses within

SMEs. At a broader level within the organization strong team working must exist, and it is essential that staff cooperate during the strategy process. At a human resource level, on-the-job training must be provided, such that business specific skills are of a high standard, so that confidence in strategy implementation is developed.

“BACK TO THE FUTURE: THE VIRTUAL MUSEALIZATION IN PUBLIC MANAGEMENT. A RESEARCH NOTE FROM ITALY”

Esposito, P.

Business Administration, University of Piemonte Orientale “Avogadro”,
paolo.esposito@eco.unipmn.it

ABSTRACT

The enhancement of cultural heritage has been a recurring theme within the scientific debate by scholars from different disciplines and in the political agenda of most countries over the last decades (Meneguzzo, Grossi, 2002; Ferri, Zan, 2012).

The purpose of this paper is to provide an analysis of the growing phenomenon represented by the "Virtual Musealization" of archaeological sites in Italy, focusing on the case of Pompeii and Herculaneum. The result will be a form of virtual accountability supporting on the one hand, the improvement in accessibility to museum services and particularly to the ruins of Pompeii and Herculaneum and on the other hand, facing the lack of resources and inadequate structures and skills for the protection and preservation of archaeological heritage of humanity (Zan, 2002; Ferri, Zan, 2012). The work aims to achieve the research objectives through an “inductive / deductive” search method (Yin, 1984, 1995).

Keywords: Virtual, Musealization, Heritage, Public Management, Financial Sustainability

INTRODUCTION

The enhancement of artistic and cultural heritage has been a recurrent theme within the scientific and cultural debate by scholars from different disciplines and in the political agenda of most countries over the last decades (Meneguzzo, Grossi, 2002; Ferri, Zan, 2012). During the early 90s, researchers focused their attention on management practices, tools and models referring to arts and cultural organizations (Peacock, 1982; Frey, 1994; Towse, 1997; Christianse and Skaerbaeck, 199 , Zan, 2002), as well as on the development of new and different organizational forms (Sicca, Zan, 2006) under pressure from the New Public Management (Pollitt, 2001; Lapsley, 2008, Ferri, Zan, 2012; Lindqvist, 2012). These studies aimed at developing, analyzing and proposing different conceptual and management frameworks within a context characterized by increasing scarcity of financial resources and

regulatory complexity. The purpose of this paper is to provide an analysis of the growing phenomenon represented by the "Virtual Musealization" of archaeological sites in Italy, focusing on the case of Pompeii and Herculaneum. The result will be a form of virtual accountability supporting on the one hand, the improvement in accessibility to museum services and particularly to the ruins of Pompeii and Herculaneum and on the other hand, facing the scarcity of resources and the inadequacy of organizational structures and skills for the protection and preservation of archaeological heritage of humanity (Ferri, Zan, 2012).

CONCEPTUAL FRAMEWORK

Over the last 20 years, dynamic complexity has been significantly shaping the public sector. This phenomenon is related to many factors embracing: the proliferation of social needs, the rising competition coming from the private sector (and higher opportunity for collaboration with it), market globalization and a rising number of players, the impact of advanced technologies, the short time-frame over which decisions are made, the higher intensiveness of unpredictability and strategic changes, and the scarcity of strategic resources.

Other economic-financial factors were a serious stagflation, welfare state crisis and growing government loans, in addition to a negative perception of bureaucracy.

These phenomena have been giving rise to the obsolescence of traditional management control systems in the public sector. The measurement of financial performance simply by using the aggregated method is no longer adequate. Accountability and prompt decision-making require proper tools allowing managers and decision-makers to understand how the aggregate financial performance can affect measures. Under this viewpoint, accountability breaking down raising critical management studies, is not the only means of making public service suppliers responsive to the citizens, but, in public choice terms, accountability becomes a "voice" rather than an "exit" option (Mulgan, 1997, 2000). This is also connected to a non-financial perspective, and particularly to the consideration of delays that are linked to the accumulation and depletion processes of strategic resources affecting performance drivers.

The most important changes were achieved within the New Public Management paradigm (hereafter NPM) by Italian local governments which were required to implement management concepts and tools in order to improve their own performance. NPM would refer to the development of innovative practiced routines being intended to improve

performance and to reinforce programs beyond the traditional conservatory government system (Borgonovi, 2005; Bardach, 1998).

Within this context the NPM would be better than public governance (Cepiku, 2005; Kickert, 2004; Meneguzzo, 2000) to achieve the two increasing inter-institutional relationships (Mussari, 2009, Borgonovi, 1994). This way, public service planning, management and supply will become something to be negotiated between a number of players, including government, the voluntary and community sector and the private sector (Rhodes, 1996). In this innovative model the problem is how to manage these composite networks (Kickert et al., 1997).

The new paradigm forces government to clarify "who does what" and "how to do what must be done" from a collaborative and responsible perspective (Osborne, Gaebler, 1992). Consequently Italian local governments have chosen to adopt a new institutional arrangement in order to become more accountable and responsible toward stakeholders and to improve citizen participation (Hood, 1998) avoiding asymmetry of information between citizens and politicians.

In the public sector, political accountability is a natural implication that is linked to the management of public resources coming from taxpayers and citizens (Aucoin, 1990). Accountability might be defined as a "chameleon-like term" to be used in reference to definite requirements arising from a relationship of responsibility, where one person or entity is responsible toward others for the performance of specific services (Mulgan, 2000) allowing stakeholders to assess their stewardship and empowering their decisions (Ricci, 2005).

Amongst three thousand museum sites operating in the Museum Virtual Library, only twenty-two are Italian museum sites. This circumstance emphasizes the long delay of our country in adapting museum exhibits to technology. This clear diagnosis highlights the vital need for a cure.

What is the reason that should encourage the use of new technologies in this field? It's preferable to recreate "digital originals", "cloning" the originals of our museums and our libraries in order to protect them, to allow a visit or a consultation to them with non-destructive effects (for example, an Etruscan tomb or a knowledgeable manuscript)? Would it be appropriate to recreate the "double" of the original that is preserved in churches, galleries, palaces in order to stimulate curiosity, favouring the promotion of tourism? Or, again, might it be intended to offer digital hidden details (the inverse of the square, the women's galleries

of churches, inaccessible areas of castles and historic buildings)? What should be the target audience of a virtual museum?

In other words, the issue is whether the "virtual museum" is to reproduce, as closely as possible, the real one, or if on the contrary must create an entirely new dimension. In recent years there has been an explosion of interest for digital libraries, on the side of virtual museums. This interest on the one hand has stimulated the development of research and studies, on the other hand it has contributed to numerous experimentations.

THE VIRTUAL MUSEALIZATION

The virtual museum can be therefore regarded as an ideal museum model, which is appropriate not only for electronic museums just existing in the digital cyberspace, but also, even though with much effort, in relation to real museums, whose attention and resources are often focused almost exclusively on the museological aspects, related to the conservation of works of art, to the detriment of the communicative and narrative characteristics.

A virtual museum can ideally aggregate works and similar objects which are scattered in different places or recreate destroyed, lost, or designed but never built constructions. In its virtual version a museum can also present objects according to criteria which are alternative to those characterizing the real exposition that, for various reasons, are not optimal. It is possible to create endless combinations of themes, the same object can become a part of different paths.

The path of knowledge is individual and proceeds according to the natural function for associative ideas. The analysis of museum sites concerning their technology content and interfaces let us to identify some common characteristics. In terms of content an on-line virtual museum is generally composed of the following areas (of course not always presenting all areas as separate sections of the site):

- a) - practical information on access, location, hours and on-site services, which are sometimes accompanied by reservation services or purchase of tickets for remote access;
- b) - teaching tools specifically designed for informational and educational purposes, to help visitors understand a work or a finding, or carry out a thorough analysis of them (these resources are recurrent in technical science museums, but unusual in art museums);

c) - information about the museum itself, from both an historical perspective and an institutional view, as well as from a logistical and spatial analysis (often accompanied by maps and photographs);

d) - sections devoted to merchandising, sometimes developed up to be equipped with e-commerce systems.

e) - information relating to permanent collections is generally provided through thematic catalogues of works and artifacts or logistical plans linked to the museum maps (for each work news commentary and explanation are normally catalogued).

From a technical point of view, in reference to the types of navigation interfaces, museum sites are mostly based on standard web technologies, with format images.

VIRTUAL MUSEALIZATION: EVIDENCE FROM ITALY

According to the Report of Civita in 2008, non-profit associations that are active in the field of cultural heritage, such as the services provided by the Sole 24 Ore, aroused great optimism, but these investigations do not contribute to the understanding of why Italy is still late in the application of technology to art museums and, above all, they do not help to understand the difference between an "on line" museum and a "virtual" museum both terms being used as unimportant synonyms. Italian museum sites certainly do not excel for the quality of communication and the level of technological solutions.

The management of cultural heritage in our country continues to suffer from a low level of technology and inadequate communication between those who are responsible for it, as well as the lack of a single computerized catalogue of the many hidden treasures in the various corners of the country. As a result, several attempts to use the network as a museum communication tool suffer from underinvestment in economic planning.

An example is represented by the site of one of the most famous and richest museums in the world, the Uffizi Gallery in Firenze. The site, in fact, despite being one of the first Italian virtual museums, has had virtually no development since its first embodiment, in reference to both graphics and content. The museum home page provides access to the various sections of the site dedicated respectively to general information, collections of the gallery, history, settings, and information and news. The section dedicated to the gallery is based on a simple interface consisting of a clickable map and several pages dedicated to single rooms, allowing the access to cards on the works they contain. Nothing more than a simple guide, if an

exception is made for a chance to virtually visit some of the rooms by means of the movie-map made of QuickTime VR. Another major Italian museum institution (even if formally located in a foreign country) is represented by the Vatican Museums that are in an even worse situation. In fact, although the official website of the Vatican Museums, whose handwriting is commendable, those who are interested to see pictures of some of the masterpieces of the Vatican Museums have to refer to a private site of a religious nature. The site that is strongly confessional makes it possible to access to about 1,400 high-quality images but it is devoid of any context information. It is divided into four sections: Vatican Museums, Sistine Chapel, Rooms Raphael and the Vatican City.

A CASE STUDY

The Virtual Museum of Archaeology (MAV) in Herculaneum is an institution of international importance. It is owned by the Foundation Cives, with the participation of other local and regional authorities such as the Province of Naples and Campania Region. Its constitution dates from 2008. The cost for the implementation of the MAV was € 5 million in order to adapt the former school Iattarino to a multifunctional centre of culture. It consists of spaces for temporary exhibitions, an auditorium, a large multimedia archaeological museum, large-scale scientific and educational designs especially for schools. More than 70 multimedia installations, three-dimensional reconstructions, holograms, laser, touch screen, environmental effects, multisensory, tables and virtual books, fog screen, playing immersive exhibits and games, multi-synchronized and interactive interfaces, tracking the visitor. In December 2010, the reconstruction of the Schola Armaturarum - which collapsed just a month before - was completed, (a common restoration in reinforced material built in the 90s of the twentieth century. Spread over a total area of 5000 square metres, built on 3 levels, it was opened in 2008 after three years of planning involving the City of Herculaneum and the Province of Naples (which formed the foundation for the management of CIVES Mav) and Campania Region since 2009. The magnificence of the ancient baths, the majesty of the city theatre, the chance to walk inside the grotto of Baia, to wander among the brothels of Pompeii. The big attraction is finally the 3D eruption of Vesuvius. The museum is located in an area of 5 thousand square metres and is articulated on three levels, including a 300 seat auditorium, with over seventy multimedia installations. All these efforts have produced positive effects in terms of attendance and business, thanks to a deep process of web accountability. In fact, the trend has been growing since the Museum was radically renewed

and the 3D projection of the film on Vesuvius. In the first quarter of this year, there has been an increase of 15% attendance in the context of a general crisis of cultural consumption and in the presence of a drop of at least 20% attendance in the tourism industry. In April there was a real boom doubling the number of visitors, both during the week and on weekends. Mav 2.0 means that: a museum adapts itself to the evolution of technology, realizing emission of science and a strong focus on new generations of digital natives. The complex management of a virtual museum as the Mav in Pompeii and Herculaneum, is characterized by a particular flexibility. The human resources who are devoted to the virtual museum display, are represented by ten units of work, including eight employees with part-time contracts (50% of full time), with an average age of 27 years. Six people on the whole, receive approximately 70,000 guests every year, and hundreds of cultural events, website, communication, promotion, planning and programming.

In the first two years of life, the MAV earned about 7,000 euro per day, but these amounts were barely sufficient to cover its start-up costs alone. The third year cash flow registered a surplus of management, allowing the museum to survive and pay the costs of operation and maintenance. The ordinary state funding supporting and ensuring the Mav financial sustainability, is still virtual. This circumstance gives explanation of why museum-virtual and virtual museums on the network which are similar to the Mav in Herculaneum and Pompeii, recognize the process of reporting on their activities as the strength of the principle of public companies' social responsibility in which accountability can become a significant part in terms of the value of qualitative information, in addition to the economic-financial component. Recent trends, not only in public company as the MAV, but also in private companies, to seek greater levels of accountability and transparency in decisions and actions can be linked to several factors (Ricci, 2010):

- Recent accountability different meanings, no longer based on the compliance to rules and regulations, but meant to be a guideline to facilitate the participation of citizens and the administrative action as a tool to inform citizens about the level of achievement of objectives and to highlight areas of responsibility (politicians and managers) in the measurement of results;
- A clearer definition of the models of performance, measurement and determination of the level of autonomy in order to achieve genuine separation of areas of activity between different levels of government (governance and internal accountability);

- The construction of models of representation and accountability for citizens to increase the level of knowledge of administrative activities and sharing of the results (external governance accountability);
- Improving the quality of public services through the definition of standard and quantitative targets for an easy and immediate assessment of the levels of citizen satisfaction (customer satisfaction);
- The improvement of internal and external control to promote autonomy in the evaluation of both the results and the performance that have been achieved.

Seven key variables are helpful to identify a proper system of accountability (Ricci, 2010):

- an articulated and clear planning process;
- a clear definition of inside and outside responsibilities;
- an adequate system of accounting and non-accounting;
- an effective internal monitoring and evaluation program;
- periodic disclosure of information;
- significant benchmarking activity `;
- a valuable use of technology in communication.

These factors should reflect the best processes of assessment and accountability.

PPP AND PUBLIC WORKS LAW IN FRANCE

ABSTRACT

Public-Private Partnership (PPP) is a highly increasing way of public technical works execution and of public services delivery through the long-term commitment of the private contractor.

France has recently adopted a legislative framework on PPP while public works law is not applicable for it. This paper examines whether the framework is an actual enhancement of the traditional law on public works.

A preliminary evaluation state procedure is obligatory, in order to decide whether the eventual use of the PPP method is value for money, and it constitutes a crucial modernization of the traditional law on the matter. The French state, endowed with a very important precedent of concessions, has managed to make use of the PPP model with success even in the delicate domain of museums and cultural heritage scopes, let alone in a rather innovating way. The paper makes a comparison of the public works law with the PPPs legislation and the concessions one by indicating the most significant similarities and differences.

Last but not least, PPP contract model does not exemplify only the contracting out phenomenon, along with the public works traditional method and the concession one, but also the School of Thought of New Public Management (NPM) initially putting the stress on privatization of public companies and afterwards on contracting out.

Keywords: Public - Private Partnership (PPP), Contracts, Public works law, Concession, French legal order, Contracting out, Preliminary evaluation, New Public Management (NPM), Museums, Culture

INTRODUCTION: PPP LAW AGAINST TRADITIONAL LAW IN FRANCE

PPPs constitute long-term contracts of technical works construction or of services provision, with allocation of risks between the public sector and the private one that is supposed to ensure beforehand financing of the scopes. The term “sponsored PPP” declares the PPP case, in which the cost of providing the service is jointly borne by the users of the service and the government through a capital subsidy, not wholly borne by the Public Administration (administrative PPP). On the contrary, in the traditional type of public works contracts there is no allocation of risks and the private contractor gets the reward for the part of the technical works already completed during the execution of the contract, uniquely by the public contractor.

France is a country endowed with a long history of concessions and many examples of PPPs in various domains of public interest (defence, education, health, environment, transport infrastructure, urban facilities, energy, culture and sports) and challenges particularly the scientific interest.

In French law, Law 85-704 (called MOP) and Ordinance 2004-559 constitute the hard-core legislation, as modified, on public works and PPPs respectively.

We assume that PPP law constitutes an actual enhancement of the traditional law on public works in the French legal order.

CRITERIA OF OPTION OF THE PPP INSTITUTION

According to Ordinance 2004-559 and the relevant newer legislation, it is obligatory to proceed to a preliminary evaluation of legal, financial and administrative nature, to demonstrate that PPP is preferable to any other type of public contract.

The process of pre-assessment is carried out in two stages: the first investigates whether the selection criteria of the contract are met and the second is a comparative analysis to confirm that PPP is the most appropriate.

The criteria are the following:

1. The complexity of the project

There is a complex task and situation and the public sector is unable to determine in advance the technical tools for the needs of the construction or operation of the project or to determine the economic-legal settings (weak financial structure, identification of needs in

human resources, etc.). It is to pay special attention to the fact that this criterion is usually activated for cultural projects.

2. The urgency of the project

It is about avoiding a delay prejudicial to the public interest in the project, regardless of the cause of the delay, or acting as a response to an unforeseen situation in form of force majeure. Projects that have security problems and cases of lack in equipment also have an urgent character. The evaluation reports must analyze the positive effects of the rapid project execution while justification is not only based on the criterion of the emergency but also on other ones, like the complexity.

3. Greater efficiency (favourable balance of advantages - disadvantages) against other forms of procurement

This alternate criterion has been inserted through article 2II of Law 2008-735, modifying the initial legislation on PPP in order to facilitate the use of the PPP mechanism. Therefore, a feature of PPP projects consists in the fact that their requirements are defined in terms of outputs rather than inputs on contrary to the conventional public works projects that usually focus on inputs. The choice of the partnership contract presupposes a comparative socio - economic analysis as well as a sensitivity one and a risk assessment and, as a result, it reminds of the concept of «best value for money» of the Private Finance Initiative (P.F.I.), namely of the PPP in the United Kingdom.

This method constitutes an important innovation against the traditional law on public works. The traditional law includes dispositions which refer to pre-assessment but they are not as precise and demanding as those of the PPP contracts. MOP law could usefully be modified to reflect the appearance of new contracts that it does not include but it needs a comparative study between the advantages and disadvantages, to perform a pre-evaluation of different alternatives (Grange, 2010).

CONTRACT AWARD PROCEDURES

The award procedures of public works contracts and of PPP ones are the following:

1. Open procedure

All interested persons, having the legitimate qualifications specified in the invitation to tender, may participate in this type of procedure, by submitting their bids.

2. Restricted procedure

This procedure is applicable mainly in important or specialized works. Any private entities feeling that they have the qualifications specified in the declaration may declare their interest. Subsequently, a default takes place and, in the second stage, only these private sectors endowed with the qualified criteria are invited by the contracting authority to submit a bid.

3. Negotiation

The negotiation procedure is provided for all the aforementioned cases in which a PPP contract may be chosen, i.e. complex projects, urgency or greater efficiency, while the unique prerequisite has to do with the height of the budget.

4. Competitive dialogue

The contracting authority may use the competitive dialogue procedure in the case of particularly complex contracts, for which it considers that the use of the open or restricted procedure will not permit the award of a particular contract. This procedure is an important novelty introduced by EU Directive 18/2004. In France, this modern type is widely used while in the Greek legal order it is marginal and the restricted procedure is almost always chosen.

CONTRACT AWARD CRITERIA

PPP and public works contracts, as previewed by the aforementioned EU Directive 18/2004, are awarded upon the following criteria:

1) Eligibility criteria

They are related to the individual candidates and their particular qualifications (personal reliability, financial solvency, technical ability).

2) Criteria for the evaluation of tenders and contract award

a) The criterion of the most economically advantageous bid

The contracting authority examines and takes into account, economic parameters - which is the case of the opposite criterion of the lowest price - and various other parameters of the contract scope (quality, price, technical merit, aesthetic and functional characteristics, environmental characteristics, running cost, cost-effectiveness, after sales service and technical assistance, delivery date and delivery period or period of completion and so on). These criteria should be clearly specified by the contracting authority, along with the weighting assigned to each of these.

b) The criterion of the lowest price

This criterion of merely financial content is excluded from the procedures of negotiation and competitive dialogue.

FINANCING A PROJECT

Financing is carried out exclusively by the government in the common type of public works while in the case of PPP mechanism things are different. In France, the private sector must establish a Special Purpose Company, or “Special Purpose Vehicle” (SPV), that bears the responsibility and the risk of the financing of the execution of the contract.

Using private funds for construction and operation of projects can accelerate the infrastructure development program, without additional funds from the government. In case of constraints on government budgets, the development of PPP projects contributes to enhancement of both employment and economic growth (Venieris, 2007).

According to European Union practice, adopted by Eurostat and the EIB, the so-called 50% rule, given that co-financing by the public sector should not exceed 50% of the contract budget, as for a concession or a PPP contract. Otherwise, EIB does not borrow public carriers, as a general rule. .

DISPUTE RESOLUTION

In France, according to ar. 22 of the Circular of 14 February 2012 (Guide of good practice in public procurement), the amicable ways for disputes resolutions relevant to public contracts are the following:

Mediation or conciliation

The mediator is an independent third party that helps the two parties reach to an agreement. He does not have the ability to bind the parties legally and facilitates rather than directs the process.

Advisory committee's amicable settlement of disputes

For all types of projects, it is recommendable to formulate a clause, under which the contracting authority authorizes a natural person to represent the contractor, upon notification of the contract. The representative may have a *mediating role* in resolving disputes arising during the execution of the contract. The preferable representatives have no hierarchical relationship with the people responsible for managing the project. It is about the advisory committees model, established by Ordinance 2010-1525.

Negotiation or transaction

Under the terms of Article 2044 of the French Civil Code "*The transaction is a contract within the parties are terminating a born dispute or prevent one from being born.*"

Arbitration

A panel of arbitrators or arbitral tribunal, selected by both parties, undertakes to make a decision on the disputes. The arbitration may be predetermined through a special clause in the PPP contract or when a dispute arises.

Besides the above, another way of dispute resolution for PPP is:

Expertise

It is ideally suited to disputes and matters of valuation that are primarily dependent on technical issues. An independent expert in the matter of the dispute is appointed by the parties to resolve it.

PPP AND CULTURE IN FRANCE

In the cultural context, the recourse of the French Administration to PPP contracts remains restricted (Maniatis, 2011). Nevertheless, the scopes of the contracts in the cultural domain are discerned by their novelties, which could be considered as inspired by the innovative character of PPPs.

For instance, the Theatre of Archipelago in Perpignan has been in operation since October 2011 and hosts a cross-border festival, shows and co-productions. The Marine Museum in Biarritz is a thermal-balance building, requiring no heating in the winter or air conditioning in the summer, for a scientific approach to oceanography through experiments.

The latest successful example of cultural PPP in France consists in the National Museum of Civilisations of Europe and of the Mediterranean, in Marseille. It includes an ancient fortress with an emblematic tower, closed for centuries and converted to a "museum-walk" connected with the main museum through a long bridge. This intervention indicates the recommendable, creative approach to the legal principle of sustainability for the historical monuments. In other words, monuments should not be treated statically, upon the negative alternative having the sense of mere prevention from damage (Maniatis, 2013).

The enhancement of the computers system in the Palace of Versailles constitutes the unique fiasco in the cultural domain through PPP. The failure was due not to mere incapacity of the private partner but to various reasons and the French museum managed to resume its normal operation soon, without making use to the contracting out, again (Vassilakou and Maniatis, 2012).

FRENCH CULTURAL LEGISLATION AND LITERATURE

Victor Hugo's contribution to the French and the wider technical legislation has been significant. In his classic work "The Hunchback of Notre Dame" essentially makes this building as the main theme of his novel. Moreover, his article of 1832 titled "War to people that demolish" in the "Journal of Two Worlds" states that there are two things in a building: the use and the beauty. Its use belongs to the owner, the beauty to the world, therefore the owner has no right to destroy the building. The philosophy of heritage protection, especially of the architectural heritage, clearly derives from this text (Maniatis, 2013).

The first major act of the French state, from 1830 on, relevant to the protection of monuments is to create the position of a general inspector of historic monuments. This central decision-maker localized monuments to preserve and gave a motivated opinion on the feasibility of servicing and maintenance work to undertake for the monuments of the State. In 1834, Prosper Mérimée, a member of a generation of romantic writers, was appointed inspector general of historic monuments and travels throughout France and also abroad. His approach to heritage, particularly the religious one, was scientific, stripped of sentimentality, which renews the approach to heritage at the time. He achieved inter alia to save the Cluny building (in the centre of Paris) and discovered and saved the textile masterpiece "The Lady and the Unicorn" at the Boussac Castle. This project is now the key attraction at the Museum of the Middle Ages, namely in the Cluny building.

In France, there was a very early legislation on the protection of cultural heritage. The Fifth Republic, under the influence of André Malraux, politician and writer, gives a major role to the State, as for cultural affairs, and mainly provides for the first time a body of doctrine relevant to cultural policy, summarized in the Decree of 24th July 1959 (Maniatis, 2013).

The first generation of heritage legislation comprises initially law of 30th March 1897, in virtue of which private buildings could not be listed without the agreement of owner (but, in case of discrepancy, the Council of State could decide expropriation) and then law of 31th December 1913. That crucial text, institutionalizing the modern status of "historic monuments", has been incorporated since 2004 into the Code of Heritage.

The second generation of heritage legislation started with L. 903 of 4th August 1962, the so-called Malraux law) on "safeguarded domains". Besides the existent status of listed buildings, this pioneer law previews the potential creation of protected areas, to save and keep in economic operation entire sets of buildings, even in the very centre of cities.

PPP model, being inherently innovative, requires a preliminary evaluation (design) procedure for its activation, in addition to the similar, traditional procedure of the state (urban planning) and the modern one (spatial planning).

A NEW TREND OF PPP PROJECTS: COMMERCIALIZATION OF PRISONS

A relatively new trend in PPP projects consists in the commercialization of traditional infrastructure of public entities.

This development is well exemplified by prisons managed by private partners through PPP contracts in some countries, such as the USA and New Zealand. In modern times, the United Kingdom was the first country in Europe to make use of private jails on the basis of 25-year duration PFI contracts. The first privately managed prison in the United Kingdom became the Wolds one in 1992, within a contract of 5-year duration. On the contrary, in Greece, according to article 2, par. 3 of L. 3389/2005, no PPP methodology is permitted for operations of state sovereignty in a strict sense (national defence, policing, administration of justice and enforcement of sentences imposed by the courts).

For the management of prisons, specialized companies have been created, let alone introduced in the stock market. In such centres cost containment is achieved, through prisoners' work and the delivery of services (correctional specialized services) with small fees.

Most companies pay the minimum wage, but many pay much less. The AT & T, for example, paid only \$ 2 an hour for prisoners of telemarketers, and Honda gets made car parts from convicts (convict-made) from prison in Ohio to \$ 2.05 per hour. Detainees usually only keep 20% of their payment, the state government grabs the rest, that is why the government is to support the provision of services of prisoners (Hightowe, 1998).

Last but not least, private management has raised severe criticism due to security problem and to lack of discipline. A high percentage of prisoner's escapes suggests bad management and raises security issues to local residents. Traditional – type prisons are more open to public scrutiny whilst PPP prisons are less transparent. It is quite hard to regulate and monitor the modern jails as violations of contractual obligations are difficult to detect. The use of prisoners as labourers is increasing unemployment for lawful citizens and may be regarded as opposite to the prisoners human rights.

COMPARING PPP AND PUBLIC WORKS

From the legislative framework on PPP and the public works result the following principal differences and similarities:

Similarities	Differences	
	PPP	Public works
Main principles within the process of selection of contractors are the transparency and the protection of the free competition.	The private sector assumes substantial part of the risk of financing, construction etc.	The government bears all risks of the project after the definite completion of the project.
	The private sector deals with the public one through a Special Purpose Vehicle (SPV).	The private sector deals directly with the public one.
In final analysis, the cost of the project is carried out by the state (unless PPP scopes are reciprocal) 	Funding for the construction of the project (initially) is carried out by the private sector.	Funding for the construction of the project is carried out exclusively by the state.
	The repayment of the private sector is usually done by the contracting authority (e.g. availability payments, shadow tolls) or by users (e.g. motorway tolls), or by a combination of both (e.g. low user charges along with public operating subsidies).	The repayment of the private sector is done by the public sector on successful delivery of the project.

Table 1: Similarities and differences between PPP and traditional-type public works

COMPARING PPP AND PUBLIC WORKS CONCESSION

According to EU Directive 18/2004, "Public works concession is a contract of the same type as a public works contract with the exception of the fact that the consideration for the works to be carried out consists either solely in the right to exploit the works or in this right along with payment". The concession was used in France in 1666 for the construction, financing and management of the project of Canal du Midi (Mediterranean – Atlantic Channel).

In French law, concessions are called Delegations, namely assignments, of Public Service (DSP). This scheme includes not only the concession, but also leases, advantageous contracts management etc (Lichère *et al*, 2009). It is to pay special attention that on international scale concession implicates transmission of power from the public authority to the private contractor (Lampropoulou, 2011).

The most significant similarities and differences between PPP and concessions are the following:

Similarities	Differences	
	PPP	Concession
They both consist in designing and constructing public works and providing services.	The private sector deals with the public one through a Special Purpose Vehicle (SPV).	The private sector deals directly with the public one.
Main principles within the process of selection of contractors are the transparency, the proportionality and the free competition.	Usually selected for non-reciprocal scopes.	Usually selected for reciprocal scopes.
They are contracts for pecuniary interest.	There is a central administrative body (MAPPP in France) competent for the contracts	There is no central administrative body competent for the contracts..
The private sector takes on a substantial part of the risks, let alone the fact that he initially must ensure the financing of the contract execution.	The repayment of the private sector is usually done by the contracting authority (e.g. availability payments, shadow tolls) or by users (e.g. motorway tolls), or by a combination of both (e.g. low user charges together with public operating subsidies).	The repayment of the private sector is done by the users.

Table 2: Similarities and differences between PPP and concession

PPP AND NEW PUBLIC MANAGEMENT

The School of Thought that is called New Public Management (NPM) is a global phenomenon, whose reforms shift the emphasis from traditional public administration to public management (Larbi, 1999). It is about the transfer of business and market principles and management techniques from the private sector to the public one. According to this concept, the supply of public services should be done in commercial and competitive terms (Venieris, 2007). This management culture puts the stress on the central role of the citizen or customer as well as on accountability for results (Manning, 2000).

PPPs have become widely accepted and popular in public sector management, as they enable the public sector to benefit from commercial dynamism, innovation and efficiencies, harnessed through the introduction of private sector investors who contribute their own capital, skills and experience. The principles of NPM encouraged the establishment of PPPs as a new management tool (Khanom, 2010), let alone the fact that NPM initially put the stress on privatization of public companies and afterwards on contracting out.

The institutional forms of PPP vary from close *contracting out* cooperative efforts to infrastructure projects for building and operating new physical facilities such as schools,

tunnels, bridges or sports arenas (Greve and Ejersbo, 2002). They are viewed by private companies as alternatives to "raw" contracting out (ISS, 2002).

CONCLUSION: PPP ENRICHING CONTRACTING OUT

In conclusion, PPP version of contracting out is as a principle an attractive method for technical works construction or services provision. It is about a modern legal tool, endowed with a lot of innovative regulations, such as the obligatory preliminary evaluation procedure that is to adopt within the traditional law on public works, in order to select the best type of carrying out each project. These dispositions are indeed an enhancement of the French law of public works and, as a result, the hypothesis of the present paper has been confirmed. Moreover, it is to underline that even crucial managerial data, such as the completion of innovative constructions in the delicate domain of heritage and museums, highlight this progress.

A recommendation for governments of countries with a separate and specific PPP law consists in considering the degree to which the requirements of traditional law on public works and of PPP law are aligned (Burger P. and Hawkesworth I.). Anyway, partnerships should not be seen as a panacea but be used in case that they add value (Her Majesty's Stationery Office, 2000).

Last but not least, PPP has already enriched in a rather satisfactory way the contracting out methodology that exemplifies NPM and the state planning, urban and spatial.

THE EFFECT OF MACROECONOMIC VARIABLES ON EXCHANGE RATE VOLATILITY

Evripidou, Loukia

Business Scholl, European University Cyprus, Nicosia, Cyprus, L.Evripidou@euc.ac.cy

ABSTRACT

Exchange rate stability is a fundamental property for economic development of a given country. It promotes price stability, stable economic growth and investments. However one of the major problems that foreign exchange market faces is volatility. The risk associated with high volatility levels in the foreign exchange market have cost implications for a number of economic agents as well as the economy as whole. Taking into account the aforementioned with the use of monthly exchange rates from January 1999 to March 2013 the aim of the current study was to determine, if any, the relationship between macroeconomic variable and exchange rate volatility. Four different macroeconomic variables have been used, namely openness of the economy, interest rate differential, unexpected news and inflation. To examine the potential relationship two different approaches have been used so as to examine the robustness of the results to changes in the methodology. From the results it can be suggested that the results are not robust to method of estimation supporting the part of the relevant literature that argues that the non-significance of the macroeconomic variable in explaining the changes of exchange rate volatility might come forth from the differences in the methodology and not to the variables as such. Even though in the current study there was not a strong support for the existence of a relationship between macroeconomic variable and exchange rate volatility, while under GARCH methodology the relationship was found to be none, under EGARCH approach in different series certain variables were found to be statistically significant. As certain previous studies suggested, the magnitude and significance of macroeconomic variable on exchange rate volatility depend on the economic conditions of a given country.

1. INTRODUCTION

The Foreign Exchange Market is considered to be the biggest financial market in the world with an average daily turnover worth about 3.98 trillion dollars today. Aiming to facilitate businesses to perform transaction outside their local currency, with globalization foreign exchange market have witness a dramatic growth over the last three decades. This development is expected to continue even further in the future since integration of financial market and world trade is anticipated to continue to grow. Additionally, foreign exchange market is a market that operates round the clock on a global level, opening at Asia and specifically Tokyo, then Europe and finally US. For that reason the correct functioning of this market is of importance to governments as well as investors and companies.

Exchange rate stability is a fundamental property for economic development of a given country. It promotes price stability, stable economic growth and investments. However one of the major problems that foreign exchange market faces is volatility. Volatility is the dispersion of asset price returns. If exchange rates are volatile then prices in the economy follow volatile movements. For that reason policy makers are eager to quantify and forecast this type of volatility since it would help them to design as well as implement a more appropriate exchange rate policy so as to progress export and foreign direct investments, economic growth, and promote overall external macroeconomic stability (Kihangire, 2004).

Apart from the policy makers, exchange rate volatility is of interest to individual agents as well. Foreign exchange market brings together individual agents such as international investors risk and portfolio managers and brokerage firms. For all those agents' exchange rate volatility has important implication in their everyday decisions. Specifically, investors and risk managers have become global in an attempt to diversify their portfolios or hedge their risk. Knowledge about exchange rate volatility in conjunction with their risk profile would help make appropriate investment decisions and hedge their risk position. Furthermore, quantification as well as forecast of volatility is of importance to those agents that are dealing with international trade and again based on their risk profiles agents that are risk averse would minimize transactions with countries with high volatile exchange rates as opposed who are considered to be risk lovers.

Due to its importance for several players in the business world as well as governments exchange rate volatility there is an extensive literature in the subject matter. However, even though the literature on exchange rate volatility is long still there is no agreement as to the factors that influence this volatility. There is a variety of factor that empirical literature indicated that affect exchange rate such the openness of the economy [Hau (2002), Stančík

(2006)], interest rates (Juthathip 2009), exchange rate regime (Kočenda and Valachy 2006), inflation [Calvo and Reinhart (2000), Devereux and Engel (2003)], and unpredictable circumstance (Calderon and Kubota, 2009), where the degree of the impact of those factors depends on the economic conditions of a given country. On the other hand there is a number of literature that suggests that there is no link between macroeconomic variable and exchange rates. The primal notion behind this view is those macroeconomic variables do not exhibit the same increase as exchange rate volatility during floating exchange rate regime (Albuquerque and Portugal 2005).

Based on the aforementioned the aim of the current study is to estimate the exchange rate volatility based on monthly data for a number of currencies and with the use of macroeconomic variable to identify the possible causes of this volatility.

2. LITERATURE REVIEW

Volatility is the variation in the price of a given financial asset and is usually separated in to historical and implied volatility. The historical volatility is measured by the standard deviation which indicates the distress of the price of a security from its mean; the higher the deviation the higher the risk associated with the given assets. Implied volatility computes the volatility of a financial price in a forward looking method by deriving a volatility figure from its associated option prices.

Since volatility is associated with higher risk is it has been suggested that it damages the smooth functioning of the financial system and at the same time has a negative effect on economic growth (Rajni and Mahendra, 2007; Mollah, 2009). In essence volatility, irrespective of the underline assets, represents changes in investors' perceptions about the relevant market. The changes in perception mainly emerge with the appearance of new information about the market, but the extent of the effect is always determined by the relevance of the information together the level of surprise generated from it.

The literature has long concentrated on the sources of information that causes volatility. A novel research by Engle (1982) suggests that volatility is a result of new unexpected information whereas latter studies postulate that volatility is caused by a number of factors such as trading volume, changes in the in monetary and fiscal policies as well as changes in investors' risk preferences (Ajao and Wemambu, 2012).

Studies have found evidence that the financial position of an economy is affected by exchange volatility and for that reasons it can be suggested that any alterations in the exchange rate

markets have cost consequences for all economic agents. In general, since exchange rate is defined as the price of one currency in relation to another then the appreciation or depreciation of one currency over another points out the strengthening or deteriorating of one currency in conjunction with the opposing currency. Any deviation of from the equilibrium rate it is assumed to be exchange rate volatility.

If exchange rates are volatile then prices in the economy follow volatile movements. That was evidence in a numerous countries, and especially in those countries where their economic growth depended largely on exports (Sengupta and Sfeir, 1996). Benita and Lauterbach (2004) supported that exchange rate volatility have real economic costs that disturb price solidity, firm profitability and the overall economic stability. As volatility is associated with risk, then this risk increased transaction costs and diminishes the economic benefits from international trade because it creates uncertainty for the exporting company's earnings. A number of studies suggested that the existence of a well-established financial market would provide the advantage of hedging against that type of risk and thus either decrease or eliminate it [Makin (1978), Cushman (1983, 1986)]. Nevertheless more recent studies found evidence of a negative relationship between exchange rate volatility and exports [Tenreyro (2007), Arize et al (2008)]. The primary notion for this negative relationship rest on the assumption that a depreciation of exchange rate would result in export growth as indigenous good and services would be cheaper and hence more competitive and the same time would discourage imports since foreign products and service would be less attractive due to the associated high costs. On the other hand an appreciation would result in a reduction of exports and a boost of import (Aliyu, 2011). Since a depreciation of an exchange rate leads to a shift from imported goods and services to the local ones, this results also to a shift of income from importing states to the exporting ones. The end result is an alteration in the economic conditions and growth of both states (Azeez et al., 2012).

Another bulk of studies suggests that the effect of exchange rate volatility on a nation's economic performance depends on the exchange rate regime which the country follows. Earlier studies postulate that fixed exchange rate regime promotes economic growth and financial stability [Mundell (1973), Frankel and Rose (2002)]. On the other hand Fischer (2001), found evidence that a fixed regime lead to speculative capital inflows and overinvestment. The results of Bastourre and Carrera (2004), suggested that exchange rate volatility is greater when other factors that influence by volatility are accounted for and concluded that there is a negative relationship between exchange rate regime and volatility.

In terms of the effect of exchange rate volatility and FDI there are two different theories explaining their relationship. The first one, production flexibility theory postulates that there is a positive relationship between exchange rate volatility and FDI because companies are expected to be competent to change their variable factors following a shock (Bastourre and Carrera, 2004). On the other hand in accordance with the second theory, risk aversion theory, exchange rate volatility has adverse effect on FDI since the higher the variation in exchange rate the higher the uncertainty for the expected exchange rate and thus the lower FDI is reduced (Goldberg and Kolstad, 1995).

In regards to the relationship between economic growth and exchange rate volatility a number of studies found evidence that there is an inverse relationship between the two. A study in the economic growth European Monetary Union found support of the aforementioned relationship (Schnabl, 2007). The results suggest that stable exchange rates create stability for asset and labour market and thus boost economic growth. The study of David et al (2010) confirms the aforementioned negative relationship in the Nigerian manufacturing industry whereas Akinbobola and Oyetayo (2010) with the utilization of data from the same country again confirm the hypothesis but with a substantial time lag. However, when examining the relationship in small developed economies Polodo et al (2011) found no evidence of its existence in a dynamic setting.

Taking into account the importance of stable exchange rates in both the economy as well as individual agents there is an extensive literature in the subject matter. However, even though the literature on exchange rate volatility is long still there is no agreement as to the factors that influence this volatility. There is a variety of factor that empirical literature indicated that affect exchange rate such the openness of the economy [Hau (2002), Stančík (2006)], interest rates (Juthathip 2009), exchange rate regime (Kočenda and Valachy 2006), inflation [Calvo and Reinhart (2000), Devereux and Engel (2003)], and unpredictable circumstance (Calderon and Kubota, 2009), where the degree of the impact of those factors depends on the economic conditions of a given country. On the other hand there are a number of studies that suggests that there is no link between macroeconomic variable and exchange rates. The primal notion behind this view is those macroeconomic variables do not exhibit the same increase as exchange rate volatility during floating exchange rate regime (Albuquerque and Portugal 2005).

Examining firstly those studies that found evidence that economic variables alter exchange rates they indicated that there are a number of macroeconomic variables that are found to affect volatility but the degree of the impact of each of those variables differs and is

influenced by the specific country's economic situation. A number of studies have examined the effect of the openness of the economy. Hau (2002) found evidence of a negative relationship between exchange rate volatility and openness of the economy. By utilizing import to GDP as a proxy of the openness of the economy and standard deviation for the changes in real exchange rate as a measure of volatility he found positively statistically significant relationship between the two variables. His theoretical model rests on the proposition of small open economy that indicated that the more open the economy is the higher the flexibility of price levels, whereas this flexibility leads to a reduction in the money supply and productivity shocks and real exchange rate volatility. Hau's results are supported by Stancik (2006) that examined the relationship in six central and eastern European countries as well as Bravo and di Giovanni (2006). The latter study took also into account the effect of trade barriers on the relationship where the analysis shows support for the inclusion of trade barriers variables and also a negative relation between economic openness, measured by trade volume, and exchange rate volatility. Nevertheless as the authors indicated, the effect of the openness is not as vast as that of the trade barriers.

In terms of unpredictable circumstances, such government crises, market crises, industrial shocks and terrorist attacks, have been primarily examined by Dornbusch (1978) and Frenkel (1981). Frenkel (1981) with the utilization of monthly data between US exchange rate over British pound, French Francs and Deutsche Mark he indicated that since the forecasted changes in the exchange rates encapsulate only a minor portion of the real change, a large portion of the unforeseen changes emerge from the arrival of unexpected news. Further contrary to the basic economic theory, in his attempt to identify a proxy variable for the news, he postulated that there is positive relation between interest and exchange rate in an inflationary setting. Hence he found a positive correlation between news and exchange rates. One the drawback of the study was the utilization of monthly data. To apprehend the element of surprise caused by new information higher frequency data is need. To overcome the aforementioned problem Galati and Ho (2003) examine the hypothesis with the use of daily euro/dollar exchange rate. There results indicated that there is a statistically significant correlation between the news and exchange rate movements, where good news cause an increase in the currency and bad news a decrease. In the same line are the evidences of Sanchez-Fung (2003) and Stancik (2006).

A number of studies have examined the effect of interest rates and inflation on exchange rate volatility. Faust et al. (2007) with the application of intraday data evaluate the effect of different macroeconomic events on exchange rates including interest rate fluctuations. The

results indicated that exchange rates are affected by expected changes in foreign interest rates whereas inflation has found to have no or little the exchange rates. Additionally, in terms of inflation Albuquerque and Portugal (2005) suggested that there is a semi-concave relationship between exchange rate volatility and inflation rates.

On the other hand there is a number of literature that suggests that there is no link between macroeconomic variable and exchange rates. The primal notion behind this view is those macroeconomic variables do not exhibit the same increase as exchange rate volatility during floating exchange rate regime (Albuquerque and Portugal 2005). Another view as to the non-clarity of the causes of exchange rate volatility rest of the modeling approaches that have been employed (Chipili, 2009). As Erdemlioglu et al (2012) noted *'the goal for volatility modelers has been to simultaneously account for the most prominent features of foreign exchange volatility: (i) it tends to be autocorrelated; (ii) it is periodic, displaying intraday and intraweek patterns; and (iii) it includes discontinuities (jumps) in prices'* (Erdemlioglu et al (2012),pp.1). The models for measuring and forecasting exchange rate volatility are divided into two categories. In the first category are those models who aim to capture the key properties of weekly or daily exchange rate returns by describing the autocorrelation in daily and weekly volatility. Those models belong in the ARCH/GARCH family and based on their individual specification can either capture the short or long memory dependencies in exchange volatility. The second category aims to capture the changes on intraday horizon including discontinuities in prices, namely realized volatility (Andersen and Bollerslev, 1998). The realized volatility models are calculated from high frequency data, such as intraday data, as opposed to daily data. Even though realized volatility model provide the advantage of estimating volatility at every moment, data on intraday basis is not available for all markets and additionally even when data are available, it is not clear how to choose the optimum number of sample intraday intervals.

3. DATA

The sample totals 171 monthly observations covering the period from January 1999 to March 2013. The choice of data was primarily to capture the turbulent period of financial distress, that emerge with the collapse of the Baring Brothers in the US and drove the local economy into recession that eventual role over to Europe. But also to take into account a more flourishing economic era that took place at the beginning of the previous decade. An additional factor in terms of data period was of course the availability of data for all the three countries under examination. The data concerning the Eurozone has been obtained from the

website of the European Central Bank. Both the exchange rates as well as the macro variable for United Kingdom have been obtain from the website of Bank of England and OECD, and lastly the data for the United States have been attained from the website of Federal Reserve Board and OECD.

The summary statistic of the both the level and the first difference are presented in table 1 below. A point of notice is that the standard deviation of the level data is significantly lower for all the three exchange rate series as opposed to the higher values that exhibited after the first differencing. It is an important observation since the traditional measure of volatility for any asset is its standard deviation. Skewness and Kurtosis aim to detect any departures from normality, where the test rejects the hypothesis of normality when the p-value is less than or equal to 0.05. Since the normal distribution has a skewness of zero and kurtosis of three, the data can be considered as a non-symmetric one and as positively skewed relative to the normal distribution apart from the first difference of Euro/US Dollar suggesting that the series is normally distributed.

Even though that from an economic point of view in terms of volatility it is more important to evaluate the level rather than the monthly changes of exchange rates it is mostly common from previous studies that exchange rates are non-stationary. In fact most of the economic and financial time series they either exhibit trending behavior or nonstationarity, such as share prices and exchange rates. Hence prior to any further investigation it is appropriate for any research to identify the most appropriate form of the trend in the data.

Even though that from an economic point of view in terms of volatility it is more important to evaluate the level rather than the monthly changes of exchange rates it is mostly common from previous studies that exchange rates are non-stationary. In fact most of the economic and financial time series they either exhibit trending behavior or nonstationarity, such as share prices and exchange rates. Hence prior to any further investigation it is appropriate for any research to identify the most appropriate form of the trend in the data.

More specifically, a stationary time series is one whose statistical properties such as mean, variance, autocorrelation, etc. are all constant over time. For a time series to be stationary is of utmost importance so as to be able to obtain meaningful sample statistics such as means, variances, and correlations with other variables. Such statistics are useful as descriptors of future behavior only if the series is stationary. For a time series data to be stationary, it must:

1. Exhibit constant spread
2. Have no trend
3. Have no seasonality

The most common way to elevate the non-stationarity is by taking the first difference of the data. Accordingly, prior to examining the effects of the macro variable on exchange volatility the first step is to examine the level exchange rate for stationarity with the Unit Root test. Autoregressive unit root test is based on testing the null hypothesis that $\phi = 1$ (difference stationary) against the alternative hypothesis that $\phi < 1$ (trend stationary). It is named unit root tests due to the fact that under the null hypothesis the autoregressive polynomial of z_t , $\phi(z) = (1 - \phi z) = 0$, has a root equal to unity. The null hypothesis assumes that a series y_t is trend stationary. When y_t is then first differenced it becomes

$$4. \quad \Delta y_t = \delta + \Delta z_t \quad (1)$$

$$5. \quad \Delta z_t = \phi \Delta z_{t-1} + \varepsilon_t - \varepsilon_{t-1} \quad (2)$$

Based on the evidence of non-stationarity, and following most of empirical finance literature, the variable to be modelled is percentage monthly exchange rate return which is the first difference of the natural logarithm of the exchange rate and is given by the following equation:

$$= 100 * \log \left(\frac{E_t}{E_{t-1}} \right) \quad (3)$$

where r_t is the daily percentage return to the exchange rate and E_t and E_{t-1} denote the exchange rate at the current day and previous day, respectively. As noted by Griebeler (2010), the justification for this transformation rest on the notion that exchange rates can be viewed as any other assets, since it has the characteristic of reserve of value.

Below there is description of the macroeconomic variable utilized in the current study:

Openness of the Economy: The openness of the economy is calculated following partly the specification of Hau (2002). Hau utilize import to GDP as a proxy of the openness of the economy whereas in the current study the variable is the sum of import and export to GDP. The openness of the economy is expected to have a negative relationship with exchange rate volatility.

Inflation : The inflation rate variable is the actual inflation rate of the given country/region.

Interest: The interest rate is define as the interest rate differential, that is the difference between the interest rate in the home currency and the interest rate in the foreign currency, following the study of Goyal and Arora (2010) who suggested that the interest differential increases volatility in the short period.

Unexpected News: The unexpected news variable is estimated based on the specification proposed by Frankel (1981) and later used by a number of other studies. As Stancik (2007) pointed out it is difficult to observe and quantify unpredictable circumstances or news hence an alternative measure should be used to evaluate those events. Based on the notion that that asset markets clear fast and react immediately to news the following then the unpredictable circumstances or news can be measure with the use of the following equation:

$$= (i - i^*) - E_{t-1}(i - i^*) \quad (4)$$

where i is the interest rate in the home currency and i^* is the interest rate in the foreign currency; the first term in this difference denotes the innovation in the interest differential and the second one denotes the interest differential which was expected to prevail in period t based on the information available at $t-1$. Following Stancik (2007) the interest rate differential is estimated from a regression of the interest differential on the constant, two-lagged values of the differential and the logarithm of the lagged spot exchange rate. The results of the three estimated regression are given the tables below. The variable is expected to have a positive effect on exchange rate volatility as indicated by a number of studies.

Table 5: Descriptive Statistics for the three exchange rate series

Variable	Observation	Mean	Standard Deviation	Min	Max	Skewness	Kurtosis	adj chi2(2)	Prob>chi2

4. METHODOLOGY

Following the relevant literature, to estimate the exchange rate volatility the GARCH model is going to be applied. The methodology and the specific of the model are going to be described below. The first in identifying the model based is to identify the degrees of p , autoregressive order, and q , moving average order. According to Gazda and Výrost (2003) from methodological stand point GARCH rests on the same assumptions as the ARMA method (Box-Jenkins, 1970). Hence the starting point in establishing the appropriate GARCH model is to identify the correct ARMA that fits the three data series.

a. ARIMA

One of the most prevalent methods for forecasting time series is the Box-Jenkins also known as ARIMA approach. ARIMA method rests on the assumption that the future value of a given variable is a linear function of its past observations as well a random error. An ARIMA model can be decomposed in two parts (Box et al., 1994). First, it has an Integrated (I) component (d), which represents the amount of differencing to be performed on the series to make it stationary. The second component of an ARIMA consists of an ARMA model for the series rendered stationary through differentiation. The ARMA component is further decomposed into AR and MA components (Pankratz, 1983). The Auto Regressive (AR) component captures the correlation between the current value of the time series and some of its past values. For example, AR(1) means that the current observation is correlated with its immediate past value at time $t-1$. The Moving Average (MA) component represents the duration of the influence of a random (unexplained) shock. For example, MA(1) means that a shock on the value of the series at time t is correlated with the shock at $t-1$.

Table 6: Characteristics of the theoretical ACF and PACF for stationary processes

Process	ACF	PACF
AR (p)	Tails off as exponential	Cuts off after lag p
MA (q)	Cuts off after lag q	Tails off as exponential decay or damped sine wave
ARIMA (p,q)	Tails off after lag (q-p)	Tails off after lag (p-q)

The methodology is based on a three step procedure.

1. Model Identification: Establish the stationarity of the different variables, identify seasonality in the dependent variable and with the use with the use of autocorrelation and partial autocorrelation functions of to decide which (if any) autoregressive or moving average component should be used in the model.
2. Parameter estimation: Attain the coefficients which best fit the selected ARIMA model.
3. Model checking: By testing whether the estimated model conforms to the specifications of a stationary univariate process. In particular, the residuals should be independent of each other and constant in mean and variance over time.

Stationarity is a necessary condition in building an ARIMA model used for forecasting, so data transformation is often required to make the time series to be stationary. There are a number of tests used to evaluate the stationarity of a data series, one of which has been already applied in the current data set is the Augmented Dickey Fuller unit root test. When the final model is approved then it will be used for prediction of future value of exchange rate.

The ARMA model can be written as follows when the data set is stationary:

$$= \alpha_1 y_{t-1} + \dots + \alpha_p y_{t-p} + \epsilon_t + \theta_1 \epsilon_{t-1} + \dots + \theta_q \epsilon_{t-q} \quad (5)$$

Which is actually a combination of an autoregressive AR(p) model and an a moving average

MA(q) model. The AR(p) is defined as:

$$= \alpha_1 y_{t-1} + \alpha_2 y_{t-2} + \dots + \alpha_p y_{t-p} + \epsilon_t \quad (6)$$

where systematic part of y_t is a linear function of p lagged values

The MA(q) is defined as:

$$= \epsilon_t + \theta_1 \epsilon_{t-1} + \theta_2 \epsilon_{t-2} + \dots + \theta_q \epsilon_{t-q} \quad (7)$$

where y_t is a moving average of past shocks to the process.

Equation 5 implies that the forecasted value is depended on the past value and previous shocks.

b. GARCH

In order to evaluate volatility Bollerslev's (1987), Connolly's (1989) and Gregoriou et al. (2004) methodology is going to be applied by employing a GARCH (Generalized Autoregressive conditional Heteroscedasticity) specification for the conditional variance of monthly exchange rates. The GARCH method has a wide range of capital markets applications. The model is based on the assumption that forecasts of variance changing in time depend on the lagged variance of capital assets. An unexpected increase or fall in the returns of an asset at time t will generate an increase in the variability expected in the period to come.

Two of the most important empirical regularities of asset return are volatility clustering and fatter tails. As Madelbrot (1963) indicated volatility clustering implies that any significant or small changes in value are usually followed by similar changes in the opposite direction. Secondly, the distribution of returns has fatter tails (leptokurtic) than those of a normally distributed variable (mesokurtic) (Alagidede and Panagiotidis, 2006).

Additionally, as Connolly argued, "*Bollerslev's (1987) GARCH model offers several advantages: it incorporates heteroscedasticity in a sensible way (for a time series), it can be expanded to include other relevant variables in the conditional variance equation, and generally it offers more flexibility in robust modelling of stock returns*". (Gregoriou, Kontonikas, and Tsitsianis;2004. pp 218).

The test involves regressing the squared OLS residuals from the conditional mean equation ε_{it} against a constant and their lagged values. The variance of disturbance for a GARCH (p,q) model is:

$$\sigma^2_t = \alpha_0 + \sum_{i=1}^q \beta_i \varepsilon_{t-i}^2 + \sum_{i=1}^p \delta_i \sigma_{t-i}^2 \quad (8)$$

Or,

$$\sigma^2_t = \alpha_0 + \alpha(L)\varepsilon_t^2 + \beta(L)\sigma_t^2 \quad (9)$$

which is actually an Autoregressive Moving Average (p, q) process,

where,

q indicates the number of the moving average components, and p the number of the autoregressive components. In the polynomial form L denotes the lag operator.

α , and δ are constant and non-negative parameters. This specification allows for the conditional variance to be dependent on past information, which will induce variability over time. More specifically, the conditional variance is explained by past shocks and past variances. The key features of this specification are that if $p=0$, the process reduces to an ARCH (q) process and ε_t white noise process when $p = q = 0$.

Based on the estimated ARMA model the GARCH to be estimated in the study is GARCH(1,1). The GARCH(1,1) indicates that predicted variance rate is based on the most recent observation of the squared average and the most recent estimate of the variance rate.

The model to be estimated is the following:

$$\sigma^2_t = \alpha_0 + \sum_{i=1}^q \beta_i \varepsilon_{t-i}^2 + \sum_{i=1}^p \delta_i \sigma_{t-i}^2 + \phi \text{NEWS}_t + \gamma_i \text{OPEN}_t + \lambda_i \text{IDIFF}_t + \rho_i \text{INFL}_t$$

(10)

Where

NEWS = is the unexpected news variable measure as described above

OPEN = is the openness of the economy

IDIFF= is the interest rate differential

INFL= is the inflation rate

As the variance is expected to be positive, we expect that the regression coefficients α , β , δ are always positive, while the stationarity of the variance is maintained, if the coefficients β and δ are smaller than 1.0. The conditional variability of the returns defined in equation 10 above is determined by three effects:

1. the constant part, which is given by the coefficient α ;
2. the part of variance expressed by the relationship $\beta_i \varepsilon_{t-i}^2$ and designated as ARCH component;
3. the part given by the predicted variability from the previous period and expressed by the relationship $\delta_i \sigma_{t-i}^2$. This component is termed as GARCH.

The sum of regression coefficients ($\beta + \delta$) expresses the influence of the variability of variables from the previous period on the current value of the variability. This value is usually close to

1.0, which is a sign of increased inactivity in the effects of shocks on the variability of returns on financial assets.

c. EGARCH

The main disadvantage of the GARCH model is its inappropriateness for modelling the frequently observed asymmetric effect of volatility, when a different volatility is recorded systematically in the case of good and bad news. In the case of martingale models, falls and increases in the returns can be interpreted as good and bad news. If a fall in returns is accompanied by an increase in volatility greater than the volatility induced by an increase in returns, we may speak of a 'leverage effect'. To capture this asymmetry, different models have been developed and the one used in this paper is the EGARCH model. This model captures asymmetric responses of the time-varying variance to shocks and, at the same time, ensures that the variance is always positive. The model was developed by Nelson (1991). In the general form, the conditional variance is written as:

$$\ln \sigma_t^2 = \alpha_0 + \beta_i \sigma_{t-i}^2 + \delta_i \frac{e_{t-i}^2}{\sigma_{t-i}^2} + \gamma_i \left| \frac{e_{t-i}^2}{\sigma_{t-i}^2} \right| \quad (11)$$

The EGARCH model is asymmetric because the level $\left| \frac{e_{t-i}^2}{\sigma_{t-i}^2} \right|$ is included with coefficient γ_i .

Since this coefficient is typically negative, positive returns shocks generate less volatility than negative return shocks assuming other factors remains unchanged. In macroeconomic analysis, financial markets and corporate finance, a negative shock usually implies bad news, leading to a more uncertain future. Consequently, for example, shareholders would require a higher expected return to compensate for bearing increased risk in their investment (Wang, 2003).

In order to capture asymmetric responses of the time-varying variance to shocks, the study employs EGARCH(1,1), which has the following specification:

$$\ln \sigma_t^2 = \alpha_0 + \beta_i \sigma_{t-i}^2 + \delta_i \frac{e_{t-i}^2}{\sigma_{t-i}^2} + \gamma_i \left| \frac{e_{t-i}^2}{\sigma_{t-i}^2} \right| + \phi \text{NEWS}_t + \gamma_i \text{OPEN}_t + \lambda_i \text{IDIFF}_t + \rho_i \text{INFL} \quad (12)$$

Where

NEWS = is the unexpected news variable measure as described above

OPEN = is the openness of the economy

IDIFF= is the interest rate differential

INFL= is the inflation rate

5. ANALYSIS OF THE RESULTS

a. ARMA model

The first step in an ARMA process is to examine the existence of stationarity in the series. As can be evidence from figures 1-3 in Appendix 1 the three exchange rates follow a different trend. In essence from Figure 1 it is clear evidence that the turmoil in the US economy have given a boost in the euro over the dollar. The same is evidence from figure 3 which exhibits the exchange rate between sterling pound and dollar. Another important point of notice from the figures is the level exchange rates do not appear to be stationary. Evidence to this is the augmented Dickey- Fuller (ADF) test that does not reject the hypothesis of unit root for any of the three data series.

To examine the stationarity of the first difference data again the Dickey Fuller Unit Root test has been applied. As is evidence from the results of the ADF, (see Tables) the difference exchange rate data, for all of the three series, has no unit root at different levels of significance.

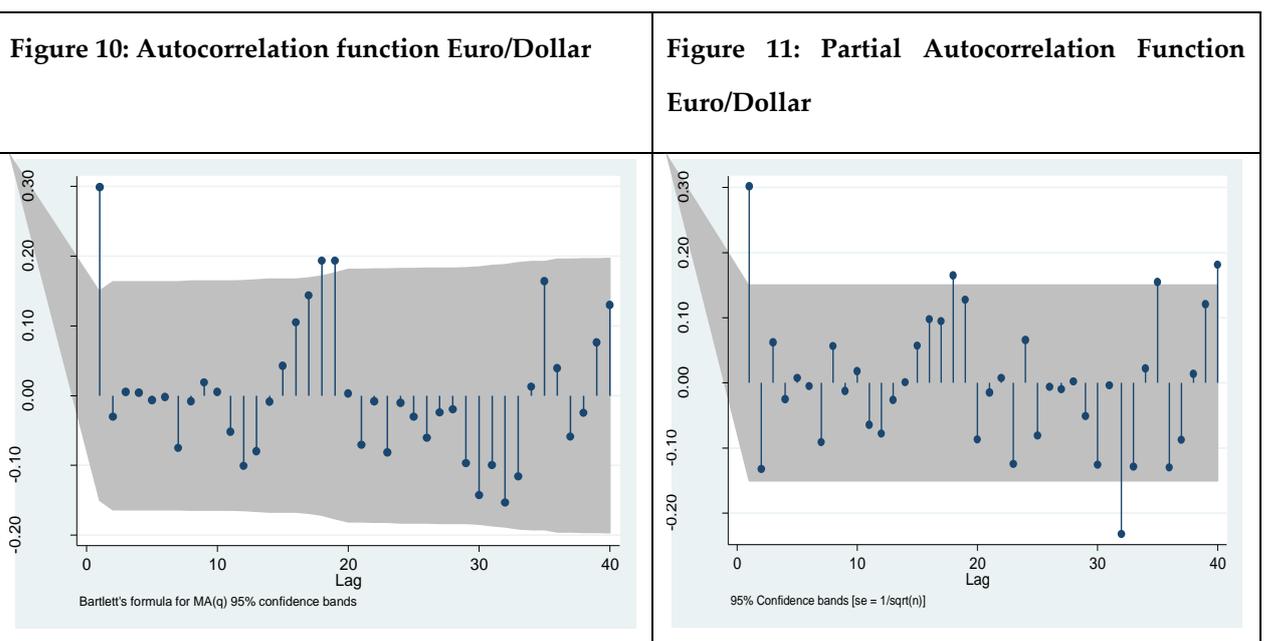

Figure 12: Autocorrelation function Sterling Pound/Euro

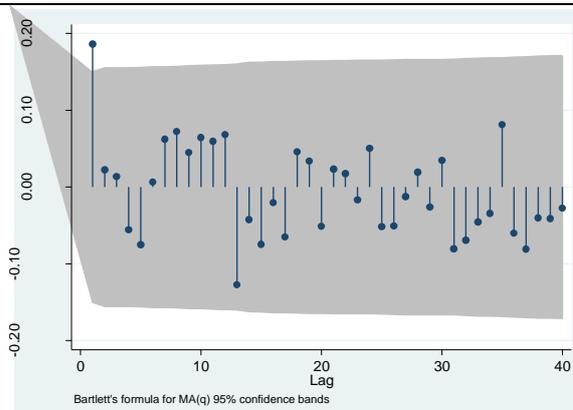

Figure 13: Partial Autocorrelation Function Sterling Pound/Euro

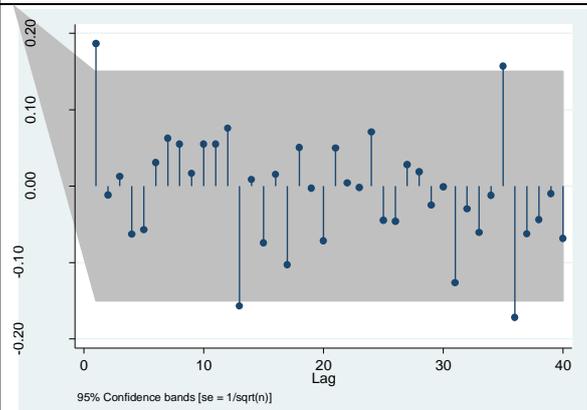

Figure 14: Autocorrelation function US Dollar/Sterling Pound

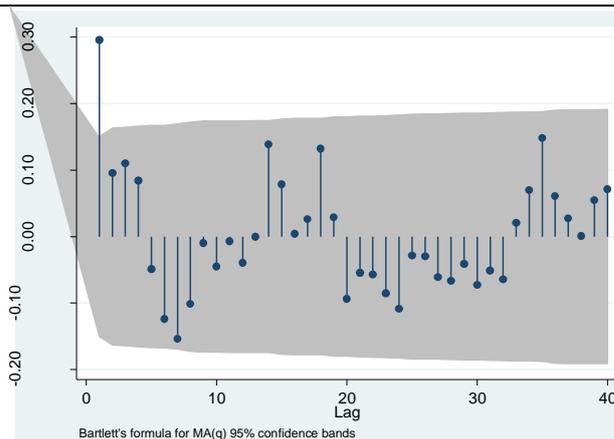

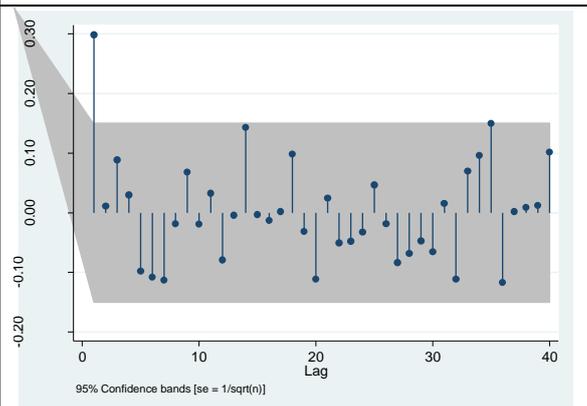

Figure 15: Partial Autocorrelation Function US Dollar/Sterling Pound

Once the stationarity is established the next step is to evaluate autocorrelation and partial autocorrelation functions to decide which (if any) autoregressive or moving average component should be used in the model. The autocorrelation function (ACF) can be used in identifying the order of MA process, which is determined by those error terms that are correlated over time (i.e. not independently distributed). On the other hand, the ACF cannot be used to identify the order of an AR process. This is due to the fact that the ACF of an AR process decays quickly (i.e. $p(k)=\beta^k$). So, in order to identify the order of an AR process we use the partial autocorrelation function (PACF). The PACF can be seen as the ACF of the time series observations separated by lag of time k units with the effects of the observations in between eliminated.

The figures 1 to 6 present the ACF and PACF for the three data series. The first two figures concentrate on the euro/dollar exchange rate. It can be seen that the ACF has only one significant cut off at the first lag showing the presence of white noise whereas the PACF also shows one significant peaks at lag one and another one at 31. Nevertheless since the spike is quite smaller than the one in lag one and also is quite far in term of time, the model that describe the series under question is ARMA(1,1). In terms of the Sterling Pound exchange rate the ACF is more clear than the previous correlograms, it exhibits only on clear spike at lag one. In terms of the PACF apart from the spike at the first lag there are other 3 smaller spike in lag 13, lag 35 and lag 37, but because there quite small again the best model is consider to be ARMA(1,1). In regards to the US/Sterling pound exchange rate both the ACF and the PACF correlograms exhibit only one spike thus for the third series as well the best model is ARMA(1,1).

b. GARCH MODEL

In this section the estimated results for the GARCH model are presented. As indicated by the ARMA model the initial starting model to be estimated in GARCH(1,1) for all the three data set. For the first model, the euro exchange rate, the inflation variable has been excluded since with the addition of this variable the flat log likelihood has been encountered. For that reason apart from the specified independent variable of the GARCH model the variable included were the unexpected news, interest rate differential and the openness of the economy. Nevertheless the results indicate that neither the independent variable nor the GARCH components of the variance were statistically significant. After different estimates the best model is GARCH(2,2) the results of which are presented to the table below.

Table 7: GARCH(2,2) EURO/DOLLAR

Distribution: Gaussian			Wald	chi2(3)	2.96	
Log likelihood = -251.7297			Prob	> chi2 =	0.3980

α	.1199394	.0371127	3.23	0.001	.0471997	.192679

It is clear evidence from the table above that the GARCH components of the variance are statistically significant for both lags and for ARCH only for the first lag. Also the significance of both δ and β indicates that, lagged conditional variance and lagged squared disturbance have an impact on the conditional variance, in other words this means that news about volatility from the previous periods have an explanatory power on current volatility. Nevertheless none of the marcoeconomic variables are found to be statistically significant in explaining the exchange rate volatility.

The next estimates concerning the sterling pound exchange rate. Again the starting model was GARCH(1,1) but the best model was found to be GARCH(2,1) where the results are presented in table 11 below. The model depicts that macro variables are once more found to be statistically insignificant whereas the GARCH components of the variance are statistically significant suggesting that that news about volatility from the previous periods have an explanatory power on current volatility.

The last series, the US dollar exchange rate is best explained by a GARCH(1,1). Nevertheless, as can be seen from table 12 the only significant variable under this model in is lag ARCH

variable. Conclusively it can be argued that, at least with the use of GARCH methodology the exchange rate volatility does not seem to be affected by any economic variable included in the current study. This in turn suggests that policy makers cannot alter or minimize the volatility through monetary policy and thus they should aim to identify the causes of volatility in other possible variable such as the capital market. Another possible explanation is that the results might be affected by the choice of the methodology, as suggested by a number of studies (Albuquerque and Portugal, 2005)

c. EGARCH MODEL

In this section the estimated results for the EGARCH model are presented. As indicated by the ARMA model the initial starting model to be estimated in EGARCH(1,1) for all the three data set. Again the first model is the euro exchange rate. The results are quite different from the estimates generated from the GARCH model suggesting that the results are not robust to the methodology utilized. Opposing to the GARCH model in the EGARCH all the macro variables are included in the estimation.

Table 10: EGARCH(1,1) EURO/DOLLAR

α	.0326356	.0385848	0.85	0.398	-.0429893	.1082605

The first point of notice is that the best model is the EGARCH(1,1) where the GARCH components of the variance are statistically significant. Additionally, in line with the results of Faust et al. (2007) the interest rate differential is found to be positively statistically significant suggesting that changes in the interest rates differences between the local and foreign country have an effect in the interest rate. The level of significance under consideration is at 95%.

For the second data series the best model was found to be EGARCH(2,1) the same as GARCH estimation. The difference between the two models is that in the previous estimation no macro variable was significant. On the contrary under the EGARCH methodology the openness of the economy is found to be negatively statistically significant in line with Hau's results as well as Stancik (2006) and Bravo and di Giovanni (2006). The result suggests that the more open the economy is the more subjective to external shock is the exchange rate. Additionally the EGARCH parameters are found to be statistically significant at 95% level of confidence interval. The results from the estimated model are presented in the table below.

Table 11:EGARCH(2,1) Sterling Pound/Euro

The final series is the US dollar exchange rate. Again the estimation between the two methodologies differ where the best model under the current approach is GARCH(1,2) . The similarity between the two models rest on the non-significance of the macroeconomic variables whereas the EGARCH Parameters are found to be statistically significant.

6. CONCLUSIONS AND RECOMMENDATION

From the ending of the Bretton Wood fixed exchange rate regime, exchange rates both nominal and real exhibited high levels of volatility all across the globe. The risk associated with high volatility levels in the foreign exchange market have cost implications for all the economic agents as well as policy makers. From the stand point of agents, international investors and portfolio managers bear higher risk in their everyday investment decisions and companies that deal with international trade endure extra cost from the increase risk level. In terms of policy makers, evidence have shown that if exchange rates are volatile then prices in the economy follow volatile movements. Hence determining the factors that affect the exchange rate volatility is of upmost importance to a number of parties.

Based on the aforementioned the aim of the current study was to determine the relationship between macroeconomic variable and exchange rate volatility. The result of the literature on the subject matter are quite mix. A part of the literature suggests that there a number of variable that they do actually affect the exchange rate volatility such as such the openness of the economy [Hau (2002), Stančík (2006)], interest rates (Juthathip 2009), exchange rate regime (Kočenda and Valachy 2006), inflation [Calvo and Reinhart (2000), Devereux and Engel (2003)], and unpredictable circumstance (Calderon and Kubota, 2009), where the degree of the impact of those factors depends on the economic conditions of a given country. On the other hand there is a number of studies that suggested that there is no link between macroeconomic variable and exchange rates. The primal notion behind this view is those macroeconomic variables do not exhibit the same increase as exchange rate volatility during floating exchange rate regime (Albuquerque and Portugal 2005). Another part of the literature argues that the absence of the relationship between the two rest on methodological issue.

With the use of monthly exchange rates (euro/dollar, sterling pound/euro, and US Dollar/sterling pound exchange rate) from January 1999 to March 2013 the current studies aimed to examine the contradicting views of the literature. Four different macroeconomic variables have been used, namely openness of the economy, interest rate differential, unexpected news and inflation. The choice was primarily the importance that was given to them by prior studies. To examine the potential relationship two different approaches have been used so as to examine the robustness of the results to changes in the methodology. Indeed, in most cases the macroeconomic variables were found statistically insignificant. Specifically, under the GARCH methodology in all the three different data series no variable was found to be statistically significant. On the other hand when applied the EGARCH methodology the openness of the economy was found to be negatively statistically significant with sterling pound exchange rate in line with Hau's results as well as Stancik (2006) and Bravo and di Giovanni (2006). Taking into account policy makers might need to consider policies that would minimize this problem. If the structure of the external transaction of a given country cannot be altered an alternative solution is for this country to consider entering into a common exchange regime system as it is said to promote economic stability. Additionally, in line with the results of Faust et al. (2007) the interest rate differential is found to be positively statistically significant with the euro/dollar exchange suggesting that changes in the interest rates differences between the local and foreign country have an effect in the interest rate. Again this has certain policy implications, since policy makers when they aim in changes in local interest rate should not only consider inflationary policies and money supply, but they need also to alter the interest rate when a foreign trading partner changes its home interest rate. Depending on the trading volume between the two countries, a change in the interest rate differential would alter the exchange rate and would lead to trade imbalances.

Lastly, it can be suggested that the results are not robust to method of estimation supporting the part of the relevant literature that argues that the non-significance of the macroeconomic variable in explaining the changes of exchange rate volatility might come forth from the differences in the methodology and not to the variables as such. Even though in the current study there was not a strong support for the existence of a relationship between macroeconomic variable and exchange rate volatility, while under GARCH methodology the relationship was found to be none, under EGARCH approach in different series certain variables were found to be statistically significant. As certain previous studies indicated, the magnitude and significance of macroeconomic variable on exchange rate volatility on the economic conditions of a given country.

ABSTRACT

Portugal is a small economy, with an open domestic market that needs competitive exporters to prosper. Trade fairs are an international promotion tool that can be used by firms considering export development and expansion. This study identifies the prime motives and barriers for exporting firms participate (or not) in international trade fairs and the critical decision factors involved in that choice.

The results indicate that a strong motive to exhibit at a trade fair is to reinforce the market presence of the firm, the possibility of finding new ideas and test new products, establish relationships with present and future customers, and enhance the brand image and reputation of the firm. The main barriers to non exhibitors firms were costs, bad previous experiences and lack of resources (financial, personnel and time). The firm's critical decisions factors to select a trade fair were value for money and the stand. The first, accounts for the ratio between costs and the mix of organizer's reputation, quality and quantity of attendees, and market coverage. The second includes the typology, size and location of the stand inside the space of the trade fair.

Keywords: International trade fairs, Motivations to exhibit or not, Firm's decision factors, Portuguese exporters.

INTRODUCTION

Trade shows, trade fairs, consumer shows or mixed shows are not synonymous. According to UFI (2011), trade shows are business to business events, where firms in a specific industry can showcase and demonstrate their new products and services; trade fairs are confined to one industry or a specialized segment of a special industry; consumer shows are events that are open to the general public, where exhibitors are retail outlets, manufacturers or service organizations looking to bring their products and services directly to the end user; mixed shows are a combination of trade and public shows. AUMA (2007, p. 24) defines trade fairs as “market events of a specific duration held at intervals, at which – with a predominant appeal to trade visitors – a large number of companies present the main product range of one or more sectors of industry and mainly sell to commercial buyers on the basis of samples”. Although the term trade fair is more used in Europe and trade show in the United States, for the purpose of the current study these terms are used interchangeable, representing opportunities for firms interested in promoting their products and services internationally.

Trade fairs is not a new marketing promotion tool, but over the last years the global trade fair industry has grown dramatically worldwide. The total indoor exhibition space is 32.6 million m², and the highest is offered by Europe (48%), North America (24%), and Asia (20%). In terms of countries, five of them (USA, China, Germany, Italy and France) account for 59% of the total world indoor exhibition space (UFI, 2011). The main international industry association was founded in 1925, in Milan (Italy), and in 2003 it becomes the Global Association of the Exhibition Industry (UFI), including 540 members (www.ufi.org).

The importance of trade fairs for firms will vary depending upon their size and the country of origin. For SME's (small and medium-sized enterprises) trade fairs play a unique role, because they take company personnel to foreign markets, allowing firms to collect market information, and assess market opportunities (Bowling and Adams, 1988; Freitas Santos, 2005). For small countries, as Portugal, facing a severe financial and economic crisis increasing exports is a priority. In 2011, a total number of 19.837 exporting firms are registered in the Portuguese Statistical Institute (INE), more 12% than in the year before. The need to increase this number in the future is paramount for the growth of the economy and the balance of payments, as Portugal experienced trade deficits in the past thirty years. For many Portuguese firms the domestic market has reached the point at which supply is exceeding demand. This is due to reductions in domestic growth, and increasing competition in local market. Consequently, research into the role of trade fairs as a mean to enter new international markets is of value to Portuguese firms who already exports, but also for those

in the early or pre-exportation stage. Research is also needed as a scarce number of studies have been developed in the last years focused on the Portuguese reality (Sarmiento, 1997; Viegas, 2000) and none, to our best knowledge, has emphasized firms' motivation, behavior and decision factors to participate at international trade fairs.

Although some studies have contributed to understand what might motivate firms to exhibit their products or services in international fairs, researchers have paid less attention to the specific reasons that encourage SMEs to become involved in those venues. Firstly, because participants in trade fairs invariably have differing objectives, depending on their size, experience, country of origin, products/services, and market focus. Secondly, the participating firms have to rise the occasion that fairs provide for selling and non-selling activities (information gathering, image building, relationship-building and motivational). Thirdly, the trade-off between perceived costs and benefits is subjective in nature as firms must be involved in pre-fair promotion, at-fair selling and after-fair follow-up activities to take full advantage of the exhibition. Finally, the resources allocated by each firm (booth size, location, design, attention-getting techniques, booth personnel) may influence the perception of success. Thus, it seems useful to study the combined reasons of trade fairs participation and non-participation of Portuguese firms in those venues.

The present study was designed in an attempt to identify the motives perceived by firms to exhibit or not their products or services in international trade fairs, to explain the behavior before, during and after the fair, and to investigate the decision factors that drive or inhibit the firms to exhibit at an international trade fair.

The following section outline some relevant previous research on trade fairs, the methodology and the study undertaken, and the results obtained.

1. INTERNATIONAL TRADE FAIRS: A REVIEW OF LITERATURE

The role of trade fairs in the communication mix of the firms has been analyzed in international and global marketing textbooks. Johansson (2009, p. 557/558) refers to the international trade fairs stating that are "excellent promotional avenues for the global marketer". Albaum, Strandkov and Duerr (1998, p. 441/442) argue that trade fairs and exhibitions are "extremely important for some industries and some countries". Kotabe and Helsen (2010, p. 453/454) stress that trade shows are a "vital part of the communication package for many international business to business marketers". Onkvisit and Shaw (2004, p.429/433) indicate "overseas product exhibitions" as "one type of sales promotions that can be highly effective". In general terms, trade fairs are "events that bring together, in a single

location, a group of suppliers, distributors and related services who set up physical exhibits of their products and services from a given industry or discipline (Black, 1986).

Trade fairs are an important tool in the international promotion strategy of the small and medium-sized firms. In the early phases of the exporting process, trade fairs create an opportunity for considerable learning to take place, both about foreign markets, and the level of competition on the industry. Many contact activities takes place during the fair, but contact development and interaction with industry continues after the trade fair.

The first book specifically about trade fairs has been written by Norman (1986), and still is a reference on the theme. Several other books followed to help firms on “how to exhibit at trade fairs” (Appleyard, 2005), on making their presence more effective (Miller, 2000) and successful (Miller, 2006; Friedmann, 1999), or describing the tasks of exposition management (Morrow, 2002; Stevens, 2005).

Norman (1986) proposed a three stage process for planning a participation in a trade fair (before, during and after) that was followed by different authors such as Miller (2000); Viegas (2000); Appleyard (2005); Rhonda and Bozdech (2006); CEIR (2010); and, Donelson (2011). These authors agree that planning is the best procedure to develop a coherent and efficient participation in a trade fair in order to obtain the maximum return on investment. Also, empirical research has shown that a successful participation in a trade fair demands a strategic planning in all the stages of the event (Framis, 1994; Sarmiento, 1997; Siskind, 2005).

The aims for exhibiting at international trade fairs can be usually divided into selling and non-selling activities. Selling activities include lead generation, closing sales, finding new customers, qualifying leads and prospecting. Non-selling activities are broadly categorized as meeting existing customers, enhancing the image of the company, carrying out general market research, meeting new distributors or agents, launching new products and even enhancing staff morale (Kerin and Cron, 1987; Blythe, 2002; Rittichainuwat and Mair, 2012). Parasuraman (1981) and O’Hara (1993) consider the participation in a trade fair the second best tool of marketing, just after personal selling, as the mean to influence the buying decisions of customers.

Herbig, O’Hara and Palumbo (1997) identify several advantages to trade fair participation: i) the large number of qualified interested people that received the promotional message; ii) the possibility of introducing new products to a large number of prospects; iii) the potential customers that can be discovered; iv) the enhance goodwill to the firm; and, v) the opportunity of free publicity to the firm. A systematic approach to the advantages of participating in an international trade fair indicates the identification of potential customers,

the increase of customer loyalty, the introduction of new products to a large number of prospects, the reinforcement and improvement of corporate image, the gathering of competitor information, and selling (Bonoma, 1983; Moriarty and Spekman, 1984; Kerin and Cron, 1987; Hoshen, 1989, Bello and Barczak, 1990; Tanner Jr. and Chonko, 1995; Miller, 2000; Rhonda and Bozdech, 2006; Blythe, 2010; Li et al., 2011). An additional advantage, according to Trade Show Bureau (1994) is the average cost per contact at a fair which remained consistently one third of the cost of personal sales call. However, although the many advantages that trade fairs have, some drawbacks can be pointed out. The costs involved (space rental, freight, booth personal travel, and living expenses) still are expensive (Trade Show Bureau; 1994; Junior, 2005). The proliferation of trade fairs in terms of number, frequency, market focus, and specialization are confusing the exhibitors who need to be more selective and conscious about the cost/benefit analysis.

Berne and Garcia-Uceda (2008) studied the criteria used by potential exhibitors and visitors in their ex-ante evaluation of trade shows. The basic features suggested by the review of the literature on trade show evaluation and selection are: i) perception of information on trade shows, including type of trade show, convenience of the location and timing, the trade show reputation and its management, the anticipated quantity and quality of attendance; ii) marketing objectives of the firm, including customer acquisition and retention, interaction with the distribution network, product scanning and marketing research; iii) the perceived costs deriving from attending trade shows (relative and differential costs).

Blythe (2010) specify three strategies and nine tactics for exhibitors interested in participating in a trade fair: the strategy of selling, includes take orders, generate leads and make useful contacts; the strategy of communication (outbound), includes image enhancing, product information and establishing a product or company presence; the strategy of communication (inbound), includes meeting existing customers, identifying new customers and observing the competition. On the side of visitors the same author (Blythe, 2010) identify three strategies and eleven tactics: one of them (gather brochures) is common to all strategies (sources of supply, information sources, and entertainment). The other tactics include place orders, make appointments, sought and unsought information, analyse offers, gather free gifts, go to demonstrations and observe displays (Blythe, 2010). Tanner Jr. (2002) adverts that the success factors are mainly strategic, suggesting the centralization in one specific function with the responsibility of define, plan and implement the firm participation in all the fairs that take place annually. Miller (2006) reinforces this idea, detaching the role of booth personnel in the success of the fair. The author indicates ways to approach attendees, establish conversation

and agreements, increase the quality of the interaction, identify business opportunities, and capture contact information.

Herbig, O'Hara and Palumbo (1997, p. 375) studied the differences between trade show exhibitors and non-exhibitors to conclude that distinct significant characteristics exist. The exhibitors have "large, international-oriented industrial companies with many customers, technically complex goods, a high degree of customization and relatively expensive goods". On the contrary, "the more portable a product is, the more simple, the less tangible, the less technical, the more inexpensive a product is, the greater the likelihood to non-exhibit". In the same study (Herbig, O'Hara and Palumbo, 1997) has shown that exhibitors correlate almost perfectly with trade show advantages and non-exhibitors negatively so. One major inhibitor for small businesses still is the cost of participation in a trade show. Nonetheless, the causal link between size of the firm and the decision to participate or not in a trade fair, need more empirical support, as the results of the current research are weak (Kerin and Cron, 1987; Seringhaus and Rosson, 1998; Tanner Jr., 2002). In Canada, a study about collective versus individual participation in a trade fair, found that size and age of the firm are not discriminating factors (Seringhaus and Rosson, 1998). However, it is expected that small firms participated annually in a lesser number of fairs than the bigger firms (Kang and Schrier, 2011).

Hansen (1996), researching the motivations to participate or not in a trade fair underlines the enhancement of the corporate image, the collection of competitor information, the introduction or test of new products/services, the loyalty of current customers, the selling of products/services, and the identification of potential customers.

The motivations for trade fair participation was also investigated by Kijewski and Yoon (1993) who have identified five reasons that affect the exhibitor decisions: exhibition performance, marketing mix strategies, exhibition profile, costs of participation and human resources capacity. They found that firms are searching for trade fairs not only in a perspective of marketing and selling implementation, but also for considering the trade fairs as a platform of communication and relationship channels construction (Gopalakrishna and Lilien, 1995; Hansen, 1996). A convincing reason for that is pointed out by Blythe (2010) who states that the majority of attendees are not firm's buyers, but influent persons in organizations that have the buying or prescriptive power in the decision making process. Therefore, the traditional emphasis on selling must be change to a marketing relationship approach.

To make trade fair more effective marketers must evaluate their participation in an exhibition. Hansen (1999; 2004) presents a five dimension scale: an outcome-based sales dimension and four behavior-based dimensions, including information-gathering, relationship-building, image-building, and motivation activities. More recently, Shi, Smith and Zhang (2012) develop a four-dimension framework (sales-relational, psychological-related, market-exploring, and competitive-intelligence) to examine trade show performance against six trade show marketing strategies (visitor-attraction techniques, number of exhibited products, booth size, booth staff number, booth staff training and follow-up contacts).

The previous participation in a fair seems to be an important factor either for experience or inexperienced firms as the aims of each are very different (Motwani, Rice, and Mahmoud, 1992). In both cases, the vivid experience of the exhibitor, the perceived advantages of being at the fair networking with current and potential customers, and the presence face-to-face with direct competitors stimulates the return to the next fair (Kemp and Smith, 1998; Smith, Hama and Smith, 2003; Breiter and Milman, 2007). Kang and Schrier (2011) indicate that as experience increases exhibitors are more prompt to be less satisfied. The authors recommend more attention to event organizers, as they must be keen of the fact and able to define marketing strategies to correct those attitudes. One of the strategies, suggest the creation of a network of trade contacts available to exhibitors, allowing the access to a list of potential buyers (Kirchgeorg, Jung and Klante, 2010). Nevertheless, satisfied exhibitors are more prompt to return in future editions of the fair, as they perceived a lower risk of participation (Patterson and Spreng, 1997).

A substantial number of corporate executives still perceive trade fairs as a non-selling activity or a social event for those employees that attend (Skolnik, 1987). The effectiveness of a fair could be questioned, sometimes because the firms are unable to measure the return on their trade fair investment. Blackwell (2010) proposes a ratio (ROI - Return on Investment), as a process to evaluate the performance of the firm's presence at an exhibition. The author recognizes difficulties in the ROI calculation, as many variables are involved when a specific trade fair is considered. Bettis-Outland, Cromartie, Johnston and Borders (2010) add the index of Return on Trade Show Information (RTSI) that describes both tangible and intangible benefits that accrue to the firm as a result of information acquired at trade fairs. However, the authors advert that "in some cases, the same information that is acquired at trade shows is also available from alternative sources, potentially making it difficult to determine true RTSI" (Bettis-Outland, Cromartie, Johnston and Borders, 2010, p. 271).

In a scenario analysis, Kirchgeorg, Jung and Klante (2010) suggest that trade shows will continue to be an integral and indispensable part of the marketing mix of the companies. However, trade show companies should continue to move away from selling space and instead become information brokers who facilitate the networking and interaction of market players.

2. METHODOLOGY

The present study was conducted in Portugal and sought to examine the firm's behavior regarding international trade fairs. The objectives of the study were threefold. First, to find out what are the rationale and preferences of the firms that lie behind the planning of trade fair participation. Second, to examine the reasons why Portuguese firms participate or not in international trade fairs. Third, identify which firm's decision factors influence the choice of a specific trade show.

In the preliminary stage of the research process an informal exploratory study was undertaken. First, several unstructured personal interviews were made to managers of exporting firms and fair organizers in order to understand the intricacies of the research problem. Simultaneously, the researcher visited two international trade fairs: one in Madrid (Fitur, 2012), and the other in Paris (Moison & Object, 2012) to directly observed the behavior of exhibitors, attendees and the atmosphere of a trade fair. Since the problem is subjective in perception, a questionnaire was used as data collection instrument.

The questionnaire contained three parts. The first part is oriented towards the firms that already has been in an international trade fair, and included: i) questions about the operational and tactical decisions of the firms' participation; ii) two lists of typical reasons and decision factors - the first list was measured in a preference scale from 1 (most preferred) to 5 (least preferred), and the second list used a five-point Likert scale; iii) questions about the communication tools used by firms during the fair.

The second part of the questionnaire was only applied to non-participant firms, and included two lists: one, with the possible reasons to not participate, measured by a five-point Likert scale; the other one, with the factors that could alter the non-participation decision of the firm, measured by a preference scale from 1 (most critical) to 5 (least critical). The third part is common to both participating and non participating firms and contained the characteristics of the respondent firms, including sector of activity, size (number of employees and total sales), international experience (number of years in international markets) and international involvement (proportion of exports on sales and number of international markets). All the

lists used in the questionnaire were derived from those identified in previous studies in the area.

Table 1 - Sample profile

Characteristics	Proportion (n = 68) (a)
Sector of activity	
Construction	12.1
Textile and Shoes	9.1
Furniture and Decoration	19.7
Tourism	7.6
Others	51.5
Number of employees	
Less than 20	15.1
21 - 50	18.2
51 - 100	21.2
More than 100	45.5
Total volume of sales (€)	
Less than 500.000	7.5
500.000 - 2.499.999	18.2
2.500.000 - 10.000.000	27.3
More than 10.000.000	47.0
International Experience	
Less than 1 year	3.0
1 - 3 years	3.0
More than 3 years	87.9
Never exported	6.1
Percentage of exports on sales	
0% - 20%	24.6
21% - 50%	29.2
51% - 100%	46.2
Number of export markets	
0 - 5 countries	27.7
6 - 20 countries	40.0
More than 20 countries	32.3

Note: (a) Totals may be less than 68 as respondents did not complete all questions.

To select the Portuguese exporting firms for the study the researcher used a random sampling process, based on secondary data from public (AICEP) and private business and trade associations (AEP, AIP, ATP, APICCAPS, APIMA). The questionnaire was sent by e-mail or post, between January 20th and July 30th of 2012, to 1108 marketing managers responsible to handle exporting activities. After a telephone recall to non-respondents, a total of 68 usable questionnaires was used, which correspond to a response rate of 6.14%.

Table 1 describes the characteristics of the firms that participated in the study. As can be seen, the composition of the sample goes beyond the manufacturing sector to include tourism,

construction and many other sectors. Further, the size of the firms by Portuguese standards, varies between small (less than 100 employees) to medium (more than 100 employees). The total volume of sales can be equally divided with half of the firms below €10 million and the other half above € 10 million. Most of the respondents firms (87.9%) have international experience (more than 3 years), have been exporting to a diversified set of markets (32.3% for more than 20 markets) and the weight of exports on total sales are significant (more than 50% in 46.2% of the firms).

Preliminary analysis of the survey data using SPSS and *chi-square* tests revealed that there were no statistical significant relationships between firms characteristics (sector of activity, size by number of employees or total sales, volume of exports on total sales, number of export markets) and the participation or not in international trade fairs. The only variable showing a significant difference ($p < 0.01$) was international experience, as suggested earlier in previous empirical evidence (Seringhaus and Rosson, 2001). Therefore, the sample proved to be relatively homogeneous and further data analysis was undertaken.

3. ANALYSIS AND RESULTS

The results of table 2 show that the main motive why Portuguese exporting firms participate in international trade fairs is to reinforce the market presence (mean score of 3.6) where the fair is taking place, enhancing its image among present and future customers, but also among competitors. It appears that Portuguese firm's are very conscious of the negative effects that the absence of a trade show could have on current customers' perception and the benefits attached of being at a fair. 16 of the respondents perceived this to be an extremely important reason to participate. Promote innovation and test new products (mean score of 3.19), increase customer loyalty (mean score of 3.03), and improve brand image and reputation (mean score of 2.9) were other important motives for participation and were perceived to be first choice factors by 6, 5 and 6 respondents, respectively.

Table 2 – Motives for participation in international fairs

Reasons	1 st Choice	2 nd Choice	3 rd Choice	4 th Choice	5 th Choice	Total	Mean (S.D.)
Reinforce market presence	16	9	7	4	6	42	3.6 (1.449)
Save costs due to a better relation cost per contact	2	4	5	3	6	20	2.65 (1.387)
Customer loyalty	5	6	11	5	5	32	3.03 (1.282)

Promote innovation, test new products	6	9	5	7	4	31	3.19 (1.352)
Tool to promote and introducing new products or services	5	5	8	11	8	37	2.68 (1.334)
Increase sales and customer portfolio	5	4	5	9	6	29	2.76 (1.405)
Improve brand image and reputation	6	9	6	11	7	39	2.90 (1.373)
Firm's routine	0	0	3	0	0	3	3.00 (0.0)
Imitation of competition	1	1	2	0	0	4	3.75 (0.957)
Disappointment with trade fairs	1	0	1	0	1	3	2.67 (2.082)

Note: Totals may be less than 51 as respondents did not complete all questions.

Somewhat unexpectedly, increase sales and expand customer portfolio ranked moderate on the motives of firms, with a mean response of 2.76 which clearly denotes that make direct sales is not of paramount importance for participants, although 5 of them considered a first choice motive. Similarly ranking below the expectations (mean score of 2.68), was one pivotal function attached to trade shows, that is, being a place to the promotion and introduction of new products. According to 20 respondents the cost per contact (mean score of 2.65) seems to be a forgotten or a lesser known criteria when a final decision must to be taken. The firm's routine and imitation of competition were the least important motives indicated by respondents for participation.

Table 3 suggests that costs was the major barrier to participation in an international trade fair, with a mean response of 4.06, and 6 respondents answering "strongly agree" with the statement that "costs of trade fair's participation are high and the return on investment difficult to obtain". This is a frequently cited disadvantage to not participate in trade fairs (Kerin and Cron, 1987; Seringhaus and Rosson, 1998; Tanner Jr., 2002; Kijewski and Yoon, 1993). Another intrinsic reason associated with the organization of the fairs was bad previous experiences (mean score of 3) which seems to marked negatively some of the respondents (5 firms reported agree or strongly agree). On the organizer side, assessing visitor and exhibitor satisfaction on several relevant topics could be important, not only to stand visitor profile analysis, but also to measure and monitor the success of a trade fair in a broadest sense. On the exhibitor side, the access to information regarding the event, such as the analysis of the visitor records, the assessment of competitors performance, the effectiveness of the

advertisement for the trade fair (TV, press, catalogues, etc.), the efficiency of the ratio between the number of invitation sent out and the number of visitors are all sensible areas that could increase exhibitor satisfaction and retention.

Table 3 – Inhibiting factors to firm participation in international fairs (n = 16)

Reasons	SD	D	NA/D	A	SA	Mean (S.D.)
Trade fairs are old-fashioned	1	4	8	3	0	2.81 (0.834)
Costs of participation	0	1	3	6	6	4.06 (0.929)
Bad previous experiences in trade fairs	1	4	6	4	1	3.00 (1.033)
The firm has no financial resources to participate	2	5	3	4	2	2.94 (1.289)
The firm has no qualified human resources to participate	3	7	3	3	0	2.38 (1.025)
The direct competition of the firm is in the same space	7	4	4	0	1	2.00 (1.155)
Trade fairs are time consuming	1	7	4	4	0	2.69 (0.946)
Firm's sector of activity is not present in fairs	2	4	4	2	4	3.13 (1.408)
Disappointment about trade fairs organizations	2	3	7	4	0	2.81 (0.981)
Don't know about trade fairs	5	7	3	1	0	2.00 (0.894)

Note: Note: Totals may be less than 17 as respondents did not complete all questions.

(SA) Strongly Disagree; (D) Disagree; (NA/D) Neither Agree nor Disagree; (A) Agree; (SA) Strongly Agree.

Some other important reasons are firm-specific, such as lack of financial resources (mean score of 2.94), need of qualified human resources (mean score of 2.38), and time-consuming process for the firm (mean score of 2.69). It seems that focus only upon resources and capabilities as the foundation for a firm's promotion strategy could limit its long-term success. The ability to establish relationships with new customers, gather information about competitors, partners and new products could make a difference over international direct competitors. Therefore, the trade fair participation must be envisaged as a long term promotional strategy rather than short term, oriented towards customer relationships building, and brand image and firm reputation enhancement.

As seen on table 4, more competitive costs are cited by 7 respondents as an extremely important factor that could change the decision to not participate in international fairs (mean

score of 2). This perception reinforces the idea already expended that costs are a critical inhibiting factor to many non-participant firms. Another important factor in terms of the highest mean score was more financial support from the government (2.06) which is available for Portuguese firms on a competitive basis, particularly for those who exports. Of course that government aid is always short, but firm's specific problem such as internal reorganization (mean score of 1.81) could disqualified the desired support.

Table 4 – Drivers of change to become exhibitor (n = 16)

Factors	1st Choice	2nd Choice	3th Choice	4th Choice	5th Choice	Mean (S.D.)
Transparency and credibility of trade fairs organizations	3	2	2	2	0	1.31 (1.493)
Better advertising and promotion of the fair	2	3	2	1	1	1.44 (1.632)
Costs more competitive	7	4	1	1	2	2.00 (1.506)
More parallel activities, such as seminars, workshops, etc.	1	1	2	3	0	1.31 (1.702)
Firm's internal reorganization	1	0	2	3	2	1.81 (2.073)
More financial support from the government	0	2	2	2	3	2.06 (2.081)
Improve location of stands in the fair	1	0	2	0	4	1.69 (2.213)
Dislike trade fairs	2	0	0	0	0	0.13 (0.342)
Lack motivation or incentive to participate	0	1	0	0	0	0.13 (0.500)
Other	0	4	0	1	1	1.06 (1.611)

Other changing factors were specifically related to trade fair organizers. The improvement of the location of the stands in the space of the fair, a better communication of the fair to prospects, the transparency and credibility of the organizer, and more activities during the fair (seminars, workshops) were all suggestions to attract potential new exhibitors. The remaining factors were seen as the least important.

Table 5 shows that 75% of exporting firms prefer to participate individually in an international trade fair on a foreign country or in Portugal. This individual approach assures the total control of the marketing objectives of the firm, the personalization of the stand, and a more focused attention to visitors. The collective participation is less frequent for exporting firms (25%), and the initiative usually comes from the government (Portuguese Agency for

Investment and External Commerce - AICEP) or from trade or industrial association. Nevertheless, many of the respondents (53.1%) see benefits in this type of participation. When asked about the importance of collectively participate in a trade fair, the majority of respondents (61.4%) see it as a strong contribution to reinforce the participation or even allow for the first time presence of a domestic firm in an international fair. Without support of government or industry associations many of the firms hardly have financial or organizational resources to apply to an international trade fair. On the contrary, some of the firms (38.6%) regarded collective participation as a limitation on their selling and marketing actions during the fair, reducing the possibilities of differentiation vis-à-vis competition. Almost all the firms have some experience of been in an international trade fair to exhibit their products or services to current customers and prospects (94.1%). Only 5.9% of the firms said that it was the first time that they have been involved in an international trade fair.

Most of the exhibitors (80.4%) made pre-fair arrangements before the show took place, including choose the location, define the booth size and the layout of the stand, and elaborate the promotion materials to attract attention, stimulate interest, and increase the number of visits to firm exhibits. Also marketing actions before the fair, such as sending invitations to current customers and prospects, and promoting the event in the website of the firm assume relevance in the communication-mix strategy. These actions are essential to inform customers about the trade fair and give them a free pass to meet with representatives of the firm. The return on investment of the international trade fair is moderated during the fair (8.3) and increases significantly (one to six months) after the end of the fair (72.9%). After one year the effects of the fair decreases to 4.2% and the firms need to repeat the virtuous cycle.

Table 5 – Exhibitor’s behavior in international fairs

Variables	Number	Percentage
Individual participation		
Yes	51	75.0
No	17	25.0
Collective participation		
Yes	26	53.1
No	23	46.9
Interest of collective participation		
No, limits individual actions	17	38.6
Yes, reinforces participation	22	50.0
Yes, only way to participate	5	11.4
How many fairs annually		
First time	3	5.9
1 to 3	23	45.1
More than 3	25	49.0

Change stand between fairs		
Never	3	6.0
Always	17	34.0
From time to time	7	14.0
Random	23	46.0
Pre-fair preparation		
Less than 2 months	10	17.8
3 – 5 Months	27	52.9
More than 5 months	14	27.5
Marketing before the fair		
Yes	48	96.0
No	2	4.0
Return on investment		
During the fair	4	8.3
One month later	13	27.1
Half year later	22	45.8
One year later	7	14.6
More than 1 year	2	4.2

Note: Totals may be less than 68 as respondents did not complete all questions.

Table 6 suggests that location of the stand was a prime driver of the decision for selecting an international trade fair, with a mean response of 4.48 on the 5 point scale used. From the exhibitor's perspective, credibility of the trade fair organizers (mean response of 4.46), profile of the attendees (mean response of 4.35), participation costs and the market coverage of the fair (mean response of 4.23) were other major critical decision factors.

The reputation and image of the organization are built on the basis of experience and communication strategies, such as the outcome of previous events, the personal experience, word of mouth and media exposure (advertising in general and specialized press). Other complementary media that could enhance the image of the organization are sponsorship by public authorities or endorsement by industry/trade associations or chambers of commerce. Another important decision factor to be considered in the decision for participating in a trade fair is the qualitative characteristics of visitors and the roles they play in their firms' purchase decision-making process. The quantity of the attendance is less important for exhibitors (mean response of 3.92).

The exhibitor's decision as to whether or not attend a trade fair is also influenced by the costs of participating in the event. These include costs linked to space rental, transport and freight, booth personnel travel, and living expenses (Junior, 2005; Berne and Garcia-Uceda, 2008). These costs are proportional to the number of fairs that the firm considers visiting per year, and must be managed according to the communication objectives of the firm's yearly marketing plan. Together with costs, the exhibitors ranked the target envisaged by the trade fair organization as equally important. It seems that firms tend to concentrate their

participation on vertical rather than horizontal trade fairs (Kerin and Cron, 1987). This could be explained by the marketing objectives of participating firms and the customer segments they want to target in order to developed sustainable relationships with suppliers, customers and channel intermediaries (Berne and Garcia-Uceda, 2008).

Table 6 – Firm’s decision factors to participate in international fairs

Factors	1	2	3	4	5	Mean (S.D.)
Credibility of the trade fair organization	0	3	0	20	25	4.46 (0.617)
Number of attendees of the previous trade fair	2	9	0	28	9	3.92 (0.739)
Competition participation	8	15	1	21	3	3.35 (0.911)
Promotion of the event by the trade fair organization	2	16	0	17	13	3.85 (0.875)
Structural conditions of the exhibition park	3	9	0	26	10	3.90 (0.805)
Market coverage of the trade fair	0	6	1	21	20	4.23 (0.831)
Profile of the attendee	1	2	1	20	24	4.35 (0.838)
Simultaneously events with the trade fair	5	21	6	14	2	3.02 (1.041)
Size booth of the stand	0	16	0	31	1	3.69 (0.512)
Location of the stand	1	4	0	14	29	4.48 (0.743)
Typology of the stand	1	11	1	24	11	3.90 (0.857)
Participation costs	0	5	1	23	19	4.23 (0.805)

Note: 5-point interval scale, from 1 least important to 5 most important.

The imitation effect (competition participation) and parallel activities during the show (mean responses of, respectively, 3.35 and 3.02) were seen as the least important decision factors to participate in an international trade fair.

Responses to the firm’s decision criteria to participate in international trade fairs were initially factor analysed using principal factor analysis with varimax rotation and the results are shown in Table 7. The Kaiser-Meyer-Olkin (KMO) test and Bartlett’s test of sphericity were computed to assess the appropriateness of factor analysis to the data. The KMO value was 0.763, and Bartlett’s test was significant at the 0.00 level. Both results demonstrate the factorability of the matrices being considered (Hair et al., 1995). A final three factor model

was estimated with 11 items, as one item (competition participation) falls under 0.50 (Hair *et al.*, 1995). The factor solution accounted for approximately 62.5% of the total variance explained, with all communalities ranging from 0.478 to 0.793 and eigenvalues greater than one. An examination of the factor loadings suggest that factor 1 was related to firms' concerns about the reputation of organizers, the number and profile of the attendees, market coverage of the fair and the costs of participation. The factor was termed "value for money". Factor 2 measured firms' concerns with the design, location and size of the stand in the fair. The factor was termed "stand". Factor 3 measured firms' concern about the promotion, animation and structural conditions of the venue. The factor was termed "dynamism".

Considering the internal consistency of the items within each dimension measured by examining the Cronbach reliability alphas, these show a high level for factors 1 (0.78) and 2 (0.756) but lower for factor 3 (0.524) suggesting lower reliability. In fact, Nunnally (1978) indicates that reliability alphas close to 0.70 indicate a high level of internal consistency between the individual scale items and the related factors. Consequently, the dimensions found to be reliable and viable were "value for money" and "stand".

The first factor assesses the cost of participation in a fair against the reputation of the organizer, the suitability of the attendees (number and profile) and the market coverage of the fair. It not only measures the costs of participation but also takes account of the mix of reputation, quality and quantity of attendees (present or potential), and the market coverage to judge whether or not, together, they constitute good value. The Portuguese exhibitors seem full aware of the costs and benefits of their decision, using different criteria to capture the best value for money.

Table 7 - Principal Component Analysis with Varimax rotation (n= 51)

Variables	F1 Loadings	F2 Loadings	F3 Loadings	Commu nalities
Reputation of the trade fair organization	0.617	-0.118	0.29	0.478
Number of attendees of the previous trade fair	0.693	-0.024	-0.029	0.482
Promotion of the event by the trade fair organization	0.167	0.090	0.745	0.591
Structural conditions of the exhibition venue	0.319	0.060	0.765	0.69
Focus of the trade fair	0.795	0.231	0.185	0.719
Profile of the attendee	0.603	0.384	0.204	0.553
Simultaneously events with the trade fair	-0.216	0.432	0.539	0.523

Size booth of the stand	0.237	0.688	0.369	0.665
Location of the stand	0.391	0.800	0.023	0.793
Typology of the stand	-0.022	0.843	0.053	0.719
Participation costs	0.663	0.471	0.095	0.67
Measures				
Eigenvalue	4.124	1.584	1.179	
Explained variance (%)	24.443	22.341	15.808	
Cumulative variance (%)	24.443	46.775	62.582	

Notes: Items measured on a 5-point Likert scale. Kaiser-Meyer-Olkin measure of sampling adequacy = 0,763; Bartlett's test of sphericity (significance $p < 0,000$).

The second factor is specifically related with the typology, size and location of the stand on the fair. The trade fair stand is the firms' calling card and varies between exhibitors in terms of size, design and appearance. The results indicate that the Portuguese exhibitors are now placing a more definitive attention upon their stand's positioning in the trade fair, matching the standards of competition and the needs of visitors (present and prospect customers).

CONCLUSION

The present study attempted to examine perceived motives and decision factors of Portuguese exporting firms to participate or not in an international trade fair. A strong motive to exhibit at a trade fair is the reinforcement of the exporter's market presence, particularly in international markets where the comparative costs of other promotional tools are relatively prohibitive. In descending order, the Portuguese exhibitors indicated the possibility of finding new ideas and test new products during the event, the establishment of sustainable relationships with important customer, the enhancement of the brand image and reputation of the firm. Contrary to expectations, increase sales and expand the customer portfolio ranked moderate, while promotion and introduction of new products ranked low on the motives of Portuguese exhibitors. The main barriers to non exhibitors firms are costs associated with the participation in the venue (rents of space and stand, travel and accommodation expenses, etc.), bad experiences on previous trade fairs, and lack of resources (financial, personnel and time). To overcome these barriers the non exhibitors suggest lessen costs, mainly by appealing to the support of governmental agencies (in the Portuguese case AICEP). Other barriers refer to the difficulties in choosing a better stand location inside the venue, the weak impact of the trade fair in the media, the reputation of the trade fair organizer and the animation during the fair.

To formulate meaningful assistance programs, it is necessary to be aware of the factors that influenced exporting firms to become involved in international trade fairs and also the reasons why non-exhibitor firms decide against involvement. While it is necessary to provide information, training, and resources to exporting firms to overcome barriers, it is also essential to highlight the benefits of exhibiting in a way that ensures non exhibitors respond positively to assistance. It is necessary to look at motives and barriers as part of a total incentive system rather than to treat them independently.

The attitude towards the individual or collective presence at an international trade fairs varies between Portuguese exporting firms. Some of them regard collective participation as a limitation in their selling and marketing actions, others as an opportunity to reinforce their international market presence. Most of the Portuguese exhibitors plan the participation before, during and after the fair takes place, but the return on the investment of the trade fair only achieve its peak after the fair (one to six months). Therefore, it is crucial that exhibiting firms took a long term approach when evaluating the return on the investment of a particular trade fair, as most of the results are intangible (image, reputation) and not immediately measurable.

The firm's critical decision factors to select a trade fair was "value for money", which means that costs of participation in an international trade fair was weighted by the mix of organizer's reputation, the quality and quantity of attendees, and the market coverage. Another important factor of decision was the typology, size and location of the stand on the fair, which represents the image of the firm, and must competitively respond to the dynamics of each trade fair environment (layout of the space, competition, type of attendees, etc.). These results have important implications for trade fair organizations. The first one suggests that costs still matter in the decision making process of the exporting firm, but are weighted by a mix of factors. The second implication indicates that the main focus of the exhibiting firms is rather on the size, design and location of the stand, than on competition observation, advertisement of the trade fair or animation during the fair.

ABSTRACT

Guimarães has hosted, during the year of 2012, one of the European Capital of Culture (ECOC). The evaluation of the event is needed as public, private and community funds are involved. The approach considers the tourists (domestic and international) as external and independent stakeholders who assessed the cultural activities developed during the event and the attributes of the city.

The results of the survey show that hosting the 2012 ECOC was a major contribution for attracting new visitors to the city, although many of them just for a short period of time. The main source of general information collected by tourists was the Internet, and the traditional media. Only a small amount of respondents demonstrated a specialized knowledge of the cultural program. The most cited and appreciated performances came from the areas of music, exhibitions, and theatre. According to the perceptions of tourists, the tangible assets were clearly detached from the set of attributes of Guimarães, including buildings, churches and chapels, whereas intangible assets were less noted. Overall, Guimarães received a very positive evaluation related to city image and stay and is highly recommended by tourists to friends and relatives.

Keywords: European Capital of Culture; Evaluation of Mega Events; Cultural Tourism; Guimarães.

INTRODUCTION

The evaluation of the European Capitals of Culture (ECOC) by external entities has become a requirement after the Decision n. ° 1622/2006/EC, dated from October 24, 2006, of the European Commission. Therefore, since the ECOC 2007 (Luxembourg and Sibiu), the European Commission publishes, in the official journal, synthetic ex-post evaluations of the events (ECOTEC 2009 and 2010; European Commission, 2009 and 2010).

Simultaneously, as festivals, fairs and international exhibitions and sporting mega events were taking an increasingly important role in the development of cities, regions and countries, the number of impact studies increased significantly (Fredline and Faulkner, 2000; Kim and Petrick, 2005; Ritchie, Shipway and Cleeve, 2009). Evaluation is a multidimensional concept that should include not only economic, but also social, environmental, and cultural impacts.

The approach used to assess the success of ECOC 2012 is the one of tourists, and their perception towards the city and the several realizations that take place during that year. Multiple studies have been made about the impact of mega events but fewer have focused on tourists as external and independent stakeholders, specifically on the evaluation of the activities of the European Capitals of Culture. The result of this research can be useful to managers interested in the planning and organization of future cultural events.

Considering the aims of the research, the paper begins with a brief review of the literature on impacts of hosting mega events, specifically cultural-related ones. The following section addresses the characteristics of Guimarães and the objectives underlying the organization of the 2012 ECOC. The third section describes the methodology used in the research. Section four presents the results of the analysis. The paper ends with some conclusions and the identification of a few limitations of the empirical research performed.

1 THE IMPACT OF MEGA-EVENTS

1.1 Advantages of hosting mega-events

Hosting a mega event causes economic, social and environmental impacts. In most cases, the economic dimension is overvalued, comparing to the social and cultural ones. Kim and Petrick (2005), in the aim of their study about the FIFA World Cup 2002, that took place in Seoul, Korea, presented three reasons why the organizers of the mega events tend to privilege

economic analyzes and to ignore social and cultural impacts. These are: i) the social and environmental impacts are seen as "external" to the economic analysis; ii) the impacts are less tangible and difficult to measure; iii) the effects tend to be associated with negative factors and therefore their evaluation is not encouraged by the promoters of the events.

In what concerns the positive economic impacts, it is widely recognized that tax revenues, jobs and incomes tend to increase before, during and after hosting a mega event (Ritchie, Shipway and Cleeve, 2009). Deccio and Baloglu (2002), and Strauf and Scherer (2010), refer also greater opportunities for giving external visibility and promoting the city and the welcoming country, as well as investments in new infrastructure that residents and tourists can benefit from.

The hosting of a mega event can also be part of a larger program of urban regeneration, as it was the case of the 1992 Barcelona Olympic Games, which were associated with the development of tourist attractions, shops and restaurants, as well as the improvement of transport infrastructure (Ritchie, Shipway and Cleeve, 2009).

As positive social impacts, we could point out: the increase of community pride of the hosting population; the improvement of their quality of life; the strengthening of cultural values; and the reinforcement of the regional or national identity (Hall, 1992; Deccio and Baloglu, 2002; Waitt, 2003, Kim and Petrick, 2005; Kim, Gursoy and Lee, 2006; Ritchie, Shipway and Cleeve, 2009). In fact, according to Gursoy and Kendall (2006), some researchers have concluded that, for residents of places hosting mega events, as it was the case of Calgary, with the 1988 Winter Olympics, and Atlanta, with the 1996 Olympics, these positive social impacts, in particular, community pride and international recognition, were as important or more than the positive economic impacts. Many years before, Hall (1992) had also emphasized that environmental, sociocultural and political impacts may be more important than economic ones. Similarly, Deccio and Baloglu (2002) have claimed that conducting a mega event may also contribute to preserve the environment and local heritage.

In a research about the measuring of the impacts of festivals and cultural events of large scale, as major impacts on the local and regional economies, Langen (2008) and Langen and Garcia (2009) reported the expenditures incurred by visitors (direct, indirect and induced). In addition to these expected effects, Baker Associates (2007), reporting the results of the Glastonbury festival (UK), mentioned trade opportunities that arose from non-profit

organizations (security, monitoring, recycling), the positive image of the city (nationally and internationally), and the contribution to the formation of a local business culture.

1.2 Disadvantages of hosting mega-events

Besides the benefits associated with the implementation of a mega event, local communities may also experience negative impacts of economic, social and environmental nature. Some of the costs associated with hosting a mega event are: the increase of the prices of goods, services and properties; traffic congestion and parking problems; increased crime and insecurity; and conflicts between residents and visitors (Deccio and Baloglu, 2002; Waitt, 2003). The environmental destruction and deterioration of cultural or historical resources are also damages that may arise from organizing mega events (Kim, Gursoy and Lee, 2006).

It seems to be obvious that a European Capital of Culture, as any international mega event, causes positive and negative impacts, but it has some peculiarities that distinguish it from the ones of sports events. On the one hand, its scope is broader, as it focuses on various aspects of the cultural life of the city. On the other hand, it has a higher temporal duration, as follows uninterruptedly over a year. Finally, its effects are more diverse because they occur at economic, social, cultural, political, physical and environmental levels.

1.3 Evaluation of European capitals of culture: a brief review

The first detailed economic impact assessment of an ECOC occurred in Glasgow, in 1990, but since 1985 this kind of cultural events have been held annually in various European cities. In 1994 it was published a report about the first ten years of the European Capitals of Culture (Myerscough, 1994), emphasizing the recognition of the citizens that the title conceded to the city was important. The same report also shows the positive effects experienced by host cities on several dimensions, such as coverage by the media, and the development of culture and tourism.

In 2004, the European Commission has ordered a study to evaluate the success of the second decade of the European Capitals of Culture (1995-2004). This study concludes that the organization of a ECOC benefits the city and the country (Palmer/Rae Associates, 2004). However, points out the lack of development of a policy of adopting the best practices (benchmarking), and the absence of a common framework and performance indicators.

The evaluation process of each of the ECOC was required by Decision n. ° 1622/2006/EC, of October 24, 2006, and on December 22, 2009 [COM (2009) 689 final], was published the first ex-post evaluations: the 2007 (Luxembourg and Sibiu), and the 2008 (Liverpool and Stavanger) ones. In the following year, it was published the ex-post analysis of the 2009 ECOC (Linz and Vilnius) [COM (2010) 762 final, December 17]. The evaluation framework includes the following dimensions: relevance of the action; relevance to the city that hosts the mega event; management efficiency of the organization; effectiveness of ECC mechanisms at EU level; the effectiveness in the development of cultural activities; the effectiveness in promoting European dimension through culture; effectiveness in achieving social, economic, urban development and tourism; and sustainability of the event (European Commission, 2009 and 2010). Thus, the European Capitals of Culture can contribute to the promotion of local culture, supporting the development of artistic and cultural activities of local organizations and facilitating access to and citizen participation in these activities (Palmer/Rae Associates, 2004; LGR, 2008; ECOTEC, 2009).

Previously to Guimarães, Portugal had hosted two ECOC. The first was in Lisbon, in 1994, which contributed to the developing of projects of rehabilitation and reform of cultural buildings. The second one occurred in Oporto, in 2001, resulting in the construction of the Music House (Casa da Música), and the rehabilitation of the National Auditorium Carlos Alberto (Auditório Nacional Carlos Alberto).

The perception of the benefits or costs associated with a mega event, as well as its success or failure, may have impacts on the image of the destination (Ritchie, Shipway and Cleeve, 2009; Strauf and Scherer, 2010). When the tourist's perception of the negative attributes outweighs the positive ones, the image of the city image can be damaged. Therefore, it is of utmost importance that perceptions of tourists can be monitored.

2 GUIMARÃES ECOC 2012

The European Capital of Culture initiative is funded by the European Union Culture Program and promotes Europe's cultural diversity. The initiative aims to highlight the richness, diversity and shared characteristics of European culture and promote understanding among citizens. The title has a long-term impact, not only on culture but also in social and economic terms, both for the city and for the surrounding region. Guimarães shared the 2012 title with the city of Maribor, in Slovenia.

Guimarães is considered the birthplace of the Portuguese nation, the site where Portugal was founded, in the 9th century, by King D. Afonso Henriques. He played an important role in many of the events that led to the independence of the country in 1143. Located in the northern region of Minho, Guimarães, with its distinctive 10th-century castle, was classified a world heritage site by UNESCO, in 2001. The city also prides itself on its architecture, including many traditional buildings from the 15th to the 19th century.

It was the first time that a Portuguese medium city hosted such a mega-event and the residents saw it as an opportunity to reinforce their pride and attract new visitors to the city. A second challenge associated with the hosting of the 2012 ECOC refers to enhancing the tourism industry, viewed by local authorities as a major driver for regional growth. A third challenge was the unique opportunity that the 2012 ECOC presented for Guimarães to reinforce the image of the city as a cultural destination, both, within the country and internationally.

The goals of the 2012 ECOC, in Guimarães, according to the institution in charge of the organization and promotion of the event were: i) empowering the local community with new human resources and professional expertise, by encouraging their proactive involvement; ii) transforming the city's economy, which historically in endowed of an manufacture economic basis, into an internationally competitive and creative economy; iii) transforming a space that passively preserves memory into one that constantly offers new and surprising cultural experiences.

The program focus on four themes: city; community; thought and arts; and the cultural program, which included music, cinema, photography, fine arts, architecture, literature, thought, theatre, dance, and street art. Besides the opening and closing ceremonies, which attracted many people, during 2012 there were approximately 600 different cultural events.

3 METHODOLOGY

The methodology was quantitative in nature and used a survey research design as a common method to investigate the tourists' perceptions of the ECOC. The design of the questionnaire was based on previous studies and on the literature review about the evaluation of other ECOC, as mentioned before in section 1. After the design of the questionnaire (both in

Portuguese and English), a pre-test was performed to assure internal and external consistency of the questions to be raised to tourists.

The final questionnaire included three parts. The first part of the questionnaire dealt with the visit to Guimarães and contained six questions. The questions try to know the cities that tourists enjoyed the most in the North part of the country or in the country, the number of times the city was visited by the respondent, how many days he/she wanted to stay, in what city and type of hotel slept, and the reasons for choosing Guimarães. The second part explored tourists' perceptions regarding the 2012 ECOC. The questions included if the tourist previously knew the event and how he/she received the information, what was the main motive of the visit, if he/she wanted to participate in some of the events and the level of satisfaction with the events taking place. Other questions tried to understand the level of knowledge about the program of the 2012 ECOC, the interest of the tourist and if the program was coherent with the profile of the city. One question was dedicated to the most strong or weak attributes of Guimarães. The last questions of this part asked the tourist if he/she wanted to return to the city, how he/she evaluated the stay, what was the impression that retained and if he/she would recommend the visit to Guimarães to a friend.

The third part covered the demographic characteristics of the respondents (such as sex, age, education, income).

The final structured questionnaire was applied between August and September 2012, allowing for the collection of 390 completed and provided usable questionnaires. The questionnaire was administered in some symbolic sites, such as the castle of Guimarães and the "Duques de Bragança" palace (Paço dos Duques de Bragança) following the criteria of nationality to attain a random stratified sample. The source was the two Guimarães tourism offices and the tourists' data registered, by nationality, in 2011. The twelve main countries of origin identified in 2011 were: Spain (28.6%); Portugal (21.8%); France (14.0%); Brazil (4.9%); Italy (3.3%); German (2.5%); England (2.9%); Netherlands (3.0%); U.S.A. (1.0%); Japan (1.0%); Belgium (1.1%); and Canada (0.7%). The remaining 15.2% corresponded to other nationalities not specified.

The data were examined using a *t-test* analysis to identify attribute's perception differences between Portuguese and foreign tourists. Then, the attributes were factor analyzed to see if there were any common variables underlying the tourist's main perceptions of Guimarães during the 2012 ECOC.

4 TOURIST'S EVALUATION OF THE 2012 ECOC: A SURVEY

4.1 Sample

Table 1 presents the profile of the survey respondents. The origin of the tourists is almost foreign (around 80%) and Portuguese (20%), which significantly corresponds to the data registered at the two tourism offices of Guimarães. The characteristics of tourists that visited Guimarães show no significant differences between gender, but they are relatively young, with nearly half of the sample under 46 years old (56.0%). They are well educated (74.2 percent possess a university degree) and mostly are married. Most of the tourists are employed and relatively wealthy, declaring incomes above €2500 (48.2%) on a monthly basis.

Table 1 - Sample characteristics

Characteristics	N (390)	%
Country of residence (Nationality)		
Portugal	81 (106)	20.8 (27.2)
Spain	117 (116)	30.0 (29.7)
France	61 (52)	15.6 (13.3)
Brazil	21 (21)	5.4 (5.4)
Italy	20 (20)	5.1 (5.1)
Germany	17 (16)	4.4 (4.1)
England	12 (12)	3.1 (3.1)
Netherlands	13 (13)	3.3 (3.3)
United States	9 (5)	2.3 (1.3)
Japan	4 (4)	1.0 (1.0)
Belgium	4 (4)	1.0 (1.0)
Canada	3 (3)	0.8 (0.8)
Others	28 (16)	7.3 (4.6)
Age		
16 – 25 years	37	9.5
26-45 years	181	46.5
46-65 years	141	36.2
More than 65 years	30	7.7
Gender		
Male	184	47.2
Female	206	52.8
Marital Status		
Single	140	36.2
Married	222	57.4
Divorced/Widow	25	6.5
Education		
Basic/Secondary	100	25.8

Characteristics	N (390)	%
University	166	42.8
Master/PhD	122	31.4
Professional situation		
Employee	299	76.9
Unemployed	19	4.9
Student	26	6.7
Retired	40	10.3
Work at home	5	1.3
Income		
Less than €501	13	3.6
Between €501 and €1000	36	10.1
Between €1001 and €2500	136	38.1
More than €2500	172	48.2

Source: authors' own survey data.

These different age profiles could be explained by the context (country, region, heritage site type) and time (year, seasonality) where these studies have been performed. Given the nature of our sample (composition and size), no further considerations will be made regarding a definitive and specific typology of heritage tourists.

4.2 Tourist's behavior

The results presented in Table 2 suggest that touring around the region is very important for cities such as Guimarães, which depends on the capacity of attraction of other middle cities located in the region. When considered as a set of cities (Guimarães, Braga, Viana do Castelo, and Douro), its total attraction capacity improves significantly. However, Porto still is the main "entry door" (30.1 percent) to the northern part of Portugal.

This occurs, first, because it is endowed with an international airport, a network of public transports (railways, buses, underground) and it is the place of departure for boats that travel to Douro. A second reason for the attracting role played by Porto metropolitan area has to do with its critical dimension, that enhances accommodation supply, both, in terms of quality (different star hotels) and quantity (number of beds). Finally, a wider range of attractions and experiences is available to different typologies of tourists in the metropolitan area, such as beaches, museums, Porto wine caves, and shopping.

Besides the importance of Porto as a tourism destination, it is very important that all the cities belonging to the northern region could benefit from tourism. The creation of thematic

itineraries (such as religious and wines routes), linking different towns and rural communities outside the Porto metropolitan area, is one strategy to increase the potential contribution of those places to regional development. However, as mentioned before, a major constrain persists, which is the tourism seasonality. Different strategies have been implemented to attenuate this phenomenon, which includes attracting selected typologies of tourists (such as seniors), organization of special events, academic conferences, professional seminars, among others.

Table 2 – Other cities visited by tourists

Cities	N	%
Braga	247	24.4
Porto	305	30.1
Viana do Castelo	157	15.5
Douro	112	11.1
Others	192	18.9
Total (a)	1014	100,0

Note: (a) Multiple response question.

Source: authors' own survey data.

As shown in table 3, hosting a mega-event such the 2012 ECOC seems to give a major contribution for attracting new visitors, as 71.5% of the respondents were visiting the city for the first time, and only 10% were returning visitors (more than 3 times). If one of the major objectives of the European Union when creating the ECOC was to give awareness to less known cities, we may conclude that the goal was reached in this particular case.

Table 3 – Tourists' intentions and accommodation

Questions	N	%
Have you visited the city before?		
First time	279	71.5
One time	35	9.0

Two/three times	37	9.5
More than three times	39	10.0
Total	390	100
How many days do you intend to stay in Guimarães?		
Less than a day	211	54.1
One day	101	25.9
Two/three days	50	12.8
Four to six days	18	4.6
More than seven days	10	2.6
Total	390	100
City where do you stay?		
Guimarães	112	32.0
Porto	97	27.7
Braga	29	8.3
Viana do Castelo	14	4.0
Others	98	28.0
Total	350	100
Type of accommodation		
Hotel	187	53.0
Hostel	44	12.5
Apartment	12	3.4
Family and friends	60	17.0
Camping	24	6.8
Others	25	7.4
Total	353	100

Source: authors' own survey data.

A clear weakness of the Guimarães destination was the short time of stay, with 80.0% of the respondents declaring that they would stay only one day (25.9%) or less (54.1%). Probably due to the large number of emigrants that each year use to visit their home country, 17% of the respondents declared to be accommodated at family and friends houses. The short time of stay has a negative impact on the accommodation chosen by tourists, as only 32% of visitors stayed in Guimarães, which loosed attraction for other neighbor cities (Braga, Viana do Castelo) or even larger cities, such as Porto. One possible explanation is the accommodation capacity (number of beds) of Guimarães, particularly in times of strong demand, as by the time some major events of the ECOC took place.

Table 4 indicates a wide variety of sources of information about the 2012 ECOC. The Internet was the main source (33.2%) used by tourists to access the general information about the event, followed by the traditional media, such as radio/TV (24.3%), and magazines and newspapers (11.2). However, the information sources that probably could be more useful in making decisions in terms of relevance for tourists were friends and family (12.9%), and the

tour guides (7.7%). This assertion is partially confirmed by the people that demonstrated real interest on the event (only 70 tourists out of 235), by knowing the entire program (23.8%) or part of it (71.5%). The level of depth knowledge of the program was very weak as only 25 tourists had an accurate and favorable opinion about the adequate match between the profile of the city and the cultural activities developed within the city during the survey.

Table 4 – Knowledge, attendance and satisfaction with the program
of Guimarães 2012 ECOC

Questions	N	%

Source: authors' own survey data.

The program included a wide range of cultural activities, but only 76 out of 235 (32.3%) of the tourists attended some of the venues. The cultural activities most cited by the tourists were related with music (37%), exhibitions (26%) and theatre (10.2%), which was the part of the program oriented towards general audiences. The number of attendees surveyed that effectively assisted to a particular cultural venue (23 out of 235) were satisfied with the performance.

4.3 Attributes' saliency of Guimarães

The image we have towards a region has a strong impact on how we view it as a destination - a place to invest in, or a place to live. One of the main outcomes that could be obtained with the organization of the 2012 ECOC was to determine which elements of Guimarães were included by tourists in their destination image. These elements are an integral part of the region's identity that has been proactively distilled, interpreted, internalized, and projected externally in order to gain recognition and to construct a favorable image. A regional destination image represents a set of beliefs and perceptions that people have about a given region, such as cultural heritage, landscape, nature, art, music, gastronomy, citizens, events and a diverse package of variables and auxiliary factors.

Table 5 presents the perceptions of all respondents regarding the different attributes of Guimarães in the broadest sense. As can be seen, in the top of the more salient attributes of the image of Guimarães stands the material heritage patrimony and include buildings and historic sites (3.08), and churches and chapels (2.28), which are closely related to the World Heritage status of the city. Below the score of 2 (mean), there are a wide range of items that

deserved the mention of several respondents, but lack relevancy in the perception of the majority of respondents.

Source: Authors' own survey data.

A synthesis of the most salient attributes of Guimarães shows that it was perceived overall by tourists as a heritage and cultural city, encompassing buildings and historical sites, churches and chapels. These tangible assets are all physical and visible for tourists, facilitating the retention of some remarkable signs that shape the image of the city. These physical attributes are remembered later by tourists in photos and personal movies shown to family and friends. In a landscape full of images, it seems that physical attributes still do matter. The declaration of Guimarães as a UNESCO world heritage site, in 2001, has also brought awareness to the city.

On the contrary, the exposure to intangible assets stimulus was more passively received by the tourists and more easily forgotten. Nevertheless, the hosting of a mega cultural event, as the 2012 ECOC, should be viewed as a long term investment that need to be maintained if the city wants to be relevant in the competitive international market of tourism destinations.

There were no significant differences of perception between Portuguese and foreign tourists with respect to the attributes of "writers", "painting and sculpture", "dance", "football", "other outdoor sports", "quality of the environment", "buildings and historical sites", and "university". The major differences ($p < 0.01$) were found in "cultural life", "folk music", "festivals", "craftsmanship", "museums", and "chapels and churches". That is, Portuguese tourists were more likely to value the cultural life (music, festivals, museums, chapels and churches) of Guimarães than the foreign ones.

The perceived attributes of Guimarães were factor analyzed to see if there were any common factors that drove tourists. The Kaiser-Meyer-Olkin (KMO) test and the Bartlett's test of sphericity were computed to assess the appropriateness of factor analysis to the data. The KMO value was 0.684, and Bartlett's test was significant at the 0.00 level. Both results demonstrate the factorability of the matrices being considered (Hair *et al.*, 1995).

Principal component factor analysis with varimax rotation was used to identify the underlying dimensions. After inspection of factors content for tourist's attribute perceptions of Guimarães, three items were deleted, two corresponding to a factor with a Cronbach's alfa less than 0.2 and further, and one that was isolated. A final four factor model was estimated with 13 items. The factor solution accounted for approximately 53.5% of the total variance explained, with all communalities ranging from 0.322 to 0.760. Although factors 3 and 4 have low reliability alpha, considering the interest for analysis, were retained.

The results of that factor analysis are listed in table 6. The factors represent the overall perception

of all respondents regarding the attributes of Guimarães and were labeled: “material heritage”, “intangible heritage”, “cultural performance”, and “sport and education”. Factor 1 is related to the basic material characteristics of the city, and it is responsible for explaining 21.41% of the total variance found, with a reliability coefficient of 0.67. It is followed by Factor 2 (11.52% of total variance and Cronbach’s alpha level of 0.56), which comprises items related to arts and cultural life. Factor 3, labeled “cultural performance”, contains dance and music (10.74% of total variance explained with the alpha level of 0.38). The final factor “sport and education”, represents 9.82% of the statistical variance and had a reliability alpha of 0.43. This factor is associated with the university campus, football and other outdoor sports.

Considering the internal consistency of the items within each dimension measured by examining the Cronbach reliability alphas, these show a high level for factors 1 and 2 but lower for factor 3 and 4. In fact, Nunnally (1978) suggests that reliability alphas close to 0.70 indicate a high level of internal consistency between the individual scale items and the related factors.

As said, the results indicate that tourists’ perceptions can be described in four dimensions. The dimensions were found to be reliable and valid, with “material heritage” as the main factor.

Table 6 - Factor analysis results with varimax rotation of tourist’s attributes perceptions of Guimarães during the 2012 ECOC

Components	Factor Loading ^a	Item means	Standard deviation	Eigenvalues	% of Variance	Cumulative %	Reliability Alpha
Factor 1: Material heritage		2.249		2.780	21.411	21.411	0.672
Churches and chapels	0.790	2.28	1.712

Extraction Method: Principal Component Analysis; Rotation Method: Varimax with Kaiser Normalization; KMO (Kaiser-Meyer-Olkin measure of sampling adequacy) = 0.684; Bartlett's test of sphericity : $p=0.000$.

a. Rotation converged in 5 iterations.

The dimensions "material heritage" and "intangible heritage" aggregate the main attributes that tourists perceived as unique and clearly distinctive of Guimarães. Each tourist has an image of all destinations where he/she has been to, but only remembers some of them if that image is truly remarkable. From the tourists' perspective, Guimarães has a historical build heritage, a quality of environment and a cultural life distinctive and easily accessed by people. These factors should support a differentiation strategy aiming to position the city as a set of historical attributes (tangible and intangible), beliefs, ideas and impressions that people associate with the birth of Portugal (Crompton, 1979; Kotler, Haider and Rein, 1993). The European Capital of Culture that took place during 2012 was an excellent opportunity to reinforce this niche, positioning and shaping the image of Guimarães.

In brief, the four factor solution offered by the analysis include a major factor of differentiation that surpasses all the other three, that is, the historical heritage of the city and the quality of its environment. These attributes should be the central elements of the city image, positioning and communication-mix.

One way of capturing the general impression caused by a tourism destination is asking to the tourist/visitor if he/she would recommend the city to a friend/relative or if he/she intends to return to the city. In the first case the results are very positive, with a mean of 4.85 regarding the recommendation to relatives and friends, but smaller in average terms in what regards the intention to return to Guimarães (mean of 3.58), which probably should be interpreted as an enjoyable city for a first time visit but not an enough exciting place for a new cultural experience. The evaluation of the stay and the city image are both quite impressive (means of 4.3 and 4.48) and denote a very good general impression of the tourists about the people and the city.

Table 7 – Recommendation of Guimarães

Questions	1	2	3	4	5	Mean	SD
Intention to return to Guimarães (a)	62	24	59	114	130	3.58	1.413
Recommendation of Guimarães (a)	1	0	7	40	334	4.85	.444
Evaluation of the stay in Guimarães (b)	0	0	10	212	109	4.30	.520
Evaluation of the image of Guimarães (c)	0	0	4	181	175	4.48	.522

Notes: (a) 1 – No, 2 – Probably no, 3 – I don't know, 4 Probably yes, 5 – Absolutely sure; (b) 1 – Very bad, 2 – Bad, 3 – Normal, 4 – Good, 5 – Excellent; (c) 1 – Very unfavorable, 2 – Unfavorable, 3 – Indifferent, 4 – Favorable, 5 – Very favorable.

CONCLUSIONS

During 2012 Guimarães has hosted one of the European Capitals of Culture. An attempt to evaluate the main outcomes of the cultural program was made in the peak of the program (August and September of 2012). The tourists' perceptions related to the ECOC program and the main attributes of Guimarães were captured by a survey research design.

The results indicate that touring around the region is very important for cities such as Guimarães, which depends on the capacity of attraction of other middle cities located in the region (Guimarães, Braga, Viana do Castelo, and Douro). Still, Porto is the main “entry door” to the northern part of Portugal.

Hosting a mega event such the 2012 ECOC seems to have been a major contribution for attracting new visitors, as the majority of tourists visited the city for the first time, and only a small portion were returning visitors. A clear weakness of the Guimarães destination was the short time of stay, which has a negative impact on the accommodation chosen by tourists, that stayed in other neighbor cities (Braga, Viana do Castelo) or even larger cities, such as Porto.

A wide variety of sources of information was used by tourists to know more about the 2012 ECOC. The Internet was the main information channel used, followed by the traditional media (Radio/TV, and magazines and newspapers).

There are only a small amount of respondents that demonstrated real interest on the event, by knowing the entire program or part of it. The level of depth knowledge of the program was very weak as only 25 tourists had an accurate and favorable opinion about the adequate match between the profile of the city and the cultural activities developed within the city during the survey. The program included a wide range of cultural activities, but the music, exhibitions, and theatre were the most cited ones and those that attended them effectively have shown appreciation with the performances.

The most salient attributes of Guimarães perceived by tourists were tangible assets, such as buildings, churches and chapels. The declaration of Guimarães as a UNESCO world heritage site, in 2001, has given the city domestic and international awareness. The saliency of intangible assets was less noted by tourist, even during the mega cultural event of the 2012 ECOC.

The differences between Portuguese and foreigner tourists are more acute when we considered the following attributes: museums, festivals and events, churches and chapels, craftsmanship, cultural life, folk music, other kind of music, football, and other indoor sports.

Overall, Guimarães was positively evaluated by tourists regarding the city image and was highly recommended by tourists to friends and relatives. The least positive indicator of satisfaction was the intention to return to Guimarães, which scores an average value,

probably because it was taken as an enjoyable city for a first time visit but not an enough exciting place for a returning cultural experience.

Therefore, we recommend a deeper knowledge of the tourism activity of Guimarães is needed in order to identify the profile of visitors and the type of holiday's activity they envisage to have. Of particular importance is the understanding of tourists' typologies (country of origin, demographic characteristics, and social and economic status), visit patterns (itineraries, duration, information sources, etc.), motivations to visit different cities and image perceptions. The results of these studies are critical for local tourism organizations (such as hotels, travel operators, politicians) to design consistent strategies to improve the movements of tourists around the entire region. Otherwise, even culturally motivated tourists interested in exploring new places and diversify experiences will tend to remain in places better served in terms of access and facilities, and that have a longer established image.

The increasing number of flights of low cost companies to/from Porto and the significant increase in tourists that came to Porto to stay for a weekend (short breaks) and the tourism attributes they are endowed with denote the potential of a few cities/territories of the northern Portugal as tourism destinations. In the particular case of Guimarães, a considerable strength is the favorable image that tourists retain about the city, while a strong weakness is the lack of critical size to be considered by its own cultural dimension. From this, it is taken, mostly, as part of one journey historical itinerary that includes neighbor cities.

One important limitation of the present study was assessing tourist's perceptions as a snapshot that captures a specific event in a particular time (August to September 2012), location (Guimarães) and a certain historical context (the hosting of the ECOC 2012). More studies are needed to cover more points in time and other locations around the country in order to compare for differences and similarities between the perceptions of heritage destinations sites (such as the Douro and Évora).

UNDERSTANDING THE HRM – PERFORMANCE LINK IN PROFESSIONAL SERVICE FIRMS: A MULTI-LEVEL PERSPECTIVE

Fu, Na¹; Flood, Patrick²

Leadership Innovation and Knowledge (LInK) Research Centre, DCU Business School, Dublin, City University, Glasnevin, Dublin 9, Ireland, na.fu3@mail.dcu.ie¹, Patrick.flood@dcu.ie²

ABSTRACT

This is a theoretical paper which aims to explore how and why the use of high performance works systems (HPWS) improves firm performance in professional service firms (PSFs). Extensive literature review indicates three research gaps as 1) the lack of focus on the professional service context in HRM research; 2) the lack of clarity on why this HR practice-performance link exists, the so called “black box” problem; and 3) the relatively undeveloped research of HRM in PSFs research. We propose a multi-level approach (organization, team and individual) and a longitudinal research design to close these research gaps. This paper contributes to better understanding how HPWS are operated in PSFs and the mechanisms through which HPWS work for organizational performance.

Keywords: High performance works systems (HPWS), firm performance, professional service firms (PSFs), multi-level analysis, longitudinal research design.

BACKGROUND

The increase in the numbers of knowledge intensive firms is a major trend in the global economy. Professional service firms (PSFs) are attracting considerable attention from management researchers as their importance grows in scale and significance within developed economies.

The professional service firms are playing an important role in the world. For example, as one of the world’s largest professional services firms and the largest of the Big Four auditing firms, PricewaterhouseCoopers earned aggregated worldwide revenues of US\$29.2 billion for the financial year 2011, and employed over 175,000 people in 154 countries (PricewaterhouseCoopers, 2012, www.pwc.com).

PSFs consist of a highly educated and professionalized workforce who provide clients with customized knowledge (Empson, 2007; Greenwood et al., 2005; Maister, 1993). Examples of professional service providers include accounting, consulting, and legal services.

The difference between PSFs and other traditional manufacturing firms is that PSFs are knowledge intensive (Morris, 2001). PSFs are also different from other knowledge-intensive firms as they provide customized solutions/services to meet clients' needs (Morris and Empson, 1998). PSFs gain competitive advantage mainly through the expert knowledge of the professional workforce. Therefore, the human resource is the most valuable resource for PSFs.

RESEARCH GAPS

Human Resource Management (HRM) plays an important role in helping organizations to achieve high performance. Three main research gaps were found in the existing studies of HRM in PSFs.

- HRM research in the context of professional service firms is *relatively undeveloped* (McClellan and Collins, 2011). Previous research on the relationship between HRM practices and firm performance has focused largely on manufacturing firms e.g. automobile plants, steel companies (Ichniowski and Shaw, 1999) and more routinized service firms like banks (Richard and Johnson, 2001) and call centres (Batt, 2002). Professional service firms are a valuable arena for studying human resources and resource-based views because the dominant resource, embodied in the skills, knowledge and experience of employees and owners, is evident (Hitt et al., 2001).
- The link between mutually reinforcing bundles of human resource (HR) practices and organizational performance is well-established. What is *less clear* is why this HR practice-performance link exists, the so called "black box" problem as shown in Figure 1. Researchers have called for closer examination of the "black box", that is, the *mechanisms* linking the two (Combs et al., 2006).

Figure 1. The Black Box of the HRM-Performance Link

- Systematic research on HR-related issues has been scarce in the literature on the professional service firm (McClellan and Collins, 2011). In PSFs, researchers have

previously addressed organizational structure (Greenwood et al., 1990; Pinnington and Morris, 2003), career systems (Morris and Pinnington, 1998) and knowledge management (Alvesson, 2001; Anand et al., 2007; Morris, 2001).

RESEARCH QUESTIONS

Based on the above gaps and the call for deeper investigation of the “black box” in the HRM -performance link, this paper aims to explore the following questions:

- 1) What are the HRM processes through which HRM has an influence on firm performance?
- 2) How are HRM policies/practices implemented by line managers and what is its impact on team and firm performance?
- 3) How do employees perceive the HRM policies/practices as well as the line managers' implementation of HRM practices?
- 4) What is the psychological process whereby employees perceive the strength of the HRM system which impacts on their behaviours?
- 5) How do individual outcomes influence team and organizational level outcomes?
- 6) What is the impact of team climate on individual, team and organizational outcomes?
- 7) What are the causal linkages between HRM and firm performance?

RESEARCH AIM

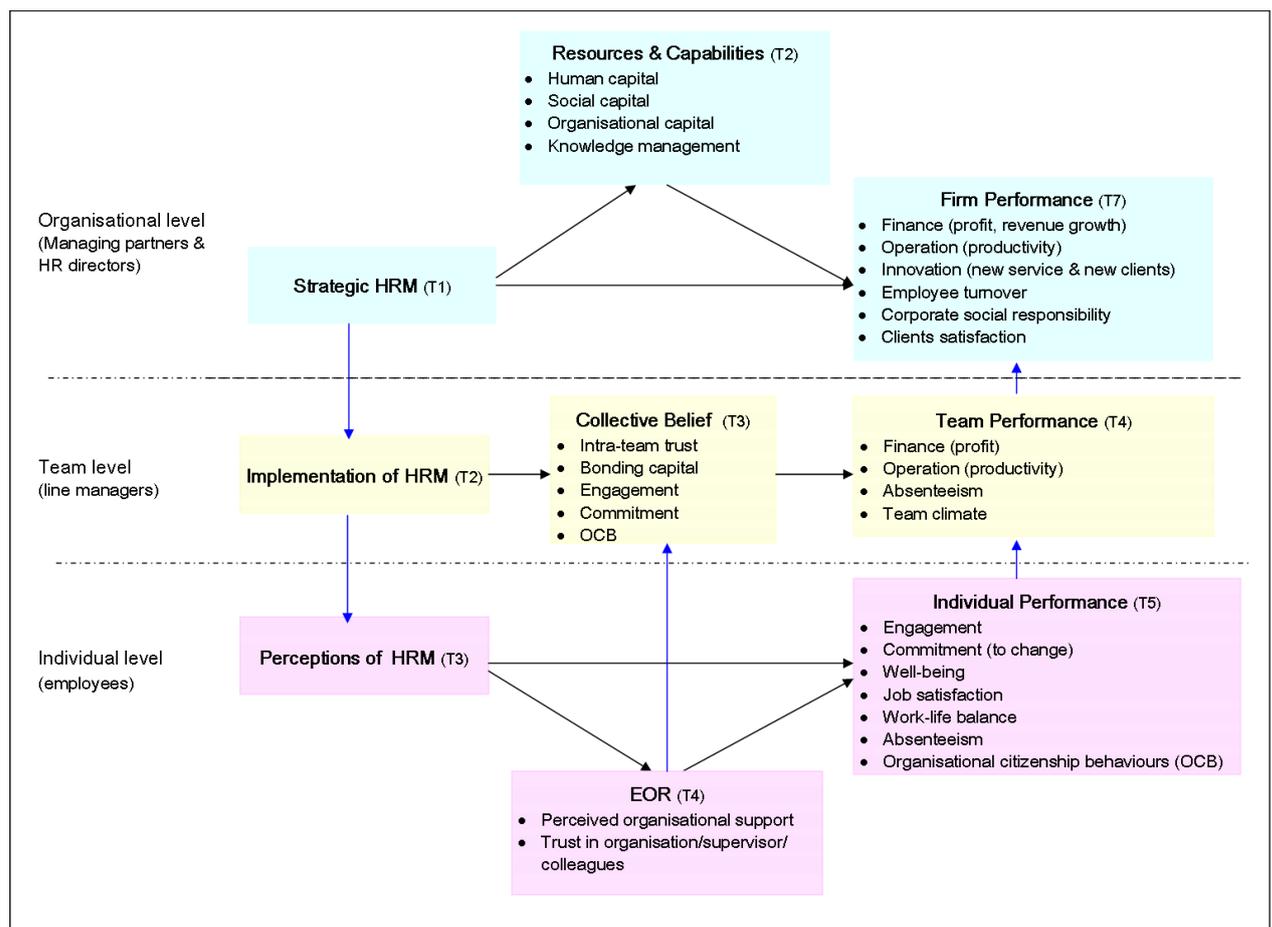

The aim of this paper is to investigate how and why HRM improves firm performance in PSFs using a multilevel approach and longitudinal research design. It integrates literature from organizational behaviour, HRM and strategy.

Figure 2 illustrates the conceptual model. The model indicates the focal constructs/variables at different levels of analysis as well as the inter-relationship of these constructs/variables.

- At the organizational level, the HRM practices such as selection, compensation, training & development, information sharing, team work and participation and their impact on firm performance are proposed. The measures of firm performance to be examined include financial, operational, innovation and corporate social responsibility (CSR). In addition, this paper claim a set of intermediate linkages through which HRM can influence organizational performance. In particular, this

paper integrates the resource-based view of the firm (RBV, Barney, 1991), the knowledge-based theory (KBT, Grant, 1996a, 1996b) and the evidence-based management theory (EBM, Rousseau, 2006; Rousseau et al., 2008), arguing that HRM influences firm performance through the creation of the resources of human capital (O'Sullivan and Sheffrin, 1998), social capital (Nahapiet and Ghoshal, 1998) and organizational capital (Subramaniam and Youndt, 2005; Youndt et al., 2004).

Figure 2 Conceptual Multi-level Model of HRM in PSFs

- At the team level, the link between line managers' enactment of HRM practices (Gilbert et al., 2011) and team performance are proposed. In addition, it explores the mediating effect of employees' collective beliefs such as intra-team trust, bonding capital, engagement, commitment and organizational citizenship behaviours (OCB).
- At the individual level, the employees' perceptions of HRM and their impact on employees' outcomes such as engagement, commitment (to change), well-being, job satisfaction, work-life balance, absenteeism, and organizational citizenship behaviours are addressed. In addition, the mediating effect of employee-organization

relationships (EOR) is proposed based on the social exchange theory (Coyle-Shapiro and Shore, 2007).

The research model proposes a horizontal impact between variables at the same level and also considers the vertical impact across different levels. This approach is supported by Purcell and Hutchinson (2007) who argue that HR practices influence employee attitudes and improve individual performance which in turn has an impact on team and organization performance. Therefore, the model proposes cross-level effects of HRM in PSFs as shown by the dashed lines in Figure 2.

Employing the resource-based view of the firm (Barney, 1991), dynamic capability theory (Teece et al., 1997), and the social exchange theory (Blau, 1964), the proposal explores how and why HRM works in PSFs by examining the HRM at three levels and linking them to the organizational, team and individual performance.

DISCUSSION

Three research gaps have been identified. These are 1) the lack of focus on the professional service context in HRM research; 2) the lack of clarity on why this HR practice-performance link exists, the so called “black box” problem; and 3) the relatively undeveloped research of HRM in PSFs research. In this paper, a multi-level of HRM model was proposed. It helps to close these research gaps. It also highlights a set of intervening variables under which high performance work systems (HPWS) have an impact on organizational performance in professional service firms. By doing so, this paper contributes to the existing research in four ways.

Firstly, this model supports the argument by Boxall and Macky (2009). Using theory, they argue that the HR system influences organizational performance through its impact on work processes such as employee involvement which in turn links to employees’ job satisfaction, trust and commitment. These in turn link to organizational operating outcomes such as cost-effectiveness, labour turnover and absenteeism.

Secondly, the proposed model includes three levels of HRM, i.e. the HR policy at organizational level, line managers’ implementation of HR practices at team level, and the employees’ perceptions of HR practices at individual level. By doing so, this paper addresses the consistency of HRM (Wright and Nishii, 2007). Unravelling the “black box” effects has been a key issue in understanding how HR practices influence employee attitudes and individual performance, which in turn impacts on unit and organization performance

(Purcell and Hutchinson, 2007). According to Liao et al (2009), employees' perception of HRM is significantly different from intended and implemented HRM. The proposed model is among the first efforts to explore the intended HR practice-firm performance relationship.

Third, this proposed model explores the psychological processes through which employees differentially react to the same HRM practices. By doing so, it contributes to employing the process-based approach in studying HRM (Sanders et al., 2012). The process-based approach of HRM indicates that some HR practices may result in different individual and organizational outcomes.

Fourth, this proposed model also addresses the cross-level effects of HRM, such as employee perception of HRM, on team level performance. By doing so, it answers the call for multi-level research to more comprehensively understand how HRM works (Lengnick-Hall et al., 2009; Purcell and Hutchinson, 2007). So far, only a few studies have done so by aggregating data from the individual level to the unit level (e.g. Chuang and Liao, 2010; Gittel et al., 2010; Kehoe and Wright, 2010; Nishii et al., 2008; Takeuchi et al., 2009). This paper employs a multi-level modelling perspective instead of aggregation. Doing so allows for the exploration of the cross-level effects of HRM at the organizational, team and individual levels.

IMPLICATIONS FOR MANAGERS

The proposed model links human resource management policy, practices and the employees' perceptions on them with individual, team and organizational performance. It provides a clear picture for managers on how HPWS work in firms. The managers who pay attention on the efficient and effective implementation of HPWS will build positive experience of management for employees which in turn improve their performance.

CONCLUSION

Based on the research gaps identified in the literature, this paper proposes a multi-level model on how high performance work systems influence firm performance, i.e. organization, team and individual level. In addition, a set of mediating variables were proposed to explain the indirect links between HPWS and performance at difference levels. It contributes to better understanding the mechanisms through which HPWS links to firm performance, i.e. opening the "black box". Empirical work based on this model is expected.

ACKNOWLEDGEMENTS

We would like to thank the two anonymous reviewers for their helpful suggestions and comments during the review process.

ABSTRACT

Chianti Classico wine is one of the most important and oldest Italian red wine Denomination of Origin. In the wine sector its brand, the Black Rooster, is the most famous and know in the world. The structure of the DO is characterized by significant prices fluctuations of bulk wine, constant production and high land values. This situation has created uncertainty in farm investments and it has contributed to increase the supply in terms of surplus or stock. The particularity is also that DO is represented by formal institutions, contracts, branch and agreements and regulations between different producers' categories.

The purpose of this work is to reconstruct and explain the supply chain and bargaining during the bulk wine selling and price performance in one of most important and oldest Italian red wine Denomination of Origin (DO): Chianti Classico employing the Structure –Conduct and Performance (SCP) framework. The paper analyzes the DO structure and farmer's conduct with the aim to understand the logic behind the price formation and their performance. The interdependence among the different firms shows a singular character on the collective dynamics, collusion systems and informal rules observed that regulate the bulk wine prices (through unspoken agreement), supply control instruments and territorial systems.

Keywords: Wine, Chianti Classico, Price formation, Structure, Conduct and Performance.

1. INTRODUCTION

The analysis of strategic configurations of the wine sector, as suggested by Miller (1990), should take into consideration the main determinants of the evolution in the market: supply

and demand conditions, rivalry, socio-institutional constraints, and the ownership structures, which are influenced by financial market and price pressures.

The objective of this work is to reconstruct and explain the supply chain and bargaining during the bulk wine selling and price formation in one of most important and oldest Italian red wine Denomination of Origin (DO): Chianti Classico employing the Structure – Conduct and Performance (SCP) framework. The paper analyzes the DO structure and farmer's conduct with the aim to understand their effect and influence on the price formation and market performance.

The Structure – Conduct and Performance as based on industrial economics (Scherer and Rose, 1990; Shepherd, 1990), is an analytical approach or framework used to study how the structure of the market and the behavior of sellers of different commodities and services affect the performance of markets. The paradigm SCP attempts to explain the market performance of an industry as a consequence of the industry structure and firm conduct assuming that there is a relationship between them. Much literature confirmed the performance of firms was associated with market structure and firms' strategic behavior. It has been argued that not only industry structure may influence firm conduct and market performance, but firm conduct and market performance are likely to feedback and influence industry structure (Egdell, 2000). The SCP model was developed by Bain in 1951, 1956 and applied to the manufacturing industry. The model comprises of three components: the industry structure, the firm conduct and the market performance. The former, which may refer to the number and size of stakeholders, product differentiation, entry and exit barriers, is determined by the market's organizational characteristics that affect the nature of competition and price behaviour within the market. Firm conduct pertains to the market's coordination mechanisms and the price policy applied by the supply chain's stakeholders.

The authors decided to focus on the Chianti Classico Denomination for several reasons. First of all, in the wine sector and not only its brand, the Black Rooster, is the most famous and know in the world. This was decisive and strategic over the years for the success and reputation of the DO. The second reason is that the structure of the DO wine is very particular: is characterized by prices fluctuations of bulk wine, steady production and high land values. This situation has created uncertainty in farm investments and it has contributed to increase the supply in terms of surplus or stock wine in the cellars. At the same time the DO is represented by formal institutions, contracts, branch and agreements and regulations between different producers' categories.

According to the SPC paradigm the structure of this paper is organized in four sections that analyze the production structure, market structure, farmers' conduct and their influence on supply chain and price performance. Through the Consortium Chianti Classico Data Base (C.DB), the author has described each producer's categories, and their representativeness inside the Consortium governance. The dynamics of supply and demand of Chianti Classico, was developed through the ARTEA (Agency for Agricultural payments in Tuscany) and C.DE time series that covering different period of observations.

2. PRODUCTION STRUCTURE OF CHIANTI CLASSICO

The first Italian grape-grower/winemaker Chianti Classico consortium was established on May 14, 1924, when a group of 33 producers gathered in Radda in Chianti to create a consortium to protect Chianti wine and its trademark of origin. The Chianti wine producing area was delimited in 1932 by ministerial decree and the boundaries have remained unchanged since then 1932. The decree described the district where Chianti Classico is produced as the "the oldest zone of origin," thereby recognizing its primacy and according it a special identity. In 1984 Chianti and consequently the oldest zone of origin, Chianti Classico obtained the Controlled and Guaranteed (DOCG) status, the highest recognition for fine Italian wines (Reg. 479/2008 CMO wine, Italian Minister Decree DL.gs 61/2010).

In 1996, a ministerial decree gave Chianti Classico its own DOCG, with production regulations different from those for Chianti wine. Since then Chianti and Chianti Classico have been two separate denominations, with different regulations and production zones.

According to article 17 of Italian law n.61/2010 and art.5 of Ministerial Decree on 16 December 2010, the Consortium proposed to carry out in respect of all the subjects included in the control system of the DO/IG protected, and promotion of brand and protection. The Consortium is administered by a Board. It is composed of 21 members elected from among the Consortium members and/or between their representatives. The assembly elects the Board members with the procedure provided by art.22 of the Consortium Statute.

On 2012, the percentage of wine produced by Chianti Classico Consortium member is equal to 86%. The 14% is the non Consortium members. Inside the Consortium structure, the members are divided in different groups or categories that identify different producers. The structure is composed by growers, winemakers and bottlers or industries.

The first category, *growers* includes members who obtain the majority of their production from their own vineyards. The purchases of grapes and/or wine are permitted provided that

they are lower production volumes. Mainly this category sells the grape to cooperatives or other winemakers.

The second category “*winemakers*” includes the producers and wine cooperatives that carry out activities of making and or bottling of wines on the condition that the wines produced and/or bottled are predominantly from grapes grown by contributing shareholders. The category also includes growers associated to such cooperatives as well as all those who perform predominantly wine-making activities.

The category “*bottlers*” or “*industries*” includes the shareholders, other than those mentioned in the previous, carrying on the bottling business and possibly winemaking. The bottlers’ category is very important not only for the number of companies but also for the size of the farmers. Mainly the bottlers’ category is composed by historical families but also by commercial and industrial groups. Table 1 below show members and non-members divided for each category.

Tab.1 Chianti Classico Consortium members and non members until 2011

	<i>Growers</i>	<i>Winemakers</i>	<i>Bottlers</i>	<i>Cooperatives</i>
Members	121	280	52	8
Non Members	151	26	0	0

Source: Consortium Data base

The winemaker represents the most important group with 280 producers. Among the cooperatives, tree has a substantial weight (calculated as the number of member and the hectoliters of wine produced) in the decision and bargaining into their category. The non-members growers are mainly the farmers that have very small planted surface (ha) and harvest (production of grape).

3. SUPPLY OF CHIANTI CLASSICO: INFLUENCES ON MARKET STRUCTURE

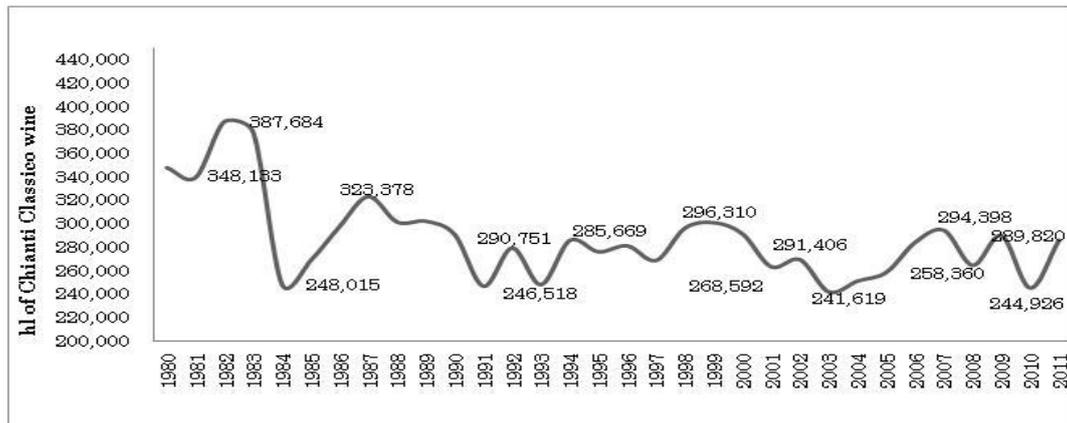

The concept of supply is used to describe how the quantity of commodities offered on the market varies by reason of resources. Supply is defined as the amount of a commodity offered for sale in a particular market during a specific time interval at the prevailing values of prices and any other relevant conditioning variables. Sometimes the adoptions of supply instruments are the consequence of market conditions and political agreement. The supply function for agricultural products is sometimes expressed as a simple relation between the quantity of output and the price of the output. Several researchers have estimated the cultivator supply to different techno-economic factors (Cummings, 1975a; Askari and Cummings, 1977; Cooley, 1973; Chen et. al. 1972; Tweeten, and Quance, 1969).

The Chianti Classico supply variable corresponds to analyze the hectoliters (hl) of wine annually produced in according the Chianti Classico disciplinary rules. The wine production can be totally bottled and sold in bottles with farmers labelling or selling as bulk wine to other Chianti Classico producers.

The supply structure is composed only by a single product mainly produced from a single variety of grapes (80 to 100% Sangiovese). Only the production of Chianti Classico wines is allowed in the area of denomination. This allows Chianti Classico wine to be issued as a Selection or Reserve or vintage. This is a unique case within the EU. The production rule allows the production of Vin Santo del Chianti Classico DOC and *Occhio di Pernice* DOC. In general, more DOCG wines can coexist in the same area. In Chianti Classico producers can choose before the harvesting time between IGT and Chianti Classico through vintage selection or vintage choice or they can choose to “declassify” their wines to “table wines” as the lower quality category.

Looking at the graphic 1, the production has only a small variation (4% per year) even if the decrease in particular years such as 1984 and 2002 was characterized by drastic climatic condition that has compromised the production in term of quantity and quality. For example, the year 1985 was characterized by a lot of snow and frost where most of the vineyards were destroyed. To the opposite, the summer of 2002 was very warm from June to August, and the product has suffered the dry and warm conditions.

Graph. 3.2 The evolution of Chianti Classico wine production

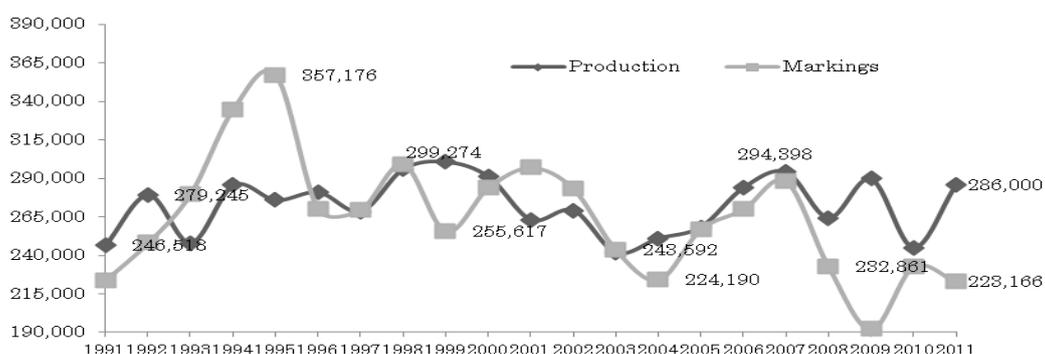

Source: Consortium Data base, our elaboration

The markings represents the hectoliters of wine sold (as Chianti Classico) in which the State marks are applied (Italian Ministerial Decree on 19 April, 2011). The result is the product is no more consider as "stock" in the winery. Each mark contains visible and invisible anti-counterfeiting systems with traceability managed by dedicated databases. According to the DO legislation, they are applied in all the bottles (0.25 lt., 0.75 lt., 3.00 lt., 5.00 lt.) that will be sold with a system that prevents its reuse.

Looking at the graphic 2 it is possible to notice that there is lag time between production and markings. This is true also because the Chianti Classico vintage is sold from October 1 of the year following the harvest. This graphic emphasizes the increase and decrease of a cycle of tree/ four years. In general, the periods of expansion (growth) have the duration of three years, followed by period's contraction recession.

Graph.2 Production and Markings: a comparison

Source: Consortium Data base, our elaboration

The shift sometimes is more or less among 20% with production values constants. The period 2004-2011 was crucial for the Chianti Classico. In 2004 the value was similar to the 1991 year. After this period, the values started to increase even if the maximum concentration in 2007 was almost equal to 1997-1998 years. The table 2 shows the annual fluctuation of marking between the different Chianti Classico categories. The most concentration of markings is represented by the categories *winemakers*.

Tab. 2 Evolution of marking (hl of wine) for different Chianti Classico categories

Year	Winemakers	Bottlers, Industries	Cooperatives	Total (hl)
2004	87.656	90.240	23.972	281.868
2005	92.577	108.520	26.252	227.349
2006	107.793	110.930	20.847	239.570
2007	113.246	110.427	24.148	247.821
2008	100.223	80.604	20.384	201.211
2009	83.163	72.262	92.640	248.065
2010	96.303	81.633	14.169	192.105
2011	98.858	87.467	13.233	199.558
Total (hl)	779.819	742.083	235.645	

Source: Consortium Data base

However, looking at the composition in term of number of farmers, the weight of bottlers is more impressive. Only 52 farmers belong to the group of bottlers; 280 in the winemakers group and 8 the cooperatives. According to this, all the categories have decreased their markings: from 2004 to 2010 there were less 89.700 hl marked and 82.00 hl from 2004 to 2011. The years 2004, 2007 and 2009 seem to be the “black years” for all the groups. Considering the average production equal to 289.000 hl, through the graph that for each year there more or less 90.000-100.000 hl that remain unsold in the cellar and DO increase its surplus (or stock).

The tables 3 show the main concentration of markings in terms of hectoliters of wine and percentage values among farmers that are included in the range. Over the past four years the market share held by the first 10 farmers in the Chianti Classico (80% formed by bottling companies) remained mainly constant around 42%, but down 9% from the peak reached in 2007. On the opposite side about 230 companies have covered 10% of the total markings, showing a growth of 3% in 5 years.

Tab. 3 Concentration of markings (hl and % values)

Farm/ hl wine marke d	2006		2007		2008		2009		2010		2011	
	hl	%										
First 10	126.689	47	146.611	51	108.889	47	80.035	42	97.797	42	100.671	42
11 - 30	67.717	25	65.319	23	58.966	25	49.990	28	65.290	28	65.229	27
31 - 60	36.428	13	35.535	12	31.221	13	28.715	13	29.578	13	34.583	14
61- 100	20.410	8	20.828	7	16.884	7	16.460	8	19.463	8	18.799	8
101 - 150	10.455	4	11.623	4	9.756	4	9.358	5	10.749	5	11.582	5
Others	8.253	3	9.825	3	7.981	3	7.939	4	10.355	4	11.315	5
Total	269.951	100	289.741	100	233.696	100	192.496	100	233.231	100	242.179	100

Source: Consortium Data base, our elaboration

Following table 4, it is possible to analyze the distribution of farms respect to the hectoliters of bottled wine focused on number farmers and their percentage value. From 2006 to 2011 the farmer included in the first categories increased from 127 to 134, even with the natural lag during the 2008-2009 years. With respect to the second categories, between 101 and 205 hl, there are farmer that increased from 18% in 2006 to 25% in 2010 and 23 % in 2011. Also the third category show a natural shift of more or less one two farmers each year. Different is the situation of the farmers included in the medium high level that register a decrease in number and percentage values. The highest level remained constant.

When the markings remain at lower values, the quantity of wine stock increases. This sum of stocks generates a surplus of bulk wine. The result is very difficult to manage, especially when is not possible to stop the production and behind each winery there are great sum of money investments.

Tab. 4 Distribution of farms for bottled wine (hl and % values)

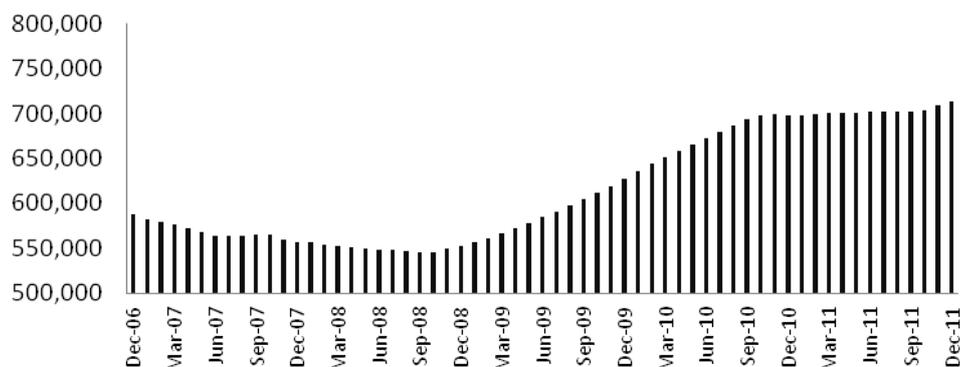

hl of bottled wine	2006		2007		2008		2009		2010		2011	
	n.	%										
Until 100 hl	127	43	123	41	130	44	139	46	134	39	134	42
101 – 250 hl	52	18	58	19	59	20	54	18	73	25	73	23
251- 500 hl	37	13	39	13	40	13	39	13	40	10	40	12
501 – 1000 hl	22	8	26	9	23	8	25	8	26	11	26	8
1001- 2000 hl	26	9	27	9	22	7	21	7	24	6	24	7

<i>2001 – 5000 hl</i>	18	6	12	4	12	4	12	4	15	4	15	5
<i>Higher 5000 hl</i>	11	4	13	4	12	4	10	3	11	4	11	3
<i>Total</i>	293	100	298	100	298	100	300	100	323	100	323	100

Source: Consortium Data base, our elaboration

Graphic 3 shows the increase of stocks that start in the period June-September 2008 and seems to never stop. The 2010 is also characterized by the presence of the 20% wine of 2009 vintage that was block as consequence of CMO blocage measures (that is to keep 20% of wine produced in wineries in order to maintain competitive prices).

4. THE DYNAMICS OF SUPPLY: INFLUENCES AND EFFECTS ON FIRM CONDUCT

The competitive pressure in the wine market determined not only a differentiation of the companies operating in the business, in terms of supply strategy and management, but also in terms of variety of organization of production chains.

Looking at the structure in the figure 1, it is possible to observe that some company realizes a fully integrated production process (from grape production to selling wine in bottle) to deliver a specific product to the market and, at the same time, realize only a part of others production processes (only grape). The critical aspect of such complex organization of the wine sector is the presence of many inter-industry markets. The growers, produce grapes that can be sold to the cooperatives, if they are the members or others winemakers that produce grape and bought grape (the quota purchased must be less than that the produced one). The

winemakers produce wine in their cellars (owned or leased). At the same time, they can buy bulk wine from other farmers but in smaller quantities and add it to their grape production. A company that purchases (grapes or wine bigger quantities) loses the status of winemakers and becomes industrial bottlers.

Figure: 1 Chianti Classico supply chain

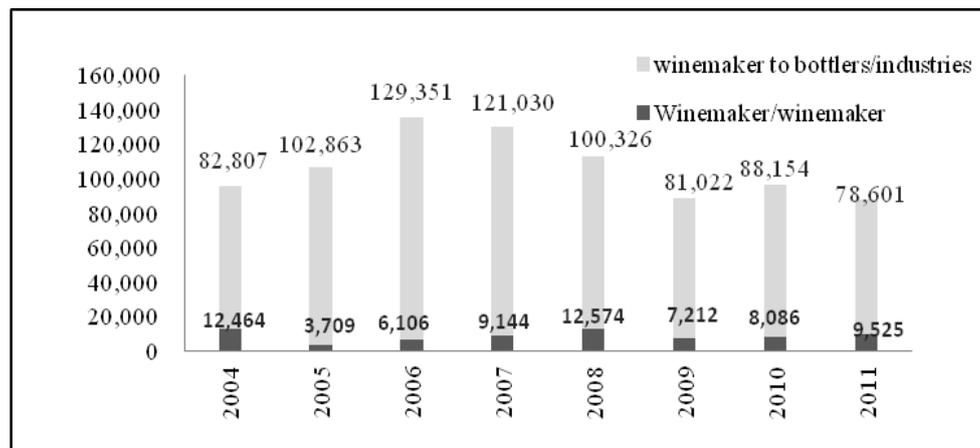

Source: elaboration by the authors, 2013

Cooperatives purchase the grape by growers through agreement pre harvesting. The growers are member of cooperatives and are forced to sell totally or most of the best production. In fact, the cooperative pays the tax on the basis of quality (defined as good health of grape and maturity of grape and their sugar content). After the vinification and ageing period, cooperatives sell the wine in bottles. Cooperatives, can choose to sell the bulk wine to the others winemakers of others categories. At the same time, they can buy the bulk wine (with the quantities allowed by the cooperative rules).

The main activity of bottlers is to buy bulk wine and then vinified in the DO area. The wine can be either sold totally in the bottles or can be transferred as bulk wine to the others bottlers. The transaction between categories is defined as *floating*. The floating of wine is the sum of bulk wine sales between the different Chianti Classico producer's categories. The floating is sold inside the DO, and cannot leave as bulk wine. It is not allowed to bottle outside the production area.

Until 2011, the wine was sold as bulk Chianti Classico wine for the past vintage and as “*wine suitable to become Chianti Classico*” for the wine produced in the same year. From this new vintage 2012, the Consortium board has decided that the sale of the bulk will be permitted only with guarantee certificate. It is no longer allowed to sell wine without the certificate. Have the sale of wine bottles increased or has the trade among the farmers reduced? The answer can be found in graphic 4 that represents the annual transaction (or sales agreement) between winemakers (hl of wine/year) and the sales from winemakers to bottlers.

Graph.4 The annual transaction among Chianti Classico categories

Source: elaboration by the authors

5. STRUCTURE AND PERFORMANCE: THE EFFECTS ON BULK WINE PRICE FORMATION

Price negotiation for bulk wine starts based on market and production conditions (vintage, total quantities (hl), quality of wines and the available quantity in the area for those specific vintage).

During the bulk wine selling negotiation “brokers or intermediary” and winemakers or bottlers take part in all the exchange sales stages (figure 1): before the agreement, during the negotiation and finally during the contractual arrangement. In the first stage, brokers collect wine growers’ offers and merchants’ demands. Wine samples are required and gathered for different vintage. Wine samples are presented to potential buyers that taste wine, to gather samples, and also to collect “informal” and strategic information about the chemical composition and sensory characteristics.

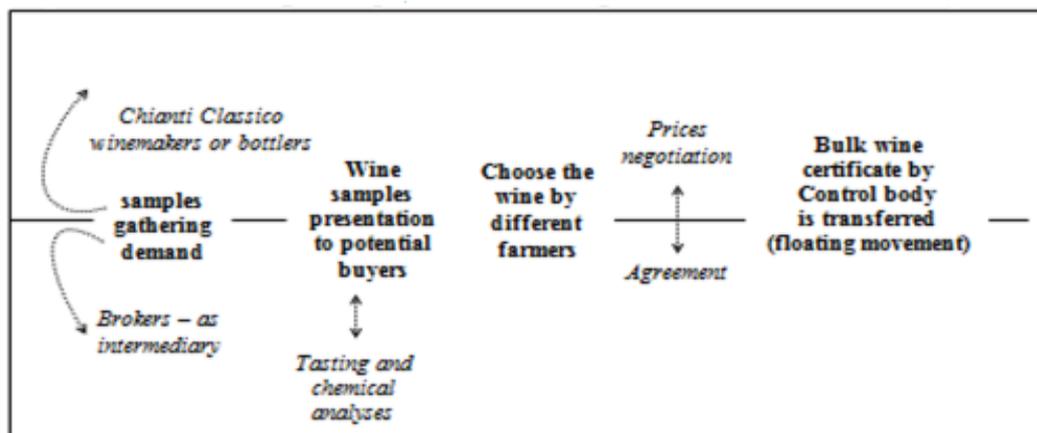

The weight of the buyer (as power policy in the DO) is fundamental to condition the final prices. These big firms (bottlers) have a dominant market position respect to the farmers with lower market shares that follow the pricing changes prompted by the dominant firm. The

first 10/13 farms (the list of the farmers for income and marking like hectoliters of wine sold) in Chianti Classico, such as the bottlers (industries) and the historical and oldest wine families, control the prices and the transfer (between bottlers and producers and between producers and producers) of bulk wine. These groups are not often cohesion in a group.

The different historical composition (cooperatives, industries, historical families, etc.) generate different bargaining interests. If the main bottlers/industries or winemakers decide to pay the bulk wine (more or less), the consequence is that the price in the bulk wine market is influenced. The winemaker's categories sell part or totally their wine production, to the main farmers (bottlers and industries) that decide the quantity and the prices. The result is that the price will be shifted (more or less) in relationship with the type of buyers (Corsinovi, 2012).

The first 10/13 farms in Chianti Classico, control the prices and the transfer (between bottlers and producers and between producers and producers) of bulk wine.

Figure: 2 The bargaining process

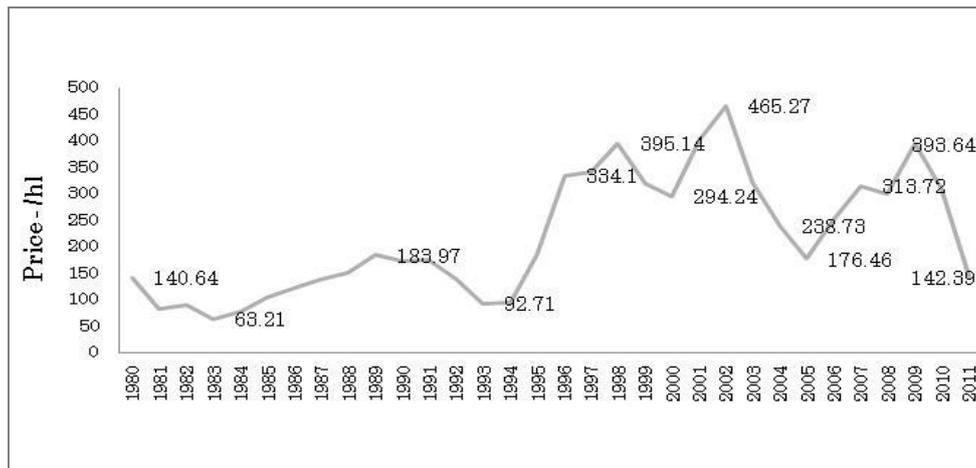

Source: elaboration by the authors, 2013

Fascinated with the brilliance of grand speculative events, the case of the wine sector, and Chianti Classico prices, is very particular and at the same time interesting. Graphic 4 shows a time series of Chianti Classico prices. The series are represented by 31 annual observations and refer to the period 1980-2011.

The average price is 207.90 € with peaks of 480 euro/hl especially in the 2000 year. In the last years, the price of bulk wine fluctuations have caused problems for many producers and report quotations from 140-170 euro per quintal today to 230-250 euro. The “cycles of prices” can last from 4 to 5 years. Over the medium term (two years), prices can fluctuate by 200%, while the production variable if we exclude vintages negative related to climatic factors- this shows a stable trend.

Graph. 4 The performance: the effects on prices

Source: elaboration by the authors, 2013

When the development cycle is well underway, prices tend to rise at a rate that gradually becomes more intense, reaching their peak a few months after the beginning of the next economic downturn. The unfolding of the recession has mirrored characters in the expansion: an early falls in the quantities with prices that remained stable. When the price drop ends to occur, the pace is faster, to continue even after the start of the new expansion.

6. CONCLUSION

The paper analyzes the DO structure and farmer’s conduct with the aim to understand the logic behind the price formation and their performance. In the case of Chianti Classico farmers, the factors that emerge as the most significant determinants of firm conduct constructs were those related to entry barriers, one form of tacit collusion occurs when firms set the same price as the leader, which may be the largest enterprise or the farmers that dominates the industry. The market power of the buyer is fundamental to establish the final

prices. These big firms (bottlers) have a dominant market position respect to the farmers with lower market shares that follow the pricing changes prompted by the dominant firm.

When there are few firms competing in a market, before choosing their strategies, they should consider those implemented by rivals, because it will significantly affect their economic performance. The interdependence among the different firms shows a singular character on the collective dynamics, collusion systems and informal rules observed that regulate the bulk wine prices (through unspoken agreement), supply control instruments and territorial systems.

The result is the tacit "collusion" needed not involve any "collusion" in the legal sense, and in particular need involve no communication between the parties. It is referred to as tacit collusion only because the outcome (in terms of prices set or quantities to sell, for example) may well resemble that of explicit collusion or even of an official cartel (Gaeta, 1993).

The number of competitors on the market is clearly an important factor.

First, coordination is more difficult, the larger the number of parties involved, in particular when coordination is only based on a tacit common understanding of the market conduct to the sustainability of collusion. For example, identifying a "focal point", in terms of market shares, may become less and less obvious, particularly when firms are not symmetric. Firms will find it easier to sustain collusion when they interact more frequently (Gaeta, 1993). The reason comes from the fact that firms can then react more quickly to a deviation by one of them. Therefore, retaliation can come sooner when firms interact more frequently.

To see this clearly, note first that firms could not tacitly collude if they did not anticipate interacting again in the future. Similarly, collusion is unlikely when firms interact only infrequently, since the short-term gains from undercutting a collusive price could then be "punished" only in a far future

AN ANALYSIS OF WORK COST IN COMPANIES LISTED ON THE FTSE MIB

Giacosa, Elisa¹; Giovando, Guido²

¹Department of Management, University of Turin, Italy, elisa.giacosa@unito.it

²Department of Management, University of Turin, Italy, guido.giovando@unito.it

ABSTRACT

The aim of this research is to analyze the cost impact of work factor of production on the company's financial statements for Italian companies listed on the FTSE MIB. Following a study of such cost in its various components, we have identified those with the biggest impact on the total work cost. Specifically, we have analysed, on one hand, the salary cost and other entries relating to employees; on the other, we have considered the company costs arising from taxation. In addition, we have examined whether there is any difference in terms of the impact of work cost with regards to the specific economic sectors of the companies under consideration.

It emerged a correlation between salary costs and operating costs, and between salary costs and turnover. This is due to the human factor being a highly important input in the company's production process and influencing the revenues made by the company through selling goods and services. This correlation is particularly evident within those economic sectors that are characterised by a high level of labour, among which are industrial products and services, travel and leisure, health.

In addition, a strong correlation between social security costs and operating costs has been identified. As operating costs vary social security costs also tend to change, despite being theoretically stricter due to their fiscal element. Finally, a time variable correlation has arisen between the other personnel costs and turnover.

This study brings literary contributions to the subject on an empirical level. The impact of work cost has been verified and quantified using a particularly representative sample. The sample itself constitutes 84% of the capitalization of the Italian stock market, which represents an international benchmark index, and makes it possible to describe the Italian economic texture in detail.

Keywords: Work cost; salaries and wages costs; social security costs; provision for employee benefits; other personnel costs; work cost impact.

1. INTRODUCTION

The relations between companies and their environment can be represented by an “input-output” model (Ferrero, 1987), according to which a company is placed in the middle of an exchange wherein it receives a series of inputs from its environment, such as factors of production, duties and conditioning, which all represent external forces that can be either positive or negative (Giacosa, 2012). Following a physical and economic transformation process, the company produces a series of outputs, consisting of fully finished products and influences (conditionings) for the company’s context. The work factor of production falls within the above-mentioned inputs, and impacts the technical and organizational structure of the company (Ferraris Franceschi, 1995).

The aim of this research is to analyze the cost impact of work factor of production on the company’s financial statements for Italian companies listed on the FTSE MIB. Following a study of such cost in its various components, we have identified those with the biggest impact on the total work cost. Specifically, we have analysed, on one hand, the salary cost and other entries relating to employees; on the other, we have considered the company costs arising from taxation. In addition, we have examined whether there is any difference in terms of the impact of work cost with regards to the specific economic sectors of the companies under consideration.

The importance of the subject is linked to a series of aspects; firstly, the work factor gains remarkable significance with regards to the company’s capability to combine all other inputs during the production activity process. Secondly, these inputs have a different effect according to the economic sector considered; sectors with the highest labour intensity seem, in fact, to be the most strongly influenced by the incidence of work cost.

The current research differs from previous studies that have followed an empirical profile. Specifically, the present study uses a sample that is particularly representative of the current Italian economic industrial context, and is made up of all Italian industrial companies listed on the FTSE MIB. The reasons for this representation are as follows: on one hand, their belonging to the FTSE MIB makes the sample very indicative, since it represents the benchmark index employed in the international context. On the other hand, the economic sectors in which the companies within the sample operate are very diversified, which thus fully reflects the Italian economic texture. Last but not least, even in the context of stock market capitalization, the capitalization of companies listed on the FTSE Italia represents 84% of the capitalization of companies listed on the Italian stock market (as of 31 January 2013).

2. LITERATURE

The work factor of production relates to human and intellectual activity, which, combined with other resources, allows the production of goods and services within the company. Companies transform, in an “economic” sense, human needs through the use of human resources (Ferrero, 1987; Farneti, 2007). In recent years, several important studies regarding the organization and management of personnel within companies have been conducted (Brusa, 1996). A rich body of literature has considered the work factor of production from many different points of view. The sudden changes in the companies’ labour request have been dealt with by many researchers, either generally or through specific analyses of different countries (Berman et al., 1994, Bertola and Rogerson, 1997).

Other studies have focused on the difficulties faced in terms of integrating human resources into the work market, and have studied the role of the mediators operating in the market (Fitzgerald, 1998; Budgen, 2008; Jain, 2010). In addition, it can be seen from the existing literature that the work factor represents, from a financial point of view, a pivotal element for enterprises, constituting a discriminating factor for their competitiveness (Porter, 1995; Becker and Huselid, 1998; Chen and Lin, 2004).

Many researchers have dealt with the subject of work cost with regards to its impact on the company’s balance sheet, either on a national (Dezzani et al, 2001) or an international level (Hermanson, 1992; Acemoglu and Pischke, 1999; Lev and Radhakrishnan, 2003). The effects of the introduction of international accounting principles (which were based on national accounting principles) on the companies’ balance sheets have also been considered (Haverals, 2007).

A particularly complex aspect of work cost with regards to its quantification is the end of service allowance. This subject has been considered by many authors (Dezzani et al., 2012). In particular, the employee benefits following the suspension of the service allowance have been subject to several studies, which have focused their attention on the “corridor method” (Amen, 2007; Fasshauer et al., 2008) or the transition from “defined benefit plans” to “defined contribution plans” (Swinkels, 2006).

However, the extant literature provides no unified vision on the connection between work cost and financial obligations (Marino et al., 2000; Bauman, 2001). Several researchers agree on the temporary effects of financial obligations on the work cost, but are divided when it comes to the permanent effects of these (Jackman et al., 1996; Nickell, 1997). Several researchers have also claimed that effects on work cost, either permanent or temporary, also

depend on other institutional variables considered, such as the work reforms within the country under consideration (OECD Employment Outlook, 2012).

Several models of work cost and taxation have been studied (Swenson, 1999), in particular the presence of taxation made up of a steady part and a proportional part (Lindbeck, 1996; Pissaderes, 1998). Some recent studies highlight the fact that the endogenous growth rate of employment changes as income tax and local tax vary (Zou, 1996; Gong and Zou, 2011).

Important quantitative analyses of the impact of the tax burden of the work cost on the balance sheet have been conducted in every single European country (Jacob, 2000; Marino, 2000; Buijink, 2002; Spengel, 2003;), though without creating correlations between the work cost and other balance sheet values. In addition, work cost analyses have been combined with other macroeconomic analyses (OECD, 1999; Marino and Rinaldi, 2000). Other researchers have used an empirical method of analysis to consider work cost. Such researchers have basically identified two different methods: “(micro) backward-looking”, which uses effective accounting data within existing companies (ex-post of the data); and “(micro) forward looking”, which is based upon ex-ante data on the hypothetical future of the company (Jacobs and Spengel, 2000; Spengel and Lammersen, 2001).

The current research, which follows an empirical approach, makes a contribution to the existing body of literature. It uses a highly representative sample, which constitutes 84% of the total capitalization of the Italian stock market (as of 31 January 2013). As a consequence, the results portray the economic reality of the main Italian industrial companies listed on the FTSE MIB, thereby allowing an international comparison, since the FTSE MIB index is used internationally as the benchmark index of the Italian stock market. At the same time, the research findings are pertinent to a multiplicity of economic sectors, since the companies within the sample operate in the most representative production contexts of the Italian production landscape. Last but not least, the variety of the economic sectors considered has allowed us to identify the different impacts of work cost in relation to the economic context in which the companies operate.

3. METHODOLOGY

3.1. The sample

Companies	Sectors	Stock Market Capitalization	% sample
A2A	Public services	1,513.5	0.67
Ansaldo Sts	Industrial products and services	1,199.95	0.53
Atlantia	Industrial products and services	8,995.09	3.96
Autogrill	Travel and leisure	2,275.92	1.00
Buzzi Unicem	Construction industry and materials	1,976.3	0.87
Campari	Food and drink	3,343.63	1.47
Diasorin	Health	1,598.06	0.70
Enel	Public services	30,056.27	13.23
Enel Green Power	Public services	7,553.18	3.33
Eni	Oil and natural gas	67,181.06	29.58
Fiat	Automotive and industrial supplies	5,477.11	2.41
Fiat Industrial	Industrial products and services	11,552	5.09
Finmeccanica	Industrial products and services	2,763.5	1.22
Impregilo	Construction industry and materials	1,524.03	0.67
Lottomatica	Travel and leisure	3,126.34	1.38
Luxottica	Fashion	16,030.77	7.06
Mediaset	Media	2,248.33	0.99
Parmalat	Food and drink	3,245.18	1.43
Pirelli & C.	Automotive and industrial supplies	4,348.81	1.91
Prysmian	Industrial products and services	3,383.48	1.49
Saipem	Oil and natural gas	9,130.8	4.02
Salvatore Ferragamo	Fashion	3,157.53	1.39
Snam	Public services	12,610.17	5.55
Telecom Italia	Telecommunications	13,552.51	5.97
Terna - Rete elettrica nazionale	Public services	6,230.83	2.74
Tod's	Fashion	3,072.6	1.35
Total amount for sample		227,146.95	70.2 (of FTSE MIB)
Total amount for FTSE MIB		323,509.28	83.79 (of the Italian stock market)
Total amount for Italian Stock Market		386,076.01	

The Italian companies included in the sample are listed in the FTSE MIB. The FTSE MIB represents the international benchmark index of the Italian stock market, given its strong

representativeness. It is in fact made up of 40 private Italian societies of primary importance and high liquidity. Furthermore, its representativeness is due to the fact that the above-mentioned companies operate in multiple economic sectors, which portray the Italian economic texture. The market capitalization of the companies belonging to the FTSE Italia constitutes around 84% of the total capitalization of the Italian market (as of 31 January 2013).

We excluded banks, insurance and other financial companies, as we have opted to analyse a sample consisting of companies operating in the industrial, rather than the financial sector. The sample is made up of 26 companies (Table 1), which represents 70.2% of the capitalization of the FTSE MIB (as of 31 January 2013).

Table 1 - The sample (data in millions of in Euros)

Source: personal elaboration

3.2. Research questions and method

To reach the goals of this research, three main research questions were formulated:

- RQ1: Is there a correlation between the cost of salaries and wages and the achieved turnover? Does this correlation vary according to the economic sector in which the company operates?

- RQ2: Is the variability of the social security costs comparable to that of the operating costs, or are the social security costs substantially static upon variation of the company's operating costs?

- RQ3: Do the various types of provisions for employee benefits and other personnel costs, of which most are non-compulsory, vary as the turnover varies?

On the basis of the above research questions, the following hypotheses have been developed:

- H1 (paired with RQ1): There is a correlation between the cost of salaries and wages sustained and the turnover achieved, since the human factor represents a source of particular significance with regards to the company's production process and the consequential turnover achieved. Such a correlation should be more prominent in those economic sectors with large incidence of labour. It is also supposed that such a relationship be dependent on the sector, since the higher or lower level of automation has a great influence on the work cost.

- H2 (paired with RQ2): The variation in social security costs is less prominent than that of operating costs, since the social security costs have a cost component which is more static (rigid) than the other cost categories.

- H3 (paired with RQ3): As turnover varies, the variability of the different typologies of provisions for employee benefits and other personnel costs and change accordingly? The achievement of high turnover makes it economically possible for the company to bear non-mandatory costs, such as employee benefits and other personnel costs, in the future.

The research methodology was organised according to the following phases:

- Phase 1: Analysis of regulation and literature review. This entailed an analysis of the work cost regulation conducted by international institutions (IASB), with particular reference to IAS 19, Employee Benefits, and to the IFRS 2, Share-based Payment. This was supported by an in-depth study of literature, which helped us to interpret the above-mentioned international accounting principles and understand their empirical application (in the context of previous studies) to specific samples.

- Phase 2: Empirical analysis. This involved an analysis of the information derived from the sample. The research methodology did not include interviews, since the information provided in the consolidated financial statements was considered sufficient to answer the research questions. With reference to *RQ1*, before linking the costs of salaries and wages to the turnover, we first identified the effects of salaries and wages on the operating costs, in order to verify whether salaries and wages represent a dominant element of the work cost. After observing a strong Pearson correlation between the costs of salaries and wages and the operating costs, we explained the variability within these costs by calculating the average annual wage, also comparing this information among different economic sector. Then, we compared the costs of salaries and wages and the turnover, to verify their Pearson correlation. With reference to *RQ2*, we firstly analyzed the impact of salaries and wages on the social security costs in order to evaluate the effects of these on employee compensation. Then, we calculated the Pearson correlation between salaries and wages and social security costs. The analysis of the correlation between the cost of salaries and wages and that of social security costs confirms how strongly the two are connected, which serves as a basis from which to answer *RQ2*. At this point, we compared the effect of social security costs on all operating costs, in order to measure their absolute value in every company of the sample. At the end, we calculated the Pearson correlation between social security costs and operating costs. With reference to *RQ3*, we firstly compared the other personnel costs incurred with turnover, as

these costs differ from wages and salaries and social security costs. Then, we calculated the Pearson correlation between the other personnel costs and turnover.

To further the analysis, the Pearson correlation ratio (p) was used to identify a positive or negative correlation between the variables under examination in the various research questions. For this, it is necessary to underline the following conditions:

- if $p > 0$ there is a direct correlation;
- if $p = 0$ there is no correlation;
- if $p < 0$ there is an indirect correlation;
- if $0 < p < 0.3$ the correlation is weak;
- if $0.3 < p < 0.7$ the correlation is moderate;
- if $p > 0.7$ the correlation is strong.

- Phase 3: Delineation of the accounting effects of work cost. Following the analysis of the above-mentioned consolidated financial statements, we identified the accounting behaviours of the companies belonging to the sample, and delineated the main differences among the various economic sectors.

The study, which was conducted during 2010-2011, used consolidated financial statements and the AIDA database. Bearing in mind the research goals, an empirical methodological approach was preferred.

4. FINDINGS

The findings are illustrated by following:

- a) the correlation between cost of salaries and wages, on one side, and achieved turnover, on the other;
- b) the comparison between social security costs and operating costs;
- c) the variation of different types of provisions for employee benefits and other personnel costs towards turnover variation.

4.1 The correlation between cost of salaries and wages, on one side, and achieved turnover, on the other

To answer *RQ1*, we wanted to identify the effects of salaries and wages on the operating costs, in order to verify whether salaries and wages represent a dominant element of the work cost. Table 2 displays mean, median and standard deviation of salaries and wages, operating costs and salaries and wages as % of operating costs for the sample.

Table 2 – Salaries and wages and operating costs (data in millions of Euros)

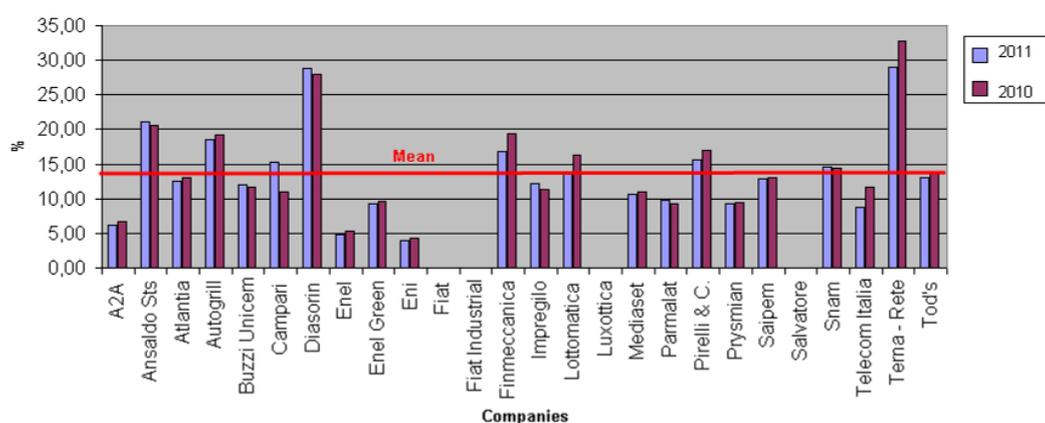

Data	2011			2010		
	Salaries and wages	Operating costs	Salaries and wages as % of operating costs	Salaries and wages	Operating costs	Salaries and wages as % of operating costs
Mean	1,063	14,050	12.95	990	11,518	12.99
Median	406	4,063	12.48	385	3,477	11.61
Std deviation	1,260	23,869	5.90	1,234	20,854	5.65

Source: personal elaboration

In 2011, the costs of salaries and wages accounted for a mean different share (12.95%) of the operating costs within the sample compared to 2010 (12.99%). However, companies such as Ansaldo STS, Autogrill, Diasorin, Finmeccanica and Pirelli & C., exceeded the mean. Other companies, such as A2A, Eni and Enel, were way below the mean: these companies, which belong to the public services sector, and the oil and natural gas industry, are characterised by a marked rigidity in terms of capital assets and a lower incidence of the human factor compared to the other production factors, wherein the human factor represents a lower work cost in the context of operating costs.

The variability of the cost of salaries and wages in terms of operating costs is not merely depicted by a comparison against the mean, but also with the median (12.48%), and the standard deviation (5.90%). A strong variability of wages and salaries against operating costs was also seen in 2010. Figure 1 shows this variability.

Figure 1 - Variability of salaries and wages as a proportion of operating costs

Source: personal elaboration

The correlation between salaries and wages and operating costs is strong in both years, as shown by the Pearson correlations, which equalled 0.85 in 2011 and 0.84 in 2010 (Table 3).

Table 3 – Pearson correlation between salaries and wages and operating costs

Pearson correlation	Salaries and wages 2011	Salaries and wages 2010
Operating costs 2011	0.85	
Operating costs 2010		0.84

Source: personal elaboration

After verifying the strong correlation between the costs of salaries and wages and the operating costs, it was necessary to explain the variability within these costs among the sample companies. For this purpose, we compared the costs of salaries and wages with the number of employees, by calculating the average annual wage (Table 4).

Table 4 – Average annual wage per employee (in Euro)

	2011	2010
Data	Average salaries and wages	Average salaries and wages
Mean	40,573	39,325
Median	39,722	39,724
Std deviation	13,455	11,523

Source: personal elaboration

It is evident that Enel and Eni (which both have a lower impact from work cost on the operating cost, compared to the mean), have a higher-than-average cost of salaries and wages compared to the mean. This means that the reduced influence of salaries and wages on the operating costs is linked to the higher value of the operating costs.

The analysis carried out so far only serves as a foundation from which to address RQ1. Before linking the costs of salaries and wages to the turnover, we conducted a preliminary evaluation of the representativeness of such costs on the operating costs.

Table 5 shows a comparison between the costs of salaries and wages and the turnover (for 2011 and 2010), since this latter represents a variable regarding the scope of the business activity. It is in fact hypothesised that there is a correlation between the actual turnover and the cost of the labour employed to achieve it. This hypothesis must, however, be contextualised by reference to the sector in question: some companies use a larger amount of labour, while others, which use more automated and technological systems, use less. At the same time, personnel costs can vary according to the different levels of personnel specialisation, which can have an impact on the hourly employee cost.

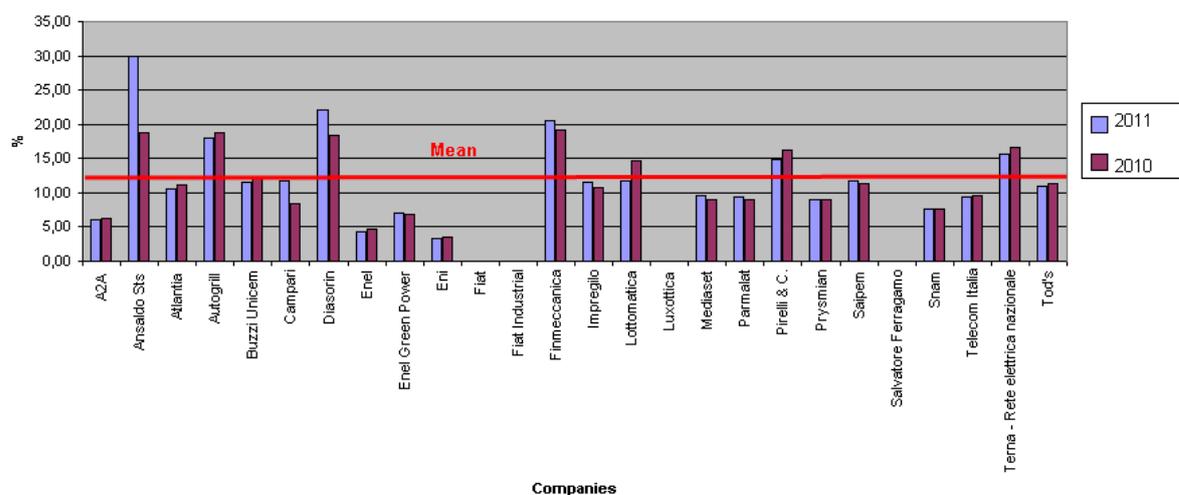

Table 5 – Comparison between salaries and wages and turnover

Data	2011			2010		
	Salaries and wages	Revenues	Salaries and wages as % of revenues	Salaries and wages	Revenues	Salaries and wages as % of revenues
Mean	1,063	15,151	12.09	990	12,901	11.10
Median	406	4,399	10.85	385	4,254	10.15
Std deviation	1,260	26,617	6.57	1,234	23,752	4.80

Source: personal elaboration

Figure 2 shows the high amount of variability seen in Table 5.

Figure 2 – Variability of salaries and wages as a proportion of turnover

Source: personal elaboration

The correlation between salaries and wages and turnover is strong in both years, as shown by the Pearson correlations, which equalled 0.82 in 2011 and 0.83 in 2010 (Table 6).

Table 6 – Pearson correlation between salaries and wages and turnover

Pearson	Salaries and wages 2011	Salaries and wages 2010
Turnover 2011	0.82	
Turnover 2010		0.83

Source: personal elaboration

With particular reference to economic sectors, we calculated Pearson correlation between salaries and wages, on one side, and turnover, on the other. It emerged that correlation is strong (more than 0.9) for the following sectors, which are characterized by a great fixed assets ratio:

- Construction industry and materials;
- Food and drink;
- Oil and natural gas;
- Public services.

When the relation between salaries and wages and turnover is considered, it is again clear that the companies that are furthest from the average belong to the public services and oil and natural gas industries (A2A, Enel, Enel Green Power, Eni and Snam); these companies are far below the average in this regard. Among the reasons for this are the marked rigidity of capital assets and the lower impact of the human factor (which produces a lower work cost) compared to the other production factors.

The above results serve to confirm H1; there is a correlation between the cost of salaries and wages and actual turnover, since the work factor of production represents a resource of primary significance within the process of production, influencing the entity in terms of the revenues. This correlation is mostly evident in the economic sectors (among which are industrial products and services, travels and leisure and health), which have high labour rates.

4.2 The comparison between social security costs and operating costs

To answer RQ2, we aimed to analyse the social security costs, which represent a crucial component of the work cost and are pivotal in terms of influencing companies' decisions to operate in one country, rather than another.

The variety of the companies within the sample did not allow us to consistently analyse the social security costs element, since every company had a different number of employees and different types of work contracts. We thus chose to equate the costs of salaries and wages compared to social security costs, in order to evaluate the effects of these on employee compensation (Table 7).

Table 7 – Salaries and wages and social security costs (data in millions of Euros)

Data	2011			2010		
	Salaries and wages	Social security costs	Salaries and wages as % of social security costs	Salaries and wages	Social security costs	Salaries and wages as % of social security costs
Mean	1,063	258	22.60	990	240	24.53
Median	406	134	22.68	385	106	24.25
Std deviation	1,260	325	9.68	1,234	304	6.94

Source: personal elaboration

The proportion of social security costs within salaries and wages averaged 22.60% in 2011 and of 24.53% in 2010, with a median of 22.68% in 2011 and 24.25% in 2010. We can thus conclude that although the percentages of the mean and median diminished in 2011, the influence of social security costs on salaries and wages is remarkable.

In both years, the correlation between salaries and wages and social security costs is very strong, as shown by the Pearson correlations, which equalled 0.96 in both years (Table 8).

Table 8 – Pearson correlation between social security costs and salaries and wages

Pearson	Salaries and wages 2011	Salaries and wages 2010
Social Security Costs 2011	0.96	
Social Security Costs 2010		0.96

Source: personal elaboration

The analysis of the correlation between the cost of salaries and wages and that of social security costs confirms how strongly the two are connected, which serves as a basis from which to answer RQ2.

At this point, we compared the effect of social security costs on all operating costs, in order to measure their absolute value in the single companies within the sample. The results are shown in Table 9.

Table 9 – Social security costs and operating costs (data in millions of Euros)

Companies	2011			2010		
	Social security costs	Operating costs	%	Social security costs	Operating costs	%
Mean	258	14,263	2.60	240	12,081	3.04
Median	134	3,813	2.88	106	3,810	2.93
Std deviation	325	25,399	1.34	304	22,223	1.19

Source: personal elaboration

Bearing in mind the different sectors in which the companies operate, the median equalled 2.88% in 2011 and 2.93% in 2010. The mean went from 2.60% in 2011 to 3.04% in 2010, and the standard deviation varied from 1.34% in 2011 to 1.19% in 2010.

As we can see, the values for companies like Enel and Eni were much lower than the average of the sample under examination. As previously observed, with regards to salaries

and wages, Enel and Eni present high operating costs, which means that social security costs have a low level of influence on operating costs.

The correlation between social security costs and operating costs is strong in both years, with a further increase in 2011, as shown by the Pearson correlations, which equalled 0.79 in 2011 and 0.77 in 2010 (Table 10).

Table 10 – Pearson correlation between operating costs and social security costs

Pearson	Social security costs 2011	Social security costs 2010
Operating costs 2011	0.79	
Operating costs 2010		0.77

Source: personal elaboration

From these data, *H2 cannot be supported*. There is, in fact, a strong correlation between social security costs and operating costs and, as operating costs vary, social security costs tend to change. As a consequence, wages and salaries are strictly related to social security costs; most of the companies in the sample show that personnel costs are a significant component of their operating costs, and this in turn results in a high amount of variation in the operating costs.

4.3 The variation of different types of provisions for employee benefits and other personnel costs towards turnover variation.

RQ3 related to the other personnel costs. These personnel costs involved are derived from the profit and loss account, and differ from wages and salaries and social security costs. They generally include provisions for employee benefits and other generic personnel costs.

As in the previous analysis, the non-homogeneous data arise due to the diversity of the companies within the sample and the differences in terms of number of employees. In order to verify H3, we have to compare the other personnel costs incurred with all the operating incomes and the results achieved (Table 11).

Table 11 – Other personnel costs and turnover (data in millions of Euros)

Companies	2011			2010		
	Other personnel costs	Revenues	%	Other personnel costs	Revenues	%
Mean	111	15,477	1.09	152	13,812	1.27
Median	55	4,307	0.86	57	4,277	1.13
Std deviation	161	28,819	0.90	234	25,707	0.57

Source: personal elaboration

The percentage impact of provisions for other employee costs as part of the operating incomes fall into a very restricted range. The mean was 1.09% in 2011 and 1.27% in 2010, while the median was 0.86% and 1.13%, respectively.

The following specific points can be highlighted. In 2011, Enel (operating in the public services sector), had a much lower percentage of personnel costs compared to the average seen in other companies. These costs included positive revenue components linked to the completion of a retirement scheme programme, which led to a labour reduction, and a profit deriving from the newly settled agreement to suppress the energy discount for employees of companies operating in Italy. Eni (operating in the oil and natural gas sector) represents a huge difference compared to the average figure for personnel costs in the 2011 financial statements, which was derived from lower retirement scheme burdens in 2011. Snam (operating in the public services sector) showed some positive revenue components in both of the years analysed. This was due to the impact of increases in internal work. Telecom Italia (operating in the telecommunications sector), showed a strong difference between 2010 and 2011 with regards to other personnel costs, a difference which is mostly ascribable to mobility obligations.

The correlation between other personnel costs and turnover was strong in 2010, with a Pearson coefficient equal to 0.94; on the other hand, in 2011 such relation was moderate, with a Pearson coefficient equal to 0.64 (Table 12).

Table 12 – Pearson correlation between other personnel costs and turnover

Pearson	Other personnel costs 2011	Other personnel costs 2010
Turnover 2011	0.64	
Turnover 2010		0.94

Source: personal elaboration

From this information, *H3 can be confirmed*. The correlation between the other personnel costs and turnover was strong in 2010 and moderate in 2011. This shows a variability of the above-mentioned relation. As a consequence, particularly with regards to 2011, we can say that a variation in turnover is not related to a change in the other personnel costs within the same entity. However, an analysis on a wider time horizon would allow us to better verify the non-existence of such a relation.

CONCLUSION

The human factor represents a constitutive element of a company, as it is a stimulus to entrepreneurial activity. The human element is pivotal to a combination of production factors: it represents the company's driving force, awarding exclusivity to the entire system and allowing it to function. On top of this, it blends in with the company's means, generating a unitary and inseparable entirety, in a coordinated, complementary and dynamic manner.

Given the importance of the work factor, a cost analysis of it is highly important, as it makes it possible to quantify its influence on other typical values within a company's financial statements. Specifically, from the analysis in the present study, a correlation between salary costs and operating costs, and between salary costs and turnover, have been identified. This is due to the human factor being a highly important input in the company's production process and influencing the revenues made by the company through selling goods and services. This correlation is particularly evident within those economic sectors that are characterised by a high level of labour, among which are industrial products and services, travel and leisure, health.

In addition, a strong correlation between social security costs and operating costs has been identified. As operating costs vary social security costs also tend to change, despite being theoretically stricter due to their fiscal element.

Finally, a time variable correlation has arisen between the other personnel costs and turnover. Specifically, the correlation is strong in 2010, and moderate in 2011. When the correlation is strong it means that upon variation of the turnover, other personnel costs, which are non-mandatory by law, change accordingly. When the correlation is moderate, variations in turnover are not related to variations in other personnel costs within the same entity. Nevertheless, in the case of either a strong or a moderate correlation, the achievement of economic benefits in terms of turnover makes it possible for the company to sustain future non-mandatory costs, such as provisions for employee benefits.

This study brings literary contributions to the subject on an empirical level. The impact of work cost has been verified and quantified using a particularly representative sample. The sample itself constitutes 84% of the capitalization of the Italian stock market, which represents an international benchmark index, and makes it possible to describe the Italian economic texture in detail.

This research is subject to several limitations. For instance, there is a need to verify the impact of personnel specialisation on the work cost, bearing in mind the differences between the various economic sectors. Such variable could change the analysis results, as it could influence the average unitary cost for every employee. In addition, it could be useful to extend the quantitative analysis across a wider time horizon, in order to evaluate the variability of the correlations among the different values. Also, it would be extremely useful to compare the Italian situation to other countries in Europe, in order to verify the different impacts of the work cost components.

A MODEL OF EFFECTIVE RECOVERY FOR ITALIAN COMPANIES TO OVERCOME THE FINANCIAL CRISIS

Giacosa, Elisa¹; Mazzoleni, Alberto²

¹Department of Management, University of Turin, Italy, elisa.giacosa@unito.it

²Department of Business Administration, University of Brescia, Italy, albmazz@eco.unibs.it

ABSTRACT

The purpose of our research is to outline a proposed model of recovery that Italian companies in financial crisis may adopt and adapt to their typical business needs. Due to the absence of a model recovery project in Italian literature and corporate regulation, a proposed model may equip management teams to deal with the delicate circumstances of financial crisis and increase their chances of returning to business as usual.

This model may be also applied by companies in other countries, thanks to the recovery project's common goal of delivering a company out of crisis, regardless of its location.

The significance of the research relates to the role of the recovery project. First, it is aimed at facilitating the recovery of a company in crisis. Secondly, it is a means for the company to disseminate economic and financial news to stakeholders, in order to overcome information asymmetries, which in the event of crisis are likely to cultivate a lack of confidence. An effective communication policy with stakeholders may increase the company's credibility, which may have suffered due to the crisis.

The findings of the research show that the crisis phenomenon is a very frequent occurrence in the lifecycle of a company. A sort of "normalization" approach to the crisis situation is commonplace, forcing the company into a new mindset for the anticipation and management of a crisis situation. To overcome a crisis, the recovery project has to include both a qualitative and quantitative component on the crisis phenomenon. The company has to reach a consensus on the content of the recovery project with stakeholders. Banks represent a privileged stakeholder, for which companies may create a single agreement for all banks involved. All parties have to commit to the recovery strategy, even adopting different behaviours towards various types of stakeholders.

Keywords: Recovery process; recovery project; effective communication policy; company's credibility; stakeholders.

1. INTRODUCTION

In the current economic climate, an increased number of firms are experiencing financial crisis. In addition, a company's descent from a normal operational state into a crisis is happening quicker than before. Situations now more often arise where a company is propelled into a state of crisis without chance to observe the usual warning signs.

Dealing with crisis in a systematic way requires the use of standardized tools and processes which can return the company to a state of growth/sustainability. The recovery project is one such instrument. A recovery project is a document that sets out the steps a company in financial crisis should follow in order to return to economic and financial stability (Guatri, 1986).

On studying the Italian regulations and literature, it yields neither the form nor content of a recovery project.

The objective of the work is to outline a proposed model of recovery which Italian companies in crisis may adopt and adapt to their typical business needs. The proposed model of recovery is derived from an empirical analysis of a sample comprising 98 recovery projects developed in Italy between 2009 and 2010.

This model is not applicable only to Italian companies, as one of the recovery project's key advantages is that it is universal in its application, regardless of company location, size or business type.

The significance of the research relates to the role of the recovery project, which does, in fact, have a dual purpose. Firstly, it is aimed at facilitating the return of a company in crisis to economic and financial stability. Secondly, it is a means of disseminating economic and financial information to stakeholders, in order to overcome information asymmetries (Singhvi and Desai, 1971; Stigler, 1994), which in the event of crisis are likely to reduce confidence in the company (Eccles *et al.*, 2001). An effective communication policy for stakeholders may increase the company's credibility, which may also have suffered as a result of the crisis.

The ability to effectively formulate and communicate the recovery project is a necessary condition of the company's survival. The success of this process depends on the stakeholders reaching a consensus (Lindblom, 1994) as a result of being informed of, and in agreement with, the policies and strategies proposed by the company (Owen, 2008). Consensus is a necessary condition for recovery, as it favours the provisioning of financial resources (Deephouse and Carter, 2005).

The motivation for the research stems from the desire to move towards a "normalization" of the crisis phenomenon in which the crisis may represent a normal phase of the business cycle. Therefore, management should foster a new mindset in preventing and managing a crisis situation, using a standardized method of problem solving. The recovery project may be considered as a standardized tool. Due to the absence of a model recovery project in Italian literature and corporate regulation, a proposed model may equip management and their advisors to deal with the delicate circumstances of financial crisis and increase their chances of returning to business as usual. An effective recovery project may promote both a new phase of development in the company's activities and an increase in its credibility with stakeholders.

This study builds on our previous research (Giacosa and Mazzoleni, 2011), which focused on the crisis phenomenon and on the recovery process, but was in an early stage of development. Thanks to a greater understanding of the sample, we have drawn out incremental findings with regard to the form and structure of the recovery project. In addition, this research analyses the company behaviour in increasing the firm's credibility with stakeholders throughout the recovery process.

The next section of the article comprises a brief literature review concerning the crisis phenomenon, prevention and management of the crisis. We then outline the research method, including the sample, hypotheses and the research phases. The next section is focused on the results and discussion. Finally, we construct some conclusions, implications and limitations of the research, which suggest avenues for further research.

2. LITERATURE REVIEW

Literature on the matter of crisis emphasizes the following aspects under observation:

- definition, reasons and typologies of the company crisis;
- prevention of the crisis;

- management of the crisis situation.

Numerous international studies have been written on the matter of **definitions and causes of the crisis** (Green, 1992; Gundel, 2005; Mitroff, 2001; Danovi and Indizio, 2008; Norberg, 2011) **and different categories of the event** (Burton, 1993; Coombs, 2006; Deming, 2000; Foster, 1980; Guatri, 1986). Warning signs have been studied (Morin, 1976; Turner, 1976; Giacosa and Mazzoleni, 2011), even if the logic employed in crisis management appears confused, because actions taken to overcome the crisis may intensify the negative situation. Anglo-Saxon studies in particular have been initially conducted by means of case studies, which highlighted the causes of the crises and the recovery methods (Argenti, 1983; Taylor, 1982). Over time, the studies have changed the meaning of crisis: changing from the concept of crisis management as an episodic and rare moment in the lifecycle of the company (Bradley, 1978; Cazdyn, 2007) to that of continuous risk management (Culasso, 2009; Huber and Scheytt, 2013) of the crisis as a frequent phenomenon (Heath, 1998; Lalonde, 2007; Rosenthal and Pijnenburg, 1991; Roux-Dufort, 2007; Gao and Alas, 2010; Alas *et al.*, 2009), also due to a radical change in economic context (Slatter *et al.*, 2008; Pollio, 2009). What results from a crisis is a natural selection of companies (Chisholm-Burns, 2010), forcing the exit of inefficient firms from the market (Giacosa and Mazzoleni, 2012);

With regard to **crisis prevention**, the early studies were made into the financial aspects of a company situation to demonstrate the significance of the analysis of indicators (Fitz Patrik, 1931; Merwin, 1942). These studies generated a lot of criticism and in turn brought about a number of samples for predictions of insolvency in order to foresee bankruptcy within a certain time frame (Alberici, 1975; Altman, 1968; Altman and Haldeman, 1977; Appetiti, 1984; Tamari, 1966). Altman's model has inspired a great number of researchers, demonstrating the validity of the application of his model for small businesses and reducing the error margin contained in that model (Blum, 1969; Deakin, 1972; Edmister, 1972). Some scientists have further developed the structure of the forecast models, determining the degree of credibility of the results produced by each model (Cattaneo *et al.*, 1986; Teodori, 1989).

Regarding the **management of the crisis situation**, the literature has focused on the possible methods of company restructuring in crisis (Deeson, 1972; Ross and Kami, 1973). The most recent studies have analysed the various tools of recovery and illustrated the effects on business continuity (Booth, 1993; Mitroff, 2001; Slatter and Lovett, 2004; Smith *et al.*, 2005; Smith and Elliott, 2006), also comparing research studies in crisis management (Coleman, 2004; Pauchant and Douville, 1992). Furthermore, a large amount of literature has focused on the

process of business turnaround as a recovery strategy (Bibeault, 1982 and 1999; Lenahan, 2006; Schragger, 2003; Slatter, 1984; Sloma, 2000), distinguishing turnaround strategy from the recovery process (Guatri, 1995; Sciarelli, 1995; Amadio and Paparelli, 2009; Fazzini and Abriani, 2011). As a result, the company must be able to deal with crisis situations in a systematic way (Pearson and Clair, 1998) by using standardized processes and tools (Slatter and Lovett, 2004), such as the recovery project. The recovery project is considered as a means of communication with stakeholders (Pajardi, 2008; Whitney, 1999) to increase the company's credibility (Argenti and Barnes, 2009; Graham *et al.*, 2005; Netten and Van Someren, 2011; Reilly and Di Angelo, 1990). In addition, companies have to learn from crisis, with the aim of avoiding future recurrences (Roux-Dufort, 2000).

Regarding **recovery studies**, in Italy, the form and content of recovery projects have not been the subject of regulations or business literature. The Italian literature has carried out some in-depth analyses of companies' business plans, with reference to the development phase (AIFI, 2002; Borsa Italiana, 2003; Mazzola, 2003). However, it has not indicated the necessary adjustments that the business plan must undergo in the event of crisis in order to sustain the restructuring process of the company in question. Only recently have guidelines been proposed for the preparation of a recovery plan (Assonime-Cndcec-Università degli Studi di Firenze, 2010), by suggesting the logic of a business plan be used to guide a company out of crisis. Despite the importance of the subject of the recovery project, it has not been analysed even by the Italian Accountants Associations.

Given the absence of a model recovery project in Italian literature and corporate regulation, we make the following main contributions to the literature. First of all, this article aims to enrich the existing literature, providing a proposal for a model recovery project that companies can adopt by way of dealing with the crisis in a systematic way. In addition, our study answers the recent calls for research with practical relevance: due to an increased number of firms affected by financial crisis, a model recovery project may help the actors of the recovery process to interact with stakeholders in communicating the company strategy and finding a means to uphold business continuity.

3. METHODOLOGY

3.1 The sample

The sample is composed of 98 recovery projects developed in Italy between 2009 and 2010,

comprising the largest restructurings over a certain period in Italy, during which the banking sector intervened as creditor. The sample has been provided by one of the most important Italian banks, which adopted the role of creditor.

The main characteristics of the sample are as follows:

- The majority were unlisted companies on the Italian Stock Exchange (86%); all of the companies are private ones.

- The sample is representative of different economic sectors: financial holding sector (11.6%), industrial products and services sector (11.2%), real estate (9.2%), household goods (8.2%), telecommunications (7.1%), construction (7.1%), fashion (5%), distribution (5%) and others minor sectors.

- More than half the sample (54.1%) had restructured debt of between €100 million and €500 million, a quarter of the sample (25.5%) had less than €100 million, while 14% had debts from €500 to €1,500 million.

- The sample contained both small to medium-sized firms and large ones: in this stage of the research, we didn't analyse the recovery project and firm's behaviour in relation to the size of the company.

Data concerning the number of Italian companies involved in a recovery process in 2009 and 2010 does not exist. Nevertheless, the sample has been considered by the banking sector as sufficiently representative in terms of number of projects, project complexity and amount of restructured debt. Indeed, the sample comprises the largest particularly well-known restructurings over a period during which the Italian banking system has evolved as a creditor.

3.2 Hypotheses and research phases

In order to meet the research objective, the following core research questions were defined:

- *RQ1: What is the form and content of a recovery project that allows the company to get over the crisis in a systematic manner?*

- *RQ2: What actions does the company take to increase the firm's credibility with stakeholders over the recovery phase ?*

With reference to the above research questions, the following hypotheses have been developed:

- *H1*: The recovery project has to explain to the stakeholder the state the company in crisis was in prior to undergoing the recovery process, the characteristics of the crisis phenomenon, and the influences of the recovery project on the economic and financial condition of the company. To achieve these aims, the recovery project has to be a detailed and comprehensive document, including both qualitative and quantitative data, and information on the crisis phenomenon and the recovery strategy.

- *H2*: During the recovery process, the company has to adopt different behaviour according to the type of stakeholder. This strategy is intended to increase the company's credibility and influence the provisioning of resources.

The methodological approach applied is arranged in three phases.

Phase 1 – An analysis of the national and international literature, and professional practices focusing on the crisis phenomenon and the process of recovery has been done. This phase allows us to identify some elements that would form the basis of a model recovery project. A “theoretical draft” of the recovery model was therefore prepared.

Phase 2 – The theoretical draft of the recovery model was compared with the sample in order to identify some common and effective peculiarities of the recovery projects from which to build a model recovery project. For each case analysed, we acquired from the banking system the recovery project presentations offered to the various stakeholders. In addition, in almost all of the cases, the draft content or the actual content of the recovery projects have been analysed. The empirical observations derived from the analysis of the sample were used to integrate the theoretical draft of the model recovery project developed over the first phase. In particular, recovery projects from the sample were analysed with reference to aspects such as:

- the composition of the recovery project;
- the causes of the crisis;
- the recovery strategy;
- the redefinition of the strategic and operational aspects of the company;
- the modification or integration of corporate governance;
- the interaction and the agreements towards stakeholders.

The research methodology did not include interviews with companies from the sample because the documentation provided by the banks was sufficient to meet the purpose of the

research.

Based on both the empirical evidence arising from the sample and the theoretical draft of the model, we formulated an “advanced draft” of the model.

Phase 3 – This advanced draft was tested via surveys. We needed a comparison with some actors involved in the recovery process. We chose financial advisors: this choice was dictated by their greater availability to participate in the research. In particular, the interviews were held with the managers of the restructuring departments of four of the major financial advisory services operating in Italy in debt restructuring from 2009. The interviewees have taken the role of financial advisor in 41% of the recovery projects of the sample (the other financial advisors weren’t available for interview within the period of research). The surveys carried out in the questionnaire were semi-structured; the applied questionnaire was composed of 28 questions, of which 13 were closed, 11 open and 4 gleaned mixed answers.

The data from these interviews was both qualitative and quantitative: in particular, quantitative information concerned some general aspects such as the number of interventions made, the reference sector involved, the amount of the debts restructured, the duration of the project, the composition of the recovery project and so on; qualitative information was about the financial advisor’s experience in the preparation of the recovery projects.

At the end of this phase, the exercise served to provide a “proposed recovery project” which takes into account both the literature, the empirical evidence from the sample and the results of the interviews.

The common approach in the survey takes inspiration from the basic principles of Grounded Theory (Glaser and Strauss, 1967), which was very useful in light of the dearth of earlier literature on the topic.

4. FINDINGS

The results gleaned from the study can be formulated as follows:

- the form and content of the recovery project model;
- the company’s actions in increasing its credibility with the stakeholder during the recovery phase.

4.1 What is the form and content of a recovery project that allows the company to overcome the crisis in a systematic manner?

In response to *RQ1 (What is the form and content of a recovery project that allows the company to get over the crisis in a systematic manner?)* the recovery project was considered an important means by which to explain to the stakeholders the characteristics of the crisis phenomenon, the status of the company before the recovery process, the recovery strategy and the influences of the recovery process on the economic and financial condition of the company.

The process of recovery has to set a forecast over a set period of time. It is useful to refer to the Anglo-American approach, for which a reasonable time horizon for the return to economic and financial stability is three to five years (American Institute of Certified Public Accountants, 2009).

The recovery project can be used in both:

- a formal sense, as it aims to renegotiate agreements with stakeholders in order to restore their trust in the company;
- in a substantive way, as it can encourage the company to redefine its strategic and organizational structure; the crisis phenomenon is an opportunity to analyse the company's weaknesses and address them.

Looking at the reference sample, the recovery project has been used in its formal sense: in fact, it has been employed to renegotiate the debt, mainly with banks. However, the significance of the substantive rehabilitation project has frequently been overlooked.

We hypothesized that the recovery project has to be a comprehensive document, containing qualitative and quantitative information about the company, the crisis phenomenon and the recovery strategy. Using the sample, we analysed the composition of the recovery project, with the purpose of verifying the nature of its content. It was found that the recovery project was generally composed of two parts (in 86.7% of cases):

- 1) The **recovery plan**;
- 2) The **economic-financial plan**.

The remaining cases (13.3%) didn't make a distinction between a recovery plan and an economic-financial plan (see Table I).

Table I – Cases where the recovery projects were divided into two parts

	No.	%
Yes	85	86.7
No	13	13.3
Total	98	100.0

Consequently, we analysed each part of the recovery project and their factual content, also distinguishing qualitative and quantitative information.

4.1.1 The recovery plan

The recovery plan explains the crisis phenomenon, making a general presentation of the company and illustrating the causes of the crisis, and the economic and financial status of the company before the recovery process began. In addition, it analyses the strategy chosen by the company to resolve the crisis, the proposal and the negotiation with the stakeholders, and the guarantees provided for the successful conclusion of the process.

In order to be a detailed and comprehensive document, the recovery plan should be composed of the following parts:

1) **General introduction of the company:** a good understanding of the company is necessary if information asymmetry is to be reduced and company credibility with stakeholders is to be improved. This part has to contain a presentation of the company's history and activities; the past and future performances; and the activity of the company, detailing market position and comparisons with competitors. Illuminating the corporate structure and shareholders is also important. In addition, information about a substantial past reorganization of the company have been provided at least in a brief summary.

The need to establish a trusting relationship with stakeholders requires an extreme level of transparency with regard to introducing the company. A company introduction was found in all of the recovery projects from the sample (see Table II).

Table II – Presence in the sample recovery plans of a general introduction of the company

	No.	%
Yes	98	100.0
No	0	0.0
Total	98	100.0

This part of the plan is mainly qualitative, but also quantitative. The qualitative part explains the company's history and activities, its market and relationships with its competitors. In addition, the corporate structure and any past reorganizations are described. The quantitative part is useful to illustrate the qualitative one; it quantified the activity results, the market share and that of their competitors and, in addition, an in-depth quantification of corporate structure and shareholders, and past re-structuring are present.

According to the first part of the recovery project – the general description of the company – H1 is confirmed.

2) **Crisis phenomenon description:** this section should identify the originating factors of the crisis and its characteristics. Even if the cause of the crisis is generally financial, the purpose is to clarify some hidden causes, both financial and strategic. An untimely recognition of the symptoms or simply minimizing them, and misidentifying the crisis event may bring about a loss of company resources.

All sample cases contained a paragraph in the recovery plan which sets out the description of the crisis phenomenon (see Table III).

Table III – Presence in the sample recovery plans of the crisis phenomenon description

	<i>No.</i>	<i>%</i>
Yes	98	100.0
No	0	0.0
Total	98	100.0

The crisis management team needs to understand and analyse the causes of the event. Without clear identification, the chances of recovering effectively and overcoming the crisis situation are reduced. In the majority of the cases, the recovery project sets out the causes of the crisis (see Table IV).

Table IV – Presence in the sample recovery plans of the causes of the crisis

	<i>No.</i>	<i>%</i>
Yes	90	91.8
No	8	8.2
Total	98	100.0

Causes of the crisis have been described as follows (see Table V):

- **External causes:** these are highlighted in 73 of the cases (74.5%) (e.g. market crisis, drop in demand). In these cases, the recovery projects are understood as an instrument for resolving only external problems (without dealing with the issue of internal strategic reorganization/restructuring). Market analysis observed the general field of reference or macro-economic aggregates, without immediate impact on the company crisis. Only in a few cases have external causes of the crisis been described, drawing attention directly to the competitive context of the company. In some cases, the cause attributable to external factors is reasonable insofar as it is supported by reductions in turnover by up to 50% during one year.

- **Both external and internal causes:** these were given in 25 of the cases (25.5%). The frequently occurring internal causes are the reduction of the operational profitability, leading to a decline in the company's own products; the inability of the original management team to manage the business activity; a large investment in capital goods and inventories disproportionate to the current market situation; an excessive internal and external growth of the company; the actions of disloyal managers or managers who implement ill-advised operations with company assets.

Table V – Causes of the crisis

	<i>No.</i>	<i>%</i>
External causes	73	74.5
Internal and external causes	25	25.5
Total	98	100.0

This part is mainly qualitative, but also quantitative. The qualitative part describes the crisis causes and categorizes them as external and internal ones. The quantitative part refers to data and information about the content of the qualitative part. In particular, it quantified the crisis causes, such as the reduction of the operational profitability, a large investment in capital goods and inventories, and a sizeable and uncontrolled external growth of the company.

With regard to the second part of the recovery project – crisis phenomenon description – H1 is confirmed.

3) **The company's economic and financial situation before the recovery process:** the recovery plan has to indicate the economic and financial status of the company before the recovery process, treating the company's business activities as a going concern. All useful information concerning active assets, debt position and equity on the one hand, and revenues and costs on the other, have to be included to provide a clear and reliable presentation of the company's status. In addition, where relevant, the recovery project has to include information about legal proceedings stakeholders are taking out against the company.

Details of the initial economic and financial situation was found in the majority of the cases from the sample (91.8%) (see Table VI).

Table VI – Presence in the sample recovery plans of the initial economic and financial situation

	<i>No.</i>	<i>%</i>
Yes	90	91.8
No	8	8.2
Total	98	100.0

Generally, the financial standing in the initial phase of project preparation looks unbalanced in terms of the use of sources as well as the degree of dependence on third parties.

A high degree of stakeholder commitment to the recovery project was observed: the recovery project has been used in a timely fashion, thanks to a constructive discourse with the stakeholders. It follows that at the formalization of the recovery project, there were no disputes with creditors in 68 of the cases (69.4%), even if past due trade payables are present. In a great number of the cases suppliers have not stopped providing goods and services, but demanded terms of payment at rates no less than those in the past. In the remaining cases, companies are involved in legal proceedings: 14 cases (14.3%) involved suppliers of goods and services; 16 cases involved the banking system (16.3%) (see Table VII).

Table VII – Existence of legal disputes brought about by the creditors

	<i>No.</i>	<i>%</i>
No legal disputes	68	69.4
Legal disputes with suppliers of goods and services	14	14.3
Legal disputes with banks	16	16.3
Total	98	100.0

The third part of the recovery project is mainly quantitative, especially when indicating

the economic and financial situation of the company before the recovery strategy. All information concerning financial situation is related to active assets, debt position and equity; for the economic situation, it concerns revenue and costs. In addition, all legal proceedings by stakeholders have to be included. To describe this quantitative part, the recovery project contains a qualitative part which gives in-depth analyses of the economic and financial information before the recovery process began.

According to the third part of the recovery project – the company's economic and financial situation before the recovery process – H1 is confirmed.

4) **Recovery process strategy:** the recovery plan should identify the strategy the company will put in place with the purpose of overcoming the crisis situation. To ensure the recovery process is fully comprehensible and coherent, the recovery plan has to elucidate the strategy in place for the following key stages:

- an emergency strategy, to ensure the company's financial stability;
- a stabilization strategy, to guarantee the company will return to profitability;
- a development strategy, with the purpose of ensuring business growth and development.

In all cases there was a paragraph in the recovery plan that detailed the recovery strategy: in the majority of cases (67.3%), an earlier plan regarding product strategy, organization, management control, etc. is approved because the crisis is considered an exceptional event in the lifecycle of the company. The main purpose of the strategy is to renegotiate the conditions of the company's debt position. In the remaining cases, there was a change in the strategy (see Table VIII).

Table VIII – The confirmation of the past strategy

	No.	%
Yes	66	67.3
No	32	32.7
Total	98	100.0

The renegotiation of the commitments with suppliers of goods or services is the major

strategy (86.7%); alternatively, the solution is based both on debt rescheduling and reorganization of the company (13.3%) (see Table IX).

Table IX –Measures to overcome the crisis

	No.	%
Renegotiation of the trade payables	85	86.7
Debt rescheduling and company's reorganization	13	13.3
Total	98	100.0

The strategy is based on the assumption for which the business experiences a rapid return to pre-crisis levels. Therefore, the above-mentioned projects usually state conservative economic and financial forecasts for the current and following year; a relevant increase in rates of turnover are expected so as to be able to generate earnings and cash flows consistent with the debts accrued. No significant interventions regarding the costs structure of the company were envisaged. In 40 cases (40.8%) the current stakeholders increased the stock capital (see Table X).

Table X – New contribution in stock capital by the current shareholders

	No.	%
Yes	40	40.8
No	58	59.2
Total	98	100.0

It was then verified whether or not the strategic and/or operative structures were redefined. In most of the cases (85.7%), the strategic and operational structures of the companies have not been redefined due to the fact that crisis is frequently considered an exceptional and external event in the lifecycle of the company. In 14 of the cases (14.3%) that showed willingness to undergo company reorganization in light of the crisis, they did not provide any detail of what interventions were taken or their effectiveness. Out of the 14 cases, 10 (71.4%) projected a relative reduction of the business costs, primarily in terms of labour

costs and 4 (28.6%) redefined some of the strategic elements of the firm in question, such as products and markets (see Table XI).

Table XI – Redefinition of the strategic and/or operational elements of the company

	<i>No.</i>	<i>%</i>
No	84	85.7
Yes	14	14.3
Of which:		
Reduction of the business costs	10	71.4
Redefinition of some strategic elements of the company	4	28.6
Total	98	100.0

We observed a modification or integration of the corporate governance in 31 cases (31.6%). Some 25 of these 31 cases (80.6%) chose modification or integration of the controlling body, while 6 of the cases (19.4%) chose modification or integration of the managing board. All these requests derive from the banking system (see Table XII).

Table XII – Modification and/or integration of corporate governance

	<i>No.</i>	<i>%</i>
No	67	68.4
Yes	31	31.6
Of which:		
modification/integration of the controlling body	25	80.6
modification/integration of the managing board	6	19.4
Total	98	100.0

The fourth part of the recovery project is mainly qualitative, due to its strategic content concerning the “strategic map” (Brusa, 2011). It explains some important strategic objectives, including the company’s position in the competitive market; the product/market combination to develop; the quality level to be attained; the characteristics of the organizational structure; the role the management should adopt; the use of other strategic elements in terms of technology, price and quality; the model to incentivize managers. In addition, this part contains a quantitative part, which illustrates all information about the above strategy in quantitative terms.

Regarding the fourth part of the recovery project – the recovery process strategy – H1 is confirmed.

5) **Guarantees:** as the recovery project is subject to the risk of future events, it has to provide guarantees to stakeholders. In 8 cases (8.2%), the project has not foreseen additional guarantees to those originally granted to the banks (these cases are those that show larger bank loans). In 68 of the cases (69.4%), additional guarantees are provided by the company alongside the guarantees initially issued. In 22 of the cases (22.4%), additional forms of guarantees are provided by parties other than the company/group of companies involved in the recovery. Of these 22 cases, 5 (22.7%) represent intervention by consortia, 12 (54.6%) by third parties represented by shareholders/directors of the company in crisis, while 5 (22.7%) are third parties formally unconnected with the company (see Table XIII).

Table XIII – Provision of guarantees in favour of the recovery process

	<i>No.</i>	<i>%</i>
Absence of additional guarantees provided by the company	8	8.2
Additional guarantees by the company	68	69.4
Additional guarantees by parties other than company	22	22.4
Of which:		
Consortia	5	22.7
Third parties ascribable to shareholders/directors	12	54.6
Third parties formally disconnected by the company	5	22.7
Total	98	100.0

The fifth part of the recovery project is mainly quantitative. In particular, it contains all information about the guarantee types, the issuer, the amount guarantee, and all conditions concerning the guarantees.

4.1.2 The economic-financial plan

The economic-financial plan expands on the effects of the recovery plan on the economic and financial situation of the company. It has to include the effects of the recovery strategy on the balance sheets, income statements and cash flow statements to demonstrate how the company is overcoming the crisis situation as a result of the recovery strategy.

Its purpose is to state the company's attitude to returning to profitability, during and after the recovery process.

It contains some documents concerning the economic and financial situation of the company, including:

- a prospective balance sheet;

- a prospective income statements;
- a prospective cash flow statements.

This data is present in almost all of the cases. All economic-financial plans contain the prospective balance sheets and income statements, due to the relevance of the content and the fact they are routinely drawn up as a matter of course by all companies. The prospective cash flow statements are provided in the majority of cases: some difficulties in the elaboration are experienced by smaller companies, due to the high technical skill required (see Table XIV).

Table XIV – Economic-financial plan content

	<i>No.</i>	<i>%</i>
Prospective balance sheets	98	100.0
Prospective income statements	98	100.0
Prospective cash flow statements	90	91.8
Total	98	100.0

These tables are provided in the recovery project, developing the assumptions upon which the forecasts for future business activity are based. Generally, assumptions are based on future operations that differ from those in the past.

The economic-financial plan is elaborated according to the method of plan development (AIFI, 2002; American Institute of Certified Public Accountants, 2009; Mazzola, 2003). In addition, the plan has been formulated in respect of the literature guidelines, with particular reference to the “prospective financial statements”. The prospective financial statements could be subdivided into the following (American Institute of Certified Public Accountants, 2009):

- financial forecast: based on assumptions made at the moment of the plan’s conception which are reasonably expected to occur (e.g. turnover developed on the basis of orders already contracted by the company);

- financial projection: based on hypothetical assumptions or the hypothesis that at the moment of preparation of the plan they were not yet verified (e.g. turnover developed on the basis of orders in negotiation).

Generally, the economic-financial plan in the recovery process contains a high level of uncertainty. Indeed, it is to a large extent determined on the basis of unverified assumptions at the moment of its preparation assuming significant discontinuity with the past. This is due to the fact that quite often the historical elements turn out to be inappropriate building blocks for recovery due to the causes of the crisis.

To reduce this uncertainty factor, the more popular techniques concern the period covered by the economic-financial plan. Generally, it may have a short-term horizon, increasing the reasonableness of the document. However, for a recovery plan to be successful often requires a longer duration. Indeed, this duration is about 15 years or more in 41.8% of cases and from 5 to 15 years in 37.8% of cases. The remaining cases (20.4%), required less than 5 years (see Table XV).

Table XV – Economic-financial plan duration

	<i>No.</i>	<i>%</i>
Less than 5 years	20	20.4
From 5 to 15 years	37	37.8
More than 15 years	41	41.8
Total	98	100.0

The use of sensitive analysis is also important in reducing uncertainty, allowing confirmation of how the conditions and status of the company before the recovery process began can be modified with changes of one or more relevant variables. Sensitive analysis allows us to estimate the margin of certainty or the sustainability of the recovery plan: it identifies the minimum level that some relevant indicators must reach in order to ensure achieving the objectives negotiated with the stakeholders (turnover, gross operating margin, contribution margin, etc.). The sensitive analysis is employed in the majority of the recovery projects (78.6%). In these cases, 40 of them (51.9%) carry it out through a stress test on the principal variables upon which the project is based, while 37 (48.1%) use multiple scenarios (see Table XVI).

Table XVI – The use of sensitive analysis

	No.	%
No	21	21.4
Yes	77	78.6
Of which:		
Stress tests	40	51.9
Multiple scenarios	37	48.1
Total	98	100.0

Due to the content of the economic and financial plan, this part is mainly quantitative. Nevertheless, a qualitative part is important in illustrating all economic and financial data and information included in this part.

According to this part of the recovery project – the economic-financial plan – H1 is confirmed.

According to the composition of the recovery project (recovery plan and economic-financial plan), H1 is confirmed: the recovery project has to be an inclusive document, including both a qualitative and quantitative component on the crisis phenomenon. Only the combined effect of these aspects allows the project to demonstrate to stakeholders the starting position of the company in crisis, the causes of the crisis, the recovery strategy and its effects on the economic and financial situation.

In addition, only an inclusive document can explain how the company is to overcome the crisis. A clear and complete communication of the recovery strategy is a requisite of meeting the wishes of the third parties, generating consensus and attracting the necessary resources.

Due to the absence of a recovery project model in the Italian literature and corporate regulation, this study allows businesses to have a model recovery project, which can be adapted according to the needs of any business. In a period characterized by a normalization of the crisis phenomenon, this recovery project model may represent a standardized tool in overcoming the crisis.

4.2 *What actions does the company take to increase the firm's credibility with stakeholders over the recovery phase?*

In response to RQ2 (*What actions does the company take to increase the firm's credibility with stakeholders over the recovery phase?*), we considered the recovery project as a means of communicating with stakeholders, increasing the credibility of the company during and after the recovery process and developing the trust of the stakeholders. To increase the possibility of overcoming the crisis, the company usually interacts with several types of stakeholders in different ways. Nevertheless, the probability of unanimous acceptance of the project is greater in the case where the proposal is not adapted according to the various categories of stakeholders and involves the payment of all amounts payable even with a delay.

In the sample, the majority of companies (73.5%) developed specific agreements for the different types of stakeholders, according to the deadlines and the conditions of the debt (see Table XVII). Generally, companies require an extension of the debt repayment term and a partial payment of the debt.

Table XVII – Presence of differentiated agreements with stakeholders

	No.	%
Yes	72	73.5
No	26	26.5
Total	98	100.0

This evidence confirms H2: the companies of the sample adapted their behaviour according to the different categories of stakeholders.

Generally, the content of the proposal is different depending on the type of stakeholders. The recovery project analyses in detail the stakeholders' requests in order to facilitate recovery. Stakeholders involved in the sample cases are as follows:

- banks, in all of the cases (100.0%);
- financial administration through fiscal transaction (86.7%);
- suppliers of goods and services (46.9%), to ensure continuity in the supply of goods and services necessary in guaranteeing business continuity;
- employees (13.2%) with the aim of obtaining their support (Whitney, 1999; Pate and

Platt, 2002; Sutton, 2002) (see Table XVIII).

Table XVIII – Stakeholders involved in the recovery process

	<i>No.</i>	<i>%</i>
Banking system	98	100.0
Financial administration	85	86.7
Suppliers of goods and services	46	46.9
Employees	13	13.2

The banking system plays a significant role in drawing the recovery process to a successful conclusion. Certainly, the banking sector very often supports the recovery of the firm insofar as it is more resistant to the effects of delayed or written-off payments on its own borrowings. Companies of the sample often ask banks to accept payment subsequent to that of the suppliers of goods and services – considered strategic for the continuance of the activity – and it is also common for banks to receive requests for more loans to repay suppliers.

The interaction with the suppliers of goods and services is common when the trade payables are concentrated in a reduced number of significant unit amounts. Employees are also involved in the recovery process: this interaction is assisted by the intervention of trade unions on behalf of those most affected by the stakeholders.

The sample shows the presence of a high number of banks involved in recovery projects. In 35 of the cases, more than 10 credit institutions (35.7%) are identified; in 58 cases between 5 and 10 institutions (59.2%); in 5 cases fewer than 5 institutions (5.1%) (see Table XIX).

Table XIX – Number of involved banks

	<i>No.</i>	<i>%</i>
Fewer than 5 banking institutions	5	5.1
Between 5 and 10 banking institutions	58	59.2
Over 10 banking institutions	35	35.7
Total	98	100.0

As the sample shows, Italian companies' work with a higher number of banks per company, compared with others in Europe, reducing the level of the bank's knowledge of each company. The degree of complexity of the recovery project is influenced by the number of credit institutions involved: the projects that involve a limited number of banks are more straightforward compared with those in which a large number of banks are involved. For cases in which the number of institutions involved was more than 10, the project is assisted by different agreements with different banks.

In 78 of the cases (79.6%), a single agreement with several banks has been formulated, while in 20 of the cases (20.4%) it was observed that different agreements were made with some banks. Of these last cases, 15 of them (25.0%) envisaged sharing the agreements with other institutions with regard to the rescheduling of debts with the commitment not to undertake banking actions of recovery; in 5 of the cases were foreseen ways for resolving the situation, differing from those agreed with the other banks (see Table XX).

Table XX – The agreements with the banking system

	<i>No.</i>	<i>%</i>
Single agreement with banks	78	79.6
Different agreements with banks	20	20.4
Of which:		
Commitment to not taking recovery actions	15	75.0
Specific repayment plans	5	25.0
Total	98	100.0

It means that, according to the banking system, which represents the most influential actor in delivering a successful the recovery project, the majority of the companies of the sample made a single agreement (79.6%): different agreements with banks would create tensions between companies and banks due to the special treatment of some banks.

Companies appear to have interacted with the banks before the recovery process began, also due to the substantial investments over the last few years in the creation of divisions dedicated to dealing with companies in crisis. Through a plenary meeting, the company presents and negotiates the conditions of the agreements with all the banks.

The granting of new financial resources is influenced by the communication process between company and stakeholders. Indeed, one of the most delicate aspects of the projects analysed was the availability of agreements for new funding. In the sample, this provision is observed in 18 of the cases (18.4%). In the remaining cases, credit lines are confirmed by the banking system on the date the recovery project was agreed (see Table XXI).

Table XXI –Granting new financial resources

	No.	%
Yes	18	18.4
No	80	81.6
Total	98	100.0

The fact that a reduced number of cases are characterized by the provision of financial resources is definitely influenced by the absence of a specific Italian law protecting banks or other lenders involved in the project, who have taken the decision to increase their exposure with companies in crisis. Such a situation, at least from a legal point of view, is prevented by the Law n. 78/2010: art. 182-quarter Bankruptcy Law has made possible the deducibility of the borrowings granted by the banks used by the company in the formalization or the execution of the recovery project (made up in accordance with the agreement of debt settlement or the arrangement with creditors).

In accordance with *RQ2*, the company has to adopt different behaviour depending on the type of stakeholders (banks, suppliers, employees). The probability of acceptance of the recovery strategy by stakeholders depends on the ability of the company and the experience and reputation of its advisors to prepare a reliable and reasonable recovery project, communicating it in a comprehensible way. In evaluating the proposed recovery project by the stakeholders, both objective (deferred payments of overdue debts or partial write-off) and subjective elements (differentiation of the proposal according to the individual stakeholders or proposition of the same offer to all parties) are considered. Therefore, *H2* is confirmed.

As earlier literature affirms (Reilly and Di Angelo, 1990; Coda, 1991; Graham *et al.*, 2005; Argenti and Barnes, 2009; Netten and Van Someren, 2011), effective communication with the stakeholders could increase the company's credibility, influencing the provisioning of resources and the levels of trust towards the company. This communication process also includes the recovery project, as it concerns a delicate circumstance involving stakeholders'

interests (Foster, 1986; Ingram *et al.*, 2002; Meigs *et al.*, 2001). Due to the fact that every kind of stakeholder has been involved in the recovery process, the company has to adopt a transparency and shared communicational approach towards stakeholders.

5. CONCLUSIONS, IMPLICATIONS AND LIMITATIONS

The crisis phenomenon is a very frequent occurrence in the lifecycle of a company. A sort of “normalization” of the crisis situation is commonplace, forcing the company into a new mindset for the foretelling and management of a crisis situation.

The recovery project is the tool by which a company can return to a state of development in a systematic way. This research has developed a model recovery project, subject to any amendments and additions particular to each individual business’s needs. The recovery project is composed of two main parts in the majority of cases analysed (86.7%):

- The recovery plan: this is the most delicate part of the recovery project, as it explains some important factors that influence the success of the recovery process, such as the presentation of the company, the causes of the crisis (both found in all of the recovery projects from the sample (100.0%)), details of the initial economic and financial situation before recovery process (which was found in the majority of the cases from the sample (91.8%)), the recovery strategy (100.0%) and the policy of negotiation with stakeholders (91.8%). The recovery plan contains both quantitative and qualitative information.

- The economic-financial plan: this allows the parties involved to understand the effects of recovery strategy on the economic and financial situation of the company and its attitude towards overcoming the crisis. It contains both quantitative and qualitative information, but mostly the former. In particular, it contains documents concerning the economic and financial situation of the company, including prospective balance sheets (100.0%); prospective income statements (100.0%); prospective cash flow statements (91.8%).

According to the composition of the recovery project, it has to be an inclusive document, including both a qualitative and quantitative component on the crisis phenomenon. The proposed recovery project model effectively details the starting position of the company in crisis, the causes of the crisis, the recovery strategy and its effects on the economic and financial situation.

The company has to reach a consensus with stakeholders on the aims and actions contained within the recovery project, which are also influenced by the agreements proposed by the company to different categories of stakeholders. In particular, it emerged that the

companies of the sample proposed differentiated agreements with stakeholders in the majority of the cases (73.5%). Banks represent a privileged stakeholder, for which companies of the sample created a single agreement for all banks involved (79.6%) in order to avoid creating tension between banks.

The success of the recovery process depends on the ability of the company and its advisors to obtain an agreement with the banks, without which the recovery cannot be completed. In addition, other creditors are involved to varying degrees, such as tax administrators, supplier of goods and services and employees.

With the intention of increasing the company's credibility, the recovery project is an instrument of communication with stakeholders. Due to the strong dependence by third parties, stakeholders' dwindling confidence towards the company and the need for business continuity, the company has to effectively communicate the recovery process in order to succeed. The purpose is to regain the respect of its stakeholders and generate commitment from all parties on the recovery strategy, even adopting different behaviours with each type of stakeholder.

The implications of this research concern the above conclusions. All companies, whether the weakest or the strongest, have to consider themselves as being vulnerable to a potential crisis. Companies have to adopt a systematic approach to the problem, which makes use of standardised tools, such as the recovery project. As there isn't a reference model for the preparation of the recovery plan, the absence of generally accepted principles can generate some difficulties in recovery planning for companies and its consultants. A model recovery project may help several actors in the recovery process to interact with stakeholders, to communicate the company strategy to them with the purpose of finding a means to uphold business continuity.

A way of overcoming the limitations of the research would be to differentiate the companies' behaviour during the recovery process according to whether or not the companies are listed and to the amount of restructured debt involved. Indeed, these factors may generate several different attitudes towards overcoming the crisis situation, thus developing different behaviours worthy of study.

First of all, it has been supposed that the crisis is affecting unlisted companies more intensely than listed. Indeed, the culture of listed companies is more oriented towards disclosure: usually, listed companies report in advance the crisis phenomenon and its warning signs, before the company faces hard financial challenges. On the other hand, the unlisted companies tend to underestimate the effects of the crisis and postpone remedial

action until the time of maximum financial stress. This aspect might merit further study.

In addition, a further analysis may be conducted distinguishing the company's recovery behaviour with respect to the amount of debt rescheduled. Our hypothesis, which we will take on for the next stage of our research, is that this behaviour can manifest peculiarities in relation to the amount of outstanding debt, which is influenced by the number of stakeholders involved.

ABSTRACT

The purpose of this study is to establish and empirically validate an integrated model identifying the causal relationships among service fairness, service quality and relationship quality and their joint effects on customer loyalty. The findings of the empirical study, based on data collected from the automobile after-sales service industry, largely support the hypothesized relationships proposed in the theoretical model. More specifically, they show that relationship quality measured as a higher-order construct reflecting supplier-customer relationship level in terms of satisfaction, trust and commitment is the main determinant of customer loyalty. Furthermore, it partially and fully mediates the relationships between service fairness and service quality with customer loyalty respectively. Thus, service quality and service fairness influence loyalty indirectly by strengthening the supplier-customer relationship quality, which was proved to be a better predictor of customers' attitude and behavior. Managerial implications of the findings are discussed and directions for further research are provided.

Keywords: Relationship marketing, Service fairness, Service quality, Relationship quality, Customer loyalty, Higher-order constructs, PLS-PM, Automobile after-sales services

INTRODUCTION

A great deal of research exists on the interactions among the service evaluation constructs as well as their correlations with relationship quality and customer loyalty. However, an integrative model of these concepts has not been tested before. This study draws on three theoretical streams: the service fairness theory, the service quality theory and the relationship quality theory to predict customers' loyalty in services. Fairness theory explains how customers' fair treatment is linked to service quality and various attitudinal outcomes, such

as relationship quality, while the literature concerning relationship quality explains how the service delivery process works. Service fairness and service quality are considered as the foundations of establishing healthy bonds between customers and suppliers, which in lead to long-term customer relationships. Finally, relationship quality theory relates its dimensions with customer loyalty. The purpose of this study is to establish and empirically validate an integrated model that identifies the causal relationships among service fairness, service quality and relationship quality and their joint effects on customer loyalty. The paper is structured as follows. The next section reviews the literature and develops hypotheses. It is followed by sections devoted to methodology analysis, discussion of findings, implications and, last but not least, limitations and suggestions for further research.

LITERATURE REVIEW AND HYPOTHESES DEVELOPMENT

In this section the concepts of service fairness, service quality, relationship quality, and customer loyalty are analyzed and the interrelations among them are discussed.

Service Fairness

The concept of fairness is rooted in the theory of justice, which is in turn is adapted from equity theory (Adams, 1965), suggesting that over-rewarded and under-rewarded relationship outcomes cause distress that people strive to reduce. Individuals are seeking a fair input/output balance and become satisfied whenever they feel their inputs are fairly rewarded. Perception of unfairness can lead to distress and dissatisfaction. In contrast, perception of fairness results in positive emotions and satisfaction (Patterson et al., 1997; Szymanski and Henard, 2001).

Service fairness (SF) or justice is understood across three dimensions: distributive, procedural and interactional fairness (Friman et al., 2002; Meng and Elliot, 2008; Clark et al., 2009; Ha and Jang, 2009; Yen et al., 2010). Distributive fairness (DF) involves price in relation to the outcomes of the service delivered and reflects customers' perceptions of the benefits and costs balance among parties. Procedural fairness (PF) is about exchange relationships and is associated with the elements of impartiality, refutability, explanation and familiarity of service personnel. Last but not least, interactional fairness (IF) deals with the fairness of interpersonal treatment and refers to: a) courtesy, respect and consideration shown by service representatives during the transaction and b) the extent and quality of mutual communication.

Several recent studies consider the relationship between customers and service providers on the grounds of the service fairness notion (Han et al., 2008; Ting, 2011; Chen et al., 2012; Zhu and Chen, 2012). Most, investigate individually the effects of each fairness dimension on other constructs such as satisfaction, service quality etc. or consider service fairness as a reflective higher-order construct having the three aspects of fairness as its sub-dimensions. Lately, Chiu et al. (2010) proved that service fairness is better represented as a higher-order construct having the three dimensions of fairness as first-order formative constructs. Given that the latter do not necessarily correlate, the elimination of any fairness dimension may alter the conceptual domain of the overall construct (MacKenzie et al., 2005). The current study, drawing upon Chiu et al. (2010), considers service fairness as a higher-order formative construct that is assessed by the summative effect of its distributional, procedural and interactional elements.

Service Quality

Service quality (SQ) is a fundamental concept of services marketing representing along with perceived service value the factors that are used by customers to evaluate their service providers (Cronin et al., 2000; Brady et al., 2005). Consensus has been reached on that perceived SQ is an attitude or global judgment about the superiority or inferiority of a service (Grönroos, 1984; Parasuraman et al., 1998; Cronin and Taylor, 1992; Teas, 1993). Berry et al. (1988) maintain that SQ is a great differentiator and the most powerful competitive weapon of service organizations.

Grönroos (1984, p. 38) defines SQ as a perceived judgment, resulting from an evaluation process where customers compare their expectations with the service they perceive to have received. Later, Parasuraman et al. (1988, p. 17), defined SQ as *“the degree of discrepancy between customers’ normative expectations for the service and their perceptions of the service performance”*. They also argue that perceived SQ is interpreted across five dimensions: reliability, assurance, tangibility, empathy and responsiveness.

Many previous studies have identified a relationship between SF and SQ (Carr, 2007; Aurier and Siadou-Martin, 2007; Han et al., 2008; Kwortnik and Han, 2011). Carr (2007) argues that customers are considering the level of SF, when they evaluate the SQ of their service providers, in their effort to achieve a balanced level of service which in turn will increase perceived levels of SQ. As a result the following hypothesis is formulated:

H₁: Service fairness positively affects perceived service quality

Relationship Quality

Relationship quality (RQ) refers to customers' perceptions of how well a relationship fulfils customers' expectations, predictions, goals and desires (Jarvelin and Lehtinen, 1996). Hennig-Thurau and Klee (1997, p. 751) postulate that RQ is *"the degree of appropriateness of the relationship to fulfil the needs of the customer associated with the relationship"*. Although, there is no clear consensus regarding the dimensions comprising the construct (Hennig-Thurau et al., 2002; Athanasopoulou, 2009), most researchers converge on the idea that relationship quality is a higher-order construct made of several distinct, though related dimensions (Dwyer and Oh, 1987; Crosby et al., 1990; Kumar et al., 1995; Gummesson, 2002; Roberts et al., 2003; Woo and Ennew, 2004). The three most common such dimensions are customer satisfaction (CS), trust (TR) and commitment (COM) (Athanasopoulou, 2009). In services, Crosby et al. (1990) first conceptualised customer-salesperson RQ through TR and CS. Later attempts of research on RQ conceptualization added COM to the bundle of the concepts dimensions (Friman et al., 2002; Hennig-Thurau et al., 2002; Kim and Cha, 2002; Bennett and Barkensjo 2005; Farrelly and Quester, 2005; Huntley 2006). In the retail market, various studies seem also to converge on the notion that the dimensions of retail RQ include CS, TR, and COM (De Wulf et al., 2001; Moliner et al., 2007; De Cannière et al., 2009; Qin et al., 2009). However, other researchers split COM in its affective and calculative facets (Vesel and Zabkar, 2010). Affective commitment (AC) refers to a customers' free will to maintain the relationship with the firm that they do business with (Vesel and Zabkar, 2010), while calculative commitment (CC) is the state of attachment to a partner in recognition of the sacrificed benefits and losses incurred if the relationship ends (Geyskens et al., 1996), suggesting a rational, in financial terms weighing up (Pritchard et al., 1999). Following the studies of Vesel and Zabkar (2010) and Hennig-Thurau et al., 2002, the current study views RQ as a reflective higher-order construct having CS, TR, AC and CC as its first-order dimensions.

Research has shown that the perception of relationship fairness enhance RQ (Kumar et al., 1995). Nguyen and Mutum (2012, p. 408) argues that *"It is, in particular, important to develop processes and procedures which the other member of the relationship judges as being fair, in order to sustain the relationship"*. Based on that, it is posited that:

H₂: Service fairness positively affects relationship quality

RQ is also strongly linked to SQ in various studies (Wong and Sohal, 2002; Roberts et al., 2003; Venetis and Ghauri, 2004; Carr, 2006, 2007; Shabbir et al., 2007; Liu et al., 2011; Ou et al., 2011). SQ is a recognised antecedent of CS (Herington and Weaven, 2009; Hu et al., 2009;

Jamal and Anastasiadou, 2009), which is one of the main dimensions of RQ. Caceres and Paparoidamis (2007) and Hsieh and Hiang (2004) indicated that improved customers' perceptions of SQ will influence aspects of RQ such as CS and TR, while Fullerton, (2005) validated the link between SQ and both dimensions of commitment. As a result, the following hypothesis can be postulated:

H₃: Service quality positively affects relationship quality

Customer Loyalty

Customer loyalty (CL) is the most important goal of relationship marketing given that results in increased profits, better acquisition rates from positive WOM, and reduced acquisition and retention costs (Zeithaml et al., 1996). Oliver (1997, p.392) defined CL as a “*deeply held commitment to rebuy or repatronize a preferred product or service consistently in the future, thereby causing repetitive same-brand or same brand-set purchasing, despite situational influences and marketing efforts having the potential to cause switching behavior*”. According to Chu (2009), CL is a positive attitude and behavior related to the level of re-purchasing commitment to a brand in the future and as such a composite approach to loyalty is most appropriate. This study treats CL as a second-order reflective bi-dimensional construct having its attitudinal and behavioral aspects as sub-dimensions (Kwortnik and Han, 2011; Karjaluo et al., 2012)

A number of studies have investigated the linkages between SF and CL (Carr, 2007; Ha and Jang 2009) and SQ and CL (Roberts et al., 2003; Fullerton, 2005; Carr, 2007; Chao, 2008). Carr (2007) argues that when a customer feels that service provider's operational strategy is to provide unbiased services then he/she will feel greater levels of loyalty and repatronage intentions. Based on that the following hypothesis is outlined below:

H₄: Service fairness positively affects customer loyalty

Building relationships with customers is a good way towards retaining customers loyal in the long-run (Sheaves and Barnes, 1996). To further reinforce this posture, a study conducted by Barnes (1997) suggested that it is unlikely for customers to be retained for long unless a genuine provider-customer relationship is present. Except of those studies which validated the direct links between RQ's dimensions and CL separately (Bettencourt, 1997; Garbarino and Johnson, 1999; Fullerton, 2005; Han et al., 2008; Deng et al., 2009; Sanchez-Franko et al., 2009). Hennig-Thurau and Klee (1997), Roberts et al. (2003) and Keating et al. (2011) have empirically validated the link between RQ represented as a higher-order construct composed by CS, TR, and COM and CL. Based on these findings the following hypothesis is posited:

H5: Relationship quality positively affects customer loyalty

The literature reports that SQ also has a well-established direct or indirect influence on CL (Zeithaml et al., 1996; Roberts et al., 2003; Fullerton, 2005; Carr, 2007; Chao, 2008). Fullerton (2005) found that both AC and CC partially mediates the relationship between SQ and CL in the retailing services setting, Keating et al. (2011) validated a direct link between SQ and CL in internet banking services except of the indirect one through RQ. Accordingly, the following hypothesis is advanced

H6: Service quality positively affects customer loyalty

Based on the review of the aforementioned studies, a model describing the proposed relationships among the nine constructs is shown in Figure 1.

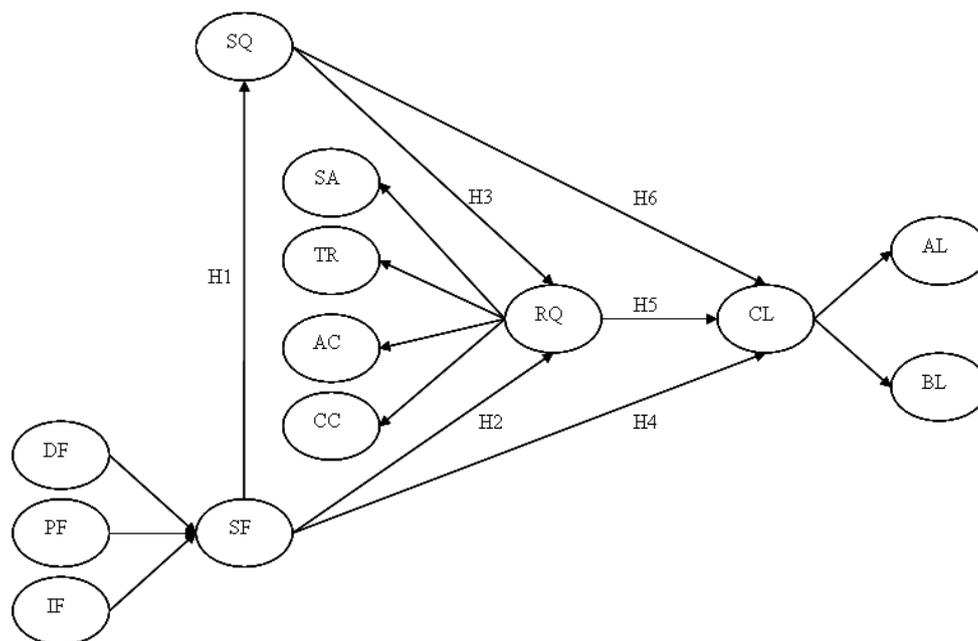

Figure 1: Proposed Model

RESEARCH METHODOLOGY

The model was tested on evidence from the auto repair and maintenance industry. The particular service is selected for the following reasons. First, these services are crucial for manufacturers' future growth since brand repurchasing rates largely depend on customers' after sales experiences (Little, 2009). Second, due to the recession that many European countries are currently experiencing, high revenues from new sales cannot be easily achieved.

According to a report prepared by Little (2008), the after sales industry, which has been long neglected by automotive manufacturers in their business strategies, achieves a significantly higher ROI than new car sales. In Germany, for example, the after sales business generates more than half of profits while accounting for only 23% of revenues. Third, currently potential new private car buyers postpone or cancel buying a new car due to recession. This leads to an increasing average fleet age, where older cars demand more service, thus, creating a profitable market for after-sales service offerings.

Sample Profile and Data Collection

In this study, prospective respondents were drawn from the customer base of a major European automotive distributor in Greece owning three service facilities in different areas of the Attica basin. A random sample of 1,000 active customers was drawn with no discrimination requirements. The fieldwork was conducted in September 2012 by four trained senior students over the phone. Prospective respondents were told that the survey was conducted on behalf of their after-sales service supplier. Contacts were made at different times of the day and days of the week in order for date and time related bias to be reduced. The procedure resulted in 420 filled questionnaires. After eliminating those with unanswered items, 408 usable questionnaires were coded for data analysis, yielding a net response rate of about 41%. Among the 408 respondents, 61% were males and 65% married. In relation to age, 12% of respondents were in the 18-24 age-group; 22% were in the 25-34 age-group; 26% were in the 35-44 age-group; 25% were in the 45-54 age-group, and 15% were older than 55. In terms of monthly income, 40% of respondents had a net income of less than € 1,000; 41% between € 1,000 and € 1,500; 15% between € 1,500, and € 2,000, and 4% more than € 2,000. Also, 40% of respondents had a university degree; 14% had some college education; 11% were university students, and 35% had a secondary school education. The sample included customers from different areas of the Attica region, 27% living in the southern part, 27% in the western part, 18% in the northern part and 9% in the eastern part. Finally, the median age of the respondents' cars was 5 years old.

Measures and Survey Instrument Design

The questionnaire was designed with measures of the relevant constructs based on scales published in the literature. With the exception of the SQ items (measured with semantic differential scales), items were measured on 7-point Likert scales anchored at 1 (strongly disagree) and 7 (strongly agree). Four items were used to measure AL based on the work of

Harris and Good (2004) reflecting the cognitive; affective, and conative aspects of Oliver's (1997, 1999) four-step loyalty framework. To measure BL, the four-item scale developed by De Wulf et al. (2001); Oliver (1997), and Zeithaml et al. (1996) was utilized. The 5-item scales, included into Han et al.'s (2008) study, were used to measure AC and CC. Items measuring CS and TR were derived from the studies undertaken by Fornell (1992) and McKnight et al. (1998) respectively. The seven items used to measure SQ were based on the study of Parasuraman et al. (1988). Finally, the three subdimensions of SF were measured using the scales provided by Han et al. (2008).

EMPIRICAL RESULTS

Measurement Model Assessment – First Order Constructs

The method of partial least squares path methodology (PLS-PM), an implementation of structural equation modeling (SEM) with Smart PLS 2.0 M3 (Ringle et al., 2005), was employed to examine the model and test the proposed hypotheses. The selection of PLS-PM was based on criteria as outlined in the work of Hair et al. (2011) such as the complexity of the proposed model and the inclusion of reflective and especially formative higher-order constructs.

The initial analysis is concerned with the measurement model adequacy assessment. The test of the measurement model involves the estimation of convergent validity, internal consistency reliability, and discriminant validity of the study's first-order reflective constructs, which indicate the strength of measures used to test the proposed model (Hair et al., 2011). Convergent validity is suggested if loadings are greater than 0.7 on its respective factor, which implies more shared variance between the construct and its measures than the error variance (Carmines and Zeller, 1979) and . In the initial run of PLS-PM, where all available measured items were included, five items (2 items for the PF and DF scales, 1 item from the IF scale and 1 item from the SQ scale) presented factor loadings less than 0.6 and for that reason were eliminated. The factor loadings of the non-eliminated items, as shown in Table 1, exceed 0.725 providing strong convergent validity. Then the reliability of all latent constructs was examined using the measures of Cronbach's Alpha (CA) and Composite Reliability (CR) (Fornell and Larcker, 1981). Hair et al. (1998) suggest that a value of 0.7 provide adequate evidence for internal consistency.

Table 2: Correlations of latent constructs

As shown in Table 1, CA and CR of all reflective measures included in the study exceed 0.7, suggesting that all items are good indicators of their respective components.

Discriminant validity was assessed in two ways. First, the Average Variance Extracted (AVE), which indicates the amount of variance that is captured by the construct in relation to the variance due to measurement error, is examined. Second, the square root of AVE extracted from each construct, is compared with the correlations among constructs. The initial run of PLS revealed that, similar to Vesel and Zackbar (2010) and De Cannière et al.'s (2009) study, CS and TR are not distinct from one another and are thus combined to form a satisfaction/trust factor (CS.TR). The findings of the new run of PLS provided strong evidence of discriminant validity among first order constructs because, as shown in Table 1, all AVE values are greater than 0.73 which in turn exceeds the recommended cutoff value of 0.5 (Barclay et al., 1995), and as shown in Table 2, the square root of AVE for all first-order constructs is higher than their shared variances.

Measurement Model Assessment – Second-Order Constructs

Second-order factors can be approximated using two approaches. One commonly-used approach is the repeated indicator approach (Lohmöller, 1989) where the second-order factor is directly measured by using items of all its lower-order factors. The procedure performs better when the lower-order constructs have about equal number of items. As stated previously, RQ and CL are modeled as second-order reflective constructs. In Table 3, the CR and AVE measures of both higher-order constructs are provided. CR and AVE for RQ equals to 0.972 and 0.676 respectively and for CL equals to 0.942 and 0.673 respectively, which are well above the recommended thresholds of 0.7 and 0.5 respectively, providing evidence of reliable second-order constructs (Wetzels et al., 2009). Finally all loadings of the second-order constructs on the first-order constructs exceed 0.885 and are significant at $p=0.01$. All of the

above support the proposed conceptualization of RQ and CL that they are reflecting customers' perception of their pre-specified sub-dimensions, namely SA.TR, AC, CC and AL, and BL respectively.

A. RELATIONSHIP QUALITY (CR = 0.972 AVE = 0.676)				
1st-Order Construct	Loadings	t-stat	95% Confidence Interval	R ²
CS.TR	0.950	57.931	[0.918, 0.973]	0.902
AC	0.914	42.979	[0.881, 0.959]	0.835
CC	0.885	36.298	[0.796, 0.941]	0.783
B. CUSTOMER LOYALTY (CR = 0.942 AVE = 0.673)				
1st-Order Construct	Loadings	t-stat	95% Confidence Interval	R ²
AL	0.935	50.484	[0.899, 0.967]	0.874
BL	0.930	48.227	[0.873, 0.961]	0.864

Table 3: Second-order reflective constructs assessment

Furthermore, the SF construct is modeled as a formative second-order construct. According to Tenenhaus et al. (2005), PLS-PM, as in the case of reflective higher-order constructs, can also be used for hierarchical models with formative constructs, by reversing the direction of the relationships between the higher and the lower-order constructs. However, this will result in a R² value for the higher order construct of unity. The measurement quality of the formative second-order factors was tested following the suggestions by Chin (1998) and Diamantopoulos and Winklhofer (2001). First, the correlations among the first-order constructs were examined. As shown in Table 4, the absolute correlations among the three first-order SF related dimensions vary from 0.731 to 0.765 with an average of 0.75. Though the correlations between first-order constructs of SF are relatively high, this result suggests that SF is better represented as a formative second-order construct, instead of reflective, since reflective second-order constructs would show extremely high correlations (≥ 0.8) among its first-order factors (Pavlou and El Sawy, 2006).

The strength of the relationship between second-order constructs and their first-order dimensions is subsequently assessed. As shown in Table 5, all first-order fairness-related components were found to have significant path coefficients in forming the customer perception about SF. Results suggest that among the factors forming fairness perception, IF is the most important followed by PF and DF. This result is similar with those of Chiu et al. (2010) in the online auctions service setting and can be attributed to the credence nature of the service under investigation. The variance inflation factors (VIF) were then computed for these

first-order justice factors to assess multicollinearity (see Table 4 for VIF values). VIF values above 10 would suggest the existence of excessive multicollinearity and raise doubts about the validity of the formative measurement (Diamantopoulos and Winklhofer, 2001). The VIF values for the first-order justice-related factors varied from 2.709 to 3.028. Therefore, multicollinearity is not a concern for the Service Fairness construct.

SERVICE FAIRNESS					
1st-Order Construct	Coefficient Value	t-stat	95% Confidence Interval	R ²	VIF
IF	0.427	1,533.148	[0.386, 0.459]		2.771
PF	0.337	1,156.184	[0.309, 0.373]	1.000	3.028
DF	0.331	1,200.919	[0.306, 0.366]		2.709

Table 4: Second-order formative construct assessment

Assessment of the structural model and hypotheses testing

The PLS-PM method was also used to confirm the hypothesized relations between constructs in the proposed model. The significance of the paths included into the proposed model was tested using a bootstrap resample procedure with 500 runs. In assessing the PLS model, the squared multiple correlations (R²) for each endogenous latent variable were initially examined and the significance of the structural paths was evaluated. The proposed relationships are considered to be supported if the corresponding path coefficients had the proposed sign and were significant. The PLS analysis results are given in Table 5.

DV	IV	Coefficient Value	t-stat	R ²	Hypotheses Test
SQ	SF	0.769	22.983	0.591	H1 confirmed
RQ	SF	0.403	8.810	0.688	H2 confirmed
	SQ	0.479	10.470		H3 confirmed
CL	SF	0.199	4.743	0.784	H4 confirmed
	SQ	0.077	1.764		H5 rejected
	RQ	0.658	15.079		H6 confirmed

Table 5: Estimated results of the structural model and hypotheses tests

SF positively affects SQ as indicated by the value of the relevant coefficient ($\beta = 0.769$; $t = 22.983$) explaining 59.1% of the variance in SQ. Therefore, H₁ is confirmed since it was found to be statistically significant and the relevant path coefficients have the hypothesised signs. As far as the determinants of RQ, both SQ ($\beta = 0.479$; $t = 10.470$) and SF ($\beta = 0.403$; $t = 8.810$)

almost equally affect RQ formation explaining 68.8% of its variance. These findings support the validity of H2 and H3, meaning that if customers perceive that the service provided is of high quality and provided fairly, the quality of their relationship with the provider increases. Finally, the determinants of CL are RQ and SF, explaining 78.4% of the variance in CL. However, RQ present a stronger influence on CL than SF, as indicated by model's coefficients of $\beta = 0.658$ ($t = 15.079$) for RQ and $\beta = 0.199$ ($t = 4.743$) for SF. Therefore, hypotheses H5 and H6 are confirmed. Although it was expected that both SQ will directly affect CL, the findings revealed that the relevant path coefficients ($\beta = 0.077$, $t = 1.764$) is not statistically significant. Thus, H4 was not confirmed, meaning that the relationship between SQ and CL is fully mediated by RQ. Roberts et al. (2003) arrived also at the same result suggesting that "the Relationship Quality scale completely subsumes the effect of the Service Quality scale" (p. 189). However, SQ indirectly affects CL through RQ since the relevant coefficient ($\beta = 0.315$), as shown in Table 7, is statistically significant. Moreover, the indirect effect of SF on CL is statistically significant ($\beta = 0.566$) and about 3 times higher than the relevant direct effect, highlighting the importance of RQ in customers' attitudes and behaviors.

CONCLUSIONS AND IMPLICATIONS

The results of this study present many implications for service managers. First, the fact that interactional fairness is the most important for customers shows that service companies should manage the interaction with customers effectively at every point of contact. For example, in car service providers, there should be enough trained employees at the phone service of the company knowing how to deal with customers and engineers should be trained to deal with customer inquiries and complaints appropriately. Also, all customers should be equally treated because preferential treatment of certain customers can destroy the relationship developed. Second, the previous implication becomes even more important if we consider that the effect of service fairness to perceived SQ is very high. The results also showed that SQ is heavily affected by SF. So, if service providers are successful in providing a fair service, they will also probably be considered as high quality service providers. Thirdly, although there is a direct effect of service fairness to customer loyalty, customer loyalty is mainly affected through relationship quality. As customers stay with the same provider for longer periods, trust and commitment increase and therefore these customers exhibit an intention to stay with the same provider, and a tendency to refer the provider to others. So, if car service providers want to reap the benefits of loyal customers, the key rests in developing strong long-term relationships with customers.

Finally, SQ only affects CL through RQ. This means, that offering a high quality service is not enough to create loyal customers. Only when SQ is coupled by long-term quality relationships do we see signs of CL. This is particularly important in today's competitive environment where many providers offer the same type of service. However, the competitive advantage comes from managing relationships with customers effectively.

LIMITATIONS AND FUTURE RESEARCH DIRECTIONS

This study, despite the significance of its findings, has a number of limitations. A first limitation is the industry-specific sample, which may affect our findings' generalizability. It is necessary to implement the proposed model in different relevant service settings before the interrelationships among service evaluation, relationship quality and customer loyalty are fully clarified. A second limitation pertains to that the findings and implications of this research were obtained using a cross-sectional study. This reduces the ability of the study to reflect the temporal changes in the research constructs. A longitudinal study on the subject is necessary in order to clarify the effects of temporal changes.

As far as future research recommendations are concerned, certain variables could be incorporated into the proposed framework to enhance its predictive performance and to provide better understanding of the customer's decision-making process. For example, a future research effort could consider the role of different type of switching barriers in the relation between relationship quality and customer loyalty. Moreover, future research can replicate this study in different types of services; and across different countries that are characterized by a different culture.

FROM OFFSHORE OUTSOURCING PROVIDER TO OWN BRAND MANUFACTURER: AN EXPLORATORY APPROACH USING RESULTS FROM THE PORTUGUESE FOOTWEAR INDUSTRY

Gomes, Paulo¹; Meneses, Raquel²

Faculty of Economics, University of Porto, Portugal, 110432029@fep.up.pt

Faculty of Economics, University of Porto, Portugal, raquelm@fep.up.pt

ABSTRACT

The transfer of values chain from one country to another has expanded strongly in several countries around the world. Although the existent literature on offshoring is extensive, very little is known about this process from the perspective of the providers. This paper discusses how that process works when offshore outsourcing providers, shift to own brand manufacturers while still remaining engaged in a business relationship with their clients.

This research aims at providing an integrative analysis, through an exploratory approach, based on Systematic Combining, of the connections between knowledge transfer, absorptive capacity and own brand building from the perspective of the providers so as to fill the main gaps in the existing literature on the offshore outsourcing process. A purposive sample was applied and seven Portuguese offshoring providers were interviewed. Afterwards, the data collected was analyzed and coded.

Five core categories and their subcategories emerged: offshore outsourcing relationship, absorptive capacity, catalyst, inhibitors and brand building triggers. This newly found last category, which was not defined in the initial literature, demonstrates specific moments that catapult firms to own brand manufacture and that without them the process would be much slower.

This paper adds value to the existing literature since it contributes to theory building, relating to the providers' own brand building process through offshore outsourcing, including the internal process mechanisms that lead the providers in the pursuit of this given business model.

Keywords: offshoring, offshore outsourcing, providers, clients, absorptive capacity, own brand building

INTRODUCTION

Nowadays offshore production is one of the pillars of globalization due to the central role it plays in global supply chains that serve global markets (Hill, 2007). In fact, numerous enterprises focus on cost-cutting strategies, such as offshoring. Nevertheless, other reasons, such as assessing qualified workforce or improvement of organizational flexibility have been highlighted as key factors affecting offshoring (Lewin and Peeters, 2006).

It is hoped that through this research, a better knowledge of the offshoring process from the perspective of the providers is achieved, given that literature on this topic can scarcely be found (Lahiri *et al.*, 2012). In a word, its purpose is to understand how the providers manage the shift to own brand manufacturers in the course of the offshore outsourcing relationship. Thus, this study aims to fill the gap in literature about this subject. Subsequently, this paper will discuss general concepts, such as absorptive capacity, in order to develop the study. Afterwards, it intends to propose a framework of analysis supported by a sample of Portuguese companies that started as offshoring providers and managed to create their own brand.

The lack of relevant theories on offshore outsourcing with specific focus on the providers influenced the methodology used in this study. Therefore, our methodology will be conducted by an exploratory approach based on Systematic Combining, which aspires to generate theory, rather than the confirmation of an existing one (Dubois and Gadde, 2002).

The Introduction is followed by a literature review on offshoring that analyzes the main points framed in the literature on the providers' side and other important concepts, such as absorptive capacity. After that, the next section addresses the methodological approach applied to this research. The research's findings are then presented. Finally, the main conclusions and limitations of this study are disclosed and directions for future research are given.

LITERATURE REVIEW

Offshore outsourcing occurs when a third-party provider is external and located offshore. This is the concept that we will be focusing on during this research and, according to Manning *et al.* (2011, p. 382), it "means the client companies choose to source functions and process supporting domestic and global operations from outside their home countries, using third-party service providers". The cooperation established between a client and a provider

can benefit both agents and, moreover, offshore outsourcing is a method to achieve external and valuable knowledge (Chen, 2005; Jensen, 2009).

Clients may take some precautions related to knowledge transfer for fear of developing potential competitors (Li *et al.*, 2010). However, clients should transfer necessary know-how for providers in order to qualify them as certified providers (Chen, 2005; Li *et al.*, 2010). Furthermore, the processes are closely monitored and training programs may cover the necessary information for the members to conduct the process efficiently (Vivek *et al.*, 2009). Besides, during the entrepreneurial process, the actors become more interdependent (Vivek *et al.*, 2009), relationships also become more flexible over time and “clients (offshorers) transfer informal ownership of the process to the provider (offshore)” (Vivek *et al.*, 2009, p. 28). In this sense, it can be inferred that throughout these monitoring and training programs, the providers will have access to the client’s know-how and routines and, hence be able to develop their own skills. In addition, by providing technological assistance, training programs and quality control systems, the client contributes to the enhancement of the provider’s quality standards and awareness of the client’s market increases.

Firms’ absorptive capacity

The collaboration with other organizations allows firms to develop their field of action and it can help them to develop new products. However, to successfully obtain new knowledge from other companies, firms must command their ability to find, learn, explore and incorporate external knowledge in the firm’s own operations (Forfás, 2005). This subject of learning has been extensively addressed and studied in the literature on absorptive capacity. According to Cohen and Levinthal (1990) absorptive capacity relates to the company’s ability to identify the value of what is new, external information, and thus assimilate and apply it for commercial purposes. Furthermore, the authors argue that absorptive capacity plays the role of a link between a firm’s intrinsic ability to bring forward newfound products and improve existing ones (Cohen and Levinthal, 1989).

Cohen and Levinthal (1990) support that the companies with advanced prior knowledge, which embodies basic skills, shared language and/or own R&D produces, will be more capable of acquiring and using information from abroad because it will contribute to the recognition of the value of new information, assimilate it and apply it for commercial purposes.

From the perspective of Cohen and Levinthal (1990), absorptive capacity also depends on individual abilities and knowledge of the organizations employees and their absorptive

capacity. Furthermore, studies evidence that when employees are endowed with training and acquire new skills, firms can evolve in their absorptive capacity. Indeed, a positive correlation between the workers' training and organizational performance has been shown by some authors (Koch and McGrath, 1996). According to Lane and Lubatkin (1998, p. 473) "the ability of a firm to learn from another firm is jointly determined by the relative characteristics of the two firms". The authors support that a firm's absorptive capacity depends on the specific knowledge that the partner offers, the similarity between the structure and organizational practices with the business partner and the familiarity that the firm has with the organizational problems of the partner.

Networks also play a significant role in developing the firm's absorptive capacity by conferring skills and processing competences that can promote acquisition, assimilation and exploitation of knowledge to build innovation (Lane and Lubatkin, 1998; Lane *et al.*, 2001; Jansen *et al.*, 2005; Lane, *et al.*, 2006). Moreover, "organizations with higher levels of absorptive capacity will tend to be more proactive, exploiting opportunities present in the environment, independent of current performance" (Cohen and Levinthal, 1990, p. 137).

Cohen and Levinthal (1990) add that absorptive capacity involves three processes, namely acquisition and assimilation of information and, finally, the ability to exploit it. More recently, Zahra and George (2002) refined the concept and classified absorptive capacity into two types: potential absorptive capacity and realized absorptive capacity. In short, whereas potential absorptive capacity is related to the access to information and knowledge, realized absorptive capacity includes processing and incorporation of the gained knowledge in the company's own operations, i.e., realized absorptive capacity focuses on the performance of the firm (Zahra and George, 2002).

Offshore outsourcing

According to Grant's research (1991) on the resource-based theory of competitive advantage, the usual approach to the generation of resources has been on the shortage of firm resources and capabilities. The theorist believes that the firm has to determine whether to develop resources internally or obtain them outwardly. Hence, in order to take the most of the union of resources and capabilities, which belong to the company and to evolve a strategy leading to a competitive edge, it is essential for the enterprise to achieve complementary resources externally, and thus a firm must not be restrained to the exploitation of its own resources and capabilities (Teng *et al.*, 1995). Grant (1991) states that any absence of assets can be settled through purchases or strategic alliances. Therefore the providers can use the relationship with

their clients as a way of complementing their resources and skills by helping to improve their strategy to make good use of their capabilities before the opportunity to have their own brand.

In the same sense, according to Arruñada and Vásquez (2006) a contract manufacturer can use the knowledge acquired throughout the partnership with their clients to benefit its own brand. In fact, some providers have recently started to shift from contract manufacturing to own brand management (Horng and Chen 2008). Burmann and Zeplin (2005) reiterate that firms should focus more on long-term brand building rather than fix their attention on short-term profits since, by building their own brand, providers can not only gain greater profit margins, but also acquire higher market information concerning product design and improvement (Liu *et al.*, 2011).

However, whereas maintaining relationships between a client and a provider has been extensively examined in the literature, the topic of own brand building in contract manufacturers in the course of an offshore relationship has grabbed little attention from business researchers (Chen, 2005), and therefore this issue has, comparatively, been discussed to much lesser extent in existing literature (Liu *et al.*, 2008).

All transferred knowledge through offshore outsourcing can be strategically used by providers to learn and develop their inner skills (Chen, 2005). However, external knowledge is not easily available to use and cannot be merely achieved in the market (Fritsch and Kauffeld-Monz, 2010). Subsequently, much depends on the company's ability to recognize profitable modes of exploring its skills and competences, and to absorb newfound knowledge (Zahra and Hayton, 2008). So, it is very important for the provider that wants to become its own brand manufacturer to evolve its absorptive capacity. Moreover, a higher absorptive capacity and/or efforts to enlarge it can both encourage innovations within a firm, as well as its ability to manage innovation (Cohen and Levinthal, 1990). Further, through the combination of potential and realized absorptive capacity, firms improve their ability to innovate and are able to create new things (Yli-Renko *et al.*, 2001). For instance, firms may evolve their ability to build their own brand. Thus, a key point of numerous enterprises is whether to create their own brand or keep providing foreign brand owners. Liu *et al.* (2011) argue that own brand building is required for the contract manufacturers that have the goal and ability to follow their growth target. So, some factors that determine the adoption of own brand manufacturing should be pointed out as catalysts, on the one hand, and as inhibitors on the other.

Firstly, the current financial crisis and its dissemination to the global economy influenced the demand for foreign markets, which in turn affected contract manufacturing (Haiyan, 2011). Hence, the crisis may be a great opportunity for providers to upgrade to own brand manufacturing and face it as a possible solution. Besides, as contract manufacturers have access to the clients' value resources, such as R&D and marketing, they will be able to develop their own capabilities which they may later use to create their own brand (Arruñada and Vázquez, 2006; Liu *et al.*, 2008). Finally, governmental policies may support firms in improving internal innovative competences and afford activities to develop brands with own intellectual property, which stimulate the providers in moving from subcontracting to own brand manufacturing (Haiyan, 2011).

However, there are some inhibitors which may prevent manufacturers from creating their own brand and remain as providers. Firstly, when international demand is constant, firms prefer to remain as contract manufacturers so as to play it safe (Haiyan, 2011).

A risk of building a new brand occurs when there is a likely reliance on the client for product improvement and advanced technologies which lead the manufacturer to lose its ability to create and maintain a product advantage (Li, 2007; Li *et al.*, 2010). Another risk factor would lie on the additional costs (both financial and time) since own brand manufacturing requires the undertaking of value-adding activities such as design, branding building and strong technological and marketing ability (Haiyan, 2011). This, requires more investments and thus may constrain firms from pursuing own brand building.

Furthermore, efforts to build a new brand could generate conflicts between the contract manufacturer and its buyer. When the providers choose to have their own brand business, which may be quite similar to the clients' product line, they are somehow going against the clients' interests so that their customers may no longer pursue the collaboration with them and thus providers may ruin the relationship and spoil their clients' orders (Liu *et al.*, 2008). Moreover, a potential cannibalization may occur when the providers offer similar products to their clients. An article by Harvey and Kerin (1979) on the diagnosis and management of cannibalization suggests that the great similarity between product characteristics and the absence of perceivable differences in quality attributes by final customers might make the premium product vulnerable or cannibalize the sales in comparison to its cheaper brand substitute (Meredith and Maki, 2001). For this reason, providers may suffer retaliation from their clients due to potential threat of competition, and the latter might also consider ending

any cooperation. Hence, the providers need to evaluate the pros and cons of engaging in own brand building.

Arruñada and Vásquez (2006) argue that when the clients' commercial viability product depends on proprietary technology and processes, they need their providers to know their business well. Thus, clients should assure the providers' competence, currency of knowledge and good faith. Consequently, ethical issues concerning brand building may arise because, when the customers transfer knowledge to the providers, they trust their good faith. So, for this reason and due to ethical matters, the providers may not choose to create their own brand.

Another inhibitor could be the contract established to moderate the entrepreneurial relationship. "When specific assets are transferred to the vendor, there is a high risk of 'hold-up'" (Barthélemy and Quélin, 2006, p. 1779). Thus, to avoid potential opportunism by the providers, clients may resort to many features of the contracts (such as: penalties, incentives and monitoring) to offset opportunism risks and relieve hazards (Barthélemy and Quélin, 2006) and to prevent the providers from using their ownership.

Drawing some conclusions out of offshore outsourcing entrepreneurship, we may argue that there is the transfer of a set of informal ownership from the clients to the providers and the latter can learn from their clients. When the providers develop their absorptive capacity, they can better absorb that external knowledge to use in their own brand. However, whilst several aspects, which have arisen out of literature, might lead the providers to build their own brand (catalysts), there are other factors that hinder firms from pursuing it (inhibitors).

RESEARCH METHOD

Eisenhardt and Graebner (2007, p. 26) state that in cases where "the existing research either does not address the research question at all, or does so in a way that is inadequate or likely to be untrue", one should resort to an approach based on theory building rather than theory testing. The lack of relevant literature influenced the methodology, and therefore, it led us to follow an exploratory approach based on Systematic Combining (Dubois and Gadde, 2002). This kind of approach is more profitable when the researcher's goal is to find out new things. Through this approach, Dubois and Gadde (2002) state that the researcher can expand his understanding of both theory and empirical world by moving from literature, to the data and

back to the field (but not necessarily in this sequence). Therefore, by going “back and forth”, the researcher can validate or refute their emergent conclusions.

Initially, a purposive sampling was used to recruit participants who meet the criteria. In total, seven enterprises were interviewed. This selection aimed to include firms from different sizes and ages. All firms are still providing to international firms, but also producing their own brand, except one firm that ceased its offshore outsourcing activity and now is working solely for its own brand manufacture. This sample falls on companies from the Portuguese footwear industry that began their activity as offshore outsourcing providers and created their own brand in the course of the relationship of offshore outsourcing.

According to Portuguese Footwear, Components, Leather Goods Manufacturers' Association's report (2012), Portugal is among the main European producers of footwear and is also in the midst of the top 10 footwear exporters for each rank of footwear except rubber & plastic and textile. Portugal accounts for 23% of the global leather footwear exports. In 2011, Portugal produced some 61 million pairs of shoes and its footwear exports increased by 21% in value. Its main trading partners are France, Germany, Spain and the Netherlands and the UK. Portuguese companies that, in the past, manufactured largely for other enterprises are manufacturing for their own brands. APICCAPS (2011) shows that between the period of 2002 and 2010 the resorting to trademarks and logos by firms become more intense up until 2008, when it then lessen, even though it is still at higher level than at the beginning of the decade. Therefore, it is necessary to underline that the footwear industry has particular inborn characteristics and singularities in its business environment that make it perfectly suitable for this study. The selection lies in the footwear industry because it would probably afford a valuable insight about this sector. Besides, we only resorted to this sector and origin, i.e., Portuguese nationality, in order to not create noise and to reach uniformity.

Data was collected through face-to-face interviews with the managers of each enterprise and after seven interviews, theoretical saturation was reached, i.e., no new or relevant information emerged. Since the main aim is to expand theory, the interviews included were only open-ended questions and the informants had the opportunity to freely express their experiences, thoughts and interpretations about the topic in their own words.

A literature review was used to loosely frame the research and to build an interview protocol which directed the conversation in such a way as to warrant that all questions were addressed. The interview protocol was composed of questions related to the issue in context, namely what contributed to the company's own brand creation while still providing offshore

outsourcing activities to foreign clients. The interview protocol was evolutionary since the insights of each discussion resulting from an interview were taken into account to the next interview, and so forth. Interviews were audio-recorded and transcribed. Furthermore, alternative sources were used, such as news from the press. Each interview's transcript and news from the press was analyzed and coded by using QSR NVivo10 software.

RESEARCH FINDINGS

Nvivo software allowed us to classify data into nodes that correspond to categories. From the literature review four categories were developed (namely: offshore outsourcing relationship, absorptive capacity, catalysts and inhibitors). During the coding, particular attention was given to new data which had not been previously identified in the literature. After the coding a new category emerged (brand building triggers) and thus, in total, five core categories were settled on (Table 1): offshore outsourcing relationship, absorptive capacity, catalysts, inhibitors and brand building triggers.

A number of subcategories were also found that descend from the main categories. Likewise, in this instance, seven subcategories, which had not yet been referred to in the literature, were found (Table 1 – highlighted cells). Nvivo also allowed us to measure the incidence of each subcategory based on the number of references by the informants (more or less referred). The analysis process engaged in coding the data and searching for features or phenomena that constituted a demonstration of how providers turn into own brand manufactures. The coding brought an expansion of the list reported in the literature. These are important insights because they broaden awareness of the existence of new and important factors which lead firms to move from subcontracting to own brand manufacture and such findings were not previously stressed in the literature. The process was greatly dynamic, since we had to constantly go back and forth to verify the previously identified evidence against the emerging insights.

Categories	Offshore outsourcing relationship	Absorptive capacity	Catalysts	Inhibitors	Brand building triggers
Subcategories	Know-how	Pior knowledge	Know-how gained through the client	Lack of commercial knowledge	Crisis in the sector
	Learning	Qualified workforce	To hold a greater decision-making power	Additional costs	Firm's generational transition
	Training	Networks	Focus on long-term investment	Avoidance of potential conflicts with clients	
	Knowledge	Similarity between the structure and organizational practices of the provider	Client's volatility	Reliance on clients	
	Information		Financial crisis	To play it safe	
			Business expansion	Ethical issues	
			Own brand as major client	Legal contract	
			Governmental policies		
			Globalization

Source: own elaboration

It is necessary to enhance the new category and subcategories that have emerged from the analysis of firms that have created their own brand and those that have already been described in the literature review. Therefore, the following interpretations are given in order to provide a better vision of these new insights. However, a list containing a description of all categories and subcategories can be found in Appendix 1.

To hold a greater decision-making power: with own brand the providers are less dependent on the clients' rules and they could get benefits that only the own brand can offer. Clients' volatility: the providers argued that it is very difficult to foresee the clients' intentions and

foretell the moment when they will decide to no longer work with them in order to work with others. So, to escape from this volatility the providers decided to move to own brand manufacture. Business expansion: after providing for many years, the providers feel that they should expand their business because they are aware that working as providers is very reductive, and they mentioned the model of own brand as good way to reach that expansion. Own brand as major client: a great catalyst pointed out by the firms for creating their own brand is to take their own brand to be the firm's major client. Thus, it may be concluded that this factor is somehow related to others, namely, to have a greater decision-making power and avoid the clients' volatility, because when the own brand constitutes the firm's major client, the providers will have more control over their own business and, subsequently, they will not have to rely on clients' approval so often. Globalization: a few firms mentioned globalization as a motivation to create their own brand since this phenomenon incites firms to internationalize and compete fiercely and globally.

Brand building triggers: this category shows that there are specific moments during the firms' journey that catapult them to own brand manufacture. These triggers come outside the firms' scope and influence their general context. Even though firms had all conditions and catalysts to operate as own brand manufactures, without these triggers the process would be much lengthy. So these triggers precipitate the leap into the own brand building. From this category emerged two subcategories. Crisis in the sector: firms somehow anticipated that they would not go further just by working as contract manufacturers, and that led them to take a risk in their own brand manufacture. Firm's generational transition: the majority of the firms interviewed are composed by the owner's relatives, namely descendants who usually have a different vision and desire a different path. Thus, when this new generation takes the charge, they put into practice a new business model: own brand manufacture.

CONCLUSIONS, LIMITATIONS & FUTURE RESEARCH DIRECTIONS

By a way of conclusion, a framework of analysis is proposed (Figure 1) that integrates the distinct contributions of relevant literature as well as this study's research findings. This framework shows that clients transfer knowledge to their providers who then may use it in their own brand. However, it is very important that firms develop their own absorptive capacity since it allows them to explore and incorporate that external knowledge. Numerous aspects operate as catalysts (know-how gained through the client; to hold a greater decision-making power; focus on long-term investment; client's volatility; financial crisis; business

expansion; own brand as major client; governmental policies and globalization) in firms pursuing brand building, but there are some inhibitors (lack of commercial knowledge; additional costs; avoidance of potential conflicts with clients; reliance on clients; to play it safe; ethical issues and legal contract) that might obstruct firms to follow that path. Finally, brand building is triggered by specific moments during the firms' routines. These triggers come outside the firms' scope and influence their general environment. Without these triggers the process would be much lengthier. Thus, they precipitate the own brand building process.

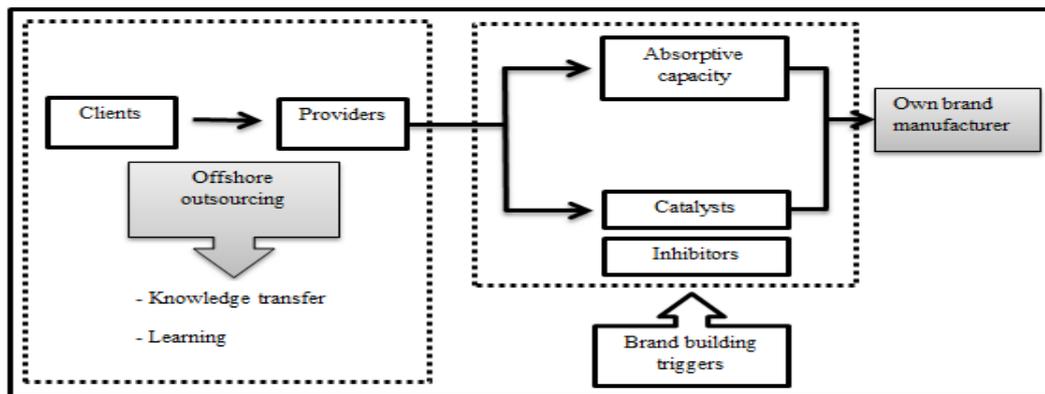

Figure 1. Providers' own brand building process

Source: own elaboration

The generic limitation of small sample subsists here. However, the strategy for case choice aimed to address this limitation. Moreover, qualitative research does not present much scope and potential as a qualitative research but it allows access to subtleties (Rosen, 1991) which enrich the theoretical field.

Some further research may be unlocked by studying different offshoring providers in Portugal among other industries, such as the traditional industries. The process could be reprised by conducting an exploratory approach in order to bring forward new results. Furthermore, another possible future research topic is the study of this process and comparing it to a sample of offshoring providers sharing the same macro-environment where own brand has not yet been created. In the course of this study, it has been noticed that most firms began by selling their own brand products across borders. Therefore, a new avenue for future research is the study of that action's influence on the firms' internationalization process.

Appendix 1. List of categories and subcategories with descriptions

		Support from the literature/Description	Reference
Category	Offshore outsourcing relationship	<p>It shows what clients transferred to providers during their relationship and, thus, what the providers gained with that relationship.</p> <p>The cooperation established between a client and a provider can benefit both agents and, moreover, offshore outsourcing is a method to achieve external and valuable knowledge</p>	Chen (2005); Jensen (2009)
Subcategories	Know-how Learning Training Knowledge Information	<p>Clients should transfer necessary know-how for providers in order to qualify them as certified providers</p> <p>The processes are closely monitored and training programs may cover the necessary information for the members to conduct the process efficiently</p> <p>During the entrepreneurial process, the actors become more interdependent relationships also become more flexible over time and “clients (offshorers) transfer informal ownership of the process to the provider (offshore)”</p>	Chen (2005); Li <i>et al.</i> , (2010) Vivek <i>et al.</i> (2009) Vivek <i>et al.</i> (2009, p. 28)
Category	Absorptive capacity	<p>To successfully obtain new knowledge from other companies, firms must command their ability to find, access, explore and incorporate external knowledge in the firm’s own operations.</p> <p>Absorptive capacity plays the role of a link between a firm’s intrinsic ability to bring forward newfound products and improve existing ones.</p> <p>All transferred knowledge through offshore outsourcing can be strategically used by providers to learn and develop their inner skills.</p> <p>Much depends on the company’s ability to recognize profitable modes of exploring its skills and absorb newfound knowledge.</p>	Forfás (2005) Cohen and Levinthal, (1989) Chen (2005)
Subcategories	Prior	Companies with advanced prior	Cohen and

	knowledge	knowledge, which embodies basic skills, shared language and/or own R&D produces, will be more capable of acquiring and using information from abroad because it will contribute to the recognition of the value of new information, assimilate it and apply it for commercial purposes.	Levinthal (1990)
	Qualified workforce	Absorptive capacity also depends on individual abilities and knowledge of the organizations employees and their absorptive capacity. Furthermore, studies evidence that when employees are endowed with training and acquire new skills, firms can evolve in their absorptive capacity.	Cohen and Levinthal (1990)
	Networks	Networks also play a significant role in developing the firm's absorptive capacity by conferring skills and processing competences that can promote acquisition, assimilation and exploitation of knowledge to build innovation.	Lane and Lubatkin, (1998); Lane <i>et al.</i> (2001); Jansen <i>et al.</i> (2005); Lane <i>et al.</i> (2006).
	Similarity between the structure and organizational practices of the provider	"The ability of a firm to learn from another firm is jointly determined by the relative characteristics of the two firms".	Lane and Lubatkin (1998, p. 473)

Category	Catalysts	It concerns the factors which foster companies to moving from contact manufacturing to own brand manufacture. Own brand building is required for the contract manufacturers that have the goal and ability to follow their growth target.	Liu <i>et al.</i> (2011)
Subcategories	Know-how gained through the client	As contract manufacturers have access to the clients' value resources, such as R&D and marketing, they will be able to develop their own capabilities which they may later use to create their own brand.	Arruñada and Vázquez (2006); Liu <i>et al.</i> (2008)
	To hold a greater decision-making	With own brand the providers are less dependent on the clients' rules and they could get benefits that only the own brand can offer.	Authors' insight

	power		
	Focus on long-term investment	Firms should focus more on long-term brand building rather than fix their attention on short-term profits.	Burmann and Zeplin (2005)
	Client's volatility	The providers argued that it is very difficult to foresee the clients' intentions and foretell the moment when they will decide to no longer work with them in order to work with others. So, to escape from this volatility the providers decide to move to own brand manufacturing.	Authors' insight
	Financial crisis	The current financial crisis and its dissemination to the global economy influenced the demand for foreign markets, which in turn affected contract manufacturing.	Haiyan (2011)
	Business expansion	After providing for many years, the providers feel that they should expand their business because they are aware that working as providers is very reductive, and they mentioned the model of own brand as a good way to reach that expansion.	Authors' insight
	Own brand as major client	It may be concluded that this factor is somehow related to others, namely, to have a greater decision-making power and avoid the clients' volatility, because when the own brand constitutes the firm's major client, the providers will have more control over their own business and, subsequently, they will not have to rely on clients' approval so often.	Authors' insight
	Governmental policies	Governmental policies may support firms in improving internal innovative competences and afford activities to develop brands with own intellectual property, which stimulate the providers in moving from subcontracting to own brand manufacturing.	Haiyan (2011)
	Globalization	A few firms mentioned globalization as a motivation to create their own brand since this phenomenon incites firms to internationalize and compete globally.	Author's insight

Category	Inhibitors	Factors that led firms thought to be inhibitors when deciding to start the own brand model. There are some factors which may prevent manufacturers from creating their own brand and remain as providers.	Haiyan (2011)
Subcategories	Lack of commercial knowledge	Own brand manufacturing requires the undertaking of value-adding activities such as design, branding building and strong technological and marketing ability. Firms possess the industrial know-how, but they do not have the commercial knowledge on the level of branding, marketing and design to create and maintain a brand.	Haiyan (2011)
	Additional costs	An inhibitor would lie on the additional costs (both financial and time).	Haiyan (2011)
	Avoidance of potential conflicts with clients	When the providers choose to have their own brand business they are somehow going against the clients' interests so that their customers may no longer pursue the collaboration with them and thus providers may ruin the relationship and spoil their clients' orders.	Liu <i>et al.</i> (2008)
	Reliance on clients	A risk of building a new brand occurs when there is a likely reliance on the client for product improvement and advanced technologies which lead the manufacturer to lose its ability to create and maintain a product advantage.	Li (2007); Li <i>et al.</i> (2010)
	To play it safe	When international demand is constant, firms prefer to remain as contract manufacturers so as to play it safe.	Haiyan (2011)
	Ethical issues	When the clients' commercial viability product depends on proprietary technology and processes, they need their providers to know their business well. Thus, clients should assure the providers' competence, currency of knowledge and good faith.	Arruñada and Vásquez (2006)

Category	Brand building triggers	It shows that there are specific moments during the firms' journey that catapult them to own brand manufacture. These triggers come outside the firms' scope and influence their general environment. Without these triggers the leap into the own brand model would be much slower.	Authors' insight
Subcategories	Crisis in the	Firms somehow anticipated that they	Authors'

	sector	would not go further just by working as contract manufacturers, and that led them to take a risk in their own brand manufacture. The majority of the firms interviewed are composed by the owner's relatives, namely descendants who usually have a different vision and desire a different path. CROWDSOURCING FOR DUBAI APPAREL INDUSTRY- - MIRAGE OR A REALITY?

ABSTRACT

‘Crowdsourcing’ is a unique operating model that utilizes the wisdom of a community by outsourcing a task originally performed by a designated professional, to an undefined but a large group of people, especially from an online community. Crowdsourcing has been used successfully for innovation, new product development and in fields like information technology, new venture financing, home furnishings and photography; however, it cannot be implemented for every business or in every geographical region. An organization faces the biggest challenge of flipping its business model upside down, with online community taking charge of process for continuous innovation and development from the owner. Outcomes could be less than satisfactory, if crowd is unable to provide right solutions within the stipulated time period.

Crowdsourcing can serve as means of distributed innovation for fashion design and development. Retailers could follow the “prosumer” concept wherein the members of an online community are buyers of the products developed by them.

This research aims to ascertain whether crowdsourcing model is applicable for Dubai’s apparel industry.

In- depth interviews with industry experts and local designers revealed their belief in the nascent model to be innovative, capable of creating a marketing buzz, suitable for short- term communication campaigns and for drawing a large online footfall. However, they expressed skepticism on the use of crowdsourcing as basis for their long- term marketing strategy. Designers agree that it is encouraging for budding talents to participate and express their creativity, however only in a vocational rather than a professional capacity.

Primary research was carried out to assess the relevance of this model for the apparel industry in Dubai. Univariate and multivariate analysis was performed on the data gathered and two major segments were identified - - each exhibiting different behavioral and psychographic characteristics.

Recommendations include initiatives towards capturing the interest of both the segments. While the luxury brands, which are exclusive in their approach, may not be able to adopt this model, many fast fashion and youthful brands could have varying level of benefits depending upon the crowdsourcing business practices adopted.

Keywords: crowdsourcing, online community, retail, technology innovation, strategic marketing

CROWDSOURCING: AN INTRODUCTION

When Harvard Clinical & Translational Science Center (Harvard Catalyst) launched a contest to solve a tough computational biology problem to the crowd looking for solutions, skeptics may have smirked internally at the obnoxiousness of the idea. However, when the same crowd responded with viable solutions that were far more innovative and of high quality, the same lot of skeptics may have had to smother their smirks. Crowdsourcing attracted far superior and ingenuous solutions than what the in-house team of scientists was able to come up for the last fifteen years (Boudreau & Lakhani, 2013, p. 69).

While there are numerous examples citing how the power of crowd has benefitted organizations and institutions, there are some where this power has lost its leash. One such example is that of Technology, Entertainment & Design (TED) which is responsible for bringing content through conferences, now held across the globe. It was in one such conference were a fraudster actually got applauded for mere jargon connections on vorte x-based mathematics. It was widely criticized by the academics and professionals who knew about the subject. They were hugely appalled by the success of the conference and thereafter praises for the presenter who seemed to have no empirical evidence for his claims (Merchant, 2013, p. 79).

Crowd sourcing is a technique where the task originally performed by a specific set of individuals within an organization is now performed by the general crowd. The concept has evolved from "outsourcing" where the organizations give away the task to some other organization having required expertise. In this, the company gives away the task to an online

crowd in the form of “open call” to use their time, labor, creativity or experience. The company can source solutions from amateurs, volunteers or experts depending upon the nature of the task. “Crowd” participating in this is generally forms an online community. The crowd sifts through all the ideas or solutions and gives their preference for alternatives.

Then the “crowd sourcer”- the entity that put across the problem in the first place, owns these solutions and gives rewards to winning individuals. The award can be in the form of monetary reward, recognition or just appreciation. (Howe, 2008)

Steps involved in crowdsourcing are as follows:

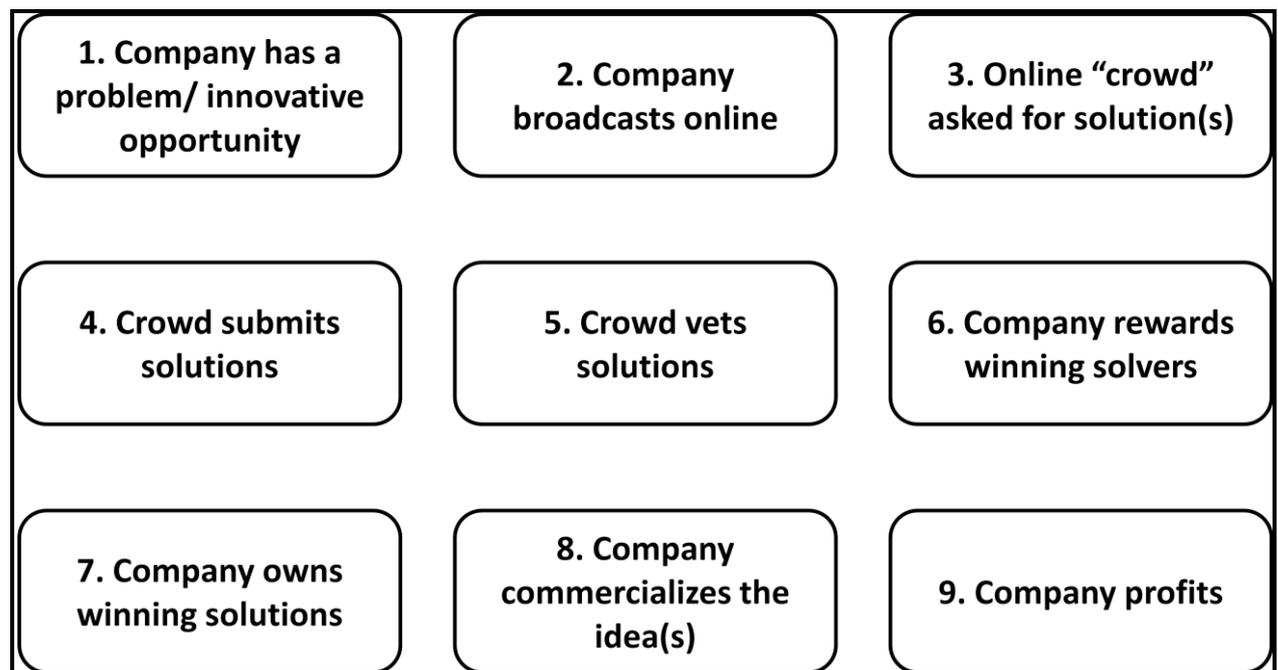

Fig. 1 Steps in Crowdsourcing; adapted by inserting Step 8 (Brabham, 2010)

Crowd sourcing: World

The term “crowd sourcing”, was first coined by “Jeff Howe” in his book “Why the power of crowd is driving the future of business” (2006).

It has been practiced for long with different organizations using it in different forms of business. Different software companies use this technique via a platform “Top Coder” to let different individuals design the algorithm to meet their programming specifications. (Gobble, 2012; Fried, 2012) Similarly furniture organization “made.com” uses this for getting the furniture designed, while advertising companies use this model for getting banners, posters and pamphlets designed. The market intelligence solution provider companies like “Chardiox” helps companies to set up crowd sourcing model for their businesses.

This model has proved beneficial for many organizations across variegated sectors. To name some- “Innocentive & Cambrian House” are software firms; “iStockphoto” is a unique photograph stocking organization from where one could buy professional images; “Trendwatching” is a consumer trend tracking consultancy; “NikeID” is the popular marketer of sneakers; “Threadless” which is a popular T-shirt crowdsourcing firm, based out of Chicago. (Anonymous, 2013)

Crowd sourcing: Apparel

Apparel retailers have also experimented and benefited from the crowdsourcing model. For retail organizations, this model helps them follow the “prosumer” concept wherein the crowd is the producer as well as the consumer of their products (Tapscott & Williams, 2008, p. 126). The “Threadless” was the first apparel company that started running its operations in year 2000 solely based on the crowd sourcing model. The company started with “T-shirts” and has expanded it to other products such as accessories, bags, iPod cases etc. Threadless gets more than 150 t-shirt designs and sells 15000 t-shirts every week. About 1.75 million visitors each month register in the company’s website. Threadless has become worth \$38 million dollar by just listening to the voice of the customer (Feitelberg, 2010).

So how does the model work? The company floats a theme every week and designers across the world put up their designs on that theme. The in-house team of the company selects the designs and put up the selected designs on the website for the “crowd” to vote. The voting process continues for a week with the top lot being filtered at every stage and moved to next. Finally, the designs are rated on a scale of 0-5 based on number of votes, comments posted and the internal team’s decision. This scoring serves as the decision point for the company to decide which design to be finally printed on the T-shirt and sold to the buyer community (Howe, 2008, p. 229).

Four primary motivators for participation at Threadless, which are equally true for other companies practicing this model for apparel, are the opportunity to make financial gains, to build creative skills, to take up freelance work, and for the love of community (Brabham, 2010).

Role of customers in crowd sourcing:

- The customers are more or less morally committed to the purchase of the most preferred design
- Customers initiate and take the responsibility for the advertising and attracting new customers

- The customers feel that they are part of the community and have great love for the community.
- Customers protect the company from any kind of activity of imitation or imitators, (hacking of website).

Following Threadless, many other organizations are practicing this model now. "Ink Fruit" uses this model for T-shirts, "Mod Cloth" for women dresses and "Sun Wrangler" for printed fabric. Wrangler has also recently come up with the launch of "Next Blue" to get ideas from crowd for designing of their new jeans. "Jo Bedu", a Jordan based organization, founded in 2007 is implementing crowd sourcing model to promote Arab designers. They use this for designing T-shirts and other apparels. T-shirts are generally designed with funny Arabic slogans and common slangs that have made them popular around the world.

However, crowd sourcing model cannot be implemented for every business. The major challenge being that this requires organizations to flip the business upside down. The community takes charge from the owner and owner does not have control over the things if the crowd is not able to provide right solutions in the stipulated time period. Also, people may not like to participate for every product and so this model can only be used for businesses which can entice consumers (Caulfield, 2009).

DUBAI: AN OVERVIEW

Dubai is a cosmopolitan city with more than 200 nationalities. Every year, an increasing number of expatriates decide to make Dubai their home. The population of Dubai is currently 2.1 million, and has grown by 5% from 2012 (Al- Attasi, 2013). The female to male gender ratio of the population is approximately 1:3 (Population by Sex- Emirate of Dubai, 2013).

Institute of International Finance has projected UAE's GDP to grow at 3.6% which is a slight lull compared to the estimated growth of 4.8% from last year, owing mostly to the lower crude oil prices (Augustine, 2013).

Dubai Retail Industry: A focus on apparel

As per Alpen Capital, UAE's retail sales are expected to witness a growth of 5-7 percent growth by 2016 (Anonymous, UAE retail sales to grow 7% by 2016: study, 2013).

Strong growth trends in retail are owing to the economic resurrection, high consumer confidence owing to high household spending, and growing acceptance of modern retailing concepts and expatriate wealth. Average household spending power/ or disposable income in

the UAE stands at \$14,400 per annum, as per property consultant Colliers International. Emirati households account for the lion's share of this spending with an average of \$23,000, while Western, other Arab and Asian households have annual spending power of \$19,500, \$13,500 and \$10,000 respectively. A.T. Kearney's 2011 Retail Apparel Index found that the UAE had the highest fashion clothing sales per capita per annum in the developing world, at \$785. The report attributed its success to 'high disposable income and immense fashion consciousness'. Dubai was a hub for major retailers and attracted a mixed assortment of value-oriented, fast-fashion, premium & luxury brands (Anonymous, UAE's retail sales to touch AED 151bn by 2015, 2013).

Interesting aspect is that non-store based retailing is also gaining momentum. The current contribution of internet sales is one percent of the total apparel market which is about USD5.4 billion. As per a report on Euromonitor, internet apparel has grown by 66 percent in 2012. Customers seem to be warming up to the idea of buying apparel online. Two key factors contributing to this phenomenon seems to be high internet penetration rates and security over online payments through credit/ debit cards (Potts, 2013).

Crowd sourcing: Relevance for Apparel in Dubai

The garments that people wear are a reflection of their individuality, identity, interpersonal position, culture and place they live in. T-shirts form an essential part of the wardrobe of people of all age group and gender. People like to wear T-shirt for various occasions like leisure, work, and routine lifestyle. T-shirts are very popular with people of all age group and many organizations are incorporating these as work wear. Dubai is located in the tropical area of the Middle East where T-shirts are one of the most preferred garments.

The T-Shirt being a fast moving garment type is very easy to manufacture and design. This is a very experiential garment where designers can creatively design different styles and select a wide range of colours. Also this garment can be worn for various purposes irrespective of gender and age which makes it even more. This is a type of garment where the crowd can easily use a template, design and creatively come up with unique designs for the crowd. T-shirts comes in fixed sizes and there are minimal fitting issues as compared to other garments categories. T-shirts require less lead time to manufacture and it enables to manufacture to come up with various collections frequently.

Problem Definition

The fashion industry faces huge challenges with its supply chain, making it difficult to carry out adequate demand planning and forecasting. Most of these challenges arise during the product development lifecycle. It is difficult to sustain any brand in an industry where consumer preferences change at a rapid pace. As a result, the brands and designers face challenge in forecasting correctly. The long lead time explodes this problem with the merchandise being ordered long before the start of the next season. Adopting a business model that can involve consumers in the early phase of designing and manufacturing could resolve some of these problems (Bonabeau, 2009).

Objective

The objective of the research was to understand whether crowdsourcing as a model would be acceptable in Dubai apparel industry. Also, we hypothesize that this model could be useful for only the casual category of apparel due to inherent design features and limitations of the model.

Sampling & Methodology

Primary Research was done in two phases- qualitative and quantitative. Qualitative Research included in- depth interviews with experts (retailers- prospective and actual implementers of the model, and designers) and prospective participants in a crowdsourcing model format. Subsequently, a survey questionnaire was designed for capturing insights of the prospects. Non-probabilistic convenience sampling was employed. Survey respondents were at least 15 years of age and residents of Dubai.

Qualitative Research: Crowd speaks

As a part of exploratory research, open ended questions were posed to ten people of various age groups and nationalities. This discussion with the respondents was done to understand their perception towards this model and to firm up the design of the survey questionnaire. Questions captured buying behavior towards T-shirts, satisfaction level of designs, openness to design competitions, trust in crowd's ability, trust in crowd's creativity, online shopping behavior and internet surfing. We found out that all of them used internet for leisure and the number of hours varied from 30 minutes to 5 hours. Most of them posted some form of content online and few of them participated in online competitions. The major drivers of participation appeared to be money, fame and interest. Friends had a certain degree of

influence on the participation levels. The people sought good designs irrespective of who the designer is and many were ready to wait for unique designs, with waiting period varying from a day to six months. While many felt that crowd does not have much potential, others felt that this model could tap hidden talent of the crowd.

Willingness to wait for a design was high if the brands were one of their favourites.

Findings: Quantitative

A close-ended questionnaire was administered to a sample size of 102 respondents. Factor analysis was performed on the key attributes identified. Extraction of factors was done using Principal Component Analysis. Rotation Method was varimax with Kaiser Normalization, with a Kaiser-Meyer-Olkin measure of sampling adequacy of 0.625 and significance < 0.05 (.000).

In the table below the rotated factors are presented:

Rotated Component Matrix				
Attributes	Credibility	External Influence	I-Voting	Competency
Crowd has the skills to assess the designs	0.773			
Posting designs online is a good idea	0.685			
Designs posted by crowd are of good quality	0.576			
Content on blogs is credible	0.474			
Participate if the brand is known		0.785		
Negative opinion of the crowd affects creativity		0.740		
Like to vote for apparel online			0.834	
People's votes would influence buying decision			0.661	
Creativity of the designs posted during competition				0.851
Extraction Method: Principal Component Analysis. Rotation Method: Varimax with Kaiser Normalization.				

Fig. 2 Factor Analysis

The final rotated component matrix yielded four factors namely- credibility, external influence, I- voting, and competency.

Next, a cluster analysis was performed using K- means cluster technique. Two distinct clusters namely *Evaluators* and *Believers* were identified. 25 cases fell in the first cluster- Evaluators; while 77 respondents were pulled towards the second cluster- Believers. Following are the radar diagrams depicting their perceptions:

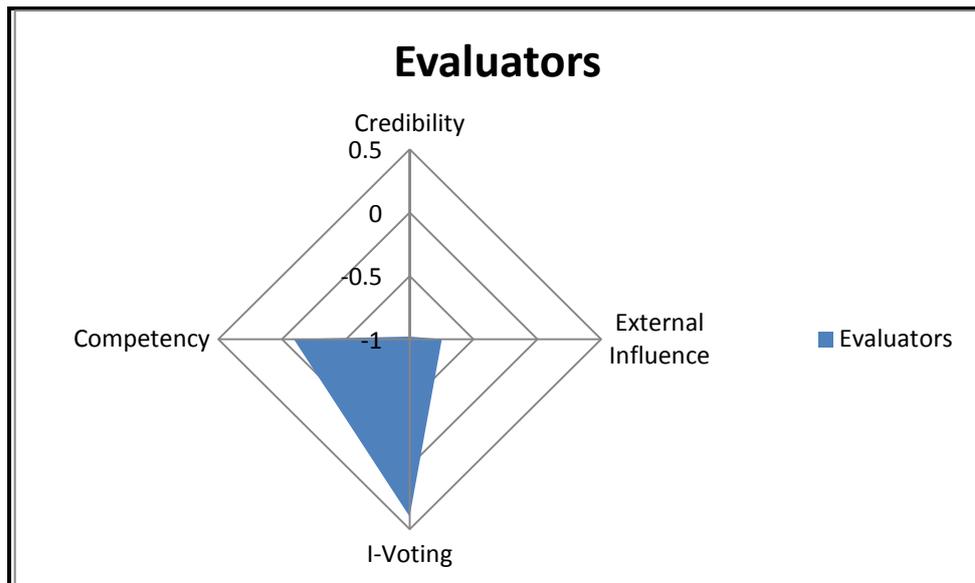

Fig. 3 (a) Cluster 1: Evaluators

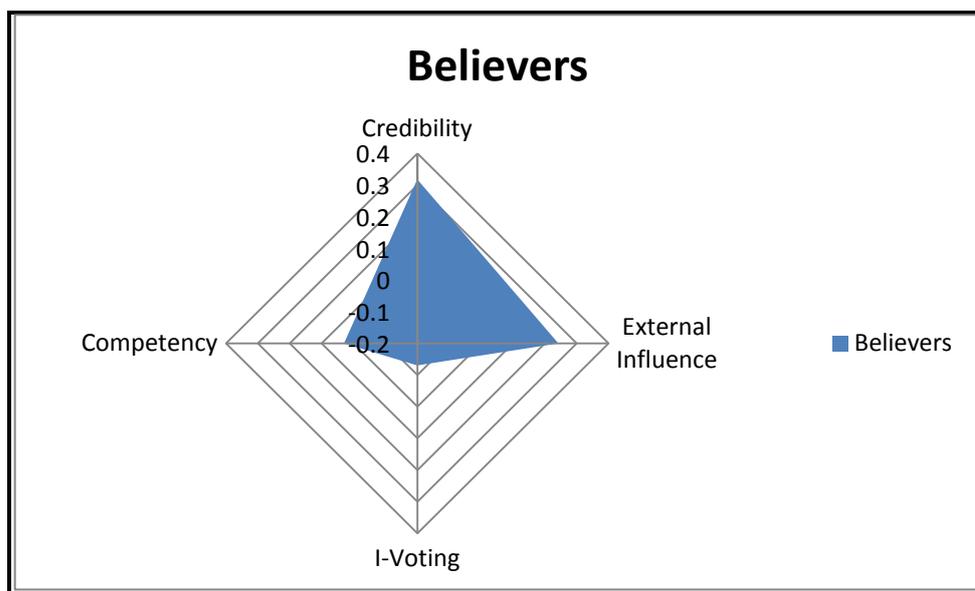

Fig. 3 (b) Cluster 2: Believers

As shown in the figure 3(a), “Evaluators” were heavily skewed towards Competency and I-Voting factors.

I- Voting factor represents the fact that these people like to vote for apparels and their shopping behavior get influenced by other people’s voting. Also these people believe that the creativity of T-shirts designed during a design competition is good. However, they do not have the trust in the crowdsourcing model. They do not consider posting designs online to be a very good idea and do not think that the crowd has the required skills to assess their design,

if they would post any. They were also concerned regarding the quality of T-shirts designed in such competitions.

From Fig. 3(b), we observe that segment “Believers” consider this business model to be highly credible; however, they do get impacted by external influence. It shows people in this segment consider posting designs online a very good idea. They have belief in the ability of the crowd to assess their designs and they are also satisfied with the quality of the T-shirts. However, these people feel that the content written on blogs is not very credible and that their own creativity may get hampered by the negative feedback received from the crowd. Also, these people are more willing to participate in the crowd sourcing model as buyer, voter or designer if the brand carrying out such model is known to them.

The profile of the segments was collated through cross- tabulation analysis:

Profile Attributes	Evaluators	Believers
If the model is implemented, would predominantly participate as:	Voters	Designers
No. of t- shirts bought in a month from a store	3	2
No. of hours spent on the internet for leisure	2-4 hrs	1-2 hrs
Influence of friends motivates me to participate in online competitions	disagree to indifferent	agree to strongly agree
Age- group	25- 40 yrs	15- 25 yrs
Nationality	UAE nationals and Expat Arabs	Expat Asians and Westerners
Profession	Predominantly students	Predominantly young professionals (included amateur designers)

Fig. 4 Segment profile

Recommendations for Believers

Since the “believers” have more trust in this model and constitutes more respondents, retailers should focus on them first. Initiates recommended are:

Building strong brand image: This segment’s allegiance to their favourite brands is strong and their participation levels could be enhanced, if the leading and popular brands engaged them innovatively in a regular fashion.

Curb negative comments on blogs: This segment is affected strongly by external influential factors. They believe they may not be able to justify their creative skills if the negative opinion about their designs is posted on the blogs. They have a fear of social evaluation and the company needs to address that. The company may keep a check on the blogs and regularly monitor and address undesirable comments towards individual designs (Shao, Shi, Xu, & Liu, 2012).

Designer’s label: Since the designers are more inclined towards recognition as compared to reward, it is important for the retailers to cater to this desire. An alternative is to put designers’ labels on T-shirts. This would encourage designers to participate more actively for fame (Wagner, 2011).

Recommendations for Evaluators

In order to address their concerns and engage them as part of the business model, we believe that the company needs to take the following steps:

Right Communication: Crowdsourcing model is fairly new to Dubai and most Arabs have not heard it before. Therefore, it is very important for the company to spread awareness about this innovative concept amongst the local and expat Arabs. Their apprehensions regarding this new model, if addressed effectively, would motivate people to participate more actively (Degen, 2010).

Distributed Decision Making: The people feel that the crowd may be biased while voting such that deserving designs may not win. Ensuring transparency and fairness in the design evaluation process would bolster people’s trust in the organization & process. Thus, decision making for choosing the winning design could consider both people’s vote as well as internal design team’s input (Wexlar, 2011).

Quality of T-shirts: People’s doubt in the quality of the T-shirts manufactured could be eliminated by keeping the suppliers, partners and other intermediaries involved in the operation process. This would ensure in solving technical issues in producing varied designs posted by the crowd.

Hybrid Model: It has been observed during qualitative interviews that Arab people in Dubai are more comfortable in buying clothes in the stores. Therefore, the company should use the

hybrid model in which the designs are posted and evaluated online to get more participation from the crowd and fast track the whole process. However, final merchandise, apart from being sold online, could be made available in retail outlets as well.

EXPERT OPINIONS

One is willing to participate and buy through this model but distraction to buy from malls and regular concepts exists. To validate, we have indulged in discussions with few more retailers. A set of open-ended questions were asked to industry experts to understand the trends of Dubai apparel industry and gauge their opinion about the crowd-sourcing model. Key findings were recorded as follows:

As per the CEO of Ink Fruits Ltd- Mr. Kashyap Dalal, building the community of first ten thousand users was the most challenging task for the company. It took them around two years to do so after which the ride has been quite smooth with the community itself promoting the brand. Tying up with design schools has opened new doors for the company to get more participation as well as fresh and unique designs. The company ensures that the most deserving designs win in the competition by gaining crowds' consensus. Ink fruit, unlike many other organizations implementing this model, have an internal expert team participating in the final decision making, making the model highly transparent and credible. Ink Fruit gets over 100 designs every week through this model which, if designed by a team of 4-5 designers may not be completely relevant.

According Mr. Bharatesh Suvarna, General Manager-Operations of Splash Gulf- a fast fashion apparel brand, there are different segments of customers in the UAE market. While this creates huge opportunity for the brands, it becomes a challenge for the designers to design for each segment separately. The brands have to constantly find and develop new talents that can fulfill the fashion needs of the various market segments. There is always a need to develop unique designs that reflect modernity and Arab cultural heritage. The market here is futuristic and consists of educated people who have high disposable income, time and opportunities to do so. Therefore, the people are attracted to shopping and spend most of their leisure time in the malls. Dubai being a multicultural land has evolved its fashion industry from both east and the west attracting many established and upcoming fashion brands. Dubai is a fashion hub for many talented designers to showcase their designs. It's a land of fusion and authentic designs where the designers get the opportunity to showcase

their unique designs. Many designers from across the globe are making Dubai as home to design business.

An executive from Orient Craft Ltd. (India)- Ms. Shweta Kanwar, who manufactures merchandise for top apparel brands in Dubai believes that crowdsourcing could be a great platform for upcoming designers who don't have resources and are seeking recognition. However, established designers may not invest their time in this model. This model was more about passion for designing and recognition and depended a lot on the personality of the designer. The main concern that troubles designers is the threat to their Intellectual Property (IP) by engaging in this online activity. If the threat of losing Intellectual Property can be eradicated, more number of designers would be willing to participate in this model (Wexlar, 2011).

Crowd sourcing model is not a new concept for Splash Gulf. Their popular "Back to School Campaign" has invited designs from school children and winning designs were chosen for production and commercialization. They have also run this promotional activity in Dubai International Academic City where they displayed certain designs and students were asked to vote for their favourite designs. Highest voted designs were showcased in their stores for sales.

As per the Marketing manager of Rivoli Fashion Group, Mr. Kunal Kapoor, they have a dedicated team of in-house designers who conceptualize designs based on the fashion trends and show feedbacks. They have their own business model and don't feel that this model would be of much value to them. On the contrary, General Manager-Buying and Operations of Maxx Group, Mr. Sanjeev Matharu is excited about the model and believes that it could be a great platform for upcoming brands to build their business. However, conventional brands would prefer to use this as a below the line marketing exercise.

Research Limitation

One of the key limitations was the low awareness about crowdsourcing model amongst the crowd, thus the research was restricted to an exploratory phase.

Companies who have implemented the crowd sourcing model did not reveal the costs incurred during each stage of crowd sourcing. This has made carrying out a cost- benefit analysis of the model difficult. The sample size could have been larger and respondents chosen in a random basis

Way Forward

The crowdsourcing model offers enormous opportunity to engage the prospects on line. It offers an innovative format for building the brand and generating revenues. However, a company should exercise caution by ensuring its acceptance for its business and the market (Schweitzer, Buchinger, Gassman, & Obrist, 2012).

A GROUNDED THEORY OF PERPETUAL RATIFYING. PUTTING LIFELONG LEARNING STRATEGIES INTO PRACTICE FOR BUSINESS COMPETITIVENESS

Green, Jan

Institute of Arts, Science and Technology, Glyndŵr University, Wales,
jan.green@glyndwr.ac.uk

ABSTRACT

The European Commission Lifelong Learning Programme has a target of involving over 6 million people in skills development and improving employment prospects. This foundation contributes to economic success and business competitiveness. Business leaders appreciate the strategic importance of lifelong learning initiatives within the workforce.

Businesses based in north east wales provided empirical data to develop a grounded theory which establishes what learning initiatives are utilised and in differing circumstance to resolve competitive concerns. An overview of the theory is presented.

Diverse business issues identify learning as being beneficial for on-going competitiveness. Three categories of learning are identified in the study; education, training and experience. The phrase 'once is not enough' indicates repetition and the perpetual nature of learning that in most situations requires verification.

The grounded theory of perpetual ratifying establishes the circumstances in which the selection of a learning approach is made and draws out the benefits derived from the learning. Business education leaders are urged to consider a move from subject specialisms to a more integrative approach that better reflects the nature of 21st century business environments and practices.

Keywords: lifelong learning; education; training, experience; dynamic capabilities; grounded theory

INTRODUCTION

The European Commission for Education and Training allocated a budget of €7 billion for the period 2007-2013 (ec.europa.eu) as lifelong learning is a priority objective for the European Union and viewed as key to economic success. To establish ways in which private sector business draws on various educating practices and outcomes a grounded theory is developed in order to identify how concerns are resolved related to the maintenance of a competitive position.

In accord with grounded theory practice the paper is structured with the methodology as the first section, followed in sequence with the research findings, the conceptual framework leads to a discussion of the findings before commenting on areas for further research.

METHODOLOGY

The methodology used in this study is classic grounded theory; the procedure is briefly reviewed and is followed by details of the sampling techniques utilised for the study.

Classic grounded theory is a general method of comparative analysis (Glaser and Strauss 1967) to fit an empirical situation and involves the discovery of theory from data which has been systematically obtained with a view to predicting and explaining behaviour. The approach is inductive and the analysis infers that the predictable patterns observed in the sample hold true (Nathaniel and Andreus 2010) for the others in a similar situation.

A grounded theory is developed from a series of conceptual analyses of empirical materials (Denzin and Lincoln 2013). The first stage in the generation of a grounded theory is the collection of data in the field by holding conversations about the central concern of the study. The data is then subject to the open coding process which breaks down the data in a line by line manner (Hernandez 2009) and identifies initial codes. Using gerunds is an effective method when coding as they suggest implicit actions (Charmez 2013) and provide linkages.

Following each data collection exercise memos are written to assist in keeping track of emerging ideas and connections (Roderick 2010). Constant comparison, which is deceptively powerful (Urquhart 2013) is also a repetitive exercise and consists of identifying similarities between incidents occurring in sequential data sets and enables nuances and meaning to be reviewed as theoretical categories are developed. A framework is shaped from the data

consisting of categories, which are conceptual elements of the theory (Glaser and Strauss 1967) and they are supported by the properties which contribute to a category.

Coding and constant comparison leads to a core category emerging that is identified as a central resolution around which other concerns revolve. At this stage workability is sought through theoretical sampling. Theoretical sampling is the response to querying where to turn to next in the data collection (Glaser and Strauss 1967) which refines and elaborates emergent categories. Pertinent data is sought; the process is deliberate (Morse 2007). Selective coding enables the data to achieve saturation, a state when there is an absence of new categories when additional data is collected (Green 2012) leading to empirical confidence and prevention of wasted additional data.

Memos are the foundation of grounded theory, without them there could be no grounded theory (Sandgren 2011). There is no prescribed format but they should contain sufficient identification to enable sorting in order to establish relationships and form the previously unwritten rules from which the new grounded theory is deciphered and written up.

A know nothing approach at the outset of a grounded theory utilises the perspective of those involved (Binsardi and Green 2012) to gain understanding. The literature is consulted following the data collection and analysis to provide additional theoretical insights.

SAMPLING

In order to establish concerns related to learning practices that link with business competitiveness pre-scheduled conversations were held with nine private sector managers throughout January 2013 who had a concern regarding the level and validity of organizational learning in a variety of situations. A sample of this size is in accord with 'social units of any size, large or small, ranging from men or their roles to nations or world regions' (Glaser and Strauss 1967:21-22). Initial conversations lasted approximately one hour. Four respondents provided follow-up data in order to achieve saturation; this required a sequence of conversations lasting for approximately 30-minutes each. This medium enabled the collection of empirical data to identify ways in which resolutions were sought and achieved. Several scenarios are presented and educating practices to acquire new knowledge were implemented in order to retain a competitive advantage and performance levels, they are listed in table 1 below. The unit of analysis is the organization.

Interview	Factor
1	Customer and supplier requirements – business continuity
2	New and amended legislation – change in process or procedure
3	Succession planning – anticipating personnel changes
4	New technology and upgrades – process amendments
5	Identification of skill and/or performance gap
6	Mergers and acquisitions – extensive and far reaching changes
7	New Products/ product updates – knowledge extensions
8	Organizational changes – structures, processes and personnel
9	New recruits / staff turnover – knowledge gaps

Table 1: Factors where learning initiatives are required for business competitiveness

GROUNDING THEORY OF PERPETUAL RATIFYING

The grounded theory of perpetual ratifying was generated from data provided in response to concerns related to the use and application of lifelong learning strategies in the maintenance of business competitiveness. Verifiable learning varied from being crucial and essential with a short-term urgency through to an identifiable strategic aim for the medium to longer term progression and development of the organization.

A data extract illustrates a positive selection bias towards individuals with evidence of learning related activities:

“I prefer to take on staff with some fairly recent pdp on their cv; they have a different outlook on life and work, they are more positive and involved in their career, they are looking to improve.”

Reference to the outlook of individuals taking part in learning opportunities supports the theory that they contribute to business competitiveness in a more proactive manner than individuals who neglect this aspect of their career.

Data was subject to line by line coding using a gerund style to retain a focus on the present that patterns out into three distinct sub-categories related to learning: education, training and experience. Depending on the organizational learning driver, the approach to closing the identified gap varied and in some instances drew on differing styles and ways of learning. It was immediately evident that there is a requirement to search beyond the term learning in order to saturate the data and consider the concepts linked to the act of learning that occur

outside the confines of compulsory education. There is one additional sub-category for the notion of lifelong.

EDUCATION

“Education paints a picture about a person – they can see projects through to completion.”

Education is valued as a contributor for both current and future options and assists in the removal of role limitations and career ceilings. Completion of an educational programme results in permanent verification through the credentials acquired. Respondents acknowledge increased confidence, a development of social senses, personal status, authority and credibility. Beyond the visible traits the data also acknowledges the personal striving and internal desire to improve that drives individuals into post-compulsory education. These traits have value to the business manager and are frequently drawn on during the routine undertaking of tasks making up a work-place role. In addition, individuals demonstrate an increased propensity to undertake diagnostics and gain additional insight into prevailing issues. Judgement is evident in order to propose solutions that may not be immediately apparent and require tenacity to implement successfully.

This approach to learning was utilised by the respondents as a support in several areas. They include succession planning, closing sector or organization-wide skill gaps, for selected new recruits and existing people with the potential to develop when transformational change was anticipated. The respondents point out that there is a clear expectation that the organizational problems are used as examples during the learning programme so that a proportion of the time spent is conceived as having direct benefit as the learner, in effect, is able to operate in the informal capacity of an internal consultant. This element is identified in the data as payback.

TRAINING

“the training we’ve done related to work roles has been crucial to the business success”

Training as a learning method is utilised for different purposes and outcomes which are more targeted, focused and short-term than education. They are mainly operational and routine; a data extract refers to training as being a lubricant that provides a smooth pathway for the organizational processes.

Induction provides the first layer of procedural training, followed by specific and role-related skills acquisition, gap training and instruction in order to reach a minimum standard of performance. At this stage the concerns are preparation and practise in order to become proficient through familiarisation and repetition.

Following mergers and acquisitions various forms of training are carried out to enable integration and a consistent approach to be presented by the newly created organization. Training is viewed as an investment by the employer and a sense of being valued by the employee. The process initiates new groupings and linkages between those taking part that endure beyond the formal training programme and serve to strengthen the emerging culture.

In addition training needs become apparent when there is a requirement to validate or assure processes and practices and business continuity is sought. Examples of this type of training include legislation changes that may prevent or restrict individuals practising when certification becomes compulsory. The need for an organization to achieve an ISO standard or sector specific certification is only obtainable via accredited and certifiable training. This takes place in a structured manner, is delivered by qualified individuals and there is a requirement to maintain a high level of attendance prior to the assessment processes to provide measures of achievement that match a specified standard.

As a learning method training is viewed as being developmental at both the individual and organizational level. It contributes to the reputation of the organization in a positive manner via improved practices and therefore supports the wider competitive position through the accumulation of training evidence.

EXPERIENCING

“don't underestimate the University of Life, that is very important, being able to get a message across in a way that is understood”

In some instances where competitiveness is challenged, such as change, drawing on learning acquired in previous situations proves to be of great value. This type of learning is utilised in assessing the use and application of resources and recalls successes and failures to consider either repetition or adaptation for the new change. The skills of reflection based on observations, insight and earlier experiences are cited in the data as being of particular

relevance and importance when evaluating a contextual scenario and reaching decisions that will impact on the future.

All the respondents refer to updating, that learning once is unlikely to be sufficient in an era of shortening product life cycles and an increasing dependency on technology that is described as being in a state of continual change. These examples reflect the dynamic nature of the 21st century business environment where job changes and a moving goal post for retirement are additional challenges.

The data makes reference to being dropped in and shovelled in to situations, particularly when they are unexpected, as being the only way to learn. Thinking time when problems arise is also highly valued and the ability to handle the range of emotions that may surface when a competitive challenge is being addressed.

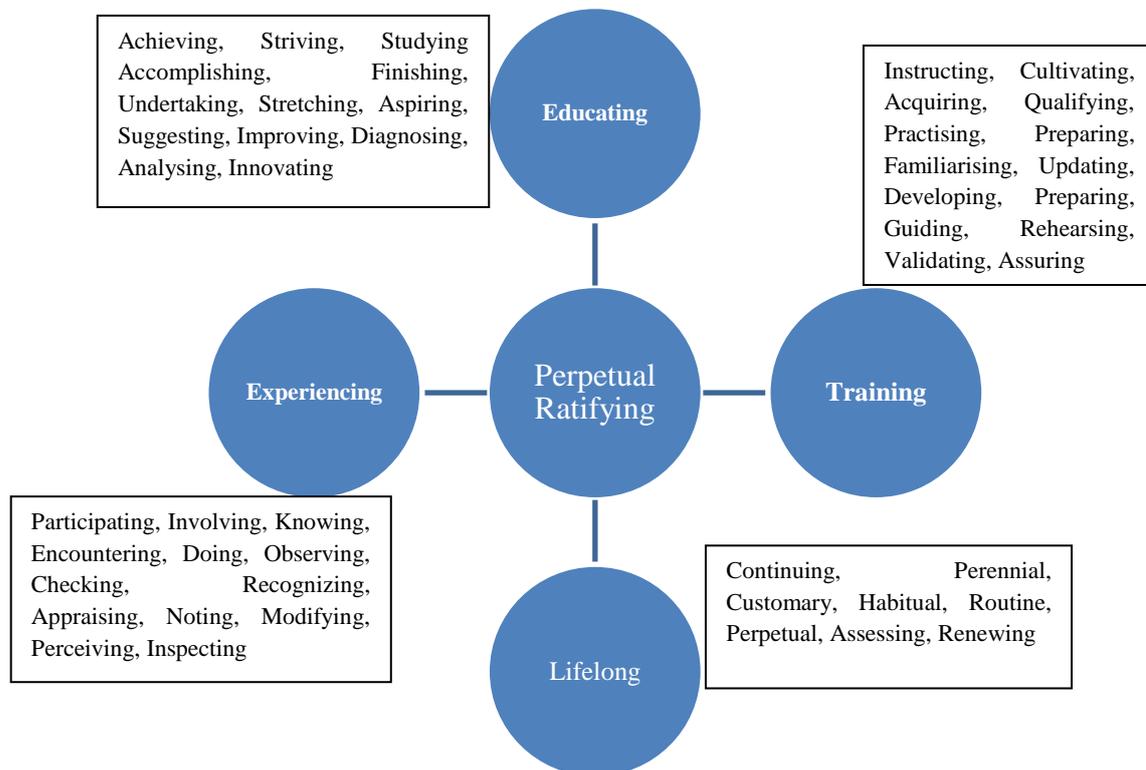

Figure 1: The Grounded Theory of Perpetual Ratifying

LIFELONG

Unstable business environments require adaptive practices, learning is no longer a one-off process. The data refers to assessments of skill bases that are integrated into strategic and

operational routines to ensure that learning is assessed on a frequent basis and renewed where outcomes dictate.

The core category which conceptualises lifelong learning is Perpetual Ratifying and consists of a diverse range of properties which illustrate the scope, depth and patterns within the data contributing to each of the four categories. Several indicators are readily transferable and demonstrate the modifiability of grounded theory.

CONCEPTUAL FRAMEWORK

A brief review of studies related to aspects of competitiveness, learning approaches, styles and methods makes up the first part of the conceptual framework. This is integrated with specific business approaches that draw on the value of learning to enhance competitiveness and also considers the relevance of business education.

COMPETITIVENESS

According to Cheung and Chan (2011) a well-developed competitiveness motive is a means of demonstrating superior capacity that requires different strategies to retain. The strategies require opportunities to engage in learning activities. This enables the acquisition of new knowledge and skills to demonstrate competency that occurs through training. Advancement is achieved through mastery as the human capital of an organization improves.

LEARNING

Learning “refers to significant changes in capability, understanding, knowledge, practices, attitudes or values” (Coffield 2008:7) and concludes as a change resulting from the participation in some form of competence development programme (Kock and Ellström 2010:76). Lifelong learning is “to be viewed as something individuals undertake at all levels and ages in the workforce throughout their working lives” (Ahlgren and Engel 2011:333).

Educing is defined as “to hone individual skills and competencies” (Prestoungrange 2000:231). It is also a practice that draws on the lessons learned from one tradition to strengthen another (Withers 1995:4) and alludes to the practices of integration and cross-

functionalisation that have increasing relevance for the 21st century organizational structure and economic environment. Educating is not a widely used term; however at a conceptual level it captures the essence of education, training and experience by way of encompassing the aims of these learning approaches through formal, vocational and life perspectives.

EDUCATING

Österberg (2004) identified a continuous need for learning due to market-based forces that drive change and result in a constant need for knowledge renewal. Galpin and Skinner (2004) researched the achievement motivation of high flyers, which they define as people aiming for senior management and anyone who is able to make a unique contribution to the future of the organisation. One of the dimensions in the study is mastery, which revealed the greatest difference between high flyers the general population, therefore demonstrating a benefit of business education and overall performance. Mastery is beyond competence (Senge 1990) and is achieved by continuous learning, it is a process.

A prevailing core element of 21st century business education is to support business activity via the enabling of individuals through knowledge acquisition. This underpins actions that are conducted in a manner that will achieve high self and corporate performance levels through focusing on job-related performance behaviours (Anninos and Chytiris 2011; Krishnan 2008). The interface through which this takes place is a transfer of knowledge to the receiver from the holder (Elmuti 2004) through diffusion.

However the specialist approach of business schools is criticised by Seetharaju (2012) as failing to adopt cross-disciplinary education in a process centric world of work where employability skills are increasingly based on process-based procedures. In order to achieve competitive advantage resources should be reconfigured into dynamic capabilities (Chien and Tsai 2012). Knowledge and learning mechanisms influence dynamic capabilities through the procedures of obtaining and absorbing knowledge that is relevant to the current environmental issues facing an organization. The learning and application require the presence of an intervention process that results in practical business application. This achieves a state of dynamic capability that is supported by mixing internal knowledge with other new domains located elsewhere (Hawass 2010) to support the required reconfiguration.

In order to close the gap between education and business Jones and Iredale (2010) propose an enterprise education pedagogy that supports work-related learning and in so doing brings

greater links between business and education through effective collaboration and increases student's awareness of the world of work. Maximum opportunities to enhance enterprising skills are developed in the expectation that they will be utilised, deployed and developed at a future point, whatever the career choice may be.

TRAINING

The term training is defined as "an activity that changes people's behaviour" Ghosh, Joshi, Satyawadi, Mukherjee and Ranjan (2011: 248). However this is acknowledged as being somewhat simplistic and also incorporates enhancing individual job performance through a planned intervention (Chiaburu and Teklead 2005) and the facilitation of employees' learning of job-related competencies that include knowledge, skills or behaviours that are critical for job performance at a successful level (Noe 2009). Effective training requires a blending of organizational and individual development to support the pursuit of growth.

The outcome of training results in the improved application of day to day workplace activities through enhanced performance. Within the training literature there is a focus on the development of competencies in order to achieve improved job performance, these are individual level competences. Competencies are demonstrable characteristics of a person that enable performance and effectiveness with a certain position. They entail knowledge, skills and behaviours that facilitate employees to efficiently perform (Dessler 2009).

Kalargyrou and Woods (2011) consider trainer competencies as being a crucial aspect of successful training as employees often perceive training with scepticism because they have an impression that they need to participate in training to fix some aspect of their role. In order to overcome this view trainers need to provide trainees with good reasons about why the training is required. These requirements may stem from economic reasons linked to promotion or the personal satisfaction derived from learning.

Fix something training is a gap approach based on the identification of what is wrong or missing altogether and does not function well. There is a deficit between the desired situation and the current position (Govaerts, Kyndt, Dochy and Baert 2011:38). To move away from the more traditional gap approach, consideration of the appreciative approach is suggested. This is person-oriented and is centred round finding and enhancing solutions that are closely aligned with the qualities and ambitions that are improved through work-place learning.

EXPERIENCING

According to Pavlica, Holman and Thorpe (1998) the process of learning in the university of life is not without its problems and this is addressed through the use of experiential learning theory. By adopting this approach, the learning outcome is 'most effective when it is grounded in everyday life, directed and controlled by the learner, rooted in a person's work experiences and has an obvious meaning for them' (Pavlica et al. 1998:301).

These authors accept that the Kolb (1984) theory of experiential learning has been most influential in managerial learning. However they suggest it is too isolationist and lacks the inclusion of social processes. This view is supported by arguing that experiences are normally influenced by contact with others and an important aspect of experiencing is listening to others. This is described as renting experiences to grasp understanding in a socially appropriate and empathetic way (Pavlica et al. 1998). The different aspects of learning through experience are integrated – learning, thinking, acting and reflecting to become a process. This process becomes a diagnosis; it is an active reframing of business situations rather than passive acceptance and becomes knowledge from within. Acquiring the ability to diagnose through experience involves the linking of the four structural dimensions in the process of experiential learning, these are:

- Personal involvement, concrete experience leads to knowledge grasp drawn from apprehension
- Reflective observation, collecting information, critical thinking, leading to intentional changes
- Conceptualization, experiments, analysis and logic, leading to sense making
- Active experimentation, risks, commitments, decisions, leading to knowledge extensions and entrepreneurial skill building

Practice is hallmarked by doing (Graff 2012), if a workable solution is not achieved at the first time of trying a second attempt is made with a slight difference in approach until a solution is found.

DISCUSSION AND CONCLUSION

When asked to demonstrate ways in which various forms of learning assist in the resolving of concerns related to competitiveness a variety of approaches are utilised. Formal education provides credentials and endorsements together with the emergence of desirable traits such as tenacity. In addition the turbulent business environment requires diagnostics and interpretation in order to remain competitive, approaches that are used during education (Cheung and Chan 2011) programmes.

It is evident that education alone is not satisfactory to achieve and maintain business competitiveness and therefore educating practices are utilised that encompass training and developmental initiatives to gain specific new knowledge and skills (Dessler 2009). Adding these elements demonstrates patterning in the data where threads of mastery become strengthened via a range of approaches. There is a clear appreciation that learning is not a one-off occurrence and updating or acquisition is a requirement when changes of varying dimensions arise. These may be short-term to close an identified gap or longer-term to gain a skill or technique for long-term use and are stratified in nature in that they occur within any area of the business.

The properties of educating are learning (formal), training (vocational) and experiencing (life). It is evident that business draws on all three approaches to cope with and adapt to changing scenarios. It is crucial that business educators adapt to ensure the convergence between business and academia (Graff 2012) is built upon, which requires the incorporation of dynamic capabilities.

AREAS FOR FURTHER RESEARCH

To expand the findings related to the benefits of educating practices an area for further research is to collect data from the actual participants as opposed to the managers or owners of a business to establish the benefits and outcomes from their perspective.

VARIANCES ANALYSIS OF THE FREE CASH FLOWS TO FIRM AND ITS IMPACT ON THE FINANCIAL STRUCTURE. SPARE PARTS MANUFACTURERS IN THE ITALIAN AUTOMOTIVE INDEPENDENT AFTER MARKET IN THE 2008-2011 PERIOD.

Guelfi, Silvano

Department of Management and Production Engineering - DIGEP, Politecnico di Torino, Italy,
silvano.guelfi@polito.it

ABSTRACT

All along, the financial balance is basic for the continuity of a company and especially when money is the critical resource. The competitive strategy needs a coherent structure and the financial receipts and payments related to the core business drive the financial structure, i.e. the relationships between equity and financial debts. In this direction, management awareness is a true source of competitive advantage and for this reason it's necessary a coherent method of analysis and a comprehensive system of measures. The present essay investigates through the variances analysis the relationship between the free cash flows to firm and the change in the financial structure and it supports the idea of an equilibrated financial structure is first of all a question of core business competitiveness, namely the distinctive quality of its products, customers, suppliers, technologies, core competences, processes, etc., and then a financial evaluation. At the end it's summarized the variances analysis of the free cash flows to firm, and the related impact on the financial structure, with reference to the Spare Parts Manufacturers, 291 limited companies, operating in the Italian Independent Automotive Aftermarket in the 2008-2011 period.

Keywords: free cash flows to firm, variances analysis, financial structure, ebitda, net working capital

1. INTRODUCTION

The primary goal of every living organism is to continue to exist in the best state of health. For the company there are the same rules and the goal of a healthy continuity is essentially nourished of balance and, in particular, of economic and financial balance. The economic

balance is achieved if, when and as the return on invested capital (Phillips, 1997) of the firm is higher than the cost of capital (Modigliani and Miller, 1958) (also defined as the return that would have generated the same capital risk in similar conditions): in this scenario, the company creates economic value. The financial balance has multiple views that, for the object of this paper, are substantially related to two: the attitude of the company, on one side, to generate cash from its operating activities and, secondly, to finance consistently its own competitive strategies using the financial resources of the shareholders rather than debt capital, the so-called financial structure (Myers *et al.*, 1984).

With particular attention to financial equilibrium, the objective of this work is to investigate, under a purely financial point of view and then without analyzing the economic impact, the relationships that exist between operating cash flow and the choices, often constrained and binding, of financial structure.

In this framework of analysis, the basic thesis of the following pages is that the relations between the two expressions of financial equilibrium are, on one side, deep and mutually interconnected and, on the other side, essential to guide the competitive strategies in the sign of a lasting health.

These conditions of financial equilibrium, once shared the main methodological implications, are then analyzed in practice versus a real economic sector, so that you can better appreciate the significance, scope of interpretation and application issues.

2. LOGIC AND METRIC OF THE ANALYSIS

The logic and the metric chosen for the analysis at issue are consistent with the objective of the company management to acquire promptly the wider awareness of the management priorities and to orientate properly their managerial decisions and actions. Consistently with this logical line are available “ad hoc” models of financial analysis more consistent with the above “managerial objectives” and in particular:

- a. as concerns the dynamic of cash flows, i.e. the receipts and the disbursements of the company, the logical driver is in the rational management that triggers them and in the different management area to which they belong: in this direction, there are operating cash flows related to the core business (the so-called free cash flows to firm) (Damodaran, 2001), cash flows related to the fiscal relationship with the treasury, cash flows related to extraordinary non-recurring events and cash flows related to shareholders’ equity and third-parties lenders debt;

- b. as regards the variances analysis the focus is on the individual factors that contribute to the determination of the free cash flows to firm (Fig. 1) and consequently cause changes in the financial structure. Through the variances analysis, as Anthony *et al.* (2004) claim, "Management wants to know not only *what* the amounts of the differences between actual and planned results were but also, and more important, *why* these variances occurred".

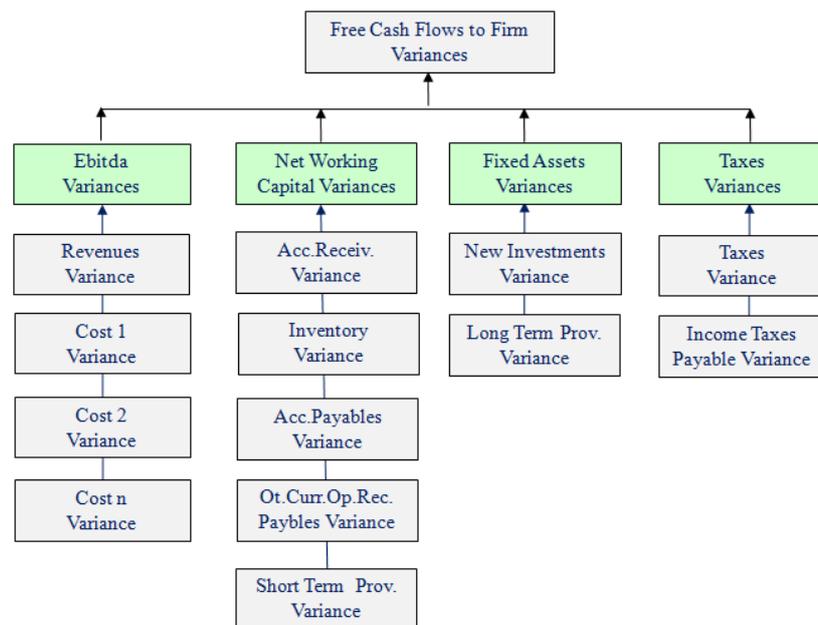

Fig. 1 – An overview of the Free Cash Flows to Firm variances analysis

- c. as concerns the financial structure, the logical assumption is the distinction of the funding sources between pure "full risk" lenders, the shareholders, and pure "partial risk" lenders, the third-parties lenders debt: in other words the financial structure under investigation is exclusively composed of shareholders' equity and net financial position lenders, the so called pure providers of capital.

2.1. Free cash flows to firm. Two basic ingredients

Before we get into the analysis of the dynamic relationships between free cash flows to firm (FCFF) variances and financial structure it's useful a synthetic overview of their nature. In this direction, FCFF:

- are a magnitude-flow, that is they belong to the family of the financial variables that can find measurement only with reference to a specific period of time (for example, an administrative exercise);
- arise from the union of the economic components of a given period and from the changes in balance sheet items (always related to the same period);

- c. show the ability of the company to generate or absorb financial resources from its own core business;
- d. determine the financial requirements to satisfy by resorting to the use of the financial leverage or new financial resources contributed by the shareholders.

Two basic ingredients

The determination of the free cash flows to firm requires two basic ingredients:

1. revenues and related costs summarized in the so-called Income Statement (or Profit and Loss Statement or Earnings Statement): the following Tab. 1 shows (among the many) a classic synthetic Added Value-Ebitda Income Statement based view:

Income Statement	Time Period n	% vs Net Revenues	Time Period n-1	% vs Net Revenues	Managerial Meaning
a) Net revenues (or sales)	1.000	100,00%	950	100%	Product between volumes sold and related selling prices
b) External operating costs	-400	40,00%	-390	-41,05%	Product between volumes purchased from external suppliers (raw materials, services, consulting, etc.) and related purchasing prices
c=a+b) Added value	600	60,00%	560	58,95%	Value added by internal operating costs (labor costs and depreciation) compared to the external operating costs
d) Labor cost	-250	25,00%	-260	-27,37%	Amount of the costs related to wages and salaries
e=c+d) Earnings before interests, depreciation and amortization (Ebitda)	350	35,00%	300	31,58%	Margin generated by the core business before interests, depreciation and amortization
f) Depreciation and amortization	-40	4,00%	-30	3,16%	Periodic decrease in an asset's value caused by obsolescence
g) Provisions for risks and future costs	-10	1,00%	-10	1,05%	Periodic provisions to support future risks and costs
h= \sum e:g) Earnings before interests and taxes (Ebit)	300	30,00%	260	27,37%	Margin generated by the core business
i) Interests	-50	5,00%	-50	5,26%	Financial expenses (or incomes) generated by financial debts (assets)
a) Extraordinary revenues/costs	0	0,00%	0	0,00%	Extraordinary expenses (or incomes)
k= \sum h:j) Earnings before taxes (Ebt)	250	25,00%	210	22,11%	Margin before taxes
l) Taxes	-100	10,00%	-84	8,84%	Fiscal costs due to the Tax Authorities
m=k+l) Net income (NI)	150	15,00%	126	13,26%	Margin after taxes

Tab. 1 - Income Statement focused on Valued Added and Ebitda

2. investments and related funds of capital summarized in the so-called Balance Sheet (or Statement of Financial Position): the following Tab. 2 shows (among the many) a classic synthetic Balance Sheet view based on Net Operating Capital Invested (Brealey *et al.*, 2011), just net operating assets, financed by shareholders' equity and third-parties lenders debt, just pure capital providers:

Balance Sheet	Time Period and % to Net Operating Capital Invested				Managerial Meaning
	Time Period n	% to NOCI	Time Period n-1	% to NOCI	
a= \sum b:d) Current operating assets	390	97,50%	350	102,94%	Financial resources invested in the core business for a period < 12 months
b) Accounts receivable	300	27,50%	270	79,41%	
c) Inventories	80	20,00%	60	17,65%	
d) Other current operating receivables	10	2,50%	20	5,88%	
e= \sum f:i) Current Operating Liabilities	180	45,00%	180	52,94%	Financial resources provided by operating resources suppliers for a period < 12 months
f) Accounts payable	110	27,50%	130	38,24%	
g) Income taxes payable	50	12,50%	40	11,76%	
h) Other current operating payables	20	5,00%	10	2,94%	
i) Short term accumulated provisions for risks	0	0,00%	0	0,00%	
j=a-e) Net Working Capital	210	52,50%	170	50,00%	Net financial resources invested in the core business for a period < 12 months
k) Tangible and intangible long term asset, net	240	60,00%	220	64,71%	
l) Long term accumulated provisions for risks and costs	50	12,50%	50	14,71%	
m=k-l) Net Fixed Assets	190	47,50%	170	50,00%	Net financial resources invested in the core business for a period > 12 months
n=j+m) Net Operating Capital Invested (or total net operating assets)	400	100,00%	340	100,00%	Total net financial resources invested in the core business
o= \sum p:s) Shareholders' Equity	290	72,50%	220	64,71%	Financial resources provided by shareholders' equity
p) Common stock	50	12,50%	50	14,71%	
q) Additional paid-in capital	30	7,50%	30	8,82%	
r) Retained earnings	60	15,00%	14	4,12%	
s) Net income	150	37,50%	126	37,06%	
t= \sum u:z) Third-Parties Lenders Debt (or Net Financial Position)	110	27,50%	120	35,29%	Net financial resources provided by third-parties lenders debt
u) Short term financial debts	50	12,50%	60	17,65%	

v) Cash and cash equivalent	-10	2,50%	-10	-2,94%	
w) Long term financial debts	80	20,00%	80	23,53%	
z) Investment securities	-10	-2,50%	-10	-2,94%	
x=0+t) Net Operating Capital Acquired (or net financial position and shareholders' equity)	400	100,00%	340	100,00%	Net financial resources provided by shareholders' equity and third-parties lenders debt

Tab. 2 – Balance Sheet focused on Net Operating Capital Invested and Shareholders' equity and third-parties lenders debt

An appropriate mix of economic and balance sheet components generates automatically (through the indirect method) the so-called Cash Flows Statement: the following Tab. 3 shows (among the many) an “ad hoc” Cash Flows view based on the distinction between operating and financial cash flows and the related impact on the Financial Structure (shareholders' equity and net financial position):

Cash Flows Statement	Time Period and % to Revenues				Managerial Meaning
	Time	% to	Time	% to	
	Period n	Revenues	Period n-1	Revenues

Tab. 3 - Cash Flows Statement focused on FCFF and free cash flows to pure lenders

2.2. Financial structure and financial leverage

As concerns the financial structure, the latter is the mix of the financial resources provided by pure capital suppliers: shareholders' equity (common stock, additional paid-in capital, retained earnings, net income) and third-parties lenders debt (short and long term financial debts net of cash and cash equivalents and investment securities).

The relationship between net financial position and shareholders' equity is the so-called financial leverage (Blazenko, 1996) (see the following Tab. 4). The latter is a very important ratio for managerial trade-off evaluations in terms of financial risk (Markowitz, 1952), funding opportunities, cost funding, company reputation, etc. and for these reasons it's rich of pervasive managerial implications.

Financial Structure	Time Period and % to Net Operating Capital Invested				Managerial Meaning
	Time Period n	% to Net Operating Capital Invested	Time Period n-1	% to Net Operating Capital Invested	
a=Shareholders' Equity	290	72,50%	220	64,71%	Financial resources provided by shareholders' equity
b= Third-Parties Lenders Debt (or Net Financial Position)	110	27,50%	120	35,29%	Financial resources provided by third-parties lenders debt
c=b/a) Financial Leverage	0,38		0,55		Company's attitude to finance core business with equity to financial debts

Tab. 4 - Financial structure and financial leverage

2.3. The variances analysis of the free cash flows to firm

A variance is the difference between two values (Anthony, 2004). Typically, the first value represents what actually happened, that is, the performance actually achieved. The other value is a performance benchmark, such as a planned result (what the firm wanted to happen) or a historical result (what happened in the past) or the best competitor performance. A variance analysis involve the breakdown of the global variance into the individual factors that caused the variance. Obviously the algebraic sum of the single variances is equal to the global variance, but it's very important to realize that there isn't only one way to do variance analysis and managers perform different variances analysis because, as Anthony *and al.* claim, "the techniques used to analyze variances depend on management's judgment as to how useful the results are likely to be".

The variances analysis methodology involves five basic steps:

1. identify the individual factors that cause the global variance;
2. define the most useful sequence of the individual factors identified: generally, from a cash flow point of view, revenues are the starting point for the variances analysis;
3. always from a cash flow point of view, it's useful to normalize each absolute value to the revenues;
4. accordingly with the previous most useful sequence, the next step, so-called flexible phase of the values, is to replace each past value with its actual value and calculate the resulting amounts;
5. calculate the variance between the two above said amounts. In particular, there are two different algebraic evaluations about variance:

1. an *unfavorable variance* is the one that makes, all other conditions being equal, actual revenues/margins (costs) value lower (higher) than in the past (or planned target): for example, if the actual external operating costs are higher than in the past, the variance is said to be unfavorable;
2. a *favorable variance* makes actual revenues/margins (costs) value higher (lower) than in the past (or planned target): for example, if actual revenues are higher than in the past, the variance is said to be favorable. As Anthony *and al.* claim, "The words favorable and unfavorable do not necessarily connote value judgments about managerial performance ... but indicate only the algebraic impact of a variance ...".

As concerns FCFF variances analysis, the individual factors that caused the global variance between two periods (for example two years) and a related useful sequence are shown by the following Tab. 5. In particular, these eleven individual factors are connected to four different variances:

1. *ebitda (earnings before interest taxes depreciation and amortization) variance* generated by three individual factors - revenues, external operating costs and labor costs – coming from income statement;
2. *net working capital variance* generated by five individual factors coming from balance sheet - change in accounts receivable, change in inventories, change in accounts payable, change in other current operating receivables and payables, change in short term accumulated provisions and provisions for risks and costs - and by one individual factor coming from a mix between Balance Sheet and Income Statement, change in short term accumulated provisions and provisions for risks and costs;
3. *fixed assets variance* generated by two individual factors - change in tangible and intangible long term (net) assets and depreciation and amortization, change in long term accumulated provisions and provisions for risks and costs – coming from a mix between Income Statement and Balance Sheet;
4. *taxes variance* generated by one individual factor, taxes and change in payable income taxes, coming from a mix between Income Statement and Balance Sheet.

Individual factors of the global variance and a related useful sequence

From

Through

To

Income Statement	1. revenues		
	2. external operating costs		Ebitda variance
	3. labor costs		
	4. Δ accounts receivable		
Balance Sheet	5. Δ inventories		
	6. Δ accounts payable		Net Working Capital variance

	8. Δ short term accumulated provisions and provisions for risks and costs		
A mix between Income Statement and Balance Sheet	9. Δ tangible and intangible long term (net) asset and depreciation and amortization	Fixed Assets variance	
	10. Δ long term accumulated provisions and provisions for risks and costs		
	11. taxes and Δ payable income taxes		Taxes variance

Tab. 5 - Individual factors of the global variance and a related useful sequence. From Income Statement and Balance Sheet to four basic variances: Ebitda, Net Working Capital, Fixed Assets and Taxes

Using the symbol Δ (delta) to represent the difference between an actual amount and a past one, the commonly used rules to find the single variances (V) are as follows:

- a. as concerns the individual factors related to the Ebitda V there are three specific variances (all the following variances can be further broken down; for example, the revenues variance can be splitted into three components: volumes (or quantity) variance, product mix variance and price variance (Anthony, 2004); the costs variance too can be decomposed into four components: volumes (or quantity) variance, mix variance, efficiency variance, price variance; the collection times variance can be disaggregated into three components related to the revenues: volumes (or quantity) variance, customer mix variance and price variance; etc.):

1. the *intensity revenues V* measures the effect on the FCFF related to a different amount of revenues:

$$\text{revenues } V = \Delta \text{revenues} \times (1 - \text{past \% cash absorption}) = 50 \times (100,00\% - 83,05\%) = 8,47$$

In synthesis, the increasing revenues generates, all other conditions being equal, a favorable variance equal to 8,47 (2,18% to actual revenues or 5,26% to past FCFF);

2. the *external operating costs efficiency V* measures the change in the FCFF caused by a different rate of external operating cost efficiency:

$$\text{external operating costs } V = \text{actual revenues} \times \Delta \% \text{ cash absorption by external operating costs} = 1.000 \times (41,05\% - 40,00\%) = 10,52$$

In synthesis, the better external operating costs efficiency produces, all other conditions being equal, a favorable variance equal to 10,52 (1,05% to actual revenues or 6,54% to past FCFF);

3. the *efficiency labor costs V* measures the effect on the FCFF due to a different level of efficiency labor costs:

$$\text{labor costs V} = \text{actual revenues} \times \Delta\% \text{ cash absorption by labor costs} = 1.000 \times (27,37\% - 25,00\%) = 23,68$$

In synthesis, the improved labor cost efficiency generates, all other conditions being equal, a favorable variance of 23,68 (2,37% to actual revenues or 14,71% to past FCFF).

The sum of the above 1), 2) and 3) variances generates the so-called Ebitda variance:

$$\text{Ebitda V} = \text{revenues V} + \text{external operating costs V} + \text{labor costs V} = 8,47 + 10,52 + 23,68 = 42,68.$$

In synthesis, the higher Ebitda produces, all other conditions being equal, a favorable variance of 42,68 (4,27% to actual revenues and 26,51% to past FCFF).

- b. as concerns the individual factors related to the Net Working Capital V there are five different variances:

1. the *collection times V* measures the effect on the FCFF related to a different days sales outstanding:

$$\text{collection times V} = \text{actual revenues} \times \Delta\% \text{ cash absorption by accounts receivable} = 1.000 \times (-3,00\% - (-2,11\%)) = -8,95$$

In synthesis, the worsening of collection times from customers generates, all other conditions being equal, an unfavorable variance of -8,95 (-0,89% to actual revenues or 5,56% to past FCFF);

2. the *inventory V* measures the effect on the FCFF related to a different days inventory outstanding:

$$\text{inventory V} = \text{actual revenues} \times \Delta\% \text{ cash absorption by inventory} = 1.000 \times (-2,00\% - (-1,05\%)) = -9,47$$

In synthesis, the worsening of the inventory rotation produces, all other conditions being equal, an unfavorable variance of -9,47 (-0,95% to actual revenues or 5,88% to past FCFF);

3. the *payment times V* measures the effect on the FCFF due to a different payment time of suppliers:

$$\text{payment times V} = \text{actual revenues} \times \Delta\% \text{ cash absorption by accounts payable} = 1.000 \times (-2,00\% - 1,05\%) = -30,53$$

In synthesis, the worsening of time payment to suppliers generates, all other conditions being equal, an unfavorable variance of 30,53 (3,05% to actual revenues or 18,96% to past FCFF);

4. the *other current operating receivables and payables V* measures the effect on the FCFF due to a different incidence of the other current operating receivables and payables:

other current operating receivables and payables $V = \text{actual revenues} \times \Delta\% \text{ cash absorption by other operating receivables and payables} = 1.000 \times (2,00\% - 1,05\%) = 9,47$

In synthesis, the improving of the current operating receivables and payables incidence generates, all other conditions being equal, a favorable variance of 9,47 (0,95% to actual revenues or 5,88% to past FCFF);

5. the *short term provisions risks V* measures the effect on the FCFF related to a different level of use of short term provisions for risks:

short term provisions for risks $V = \text{actual revenues} \times \Delta\% \text{ cash absorption by use of short term provision for risks} = 1.000 \times (0,00\% - 0,00\%) = 0,00$

The sum of the above 1), 2) 3), 4) and 5) variances generates the so-called Net Working Capital variance:

Net Working Capital $V = \text{collection times } V + \text{inventory } V + \text{payment times } V + \text{other current operating receivables and payables } V + \text{short term provisions risks } V = -8,95 - 9,47 - 30,53 + 9,47 + 0,00 = -39,47$.

In synthesis, the greater amount of Net Working Capital produces, all other conditions being equal, an unfavorable variance of -39,47 (3,95% to actual revenues and 24,52% to past FCFF).

- c. as concerns the individual factors related to the Fixed Assets V there are two different variances:

1. the *new investments* (originated by the algebraic sum of change in the net fixed assets and depreciation and amortization) V measures the effect on the FCFF related to a different rate of new tangible and intangible investments:

new investment $V = \text{actual revenues} \times \Delta\% \text{ cash absorption by new investments} = 1.000 \times (-6,00\% - (-4,21\%)) = -17,89$

In synthesis, the increasing new investments generate, all other conditions being equal, an unfavorable variance of -17,89 (-1,79% to actual revenues or 11,11% to past FCFF);

2. the *long term provisions risks V* measures the effect on the FCFF related to a different level of use of provisions for risks:

long term provisions risks $V = \text{actual revenues} \times \Delta\% \text{ cash absorption by use of provision}$
 for risks $= 1.000 \times (-1,00\% - (-1,1\%)) = 0,53$

In synthesis, the higher use of provisions for risk generates, all other conditions being equal, an unfavorable variance of 0,53 (0,05% vs actual revenues or 0,33% vs past FCFF);

The sum of the above 1) and 2) variances generates the so-called Fixed Assets variance:

Fixed Assets $V = \text{new investments } V + \text{long term provisions risks } V = -17,89 + 0,53 = -17,36$.

In synthesis, the greater amount of Fixed Assets Capital produces, all other conditions being equal, an unfavorable variance of -17,36 (1,74% to actual revenues and 10,78% to past FCFF).

d. as concerns the individual factors related to the Taxes there are two variances:

1. the *taxes pressure* V measures the effect on the FCFF related to a different tax rate pressure:

taxes pressure $V = \text{actual revenues} \times \Delta\% \text{ cash absorption by taxes pressure} = 1.000 \times (-12,00\% - (-8,84\%)) = -31,58$

In synthesis, a higher tax rate pressure generates, all other conditions being equal, an unfavorable variance of -31,58 (-1,90% to actual revenues or -19,61% to past FCFF);

2. the *payable income taxes* V measures the effect on the FCFF related to a different payable income taxes level:

payable income taxes $V = \text{actual revenues} \times \Delta\% \text{ cash absorption by payable income taxes} = 1.000 \times (1,00\% - 0,53\%) = +4,74$

In synthesis, the higher level of payable income taxes pressure generates, all other conditions being equal, a favorable variance of +4,74 (+0,47% to actual revenues or 2,94% to past FCFF);

The sum of the above 1) and 2) variances generates the so-called Taxes variance:

Taxes $V = \text{taxes pressure } V + \text{payable income taxes } V = -31,58 + 4,74 = -26,54$.

In synthesis, the increasing negative fiscal cash flows produces, all other conditions being equal, an unfavorable variance of -26,54 (2,65% to actual revenues and 16,67% to past FCFF).

The following FCFF Bridge, Fig. 2, summarizes the contribution of each individual variance to the FCFF global variance. In particular, it's very important to identify if the

change in FCFF is due to an Income Statement factor or to a Balance Sheet factor, and in particular to a contribution of ebitda, net working capital, fixed assets and taxes.

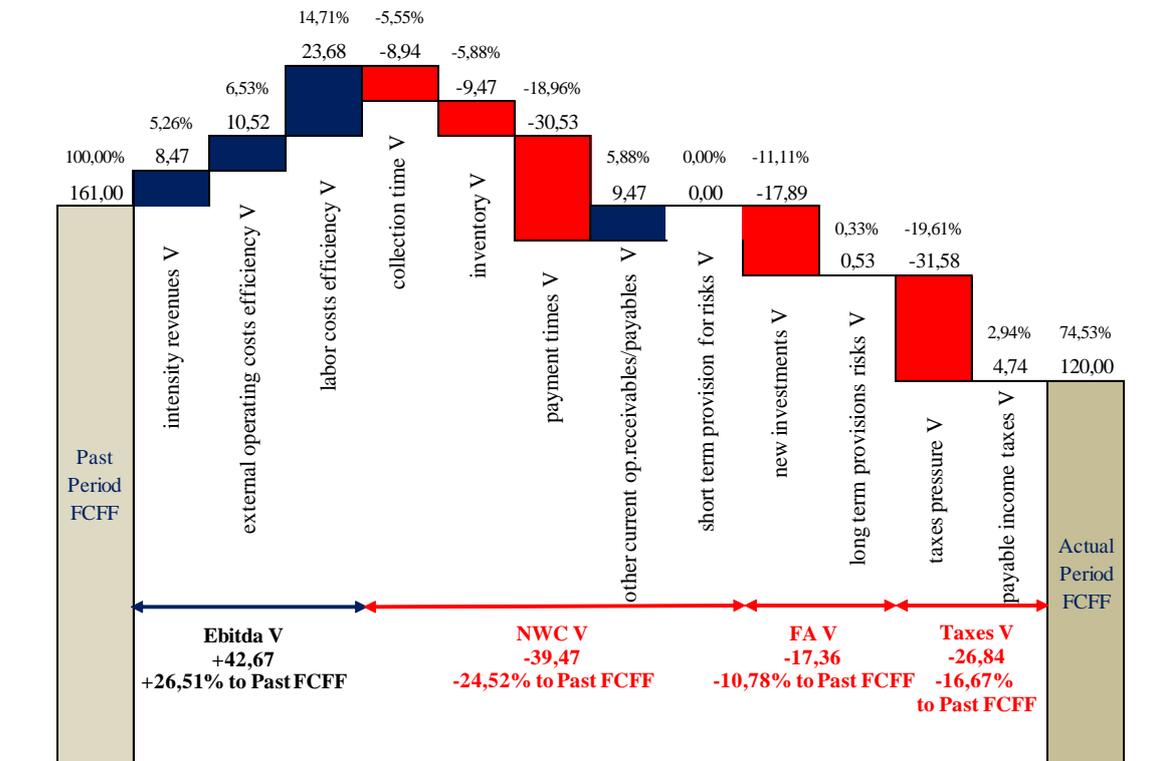

Fig. 2 – Free Cash Flows to Firm bridge

Under a managerial point of view it is essential, on one side, to measure which managerial processes – selling, purchasing, innovation, etc. - are increasing (or decreasing) FCFF and, on the other side, to identify the best way to preserve good performance, that is the positive FCFF variances (in the example the ebitda components), and to correct bad performance, that is the negative FCFF variances (in the example the net working capital and taxes components). By the variances quantification, the management conquists the precious opportunity to focus the right energies on the most relevant critical points and to concentrate on the existing, and frequently hidden, relationships between the different variances.

3. From the variances analysis of the free cash flows to firm to a different financial structure. Synthetic relationships of equilibrium

Between FCFF and financial structure there is a strong relationship in terms of financial equilibrium and healthy continuity of the firm. In this direction, positive FCFF variances are, financial and extraordinary costs paid, the most authentic way to lead the company towards a double purpose: the financial structure target and the competitive position target. In particular, the positive FCFF variances, all other conditions being equal, allow:

- a. the strengthening of the degree of financial independence and therefore a greater bargaining power towards stakeholders;
- b. a continuous pay out of dividends with a consequent shareholders' satisfaction;
- c. an improvement of the financial debts quality: extension of financial debt maturities, lower funding costs, greater possibilities to reduce the amount of financial debts;
- d. a better competitive reputation.

In the above example the reduction of FCFF, from 161,00 to 120,00, causes, all extraordinary and financial and dividends conditions being equal, an identical impact, -41,00 on the process of reducing the Net Financial Position, from 51 of the past year to 10 for the current year (Tab. 6). In particular, this is the difference between positive ebitda variance (+42,67) and negative net working capital (-39,47), fixed assets (-17,36) and taxes (-26,84) variances.

Financial Values	Time Period and % to Net Revenues				Managerial Meaning
	Time Period n	% to Net Revenues	Time Period n-1	% to Net Revenues	
a. Free Cash Flows to Firm	120	12,00%	161	16,95%	Company's attitude to provide/require financial resources (after taxes) from its own core business
b. Free Cash Flows to (Pure) Lenders	120	1,00%	161	16,95%	Cash flows available for pure lenders
c. Financial revenues/costs (tax shield net) and Dividends to shareholders	-110	-11,00%	-110	-11,58%	Cash out by financial revenues/costs and dividends
d=b-c) Net Financial Position reducing through change in FCFF	10	1,00%	51	5,37%	
e. Net Financial Position	110	11,00%	120	12,63%	Financial resources provided by third-parties lenders debt

Tab. 6 – The change in Free Cash Flows to Firm drive (extraordinary, financial and dividends cash out conditions being equal) changes on the financial structure

4. Spare Parts Manufacturers in the Italian Automotive Independent After Market. The variances of the free cash flows to firm and the financial structure in the 2008-2011 period

This last section highlights, in brief and in accordance with the purpose of the present work, the results obtained from the Competitive Risk and Enterprise Value Research Center of the Polytechnic of Turin (Italy), whose mission is to develop models and metrics for measuring economic performance. First of all, some information about the analysis scope:

- a. the results of the analysis are focused on the free cash flows to firm variances analysis and their impact on the financial structure;
- b. the statistical sample is composed by 291 limited companies operating in Italy as Spare Parts Manufacturers for the Italian Automotive Independent After Market. The above 291 companies are composed by 36 large companies (turnover greater than € 100 million), 43 medium-sized enterprises (turnover between 30 and 100 million euro) and 212 small business (turnover lower than € 30 million). All data, extracted from the financial statements officially registered at the Italian Chambers of Commerce, are public;
- c. the 2008-2011 is the analyzed period and for each period the FCFE variances analysis shows the contribute of each individual factor as ebitda, net working capital, fixed assets and taxes and the related relationship with the financial structure.

The set of all the 291 companies shows, in brief (Tab. 7), the following financial highlights:

- a. a slight increase in revenues (2011-2008 cagr of +0,47%);
- b. a meaningful decrease in ebitda (2011-2008 cagr of -2,08%);
- c. a small increase in taxes with a 2011-2008 cagr of +0,36%;
- d. an increasing of net capital invested (cagr of +0,98%) in both its components, net working capital (cagr of +1,33%) and net fixed assets (cagr of +0,55%);
- e. a consistent improving in the financial structure: shareholders' equity, cagr of + 1,95%, and third-parties lenders debt, cagr of -19,38%.

Financial Highlights	2011	2010	2009	2008	Cagr 2011/2008
Net revenues	14.367.975	13.794.764	11.865.651	14.168.271	0,47%
Ebitda	1.057.623	1.097.205	894.752	1.126.306	-2,08%
Taxes	229.053	211.284	152.926	226.569	0,36%
Net Working Capital	2.391.162	2.280.608	2.125.237	2.298.281	1,33%
Net Fixed Assets	1.910.717	1.939.896	1.867.210	1.879.459	0,55%
Net Capital Invested	4.301.879	4.220.503	3.992.447	4.177.740	0,98%
Shareholder's Equity	4.179.437	4.367.495	4.124.765	3.944.051	1,95%
Third-Parties Lenders Debt	122.442	-146.992	-132.318	233.689	-19,38%

Tab. 7 – The main financial highlights for the Spare Parts Manufacturers in the Italian Automotive Independent After Market

As concerns the individual factors of the FCFF variances analyses, the Tab. 8 highlights some interesting observations:

- a. except for 2010, ebitda has always negatively contributed to the improvement of the FCFF: in other words, the lower Ebitda produces for three years on four, all other conditions being equal, an unfavorable variance: -0,53% to 2011 revenues, -0,36% to 2009 revenues and -1,41% to 2008 revenues. The critical point is especially related to the external operating costs (always negative except the 2009) which are absorbing the positive contribution of revenues to FCFF: it's an uneconomic exchange between revenues and external operating cost. On the contrary, labor cost generates a favorable variance in 2011 and in 2010, but is not enough to change the sign of ebitda variance;
- b. as regards to the net working capital the contribution to FCFF is always, except for 2010, positive and first of all thanks to lower collection times, for the second consecutive year, and to a favorable variance of the other current operating receivables and accounts payable;
- c. the positive fixed assets variance is mainly due to an investment slowdown and this trend could have a negative impact on future results; without this investment cutting, 0,95% to revenues in 2011, the FCFF variance would have been negative in 2011, -0,10% to revenues;
- d. higher taxes produce an increasing unfavorable variance: -0,47 to revenues in 2011 and -0,22 to revenues in 2010.

Free Cash Flows to Firm: Individual Factors V (to Revenues)	2011	2010	2009	2008	Δ 2011-2008
a=b+c+d+e)Free Cash Flows to Firm V	0,85%	-2,13%	3,11%	0,80%	0,05%

e2)Income taxes payable V	-0,27%	-0,13%	0,94%	-0,11%	-0,17%

Tab. 8 – The main individual factors of the FCFV variances analysis for the Spare Parts Manufacturers in the Italian Automotive Independent After Market

As concern the relationship between the FCFV variance and the impact on the financial structure, Tab. 9 shows how the positive 2011 FCFV, +0,85% to revenues, is higher than extraordinary revenues/costs (tax shield net) V, -0,69% to revenues, but not enough to hold up shareholders' equity V needs, -3,80% to revenues, and all this in despite of a positive financial revenues/costs (tax shield net) V to revenues, +0,35. It means a financial deficit V to revenues equal to -3,28% satisfied through, on the one hand, the 2011 FCFV, +1,40% to revenues, and, on the other side, an increasing of the Net Financial Position V, + 1,89% to revenues.

Free Cash Flows to Firm: Individual Factors V vs Revenues	2011	2010	2009	2008
a)FCFV V to revenues	0,85%	-2,13%	3,11%	0,80%
b)Extraordinary revenues/costs (tax shield net) V to revenues	-0,69%	0,74%	0,46%	-0,58%
c=a-b)Free Cash Flows to Pure Lenders V to revenues	0,17%	-1,39%	3,57%	0,22%
d)Financial revenues/costs (tax shield net) V to revenues	0,35%	-0,28%	0,39%	0,31%
e)Net Shareholders' equity V to revenues	-3,80%	-1,35%	-0,55%	-0,87%
f=c+d+e)Financial Surplus (-Deficit) V to revenues	-3,28%	-3,02%	3,40%	-0,33%
g)Third-Parties lenders debt (or net financial position) V to revenues	1,89%	-0,11%	-3,08%	1,13%
h)FCFV actual period to revenues	1,40%	3,13%	-0,32%	-0,80%
i=g+h)Third-Parties lenders debt V vs revenues + FCFV actual period to revenues	3,28%	3,02%	-3,40%	0,33%

Tab. 9 – The main individual factors of the FCFV variances analysis for the Spare Parts Manufacturers in the Italian Automotive Independent After Market and the impact on the financial structure

In synthesis, in 2011 Spare Parts Manufacturers generate a favorable but insufficient FCFV: at the same time, they, on the one hand, increase third-parties lenders debt and, secondly,

decrease shareholders' equity realizing by this way an important change in the Financial Structure in the direction of worsening the level of financial independence.

3. CONCLUDING REMARKS

As shown in the present essay there are strong relationships between free cash flow to firm and financial structure: a rigorous management of FCFF is the best way to manage seriously the financial structure (and sometimes vice versa). The variances analysis is a simple, flexible and precious method able to quantify the impact of the management process, from competitive strategies to managerial actions, on the financial structure equilibrium. Through ebitda, net working capital, fixed assets and taxes variances it's possible to investigate each link between the economic and balance sheet side and the financial one, too often the dark side of the firm crisis/weakness and almost always the true over boosting for a continuous competitiveness. Each variance in the individual factors of the FCFF is, all extraordinary and financial cash in cash out being the same, a variance in the financial structure and consequently it is a variance compared to those who finances the company and its possibilities to belong to the future.

**ORGANISATIONAL CULTURE AND THE VALUE
PRIORITISATION OF A FIRM'S INTELLECTUAL CAPITAL:
TOWARDS A CONCEPTUAL FRAMEWORK**

ABSTRACT

Ulrich defined intellectual capital as Competence x Commitment. The model was later extended to include Control as a key ingredient to measure and leverage intellectual capital. In an earlier paper, we expanded this model to include two additional dimensions, Creativity and Culture, and defined the relationship between intellectual capital and the following five critical variables: Competence, Commitment, Control, Creativity, and Culture. We showed how the interrelationships between these variables can help firms to define and describe their intellectual capital assets.

In this paper, we focus on conceptually exploring organisational culture and its impact on building a strong organisational foundation for intellectual capital. In particular, we focus on the collective dynamics of the type of organisational culture and the characteristics and volatility of the industry in which the firm operates, and its influence on a firm's ability to develop and leverage its intellectual capital. Underlining the increasingly critical strategic importance of tacit knowledge and resources in competitiveness and sustaining competitive advantage, this paper provides a framework that CEOs and senior managers can use to identify and prioritise the value of intellectual capital to their firm based on the organisation's culture and industry characteristics in which the firm operates. In concluding we draw together various convergent strands from associated research streams, and present a 2x2 matrix conceptualising intellectual capital complexity in relation to the firm's level of competitiveness. In this paper we seek to preliminarily explore, as well as encourage additional research to further develop and test this framework in order to establish the interrelationships between organisational culture and intellectual capital.

Keywords: Intellectual Capital, Organisational Culture, Knowledge Management, Tacit Knowledge, Intellectual Assets, Intellectual Framework

INTRODUCTION

The culture of an organisation is influenced by a number of factors, including the industry within which it operates and its maturity cycle, industry volatility, the age of the organisation, leadership style of its senior management, competitive pressures, organisational structure, and various other related factors. Because of its very intrinsic and abstract nature, culture means different things to different individuals, often even within the same organisation – this is even more so accentuated across organisations, industries, regions, countries, and cultures.

Ulrich (1998) defines intellectual capital (IC) as 'Competence x Commitment'. This was later extended to include Control as another key element for measuring and leveraging intellectual capital. In an earlier paper we further extended this model to also include an additional two dimensions, Creativity and Culture – providing a fundamental basis supporting the other elements, fostering conducive dynamics for IC development, enhancement and exploitation (Gupta and Azzopardi 2013). Facing ever competitive and dynamic environments, many firms increasingly recognize the value of their intellectual capital. However, this does not automatically translate into full scale leveraging of their intellectual assets to build a sustainable and successful enterprise. Intellectual capital is of value only if an organisation capitalises on it. To use an analogy, if intellectual capital of employees is viewed as a seed and the organisation is the soil, the characteristics of the soil and its nurturing elements impact the ability of the seed to grow and bloom. The soil for intellectual capital is the culture of an organisation.

Culture is immensely powerful and impactful on organisational dynamics and hence must in this regard be singled out and its impact on the value prioritisation of the firm's intellectual capital should be carefully studied. While many other elements of an organisation can be replicated, such as structures, systems, and even products and services, an organisational culture that promotes learning and the leverage of knowledge is hard to imitate – and further, provides competitive and sustainable advantage prospects for firms (Barney, 1986). In addition, a healthy and conducive organisational culture contributes to other critical components of intellectual capital, such as human capital, technology capital, business

capital, and social capital (Martin-de-Castro, 2006). This is not to say that the other four elements, namely, Competence, Commitment, Control (Ulrich, 1998), and Creativity (Gupta and Azzopardi, 2013) are less valuable. It simply means that if an organisation does not pay close attention to the impact of its culture on its intellectual capital, the other four 'C' elements supporting the development and leverage of intellectual capital are likely to be adversely affected or compromised – impacting on the firm's IC prospects.

In this regard, while culture is almost unanimously understood to be a critical and defining characteristic of the DNA of an organisation, there is no single definition of organisational culture. Though much has, and continues to be written about organisational culture, like many evolving fields it remains bereft of universal definitions. While an extent of convergence is evident, on-going academic debate and research initiatives adopt varying perspectives informed by different theoretical approaches. This is understandable, as by its nature organisational culture and its myriad interrelated dynamics presented by diverse organisations' contexts and circumstances are complex. Consequently, while highlighting that organisational culture can be a source of sustainable competitive advantage (Barney 1986), in their recent extensive review of instruments for exploring organisational culture in the extant literature, Jung et al (2009, p.1087) indeed concluded, as may be expected, that "there is no ideal instrument for [organisational] cultural exploration. The degree to which any measure is seen as 'fit for purpose' depends on the particular reason for which it is to be used and the context within which it is to be applied".

Yet notwithstanding, as inferred earlier, what is almost universally accepted though is that organisational culture can be an intrinsic and invaluable asset that often is the cornerstone of long-term sustainable success. Bontis (1998) suggests that cross-references between intellectual capital data and the cultural dimensions proposed by Hofstede (1980) can show interesting relationships between concepts. In this respect, culture is valued as much, if not more, than tangible assets in mergers and acquisitions because it is not only hard to imitate, but also it may take competitors many years and many mistrials to imitate and attempt to cultivate a successful and healthy organisational culture. Lacking a universal definition, it becomes imperative for each organisation to be able to define and develop a universal language of its own culture – as well as acknowledge that while the other 'C' characteristics influencing IC are also important and influential, ultimately they are in turn, impacted by the underlying organisational culture. For example, all organisations need control mechanisms.

Still the culture of the organisation determines whether such controls stifle or facilitate organisational learning. Often, there are indirect references to the role of organisational culture in intellectual capital literature, particularly as it relates to structural capital where structural capital is defined as the organisation's "*strategies, processes and policies*" (Dzinkowski, 2000). However, an organisation's culture is more than the sum of its strategies, processes and policies.

In this regard, we use the following definition of organisational culture in this paper (Wu, 2008, p. 2540):

"organisational cultures consist of interactions among critical masses of people with different preferences and past choices that have the capacity to wield critical influences upon each other, both in the short and long terms, within and beyond the confines of organisations and resource constraints."

In the next section, we identify and elaborate on an existing model that classifies different types of organisational cultures. We then conceptualise the impact of different types of organisational cultures on intellectual capital.

ORGANISATIONAL CULTURE MODELS

Beyond specifics narrowly associated with particular organisational types, contexts or sectors, in line with stated research objectives, this paper adopts a broader scope on organisational culture towards establishing a generic conceptual platform and model adaptable to different organisations. This enhances applicability for comparative research across different organisational types, sectors or industries, and enables the utilisation of the model as an analytical strategic tool for management practice and consulting purposes.

This paper builds upon the established model of organisational culture types adapted by Deshpande et al (1993) from the works of Quinn and Rohbraugh (1983) and Cameron and Freeman (1991). In a nutshell, the basis for this model derives from Quinn and Rohbraugh's (1983) 'competing values framework' for organisational effectiveness analysis. Their research consolidated extant theoretical and empirical insight, establishing 'control-flexibility' and 'internal-external' as the major dimensions and basis for their practical 2x2 matrix – accounting for and condensing a broad range of important indicators impinging on organisational culture.

Prior to this framework, earlier studies were impractical for organisations to apply given the need to account for numerous dimensions (Quinn and Rohbraugh 1983). Nonetheless, merging theoretical traditions deriving on the one hand from organisational behaviour and systems-structural domains, and transaction cost perspectives grounded in economics (Williamson 1975) on the other, as well as being consistent with the seminal works of Ouchi (1980), Mintzberg (1979) and Williamson (1975) on organisational forms, the sound relevance of this approach based on two key dimensions defining culture types is recognized and established (Deshpande, 1993; Saxby *et al*, 2002).

Here, this paper adopts and builds further on the slightly modified representation of this model put forward by Saxby *et al* (2002) – which also incorporates generic strategy as well as environmental scanning methods. Generic strategy and organisational culture are inextricably linked (Weick, 1985), and environmental scanning is a behavioural characteristic critical to organisational culture as it impacts the effectiveness of strategic planning towards sustainable competitive advantage in increasingly competitive and dynamic environments. This is aligned to the applied stance of this paper and practice-based application. Additionally, intellectual capital and knowledge being core, the authors of this paper develop this model further and posit that the importance, critical conduciveness to, and strategic relevance of tacit knowledge tends to comparatively increase along the ‘flexibility-control’ continuum on the vertical axis as one moves towards less mechanistic and more organic and unstructured, flexible organisational contexts (Figure 1).

This is crucially important since, all else being equal, as competition intensifies in increasingly dynamic and globalized markets, greater critical importance is placed on tacit forms of knowledge for sustainable competitive advantage and survival (Hall, 1992) – fundamentally in line with the resource- and knowledge-based views of the firm (Barney, 1991; Grant, 1991, 1996). Conversely, organisations competing in dynamic contexts characterized by volatility and greater extents of uncertainty tend to be less effective and conducive to competitiveness when organisational cultures are based on mechanistic processes founded on stability. The enhanced model of organisational culture types established for this paper is presented in Figure 1 below.

axis of this matrix, the 'organisational focus' continuum discerns between organisations' focus in relation to 'internal' or 'external' orientation. The various attributes and distinguishing characteristics of the four culture types are respectively indicated together with reference to the likely complementary generic strategy relevant to those organisational contexts vis-à-vis external environmental conditions typically associated with each culture type for the purposes of strategic fit.

This model (Figure 1) clearly indicates that one cannot be prescriptive when it comes to propose a universally acceptable definition of culture, or to promote an 'ideal' culture. Diverse and varying circumstances demand a culture that would befit the idiosyncratic circumstances of the organisation in question. Against this backdrop we can now conceptualise the role of intellectual capital and the development thereof again in line with the diverse and varying realities within which the organisation is operating – focusing our attention on the particular and unique characteristics of the firm and the realities of their concomitant industry dynamics.

FIRM CHARACTERISTICS, INDUSTRY DYNAMICS AND THEIR ASSOCIATION WITH INTELLECTUAL CAPITAL

In a knowledge-driven economy, business leaders understand the strategic importance and value of intellectual capital and the need to leverage it for the long-term competitive advantage of the firm. While the economic value and sustaining power of intellectual capital is well understood and the direct and strong relationship between intellectual capital and the survival and success of a firm is widely embraced, what is less well understood are how to apply the IC models, tools, techniques and frameworks to deliver bottom line results. According to Reinhardt *et al* (2001, p. 796), "*The interaction between human capital, organisational capital, and customer capital can produce financial capital that, over time, can turn into equity recognized by the capital market, a status that enable the equity in turn, to influence the market value of the company*". In other words, intellectual capital can become the invisible hand that drives a firm's equity and increases its market value. This requires firms to carefully identify, compile, monitor, and grow a firm's intellectual capital assets. While this is necessary, it is not sufficient. Firms must also pay close attention to two additional dimensions: one, the interfaces and interactivity between the compartments or categories of intellectual capital itself, namely human capital, organisational capital, and customer capital, and two, the interfaces and interactivity between a firm's intellectual capital assets and the dynamic

business world within which it operates. It is the dynamic interplay of these two dimensions that results in further expansion and strengthening of a firm's intellectual capital and in turn, leads to *sustainable* competitive advantage and strengthening of its competitive positioning within its industry.

The ability of a firm to become a rigorous, resilient, agile and feared competitor in the marketplace is based on its ability to find the "gold" in the interfaces and interactions' between its human capital, organisational capital, and customer capital. While each one of the three dimensions of intellectual capital can drive profits, the core ability to strengthen and sustain one's competitive position in the marketplace comes from how a firm congeals and leverages the intellectual capital that lies on the borders or fringes of its various intellectual assets. In other words, this dimension determines the level of competitiveness of a firm in the marketplace and can range from highly competitive to non-competitive. The second dimension determines the interfaces and interactions that a firm has with the external world. In other words, how does a firm leverage its intellectual assets to compete in its industry with other competitors? How does it convert its internal currency of intellectual assets into products and services that the market wants and appreciates and more importantly, is willing to pay a premium for over the long-term?

These two dimensions are critical because this is what sets apart the highly competitive, and therefore, often times, the highly successful firms, from the ones that are less competitive and therefore, less successful. Each of these two dimensions is discussed below.

The role of intellectual capital among highly competitive vs. non-competitive firms

Molina *et al* (2004) used the following 14 variables to determine a firms' level of competitiveness: market share, profits, return on investment, technological provision, financial management, quality of products-services, after sales service, managers' educational background, customer royalty, supplier loyalty, location of establishment, employees' professional know-how, employees' commitment and loyalty, and firm's reputation. Highly competitive firms have a propensity toward growth and expansion, create and deliver new products and services rather than marketing similar products and services, venture into new markets rather than limiting themselves to existing markets. Molina *et al* (2004) further state that "*executives in highly competitive firms also display greater skilfulness in conceiving, developing, and exploring information technologies*", arguing that IT is a key force in the world of business today. Molina further argues that while both internal forces (business expansion, offerings of

new products and services, new markets, etc...), and external forces or market dynamics influence the competitive nature and positioning of a firm, internal forces are more significant in influencing the level of competitiveness of a firm. Therefore, the intellectual capital of a firm influences a firm's internal forces to become a highly competitive firm in the marketplace. We envision that when there is rich interactivity and interfaces between different segments of intellectual capital, it further strengthens the firm's ability to be perceived as a hard-to-beat competitor.

The role of intellectual capital and market forces

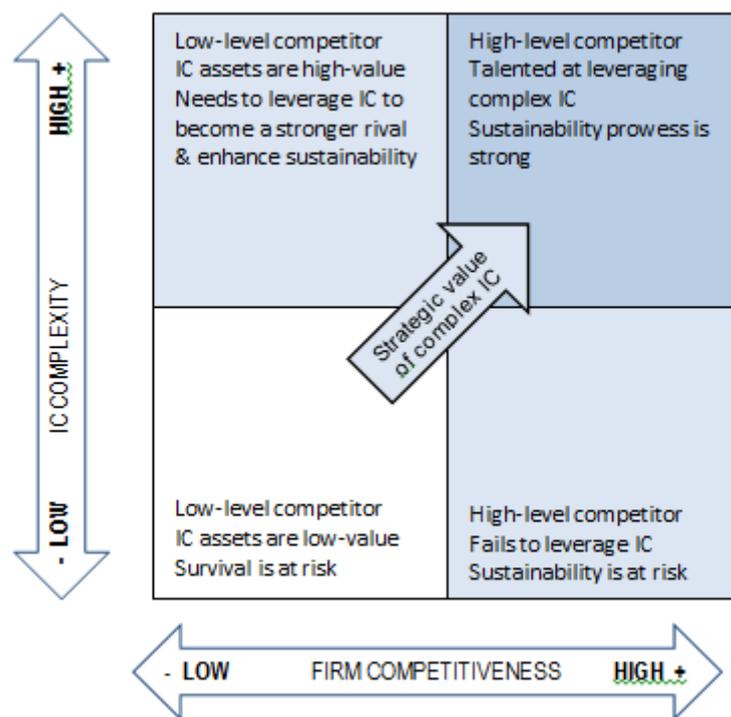

From a theoretical perspective, both the more traditional external/market-driven approaches to strategy (e.g. Porter's five forces analysis) as well as more contemporary approaches primarily driven by an internal emphasis leveraging capability and knowledge (e.g. resource- and knowledge-based views of the firm), require 'fit' between an organisation's strategic initiatives and its broader external environment in order to exploit opportunities for the growth and sustained success of the firm. In other words, firms must focus and build on their capacity and agility to apply their intellectual assets to address shifting market realities (Teece *et al*, 1997; Teece, 1998, 2007; Barney, 2001).

The impact of intellectual capital on the profits of a firm depends on its ability to 'play in its chosen field'. In other words, the internal currency of a firm's intellectual capital can be converted into market 'gold' only if a firm leverages its intellectual capital in ways that are more efficient, effective, valuable, and sustainable than its competitors. It is not enough to just 'play'. Instead, sustainability demands that players in the field be exceptional at changing the rules of the game depending on the landscape, the climate, the tools of the game, the spectators, and other factors that influence the ability to win the game. This is why it is not enough to simply use the same pool of intellectual capital that a firm's competitors have access to, but instead to seek and find higher-order or more complex intellectual capital that often lies hidden in the crevices between the interfaces of different categories of intellectual capital.

The matrix below conceptualises the association between competitive characteristics of a firm and the nature of intellectual capital and its knowledge characteristics (explicit or tacit) that are key success factors for effective competition in such contexts (Figure 2). Hence, in order to achieve sustainable competitive advantage a firm must systematically elevate itself to be a

high-level competitor among rivals and secondly, must apply its intellectual capital to leverage the market dynamics to its advantage.

Figure 2: IC complexity vs. Firm's Level of Competitiveness

[Source: The authors]

In consolidation, in Figure 1, we outlined the relationship between 'organisational structures' ranging from mechanistic processes to organic processes, and 'organisational focus' ranging from internal maintenance to external positioning. In Figure 2, we show the relationship between a firm's current competitive position in the marketplace and its stock of complex IC assets. While it is beyond the scope of this paper to elaborate on the relationship between organisational structures, focus, competitive positioning, and complexity level of IC, it is important to reiterate the inter-linkages between these four dimensions. It is clear that organisations that lean toward organic processes with an external focus are likely to rely on intricate and complex IC assets and therefore are likely to be strong players in the marketplace with an ability to keep other rivals at bay.

CONCLUSION

In an earlier paper, we expanded the framework for intellectual capital to include two additional dimensions – culture and creativity – in addition to the three that are currently noted in the literature, namely competence, commitment, and control. In this paper, we focus on the inter-relationship and impact of culture on intellectual capital. In particular, we show the inter-play between different cultural types and levels of business volatility on intellectual capital and argue that the more volatile the industry is, the greater is the need for tacit knowledge, and the more critical it is for firms operating in this environment to adapt a flexible and organic culture that encourages the creation and leveraging of intellectual capital. Figure 2 may serve as a model against which a firm may check its position in terms of how effectively and proactively it is capitalising on its intellectual capital given the dynamic realities of the environment within which it must compete. This position will eventually help managers to take actionable steps forward to remedy their situation and ensure that they are on the right track towards becoming a high-level competitor because it is talented at leveraging complex intellectual capital thus ensuring its strong sustainability prowess. This conceptual paper sought to preliminarily explore these convergent strands and provide a foundation to encourage additional research to further develop and test these conceptual frameworks in order to establish the interrelationships between organisational culture and intellectual capital.

ABSTRACT

Purpose - The purpose of this quantitative, correlational research study was to determine the relationship, if any, between segmentation and positioning strategies employed by universities in Cyprus to increase student enrollment.

Design, methodology - Each strategy was individually investigated using quantitative research methodology in one of the study's first two null hypotheses, and then collaboratively examined in the study's third hypothesis.

Findings - The findings allowed the rejection of all three null hypotheses. Relationships between segmentation and enrollment and positioning and enrollment were found to be relatively strong, with full-sample correlation coefficients of $r(334) = .83, p < .01$ and $r(334) = .86, p < .01$, respectively. A moderately strong predictive relationship ranged from $R^2 = .63, F(1, 107) = 183.23, p < .01$ to $R^2 = .80, F(1, 106) = 415.72, p < .01$ between effective implementation of market segmentation strategy and enrollment. Similar findings showed a moderately strong predictive relationship ranged from $R^2 = .48, F(1, 334) = 311.09, p < .01$ and $R^2 = .84, F(1, 106) = 558.92, p < .01$ between effective implementation of positioning strategy and enrollment.

Practical implications - Marketers can increase the number of students at their institutions by implementing effectively the segmentation and positioning strategies

Keywords: Cyprus, segmentation, positioning, marketing strategy, marketing implementation

1. INTRODUCTION

Research studies show that academic administrators do not fully implement marketing strategies along with the concept of marketing. They put in practice promotion and price strategies, ignoring product, and distribution channel strategies. Similar to the findings of Lovelock and Rothschild (1980), Goldgehn (1991) and Helgesen (2008) indicated that U.S. colleges and universities do not implement marketing techniques properly within the context of a marketing plan. In addition, marketers in colleges and universities do not understand the different marketing concepts and hence, marketing strategies are not fully practiced or implemented by the staff (Bingham, 1993; Brown & Oplatka, 2006). These research studies showed that this problem still exists. However, the study's findings were expected to contribute to the existing body of knowledge by providing a current assessment of the segmentation and positioning strategies in the university setting in Cyprus.

2. PURPOSE OF THE STUDY

The purpose of this quantitative, correlational research study was to determine the relationship, if any, between segmentation strategies and positioning strategies currently employed by universities in Cyprus to increase their students' enrollment. Enrollment is an important factor that has a significant impact on universities' profitability and their survival. Other factors that have an impact on profitability were the increased expenses, the reduced revenues the waste and unnecessary overhead, none of which were connected to marketing. Marketing strategies were mostly associated with the marketing mix strategies, which different organizations and universities implement in their business and management operations (Kotler & Andreasen, 2008). Other marketing strategies that organizations apply to support the marketing mix strategies are the segmentation and positioning strategies. As a consequence, this research critically examined the segmentation and positioning strategies, which the universities in Cyprus implement in their business operation. The study examined the relationship between the implementation of segmentation and positioning and students' enrollment in a university setting in Cyprus. This research also examined the contribution effect of each strategy on universities' enrollment.

3. RESEARCH QUESTIONS

The research questions that have been formulated to examine the purpose of this study were the following:

1. To what extent, if any, is there a relationship between the implementation of a segmentation marketing strategy and enrollment in the Cyprus universities?
2. To what extent, if any, is there a relationship between the implementation of a positioning marketing strategy and enrollment in the Cyprus universities?
3. Which, if any, of the marketing strategies of segmentation and positioning more strongly relate to enrollment in the Cyprus universities?

The hypothesis questions for this quantitative research study are as follows:

H1_o: There is no correlation between the implementation of a segmentation marketing strategy and enrollment in the Cyprus universities.

H1_a: There is a correlation between the implementation of a segmentation marketing strategy and enrollment in the Cyprus universities.

H2_o: There is no correlation between the implementation of a positioning marketing strategy and enrollment in the Cyprus universities.

H2_a: There is a correlation between the implementation of a positioning marketing strategy and enrollment in the Cyprus universities.

H3_o: There is not a strong relationship between the marketing strategies of segmentation and positioning and enrollment in the Cyprus universities.

H3_a: There is a strong relationship between the marketing strategies of segmentation and positioning and enrollment in the three private Cyprus universities.

4. THEORETICAL FRAMEWORK

This brief review of the literature shows that universities do not fully practice segmentation, positioning and marketing mix strategies and hence, it can be argued that this has a significant effect on the business operations and on the students' enrollment (Anctil, 2008; Brown & Oplatka, 2006; Gabbott & Sutherland, 1993; Ghosh, Javalgi & Whipple, 2008;

Goldgehn, 1991; Johnson, Jubenville & Goss, 2009; Lovelock & Rothschild, 1980; Washburn & Petroschious, 2004). These studies examined only one concept of marketing mix, which was the marketing communications, or promotion, ignoring the other concepts that were the product, the place, the price, the segmentation, the targeting, and the positioning strategies (Chimanzi, 2004; Opoku, Hultman & Esmail, 2008). Hence, it can be argued that this has a significant effect on the students' enrollment because universities do not fully practice all fundamental marketing strategies. In addition, the decrease in enrollments affects not only the image and reputation of higher institutions but also their business operations.

Many researchers point out that the philosophy of marketing and specifically the different marketing strategies can contribute to the universities' greater effectiveness (Burns & Hayes, 1991; Ghosh, Javalgi & Whipple, 2008). Hence, the marketing strategies of segmentation and positioning can contribute effectively on the profitability of the different universities. Nevertheless, this brief review of the literature shows that research studies do not have enough evidence of how colleges and universities implement the different marketing strategies. On this perspective, this brief review of the literature shows that there are no formal surveys that examine the relationship between the effective marketing strategies and enrollment in a university setting. In addition, the literature review shows that there are no formal research studies that examine the contribution effect of each strategy on students' enrollment. This relevant literature review indicates a relationship between implementation of segmentation strategy and promotion strategy and enrollment, and the contribution effect of each strategy on organization's enrollment. However, studies do not prove this relationship and the contribution effects of the segmentation, positioning and marketing mix strategies in a university setting. Hence, it can be argued that the examination of the above relationship as well as the examination of the contribution effects of these marketing strategies was a need for additional research within the area of marketing strategies in a university setting.

5. SELECTION OF PARTICIPANTS

The research questions for this study were examined with the method of quantitative research. Questionnaire surveys were given to academic administrators or public relations officers at each of the universities to examine the implementation of the different marketing strategies in their workplace. The universities in Cyprus were studied as one unit. In addition, the analysis was broken down by individual university, then the findings were

summarized to compare and contrast the different universities. The target population of this research study was 600 respondents. Specifically, the total employee target population for this study was 600 representing: 200 in the first university; 200 in the second university; and 200 in the private university. Questionnaires were given to academic administrators or public relations officers to each university, striving for as large a sample as possible, with a hope of a 50% sample. This research did not examine the entire population because then would not be able to conduct inferential statistics. Hence, a simple random sampling was used to select the participants. This study did not include students in the target population because the purpose of this proposed quantitative research study was to determine the relationship, if any, between segmentation strategies and positioning strategies implemented by academic administrators and directors of the administrative staff to increase students' enrollment.

An a priori power analysis using GPOWER (Faul & Erdfelder, 1992) was carried out to determine an appropriate sample size. The power of a test indicates the probability of correctly rejecting a false null hypothesis (Cohen, 1989). To detect a medium effect size ($d = 0.5$), a total sample size of 176 was needed to conduct a one tailed paired sample t test on means with $\alpha = 0.05$, and power = 0.95, and a sample of 140 was required for $\alpha = 0.01$ and power = 0.99. The total employee target population for this study is 600 participants. Hence, a priori power analysis using GPOWER was carried out to determine an appropriate sample size. A pilot study was conducted to test and determine the survey's effectiveness. A pilot test of the survey instrument was conducted with 40 academic administrators at each of the universities. For this reason, the number of the pilot test participants was 120. Based upon information collected, the study was modified accordingly.

6. RESULTS

6.1 Analysis of research question and hypothesis 1.

The outcome of the correlation for the full sample is presented in Table I. This demonstrates a correlation of $r(334) = .83$, $p < .01$ at the .01 significance level between the two variables identified in the full sample (perceived effectiveness of implementation of segmentation strategies and perceived impact of segmentation strategies on enrollment). This correlation coefficient was found to be significant at the 0.01 level, exceeding the threshold of significance $p < .05$ that was set for analysis.

Thus, in terms of the full sample, hypothesis 1 (alternative hypothesis) could be said to be supported and the null hypothesis was rejected.

Table I.

Correlation Across Full Sample for Perceived Effectiveness of Implementation of Segmentation Strategies and Perceived Impact of Segmentation Strategies on Enrollment

Correlations			Perceived effectiveness of implementation of Segmentation Strategies	Perceived impact of segmentation of strategies on enrollment
Perceived effectiveness of implementation of Segmentation Strategies	of Pearson	1.000		.83**
	of Correlation			
	Sig. (2-tailed)			.000
	N	336		336
Perceived impact of segmentation strategies on enrollment	of Pearson	.83**		1.000
	of Correlation			
	Sig. (2-tailed)	.000		
	N	336		336

** . Correlation is significant at the 0.01 level (2-tailed).

The analysis process above was repeated using the same evaluation levels, following a process that split the original data set into three separate, smaller datasets. This split was accomplished using the SELECT CASES function in SPSS, with the selection mode indicating "IF UNIS=?" (with each individual university selected in turn). Each sorted university dataset was then saved to its own file to facilitate the analysis process. The results of each individual university correlation are identified below.

The correlation outcomes between the two variables in use for this hypothesis at University A are presented in Table II. Using the same evaluation criteria as above, this correlation was found to be $r(107) = .80, p < .01$ between the two variables with significance at the 0.01 level (two-tailed), below the $p < .05$ level that was identified as the significance level

required for acceptance. Thus, for University A the null hypothesis was rejected and the alternative hypothesis was once again accepted.

Table II.

Correlation Between Perceived Effectiveness of Implementation of Segmentation Strategies and Perceived Impact of Segmentation Strategies on Enrollment at University A

Correlations ^a			Perceived effectiveness of implementation of Segmentation Strategies	Perceived impact of segmentation of strategies on enrollment
Perceived effectiveness of implementation of Segmentation Strategies	of Pearson	1.000		.80**
	of Correlation			
	<i>Sig.</i> (2-tailed)			.000
	<i>N</i>	109		109
Perceived impact of segmentation strategies on enrollment	of Pearson	.80**		1.000
	of Correlation			
	<i>Sig.</i> (2-tailed)	.000		
	<i>N</i>	109		109

** . Correlation is significant at the 0.01 level (2-tailed).

a. Universities = University A

The results of the correlation analysis as performed above at University B are presented in Table III. Once again, significance at the 0.01 level (two-tailed) is found between perceived effectiveness of implementation of segmentation strategies and perceived impact of segmentation strategies on enrollment at University B only for a correlation coefficient of $r(117) = .83, p < .01$. Thus, for University B the null hypothesis was rejected and the alternative hypothesis was once again accepted.

Table III.

Correlation Between Perceived Effectiveness of Implementation of Segmentation Strategies and Perceived Impact of Segmentation Strategies on Enrollment at University B

Correlations ^a		Perceived effectiveness of Segmentation Strategies	Perceived impact of segmentation strategies on enrollment
Perceived effectiveness of implementation of Segmentation Strategies	of Pearson Correlation	1.000	.83**
	<i>Sig.</i> (2-tailed)		.000
	<i>N</i>	119	119
Perceived impact of segmentation strategies on enrollment	of Pearson Correlation	.83**	1.000
	<i>Sig.</i> (2-tailed)	.000	
	<i>N</i>	119	119

** . Correlation is significant at the 0.01 level (2-tailed).

a. Universities = University B

The same process was used to identify the correlation, if any, between perceived effectiveness of implementation of segmentation strategies and perceived impact of segmentation strategies on enrollment at University C. The results of this analysis are presented in Table IV. This analysis showed a correlation coefficient of $r(106) = .89$, $p < .01$, which was significant at the 0.01 level (below the $p < .05$ level that was identified as the significance level required for acceptance). Thus, at University C as well, the null hypothesis for Hypothesis 1 was rejected and the alternative hypothesis was accepted.

Table IV.

Correlation Between Perceived Effectiveness of Implementation of Segmentation Strategies and Perceived Impact of Segmentation Strategies on Enrollment at University C

Correlations ^a		Perceived effectiveness of Segmentation Strategies	Perceived impact of segmentation strategies on enrollment
Perceived effectiveness of implementation of Segmentation Strategies	Pearson of Correlation	1.000	.89**
	<i>Sig.</i> (2-tailed)		.000
	<i>N</i>	108	108
Perceived impact of segmentation strategies on enrollment	Pearson of Correlation	.89**	1.000
	<i>Sig.</i> (2-tailed)	.000	
	<i>N</i>	108	108

** . Correlation is significant at the 0.01 level (2-tailed).

a. Universities = University C

The analysis of hypothesis 1 indicated that the correlation coefficients were $r(334) = .83, p < .01$ (full sample), $r(107) = .80, p < .01$ (University A), $r(117) = .83, p < .01$ (University B), and $r(106) = .89, p < .01$ (University C), with significance for all correlation coefficients at the 0.01 level, which was below the $p < .05$ level that was identified as the significance level required for acceptance. At all levels of analysis, including at the sample-wide level as well as at each of the universities, the null hypothesis for H1 was rejected and the alternative hypothesis was accepted. The research demonstrated that there was a correlation between the implementation of a segmentation marketing strategy and enrollment in the universities in Cyprus.

6.2 Analysis of research question and hypothesis 2.

As with hypothesis 1, a split dataset was used to generate both full sample outcomes and individual university outcomes for consideration and to ensure that the same results were found among the various datasets. The existing split data sets were used for this analysis as well, as the same variables were available within these data sets.

The first correlation for the two variables for hypothesis 2 was performed across the full sample, which included all three universities and is presented in Table V. This correlation analysis showed a correlation of $r(334) = .86, p < .01$ between perceived effectiveness of implementation of positioning strategies and perceived impact of positioning strategies on enrollment, at a significance level of 0.01. This is lower than $p < .05$ (the established significance level threshold) and thus, the null hypothesis $H2_0$ was rejected for the full sample and the alternative hypothesis is accepted. This analysis was repeated on the individual university level to determine if the results are consistent across all three universities.

Table V.

Correlation Across Full Sample for Perceived Effectiveness of Implementation of Positioning Strategies and Perceived Impact of Positioning Strategies on Enrollment

Correlations		Perceived effectiveness of implementation positioning strategies	Perceived impact of positioning strategies on enrollment
Perceived effectiveness of implementation positioning strategies	of Pearson of Correlation	1.000	.86**
	<i>Sig. (2-tailed)</i>		.000
	<i>N</i>	336	336
Perceived impact of positioning strategies enrollment	of Pearson on Correlation	.86**	1.000
	<i>Sig. (2-tailed)</i>	.000	
	<i>N</i>	336	336

** . Correlation is significant at the 0.01 level (2-tailed).

The analysis above was repeated using the same variables and statistical significance level of $p < 0.05$ at the individual university level to determine if the correlation observed in the full sample persisted across all three universities. This section presents the results of these three correlation processes, which were constructed using the split data set as indicated above. The results of the correlation analysis as performed above at University A are demonstrated in Table VI. In common with the full sample, university A showed a correlation between the two variables tested. A correlation coefficient of $r(107) = .81, p < .01$ was found to be significant at the 0.01 level, exceeding the threshold of significance $p < .05$ that was set for analysis. Thus, for University A this was found to be a significant correlation and allowed the rejection of $H2_0$ and the acceptance of $H2_a$.

Table VI.

Correlation for Perceived Effectiveness of Implementation of Positioning Strategies and Perceived Impact of Positioning Strategies on Enrollment at University A

Correlations			Perceived effectiveness of implementation positioning strategies	Perceived impact of positioning strategies on enrollment
Perceived effectiveness of implementation positioning strategies	of Pearson of Correlation	1.000	.81**	
	Sig. (2-tailed)		.000	
	N	109		109
Perceived impact positioning strategies enrollment	of Pearson on Correlation	.81**		1.000
	Sig. (2-tailed)	.000		
	N	109		109

** . Correlation is significant at the 0.01 level (2-tailed).

a. Universities = University A

The results of the correlation analysis as performed above at University B are presented in Table VII. University B demonstrated a very similar ranking to university A, with a correlation coefficient of $r(117) = .87, p < .01$ which was found to be significant at the

0.01 level (below the $p < .05$ level that was identified as the significance level required for acceptance). Thus, at the University B level as well as at the university A data level and in the full data set, $H2_0$ may be rejected and $H2_a$ may be accepted.

Table VII.

Correlation for Perceived Effectiveness of Implementation of Positioning Strategies and Perceived Impact of Positioning Strategies on Enrollment at University B

Correlations ^a		Perceived effectiveness of implementation positioning strategies	Perceived impact of positioning strategies on enrollment
Perceived effectiveness of implementation positioning strategies	of Pearson of Correlation	1.000	.87**
	<i>Sig. (2-tailed)</i>		.000
	<i>N</i>	119	119
Perceived impact positioning strategies enrollment	of Pearson on Correlation	.87**	1.000
	<i>Sig. (2-tailed)</i>	.000	
	<i>N</i>	119	119

** . Correlation is significant at the 0.01 level (2-tailed).

a. Universities = University B

The final test that was performed during the examination of this area was for the University C dataset. The results of the correlation analysis as performed above at University C are presented in Table VIII. This analysis showed an even stronger correlation than any of the other three tests that had been performed. With a correlation coefficient of $r(106) = .92, p < .01$ and a significance level of 0.01 (below the $p < .05$ level that was identified as the significance level required for acceptance), this test also demonstrated a statistically significant correlation between the two variables that were tested, leading to a rejection of the null hypothesis $H2_0$ and an acceptance of the alternative hypothesis $H2_a$.

Table VIII.

Correlation for Perceived Effectiveness of Implementation of Positioning Strategies and Perceived Impact of Positioning Strategies on Enrollment at University C

Correlations		Perceived effectiveness of implementation of positioning strategies	Perceived impact of positioning strategies on enrollment
Perceived effectiveness of implementation of positioning strategies	of Pearson of Correlation	1.000	.92**
	<i>Sig.</i> (2-tailed)		.000
	<i>N</i>	108	108
Perceived impact of positioning strategies on enrollment	of Pearson on Correlation	.92**	1.000
	<i>Sig.</i> (2-tailed)	.000	
	<i>N</i>	108	108

** . Correlation is significant at the 0.01 level (2-tailed).

a. Universities = University C

The correlation coefficients found during the analysis of hypothesis two indicated that there were correlations of $r(334) = .86, p < .01$ (for the full data set), $r(107) = .81, p < .01$ (for University A), $r(117) = .87, p < .01$ (for University B), and $r(106) = .92, p < .01$ (for University C). All of these correlation coefficients were supported at a statistical significance level of 0.01, which was below the significance level of .05 that was set by the researcher for acceptance of the null hypothesis. This analysis showed that at every level the null hypothesis for Hypothesis 2 was to be rejected and the alternative hypothesis to be accepted. That is, the findings supported the contention that there is a correlation between the implementation of a positioning marketing strategy and enrollment in the universities in Cyprus.

6.3 Analysis of research question and hypothesis 3.

The analyses for research questions 1 through 2 focused on correlations, or identification in similarities of performance. However, this did not allow direct comparison of

the results, nor did it allow direct identification of the relationships between variables that may be found in this case. Furthermore, as correlation did not imply causation, it did not say anything about the potential causal relationships between the variables. To determine if there was a relationship between these two factors and enrollment, linear regression was chosen to examine this relationship.

Two linear regression processes were used to explore the issues involved in this evaluation. This was evaluated using a significance level of $p = 0.05$. These two regression processes were repeated four times each, as with the correlation processes. These included the full sample (all three universities combined) as well as individual runs for University A, University B, and University C. The results of this analysis are presented below, divided by the sample including full sample, University A, University B, and University C findings. The variable pairings used in three separate linear regression determinations for each of the analysis levels are identified in Table IX. These variables are consistent throughout the analysis levels.

Table IX.

Variable Specifications for Linear Regression Process

Variable	Description
X ₁ (Independent)	Perceived effectiveness of implementation of Segmentation strategies
Y ₁ (Dependent)	Perceived impact of segmentation strategies on enrollment
X ₂ (Independent)	Perceived effectiveness of implementation of positioning strategies
Y ₂ (Dependent)	Perceived impact of positioning strategies on enrollment

All regression equations were specified in the form $Y_i = \text{slope} * X_i + \text{intercept}$, in which i = the number of the variable as specified above. Each variable number corresponded to the related correlation-based hypothesis above. Each equation was specified for the variable pair using the appropriate matrix determination (Constant/B for the slope and Variable/B for the intercept). R^2 values (from 0 to 1) were used to determine the strength of the relationship described by each equation, and the ANOVA output from each was used to determine if the relationship was statistically significant.

Following the process of specification for each of the models, the R^2 values for each of the outcomes were considered to determine how strong the relationship between the two

variables was. The R^2 value varies between 0 and 1, with 0 indicating no significant relationship and 1 indicating an absolute relationship.

The R , R^2 (coefficient of determination) and regression equation determined for each of the two variable pairings in the full sample are described in Table X.

Table X.

Linear Regression Outcomes (R , R^2 and Regression Equation) for Each Variable Pair, Full Sample

Variables	R	R^2	Regression Equation	F	ANOVA Sig.
X_1 (Independent)	.83	.70	$Y_1 = .206X_1 + (-.501)$	762.32	.000
Y_1 (Dependent)					
X_2 (Independent)	.69	.48	$Y_2 = .183X_2 + .016$	311.09	.000
Y_2 (Dependent)					

In the case of the relationship between X_1 and Y_1 , the $R^2 = .70$, $F(1, 334) = 762.32$, $p < .01$ value indicates a moderate relationship between the two variables; colloquially, 70% of the variation in Y_1 can be explained by the corresponding value of X_1 . The ANOVA output for this test indicates a significance of .000, which is below the significance threshold of $p = 0.05$. Thus, this is accepted as a valid and statistically significant relationship on the sample-wide level. The $R^2 = .48$, $F(1, 334) = 311.09$, $p < .01$ value in the regression analysis between X_2 and Y_2 indicates a more modest relationship. This demonstrated that 48% of the variation in outcomes in Y_2 was explained in variation in X_2 . In addition, it was a less convincing relationship and may make prediction based on X_2 considerably harder, but remained a relationship that should be considered. The ANOVA test for this linear regression shows a significance level of .000, below the established level of $p = .05$ required for assignment of statistical significance. Thus, this linear regression relationship is also accepted on the sample-wide level.

The analysis process was performed in the same way for University A as it was for the sample on the whole. The most important outcomes for the linear regression equations constructed for University A are demonstrated in Table XI. It should be noted that although the specific numbers were different in this case, the general strength of the relationships in each of the three cases was similar to the sample-wide pattern.

Table XI.

Linear Regression Outcomes (R , R^2 and Regression Equation) for Each Variable Pair, University A

Variables	R	R^2	Regression Equation	F	ANOVA Sig.
X_1 (Independent)	.795	.63	$Y_1 = .203X_1 + (-.459)$	183.23	.000
Y_1 (Dependent)					
X_2 (Independent)	.805	.65	$Y_2 = .208X_2 + (-.511)$	196.71	.000
Y_2 (Dependent)					

The relationship between X_1 and Y_1 demonstrated an $R^2 = .63$, $F(1, 107) = 183.23$, $p < .01$ value (indicating that 63% of the variance in Y_1 could be explained by X_1). Although not a perfect predictive measure, this is relatively strong. The ANOVA analysis for this process demonstrated a significance of .000, lower than the $p = .05$ threshold that was set. Thus, this can be seen to be a moderately strong and statistically significant relationship. The relationship between X_2 and Y_2 was a bit stronger, with an $R^2 = .65$, $F(1, 107) = 196.71$, $p < .01$ value (indicating 65% of the variation in Y_2 being explained by X_2). This was accompanied by a statistical significance level in the ANOVA of .000, indicating that again this represented a moderately strong and statistically significant predictive relationship. The same process was used to create linear regressions for University B as in the other samples. The results of this are presented in Table XII.

Table XII.

Linear Regression Outcomes (R , R^2 and Regression Equation) for each Variable Pair, University B

Variables	R	R^2	Regression Equation	F	ANOVA Sig.
X_1 (Independent)	.83	.70	$Y_1 = .217X_1 + (-.763)$	267.28	.000
Y_1 (Dependent)					
X_2 (Independent)	.87	.76	$Y_2 = .216X_2 + (-.669)$	372.59	.000
Y_2 (Dependent)					

The relationship between X_1 and Y_1 in this case indicated an $R^2 = .70$, $F(1, 117) = 267.28$, $p < .01$ value (indicating that 70% of the variation in Y_1 is because of X_2). This was accompanied by an

ANOVA significance level of .000, indicating that this was a statistically significant result. This can be described as a moderately strong relationship between these variables. The $R^2 = .76$, $F(1, 117) = 372.59$, $p < .01$ value for X_2 and Y_2 showed one of the strongest relationships (indicating that 76% of the variation in Y_2 was associated with the value of X_2). This also showed an ANOVA significance of .000, indicating that the relationship was statistically significant. This is the one of highest levels of predictive power seen in the results as a whole.

Linear regressions were prepared for University C in the same fashion as the previous results. The outcomes of this analysis are described in Table XIII.

Table XIII.

Linear Regression Outcomes (R , R^2 and Regression Equation) for each Variable Pair, University C

Variables	R	R^2	Regression Equation	F	ANOVA Sig.
X_1 (Independent)	.89	.80	$Y_1 = .201X_1 + (-.337)$	415.72	.000
Y_1 (Dependent)					
X_2 (Independent)	.92	.84	$Y_2 = .211X_2 + (-.572)$	558.92	.000
Y_2 (Dependent)					

The first relationship, X_1 and Y_1 , indicates a very strong result with an $R^2 = .80$, $F(1, 106) = 415.72$, $p < .01$ value (indicating that 80% of the variation in Y_1 can be attributed to the value of X_1). The statistical significance of this finding was indicated by the ANOVA statistical result of .000. Thus, this was accepted as a predictive model. The second relationship between X_2 and Y_2 also showed a very strong $R^2 = .84$, $F(1, 106) = 558.92$, $p < .01$ value (indicating that 84% of the variation in Y_2 at University C could be explained by X_2). The statistical significance of this result is indicated by the ANOVA significance value of .000. Thus, this was accepted as a very strong predictive relationship.

The findings for the full sample level and at individual levels were consistent, although they varied in specific level. All results that were found were statistically significant. For the relationship between X_1 and Y_1 in all sample sets, there was a moderate to strong relationship ranged from $R^2 = .63$, $F(1, 107) = 183.23$, $p < .01$ to $R^2 = .80$, $F(1, 106) = 415.72$, $p < .01$. This indicates that there is a predictive relationship between effectiveness of market segmentation performance and the impact of market segmentation on enrollment levels as

indicated by the findings of this study. The relationship between X_2 and Y_2 was similar in magnitude to the relationship between X_1 and Y_1 . The R^2 value for this pairing ranged between $R^2 = .48$, $F(1, 334) = 311.09$, $p < .01$ (in the full sample) and $R^2 = .84$, $F(1, 106) = 558.92$, $p < .01$. This demonstrates a widely variable but moderate relationship between the variables, which represented the effectiveness of a positioning strategy and the impact of positioning on enrollment levels as indicated by this study.

7. CONCLUSIONS

This research has shown that academic administrators appear to have a moderate to strong grasp of the use of segmentation and positioning strategies to force increased enrollment. As a consequence, the implementation of marketing is becoming increasingly effective in the university environment. Nevertheless, there are still some areas for possible improvement that were highlighted by this study. The most noticeable one is the concept of the marketing mix. Currently, it can be expected that universities make use of marketing communications or promotion such as catalogues and view books, websites, and other materials strongly to remain competitive and to draw in students. Universities use these marketing communications tools to reach students and to drive up enrollment figures. However, the use of promotion tools is not enough to sustain a long-term enrollment increase, and thus does not represent sufficient use of the marketing mix. University administrators need to consider other elements of the marketing mix to improve the enrollment outcomes. For example, private universities can increase their competitive positioning in the market by implementing the pricing feature of the marketing mix.

Thus, universities could increase enrollment from students seeking relief from increasing higher education costs in the private area by pricing their product competitively in the marketplace. However, universities must also consider the fact that may even discourage enrollment if students perceive that they are receiving an inferior product because costs are substantially lower than their competitors. Examining ways in which more of the marketing mix can be used, rather than simply the marketing communications aspects, will help to increase the university's value for money put into the marketing mix. Universities must understand that sustaining or increasing enrollment is essential for maintaining competitive advantage in the market, and so should not automatically reject any marketing mix element that will allow them to maintain this advantage.

One area that this research has provided a contribution is in formal study of the relationship between segmentation and positioning strategies and enrollment in a university setting. Thus, this research filled a gap regarding the implementation of marketing strategies in the university setting; whereas the literature review noted there has been little or no formal study. However, this research was conducted in a university setting, and did not examine interaction effects between the various marketing strategy tools. Instead, it focused on identifying individual effects of the segmentation and positioning on enrollment. This does leave an ongoing gap in the research in identifying, which of the various marketing mix strategy tools or elements such as product, price, promotion and place contribute to the student decision to enroll. Furthermore, another area of study that could be a good area for further research into the subject is the examination of the additional elements of the extended marketing mix such as people, process, and physical evidence. One suggestion for future study is regarding the possible ambiguous term of marketing mix. An avenue for further research might be to break down this term into specific terms such as price product, promotion and place to more accurately assess each variable's impact. In addition, it may be academically advantageous to expand the study to include other countries, such as those in Europe or the United States.

ABSTRACT

The genesis of socially responsible investing in global corporate governance practices has been studied, the benefits of socially responsible investing has been identified, socially responsible investments and their methods have been classified, problems that prevent the formation and development of social responsibility and socially responsible investment of corporations in Ukraine have been identified, directions to encourage social responsibility have been proposed.

Keywords: corporate governance, social responsibility of corporations, socially responsible investment, social investment of the business, stakeholders, screening, government's motivation of corporation to social responsibility.

INTRODUCTION

Current complex situation caused by the broad spectrum of economic, social and ecological problems the solution of which requires active participation of government and local authorities, businesses and citizens, made the world community come up with the concept of sustainable growth. This idea of this concept is to ensure economic growth and people's social security system while decreasing negative impact on the environment.

Social responsibility of corporations (SRC) has become the big business's contribution to the sustainable growth; which means its responsibility for the impact of their decisions and activity on society and environment, as well as providing stakeholders with full and reliable information.

PROBLEM DEFINITION

The concept of social responsibility of corporations (SRC) as the tool for cooperation and partnership between the state and businesses as well as the way of improving social and labor relations during economic transformations has become the subject of the active discussion in scientific and business circles. The leading international agencies such as the United Nations,

International Standardization Organization, World Bank, UNESCO and others carry out varied research projects in this sphere. Problems of corporate governance and social responsibility of corporations have been researched by the following foreign scholars: Y. Blagov, A. Berli, G. Bowen, M. Van Marreviyk, N. Jacob, K. Devis, T. Donaldson, P. Draker, A. Carroll, G. Minz, J. Moon, D. Matten, L. Preston, G. Fitch, W. Frederick, M. Friedman, R. Freeman, V. N. Yakimets and Ukrainian scientists: A. I. Amosha, V. A. Yevtushevskii, D. G. Lukianenko, A. S. Povazhniy, V. S. Ponomorenko, I. L. Sazonets, M. G. Chumatchenko, O. M. Yastremska and others.

Today a growing number of corporations have come to understanding that focusing only on financial aspects of the activities is not enough for the successful business. The increase of social funds, and pro-active attitude of the company in the sphere of social responsibility of corporations form their positive image, and raise the confidence of the shareholders, investors and other stakeholders.

Social responsibility of corporations is a socioeconomic institution that operates as a partnership of corporation and stakeholders, reduces the transactional expenses, finds the solution to the conflict of interest and obtains stable competitive positions by the corporation by means of social responsible investment, social reporting, social partnership, dividend policy and corporate communication. The study, generalization and adaptation of progressive world experience are quite important for establishing this institution in Ukraine. It is reasonable to consider the first instrument of corporate social responsibility that is socially responsible investment and to offer mechanisms how to adapt the best world practices in Ukraine.

The aim of the article is to study social aspects of corporate governance and socially responsible investments in particular that is one of the most important tools for improving corporate social responsibility.

RESEARCH RESULTS

Today more and more investors understand the significance of nonfinancial factors in forming capitalization. They have an opportunity to contribute to the sustainable growth through socially responsible investment (SRI) in order not only receive profit from the money invested, but also create positive social changes, to reduce negative impact on the environment.

SRI is a process when the company chooses social responsibility and uses the appropriated social investments to benefit the main stakeholders and local community.

Summarizing the definitions of banks social investments given by V. N. Yakimtsev, L. I. Sazonets, Y. E. Blagov we come to the conclusion that social investments of the business are

material, technological, administrative resources, financial funds of the corporation, that by the management decision are channeled to implement social programs, that are of interest to the main internal and external interested parties with a view to receive certain social and economic strategic effect [1, 10, 14].

SRI on the stock markets began to develop in 1960th and during next 20 years it was in congruence with the term „ethical investing" in a greater or lesser degree. Later it became only one of social responsible investment trends. The reaction of the civil society to the ethical problems became an impulse for SRI development in the USA. The establishment of PAX World Fund in 1971 that refused to invest money in those companies that received profit from the Vietnam War became a historical event. At that time Sullivan Principles were developed in the USA that confronted companies trying to invest into Republic of South Africa supporting existing apartheid regime there.

The European nations' concern about the problems related to human rights and labor practices had determined social criteria for making investment decisions. As a result, in the 1980th the transfer of „ethical investing" into „social responsible investment" started. In the 1990th the concept of sustainable growth and climate change hypothesis received international recognition. In view of that, the concept of SRI also included an environmental aspect.

The Russian scholar Y. E. Blagov states that after high-profile corporate scandals at the beginning of the 21st century such as the crash of Enron and WorldCom, the governors of the stock markets began to emphasize corporate governance. In 2002 in the USA the Sarbanes-Oxley law was adopted. It stated the demands to the emitters about internal audit, administration and information disclosure. The investors began to treat emitters' corporate government with more attention. It was accomplished by turning it into one of SRI's directions [1].

Within last fifteen years the corporate's investments into socially responsible programs in the USA raised five times and accounted for 3 billion US dollars in 2010 (Figure1) [12].

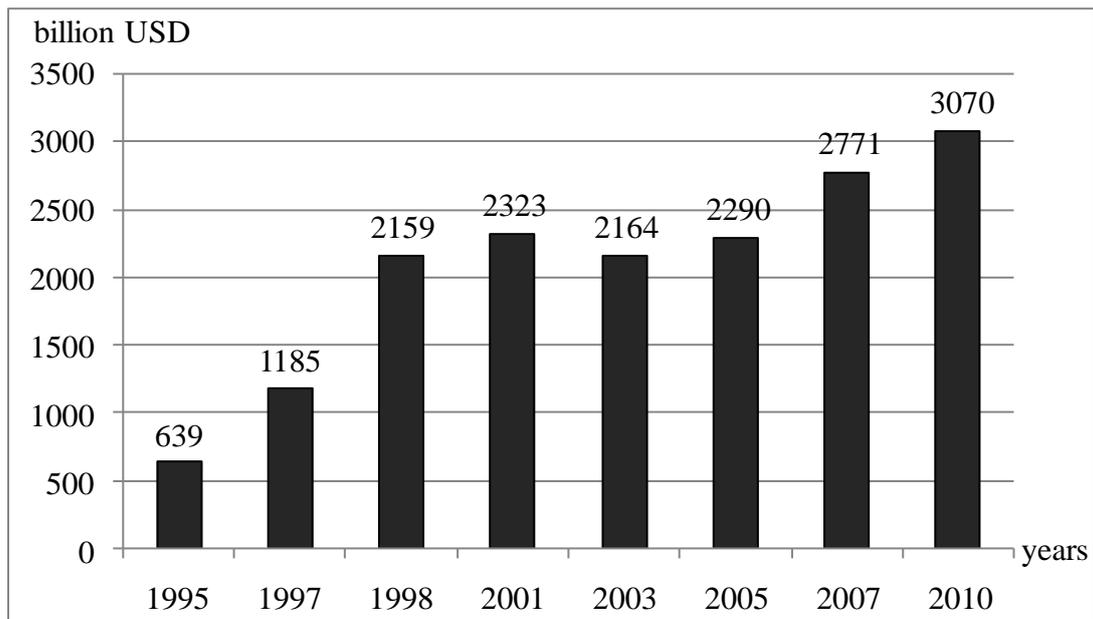

Figure 1. Volume of socially responsible investments in the USA in 1995-2010

Source: Stock markets in context of „Ernst&Yang" stable development, 2011.

Within 40 years SRI has evolved from individual practices of ethical investments to the separate segment of stock market with its participants and substructure.

At the beginning of 2010 the world volume of SRI was rated at about \$10,9 trillion that is 50 % more than in 2007 before the world economic crisis (Figure 2).

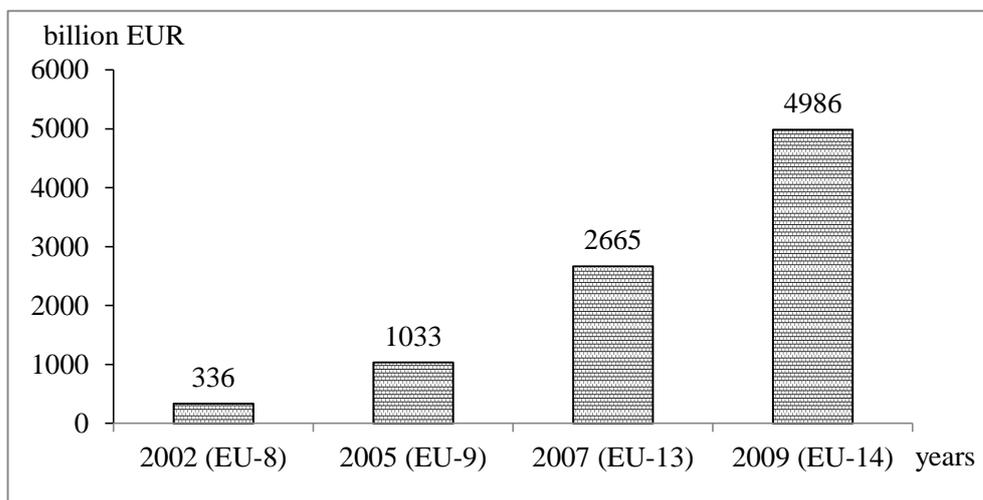

Figure 2. Volumes of social investments in the world

Source: Stock markets in context of „Ernst&Yang" stable development, 2011

Since PAX World Funds establishment in 1971 the number of investors who use SRI methods has considerably increased. There have been formed groups of institutional and individual investors in developed countries that follow the SRI established directions, criteria and methods.

Financial institutions that invest their own funds, insurance companies and retirement funds, investment banks (companies), that exercise administration of legal bodies' holdings, including churches, public and education institutions belong to the institutional investors in socially responsible investments.

The Ministry of Finance in Norway stated in the monitoring survey that retirement funds appeared to be SRI development catalysts. Thus, in 2000 there were some changes in pension legislation introduced in Great Britain and then in other countries of the EU and the USA. According to these amendments the retirement funds were obligated to broaden the degree of their participation in the SRI. For example, Norwegian State Fund has to „avoid the investment, which is bound with an unacceptable risk of assisting unethical conduct, particularly the violation of the fundamental humanitarian principles, serious human right violation, corruption or essentially negative environmental impact" [9].

Individual investors in SRI are investment companies that represent the interests of private persons or the private persons themselves who are professional participants in the stock market. The most popular form of SRI realization for the individual investors is unit (mutual) investment funds. In 2010 there were 879 mutual SRI funds in Europe, their volume accounted for about 75 billion euro, in the USA there were 250 mutual funds with the volume about \$ 316 billion.[15, 17]. From 2002 to 2009 the number of countries of the EU that also included their reports of the amount of socially responsible investment into the list of necessary statistical accounting reports: if in 2002 there were 8 countries that had such statistics, in 2009 14 EU countries provided the SRI statistics, besides, the volume of social investments during this period grew almost by 14, 83 times (Figure 3).

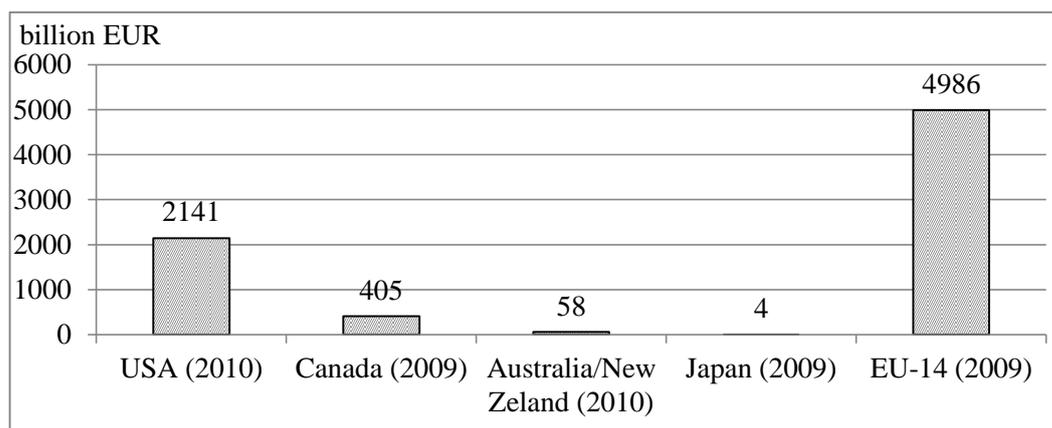

Figure 3. Volume of socially responsible investments in EU*

Source: Stock markets in context of „Ernst&Yang“ stable development, 2011; Green, Social and Ethical Funds in Europe 2010 Review. - Vigeo. - Milan, 2010.

There are several forms of social programs realization; however the most popular forms are traditional charity and social investment or venture philanthropy. The advantages of the socially responsible investments in comparison with traditional charity are in that fact that social investment is a long-term program that expects:

- integration of company's goals with social programs strategies;
- strategic approach to social programs realization and strategy development;
- corporation's initiative in social programs realization and development;
- investment is not only monetary and in-kind aid, voluntary work and financial participation of the corporation employees, but also partners' resources (government and self-governing authorities, noncommercial organizations other companies etc.);
- taking into account partners' interests on the condition of getting benefits for corporation;
- the programs of social investment are stable and economically grounded just as any other business ventures;
- program package is formed on the basis of indirect investment principles, that allows to combine different community activities.

According to V. V. Dorofienko and V. M. Goncharov social responsible investments as a process develops towards social partnership with the idea of establishing constructive cooperation among three parties: governmental establishments, organizations and society in order to solve a social issue. The effectiveness of the mechanism is due to the joined efforts of

the three parties. Thus, ideally, social partnership is the interaction of two or three parties to address the important social issues. This is beneficial to all participants and to the community where the project is implemented [13]. Social investment when classified according to investment objects and the impact level on the corporation and society can be divided into three groups: the first group comprises social investments that affect the corporation income directly and society indirectly, the second group is made up of the investments that affect both corporation income and society directly within medium- and long-term period, the third group contains the investments, that affect the corporation and certain focus-groups directly (Table 1).

The formation of SRI portfolio is based on the same approaches, as the formation of the traditional investment portfolios, including determination of the investment policy, short- and long-term goals, tolerance and risk, and also understanding of the tasks during the process of portfolio management.

The task of the traditional portfolio management is to achieve the optimal balance between risk and profit during a certain period of time. During the SRI portfolio management social, ecological and ethical investment aspects as well as emitters corporate governance practices are being considered.

It is reasonable to divide the SRI methods into two groups: screening (selection) of the investment object and influence of the shareholders. They supplement each other allowing taking SRI issues on different stages of investment cycle into consideration. The investment objects selection takes place before papers are obtained. Shareholders may have influence after the portfolio was formed.

Basic method of the SRI is negative screening or discarding. Generally because of ethical consideration investors remove from their portfolios emitters' papers of the companies from alcohol and tobacco industry, gambling and nuclear power.

Screening belongs to negative methods and based on the exclusion of the companies that do not follow SRI principles stated in the United Nations Global Treaty „The Millennium Development Goals“, basic International Progress Organization's conventions; OECD for global companies leadership [16].

Table 1

Social investment kinds and their impact on interrelation "corporation- society"

Level of impact	Kinds of investment
Direct profit of the corporation ;	investment in quality goods production and quality services provision
indirect (through commodity and services	investment in development of production (including modern and sufficient investment in basic methods), growth of economical

market) on the society	efficiency and competitiveness, innovation management
	investment in staff development
	investment in support and development of honest business punctual and full-scale payment of the taxes and charges
Direct on the corporation and society (mainly in medium- and long-term period)	growth of the dividend yield and punctual distribution
	investment in local community development within the territory of the residence
	investment in environmental defense rendering of monetary, financial and other kind of aid to the authorities completing complex social tasks (poverty, unemployment) and other in extraordinary circumstances
Direct on the corporation and certain focus-groups, projects	investment in programs of corporative philanthropy and clarity realization

Since the beginning of the 1990th investors have used positive screening when selecting those companies that realize active social policy and programs and minimize their business activities impact on the environment. The most common kind of the positive screening is the choice of the papers that belong to „the best" companies in their sector (best-in-class). This allows to guarantee portfolio diversification.

Institutional investors also use reciprocal procedure that uses shareholders' rights to influence emitters' activity in SRI. The reciprocal approach implies meetings with the corporate management, voting during the general meeting of shareholders, signing shareholders' resolutions and interaction with MSM. The difference between this method and screening lies in that fact that the reciprocal action has the influence not on the security selection, but on the emitters' behavior with formed portfolio.

The group of the companies „System Capital Management" (SCM) is a leading national corporation in social responsibility. In 2011 it took the first place for the fourth time in a row in the rating "Guards of the socially responsible companies" held by the „Gvardia" magazine of the „Galitsky Contracty" publishing house. SCM was founded in 2000. It possesses its share in more than 100 Ukrainian enterprises. Their staff accounts for about 130.000 employees. The company is focused on six main business areas: mining, steel industry, power production, finance, telecommunications, MSM and real estate. The largest investment volume of the SCM is concentrated in the industrial sector. Power, mining and smelting companies that are the members of Metinvest and DTEK's: branch holdings (the companies of SCM Group) are the main source of the Group's income. Most of the Group's employees work for them, however, the investments in nonindustrial economic sectors are also quite substantial. To provide business sustainable growth the company took decision on further investment

portfolio diversification and business development in new areas. According to the plan, parts of the postindustrial directions - financial, telecommunication, media, and real estate are to be brought from current 10 % to 30 % by 2015. The main consolidated finance indicators of the SCM are presented in Table 2.

Table 2

Dynamics of the main consolidated finance indicators of the SCM

Since 2005 the company has been restructuring management to ensure clear, obvious and effective corporate governance and structure that could meet the world standards. They also created supervisory boards for all branch holdings, and special branch committees to assist supervisory boards in social responsibility, auditing, assignment and compensation, strategy and investment; internal auditing and risk management. The company understands the sustainable growth as a necessity to develop independently, and build up relations with participants of social processes, considering their interests. Local expert evaluation was held in the SCM and essential stakeholders were determined. They include work groups of the firms, territorial communities, local self-governing authorities in regions where Group’s companies are located, state government bodies, MSM. The SCM undertook following obligations:

- to determine and understand social aspects of its activity and interests of the stakeholders;
- to consider and react to stakeholders’ needs;
- to report the decisions, internal and external activities of the company to the stakeholders.

The SCM and companies of the Group determine themselves as socially responsible business that strives to contribute into building strong and successful Ukraine - equal in rights member of the world community. The SCM proclaimed following SRC directions: responsibility for the employees, environmental protection, development of local communities, social investment, sponsorship and charity. Since 2005 the company has been publishing reports. Since 2007 they have been prepared according to GRI standard (21 indexes of social activity effectiveness are being used). Priority guidelines of the company's social investment are: investment in operations area development, labor and industrial safety, environmental protection, targeted assistance (Table 3,4).

Table 3

Notes:

¹ - the presented in SCM report data concern only two company's enterprises (Kryvyi Rih Southern Mining and Enrichment plant and „Azovstal" iron and steel works);

² - the presented data concern only three biggest company's enterprises;

³ - the presented data concern only one company's enterprise („Yenakiieve" iron and steel works);

⁴ - for the purpose of data comparability and because in 2007 „Ukraine Development" fund with such activities as sponsorship, charity, targeted assistance was founded this kind of socially responsible investment was excluded from general SRC report. The Fund's volume of investment during 2007-2009 in previously mentioned directions was about 70 % of total social investment value, given in the table;

⁵ - investment in personnel training and development.

The special feature of the Group's approach to SRC is that targeted assistance since 2007 has been considered as a separate kind of social responsibility, individual project and Group's fund [5].

The Group respects the right of its employees to establish and to join trade unions and other communities in order to represent their work and socioeconomic rights and interests. It also forms long-term partnership with trade unions, employees, pensioners, retired workers and other persons involved. Protection of the employees' labor law and their professional bodies, employment terms improvement and social protection coverage are regulated by collective agreement, concluded in all enterprises of the SRC Group.

Objective and subjective problems of social investment are caused by external and internal reasons. External reasons include the following: the public is not ready yet for an adequate perception of such kind of information; the state tries to use it in its interests; experts, partners and investors need it only occasionally, that's why the management of the corporation discloses only general information about socially responsible investing without „risking" the details of the relevant financial flows. These disadvantages are associated

primarily with the imperfection of the existing collaboration model between business, society and state. Internal reasons include lack of common idea of social investment and SRI; the lack of combination of social investment with expenses, associated with the main activity; unsystematic approach to socially responsible investment as a result of differences in goals, facing different centers of corporation's power; the presence of different, sometimes conflicting, requirements for accounting in internal and external programs; the lack of generally accepted standards of domestic companies' public social reporting, etc.

On the other hand, modern business environment forms principles that stimulate corporations to arrange and disclose information about social investment. Those principles are the following: the urgent need for disclosure of business problems to find common solution; the formation of a positive image of corporations and loyal public opinion; achievement of high degree of transparency with a view of further entering international stock markets and cooperation with foreign partners, investors, experts, and expansion of activities etc.

One of the main reasons that prevents transparency in social responsible investment is potential conflicts. This reason is mentioned in many works on social responsibility of corporations by V. S. Kuznietsov, O. S. Povazhnyi, V. S. Ponomarenko, I. L. Sazonets. [2; 7; 8; 10] that take place after social investment information disclosure. The conflicts can come up between such stakeholders' groups as managers and investors; producers and consumers; corporation and tax authorities; corporation employees and people with low income; corporation government and society; recipients and distributors of social investments including senior executives and employees of corporations; distributors and recipients of social investments, a group of social investment recipients.

There is a number of possible ways in resolving this conflict that are successfully used in business environment:

- to establish noncommercial funds with social tasks at majority stakeholders' cost (for example «System Capital Management" group of companies with its «Ukraine Development" fund);
- to have a board of trustees with broad participation of the public and experts;
- to form the constructive partnerships with the state in order to establish effective standards and supervise social duties execution by all market entity.

As for directions and measures of state stimulation by SRC and socially responsible investment it is reasonable to divide them into short-term (by 2012), medium-term (by 2017) and long-term (by 2020), Table 5.

Table 5

Measures of state SRC Stimulation

Directions/ measures	Short-term 2011-2012	Medium-term till 2017	Long-term till 2020
Directions	Upgrade of mechanisms of charity tax concession	Increase of social responsible investment appeal	Development of National Program SRC stimulation
Measures	Simplification of VAT procedure; calculation in charity area	Expansion in the quantity and weightage of social advertising	Adoption of the best SRC world practice
	Adoption of the law on the decrease of the tax base by the charity expenses volume	Cooperation with MSM to publish SRC's programs (partial publication quota transfer, antitrust legislation correction)	Inspection and agreement of measures of the stimulation, determination of upgrading directions
Directions	Informational partnership and SRC transparency growth	Legal regulations improvement	Development of the co-financing with business project
Measures	Establishment of the best practices competition and SRC programs, rating publishing'	Inclusion SRC in necessary requirements for participation in privatization and tender competitions, capital investment projects etc. ¹	Development and adoption of the social partnership projects between state, business, local community of environmental defense financing, local community in operations areas development
	Conduction of conferences together with business and communities	Establishment of determination and formalization of parties rights and obligations necessity (employer and work collective, employees) in internal corporate papers (statute, collective and employment agreement, contract)	

CONCLUSIONS

Thus, unlike spontaneous sponsorship and charity, socially responsible investment as SRC's instrument due to its regular character, consistency and close link with the corporation allows to increase benefits for society and for itself.

Economical effect from socially responsible investment is growing with high level of corporation communicative activity aimed at explaining this activity aspect. Nevertheless, only few corporations display high level of transparency in this question today. The main reasons for that are: the absence of institutional premises, different stakeholders' groups' conflicts of interests. To solve these problems we need to promote the ideas about that

advantages of SRC, socially responsible investment and apply the effective management strategies to regulate the relationship among stakeholders.

HERITAGE PPP LAW AND MANAGEMENT

Kalogirou, Sofia¹; Maniatis, Antonios²

¹Hellenic Open University, Greece, sofoklo@hotmail.com

²Higher Technological Educational Institute of Patras, Greece, maniatis@dikaio.gr

ABSTRACT

Public – Private Partnership (PPP) contracts model exemplifies the New Public Management, which recommends private sector mechanisms for state services. This School of Thought is based on “the rule of the three E” (Economy, Effectiveness, Efficiency) for the state. PPP novelty has already been a worldwide trend that may be proved to be suitable for the protection of heritage, even in sensitive cases such as museums, in spite of the failures in the museum of Versailles and in the Royal Armouries, in the United Kingdom. Besides, the coverage of monuments with earth serves various purposes of the state whilst private individuals also make use of it illegally, for instance by committing antiquities looting. So, there is an informal “Public – Private Practice” (or “Partnership” by improper use of the term), with a negative impact for heritage, instead of the potential use of the PPP legal tool for the protection of heritage and the promotion of culture. Finally, the PPP model in the cultural domain is to be correlated to the similar diachronic institution of sponsorship.

Keywords: PPP contracts, Culture, Heritage, Museums, New Public Management (NPM), Excavations, Antiquities looting, Coverage with earth, Criminal... “PPP”, “The rule of the three E” (Economy, Effectiveness, Efficiency)

INTRODUCTION: REGULATIONS ON PPP CONTRACTS AND CULTURAL HERITAGE

Public - Private Partnership (PPP) has recently constituted a worldwide trend (Patrikios, 2009). The PPP contract is an agreement within public sector bodies enter into long-term contractual agreements with private sector entities for the construction or management of public sector infrastructure facilities by the private sector entity, or the provision of services

(using infrastructure facilities) by the private sector entity to the community on behalf of a public sector entity (Peirson and McBride, 1996).

Heritage is a formal term for inheritance, namely the property that has been or may be inherited by an heir, in the field of Private Law. Fortunately, legal culture has enriched the term and developed it in the field of Public Law (Merryman, 1989). Indeed, heritage signifies things such as works of art and immaterial cultural goods, like cooking recipes, and folklore that have been passed on from earlier generations. It is to underline that the notion of heritage is a dynamic one and the cultural law has the tendency to broaden it. For instance, the Convention on the protection of the world cultural and natural heritage, adopted by UNESCO in 1972, protects not only cultural heritage but also the natural one, namely formations and landscapes made by nature without human intervention. There is also an actual trend of codification on the matter, exemplified by the French legal order. Indeed, in 2004 France adopted a heritage code, the creation of which the Council of Europe encouraged (Du Bois de Gaudusson, 2006). Codification is particularly useful as, on the one hand, it presents the dispositions (archives, libraries, archaeology, museums or even the historical monuments) in a single set and, on the other hand, it facilitates the access to these dispositions (Monnier and Forey, 2009).

This paper focuses on cultural heritage, particularly historical monuments, as it is the common case of heritage.

We assume that PPPs are suitable for the protection of cultural heritage, even in sensitive cases such as museums of royal heritage.

PPP CONTRACTS LAW AND MANAGEMENT

The first known case of concession from the public sector to the private one has to do with a great civil engineering project for the people of Eretria, in Greece, in the 4th century BC. They hired a foreign engineer, Chairephanes, in an attempt to drain a marshy area, situated rather far from the city, at the heart of their territory. This project exemplifies the “Build – Operate - Transfer (B.O.T.)” model, whose financing was undertaken by the contractor and his partners, who would take advantage of the land for ten years.

The concession model was in use in the times of the Roman Empire and later, in various countries. In France, it acquired a particular significance due to the fact that in the period of

the one-class (liberal) state, which was formed in the 18th century, the principle of the abstention of the state from any economic activity was strictly applied whilst the entities of local self-government enacted an active role to build up the welfare state.

It is to pay special attention to the fact that the concession model is compatible with cultural projects, even museums that are by definition non-lucrative organizations, in spite of the fact that, as a general rule, concessions are used for reciprocal scopes. For instance, before the introduction of the legal framework on PPPs in France delegations of public service and concessions were used in the cultural domain, as it was the case of the museum Jacquemart – André. In 1995 this museum in Paris had 20.000 visitors and an operation deficit of 458.000 euros. Since the adoption of the concession model, the museum annually has acquired 180.000 – 240.000 visitors and perceived 137.000 – 150.000 euros. It is not about an abandon of responsibilities but a delivery of them, within the state prefers to concentrate its efforts to the collection and the rehabilitation of the works of art (Legrand, 2005).

The United Kingdom is considered as the homeland of PPP through the institutionalization of Private Finance Initiative (P.F.I.) in 1992 for non-reciprocal scopes, such as schools, hospitals and jails but it was inspired by both concession model and legislation on public constructions in the French legal order. It is to signalize that PPP exemplifies the New Public Management, neoliberal School of Thought that refers to the tendency to adopt the principles and values of the private sector in order to meet financial objectives and goals (Kalogirou and Maniatis, 2012). The adoption of a legislative framework on PPP contracts has recently been very frequent, in comparative law. For instance, this institution has been introduced into the Greek legal order in virtue of Law 3389/2005 but it has not been tested yet in the cultural domain.

The PPP framework in the French legal order has very great similarities to the British model and has already been modified to become more flexible. In the cultural context, the recourse of the French Administration to PPPs remains restricted (Maniatis, 2011). The British experience demonstrates that these have to do with the implementation of heavy cultural equipments, such as spectacles rooms, theatres or libraries. In France, the Theatre of Archipelago, constructed in Perpignan since October 2011, has been programmed to host festivals with a trans-border character between the French culture and the nearby Spanish one. Besides, among others, the national Museum of the civilizations of Europe and the Mediterranean was constructed, in 2012, in Marseille. It is to signalize that the scopes of the contracts in the cultural domain are discerned by their novelties, which may be inspired by

the innovative character of PPPs. For instance, it is about the construction of an aquarium, the scientific attempt of approach to oceanography through experiments, the thermal balance in a museum building, the walk gardens connected with the aforementioned central museum in Marseille through a bridge, the services of digitalization of pieces of French cultural heritage as well as the Informatics services. More concretely, a PPP contract had been signed by the public entity "Versailles Museum" for the Informatics system mainly for tickets.

The topic of the dysfunctions of the PPP mechanism particularly in the heritage domain has not yet received considerable research attention, just like the similar topic of dysfunctions for cultural sponsorship (Maniatis and Kapralou, 2012). Editorial critiques often mention that PPPs liberate government finances, therefore increasing the set of infrastructure development projects that government can undertake, like the beneficial intervention of sponsors. However, recent empirical research supports the rather negative opinion that there is no *prima facie* economic reason to desire PPPs over Public Sector Provision (PSP) of infrastructure and PPPs hardly ever free public finances. Anyway, the legally required "special purpose company", created by the private winner of the competition procedure in the pre-contract stage, for the implementation of a PPP contract, matches well to the fundamental contemporary economics of infrastructure development projects. Lastly, it is anticipated that PPP modification will continue to advance in the future, when more detailed and specialized academic research has been adequately conducted (Chinyere and Xu, 2012). So, the legal concept is as a general rule positive but the economic crash test, although restricted at least in terms of quantity, proves to be apprehensive against the traditional way of constructing and managing public works. Anyway, it is self-understandable that it is about a very new legal and managerial tool that is open to essential changes, as implied by the aforementioned French experience.

NEW PUBLIC MANAGEMENT

New Public Management constitutes an umbrella term covering a set of public sector reforms across most OECD countries. Its origins are associated with the Taylor's approach to Scientific Management, within management is identified as the organization technique to meet financial goals. (Christopoulou S., 2008) It is also strongly related to the UK Prime Minister Thatcher and the US President along with the New Zealand Labour government of 1984.

Thatcher and Reagan denied the 'planning' approach that had been the orthodoxy in the US and the UK public sectors in 1960s and early '70s and favored a 'business-like' one. Gradually, partly through doctrine and partly through trial and error, in early 1990s a number of influential commentators appeared to believe that there was one clear direction – at least in the Anglophone world. This general direction was soon labeled as the New Public Management (NPM) or (in the US) Re-inventing Government. (Pollitt and Dan, 2011).

The philosophy of the New Public management is based on “the rule of the three E” (Economy, Effectiveness, Efficiency) whilst the way this rule works is pictured in the following figure:

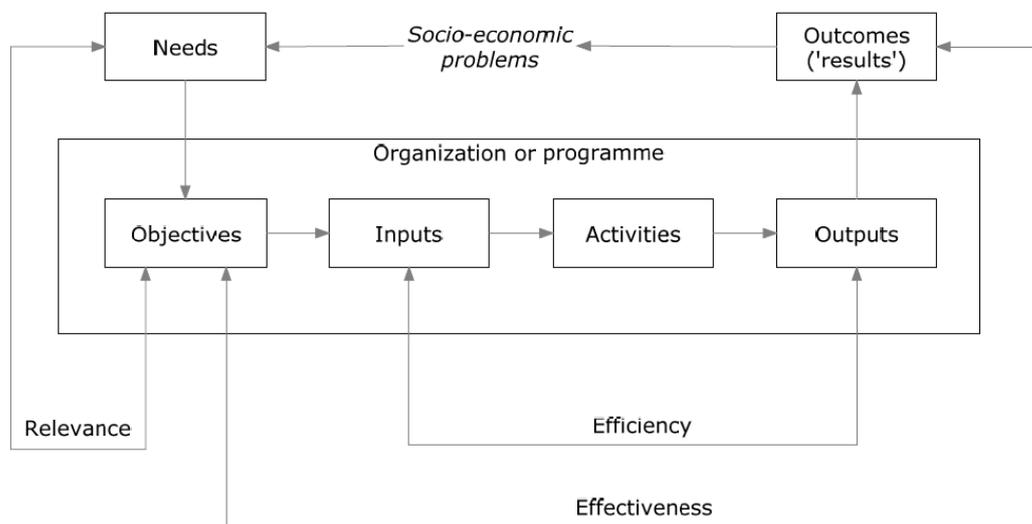

Figure 1 (Pollitt and Dan, 2011).

The NPM promotes the self-restraint of the state mechanisms of intervention as well of the institutional safeguards and their replacement by a set of standards of effectiveness through organizations of quality certification, assessment tests, strategies of competition enhancement e.t.c. (Markantonatou, 2011). It emerges as another model of operation of public services that contributes to the more qualitative management of contemporary social needs and includes actions submitted either to the classic management or to separate social sciences. The NPM is a two-level phenomenon. In the higher level, it is a general theory or doctrine, according to which the public sector can be improved through the adoption of business concepts,

techniques and values. In the more mundane level, NPM is a bundle of specific concepts and practices, including:

- Greater emphasis on 'performance', especially through the measurement of outputs
- A preference for lean, flat, small, specialized (disaggregated) organizational forms over large, multi-functional forms (e.g., semi-autonomous executive agencies)
- A widespread substitution of contracts for hierarchical relations as the principal coordinating device
- A widespread injection of market-type mechanisms (MTMs) including competitive tendering, public sector league tables, performance-related pay and various user choice mechanisms (Pollitt and Dan, 2011).

The NPM is considered as a "compact system of global significance" even though there are many differences in the way that is perceived and applied. That is why we can separate within the larger JDM four different models.

- The Efficiency Drive NPM Model
- The Downsizing and Decentralization NPM Model
- The In Search of Excellence NPM Model
- The Public Service Orientation Model

These subsets of NPM vary as for the emphasis in individual issues but not in the main targets. Their common denominator consists in the need of produced work measurability, of privatization of state functions, of staff and fees restriction, of business practices introduction, of autonomization of some parts of the management and of merge of some others (Markantonatou, 2011).

The major differences between public mandarins concept and NPM are shown in the following table:

Public mandarin phenomenon	New Public Management
Short-term programming	Long-term programming
Static setting of goals	Dynamic setting of goals

Avoidance of mistakes	Pursuit of success
Minor importance of the economic assets	Major importance of the economic assets
Hierarchical and rigid structure	Austere structure
Limited assignment of the decision-making power	Maximum assignment of the decision-making power
Emphasis on the procedural forms	Emphasis on the results

Table 1. Differences between public mandarin phenomenon and New Public Management (Christopoulou, 2008)

Whilst it is now fairly clear that the whole of the world is not following the same path, it remains true that NPM ideas spread very widely, and are often still seen as the most obvious route to modernization.

THE MANAGEMENT OF PPP IN VERSAILLES

The case of the Castle in Versailles constitutes the first failed PPP contract in France instead of being an exemplary success according to the expectations of the government. In 28 May 2008 the direction of the competent public entity made the decision to get rid of the contract, signed by the former president and afterwards minister of Culture, with a company providing Informatics services. It was about the normal end of an abnormal partnership, given that during the 15 months since the signing of the contract, the PPP had been marked by many imperfections by the private partner's side. Among the defaults there were that the software of the tickets editing was unstable, extremely slow and unsatisfactory, by causing problems such as the enhancement of the queue of waiting visitors. It is to underline that PPP would have as a window display the sight-seeing of Versailles, whose gardens constitute an example of cultural (along with natural elements) heritage included in the "World Heritage List" according to the aforementioned Convention on protection of world cultural and natural heritage. More concretely, the Palace and the park have been listed in 1979 and constituted a part of the initial set of monuments of France in this important list. So, in principle the political choice to use this sight-seeing of worldwide prestige was correct.

Upon the competent public service for PPPs (called in French "MAPPP"), besides the incapacity of new technological tools management, the failure of the contract is due to the decision of the Ministry involved to delay the execution of the contract and to the fact that the acquisition of Unilog by another private company, Logica, caused a climate of uncertainty to its employees and, as a result, some of them left their workplace in the critical moment. "MAPPP" concludes that this case enhances its managerial position that the assigning authority should interfere as less as possible as for the contractual obligation, unless a dysfunction emerges.

After ending the contract, the public foundation of the museum and the national domain of Versailles took on again the internal management of the tickets reservation through the new systems of technology. Up the end of 2008 the problems had been fully resolved and the system of reservation functioned regularly. Moreover, the foundation noticed in its 2008 annual report that the ending of the PPP contract caused the need in recomposing the team of Informatics maintenance of the tickets system in order to face the development of the new tools of this system and that this activity should be externalized within a PPP contract.

THE MANAGEMENT OF PPP IN LEEDS

In December 1993, a PFI contract was signed, of sixty-year duration, between the Royal Armouries and the private company "Royal Armouries International plc (RAI)" for the construction, operation and guardianship of the new museum of the United Kingdom, in Leeds. RAI would assume the entire risk and perceive the revenues coming from the visits of the public as well as from parking and restaurant services. In spite of the fact that the museum was delivered to use in time and in conformity to the budget, it did not manage to cover its operation fees and, as a result, in July 1999, after a revision of the contract with RAI, which was no more truthful, the Royal Armouries assumed the responsibility of the operation of the museum. This political decision highlights the subsidiary and financially unadvisable mission of the state in economy as the Ministry of Culture had to contribute by 10.000.000 pounds in order to save the museum from definite pause of operation. As a result of the revised contract, the Armouries received further financial back of 1.000.000 pounds annually and were supposed to economize approximately 2.000.000 pounds per year. The failure of the PPP contract is due to the very restricted demand, in comparison with the pre-evaluated one (approximately 60% of the expected levels in the first year of operation and 35% in 1999), and to the very restricted capacity of the building (pre-evaluation consisting in 1.300.000 visitors

per year with an average visit duration of 2,5 hours while in reality the number of visitors was 600.000-650.000, with a real average visit duration of 4 hours) and also to the policy of high pricing (up to 18 dollars per individual) in spite of the counsellors' warning on the matter (Legrand, 2005).

THE QUESTION OF EARTHED-UP HERITAGE PARTICULARLY IN GREECE: A CRIMINAL ... "PPP"

Coverage with earth for immobile historical monuments constitutes a controversial issue, particularly widespread in the archeological practice on international scale (Maniatis, 2013). In Greece, during the excavation for the metro of Thessalonica, an Early Christian Basilica was discovered, in the station "Syntrivani", namely in the centre of the city. The monument was to be transferred in a distance of about 200 meters, in the park of the Theology Faculty of the Aristotle University of Thessalonica. However, this decision was attacked and finally the coverage with earth was decided. "*The future cannot and should not be built against the past*", according to some archeologists reminding of the final paragraph of the Amsterdam declaration, adopted in 1978.

Besides, a recent double case of discoveries in the Greek region of Central Macedonia reveals the error, according to which the coverage with earth protects the monuments not only from the harm of their material substance but also from crimes, such as antiquities looting. Anyway, it is to signalize that in Thessalonica the "Syntrivani" square is added to the casuistic of the coverage of the immurement of the White Tower with earth and the prevention of the unearthing of the nicest temple in the "Antigonidon" square, which had been transferred there in ancient times, in virtue of the "wandering temples" custom (Maniatis, 2010).

Another recent case consists in coverage of a very important ancient temple with earth, during the excavations for the reconstruction of a line of the Athens-Piraeus Electric Railways. As the State makes use of this method for various legitimate reasons, for instance as a "mortgage" for an on-the-field research, to be accomplished by the future generations of archaeologists, some private individuals take benefit from it as a "mortgage" for illicit excavations of the current era, let alone the fact that they dissimulate accidental archeological findings to continue their own building works. As a result, a finding emerges, consisting in the counterbalancing dynamic of criminality against the controversial practice of Public

Administration. So, administrative and private practices result in a homogeneous total, particularly in the countryside. In other words, empirical research demonstrates clearly that there is an informal “Public – Private Practice” (or “Partnership” by improper use of the term), with a negative impact for heritage, instead of the potential use of the PPP legal tool for the protection of heritage and the promotion of culture! For instance, the comparable institution of cultural sponsorship has been used in France to reward anyone giving to the authorities useful information in case of looting of works of art.

CONCLUSION: SUITABILITY OF PPP FOR THE PROTECTION OF HERITAGE

The implementation of the PPP model failed as for the emblematic museum of Versailles and the righting of this failure was not attempted through a similar contract. However, this datum should not cause misconceptions on the suitability of the model as PPPs, being themselves an innovation, have proved to be a vehicle conducive to other relevant innovations and to success, in managerial and legal aspects. Moreover, the failures in the United Kingdom should not lead to generalizations but to a more attentive application.

The hypothesis of the present paper has been confirmed in combination with the following major findings:

1. The PPP model constitutes a formal care of the state about the public interest and therefore it may be an antidote to the insufficient state policy for the protection of heritage in combination with private individuals' crimes, such as antiquities looting (phenomenon called criminal ... “PPP”). This function consists *inter alia* in promoting legitimate archeological excavations and in upgrading the guardianship of archeological sites and museums.
2. The PPP approach to the cultural domain of the public policy should be particularly flexible and attentive. It is to signalize that if monuments need protection and are considered as more important against the rest cultural goods, museums, at least the heritage ones, are more sensitive because, on the one hand, they need technical service often expensive and, on the other hand, they generally seem to be rather unattractive for the public as they have to do with the past, let alone of anachronistic character. Anyway, PPPs are suitable for non-lucrative scopes, such as museums, given that even concession, that is traditionally used almost only to reciprocal

projects, has conduced to success the management of museums and similar entities, in France. It is to pay special attention to the fact that PPPs, already in their initial form (PFI) in the United Kingdom, were orientated to merely non-reciprocal scopes of the public policy related to the crucial social fundamental rights of citizens (schools, hospitals) and to the nuclear of the state mission (jails), not to reciprocal scopes. This means that capitalism had already a very drastic and successful alternative against the common way of constructing public infrastructure, the concession contracts fully adaptable to new technologies of each era and intrinsically connected with reciprocal charges of end-users particularly in the domain of transports. In this socioeconomic context, PPP were conceived by New Public Management *formally* as a variant of the concession model, which keeps its traditional use particularly for transports, and *operationally* as an alternative against the traditional-type public works contracts, *not the concession ones*. So, the prejudice that PPPs are a neoliberal mechanism similar to concessions is legally accurate but is not usually confirmed in managerial terms.

3. PPPs in general are open to further scientific research and no fixed relevant assessment has resulted to date, on international scale. So, although they may be suitable for various scopes, such as the heritage ones, it is not sure that they are preferable to PSP of infrastructure, including the aforementioned function against the criminal "PPP" phenomenon.
4. Last but not least, PPPs for cultural scopes are characterized by an important particularity that still remains out of scientific discussion, namely their similarity to another diachronic institution of funding, the sponsorship. If kings have become a point of reference for PPPs due to some cases of failure of royal heritage management, a significant and non-elaborated question has to do with kings as a potential point of inspiration, enacting the role of Maecenas generally for PPPs. This development may be facilitated through the recommendable correlation of the PPP law to the cultural sponsorship one, as this proposal has been recently formulated (Vassilakou and Maniatis, 2012).

KNOWLEDGE-INTENSIVE STRATEGIES IN LOW-TECH SECTORS DURING THE CRISIS: THE CASE OF THE GREEK WOOD AND FURNITURE SECTOR

Karagouni, Glykeria¹; Tsakanikas, Aggelos²

¹Department of Chemical Engineering, National Technical University of Athens, Athens, Greece, karagg@teilar.gr

²Department of Chemical Engineering, National Technical University of Athens, Athens, Greece, atsakanikas@iobe.gr

ABSTRACT

The paper explores the strategies used by Greek wood and furniture firms during the crisis under the lens of the newly developed notion of knowledge intensiveness. A field research of 394 firms contacted in 2012 revealed that in spite globalization and crisis the sector remains rather passive with limited effort to develop innovation. The majority of these firms are introvert with low cost and differentiation to be considered their main but rather weak strategies, since according to managers their competitive advantages are easy to imitate. Still, the effect of customer loyalty, size and exports is significant. Wood and furniture firms should try to become more knowledge-intensive, build capabilities, seek knowledge all along the value chain and place technology and collaborative efforts at the heart of their competitive advantage. This seems to be the best way to confront both crisis and globalization threats.

1. INTRODUCTION

During the last decade researchers have argued for the need of new strategy paradigms at firm level, based on knowledge. New theories have evolved around the notion of Knowledge-intensive entrepreneurship (KIE) which is considered a key socio-economic phenomenon that drives innovation, and economic growth enhancing the competitiveness of both firms and countries (Malerba and McKelvey, 2010).

So far, the debate on KIE has mainly focused on firms in high-tech sectors. To date, little attention has been paid to firms that belong to so-called low-tech, traditional and mature

industrial sectors. However, a small but increasing stream of empirical research has indicated the importance of KIE in these sectors as well (e.g. Karagouni and Kalesi, 2010).

The crisis revealed certain pre-crisis weaknesses of some countries (e.g. Greece and some southern and eastern European countries), sectors (e.g. traditional mature sectors such as textiles and furniture) and types of strategies (e.g. low-cost) and innovations (e.g. financial innovations). Future prospects for innovation in these countries and industries will greatly depend on their disengagement from current and adoption of novel approaches which turn more around knowledge.

The paper has been structured as follows. After a short description of the relevant theoretical framework, the Greek wood and furniture sector is described as the object of the survey. The following units present the results and the relevant discussion exploring the factors that affect innovative performance of these firms in crisis period and providing a clear mapping of the characteristics of the specific ecosystem.

2. THEORETICAL BACKGROUND

Current theoretical and empirical research enhances the role that traditional sectors still play in modern and vulnerable economies and directs importance of innovation outside R&D-intensive fields (Robertson et al. 2009; Hirsch-Kreinsen and Schwinge, 2011). A new research stream (Smith, 2008; Hirsch-Kreinsen et. al, 2003; Karagouni and Caloghirou, 2013) focuses on low-technology industries claiming that besides their strong path-dependency they can be knowledge-intensive, develop knowledge-based innovation and invest in trans-sectoral knowledge seeking and learning (Hirsch-Kreinsen and Schwinge, 2011). According to Smith (2008) "Growth within the less glamorous, traditional sectors is certainly innovation-based and moreover it rests on cognitively complex and deep knowledge bases, which from time to time are subject to discontinuous change". Recent empirical research confirms that low-tech firms which became knowledge-intensive managed to improve their competitiveness by repositioning within the product supply chain (Schwinge and Kreinsen, 2012; Karagouni et al., 2012) and following market niche strategies. They further engaged export-oriented strategies in addition to this strategic orientation towards knowledge creation and innovation, especially in cases of limited domestic markets (Schwinge and Kreinsen, 2012).

Thus low-tech firms tend to develop different kinds of competitive advantage in order to address competition within their vulnerable and mature markets. Besides the well-known and mostly-used cost-leadership, they turn to differentiation and innovation. They engage mainly in new product development and frequent changes or improvements of process

technologies (Hirsch-Kreinsen 2008a, Robertson and Smith 2008, Robertson et al. 2009). While a very small percentage of individual low-tech firms develop R&D activities, the majority apply mainly open innovation (Hirsch-Kreinsen and Jacobson, 2008; Likar et al., 2008). Process, organizational and marketing innovations are more common (Heidenreich, 2009), while product innovations are in their majority incremental (Bender, 2004). A significant feature of low-tech innovation is the engagement of many stakeholders all along the value chain in open innovation. Suppliers are of utmost relevance in this context, since low-tech firms rely heavily on raw material, machine and equipment technological advances (Bender, 2004; Heidenreich 2009). In this context LMT firms are widely termed as “supplier-dominated firms” referring to Pavitt’s taxonomy of sectoral innovation modes (Heidenreich 2009; Robertson et al. 2003). While in-house R&D is not a crucial strategy element in low-tech sectors, firms can create innovation by becoming knowledge-intensive. Both literature and empirical findings (Gupta and McDaniel, 2002; Hirsch-Kreinsen, 2008; Schwinge and Hirsch-Kreinsen, 2012) show that accumulated knowledge can support a new way of combining inputs or resources based on exploitative learning processes, increase effectiveness and create sustainable competitive advantage. *Knowledge intensity* refers to external and/or internal ‘knowledge seeking activities’, ‘initial knowledge capital’ and relevant ‘human capital’ (Caloghirou et al., 2012). Knowledge-intensive low-tech firms seek mainly new technical and practical knowledge linking external knowledge with the firm-specific knowledge base (Bender and Laestadius 2005; Medanoça 2009; Robertson and Smith 2008) relying on training and highly qualified personnel skills.

According to this knowledge-oriented perspective, knowledge and competencies of “human capital” are valuable firm assets due to their firm-specific, socially complex, and path-dependent characteristics (Collins and Clark, 2003; Wright et al., 2001). Innovation is usually connected to motivation and ability of human capital to develop creative and innovative approaches. Human resource management’s role is crucial in nurturing the necessary conditions for this task. Firms use strategic HR practices, such as training, performance appraisal, and compensation, as means to motivate employees' knowledge bases and their creative thinking (Chen and Huang, 2009).

Globalization and trade liberalization in combination with the global financial and public debt crisis that countries are now experiencing have created vulnerable and volatile environments. Mature industries are subject to major changes but cumulative knowledge and its creative combinations can provide novel options to companies in order to survive

(Protogerou and Karagouni, 2012). All the above indicate that knowledge-oriented strategies may play an important role in the enhancement of low-tech companies' performance and competitiveness by creating and sustaining strong competitive advantages.

3. WOODWORKING AND FURNITURE SECTORS

3.1. Industry structure

The wood product manufacturing industries or woodworking industries include the production of sawn wood, wood-based panels, joinery and carpentry materials, containers packaging and other wooden articles. The furniture industry is part of the down-stream value chain activities of this sector including other material as well. It is essentially an assembling industry, which employs various raw materials ranging from wood and wood-based panels to metals, plastics, textile, leather and glass. There are many different types of furniture with very different uses.

Woodworking and furniture industries are two vital, sustainable, innovative and eco-compatible sectors, with a turnover in 2009 of around €198 billion, an added value of around €60 billion and an employment rate of 2.1 million people in more than 300 000 companies (EU-27, Eurostat, 2012). The vast majority are SMEs, with the wood-based panel sub-sector and a handful of sawmills to be the exception. The furniture industry accounts for nearly half of this turnover, followed by the production of construction elements (19.3%), sawmilling (13.9%) and panel production (9.2%). The majority of furniture producers are micro-enterprises (less than 10 employees).

The sector faces growing competition from low-cost, emerging economies and a growing number of technical trade barriers. Furthermore, the furniture sector is not only facing difficulties in accessing wood as a raw material, but also a dramatic rise in the price of materials such as leather, plastics natural fibres and petroleum derivatives. The general financial and economic crisis has had a major impact on the entire sector: between 2008 and 2009 65000 companies shut down and turnover decreased by more than 20% (eu.enterprise.sectors).

3.2. Sector Dynamics and the role of Innovation

Woodworking companies are considered innovative and knowledge-intensive (Smith, 1999; Hirsche-Kreinsen and Scwinge, 2010) demonstrating a continuous development of processes. Companies in the sector have built in high-quality innovation systems for both products and processes and excellent sectoral research and technological development knowledge centers.

Global machinery manufacturers, suppliers, the chemical industry, Universities and independent research centers develop synergies assisting the advancement of process and product developments. Innovations turn around engineered wood products, wooden composites, novel fittings and other wooden products.

Furniture companies are less knowledge-intensive or innovative regarding technical innovation. Investments in internal R&D processes are very low to non-existent, very few firms engage in radical breakthrough technologies and hardly any firm protects its intellectual property through patents. The sources of technological changes are often found outside the sector, for example, in the wood processing machinery, IT services, high-speed automation and manufacturing logistics, paints and lacquer (Poliacov et al., 2009).

Knowledge evolves mainly around aesthetic, design and fashion related issues and focuses on creativity and strong image building. Yet, process and product innovation is evident in the undertaking of lengthy processes of restructuring and modernization, development of sustainable production methods and novel business models (e.g. modular design). Major factors of competitiveness for the sector consist of research and innovation along the whole value chain (Figure 1) and mainly material and fittings, skills and quality, design and added value, knowledge and know-how, together with better access to third country markets.

4. THE WOODWORKING AND FURNITURE SECTORS IN GREECE

4.1. Industry structure

Woodworking and furniture industries play a significant role in Greek economy, with a turnover in 2008 of around €2 billion, an added value of around €1 billion and an employment rate of 35.000 people in more than 15.000 companies (Eurostat, 2009). The vast majority is micro-companies, with the wood-based panel sub-sector and sawmills to be the exception.

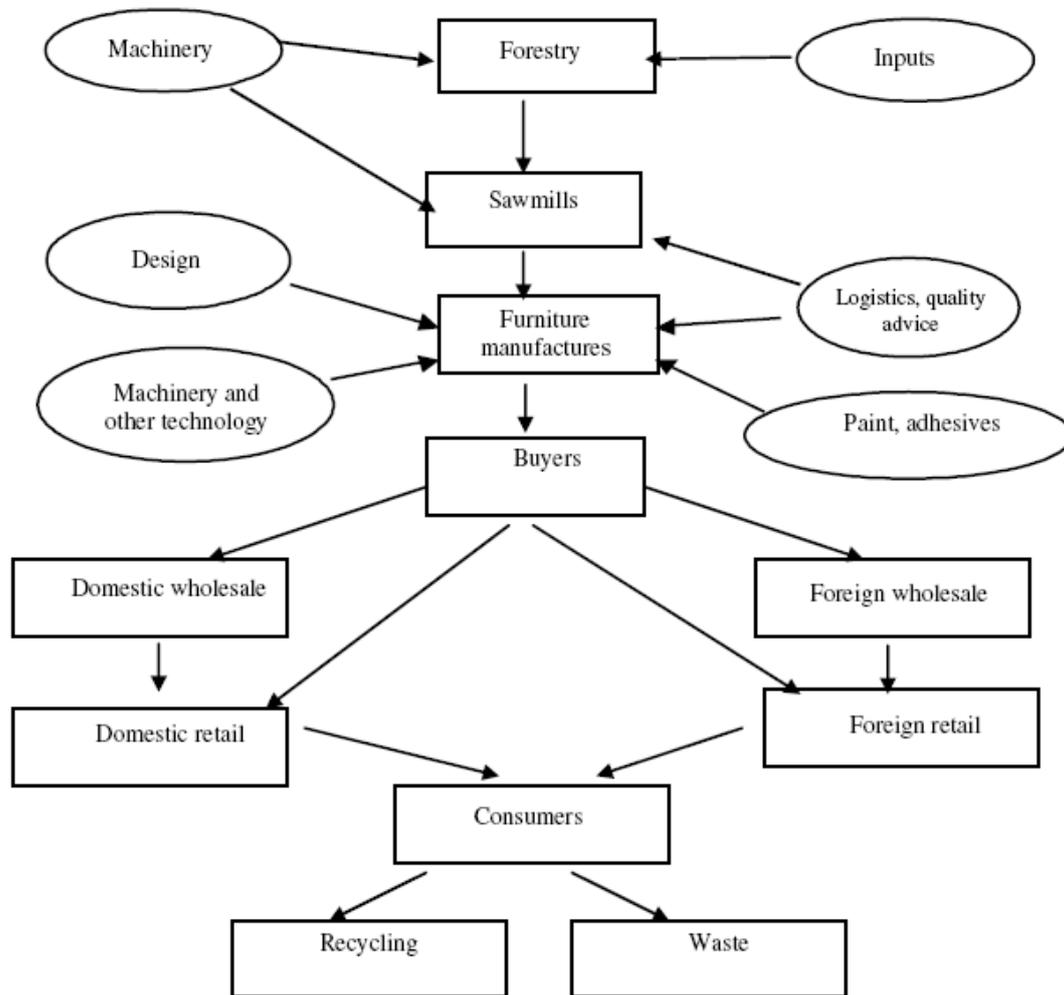

The sector is mature, highly fragmented and labour-intensive with many firms operating in a 'craft' production mode. 66% of the firms are less than 30 years old and cover mainly the domestic market, as exports are rather insignificant.

The industry faces growing competition from low-cost, emerging economies and a growing number of technical trade barriers. Decreasing production in absolute numbers was combined with the increasing number of trendy products from Italy and Spain, cheaper products from Turkey, China and India and different approaches such as of IKEA. Furthermore, it faces difficulties in accessing wood as a raw material and a dramatic rise in the price of materials such as leather, plastics natural fibres and petroleum derivatives (Tringkas et al., 2012). The general financial and economic crisis has had a major impact on the entire sector: In 2008 most companies had losses of profits (56.8%) or even damage (27.3%). Regarding the furniture sector, the production volume decreased by 47% among 2009-2011, and further by around 30% in 2012 (EL.STAT).

3.2. Sector Dynamics and the role of Innovation

Greek wood and furniture companies are not considered as innovative even with the Schumpeterian concept of innovation. Recent research (Karagouni et al., 2010), which covered wood and furniture companies in the region of Thessaly, Greece, indicated that only an 18% of firms in the sample developed some incremental innovation. Improvements of existing products and purchase of process innovation are the main innovation activities. Advancement of existing and development of new equipment (AMT), the import of design systems (CAD), the application of CIM and MRP, as well as the pilot use of new or improved raw material or semi-finished products are further innovations pursued by Greek wood and furniture manufacturers. A network of international machinery manufacturers and suppliers play a significant role in research and development advances regarding mainly medium and large organizations (Tringkas et al., 2012). Furniture companies invest on differentiation through the development of aesthetic value and fashion. Yet, design is still underdeveloped while process innovation refers more often to restructuring and modernization.

Figure 1 Wood furniture value chain

Source: UNIDO

Major weaknesses of both sectors regard the lack of specialized technical personnel, overall organization and quality control while entrepreneurs' educational level is rather low (Likar et al., 2008). The last five years the sectoral context starts changing by becoming more knowledge-intensive. New entrepreneurs or successors have a high educational level and turn to research, innovation and knowledge management.

5. EMPIRICAL PART

Methodology and measures

The survey was undertaken during the summer of 2012 in Greece (crisis period). The field research was conducted through personal telephone interviews with the aid of CATI (Computer Administered Telephone Interviewing). The original sample came from almost

2.296 SMEs which belong to the sectoral ecosystem of wood and furniture manufacturing and wholesale trade. The reason for including also trade firms in the sample is that at least in Greece they are very much linked with the manufacturing companies they collaborate. Thus, they could be considered as an integral part of the specific ecosystem. More specifically in the analysis we have included firms belonging to the following NACE Rev 1 sectors

- Sector 20 Manufacture of wood and of products of wood and cork, except furniture;
- Sector 36.1: Manufacture of furniture
- Sector 51.53 : Wholesale of wood, construction materials and sanitary equipment

The analysis consists of two parts. At the first stage we run an OLS regression, in order to understand the factors that affect innovative performance of these firms. At the second stage we try to build a typology of the examined firms by implementing cluster analysis and by using the variables that turned out to be significant. This provides a clear mapping of the characteristics of the specific sectoral ecosystem.

The first step in the analysis was to try to identify the factors that affect innovative performance of the firms. More specifically, the variables / measures that will be in the analysis are the following:

As dependent variable (variable INN) we use the number of product and/or process innovations that were introduced by the firm during the last three years.

As independent variables, that is elements that we believe that they might affect innovative performance, we use the following:

COST_LEAD: Cost leadership measures whether the firm has a cost competitive advantage. It takes the value of 1 if the firm charges significantly higher than competition and scales up to 7 if the firm holds a significant cost advantage compared to all competitors. Due to the recession in the Greek economy and constrains from the domestic market, there is an urgent need for reducing prices. Therefore firms must find a way to re-organize their resources, to undertake process innovation. We expect firms that are cost leaders to innovate to a greater extent than those that they might offer more expensive products. However, the opposite could also hold, as successful product innovation may lead also to higher value added products, which should be priced with a mark up from the usual competition.

DIFF_LEAD: differentiation leadership measures whether the firm has a competitive advantage based on differentiation. It takes the value of 1 if the firm's products do not differentiate significantly compared to competition and scales up to 7 if the firm holds a significant differentiation advantage compared to all competitors. A positive sign is expected here, as in order to differentiate firms must constantly innovate.

CR_DES This variable is a measure of the difficulty of the competitors to copy the competitive advantage of the firm. It takes the value of 1 if the competitors can easily recognize and copy the competitive advantages of the firm and scales up to 7 if the competitors can hardly recognize and copy these competitive advantages.

MAN_GR: It measures the management's commitment to achieve specific targets in relation to the company's growth. It takes the value of 1 if the managers are more interested in the typical everyday administrative tasks than having a strategic vision for the future and scales up to 7 if the managers are strongly motivated and committed to achieving specific growth targets.

CUST_LY: It is a measure of the customers' loyalty. It takes the value of 1 if the customers buy products / services randomly and have no preference in brand name and scales up to 7 if the majority of the customers buy regularly the company's products and show a strong preference to the specific brand name. A high degree of customer's loyalty means that firms are not under pressure from the demand for innovation.

SPEC: This variable measures the firm's workforce of qualified personnel. It takes the value of 1 if only a small percentage of the firm's staff is highly qualified and scales up to 7 if the firm occupies specialized scientific staff in most of its departments and levels. A positive sign is expected here.

ICT: It measures whether or not a firm uses new technologies and tries to integrate ICTs. It takes the value of 1 if there is no effort to adapt to the new conditions by incorporating new ICT and scales up to 7 when the firm has a strong lead compared to its competitors to incorporate new ICTs. A positive sign is expected here, as firms that follow the latest developments on ICTs and try to integrate new technologies in their processes are more eager to change and especially process innovation.

CULT: This variable measures whether the business environment and culture encourages employees to take initiatives and propose new ideas. An evaluation of 1 means that no initiative or risk is allowed and any failures are unacceptable. On the other hand the value of 7 means that there are official processes that encourage the initiative and risk and potential failures to use as learning experience for the future.

BON: It measures whether there is any system of reward and recognition for successful ideas and innovation. It takes the value of 1 if neither formal nor informal recognition nor reward is available and scales up to 7 if there is a well established formal system of reward and recognition of staff suggesting ideas and successful innovations.

RD firms' spending takes the value of 1 if there are no R&D expenses and scales up to 7 if the company is a leader in its sector in relation to the R&D expenses (turnover rate greater than 10%).

COLL: It is a measure of the degree to which firms participate in research projects. It takes the value of 1 if the firm has not participated in any research program over the last 5 years and scales up to 7 if participating in R&D collaborations is a strategic choice of the firm.

SIZE. It measures the size of the firms in terms of employment. It takes the values of 1 for micro firms, 2 for small firms, 3 for medium sized firms

EXP: The exporting activity of the firm. It takes the value of 1, if the firm is not exporting and scales up to 7 if the firm is exporting more than 60% of its sales

EXP*SIZE: It is an interaction term of exports and size. We are able to capture the joint effect of the two variables.

SEC: It is a dummy variable taking the value of 1 for manufacturing firms and 2 for trade firms

Sample descriptive

In terms of size, the vast majority, almost 3 out of 4, are micro firms that employ less than 9 employees. Only 3.6% of the firms, 11 manufacturing and 3 from the trading sector are medium sized. In terms of location of headquarters, 60% are located in the two main cities (regions of Greece), whereas another 40% is located in various other regions of the periphery of Greece

Table 1: Size of the firms

Number of employees	Number of firms	%	<i>Manufacturing</i>	<i>Trade</i>
<=9	287	72,8	228	59
10_49	93	23,6	82	11
50 - 249	14	3,6	11	3
Total	394	100	321	73

The vast majority of firms do not export. A 15% presents some exporting activity but this is not an important part of their sales, as it represents less than 10% of their turnover. On the other hand there are 28 firms (7%), mostly manufacturing that they seem to export more than 20% of their sales

6. RESULTS AND DISCUSSION

Firms have evaluated at a 1-7 Likert scale the degree to which their competitive advantage is related with cost. While 9.6% of the firms responded with a 7, indicating cost leadership, more than half the sample responded with at least 5, indicating that they perceive themselves as cost leaders. On the other hand there are a 10% of firms that they feel they are significantly more expensive from competition, focusing probably on other niche markets with higher value added products.

Table 2: Cost competitive advantage: Degree to which competitive advantage is related with cost

Value (Likert scale 1-7)	1	2	3	4	5	6	7	TOTAL
Number of firms	23	18	29	99	146	41	38	394
%	5,8	4,6	7,4	25,1	37,1	10,4	9,6	100,0

1: The firm charges very high prices for its main products

7: The firm holds a significant cost competitive advantage

Almost 20% of the firms believe that the main source of their competitive advantage is diversification (rated 6-7 in the Likert scale). Another 20% lie at the other end of the spectrum, indicating those firms which are not significantly diversified from competitors.

Table 3: Diversification advantage: Degree to which competitive advantage is related with diversified products / services?

Value (Likert scale 1-7)	1	2	3	4	5	6	7	TOTAL
Number of firms	3	10	68	78	159	26	50	394
%	0,8	2,5	17,3	19,8	40,4	6,6	12,7	100,0

1: The products / services have quality / operational disadvantages among most other competitors

7: Firm's products/ services are largely differentiated from those of competitors

Almost half of the sample believes that their competitive advantage is rather easy to be imitated, so actually they do not possess a unique characteristic. On the other hand 20% seem to hold that rare sources of advantage or the capital requirements for this are too high.

Table 4: Imitation effect: How easy if for competitors to duplicate the competitive advantage of firms

Value (Likert scale 1-7)	1	2	3	4	5	6	7	TOTAL
Number of firms	68	47	84	52	59	26	58	394
%	17,3	11,9	21,3	13,2	15,0	6,6	14,7	100,0

1: It's easy for competitors to recognize and track the sources of competitive advantage of the firm

7: Competitors are difficult to recognize and reproduce the sources of competitive advantage of the firm. The capital requirements and manpower for this to happen is significant.

Another interesting topic that was explored in the survey was whether day to day management and business activity is the main concern of the managers-owners of the company. It is well expected for managers to do that, however sometimes and especially in micro firms, strategic planning and specific growth targets may not be at the heart of the business activity. Indeed, a 40% of the sample responded with 1 to 3 in the Likert scale indicating that they lack this strategic vision for the future, as making end meets.

Table 5: Managers' commitment to specific growth targets

Value (Likert scale 1-7)	1	2	3	4	5	6	7	TOTAL
Number of firms	117	11	32	49	78	6	101	394
%	29,7	2,8	8,1	12,4	19,8	1,5	25,6	100,0

1: Managers are mostly interested in day to day administrative tasks, lacking a strategic vision for the future

7: The managers are strongly motivated and committed to achieving specific growth targets

Furthermore, the customers' loyalty in the examined firms was also explored. Almost 40% believe that they have a relatively loyal customer base that is customers that they show a strong preference to the specific brands (products / services). This can be a disincentive for innovation, as firms are not under pressure from the demand for innovation.

Table 6: Degree of customer loyalty

Value (Likert scale 1-7)	1	2	3	4	5	6	7	TOTAL
Number of firms	40	4	30	40	127	41	112	394
%	10,2	1,0	7,6	10,2	32,2	10,4	28,4	100,0

1: Insignificant: Customers are usually random and have no specific preferences in brands

7: Very large: the vast majority of customer buys regularly the company's products and exhibit a strong preference to the specific brand

Less than 10% of the sample has a significant lead compared to competitors in terms of ICTs integration. More than half of the sample is rather a slow adopter of ICTs.

Table 7: ICT usage: Degree to which firm integrates ICTs

Value (Likert scale 1-7)	1	2	3	4	5	6	7	TOTAL
Number of firms	72	34	74	36	140	10	28	394
%	18,3	8,6	18,8	9,1	35,5	2,5	7,1	100,0

1: There is no attempt to adapt to the new technological conditions by incorporating new ICTs.

7: The firm has a strong lead compared to its competitors to incorporate new ICTs

Some factors of the internal environment of the firms were also examined in the survey aiming at identifying whether the business culture promotes risk taking or awards new ideas. A 30% of the firms have responded with at least 5 in the specific Likert scale, indicating those firms that seem to allow for such risk taking. On the other hand when firms are asked about formal award mechanisms of processes for recognition to the employees that suggest ideas or take initiative to promote innovation, then less than 10% responds positively (at least 5 in the Likert scale). So the perception of an environment that encourages risk taking initiative is not actually formally integrated in the business environment.

Table 8: Internal environment: The degree to which business culture encourages employees to take initiative and propose new ideas, allowing the risk of possible failure

Value (Likert scale 1-7)	1	2	3	4	5	6	7	TOTAL
Number of firms	114	13	93	44	96	11	23	394
%	28,9	3,3	23,6	11,2	24,4	2,8	5,8	100,0

1: No initiative and risk is allowed

7: There are official processes that encourage the initiative and risk, and potential failures are used as learning for the future.

Table 9: Award mechanisms: Degree to which there are systems of reward and recognition for ideas and successful innovation

Value (Lincert scale 1-7)	1	2	3	4	5	6	7	TOTAL
Number of firms	197		162		29		6	394
%	50,0		41,1		7,4		1,5	100,0

1-2. There are no formal nor informal recognition and reward mechanisms

7. There are well established formal processes of reward and recognition of staff suggesting ideas

In terms of R&D expenses more than 75% of firms do not spend any money on R&D.

As it was expected this traditional sector is not R&D intensive and any innovation stems from non R&D innovation.

Table 10: R&D expenses: level of R&D spending

Value (Lincert scale 1-7)	1	2	3	4	5	6	7	TOTAL
Number of firms	285	17	45	13	27	1	6	394
%	72,3	4,3	11,4	3,3	6,9	,3	1,5	100,0

1: No R&D expenses

7: The firm is a leader in its sector in relation to R&D (above 10% of sales)

Participating in collaborative R&D projects, at least publicly funded could be an alternative for those that do not want or simply cannot commit resources. However, the vast majority of firms has not participated in any R&D collaborative agreement during the last 5 years. Only 33 firms have responded with a 5 to 7 in the 1-7 Likert scale, indicating the most R&D intensive firms of the specific ecosystem.

Table 11: R&D collaboration: Degree of participation in research projects / collaborations relating to your business over the last five years?

Value (Lincert scale 1-7)	1	2	3	4	5	6	7	TOTAL
Number of firms	356	5			16	12	5	394
%	90,4	1,3			4,1	3,0	1,3	100,0

1: No R&D collaboration whatsoever

7: Yes, it is a main feature of the firm's strategy

All the above variables were included in an OLS regression. Results are presented in the following Table 12. The difference between Model 1 and Model 2 lies only in the use of the interaction term linking exports with size. Furthermore, a separate analysis was undertaken in the two main sectors, manufacturing and trade.

Regression results show that the effect of size and exports is significant, indicating that firms that export – mainly the larger ones – seem to innovate more. This of course may be explained by both directions: in order to be able to export, firms need to constantly innovate. But on the other hand, exporting activity may also trigger a more intense effort for innovation, as competition is more intense in international markets, therefore maintaining a market position requires the development of capabilities to innovate. It should also be noticed that in the trade sector, size is negatively related with innovation, although at a $p < 10\%$ level.

Furthermore, cost leadership is positively correlated with innovation. However this result is strongly related with manufacturing firms, as in the trade subsample the factor is not significant.

Management commitment to specific growth targets is also positively related with innovation, although at a low significant level, as the result is significant only to firm from the trade sector.

Customers' loyalty or switching costs is the factor that is mostly significant for the whole sample and both subsamples. It turns out that despite the fact that most of the surveyed firms have committed customers, this is not a disincentive to innovate, but on the contrary is related with innovativeness. This might be explained by the idea of innovation risk. Since in order to innovate firms have to commit human and economic resources, the fact that they already enjoy a relative secure client base allows for investing in innovation.

Table 12: Degree of innovation:

No of obs	394	394	321	73

Notes: * significant at the $p < 10\%$ level, ** significant at the $p < 5\%$, *** significant at the $p < 1\%$. Standard errors are reported in parentheses.

A business environment that strongly encourages initiatives and risk taking, and where potential failures are used as learning experience for the future is also related with innovation. But this is more important for manufacturing rather than trade firms

Finally, R&D is - as expected - positively related with innovation, however as it was described earlier it affects only a very small part of the sample. All other variables used in the equation turned out insignificant

At the next step of the analysis, we use the significant variables to perform cluster analysis. Results reinforce the presence of three clusters as given in Table 13.

	Firm characteristics	Innovative performance
Cluster A: Laggers	No outsourcing Limited use of Internet by the personnel Limited use of employees performance indicators No relationships with other actors in the value chain (suppliers / clients)	63% no innovation or product / process improvement
Cluster B Building capabilities	System of wages is highly appreciated by employees Significant training of the personnel Highly skilled personnel (same extent as firms from cluster C) Significant efforts to reward innovative ideas and risk taking	34% no innovation or product / process improvement
Cluster C: The established	Intensive effort for vertical integration	12% no innovation or product / process improvement

	Firm characteristics	Innovative performance
ones''	Technology at the heart of their competitive advantage, mostly collaborative R&D Intensive marketing activities Highly skilled personnel	

Cluster A include 125 firms and is dominated by 85% of micro firms, which are in any case the vast majority of the sample. Cluster B includes 149 firms and although 78% are micro firms, a 20% of them are small (10-49). Finally cluster C includes 120 firms, and only 54% are micro firms, whereas 38% are small, and 7.5% are medium firms. So actually there is clear size distinction in the 3 clusters.

From the above table, it is evident that cluster C – which includes most of the small and medium sized firms of the sample - is the better performing set of firms. It includes firms that can be characterized as more aggressive in the market with significant efforts to innovate and gain market shares from competition and constantly building a strong competitive advantage. Looking at the actual identity of these firms, this group represents the most established firms of the sectors, with a traditional position in the market. They have surpassed a crucial viability test and they try to grow by using all the right tools and mechanisms, although they commit limited resources to R&D.

On the other hand, cluster B seems to be more concerned with establishing a position in the market and building internal capabilities. They are in the process of integrating technology; they have invested in raising the educational level of the personnel and generally they try to align internal business processes with market developments. They are possibly more non-R&D innovators, at least those that actually innovate.

Cluster A is the worst performing set of firms. These firms seem to lag in all aspects of business development and not only on innovation. Their viability over the next 2-3 years seems to be highly questioned, as they are not in a course of building any sort of capabilities. Some defensive strategies of reducing costs are taking place, but nothing is certain on whether it could be sustainable.

7. CONCLUSIONS

The paper reveals some typologies of wood and furniture firms based on their strategic orientation towards innovation and knowledge creation. More precisely the study explored the factors that affect innovative performance of these firms in crisis period and provided a clear mapping of the characteristics of the specific ecosystem. The majority of these firms (3/4) are introvert, as they focus only on internal demand. These cannot be considered as knowledge-intensive or innovative. There is however a group of extrovert firms that seem to be able to export, although to a limited number of markets. These firms – despite the fact that they are also family run – are more innovative than the rest.

An interesting finding was that innovation is significantly connected to cost leadership. The common belief for the sector so far was that differentiation and creativity were the driving forces of competitive advantage. Yet human resource practices are under-developed since formal processes towards risk taking and innovative ideas are rather scarce. Therefore, the perception of an environment that encourages risk taking initiative is not actually formally integrated in the business environment.

In spite the fact that one should expect some stronger reaction towards globalization and economic crisis, the wood and furniture industry seems to remain rather passive with limited effort to network and outsource, to use ICT or explore and activate other linkages along the value chain. Some firms try to build capabilities in order to address markets focusing mainly on Human Resources. Bigger companies try to become more knowledge-intensive, seeking knowledge all along the value chain and placing technology and collaborative efforts at the heart of their competitive advantage. This seems to be the best way to confront both crisis and globalization threats.

The study indicates that the wood and furniture industry in Greece faces in its majority survival problems, since it seems unable to correspond to changes and new market behaviours. False assumptions on cost leadership and a focus on day to day management and business activity combined with old-fashioned ways on human-resource management do not allow for the development of sustainable competitive advantages.

In order to improve competitiveness and viability, wood and furniture firms must find ways to re-organize their resources renew strategies and turn to advanced product/process innovation instead of mere improvements or imitations. Managers should try to turn to exports developing all necessary networks for both new product development and promotion. Entrepreneurial and managerial teams should realize the importance of possessing and further cultivating a suitable internal environment by building specific

capabilities' set and further cultivating them. A business environment that strongly encourages initiatives and risk taking and where potential failures are used as learning experience for the future can support innovation.

Furthermore, specific efforts should be made regarding the enhancement of the sector's innovation system at least at regional or national level as well as the role of non-business innovation actors, along with institutional and financial support towards the sector's enterprises. Policy makers should develop more targeted innovation policies to encourage relative entrepreneurial and knowledge-intensive strategies taking into consideration all the above characteristics of the examined firms.

Our findings verify relevant theory and empirical research; competitiveness seems to be related to export-oriented strategies in addition to a strategic orientation towards knowledge creation and innovation. Knowledge-intensive wood and furniture firms are typical low-tech cases which seek mainly new technical and practical knowledge and engaged in frequent changes or improvements of process technologies. Human resource management's role has been proved to be crucial in nurturing the necessary conditions for innovation even with its wide sense.

The above research covers a specific time period. Further research is suggested in post-crisis period to compare the effects of knowledge-intensive and other types of strategies on survival and economic performance. Furthermore, this research can be extended to explore different kinds of strategies in relation to innovative performance and competitive advantage such as the resource-based view and the Dynamic Capabilities Framework. Another suggestion should be to extend the research in other low-tech sectors and compare their reaction to crisis and the strategies and competitive advantages they develop in order to survive in today's vulnerable mature markets.

ABSTRACT

In this paper we argue that production technologies choice or development plays an important role in low-tech but knowledge-intensive venturing. A small but growing stream of literature emerges that stresses the importance of knowledge-intensive entrepreneurship in low technology industries and their role in advanced economies. Focusing on the empirical case of the Greek wood and furniture sector, we explore how new low-tech ventures use knowledge from multiple and often trans-sectoral fields to intensively create and deploy many forms of production-relevant knowledge in order to develop innovative production technologies, build their initial competitive advantage and enter mature and saturated markets. The results highlight that knowledge-based innovation is necessary to start a viable low-tech but knowledge-intensive venture. This refers mainly to production technology innovation and can be incremental or radical. The development process demands certain capabilities as networking, synthesizing competencies to tap into knowledge sources and learning. Entrepreneurs own specific traits and skills and are more than just passive technology adopters. Corporate venturing presents certain advantages compared to the new-to-the-world ventures regarding both sources access and necessary human and financial capital.

1. INTRODUCTION

Investments in knowledge and innovation are becoming critical in low-tech industries. Established or new-to-the-world companies of traditional businesses enclose a dynamic approach of knowledge in order to create competitive advantages and compete in mature markets (Hirsch-Kreinsen and Schwinge, 2011; Robertson and Smith, 2008). Yet, to our knowledge low-tech industries remain a rather unprivileged research topic in the framework

of strategic entrepreneurship and management on the basis of knowledge-seeking activities and innovation development.

The present paper is part of an ongoing study on Knowledge-Intensive Entrepreneurship (KIE) and low-tech industries. The research used multiple case study design (Yin, 1989) to build theory (Eisenhardt, 1989) based on a capabilities approach in order to offer some insight and explain new knowledge-intensive venture success and failure within low-tech industries. The concept of Knowledge-intensive entrepreneurship uses knowledge as the core of all entrepreneurial activities. According to Malerba and McKelvey (2010) KIE refers to new firms with significant knowledge intensity in their activities that develop innovative opportunities. The paper explores the role of production technologies in knowledge – intensive low-tech venturing. More specifically, we explore how new low-tech ventures use knowledge from multiple and often trans-sectoral fields to create and deploy many forms of production-relevant knowledge in order to develop innovation, build initial competitive advantage and enter mature and saturated markets.

Empirically, the focus of the paper was on the wood and furniture industries in Greece. The sectors are representative not only for Greece but for Europe and globally as well. They are old low-tech industries which showed little propensity and capacity to innovate in the past but due to global pressures today they have turned to knowledge-based innovation. Face-to-face interviews with local firms, research organizations and industry experts offered insight to analyze the nature of innovative activities both at the founding stage and later in the firms' lifespan, the central role of production technologies, the development of linkages and the complex use of knowledge sources.

The remainder of this paper is organized as follows. Section 2 provides a short literature review on the knowledge-intensive innovation pattern in low-tech sectors and the role of production technologies in general while the third section describes the research methodology. The fourth section gives a brief description of Wood and Furniture sectors regarding industry structure, technology and innovation in general and the fifth addresses more specifically these industries' profile in Greece. Section 6 contains the empirical part of the paper. Results draw on the types of knowledge-intensive ventures found in the sectors, their introductory innovation activities and the development of innovative production technologies using key knowledge sources. Types of knowledge linkages, capabilities needed and differences between new and corporate venturing will be further discussed. Finally, Section 7 summarizes the key findings and draws some conclusions.

2. THEORETICAL BACKGROUND

2.1. Knowledge-intensive Innovation in Low-tech Industries

In the last few years a rich literature is emerging enhancing the role that traditional sectors play in modern economies and directing importance of innovation and technological change outside R&D-intensive fields (Hirsch-Kreinsen and Schwinge, 2011; Robertson et al. 2009). There is now a growing awareness that low-technology industries, which still make up a considerable share of production and employment in developed and developing economies, can be knowledge-intensive, develop knowledge-based innovation and invest in trans-sectoral knowledge seeking and learning (Hirsch-Kreinsen and Schwinge, 2011). According to Smith (2008) "Growth within the less glamorous, traditional sectors is certainly innovation-based, and moreover it rests on cognitively complex and deep knowledge bases, which from time to time are subject to discontinuous change"

Low-tech industries engage mainly in new product development and frequent changes of process technologies (Hirsch-Kreinsen 2008a, Robertson and Smith 2008, Robertson et al. 2009). While a very small percentage of individual low-tech firms engage in R&D activities, the majority apply mainly open innovation. Especially when referring to knowledge-intensive innovation, processes translate knowledge to innovation; i.e. in-house knowledge is developed by including new knowledge and technologies that stand out from the resources of the existing sectoral system (Robertson and Smith 2008; Hirsch-Kreinsen and Schwinge, 2011). This can be scientifically-generated knowledge as well as new combinations of technical and practical knowledge which create innovation. Process, organizational and marketing innovations are more common ((Heidenreich, 2009), while product innovations are in their majority incremental (Bender, 2004). Yet, there are many cases where product innovation cannot be separated from process innovation. While the phenomenon is more usual in the food sector there are many cases of innovative material treatments or additional process steps which introduce novelty. A significant feature of low-tech innovation is the engagement of many stakeholders all along the value chain in open innovation. Suppliers are of utmost relevance in this context, since low-tech firms rely heavily on raw material, machine and equipment technological advances (Bender, 2004, Heidenreich 2009).

2.2. Production Technologies and Knowledge-intensive Low-tech Ventures

Technology is the process of applying the findings of science and other forms of enquiry to applied situations. Rosenberg (1982) defined technology as "knowledge of techniques, method, and designs that work and, that work in certain ways and with certain consequences,

even when one cannot explain exactly why." Adopting this view for knowledge-intensive low-tech industries, technology can be treated as a set of pieces of knowledge ultimately based on selected principles, know-how, methods, experiences, and also, of course, physical devices and equipment. Production technology therefore involves applying the work of researchers and industrial practice to develop new products and processes covering technologies for an extremely varied range.

Low-tech technologies are usually well-established with technological norms, methods and leitmotifs to exist for many generations (Hirsch-Kreinsen and Schwinge, 2011) and with an increasing trend towards improvements and automatization. At a first glance processes and products seem rather standard and at an advanced stage, lacking the prevailing technological contingency of high-technology undertakings. Low-tech industries are generally confronted as "borrowers" of technology which may come from other sectors such as machinery, ICT and raw material producers (Bender, 2004; Hirsch-Kreinsen and Schwinge, 2011). Entrepreneurial or managerial teams have to locate and organize the individual and often miscellaneous pieces of product and/or process technology they need in order to innovate. That may range from production lines to engineering and operating procedures.

Besides the skepticism of low-tech innovation, there is a growing stream of literature indicating the importance and complexity of process innovations in low-tech industries (Hirsch-Kreinsen, 2003; Bender, 2004; Trippi, 2010; Hirsch-Kreinsen and Schwinge, 2011). Bender (2004) defines as process innovation changes in the production process including design and logistics. Hirsch – Kreinsen (2008a, 2008b) commends on the incremental character of such activities. Yet, there is no relevant theoretical or empirical work to our knowledge on the role of production technologies in cases of venturing and innovation within low-tech industries, especially within the frame of knowledge-intensiveness.

Within the notion of knowledge-intensive entrepreneurship a venture creation is tightly connected to knowledge-intensive innovation (Malerba and McKelvey, 2010). When referring to low-tech manufacturing, the transformation of an innovative business concept into a marketable product presupposes the choice and set up of the suitable production technologies. Entrepreneurs, entrepreneurial teams or managerial teams try to identify and acquire advanced production technologies to combine and create the technologies they need. In cases where the output of innovation constitutes the initial competitive advantage, planning and installing the suitable production technology entails a great amount of creativity and trans-sectoral knowledge combination (Karagouni et al., 2012). Advanced

production technologies enable “the firm to capture lucrative and more value added markets for growth” (Evers, 2011).

Knowledge is mainly incorporated into production via investment. The commitment to physical creation is a significant transition point in venture creation. Certain businesses require considerable tangible and intangible resources for the set up of production technology since most of them, besides the use of standard equipment and technology, develop production technology novelties.

Differences can be found when referring to new-to-the-world or corporate venturing. The set-up of production technology occurs in parallel with organization creation. This refers to the building of the physical structure, which can be common in the two types of ventures. It also refers to organizational processes that “surround production technology at the core” (Thompson 1967). The procedures which are usually required when installing the purchased equipment or the ex ante specification for systems to be constructed in an application-oriented manner, are both to a large degree based on the accumulated practical knowledge of the respective agent (Hirsch-Kreinsen et al., 2003). Thus new-to-the-world ventures encounter more problems, obstacles and inconsistencies related to corporate ventures; these can count on their accumulated knowledge, existing organizational regimes, routines and processes and relevant experienced human capital.

3. METHODOLOGY

A multiple exploratory case study research design was selected (Yin, 2003) to allow for theory building, since the present paper is a part of a broader research on KIE in low-tech sectors. The individual low-tech company was the unit of analysis. This research design enables the specification and elaboration of theoretical constructs and their relationships that are not yet well-defined in literature (Eisenhardt, 1989). Our sample of knowledge-intensive ventures follows Malerba and McKelvey (2010) definition of KIE (see above) and satisfies the following criteria:

- Knowledge-Intensive venture creation among 1998–2007
- Corporate venturing or new-to-the-world venture
- Evidence of being assigned to the most innovative companies in the market or product field through knowledge-seeking activities.

The most representative low-tech sectors in Greece are the food and drinks, wood and furniture, and textiles and clothing industry, which have also a significant share of

employment and value-added for the European manufacturing industry and economy. Data were collected from relevant sectoral databases, while sectoral experts gave information about new, knowledge-intensive ventures.

For the purposes of the present paper the authors used the sample of wood and furniture sector consisting of ten rich case-studies (Table 1). Face-to-face, in-depth interviews were conducted during 2009-2011 with different interviewees of the companies using a semi-structured questionnaire. Additional sources of information were employed such as plant visits, company reports, awards and company websites. Interviews with five industry experts and five scientists from Academia provided an excellent overview of the topics researched and a useful complement to the interviews.

There are four cases of corporate venturing and six of new-to-the-world firms. Regarding size there is one large, two micro, four small, and three medium sized enterprises. The ten cases belong to different subsectors of wood and furniture industries, are all knowledge-intensive and are located in different regions covering the whole of the Greek mainland. Six of the cases do not export at all, while two of them have a significant export orientation. Due to its heterogeneous composition, the ten-case sample is considered as quite representative of the two sectors in Greece.

Table 1. Ventures' demographics

a/a	Main Activity	Year of venturing	employees	Exports (% sales)	Main Type of Innovation	Location
F1	veneers, veneer stitching	2007/N	8	10	Process	Larissa
F2	lacquered/printed MDF laminate flooring	2004/CV	126	25	Process	Grevena
F3	Kitchen, wardrobe	2007/N	14	0	Process and business model	Karditsa
F4	panels, flooring, glue – laminated products	2003/N	11	0	Product, Process	Grevena

a/a	Main Activity	Year of venturi ng	emplo yees	Exports (% sales)	Main Type of Initial Innovation	Location
F5	Evropanel furniture - walls	for 2001/N	9	0	Process	Giannitsa
F6	Marine Plywood wooden flooring decorative panels	2005/CV	185	50	Process	Korinth

4. WOODWORKING AND FURNITURE SECTOR

4.1. Industry structure

The wood product manufacturing industries or woodworking industries include the production of sawn wood, wood-based panels, joinery and carpentry materials, containers packaging and other wooden articles. The furniture industry is part of the down-stream value chain activities of this sector including other material as well. It is essentially an assembling industry, which employs various raw materials ranging from wood and wood-based panels to metals, plastics, textile, leather and glass. There are many different types of furniture with very different uses.

Woodworking and furniture industries are two vital, sustainable, innovative and eco-compatible sectors, with a turnover in 2008 of around €221 billion, an added value of around €60 billion and an employment rate of 2.4 million people in more than 365 000

companies (Eurostat, 2009). The vast majority are SMEs, with the wood-based panel sub-sector and a handful of sawmills to be the exception. The furniture industry accounts for nearly half of this turnover, followed by the production of construction elements (19.3%), sawmilling (13.9%) and panel production (9.2%). The majority of furniture producers are micro-enterprises (less than 10 employees).

The sector faces growing competition from low-cost, emerging economies and a growing number of technical trade barriers. Furthermore, the furniture sector is not only facing difficulties in accessing wood as a raw material, but also a dramatic rise in the price of materials such as leather, plastics natural fibres and petroleum derivatives. The general financial and economic crisis has had a major impact on the entire sector: turnover decreased by more than 20% between 2008 and 2009 (eu.enterprise.sectors).

4.2. Technology and Innovation

Woodworking companies are considered highly innovative and knowledge-intensive (Smith, 2008; Hirsche-Kreinsen and Scwinge, 2010). Companies in the sector have built in high-quality innovation systems for both products and processes and excellent sectoral research and technological development knowledge centers. Global machinery manufacturers, suppliers, the chemical industry, Universities and independent research centers develop synergies assisting the advancement of process and product developments. Innovations turn around engineered wood products, wooden composites, novel fittings and other wooden products.

Furniture companies are also knowledge-intensive but less innovative regarding technical innovation. Knowledge evolves mainly around aesthetic, design and fashion related issues and focuses on creativity and strong image building. Yet, process and product innovation is evident in the undertaking of lengthy processes of restructuring and modernization, development of sustainable production methods and novel business models (e.g. modular design). Major factors of competitiveness for the sector consist of research and innovation (along the whole value chain and mainly material and fittings, skills and quality, design and added value, knowledge and know-how, together with better access to third country markets.

5. THE WOODWORKING AND FURNITURE SECTOR IN GREECE

5.1. *Industry structure*

Woodworking and furniture industries play a significant role in Greek economy, with a turnover in 2008 of around €2 billion, an added value of around €1 billion and an employment rate of 35.000 people in more than 15.000 companies (Eurostat, 2009). The vast majority are micro-companies, with the wood-based panel sub-sector and a handful of sawmills to be the exception.

The sector is mature, highly fragmented and labour-intensive with many firms operating in a 'craft' production mode. 66% of the firms are less than 30 years old and cover mainly the domestic market, as exports are rather insignificant.

The industry faces growing competition from low-cost, emerging economies and a growing number of technical trade barriers. Decreasing production in absolute numbers was combined with the increasing number of trendy products from Italy and Spain, cheaper products from Turkey, China and India and different approaches such as of IKEA. Furthermore, it faces difficulties in accessing wood as a raw material and a dramatic rise in the price of materials such as leather, plastics natural fibres and petroleum derivatives. The general financial and economic crisis has had a major impact on the entire sector: In 2008 most companies had losses of profits (56.8%) or even damage (27.3%).

5.2. *Technology and Innovation*

Greek wood and furniture companies are not considered as innovative even with the Schumpeterian concept of innovation. Relevant research (Karagouni et al., 2010), which covered wood and furniture companies in the region of Thessaly, Greece, indicated only an 18% of innovative firms in the sample. Improvements of existing products and purchase of process innovation are the main innovation activities. Advancement of existing and development of new equipment (AMT), the import of design systems (CAD), the application of CIM and MRP, as well as the pilot use of new or improved raw material or semi-finished products are further innovations pursued by Greek wood and furniture manufacturers. A network of international machinery manufacturers and suppliers play a significant role in research and development advances regarding mainly medium and large organizations.

Furniture companies invest on aesthetic value and fashion. Yet, design is still underdeveloped while process innovation refers more often to restructuring and modernization.

Major weaknesses of both sectors regard the lack of specialized technical personnel, overall organization and quality control while entrepreneurs' educational level is rather low. The last five years the sectoral context starts changing by becoming more knowledge-intensive. New entrepreneurs or successors have a high educational level and turn to research, innovation and knowledge management.

6. EMPIRICAL PART

6.1. Knowledge –intensive Innovation in Greek Wood and Furniture Sector

Our research revealed that Knowledge-intensive ventures are rather rare in the Greek low-tech industries and especially the wood and furniture sectors. Yet, there were certain cases found which created initial competitive advantages due to knowledge seeking and a harmonic combination of externally acquired and in-house developed knowledge.

More precisely, **three types of knowledge-intensive ventures** could be traced. The **first type** presents a more balanced emphasis on different dimensions of innovation²² and relies mainly but not solely on external knowledge seeking. Five cases belong to this type. The **second type** develops only the technical dimension of innovation combining both internal and external knowledge development. This group contains three cases and only corporate ventures, raising certain questions on knowledge-intensive corporate venturing. The **last type** focuses again on only the technical dimension of innovation relying on only external knowledge and refers to two new-to-the-world ventures.

Although our research started without seeking ventures of certain types of introductory innovation, it turned out that knowledge-intensive wood and furniture ventures develop mainly process innovation (Table 1). Even in cases of innovative products or business models, process changes and novelties were necessary to support the initial innovation. This is in line with relevant literature (Heidenreich 2009, Fagerberg, 2005). Hirsch-Kreinsen (2008b) further notes this close relationship between product and process innovation. More precisely,

²² *Note: Actually it covers the three axes of a new venture: technology axis which is relevant to the technical development of a novel concept up to full scale production, Market axis which refers to the interaction with the market and the business axis which includes the business steps needed such as commercialization and business scheme selection, business and relative model development and IPR protection.*

Knowledge-based introductory innovations of the ventures cover all four categories of the venture idea newness: (1) new to the world : one case with novel business concept and one with patented process technology, (2) new to the market (national / international market): eight out of ten cases, (3) new to the firm: all cases, and (4) a first mover or assigned to the most innovative companies in the market or product field: all ten cases are first movers at least at national level. Knowledge-intensive and innovative venture ideas can produce (1) novel products supported by novelties in production technologies (six cases) (2) methods of production, processes and technologies (all ten cases), (3) methods of promotion (one case) and (4) business models (two cases) creating niche markets.

However, most of the initial innovations cannot typically be characterized as “breakthroughs” or “radical departures”, since they more often constitute combinations of existing patents and innovations in general. W&F companies target more to innovate in functional parameters in order to produce initial competitive advantage, such as: quality (2 cases), functionality (3 cases), exploitation of innovations other produced but adapted to local conditions (3 cases), or present unique images either by a novel business model and method of promotion (one case), or innovative products which however do not constitute the core products of the company (one case). This can be a major characteristic of low-tech industries and specifically wood and furniture sectors.

In all cases of wood and furniture sector all innovations later in new ventures’ lifespan turn mainly around the initial novel concept. Yet, they are not mere improvements or additions to product families and refer mainly to process or concept innovations.

Patents and intellectual property protection are not popular among the cases although they are knowledge-intensive and one would expect much more focus on protecting knowledge. Agents of wood and furniture sector believe in the strength of their unique ideas. “No one can really copy the whole package” according to some of them. As one interview partner put it: “it is not enough even to watch the way an entrepreneur makes his/her strategic moves”. Another entrepreneur patented his novel technology but he is revealing its secrets to everyone who asks about it. *“I gave the technology to them. I will have more novel ideas. This is a way that we became famous. This is how they all visited my new company!”* There are two cases with patented technology but there are the exceptions. Almost all interviewees find the patenting procedure time-consuming.

6.2 Production Technologies of Knowledge-intensive W&F Ventures

Besides focusing on a few technological core competencies, most of the cases sustain competencies in multiple technology fields. Table 2 provides an overview on the respective partnering activities. Machinery suppliers and suppliers of raw and intermediate products play the most important role. They belong to various fields which somehow are connected to different links of the relevant value chain. Because of increasing technology convergence, these fields are often relatively different from the core technologies and this puts further emphasis on the importance of successful technology exploitation (Patel & Pavitt, 1997). Other knowledge sources are also involved confirm the view in the literature (e.g. Granstrand, 2000; Garcia-Vega, 2006; Bender, 2004; Hirsch-Kreinsen and Schwinge, 2011) that low-technology sectors rely on a variety of knowledge sources and make use of distributed and trans-sectoral knowledge bases.

New entrepreneurs or entrepreneurial teams usually develop novel business ideas and consume resources to combine or modify existing technologies or even support the development of new ones. Thus, they develop linkages which go beyond traditional buyer-supplier relations being more interactive. In most cases they co-operate with machine manufacturers to develop extremely specialized equipment to fit specific requirements. A kitchen manufacturer co-developed a multi-task machine to fit his novel "box-concept" of line production. The CNC machine was then patented by the manufacturer (with the kitchen manufacturer's permission) and won an innovation prize in a world machine exhibition.

The most impressive case was a woodworking corporate venture. The entrepreneur engaged 20 machine manufacturers of various fields, which were ranged as the global leaders in specific technologies to co-operate under the guidance of a leading consultant international company to produce "his technological miracle". This impressive operation ended with a patented MDF production technology which had cost more than 70 million Euros.

Table 2: Knowledge sources

Cases \ Knowledge source	F1	F2	F3	F4	F5	F6	F7	F8	F9	F10
Customers		1			2					
Suppliers of raw materials & intermediate products	4	3	7	2	1	1	2	3	3	4
Suppliers of machinery, packaging	3	20	4	3	2	5	4	6	4	5
Competitors (firms from the same sub-sector)	1	2			1		1			
Other firms	2	4	2	2	3	2	2	4	2	3
Universities, Technical	1	2	1	1	1	1	1	2	1	2

Colleges										
Consultants	1	3	1	1	1	1	1	1	2	2
Other actors / organizations	1			1		1		3	1	3
Total	13	35	15	10	11	11	11	19	13	19

All major technologies are developed mainly by European manufacturers. American machine suppliers are also used in two cases. Greek companies are used for supportive constructions and ICT solutions. This is however not strange since Greece lacks relevant industries; the same phenomenon is observed in other countries and other sectors as well (i.e. Trippl, 2010).

In table 1 there are three cases presented where the novel initial business ideas turn around innovative products. Yet, all three cases developed novel production technologies as well. One of them bought patented technology by an American research organization. However this technology had to be modified to suit local conditions and raw material. An almost “turn-key solution” turned to a new research; problems of the pilot production led to a formal European research project. This case denotes a further direction towards the potential hidden behind the so-called “purchase of embodied technologies”.

Yet, all cases show a rather weak relation to Universities and other research institutions. This can be attributed to the fact that there is only one relevant educational and research institute in Greece to fit the relevant field and it has been contacted by all ten cases (Table 2).

Among the cases, there are also two cases where the initial business idea is a novel business model. In both cases innovative production technologies, although incremental, supported the basic idea advancing existing ones. Both cases needed and developed co-operations with different technology areas and occupied international organizations.

In all cases wood processing technology, wood behavior science, chemistry, mechanical engineering, material engineering, ICT and extruding technology are engaged while certain other fields are involved in each case. A creative bricolage of research work and industrial practice results in innovative products and processes covering technologies for an extremely wide range. In parallel, improvements, parameterization and automatization are involved to solve problems and create new directions. These cases indicate that low-tech companies may be something more than just “borrowers” of technology. Yet, they verify the fact that entrepreneurial or managerial teams locate and organize the individual and often miscellaneous pieces of product and/or process technology they need in order to innovate.

The cases verified also existing literature (e.g. Smith (2008); Robertson et al., 2009) regarding the significance of raw materials and intermediate products in low-tech innovation. However their role during venturing does not appear to be that important; they rather support than

guide the initial novelty. In most cases novel material adds to properties of the final product or constitutes part of improvements. There is only one case where the innovative material gave birth to an innovative production technology and the opening of a new niche market. Once again suppliers of innovative raw materials are in their majority foreign companies.

A quite interesting issue is the fact that novel production technologies as venture enablers arise either as solutions to specific problems in the cases of corporate venturing and as a medium to create niche markets in the cases of new-to-the-world firms. All cases indicate that entrepreneurs (even new ones) have a satisfactory knowledge of the sectors and a relevant experience. This is rather expected; innovation in production technology cannot start without any previous involvement in the relevant fields. Most case-study firms are established by agents between 34 and 42 years old which strengthen the assumption of the significance of prior entrepreneurial experience and knowledge. There is only one exception where the entrepreneur is 26 years old. In this case, though, there was a strong family company as a sectoral background, important knowledge background and a sense of worldview on economic and other specific knowledge since the entrepreneur is a PhD holder and prior member of international large organizations. There are also two cases of corporate venturing with entrepreneurs older than 50 years old. These own the two larger organizations of the sample.

All four cases of corporate venturing present certain advantages compared to the new-to-the-world ventures. Resources are richer and abundant, networking and contacts are easier, organizational capabilities are higher and better developed. This is in line with literature which states that corporate ventures can benefit from their parents' resources, which are an important requirement for enhancing the innovation process (Thompson 1965).

The four cases of corporate venturing have engaged a significant part of human, social and financial capital in reaching various knowledge bases and translate combinations in novel production technologies. Path dependencies secure easier and faster co-operations, more trust and advanced planning. There is always a better mapping of the relevant areas of interest, while the problems of spatial proximity can be easier overcome. Accumulated technical and practical knowledge can also secure and enable further advances required. New-to-the-world ventures reported many problems, and obstacles related to important lack of relevant knowledge, significant waste of time in searching for appropriate knowledge sources, severe difficulty in establishing contacts and trust with stakeholders, lack of proper human resources and many inconsistencies between planning and realization.

Many times, even in cases of successful production establishment new entrepreneurs missed the qualified, interdisciplinary team which would embrace the design, engineering, production, marketing, procurement and quality departments due to the emphasis given on idea implementation through technology. Yet, all entrepreneurs admitted that learning was developed all along the founding stage. Even activities such as the installation and preparation of equipment and trial production were knowledge-generating activities.

All companies continued to be knowledge-intensive and innovative. Yet, the following innovations in these firms' lifespan are rather incremental and mostly product improvements, New Product Developments and applications of novel raw material. Process modifications are also reported; still not at the scale of the initial innovation.

All ten investments have survived the usually used five years criterion (Ensley et al., 2006). Most of them have shown an increasing sales rate till 2009. The severe economic crisis in Greece created significant problems in almost all of them.

7. SUMMARY AND CONCLUSIONS

A small but increasing stream of literature supports the ability of low-tech sectors to be knowledge-intensive, produce innovation and play a significant role in advancing technologies and technological change (von Tunzelmann and Acha, 2004; Robertson et al. 2009). Various scholars have also pointed out that low-tech innovation follows different ways of development than high-tech innovation; it engages open innovation forms instead of R&D, produces rather process than product innovation and is mostly supplier-dominated (Hirsch-Kreinsen and Schwinge, 2011). Yet, little is still known about the degree and modes of innovation development and technology embeddedness in low-tech new ventures. The paper claims that production technologies hold a significant role in knowledge-intensive venturing and deserve a further investigation, within the framework of knowledge-intensive entrepreneurship of low-tech sectors.

Empirically, the focus of the paper was on the wood and furniture industries in Greece. The sectors are rather representative not only for Greece but for Europe and globally as well. They are old low-tech industries which showed little propensity and capacity to innovate in the past but due to globalization and trade liberalization today they face enormous competition and have turned to innovation and learning challenges. Based on 20 face-to-face interviews with local firms, research organizations and industry experts, the nature of innovative production technologies and all innovative activities both at the founding stage and later in

their lifespan, relevant knowledge sources and linkages and mechanisms of implementation have been analyzed.

The empirical results have shown that Greek wood and furniture new ventures prefer to invest on production technology innovation in order to secure a position within mature and saturated markets. Technologies are developed as accumulation of various pieces of knowledge sources out of the strict sectoral limits, selected to fulfill conditions and limitations of the initial business idea and combined in novel ways ending up even with machinery innovation. The study has shown that low-tech but knowledge-intensive entrepreneurs interact with a wide range of stakeholders all along the value chain and at global level. Yet, machine manufacturers and raw material providers are the most important links; this was rather expected since we refer to production technologies, but not to the extent found. The results also seem to contradict the common belief that low-tech companies are just “buyers of embodied technologies”. Entrepreneurs co-operate with machine manufacturers to produce novel machines and equipment or even to develop novel processes.

Differences have been traced among corporate and new-to-the-world ventures. Established organizations seem to have the potential, capital and capabilities to develop far more advanced innovative production technology innovations than the newly established companies.

The study indicates that entrepreneurs need to own at least relevant technical and sectoral knowledge and must have developed corresponding capabilities to organize introductory innovations which will constitute the initial competitive advantage. Rather than being passive technology adopters adapting business ideas to existing production technologies, they must be active contributors to process development in order to differentiate. An overall knowledge of the sector all along the value chain and a competence of locating necessary knowledge sources out of the boundaries of the sector seem to be significant. Therefore bricolage, networking, synthesizing and learning capabilities may be core entrepreneurial capabilities for starting a new low-tech but knowledge-intensive venture. In terms of organizational practices, a variety of skill levels and forms of work organization is needed rather than simply the low-skill, hierarchical model that is often assumed. More precisely, technology-flows need to be managed by an interdisciplinary team in order to produce desired results in operations floor and translate them into viable competitive advantage.

Besides the managerial implications, the paper suggests that the role of production technologies should constitute a necessary part of innovation and venturing theory, especially for low-tech sectors, since it is the “vehicle” of business concept implementation in

manufacturing sectors. Within the framework of Knowledge-intensive entrepreneurship capabilities, mechanisms and practices should be also developed at operations level, since that is the level where knowledge selection, combination and elaboration creates tangible results of newly created knowledge.

Given the nature of our study, we do not argue that our findings may be generalized to other low-tech industries and nations. Further empirical and theoretical research is required to enhance our understanding on this specific direction of knowledge-intensive entrepreneurship and namely the role of production technologies in low-tech but knowledge-intensive venturing.

UNIVERSITY- INDUSTRY COLLABORATION A THEORETICAL FRAMEWORK

Khodabandehloo, Akbar

Department of Economics and IT, University West - Trollhättan, Sweden,
akbar.khodabandehloo@hv.se

ABSTRACT

Purpose: Developing a theoretical framework for exploring factors promoting/hampering university-industry collaboration.

Design/Methodology/Approach: A review of the literature on the subject was carried out.

Results: The construction of a theoretical framework for studying motivations and barriers in connection with university-industry collaborations was accomplished.

Limitation/Implications: The developed framework is limited in terms of not reflecting dynamic features, changes, or developments of university-industry collaboration, but is well suited for investigating reasons for collaboration between university and industry, and barriers obstructing such collaboration.

Originality/Value: This study integrates research on cultural geography, inter-organizational collaboration, and university-industry collaboration, which is a novel approach.

Keywords: collaboration, inter-organizational collaboration, university-industry collaboration, motives for inter-organizational collaboration, barriers to inter-organizational collaboration, university-industry.

INTRODUCTION

Knowledge management has changed the view on knowledge processes and knowledge production (Santoro and Gopalakrishnan, 2000; Hurmelinna, 2004; Rod, 2005; Hermans and Castiaux, 2007). Organizations, and society in general, have moved from acquiring knowledge through a traditional internal procedure to a network-based approach. Success in

managing knowledge development highly depends on the effectiveness with which the organization can gain, create, and transfer knowledge and resources, both within the organization and beyond its boundaries (Hurmelinna-Laukkanen, 2001, 2011). Knowledge in all areas and in all applications are increasingly collaboratively produced, distributed, and used (Kuhlen, 2003). One indication of this development is the growing number of university-industry collaborations (UIC), and the fact that governments around the world are requesting extended collaboration between universities and industries. In Sweden for instance, the Higher Education Act (1992:1434, 1.2) is since 1992 stipulating collaboration with the surrounding community.

This request, or political pressure, is only one of the driving forces behind UIC in Sweden, or in society in general. Policy makers and researchers commonly agree that UIC is one of the most promising constituents in strengthening knowledge development, and fostering innovation capability (Hofer, 2004). However, contrasting opinions is noted when exploring the interest in UIC from the perspective of the industry. In a survey, IBM (2006) asked the CEOs of various global companies to describe the most significant sources of innovative ideas. As Figure 1 illustrates, academia received the lowest rating. This raised the question: Why was academia rated so low, despite studies indicating UIC to be an important factor in development and innovation? Worasinchai *et al.* (2008) remarked: "This reinforces the fact that no suitable model or framework has been developed to make U-I relationship efficient, successful, and fruitful for both parties". They argue that comprehending what affects UIC is vital for accomplishing an effective UIC. Some researchers have concluded that many obstacles remain on the road to a successful realization of UIC (Lee, 2000; Rohrbeck and Arnold, 2006). Hofer (2004) suggested that assessing the motives for collaboration is necessary in order to understand the driving forces behind UIC.

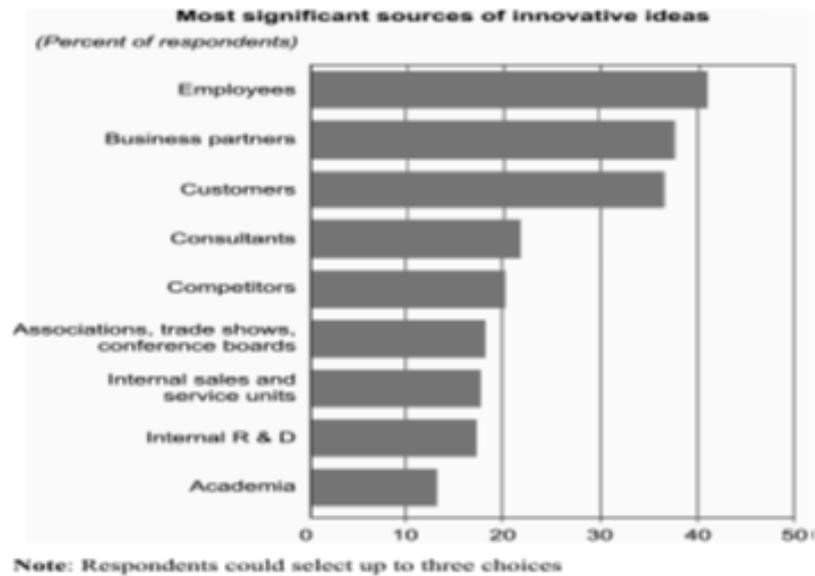

Figure 1. Significant sources of innovative ideas, as rated by CEOs of various global companies (Worasinchai *et al.*, 2008)

The purpose of the present study was to develop a theoretical framework for exploring motivations and barriers related to UIC. The framework will later be applied in a research project, investigating the collaboration between a local university in Sweden and organizations in the area.

APPROACH OF THE LITERATURE REVIEW

A narrative review of the literature on university-industry collaboration (UIC) was chosen as approach. The choice was founded on recommendations previously proffered by scientists (Ghauri and Gronhaug, 2005; Bryman and Bell, 2007) who regarded it suitable for such a study. A detailed, rigorous systematic review of the literature (Green, 2006; Cronin *et al.*, 2008) was not needed, since the motive was to acquire a deeper understanding of the research area by enriching its discourse, which would form the foundation for the construction of the theoretical framework.

Literature to be included in the review was identified by conducting an electronic database search, the databases used being: ABI Inform, Academic Search Elite, EMERALD, Social Sciences Citation Index, PRIMO, and Google Scholar. The keywords used in the search were: collaboration, inter-organizational collaborations, university-industry collaborations, motives for inter-organizational collaborations, barriers to inter-organizational collaborations, and university-industry collaborations. Some of the acquired articles were literature reviews, or

contained a literature review section, which means that the motives and barriers in relation to collaboration were retrieved from a number of articles. Articles with overlapping data were consequently excluded. This strategy had its shortcomings, since only journal articles were included, while books were omitted.

THEORETICAL FRAMEWORK

Collaboration – What does it mean?

Collaboration is a very broad and encompassing term. It stems from Latin: “co” – together and “labore” – to work, i.e., it means working together. Historically, as in German and French, collaboration also means, “work with the enemy”. Collaboration is however commonly understood as working together, and policy makers, administrators, and the general public are vigorously promoting collaboration between organizations (Longoria, 2005).

Although the importance of collaboration has been emphasized for the past decades, the concept is not so easy to define. On the contrary, we find many different and sometimes contradictory definitions of collaboration (Wood and Gray, 1991; Axelsson and Bihari Axelsson, 2006; Franco *et al.*, 2006). Collaboration is sometimes used as a synonym for networking. For example Axelsson and Bihari-Axelsson (2006) made no distinction between networking, cooperation, and collaboration. They referred to institutional economic theory, and maintained that inter-organizational integration can be achieved either through the “visible hand” of management hierarchy, or through the “invisible hand” of the market. They also mentioned a third option, a network mode of integration, an intermediate between market and hierarchy, which amounts to more or less voluntary cooperation or collaboration between organizations. Some scientists do however distinguish between the concepts. Himmelman (1993) reckons that organizations have the following options for cooperating with other organizations:

- “Networking is exchanging information for mutual benefit (This is the most informal of the four options.).
- Coordination is exchanging information and altering activities for mutual benefit, in order to achieve a common purpose. Coordination requires more organizational involvement than networking, and can be an important strategy for change.
- Cooperation is exchanging information, altering activities, and sharing resources for mutual benefit, and to achieve a common purpose.

- Collaboration is exchanging information, altering activities, sharing resources, and enhancing the capacity of another organization for mutual benefit, and to achieve a common purpose. Members of a collaborative effort view each other as partners, and are willing to share risks, resources, responsibilities, and rewards.”

What thus distinguishes collaboration from other options is that collaboration is more complex and time consuming. The members view each other as partners, share risks, resources, and responsibilities. Collaboration should therefore be chosen with careful consideration (Himmelman, *ibid.*). According to Longoria (2005), it is important for the interested organization to clarify the meaning of the term collaboration. But defining what the term means is not an easy task.

In a literature review, Longoria (2005) identified fifteen definitions of collaboration. Among these, the following definition, offered by Wood and Gray (1991), was selected as the superior one: “Collaboration occurs when a group of autonomous stakeholders of a problem domain engage in an interactive process, using shared values, norms, and structures, to act or decide on issues related to that domain” (Wood and Gray, *ibid.*).

From this definition we can list a number of attributes that to some extent enables us to distinguish collaboration from other forms of cooperation between organizations.

- Autonomous stakeholders
- Stakeholders of a problem domain: a group of organizations with an interest in a problem domain
- Interactive process: a change-oriented relationship of some duration
- Shared rules, norms, and structures: participants sharing a negotiated order
- Action or decision: participants must intend to act or decide to do so
- Domain orientation: collaboration requires that participants orient their process, decisions, and actions toward the problem domain that brought them together.

Motivations for collaboration

What drives organizations in general and university-industry in particular to collaborate with each other? Tranquist (2001) argues that for collaboration to take place at all, a genuine wish to do so is fundamental. When reviewing the literature, Oliver (1991) found the following motivations for inter-organizational collaborations:

- Necessity: Organizations collaborate with each other in order to meet necessary legal or regulatory requirements.

- Asymmetry: Organizations collaborate with each other to exercise power or control over other organizations or their resources.
- Reciprocity: Collaboration may be based on reciprocity instead of asymmetry. Collaboration among organizations is emphasized, rather than domination, power, and control, and pursuing common or mutually beneficial goals and interests constitute the motives.
- Efficiency: This motive is internal rather than external. The purpose here is to increase the input/output ratio, with the intention of reducing the transactions costs and attain efficiency.
- Stability: Organizations change behavior as an adaptive response to environmental uncertainty. Uncertainty prompts organizations to establish collaborations with each other in order to achieve stability and predictability in their relations with others.
- Legitimacy. Enhancement of organizations' legitimacy was also a significant motive for collaboration.

Huxham and Vangen (2005) argue that the purpose of collaboration is to create collaborative advantage. They identified a number of common foundations for collaboration. These are:

- Access to resources: Organizations collaborate with other organizations to acquire access to technology, knowledge, expertise, and other resources.
- Shared risks: Organizations collaborate when the consequences of failure are too severe, the collaboration being a strategy to share and reduce risks.
- Efficiency: Economics of scale, operational efficiency, and coordination of public service delivery are plausible reasons for collaboration.
- Coordination and seamlessness: Coordination aids in avoiding duplication.
- Learning: Collaboration may be developed in order to enable mutual learning.
- The moral imperative: In today's society, important social issues cannot be tackled by organizations acting alone. Collaboration is essential when seeking solutions to many social issues.

A large variety of potential motivations for UIC were identified in articles on the subject of UIC. In a survey, including more than 400 research joint ventures, Lee (2000) found the motives for the industry to collaborate with the university to be: research on product development, research to explore new technology, solving technical problems, designing prototypes, providing seminars and workshops, conducting fundamental research, providing support to universities, and development of software. On the other hand, the reasons for academics to collaborate with the industry are: securing funds for graduate assistants and lab

equipment, gaining insight into one's own research, field test applications to one's own theory, supplementary funds for one's own research, assisting university's outreach mission, creating student jobs and internships, gaining knowledge useful for teaching, and searching for business opportunities.

In a study based on contributions from 49 academics and managers from industries and universities in Finland and Portugal, Hurmelinna (2004) found that the most frequently cited motivation for collaboration was "actualization/competitiveness", which reflects the acquisition of competitive edge. The second most frequently named category was "education with meaning", reflecting the need for more practical and useful education, more in line with the needs of companies as well as the society. Access to funding/financial resources, information, knowledge, and other resources were next on the ranking list. "Image", yet another frequently mentioned motivation, reflects the organizations' reputation, visibility, and social status.

Rohrbeck and Arnold (2006) stated that there are a variety of motivations for UIC, and that these vary depending on firm size, company culture, and geographic location of the firm. In their literature review, they found that the universities' motivations for collaboration are: enhancement of teaching, funding/financial resources, sourcing knowledge and empirical data, political pressure, enhancement of reputations, and job offers for graduates. The motivations for collaboration in the industry are: sourcing the latest technological advances, use of laboratory, personal resources/cost savings, risk sharing for basic research, stabilizing long term research projects, and securing new recruiting channels.

Based on 98 interviews with university administrators, academics, industry scientists, business managers, and entrepreneurs in two regions in the USA, Siegel (2003) found that the collaborating actors had different motives for the collaboration. A primary motive for university scientists to collaborate was gaining recognition from fellow scientists, by publishing articles in top journals, and making presentations at prestigious conferences. The secondary motive was financial gain, a desire to secure additional research funding for graduate students and for laboratory equipment.

The primary motives of the technology transfer office and the university administration were protection and marketing of the university's intellectual property. Secondary motives included securing additional research funding for the university via royalties and licensing fees, sponsored research agreements, and a desire to promote technological diffusion. The primary motive for collaboration (between companies) within the industry was financial gain, and the secondary motive was maintaining control of proprietary technologies.

Hughes (2006) identified four different functions for universities that might be conceivable motives for collaboration between universities and industries. The first function is educating people, providing suitably qualified human capital for the industry. The second is increasing the stock of codified knowledge, useful for the industry. The third capacity is their role in problem solving that concerns the needs of the industry. Finally, the fourth function, what Hughes called the “public space function”, included a wide range of collaborations between university staff and the business community, from informal social interactions, meetings, conferences, entrepreneurship, and entrepreneurship activities, to the exchange of personnel, including the role of internships.

Hughes further claimed that it is urgent to recognize the different elements that individual universities may stress, since these may reflect their own particular missions, economic circumstances, and particular localities or regions within which some of them are located.

Barriers to UIC

In spite of numerous motives for UIC, a number of barriers that collaborative partners must overcome to facilitate an effective collaboration, have indeed been identified in the literature. As mentioned above, the concept of collaboration is vague, and this is considered to be one of the factors creating barriers to UIC. An evaluation of collaboration between the Swedish higher education and the society reported, “One obstacle is posed by the vagueness of which the national authorities define the concept of collaboration”. (Report from National Agency for Higher Education 2005:24 R). However, this is only one of the barriers to UIC.

A concept capturing a prominent position in the reviewed articles is the impact of proximity on inter-organizational collaboration (Boschma, 2005; Knoblen and Oerlemans, 2006; Pablo and Perkmann, 2007). In their literature review, Knoblen and Oerlemans (ibid.) distinguished between the following seven forms of proximity:

Geographical proximity has been defined as the spatial and physical distance separating actors. It is believed that a short geographical distance facilitates face-to-face-interactions, and eases collaboration. A large distance may rather create barriers to collaborations between organizations.

Organizational proximity is a term suffering from a high level of ambiguity, and different authors define it in different ways (Knoblen and Oerlemans, op.cit.). Boschma (2005) defined it as “the extent to which relations are shared in an organizational arrangement, either within an organization, or between organizations”. Since similarity facilitates mutual understanding,

IOCs are expected to be more efficient, and to produce better results, when the organizational context of the partners is similar.

Cultural proximity Organizations with similar cultural backgrounds are expected to collaborate and interact more easily, showing better results.

Institutional proximity is analyzed on two different levels. At the general level, the concept is often based on similarities between the institutional frameworks of countries and regions, such as legislative conditions, labor relations, business practices, etc. Formal institutions (such as laws and norms) and informal institutions (like cultural norms and habits) are believed to affect the collaboration with their partners (Knoben and Oerlemans, 2006). The effect of institutions (formal as well as informal) on the norms and routines of an organization is however determined at a lower level (the dyadic level). Shared institutional norms and values are expected to facilitate collaboration between organizations.

Cognitive proximity is defined as "the similarities in the way actors perceive, interpret, understand, and evaluate the world" (Knoben and Oerlemans, op.cit.). Shared routines and cultures are considered expediting collaboration between actors.

Technological proximity is based on shared technological experiences and knowledge bases. Technological proximity between actors was inferred to aid development of technological knowledge and technologies.

Social Proximity, or relational proximity, is defined as a social relation, where trust between the agents is based on friendship, kinship, or experience (Boschma, 2005), enabling the exchange of knowledge.

In their literature review, Knoben and Oerlemans (2006) found that cognitive, institutional, cultural, and social proximity constitute parts of organizational proximity. Consequently, they reduced the proximity to three categories: geographical proximity, technological proximity, and organizational proximity. They argued that the three dimensions of proximity eliminated overlap, reducing the conceptual ambiguity.

A number of barriers to UIC were identified in the literature review. In a study based on interviews with three stakeholder groups: academic scientists, university administrators, and managers/entrepreneurs, Siegel *et al.* (2003) found that the three groups perceived the following as barriers to UIC:

- Difficulties in comprehending the university, the corporates, or the scientific environment and its norms
- Insufficient rewards for university researchers
- Bureaucracy and inflexibility of university administrators

- Insufficient resources devoted to technology transfer by universities
- Poor marketing/technical/negotiation skills of university administrators
- University too aggressive in exercising intellectual property rights
- Faculty members/administrators having unrealistic expectations regarding the value of their technologies
- Public domain mentality of universities

In a study based on contributions from 49 academics and industry managers, Hurmelinna (2004) found that obstacles for collaboration between university and industry mostly comprised:

- Different needs and objectives, and different attitudes
- Lack of knowledge/experience in terms of how to collaborate
- Lack of practical knowledge in universities
- Different time horizons, and different language/mental worlds

Rohrbeck & Arnold (2006) identified the following three categories of barriers to UIC in a review:

Cultural barriers: The university and the industry have divergent missions and goals. The mission of the university is to advance science and public good, while the mission of the industry is to make a profit, and to advance private good. The university and the industry also have different goals. The university's goal is to produce scientific results that are thoroughly validated (fundamental to the university), and to advance its scientific reputation. In contrast, the goal of the industry is to produce marketable products and services, and they are not interested in extensive validation of research results. The conflicting goals lead to conflicting interests in terms of secrecy and intellectual property rights (IPR). The industry is interested in acquiring confidential research results, but the university needs to publish the results (and to enhance scientific reputation) prior to application. Different cultures mean different basic assumptions concerning research results. For instance, speedy research results are by the industry generally assumed to be the result of effective management, in contrast to the university, where speedy results are associated with research being rushed, and validation being inadequate.

Institutional barriers: The nature of work is different at the university and in the industry. Universities are usually engaged in basic research, with diffuse, abstract, and complex goals, while the industry is more interested in applied research. The industry is seeking short-term profit and reports quarterly results, while reporting cycles at universities usually extend

much further. Perceptions of what the product of R&D actually entails also differ between the university and the industry.

Changes in organizational structure, and a change of responsibilities might create a barrier to collaborations. This is particularly likely when the UIC is initiated and run by a person, who later is replaced.

Operational barriers: Universities are mostly public institutions, and their operations are very differently organized in comparison with the profit driven industry. Most industries have well defined incentive systems, strategies, etc. Universities are more bureaucratic, and have no explicit incentives. Their processes of budgeting, task definition, and task execution are thus very different.

Lack of knowledge about the partner's processes creates barriers to collaborations. Insufficient coordination and project management are two other obstacles. Not accepting transferred results generated by the partner may be yet another hinder.

Limitations of the study

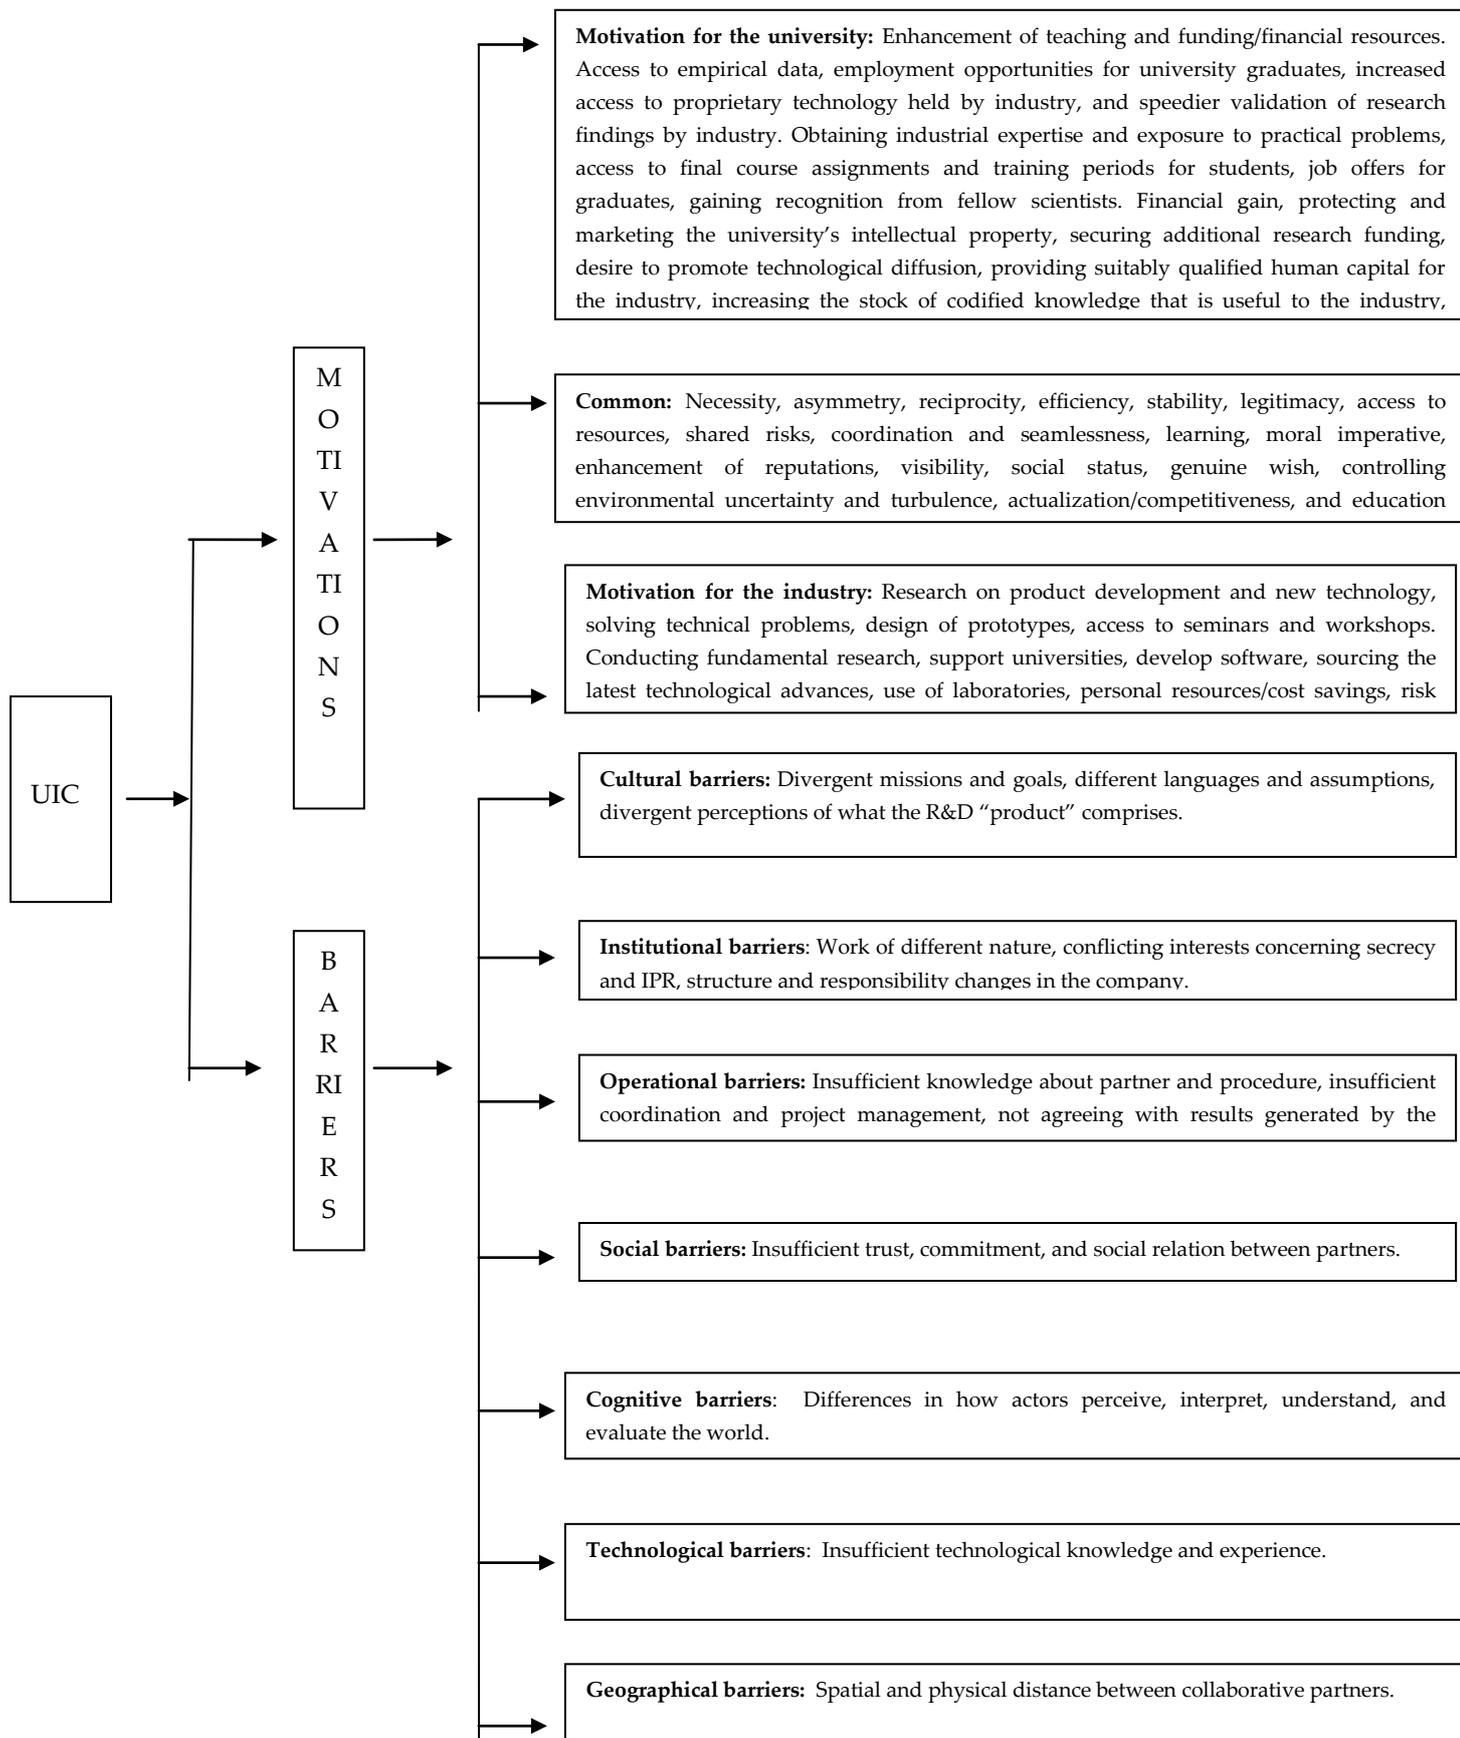

Understanding how the evolution of UIC is materialized, and comprehending its dynamic features yield crucial insights into how such collaboration might be governed. Notwithstanding, the framework developed here is intended for studies on motivations for and barriers to UIC. The designed frame is hence limited in terms of its contents, and does not reflect actual dynamic features, changes, or development of collaboration between partners.

CONCLUSIONS

The review revealed a number of motivations for UIC. They were categorized into three groups. Some motivations were shared between the university and the industry. Other motivations related only to the university, or to the industry alone. The review also disclosed the existence of different types of barriers to UIC: cultural, institutional, operational, social, cognitive, technological, and geographical barriers. The acquired information provides an adequate theoretical framework (see Figure 2) for detailed research on motivations and barriers in relation to UIC, which is what this work aimed at, and it will be utilized in the next study, which specifically will be examining the collaboration between a local university in Western Sweden and organizations in its surround

NETWORKING FOR REGIONAL DEVELOPMENT: A CASE STUDY

Khodabandehloo, Akbar

Department of Economics and IT, University West - Trollhättan, Sweden,
akbar.khodabandehloo@hv.se

ABSTRACT

Purpose: To elucidate what characterizes a network for regional development, why actors participate in such a network, and perceptions about networking for regional development.

Approach/Design: The study focused on using networking for regional development in Sweden, utilizing a qualitative method with a hermeneutic approach.

Findings: A network for regional development entails hierarchy, and may be characterized by dominance. A network is supportive, and networking is a necessary strategy for regional development. Increased societal complexity reinforces the need for networking. Networks comprise advantages as well as disadvantages. A network for regional development requires leadership, individuals who take the lead.

Research limitations: As this was an intra-case study, it was problematic to generalize the findings and to make a cross-case analysis.

Practical implications: The attributes of a network for regional development, hierarchy and dominance, constitute problems that need to be solved. The informal character of a network may create vagueness, making it difficult to produce tangible results. Hence it is vital to discuss results from different angles. An effective network requires a process leader who promotes trust and mutuality, and pushes the network in the desired direction.

Originality/Value: The present paper integrates research on network for regional development with general network theory, offering a better comprehension of the network model as a regional development strategy.

Keywords: network, networking, network-based strategy, regional development

INTRODUCTION

Research on networking as phenomenon is abundant, and topics cover a wide range (see Gulati, 1998; Lind, 2006; Borgatti and Foster, 2003; Borgatti and Halgin, 2011). Economists and sociologists, e.g. Alfred Marshall, Max Weber, and Joseph Schumpeter, observed that networks of interdependent firms are crucial for enhancement of economic growth and innovations (Staber, 1996). Scientists working in the field of organization and management consider networking a means to manage companies' resource dependencies and environmental uncertainties (Pfeffer and Salancik, 1978), while neo-institutional economists (Williamson, 1985) regard networks as an alternative governance of markets and hierarchies. Staber (1996) identified other perspectives in his research on networking, e.g. network formation, trust building, conflict resolution, and partnering, and also pointed out network structures and networks for various developments, from organizations to regional economies. In a review of organizational network relationships, Borgatti and Foster (2003) unveiled a network-paradigm that incorporated social capital, embeddedness, network organizations, joint ventures, inter-firm alliances, knowledge management, social cognition, and a catch-all category. In a theoretical investigation, Lind (2006) identified four different approaches to network: as a perspective, a phenomenon, a research method, and as a strategy for development. Network as a development strategy is known to promote development of individuals, organizations, and regions, the latter being the focus of this paper.

Development roughly comprises three forms: a top-down planning strategy, a bottom-up activation strategy, and a network-based development strategy (Svensson and Von Otter, 2000). These strategies have been used in parallel; but over time, the activation strategy has gained popularity. Recently however, the network-based approach has gained interest (Gustavsson and Hofmaier, 1997; Svensson *et al.*, 2001; Swedish Quality and Competence Council, 2003; Holmquist, 2010; Sotarauta, 2010; Alderete and Bacic, 2012), and researchers in the area of small business entrepreneurship propose networking as a strategy for development (Staber *et al.*, 1994; Hoang and Antoncic, 2003; Cooney, 2005; Holmquist, 2010; Alderete and Bacic, 2012). In a study on small manufacturing businesses, Fuller-Love and Eysyllt (2004) found that networking improved performance more effectively than other strategies. Networking as a strategy for development, knowledge, and skills exchange

functions on all levels, from individuals to organizations and regions. It is designated to contribute to global economic growth (Svensson *et al.*, 2001, Lind, 2003; Möller and Svahn, 2004), as it is more efficient than other strategies, particularly when compared with traditional forms of inward-looking development strategies, like "Business Process Reengineering" or "Total Quality Management" (Holmquist, 2010).

Despite the interest in network-based approaches, the old systems remain strongly rooted in society, which hampers regional development (Harmaakorpi and Niukanen, 2007). Research on networking in this context is limited and thus called for (Holmquist, 2010; Alderete and Bacic, 2012). The ambition of the present study was to highlight some prominent ideas within network research in order to identify factors relevant to regional development by means of networking. The purpose was to improve understanding and knowledge of the network-based development strategy by seeking the answers to three questions: What characterizes a network for regional development? Why do actors participate in such a network? How do actors perceive participating in a network?

EMPIRICAL APPROACH

A qualitative method with a hermeneutic approach was utilized in the study. An exploratory perspective was applied in accordance with Saunderson *et al.*, 2009). The chosen design was in the form of a case study, since this design facilitates retrieving answers to the questions "how" and "why" (Yin, 2003). The case was "Tillväxt Uddevalla" (hereafter TU; transl. Growth of Uddevalla), a network for regional development in Uddevalla, a city in West Sweden.

A network may be an internal network-based form of organization, like a decentralized organization, or it may consist of independent organizations connected by partnership (Hamaakorpi and Niukkanen, 2007). TU falls into the latter category. Network is in the literature defined as a set of dyadic relationships, or as a larger, multi-actor alliance (Gulati, 1998). A regional development network might be either of three archetypes: a large and loose regional development network, a heterogeneous multi-actor network, or a closed and homogeneous Public Sector Network (PSN) (Hamaakorpi and Niukkanen, 2007). TU is a heterogeneous multi-actor network, i.e. members are from different sectors of the society. The network has commonly accepted goals, and comprises several sub-networks. The TU

members mainly comprise representatives from small companies, different organizations, and authorities of Uddevalla City.

Selecting TU for the case study was founded on discussions and consultations with experts from academics and industry (Chisnall, 2005; Bryman and Bell, 2007; Saunder *et al.*, 2009). After four meetings of familiarizing with the members, seven individuals were selected for data collection. Interviews, conducted by means of a questionnaire with open questions, were carried out orally with four of the members, while the other three submitted written answers to the interview questions. In two cases, data collection was completed by telephone. A semi-structured interview guide (Bryman and Bell, 2007) was followed, and a conceptual framework (see below) was used as the foundation for constructing the interview guide (Ghauri and Gronhaug, 2005). After testing the questionnaire, the guide was forwarded to the respondents.

The present study assumed an abductive structure, rather than being deductive or inductive. In such a study the researcher moves between theory and empirical data, allowing understanding to emerge gradually (Alvesson and Sköldbberg, 2008). Abduction (“intermediate” between induction and deduction) is recommended for research on innovation systems, networking, and creative value networks (Patokorpi and Ahvenainen, 2009).

Three interviews were conducted at the respondent’s work place and one at Campus Uddevalla. Interviews lasted 2.5 - 3 hours. The informants were granted anonymity.

After a short presentation of the project, data collection (following the interview guide) was conducted as dialogues. Respondents were encouraged to explain and clarify their views about research issues. The interviews were recorded and subsequently transcribed. Transcriptions were sent by e-mail to the interviewed for approval.

An intra-case analysis was carried out (Miles and Huberman, 1994), i.e., data from a selected case were analyzed against the conceptual framework of the study. The analysis comprised three phases: data reduction, data display, and drawing conclusions (Miles and Huberman, 1994). The data reduction was extended in order to provide an organized, compressed assembly of information, permitting conclusions.

THE CONCEPTUAL FRAMEWORK

Network is a concept used in many contexts, encompassing different meanings, e.g. relationships within a family or a neighborhood, club activities, cooperation and contacts between companies, governance mechanism, or an institutional form of exchange (Hägg and Johansson, 1982; Sjöstrand, 1985; Svensson *et al.*, 2001). Williamson (1975) defined network as a phenomenon between markets and hierarchies. Castells (1999) considered it a phase in organizational development from industry to service, and now the emergence of a network society: "Networks constitute the new social morphology of our societies." Castells built his analysis on the concept of "nodes" and "flows": "A network is a network of interconnected nodes." Borgatti and Foster (2003) declared, "A network is a set of actors connected by a set of ties. The actors (often called "nodes") can be persons, teams, organizations, concepts, etc."

Gustavsson and Hofmaier (1997) argued that the term network expresses a perspective rather than a well-defined concept. They made no attempt to define network and believed that a general definition is of no significance. Others share this opinion, and believe it is preferable to clarify its meaning in each specific context (Svensson *et al.*, 2001).

Attempts have been made to categorize networks. Borgatti and Halgin (2011) distinguish between group and network, claiming, "A fundamental part of the concept of group is the existence of boundaries. In contrast to groups, networks do not have natural boundaries." Utbult (2000) implies that the boundaries of a network are not always clear, and those included in the network may not even be aware of being part of a network structure.

Network as a development method

Top-down planning strategy, bottom-up driven activation, and network-based strategy are the three development strategies (Svensson and Von Otter, 2000; Svensson *et al.*, 2001). The network-based development strategy combines the activation strategy with broad voluntary collaboration between different entities, and the driving force is common interest. The strategy is used for open projects; i.e., targets and expected outcomes are not as explicit as when a planning strategy is applied. The objective may be to change something, to develop skills, or to learn. It may also be to improve quality, competitiveness, and innovation climate, to contribute to regional and local development, or to achieve long-term economic development (Utbult, 2000; Svensson *et al.*, 2001; Lind, 2002). Alderete and Bacic (2012) state that when referring to local development or territorial development, we need to emphasize the importance of four main dimensions: the economic, social/cultural, environmental, and

political aspects. In an article from 1985, Granovetter applied the concept of embeddedness to market societies, arguing that all economic behavior is embedded in a larger social context by necessity. He insisted that, “most behavior is closely embedded in networks of interpersonal relations, and that such an argument avoids the extremes of under- and over-socialized views of human action”.

Using network as a development strategy is believed to promote development of individuals, organizations, as well as regions. Viewed from this perspective, networks consist of a number of autonomous actors helping each other reaching a goal they would not have been able to accomplish on their own (Svensson *et al.*, 2001; Hamaarkorpi and Niukkanen, 2011). Many individuals, companies, and organizations are applying a network model on their work processes (Dalsgaard and Bendix, 1998), without labeling it a network.

Characteristics of the network

Network and organization are usually viewed as opposites. While the network is informal, cooperative, spontaneous, and flat, and involves being engaged in relationships and side contacts, the organization is characterized by formality, controlled routines, hierarchy, and vertical contacts (Utbul, 2002). However, Svensson *et al.* (2001) believed that such a dichotomy is not meaningful. A network can be a form of organization even if it lacks legal status and formal relationships, and an organization may well be informal. The authors claimed that the distinguishing feature of a network is its equality foundation. Gulati and Singh (1998) discussed the existence of hierarchical elements in alliances, and proposed that more hierarchical controls led to greater coordination and better information processing capabilities.

The literature describes various traits characteristic of networks, for instance: Networks are problem-driven, and problems are situated (Gustavsson and Hofmaier, 1997). A network is self-organized, dynamic, has no hierarchy, and participation is voluntary (Dalsgaard and Bendix, 1998).

Various preconditions for a successful network have been described. Among these necessities are: network vision, time and resources, tempo and continuity, communication, reward forms, trust, equal relationships, external aid, motivation, curiosity, clear objectives, and performance criteria (Ershammar, 2000; Svensson *et al.*, 2001; Florén and Tell, 2004).

Bergh (2006) proffers the following recommendation to those involved in inter-organizational networks: "Be prepared to invest time and energy in participation; try to get others involved, and be active when the program for the network is formulated." Other factors essential for network strategy success are significant key individuals and a strong network leadership (Harmaakorpi and Niukkanen, 2007; Sotarauta, 2010), but also absorptive capacity of network actors: "A firm's ability to recognize the value of new information, assimilate it, and apply it to commercial ends" (Cohen and Levinthal, 1990).

Why network?

There are several explanations to why networks emerge, and a number of them are listed above in this paper (Pfeffer and Salancik, 1978; Williamson, 1985; Staber *et al.*, 1994). While Barnir and Smith (2002) put forward that social networks provide additional resources as well as emotional support to small enterprises, the idea of networks being crucial for organizations to master their tasks is far from new (Gustavson and Hofmaier, 1997). Several good examples from the U.S. and Europe have contributed to the current interest in networks, one example being Porter's (1987) analysis of the competitiveness of nations, in which collaboration between organizations indeed was the center point.

Svensson *et al.* (2001) pointed out the increased need for change and development in society, and believed that cooperation between firms in networks may be a strategy for support and stimulation of development. One important reason for the growing interest in networks, they claimed, is that the old control mechanisms, particularly the top-driven program model, no longer are effective. Nohria (1992) and Holmqvist (2010) both suggest that an increase in societal complexity, technological development, ongoing processes of innovation in society, the organization's contact with the environment, globalization, and growing demands on managers/leaders for extending business contacts are further reasons for an increasing interest in network strategies.

Lind (2003) highlighted value-adding and value diffusion as two reasons for emergence of networks. The flexibility of networks generates economic value for enterprises in a network. Lind also emphasized how cooperation in networks has positive effects on transaction costs. In addition to economic value, the network also creates social value, e.g. social capital and social responsibility. Diffusion pertains to how value spreads in a network.

Lavie (2007) underlines the significance of value creation in networks, and points out that earlier research insisted on more value creation, paying less attention to value

appropriation/value capture: "A firm whose alliance portfolio comprises a set of powerful partners may be unable to appropriate the benefits that its alliances produce."

The above discussion conveys that emphasizing the value creation effect of network resources alone is not enough. It is essential to stress the importance of value diffusion and value capture as well.

Perceptions about networks

The literature on networking lists a range of advantages/possibilities, but also a number of disadvantages/difficulties, associated with the network strategy (Svensson *et al.*, 2001; Lind, 2002; Holmquist, 2010). The advantages/opportunities are: 1) It is flexible; working arrangements and activities can quickly be adapted to external changes and internal needs. 2) When many actors cooperate, economies of scale occur, which increases the development capacity. 3) The cooperation is demand driven. It is based on the perceived problems and the actual situation of the participants, which makes networking concrete and results-oriented. 4) The open and flexible way of working facilitates creativity and innovation. 5) The cooperation is horizontal, and is based on voluntary participation, equal relationships, and exchange of experience. 6) The potential for exploiting external knowledge is increased, and organizing the cooperation is easier on an equal footing.

Some disadvantages/difficulties are nevertheless linked with the network strategy. 1) The arguing that networking is an effective method to strengthen development capability is difficult to verify, and so are tangible results. Vagueness and ambiguity about purpose, methods, and results constitute problems. 2) Allocation of responsibility is unclear. Ideas and proposals are raised - but who implements them? 3) A major weakness is the low representativeness. There is no broad-based participation. 4) The feedback is difficult to control. 5) The network may become restricted, participants forming a closed club, in which development stops at an individual level.

Notwithstanding these difficulties, the network approach can be, and is, used for regional development. However, exploitation of the potentiality of using network for development requires some necessary conditions.

RESULTS AND DISCUSSION

What characterizes a network?

Networks and organizations are often experienced as contrasts, networks being more informal, involving personal relations, and organizations entailing control, hierarchy, and authority (see above). The respondents in this study confirmed many of these characteristics, one of the comments being: "We work informally; anyone can participate and make his/her voice heard. We have an agenda for our meetings, but we select a new chairman at every meeting."

In the TU project some interviewees observed hierarchies and a lack of spontaneity. They did however appreciate side contacts leading to cooperation. These opinions are consistent with those of Svensson *et al.* (2001) who discerned no dichotomy between the two. They consider network as an organization without juridical or formal status, and mean that organizations may be informal and vague in the new economy. Gulati and Singh (1998) claimed that hierarchical elements are present in alliances and networks, and others elaborated this discussion (Lind, 2004), arguing them to be "social entities on an organizational level".

The interviewees disclosed divergent opinions about the constitution of the network. One member of the TU project deemed it positive that different community groups participates in the network, while another feared that TU incorporates groups raising important issues as a means of legitimacy, which might cause competition. A third respondent feared that presence of businessmen and politicians might lead to debates rather than a focus on solutions. TU comprises a number of individuals and organizations with different backgrounds; hence values and interests may induce differences in influence and power. This "membership disparity" might of course create a situation where some members may experience difficulties in obtaining a balanced member involvement. Large, resource-rich agencies, and institutions with well-educated, self-confident staff tend to dominate smaller organizations (Starkey, 1997). Lavie (2007) describes this situation as an asymmetric absorptive capacity between smaller and larger members of a network, leading to a value capture problem for the smaller members (see above).

Notwithstanding, different experiences and backgrounds in networks and debates may well provide extra value, as long as they are egalitarian (Svensson *et al.* 2001). Other researchers agree that different ideas and ideologies in a network can be "healthy, give creative tension and lively debates", but warn that, "...when strong-minded (and loud-mouthed) people with

conflicting ideas meet, they can disrupt network meetings and progress with excessive ideological, methodological, or technological debate. This may lead to alienation and withdrawals from the network by those who feel unjustly treated, or simply bored" (Starkey, 1997). Sennermark (2010) found that network members appreciate different backgrounds, and believed that they lead to interesting discussions. Different perspectives contributed to increased understanding of different roles and existing problems. Aderete and Bacic (2012) believe inter-firm networks to be a necessary condition for regional development, but not alone. The relationship with other social groups has an impact on how cooperation between firms affects territorial development.

Gulati (1998) showed that social networks have an influence on the creation and success of alliances and company webs. "By channeling information, social networks facilitate the discovery of new alliance opportunities, consequently influencing when, and how often, firms enter into alliances", state Gulati.

The conceptual framework defined above suggests that networks are characterized by equality, voluntariness, participation, and transparency. Not all respondents in this study agreed in full, one of them maintaining: "As a new member it's not easy to make one's voice heard, and get acceptance for one's ideas." Starkey (1997) pointed out that a network might be characterized by dominance; some acquire more influence than others. He suggested that one should solve this problem directly as it arises, or less influential individuals might choose to leave and/or turn to rivaling networks. Svensson *et al.* (2001) made it clear that no one voluntarily takes part in a network if one party constantly dominates. On the other hand, relations in networks are not always symmetrical; some have more power and influence than others (Sjöstrand, 2004). According to Lavie (2007): "The relative bargaining power of partners in the alliance portfolio constrains the firm's appropriation capacity."

Most TU members urged that engagement and unity around common issues were vital to participation and development of TU. Other prerequisites mentioned were: trust, equality, time and resources, active participation, process leaders, communication within the network, tempo, and continuity.

Reward affects the function of a network (Ershammar, 2000). Respondents commenting this regarded the meetings as such as sufficient remuneration, and agreed with the view of Svensson *et al.* (2001): As participation is voluntary, the work itself must be rewarding.

One respondent stressed the importance of high levels of ambition and commitment, i.e. "active participation".

The interviewees believed that the informal character of TU created vagueness, and might lead to unclear results, in the end affecting the function of the project. These opinions confirm previous work by Svensson *et al.* (2001), who conveyed that networks have difficulties showing tangible results; results are rarely discussed in terms of efficiency, but rather in words like synergies, contacts, and new ways of thinking, etc. A significant aspect of securing success of TU, forwarded by the respondents, is the presence of a process leader. Process leaders have a big impact on results (Swedish Quality and Competence Council, 2003), even when cooperation is prevalent in the group (Svensson *et al.*, 2001). The person initiating the network may be recruited as the leader, a "hub member", or one may use an external resource. The leader should encourage dialogue and discussion, but discourage debate. Dialogue is the most efficient strategy for a group to reach common understanding and knowledge (Swedish Quality and Competence Council, *op.cit.*). Harmaakorpi and Niukanen (2007) found that: 1) Strategic leadership was more effective than tactical or operational leadership. 2) Informal network leadership was superior to a formal network leadership. 3) Network leadership skills were more important than network management skills.

Why network?

Respondents found TU supportive, and they believed networking was a crucial strategy for development of the companies and organizations in the project, in view of their small scale and limited resources. Cooperation in TU meant pooled resources, and the work aimed at development not only of the region but also of their own organizations. Their main reasons for involvement in the network were cooperation between businesses and local authorities, and the opportunity to unite and raise common issues. Lavie (2007) means that value-creation may arise by: 1) using network resources to directly extend and reinforce value-creation opportunities, 2) generating value from resource combinations, and 3) indirectly profiting from network resources that enhance the value of internal resources, or that provide opportunities to incorporate external resources.

Resource dependency, environmental uncertainty, rapid change of society, cooperation between businesses, and the necessity of networks for growth and development are among the reasons for networking (as shown above in *Theoretical Framework*), and were sanctioned by

all respondents in the present study. Networking is a key factor for innovation and dynamism in territories (Holmquist, 2010; Sotarauta, 2010; Alderete and Bacic, 2012).

In spite of unity among the respondents concerning the reasons for being engaged in TU, opinions about how the work should be organized diverged. Networks are, according to Lind (2002), characterized by lack of formal decision-making and controlling structures. Trust and mutuality are essential, not a price mechanism and hierarchy. According to the Swedish Council for Quality and Competence (2003), it is vital to discuss leadership issues even though a network leader is not called a manager. Gulati and Sigh (1998) argued: "Alliances with more hierarchical controls are capable of greater coordination and show better information processing capabilities than those with fewer controls." They mean that alliances may include several hierarchical elements in their structure: 1) a command and authority structure, 2) incentive systems, 3) standard operating procedures, 4) dispute resolution procedures, and 5) non-market pricing systems, such as cost-plus systems. These hierarchical elements are present to varying degrees in different alliance governance structures (Gulati and Sigh, op.cit.)

Perceptions about network

Respondents recognized the advantages of TU; they perceived that they acquired strength as a group and were given opportunities to raise issues relevant to the development of the region. Respondents agreed with many of the virtues stated in the conceptual framework, and perceived that TU was flexible, dynamic, and that participation was voluntary. TU provides knowledge, coordination, interesting dialogues, idea exchange, and facilitates cooperation. They believed that TU could contribute to a good business environment, as it incorporates a broad affluent representation of businesses in Uddevalla. Some negative opinions about TU were also presented, e.g. worries that the flexibility of TU might cause work to dwindle. Selander (2008) reasons that flexibility (by definition) may result in the network developing from being too instable to being too formalized, and vice versa. The challenge lies in finding the balance between the two.

The respondents pinpointed some other difficulties with networking, for example in terms of communication: time consuming, long meetings, and lack of priority in the home organization. They also perceived lack of expediency once decisions had been made. Other comments included relevance of issues to work with, uncertainties around purpose and results. People lost interest in TU due to vague feedback on vague results, confirming the

views of Svensson *et al.* (2001), who argued (see above) that efficiency was not a concept much used in similar problem contexts. Some respondents called for increased formalization and a better network representativeness. The risk of the network limiting itself to be a closed club, only developing the participants was also put forward. It is vital for all networks to counteract development of membership despair, where ambitious people take over meetings, while the less active feel excluded. (Starkey, 1997; Svensson *et al.*, op.cit.)

Conclusions and practical implications

Networks are often claimed to be informal, flat, spontaneous, and characterized by equality, voluntary participation, and transparency. Nonetheless, the present study discloses that hierarchy exists in networks, and that dominance indeed is a network attribute. Should dominance emerge in a network, it must be reduced/eliminated, or less influential actors may choose to leave the network, as participation is voluntary. This would have consequences, since exchange of members in a network influences its performance (see above).

Leadership is crucial to the outcome of a network. Equality being the norm along with absence of a controlling structure and formal decision-making, are however factors making it difficult to lead a network. This study shows (as judged by the response by the interviewees) that a network is supportive, and that networking is a necessary strategy for development, particularly for small enterprises and organizations, with their limited resources. The increased societal complexity, requiring increased contact between actors, reinforces the need for networking.

Drawing extensive conclusions from one case study is problematic. It is nevertheless not far-fetched to suggest that small organizations with limited resources benefit more from an outward-oriented network-based strategy than from an inward-oriented planning strategy when developing their organization, and that this is likely to be true also for regional development. Although value-creation is an important effect of networking, to a small organization, value capture holds equal importance since this typically provides more challenges. Respondents left various positive as well as negative remarks on networking (see above), from which one may conclude that the challenge of a network is to find a balance between flexibility and formality.

This study made it clear that networking is an effective method for strengthening development capability. Showing concrete results is however not that easy, and may contribute to lack of interest in networking. Hence, actors should be made aware of that a

network-based strategy, rather than a planning strategy, often is used for open projects. Process leaders might play a significant role here by ensuring that actors in a network are realistic in their expectations about outcome and results, thus prohibiting disappointment due to unrealistic anticipation. Leading and controlling a network is difficult, since its informal character prohibits the use of market mechanisms or hierarchy as a governance structure. Trust and mutuality are consequently required, which process leaders need to promote in order to secure the desired outcome of a network.

The main contribution of the present paper is that it integrates research on network for regional development with general network theory, thus offering a better comprehension of the network-based strategy for regional development.

Further research

The aim of the present study was to explore how actors (in general) perceive their participation in a network, not to compare (similarities/differences) different actors' perceptions of participating in a network. One case study does not allow generalization of the findings. A qualitative, exploratory cross-case study would improve the analysis of results, and a quantitative survey research, with a large number of networks comprising many actors, would facilitate broadening and generalization of the results. Learning is of strategic significance to development. One interesting research area would be to study how learning networks operate, and to clarify the requirements for a development-oriented learning.

ABSTRACT

The importance of social media is evident as millions of people use it to connect with others, share content and discuss different topics (Kaplan and Haenlein, 2010; Kim and Ko, 2010). Although it is clear that social media is powerful and ubiquitous, many fashion brands have been reluctant or unable to develop strategies and allocate resources to effectively engage with the new media. The aim of this paper is to critically review the literature that explicitly addresses the adoption, application and impact of social media by fashion brands. In particular, the paper seeks to explain what the new face of social media is, as well as it identifies its importance as a strategic marketing tool and proposes a number of alternative strategies for fashion brands. As demonstrated by our findings, implementing such strategies will allow fashion brands not only to survive, but also create new competitive advantages and thrive in the new global business environment.

Keywords: social media, fashion, strategic marketing, global business environment

INTRODUCTION

Despite the myriad of digital and social media, the question of the state of fashion in the digital context remains largely unexplored, particularly with regards to the particularities of fashion management, which have posed a challenge in adopting digital technologies in the sector over the past two decades (Okonkwo, 2010; Tungate, 2009; Vecchi and Kontu, 2012). Until recently, the fashion industry has shown low commitment towards integrating advanced Internet technologies and its associated interactive and digital tools in the sector's

marketing and overall business strategies (Okonkwo, 2010). The fashion industry seems to be present and conduct business on the Internet as a result of ever evolving consumer needs and expectations. For instance, notable international fashion brands such as Versace and Prada did not have corporate websites until 2005 and 2007, respectively. The slowness of the fashion industry in establishing an online presence in comparison to other sectors visibly clashes with the common idea of an industry that is known for innovation, avant-gardism and creativity (Michault, 2009).

Coupled by the growing demand for a stronger online presence, the rise of social media in recent years brings forth new challenges to fashion brands. The importance of social media is evident as millions of people utilize it to connect with others, share content and discuss different topics (Hanna et al., 2011; Kaplan and Haenlein, 2010, 2011; Kietzmann et al., 2011). Although it is clear that social media is powerful and ubiquitous, many fashion brands have been reluctant or unable to develop strategies and allocate resources to effectively engage with social media (Michault, 2009; Okonkwo, 2010; Tungate, 2009). This attitude has changed in the last few years; social media such as YouTube, Facebook, Twitter, Tumblr, Instagram, Pinterest, Vimeo and Vine have become an integral part of how fashion brands connect with their consumers, providing immense opportunities for innovative marketing communication (Arthur, 2013; Bautista, 2013a; Kim and Ko, 2010; Nguyen, 2011; Wasserman, 2012).

The academic literature on social media is still in early stages and there is limited evidence of its potential as a strategic marketing tool. Furthermore, the connections between social media and fashion remain largely unexplored with little academic research on the applications of social media in the fashion context. To address this gap, our paper provides a critical assessment of the adoption of social media amongst three well established fashion brands, in order to identify the importance of social media as a strategic marketing tool and to propose a number of alternative social media strategies for fashion brands. As demonstrated by our findings, implementing such strategies will allow fashion brands not only to survive, but also create new competitive advantages and thrive in the new global business environment.

SOCIAL MEDIA AND MARKETING

The process of adopting social media as part of the company's marketing programme requires new thinking and new tactics; traditional push marketing methods are incompatible with social networking (Li et al., 2007; Singh et al. 2008). Lack of experience in engaging social

media as marketing communication tools means, that, for many pioneers, this is still a trial-and-error process. In this respect there is a considerable knowledge gap on the real nature and importance of Web 2.0 and its added value for marketing strategy. Most knowledge on the role of Web 2.0 applications as marketing tools is primarily based on anecdotal evidence. This evidence also suggests that, paradoxically, the majority of firms pioneering in engaging social media as a marketing tool are large corporations. Based on field experience, our paper will classify the main paths marketers can follow in order to extract value from the strategic use of social media. Constantinides et al., (2008) identify three ways in which this could occur:

1. Engaging social media as PR and as direct marketing tools;
2. Engaging social media personalities for consumer influence;
3. Engaging social media for personalising the customer's online experience.

The three strategies are further explored through case studies of three different fashion companies by critically assessing their social media strategy. The next section illustrates the methods that were adopted for the research.

METHODOLOGY

In line with the exploratory nature of the study, the current research relies on comparative case study research to critically assess the social media campaigns of three fashion companies. "Case studies represent a methodology that is ideally suited to creating managerially relevant knowledge" (Gibbert and Ruigrok, 2010) and they are considered the most appropriate as tools in the critical, early phases of a new management theory, when key variables and their relationships are being explored (Eisenhardt, 1989; Yin, 2008). Therefore case study research is particularly useful at the early stages of theory development, in which key themes and categories have yet to be empirically isolated (Eisenhardt, 1989; Elg and Johansson, 1997; Yin, 2008). Although we acknowledge the richness of adopting a single case study, multiple case studies provide a more solid basis for generalization and can provide substantial opportunities for theory-building (Dyer and Wilkins, 1991).

As illustrated in Table 1, we purposefully selected three case studies of fashion companies (Donna Karan, Calvin Klein and Burberry) to illustrate the strategic use of social media in the fashion industry.

Company	Founded	Country	Short description
Donna Karan	1984	US	An international New York based fashion house designing and marketing men's and women's clothing, sportswear, accessories and shoes through its own retail stores, department stores and specialty stores worldwide. Donna Karan International is part of the publicly traded LVMH Group since 2001.
Calvin Klein	1968	US	A New York based fashion house designing and marketing women's and men's collections from apparel, accessories, underwear and fragrances, to home furnishings through an extensive network of licensing agreements and other retail formats worldwide. The company is publicly listed.
Burberry	1856	UK	An international UK based fashion house designing, manufacturing and marketing men's, women's and children's clothing and non-apparel accessories globally through a diversified network of retail (including digital), wholesale and franchise channels worldwide. The firm is publicly listed.

Table 1: Overview of case companies

These fashion companies were chosen as they have all a quite diversified product range. Donna Karan and Calvin Klein are from the US and Burberry is from the UK. In particular while Burberry and Calvin Klein can be considered heritage brands for the UK and the US respectively, Donna Karan is of more recent establishment. Owing to the diversity of their retail operations ranging from a very narrow retail format such as own stores and flagship stores to a very diversified network of retail platforms they represent three emblematic examples of fashion brands and they all implement substantially very different digital strategies. In the light of both the exploratory nature of the study and the wide variety of the fashion brands' features, three case-studies was deemed as adequate to provide rich insights over the use of social media in the fashion industry.

The fashion industry was deemed as the ideal industry setting for the study since it is by definition a very creative industry (Vecchi, 2008), which is consumer-driven (Mosca, 2008), and where establishing empathy with the final consumers is of paramount importance (Venturi, 2011). Additionally, the choice of the sector was driven by the acknowledgment that in the creative industries, technology adoption is considered to be more extensive than in any other sector (Florida and Gates, 2001).

Data collection for each case study relied on the adoption of the following research protocol as outlined in the Table 2 below.

Case study dimension	Research objective	Sources of evidence
Company background	To contextualize the brand within the broader development of the company	Secondary literature Grey literature
Company history	To contextualize the social media strategy within the broader marketing strategy adopted	Secondary literature Grey literature
Social media strategy	To contextualize the social media strategy adopted in relation to the specific brand	Online observations and content analysis

Table 2: Research protocol

In order to produce three robust case studies we relied on a wide variety of sources ranging from secondary sources such as newspapers, industry reports and grey literature through primary sources by the means of online observations and content analysis.

First, in order to contextualize the brand within the broader development of the company we collected information about the company background. Second, in order to contextualize the social media strategy within the broader marketing strategy adopted, we collected information about the company history. While these two case study dimensions were investigated by mostly consulting secondary sources such as industry reports and grey literature, the brand's social media strategy was critically assessed by relying on primary data collection. More precisely, as previously done by Ross (2010) and by Nguyen (2011) the

investigation of the social media strategy relied on a qualitative online observations of the aforementioned three fashion brands whose social media activities across several social media were observed. For the purpose of the study, these were deliberately restricted to Youtube, Facebook, Twitter, Tumblr and Pinterest. Social media activity was then observed from January to June 2013. More specifically, as part of the qualitative observations of the brands' social media activities, these were assessed in relation to the content and according to the theoretical framework adopted from Constantinides et al. (2008) as previously described.

FINDINGS

Table 3 below outlines the effectiveness of the social media strategies implemented by the three fashion brands as measured by number of likes on Facebook, number of followers on Twitter, number of subscribers on their YouTube channel and number of followers on Pinterest.

Brand	Facebook (likes)	Twitter (followers)	YouTube (subscribers)	Pinterest (followers)
DKNY	1,229,091	456, 181	2,212	13,275
Calvin Klein	7,252,805	722,415	17,384	n/a
Burberry	15,437,483	1,948,686	71,993	49,616

Table 3: Overview of the case brands' social media presence on 30 June 2013.

While the value of these numbers is surely questionable, they need to be contextualized within the brands' respective digital strategies as they provide a useful indication of the different social media platforms on which these brands tend to rely the most. Quite interestingly while the two heritage brands Calvin Klein and Burberry more extensively engage across all the distinct social media platforms (Calvin Klein does not focus on Pinterest but instead uses Tumblr for visual material as previously discussed), DKNY tends to rely more extensively on Twitter.

Arising from the discussion in the findings, Table 4 summarizes the different digital strategies implemented by the three fashion brands considered. Referring to the taxonomy previously introduced by Constantinides et al. (2008), DKNY seems to use social media as a PR and direct marketing tool, while Calvin Klein mostly engages with social media personalities and Burberry uses social media to allow customization.

Brand	Digital strategy
DKNY	Engaging social media as a PR and direct marketing tools
Calvin Klein	Engaging social media personalities for customer influence
Burberry	Engaging social media for personalizing the customer's online experience

Table 4: Overview of the brands' digital strategies

Our findings illustrate how there is a perceptible shift in fashion marketing. Newer tools in marketing such as social media are giving fashion brands the option to not only address their audience but also to interact with them in real-time. Indeed, social media is single-handedly changing the face of fashion marketing. Accordingly, the rapid adoption of social media requires marketers to have a 360-degree strategy to deal with more discerning consumers. Our findings demonstrate that fashion marketing is evolving into two-way communication and social media play a pivotal role in this process. While initially considered digital late-comers (e.g. Okonkwo, 2010; Tungate, 2009), the findings from our three illustrative case studies outline how fashion brands have often found novel and creative ways to implement digital strategies aimed at PR and direct marketing (as in the case of DKNY), new ways to engage celebrities to endorse their products (as in the case of Calvin Klein), new solutions to tap into consumer's creativity in the form of advertising concepts and to make the customer a co-producer (as discussed in relation to Burberry).

In particular our findings highlight some peculiarities in their use of social media and can surely provide useful lessons and valuable guidelines for companies in other creative sectors such as the design, the music, the film and the luxury industries. Social media were identified as a substantive method of promoting the fashion brands' identity by leveraging on consumers' emotions. Similarly, social media are increasingly employed to change consumers' perceptions of a fashion brand or a product. A very few fashion firms tend to use

social media as a distribution channel – those pioneers who do, they seem to have fully understood the broader implications that social media utilization might have for traditional fashion retail and implement a digital strategy that can successfully capitalize on their complementarities and synergies. This could be seen as the biggest innovation and change in practice in recent times. From a marketing perspective, the valuable experience of the three fashion brands provides novel insights into fully reaping the benefits associated with social media capitalization.

ORIGINALITY

While the academic literature on social media tends to be very general and not sector-specific (Arthur, 2013; Bautista, 2013a; Kim and Ko, 2010; Nguyen, 2011; Wasserman, 2012), our study presents one of the first appraisals of the literature with regard to the likely development, implications and impact of the use of social media in fashion retail. Moreover the paper seeks to break new ground by attempting to use some evidence from the fashion industry to provide rich insights that could be valuable to firms in other sectors.

ABSTRACT

Purpose – The main objective of this paper is to provide evidence about corporate failure prognosis in a developed market such as Greece and identify new value-relevant variables concerned with the quality of financial statements and the managerial choice of accounting methods and techniques in order to enhance the accuracy of the corporate failure prediction models.

Design/methodology/approach – In this paper multiple discriminant analysis, logit analysis and probit analysis are employed to construct models for the prediction of corporate failure. The impact of accounting agility and managerial discretion on the accuracy of the prediction models is explored.

Findings – This study identifies new value-relevant predictor variables concerned with the choice of accounting methods and techniques and also provides evidence that these variables enhance the accuracy of the existing corporate failure prediction models.

Practical implications – The existing corporate failure prediction models embody an endogenous flaw of the predictor variables that derives from the quality of financial statements and corporate agility concerned with the choice of accounting methods. Financial institutions should reexamine the efficiency of their methodologies concerned with their credit risk assessment.

Originality/value – The results of the study will redirect Academia's attention towards future research and they will also assist regulatory authorities to reconsider the current framework concerning managerial discretion.

Keywords: Accounting methods, managerial discretion, corporate failure prediction models

1. INTRODUCTION

Corporate failure is an important aspect of real economy since it affects first the society and then in particular a number of stakeholders such as employees and their families, managers, shareholders, creditors, auditors and many others. One of the main causes for this paper has been the extensive empirical research concerning managerial choice of accounting methods and techniques that aggravates the quality of reported accounting and financial information. However, it is limited on one accounting choice at a time and very often in a “positive” perspective to “explain” and “predict” as it is defined by Watts and Zimmerman (1986) and always as if the efficient market hypothesis stands in its strong form. On the other hand, corporate failure literature seems to neglect the preceding research and it limits the predictor variables of the existing models only to financial ratios as if accounting and finance are trapped in different water-tight compartments making their communication not feasible.

The main objective of this paper is to provide evidence about corporate failure prognosis in a developed market such as Greece and identify new value-relevant variables concerned with the quality of financial statements and the managerial choice of accounting methods and techniques in order to enhance the accuracy of the corporate failure prediction models. For the successful completion of our objective, we employed multiple discriminant analysis, logit analysis and probit analysis incorporating both financial ratios and choices of accounting methods and techniques as predictor variables of our models.

The remainder of this paper is organised as follows: In the next section we report a thorough literature review concerning corporate failure prognosis and managerial choice of accounting methods. Our research methodology including statistical modelling, sample and variable selection processes is embedded in the third section of this paper. The fourth section contains the empirical results of our research and the accompanying discussion of these results. Finally, our concluding remarks are cited in the fifth section of this paper.

2. LITERATURE REVIEW

Altman (1968) was the pioneer who employed multiple discriminant analysis (MDA) for the prediction of corporate failure with the use of financial ratios after the inspiring work of Beaver (1966) who developed a model with the use of univariate analysis. Until today, academics are striving to find the appropriate financial ratios that would maximise the accuracy and the predictive power of their models (Meyer and Pifer, 1970; Edmister, 1972; Altman et al., 1977; Eisenbeis, 1977; Martin, 1977; Ohlson, 1980; Collins, 1980; Altman, 1984;

Johnsen and Melicher, 1994) by testing them in various sectors, industries (Espahbodi and Espahbodi, 1984) and markets (Peel and Peel, 1988; Keasy et al., 1990; Tamari, 1984; Ugurlu and Aksoy, 2006).

During the last twenty years computer science researchers have also been engaged to this field due to the endogenous problems of the traditional statistical models which are based on the assumptions of linearity and normality that rarely exist in real economy. After two decades of relative research the current literature provides evidence that artificial neural network approaches, support vector machines and other computer based models outperform traditional statistical models (MDA and logit – probit analysis) in different industries, economies and eras (Altman et al., 1994; Lin and McClean, 2001; Alfaro et al., 2008; Yim and Mitchell, 2007; Tsukuda and Baba, 1994; Ozkan-Gunay and Ozkan, 2007; Etemadi et al., 2008; Lin, 2009; Huang et al., 2008; Wu et al., 2010).

Nevertheless, the financial patterns of failed corporations are more unstable than those of non-failed ones (Martikainen and Ankelo, 1991). Evidently, determinants of the efficiency of the corporate failure prediction models can be the economic cycle phase e.g. recession (Richardson et al., 1998), cash flow information (Sharma, 2001), the quality of accounting and financial information (Gadenne and Iselin, 2000), and the detection of fraudulent financial reporting (Liou and Yang, 2008). However, the existing legal framework offers enough space for creative accounting practices (legitimate and illegitimate) including aggressive choice and application of accounting principles (Mulford and Comiskey, 2002) that mitigate the quality of reported financial information. In cases where corporate bankruptcy has its roots in corporate ethics which form a direct link between the public interest and corporate strategy when possible conflicts are not successfully settled by law (Steinmann, 2007), the existing corporate failure prediction models under-perform when applied in different economies, markets and sectors.

Unfortunately, the current empirical research is confined to one accounting choice at a time when the majority of managers have an objective that could be better served by the combined effects of several accounting choices (Zmijewski and Hagerman, 1981). In some cases where their objective was concerned with income smoothing, executive compensation, valuation concepts, debt covenants and taxation purposes we witnessed the collapse of firms like Enron, Worldcom, Barings Bank, Imarbank and many others. The existing literature suggests that the determinants of the managerial choice of accounting methods is influenced by market imperfections such as agency costs, information asymmetries and externalities affecting non contracting parties (Fields et al., 2001). Agency

costs often provide guidance to managerial choice of accounting method in order to enhance executive compensation and avoid debt covenant violations (Holthausen and Leftwich, 1983; Smith and Warner, 1979; Zmijewski and Hagerman, 1981; Dhaliwal, 1980; Dhaliwal, 1988; Healy, 1985; Kosmidis and Terzidis, 2011), information asymmetries in the same way in order to manipulate corporate valuations (Gagnon, 1967; Copeland and Wojdak, 1969; Lewellen et al., 1985; Robinson and Shane, 1990) and externalities in order to influence external parties such as unions, lenders and government (DeAngelo and DeAngelo, 1991; Jones, 1991; DeAngelo et al., 1994; Astami and Tower, 2006),

3. METHODOLOGY

This paper is based on the prior work of Kosmidis et al. (2011) and consequently most of their methodological assumptions are adopted as well. This means that the paper focuses on the construction of an accounting-based corporate failure diagnosis model with data from Greece since accounting-based models outperform market-based models in terms of differential error misclassification costs (Agarwal and Taffler, 2008). The research sample contains 27 failed and 27 non failed companies which meet the criteria for the definition of micro, small and medium-sized enterprises provided by the Commission of the European Union (2003) and includes only companies with limited liability (Ltd) and societe anonyme (s.a.) in order to overcome the scarcity of publicly available information since these companies are obliged to disclose financial statements such as the balance sheet and the income statement in accordance with the Greek Financial Reporting Standards. Failed corporations are considered those having been bankrupt or discontinued operations and non failed corporations those that are going concern. The study extends from 2003 to 2009, a time period before the deep recession that Greece is suffering now while trade and services companies were excluded from the sample. The financial statements of these corporations are provided by the ICAP database.

The methodology of the existing literature varies among different predictor variables and different econometric techniques. The present study employs MDA, logit analysis and probit analysis to construct corporate failure prediction models based on data from a peripheral developed country such as Greece. MDA was originally introduced by Altman (1968) in order to discriminate the financially distressed from the financially viable corporations. MDA is widely used in classification problems where the dependent variable is

categorical and shares all multiple regression assumptions (pros and cons). The discriminant function is a linear function of the following form:

$$Cq = a + \sum_{j=1}^n b_{ji} FR_{ji} + \sum_{k=1}^m c_{ki} AM_{ki}$$

where C_q represents the multiple discriminant score for the category q , a represents a constant term, FR represents j discriminant variables (financial ratios) and b, c represent n, m discriminant coefficients for i corporations. A key issue for our analysis is the introduction to the model the choice of accounting methods and techniques AM as k dummy variables.

Logit analysis is the logistic transformation of the ordinary regression model used for predicting the probability π of success (corporate bankruptcy) when the dependent variable is binary. The logistic regression model has the following form:

$$\text{logit}(\pi) = \log[\pi / (1-\pi)] = c + \sum_{j=1}^n b_{ji} FR_{ji} + \sum_{k=1}^m c_{ki} AM_{ki} = Z$$

where $\pi/(1-\pi)$ is the odds ratio and c represents the intercept. The formula expressing the logistic regression model directly in terms of π is

$$\pi = e^z / (1 + e^z) = 1 / (1 + e^{-z})$$

where the probability π of success (corporate failure) lies between zero and one when the value of Z ranges from $-\infty$ to $+\infty$ for all FR and AM values (Agresti and Finlay, 1997). The relationship between the dependent variable and the independent variables is a non-linear sigmoid relationship. In corporate failure diagnosis problems where the dependent variable is categorical, the statisticians favour logistic regression over ordinary linear regression because the binomial distribution describes the distribution of prediction errors better than the normal distribution while the latter is more difficult to interpret especially in cases where Z takes values above one and less than zero.

On the other hand, probit analysis transforms percentages to probits (probability units) and the probability, π , of corporate failure is defined by the standard normal cumulative distribution function of Z as expressed in the following form:

$$\pi = \Phi(z)$$

where Φ represents the cumulative distribution function of the standard normal distribution. Although the similarities between probit and logit analyses are numerous, the former is favoured when the data are normally distributed and vice versa.

The research sample is consisted of 54 corporations which it is adequate for failed corporations because it reflects the whole statistical population, however over-sampling of failed corporations may lead to a non-random sample but this compromise is embodied by other existing models as well due to the low frequency rate of failed corporations (Balcaen and Ooghe, 2006). The variable selection process is applied in six stages. The selection and computation of 41 financial ratios are performed in the first stage. The definition of these financial ratios is embedded in Appendix A. At the second stage, we perform cluster analysis of financial ratios in order to detect possible inter-correlations and thus avoid multicollinearity problems in model construction. At the third stage, two tail t-tests are conducted for all these 41 financial ratios. The null hypothesis assumes that there is no significant difference in the mean values of these financial ratios between failed and non-failed corporations while the alternative hypothesis assumes that there is significant difference. During the fourth stage, we apply univariate discriminant analysis to identify the financial ratios from each cluster exhibiting enhanced predictive power and thus reducing dimensionality (Hua et al., 2007). At the fifth stage, we conduct X^2 tests between the choice of accounting methods and techniques and the status of the corporations in order to detect possible association of failed corporations with certain choices of accounting methods and techniques. Finally in the sixth stage, we proceed to the construction of the preceding models with and without the *AM* variables in order to witness the possible incremental information content of the *AM* variables in terms of enhanced ratios with correct classifications.

4. EMPIRICAL RESULTS AND DISCUSSION

We performed cluster analysis of all 41 financial ratios in order to detect possible inter-correlations among variables. We also employed the Ward linkage method to determine the distance between clusters. Based on the similarity level, the appropriate number of clusters is five. We also performed univariate discriminant analysis (UDA) and T-tests in order to detect the financial ratios that best discriminate the failed from the non-failed corporations. The preceding results of the first cluster are reported in Table I. It is obvious that there are discrepancies between UDA and T-test results. For example, FR31 and FR32

exhibit superior discriminatory power according to UDA results but there is no statistically significant difference between the mean values of these ratios for failed and non-failed corporations.

Table I UDA and T-test results of Cluster 1 financial ratios

Cluster 1						
Ratio	STATUS	MEAN	SD	T-values	Sign.	UDA %
FR31	Non-failed	0.0680	0.5400	0.89	0.380	70.40

	Failed	0.8320	0.3160			

Note: Significant difference between failed and non-failed corporations at the * 0.1, **0.05 and ***0.01 significance level.

The UDA and T-test results of the second cluster are reported in Table II. Here, the two methods coincide as far as FR36 and FR1 is concerned but for FR2 although there is a statistically significant difference between the mean values of this ratio for failed and non-failed corporations, the UDA results are poor. The UDA and T-test results of the third cluster are reported in Table III. As previously reported, the two methods coincide in the majority of variables. However, it is worth mentioning that the T-tests of the ratios of this particular cluster exhibit no difference between the mean values of any ratio for failed and non-failed corporations.

Table III UDA and T-test results of Cluster 3 financial ratios

Cluster 3						
Ratio	STATUS	MEAN	SD	T-values	Sign.	UDA %

	Failed	6.1000	20.5000			
FR34	Non-failed	3.3600	3.2100	-1.69	0.102	51.90
	Failed	6.7400	9.9200			

Note: Significant difference between failed and non-failed corporations at the * 0.1, **0.05 and ***0.01 significance level.

Accordingly, the same lack of discrepancies is observed between UDA and T-test results for the financial ratios of the fifth cluster which are reported in Table V. The majority of financial ratios that exhibit enhanced predictive power according to UDA results, show significant difference between the mean values of these particular ratios for failed and non-failed corporations as well.

Table V UDA and T-test results of Cluster 5 financial ratios

Cluster 5						
Ratio	STATUS	MEAN	SD	T-values	Sign.	UDA %
FR7	Non-failed	0.1520	0.2960	2.25	0.029**	66.70
	Failed	-0.0150	0.2480

	Failed	0.2100	0.1650			

Note: Significant difference between failed and non-failed corporations at the * 0.1, **0.05 and ***0.01 significance level.

During the final stage before the construction of the corporate failure prediction models, we conduct X^2 tests between the choice of accounting methods and techniques and the status of the corporations in order to detect possible association of failed corporations with certain choices of accounting methods and techniques. As we can see in Table VI, twelve accounting methods and techniques are tested and we found significant dependence between them and the status of the companies in only three cases. In AM1 we witnessed non-failed corporations to capitalize their start up costs while the failed ones tend to do the exact opposite. In AM2 we found evidence of non-failed corporations to capitalize their R&D costs when failed corporations do not share the same attitude probably because they do not invest in R&D at all. In AM9 we also found significant dependence between the status of the companies and the provision for depreciation. In particular, failed corporations tend to avoid depreciating their fixed assets one year prior to their bankruptcy which is consistent with the contracting theory literature vis-à-vis income increasing techniques.

Table VI X^2 test results of Accounting Methods and Techniques

Accounting Method	DEFINITION	X^2	Significance
AM1	Capitalization of Start-Up Costs	9.826	0.002 ***
AM2	Capitalization of R & D Costs	3.000	0.083 *
AM3	Intangible Assets	1.271	0.260
AM4	Investment in Associated Companies	0.333	0.564
AM5	Revaluation of Fixed Assets	1.862	0.172
AM6	Receive Government Grants	1.862	0.172
AM7	Provision for Pensions	0.114	0.735
AM8	Provision for Extraordinary Items	0.731	0.393
AM9	Provision for Depreciation	8.206	0.004 ***
AM10	Provision for Additional Depreciation	0.220	0.639
AM11	Tax - Exempt Reserves	0.114	0.735
AM12	Board of Directors' Compensation	0.220	0.639

Note: Significant difference between failed and non-failed corporations at the * 0.1, **0.05 and ***0.01 significance level.

For the construction of the three models, we choose only one financial ratio from each cluster in order to avoid multicollinearity problems although multicollinearity is irrelevant in the MDA model (Eisenbeis, 1977). Our objective is to construct three alternative models: i) the discriminant model (DM), ii) the logit model (LM) and iii) the probit model (PM), in accordance with the methodology of the preceding section. Then we introduce to these models the dummy variables concerning the choice of accounting methods and techniques in order to test the impact of these dummy variables on the accuracy and robustness of these models. The information content of the dummy variables is guided but not limited by the X^2 results of Table VI.

The former three models (DM1, LM1 and PM1) without the use of the AM variables and the latter three models (DM2, LM2 and PM2) with the use of the AM variables appear in Table VII. The linear classification functions derived from DM1 and DM2 for the failed and non-failed corporations are also embedded in Table VII. The preceding discriminant functions of DM1 and DM2 lead to 81.5% and 87% of correct classifications respectively. Moreover, the probability to classify a failed corporation as non-failed (Type I error) is 18.5% for DM1 and 14.8% for DM2 while the probability to classify a non-failed corporation as failed (Type II error) is 18.5% for DM1 and 11.1% for DM2. Both DM1 and DM2 can be considered as robust since Wilks' Lambda low values (0.676 and 0.513) indicate excessive discriminatory power of the classification functions and the X^2 statistic provides evidence to reject the null hypothesis that the mean values of the preceding classification functions are equal between the two groups of corporations.

In comparison with the DMs, the LMs outperform in terms of accuracy ratio of correct classifications and Type I & II errors. That is 83.3% hit ratio for LM1 and 90.7% for LM2, 14.8% probability of Type I error for LM1 and 7.4% for LM2 and 18.5% probability of Type II error for LM1 and 11.1% for LM2. Furthermore, both LM1 and LM2 can be considered as robust since the values of Nagelkerke R^2 (0.462 and 0.700) which is a pseudo R^2 statistic, an approximation of R^2 for the linear models when the dependent variable (company status) is categorical, can be perceived as satisfactory and the Hosmer-Lemeshow goodness of fit statistics (0.746 and 0.273) are well above 0.10 and thus provide evidence that the LMs adequately describe the data.

Table VII Estimates of the Discriminant, Logit and Probit Models

Variables	DM1	DM2			LM1	LM2	PM1	PM2
	Non- failed	Failed	Non- failed	Failed				
Intercept	-35.161	35.562	-39.665	37.418	-2.404	-0.288	-1.097	-0.476
FR1	7.296	6.263	7.890	6.570	-1.666	-1.475	-0.950	-0.786
FR14	24.773	25.177	25.825	25.306	1.650	0.972	0.839	0.589
FR17	0.481	0.541	0.516	0.569	0.069	0.153	0.043	0.092
FR20	16.388	12.593	18.990	13.934	-4.011	-6.116	-2.247	-3.223
FR39	2.261	3.211	1.790	3.175	1.077	1.323	0.487	0.757
AM5			2.736	1.602		-1.533		-0.731
AM7			5.404	4.502		-2.191		-1.169
AM9			-6.721	-3.056		4.868		2.463
Wilks'								
Lambda	0.676		0.513					
X ² (Sign.)	19.378 (0.002)		32.024 (0.000)					
Nagelkerke								
R ²					0.462	0.700		
H-L Test					5.11	9.89		
(Sign.)					(0.746)	(0.273)		
Pearson X ²							54.8	76.8
(Sign)							(0.233)	(0.002)
Accuracy								
Within								
groups	0.815	0.815	0.889	0.852				
Overall	0.815		0.870		0.833	0.907	0.815	0.889
Type I error		0.185		0.148	0.148	0.074	0.185	0.111
Type II								
error	0.185		0.111		0.185	0.111	0.185	0.111

The PMs under-perform in comparison with the LMs and outperform in comparison with the DMs, in terms of accuracy ratio of correct classifications and Type I & II errors. That is 81.5% accuracy ratio for PM1 and 88.9% for PM2, 18.5% probability of Type I & II errors for PM1 and 11.1% for PM2. Finally, PM1 can be considered as robust since the Pearson goodness of fit statistic (0.233) provides evidence that the PM1 adequately describes the data. However, this is not the case for PM2 where the Pearson goodness of fit statistic (0.002) is less than 0.05.

In any case, the AM variables exhibit enhanced information content and their introduction to the existing corporate failure prediction models attributes excessive discriminatory power. In terms of accuracy ratio and Type I & II errors DM2, LM2, and PM2 outperform DM1, LM1, and PM1 respectively. Moreover, our findings are consistent with the contracting theory since managerial choice of accounting methods and techniques is determined by market imperfections such as agency costs, information asymmetries and externalities (Fields et al., 2001). The combined effects of certain accounting choices and techniques on the accuracy of the existing corporate failure prediction models are also tested

while the current literature is limited on one accounting choice at a time when the majority of managers have a purpose that could be better served by the combined effects of several accounting choices (Zmijewski and Hagerman, 1981).

5. CONCLUSIONS

One of the main obstacles of this research has been the scarcity of publicly available information especially the data concerned with the choice of accounting methods and techniques of failed corporations. Nevertheless, we constructed accounting-based models for the prediction of corporate failure with Greek business data. Our motivation was to bridge the gap between the accounting choice literature and the prediction of corporate failure literature. We attained that with the employment of multiple discriminant analysis, logit analysis and probit analysis incorporating both financial ratios and choices of accounting methods and techniques as predictor variables of our models

Our objective was to construct the three preceding alternative models (DM, LM and PM), in accordance with the described methodology with and without the incorporation of the AM variables in order to detect possible incremental information content of the AM variables in terms of enhanced ratios with correct classifications. In any case, the AM variables exhibit enhanced information content and their introduction to the existing corporate failure prediction models attributes incremental discriminatory power. In terms of accuracy ratio and Type I & II errors DM2, LM2, and PM2 outperform DM1, LM1, and PM1 respectively. The combined effect of the AM variables used in the final models is obvious even though the χ^2 results among seemingly unrelated accounting methods are not consistent with the overall accuracy ratio of the models.

Finally, we believe that our study is limited to few accounting choices and techniques by the scarcity of publicly available information and future research is necessary in order to explore the impact of the plethora of accounting methods and techniques that are acceptable by different GAAPs on the prediction of corporate failure.

MEDIATING IMPACT OF “TRUST” IN THE RELATIONSHIP BETWEEN E-SERVICE QUALITY & CUSTOMER SATISFACTION IN THE CONTEXT OF INTERNET BANKING

Kundu, Sukanya

¹Alliance Business School, Alliance University, Bangalore, India, sk54015@gmail.com

ABSTRACT

The main objective of this study is to find the role of trust as a mediating variable between e-service quality and customer satisfaction in Internet banking. Structure equation modeling has been used to analyze the effects of independent variable e-service quality on customer satisfaction and the role of mediating variable trust. Stepwise analysis has been done to examine the effect of trust on customer satisfaction. E-service quality was found strongly correlated with customer satisfaction. The results does not confirm trust as a mediating variable between e-service quality and customer satisfaction, though a positive significant relation can be found between trust and customer satisfaction when tested in a separate cause and effect model. The research implies that banking service providers should focus mainly on the improvement of the service quality of Internet banking to get more satisfied customers.

Keywords: customer satisfaction, e-service quality, E-S-QUAL, Internet banking, mediating variable, trust

INTRODUCTION

In today's world of intense competition, the key to sustainable competitive advantage lies in delivering high quality services that will in turn result in satisfied customers (Shemwell, Yavas, & Bilgin, 1998). In an era of intense global competition; many organizations have now shifted the paradigm of service quality to customer's perspective (Parasuraman, Zeithaml, & Berry, 1985). Based on this paradigm, a customer will judge the quality of service accorded and determine whether it met his/her expectations (Grönroos, 1984; Parasuraman et al., 1985, 1988). Service quality and customer satisfaction are the two core concepts that are at the center of the marketing theory and practice (Spreng & Mackoy, 1996). The relationship

between service behavior and service quality has proven its role and importance in management/marketing (Valarie et al., 1996; Heskett & Sasser, 2010; Hutchinsona et al., 2009). The concepts of service quality and service satisfaction have been highly considered and used in marketing texts and activities, during previous decades. Marketing researchers have praised the advantages of satisfaction and quality, and have mentioned them as indices of an organization competitive benefit (Ruyter, 1997).

But an observed relationship may be part of a more complex chain of effects. These complex relationships are described in terms such as indirect influences, distal vs. proximal causes, intermediate outcomes, and ultimate causes; all of which share the concept of mediation. A mediator can be thought of as the carrier or transporter of information along the causal chain of effects.

Here, this study will measure the mediating role of trust as attributed by a customer to service quality of Internet banking and customer satisfaction. The main objectives of this study are to find out e-service quality through gap model (Service perception vs. Service expectation) based on the E-S-QUAL scale suggested by Parasuraman et al. (2005). Later, mediating role of trust will be studied. As evident from literature trust and e-service quality exert a positive influence on customer satisfaction.

LITERATURE

Service quality and e-service quality

Service quality has become as one of the key driving forces for business sustainability and is crucial for firms' accomplishment (Rust and Oliver, 1994). The importance of service quality has been proved as the ultimate goal of service providers throughout the world (Sureshchandar, Rejendran, & Anantharaman, 2002). Service quality has been defined as a form of attitude – a long-run overall evaluation (Zeithaml, 1988; Parasuraman et al., 1988) while perceived service quality as a general, overall appraisal of service. Original 22-item SERVQUAL instrument by Parasuraman (1985, 1988, and 1994). provided researchers with the possibility of measuring the performance expectations gaps composed by five determinants knows, reliability, responsiveness, empathy, assurance and tangibility. However, studies dealing with people-technology interactions imply that customer evaluation of new technologies is a distinct process. Findings from an extensive qualitative study of how customers interact with, and evaluate, technology-based products (Mick and Fournier 1998) suggest that (a) customer satisfaction with such products involves a highly

complex, meaning-laden, long-term process; (b) the process might vary across different customer segments; and (c) satisfaction in such contexts is not always a function of preconsumption comparison standards. Findings of different studies by Cowles 1989; Cowles and Crosby 1990; Dabholkar 1996; Eastlick 1996, Davis 1989, and Szajna 1996) reveal important differences in acceptance and usage of technologies across customers depending on their technology beliefs and suggest that similar differences might exist in the evaluative processes used in judging e-SQ.

In 2005 Parasuraman et al further developed E-S-QUAL, a Multiple-Item Scale for Assessing Electronic Service Quality. The basic E-S-QUAL scale developed in the research was a 22-item scale of four dimensions : efficiency, fulfillment, system availability, and privacy. The second scale, E-RecS-QUAL, is salient only to customers who had nonroutine encounters with the sites and contains 11 items in three dimensions: responsiveness, compensation, and contact.

Customer satisfaction

Satisfaction is a person's feeling of the pleasure or disappointment arising from comparing products perceived performance in relation to expectation. It is a state of experience that might vary in intensity but not in quality (Stauss & Neuhaus, 1997). Various authors reflect the notion that satisfaction is a feeling which results from a process of evaluating what has been received against what was expected, including the purchase decision itself and the needs and wants associated with the purchase (Armstrong & Kotler, 1996). Customer satisfaction is the primary mental state of customer which comprise by two thing (1) expectation before purchase (2) perception about performance after purchase (Oliver 1997, Westbrook & Oliver 1991). Bitner & Zeithaml (2003) stated that satisfaction is the customers' evaluation of a product or service in terms of whether that product or service has met their needs and expectations. According to Boselie, Hesselink, and Wiele (2002) satisfaction is a positive, affective state resulting from the appraisal of all aspects of a party's working relationship with another. Customer satisfaction is defined as a result of comparison between what a customer expects about services provided by a service provider and what the customer receives in actual terms (Caruana, Money, & Berthon, 2000; Parasuraman et al., 1988). If the service provided by an organization does meet a customer's needs and expectations, then this may subsequently lead to higher customer satisfaction (Foster, 2004; Parasuraman et al., 1988; Walker et al., 2006).

Relationship between service quality and customer satisfaction

A number of empirical studies did indicate a link between service quality and satisfaction (e.g., Fornell, 1982; Taylor and Baker, 1994). Extant research in this area shows that the proper implementing and dispensing of the core service quality features may justifiably increase customer satisfaction (Gronroos, 1984; Parasuraman et al., 1988; Walker et al., 2006). The service quality research literature is consistent with the notion of perceived quality models. For example, Parasuraman et al. (1985) state that a conceptual service quality model highlights that the match between service quality standards and customers' standards may decrease service performance gap and increase customer perceived value about the quality systems. Consequently, it may lead to higher customer satisfaction.

Trust

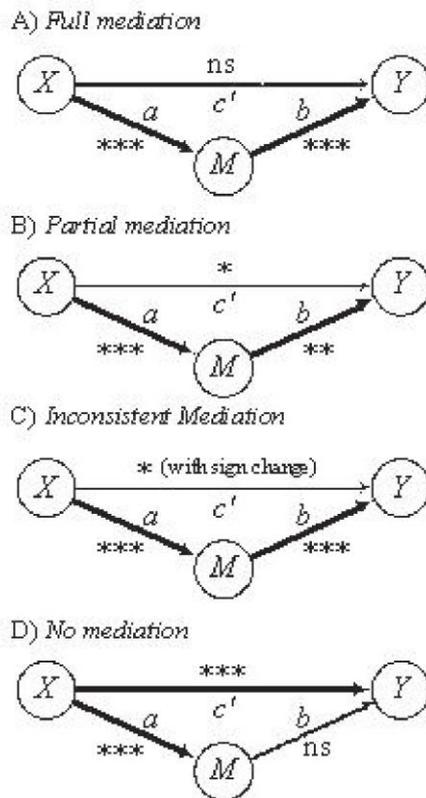

"Trust is like the air we breathe, when it's present, nobody really notices. But when it is absent, everybody notices." (Warren Buffet, qtd. in Sandlund, 2001). In business trust is viewed as one of the most relevant antecedents of stable and collaborative relationships. Wilson (1995) states "Trust is a fundamental relationship model building block". Trust is considered to be an important element of consumer perceptions about brands and companies (Aaker, 1997). Reichheld and Scheffer (2000) state that "To gain the loyalty of customers, you must first gain their trust". Trust is beneficial for both customers and companies: customers benefit through a reduced perception of risk toward service provider and through social benefits derived from a trusting service provider; companies benefit through increased sales, reduced costs, positive word-of-mouth and even employees retention (Moorman et al., 1993; Schurr et al., 1985). Zaheer et al., (1998) found trust to have an important role in facilitating closer buyer-supplier relationships by reducing the tendency of firms to take advantage of each other. Researchers had established that trust is essential for building and maintaining long-term relationships (Rousseau, Sitkin, Burt, & Camerer, 1998; Singh & Sirdeshmukh, 2000). Trust and commitments are key variables for businesses because a) they encourage marketers to work at preserving relationship investments, b) resist attractive short-term alternatives in favour of the expected long-term benefits of staying with existing partner and c) view potentially high-risk actions as being prudent because of the belief that their partner will not act opportunistically (Morgan & Hunt, 1994). Trust involves one person's expectations that another will behave in a certain way (Deutsch, 1958; Schurr & Ozanne, 1985). It can be defined as one party's confidence in the other relationship members reliability, durability and integrity and the belief that its actions are in the best interest of and will produce positive outcomes for the trusting party (Peppers & Rogers, 2004). Trust

between two parties requires that, if one part does not behave as expected, the other party will experience more negative outcomes than if the other does behave as expected (Deutsch, 1958). Morgan and Hunt (1994) stated that trust exists only when one party has confidence in an exchange partner's reliability and integrity. While defining trust Moorman, Deshpande, & Zaltman, 1993) referred to the willingness to rely on an exchange partner in whom one has confidence. If one party trusts another party that eventually engenders positive behavioral intentions towards the second party. Therefore if one party believes that the actions of the other party will bring positive outcomes to the first party, trust can be developed (Anderson and Narus, 1990). Doney and Cannon (1997) added that the concerned party also must have the ability to continue to meet its obligations towards its customers within the cost-benefits relationship; so, the customer should not only foresee the positive outcomes but also believe that these positive outcomes will continue in the future.

Relationship between service quality and trust

The quality elements of the e-service are expected to affect e-trust directly (Gronroos et al., 2000), because they represent trust cues that convey the trustworthiness of the site and the system to customers (Corritore et al., 2003). In a review of studies on online trust, Grabner-Krauter and Kalusha (2003) even interpret e-quality determinants as trust, i.e. trusting beliefs, and intentions to repurchase as trusting intentions. Furthermore, Corritore et al. (2003) call web sites objects of trust and suggest that navigational architecture and design elements have a direct effect on trust. A qualitative study by Davis et al. (2000) on e-tail brands also demonstrates the importance of e-tailer trust, with quotes such as "Think of brands I trust in terms of quality" and "if there was no trust, I couldn't allow the service to continue". Although these studies are not on e-trust, e-quality can be expected to have a positive effect also trust in the online medium. Therefore, in analogy with the arguments used to underpin the relationship between satisfaction and e-trust, we expect that the confidence customers have in online exchanges will be positively affected by the quality of their online experiences.

Mediation

Baron and Kenny's (1986) influential paper on mediation analyses stated three necessary but not sufficient conditions that must be met in order to claim that mediation is occurring (Kenny, Kashy, & Bolger, 1998; MacKinnon, Lockwood, Hoffman, West, & Sheets, 2002).

1. X is significantly related to M.
2. M is significantly related to Y.
3. The relationship of X to Y diminishes when M is in the model.

Where exogenous causal influence as X, the endogenous causal influence, or mediator, is referred to as M, and the dependent variable or outcome is referred to as Y.

Figure 1: types of mediation

source : Little et al., chapter 9 : structural equation modeling of mediation & moderation with contextual factors

Each of the three constructs must show evidence of a nonzero monotonic association with each other, and the relationship of X to Y must decrease substantially upon adding M as a predictor of Y.

Objectives

The current study has three major research questions: first, which features of e-service quality may affect customer satisfaction? Second, which features of e-service quality may affect trust? Finally, does trust affect the relationship between e-service quality features and customer satisfaction?

Hence, this study is conducted to measure three main objectives: first, the relationship between the e-service quality features and customer satisfaction. Second, the relationship between the service quality features and trust. Lastly, the mediating effect of trust in the relationship between e-service quality features and customer satisfaction that occurs in Internet banking in the context of selected Indian public sector banks.

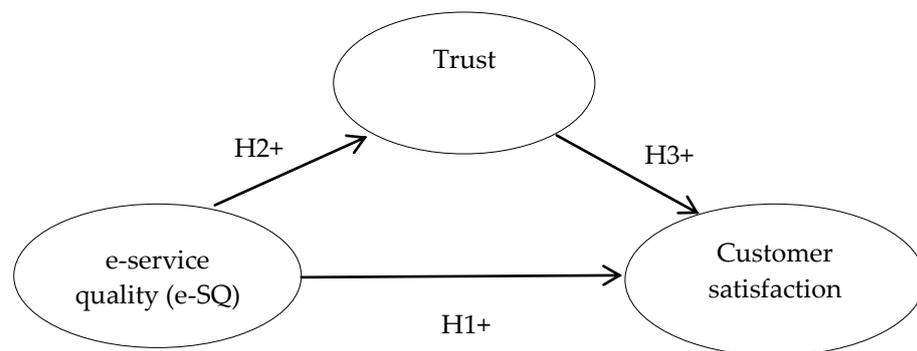

Figure 1 : Theoretical model of the study

Hence, it can be hypothesized that:

H1: e-service quality has a positive significant effect on Customer Satisfaction.

H2: e-service quality has a positive significant effect on trust.

H3: Trust has a positive effect on customer satisfaction.

METHOD

Sample

The empirical data are drawn from 367 customers of Internet banking from three selected public sector banks in India using a structured questionnaire. Data was collected from the metropolitan city of Kolkata, India. Response rate was 77%. Among the respondents 69% were male and 31% were female.

Questionnaire

Structured questionnaires comprising of five sections have been used to collect data. The questionnaire has four sections : Section A : about your expectation on Internet bank services, Section B : about the specific bank's performance on Internet bank services, Section C : about

your satisfaction by availing services offered by Internet banking, Section D: about your trust on bank's performance and Section E : background of the respondent.

Following the trend of previous researches in this field 5 points Likert scale was used to measure all of these variables. e-SQ has been measured by using 24 items. A set of 24 Q (P-E) columns were derived in the data sheet of SPSS for analysis of the gap scores between perceived service and expected service to get the service quality of Internet banking. The idea of using difference scores has been used in developing scales for measuring constructs such as role conflict (Ford, Walker, and Churchill 1975). The trust has been measured by using 4 items and customer satisfaction has been measured by using 4 items.

The values of coefficient alpha ranged from 0.772 to 0.906 and there were no suggestion that deletion of certain items from each dimension would improve the alpha values. So, no items were deleted.

Data Analysis

To assess direct and indirect relationships among the studied variables a two-step procedure was followed using confirmatory factor analysis and structural equation modeling (Anderson & Gerbing, 1988). Amos 18.0 has been used to perform these analyses. The analysis has been done according to the following steps :

- i. The basic E-S-QUAL part of E-S-QUAL A Multiple-Item Scale for Assessing Electronic Service Quality model of Parasuraman et al. (2005) was adopted with minor modification and tested to get the e-SQ construct of Internet banking for the purpose of this research.
- ii. The proposed construct of customer satisfaction and trust was tested with CFA.
- iii. In the Model 1, path from the e-SQ to customer satisfaction have been examined.
- iv. In Model_2, path from e-SQ to trust has been tested to satisfy the necessary condition 1 of mediation as proposed by Baron and Kenny's (1986)
- v. In Model_3, path from trust to customer satisfaction has been tested to satisfy the necessary condition 2 of mediation as proposed by Baron and Kenny's (1986)
- vi. In Model_4, path from e-SQ to customer satisfaction and paths from e-SQ to customer satisfaction mediated through trust have been examined.

RESULTS

The reliability statistics of the three constructs has been shown in table 1. The reliability coefficient or alphas for the different constructs were computed using the reliability procedure in SPSS (version 19.0).

Construct	Sub constructs	No. of items	Cronbach's alpha
e-SQ	System availability	4	0.772
	Efficiency 1	4	0.773
	Efficiency 2	5	0.906
	Fulfillment	4	0.814
	Privacy	7	0.880
Customer satisfaction		4	0.831
Trust		4	0.804

Table 1 : Reliability statistic of the constructs used in research

The reliabilities of all the constructs used in this study were found to be above the standard set by Nunnally (1978), which is 0.50-0.60. The results found by exploratory factor analysis on the three constructs are shown in table 2.

Factor labels	Factor loadings	Eigen values	Percent of variance

Table 2 : Factor analysis for e-SQ, customer satisfaction and trust

The data was subjected to 2nd order confirmatory factor analysis using AMOS 18 to test the model fit and unidimensionality of service quality scale item on all the constructs. Maximum likelihood technique was used. Confirmatory factor analysis involves the specification and estimation of hypothesized model of factor structure being measured by latent variables to account for covariances among a set of observed variable (Koufteros, 1999). The measurement model specifies how the latent variables are measured in terms of observed variables. The result of initial confirmatory factor analysis showed that R² values of two of the variables in efficiency1 construct and one variable of availability construct was below 0.450. These three variables were omitted from the e-SQ construct. The resulting confirmatory factor analysis showed that that the data fit the measurement model fairly well (refer table 3 & 4).

	Constructs	Indicators	Standardized coefficients	R ²
e-SQ	System availability	qav4	.697	0.486

Table 3: Confirmatory factor analysis : standardized coefficients

Fit indexes	Recommended Value	Observed Value		
		e-SQ	Trust	Customer satisfaction
Chi-square/ degrees of freedom	≤ 3.0	1.8	14.14	1.609
GFI (Goodness of fit)	≥ 0.90	.938	.975	.997
AGFI (Average Goodness of fit)	≥ 0.80	.922	.875	.984
RMR (root mean square residual)	≤ 0.05	.011	.015	
CFI (Comparative Fit Index)	≥ 0.90	.966	.958	.998
NFI(Normed Fit Index)	≥ 0.90	.931	.955	.996
RFI(Relative Fit Index)	Close to 0.90	.921	.864	.987
TLI(Tucker-Lewis Index)	Close to 0.90	.961	.873	.995
RMSEA(root mean square error of approximation)	≤ 0.05	.042	.162	.035

Table 4 : Summary statistics of model fit

As it can be seen from table 3, the R² values, which explain the relative variance of the dependent variable, are satisfactory (larger than 0.450) (Joreskog & Sorbom, 1999). So, all manifest variables are valid for further analysis through Structural Equations Modeling (SEM).

Goodness-of-fit of all the three constructs (with minor variation in the construct of trust) indicated “reasonable or good fit” or RMSEA < 0.05 . Brown and Cudeck (1993) suggested that root mean square error of approximation (RMSEA) between 0.05 and 0.08 provide reasonable error of approximation. Hair et al., (2009) suggested $0.05 < RMSEA < 0.08$ is for “good fit”. CFI (comparative fit index) for all the three constructs > 0.90 denoting a good fit. Hu and Bentler (1999) suggested that a rule of thumb for the CFI and the incremental indexes is that values greater than roughly 0.90 may indicate reasonably good fit of the researcher’s model. The GFI

was the first standardized fit index (Joreskog & Sorbom, 1999). GFI = 1.0 indicates perfect model fit. Therefore, a GFI > 0.90 demonstrates reasonable fit for all the three constructs used in this study. From the above goodness-of-fit evaluation, confirmatory factor analysis for the three constructs e-SQ, trust and customer satisfaction reasonably supported their model's fit.

Convergent validity

Convergent validity of a scale measure is used to assess whether the individual scale items are related or not (Susarala et al., 2003). It refers to the degree to which the two measures designed to measure the same construct are related (Netemeyer et al., 2003). To analyse the convergent validity the factor loadings and the average variance extracted were examined as suggested by Fornell and Larcker(1981). In this research most of the indicators have loading from 0.6 to 0.9 which is in line with Bagozzi and Yi (1988). With this the average variance extracted is more than 0.5 which is acceptable. In this research the average variance explained by each construct has been shown in table 5.

	AVE	Composite reliability
System Availability	0.498	0.748
Efficiency 1	0.493	0.660
Efficiency 2	0.665	0.908
Fulfillment	0.522	0.813
Privacy	0.513	0.880
Trust	0.506	0.803
Customer satisfaction	0.552	0.831

Table 5 : Average variance extracted and composite reliability of service quality construct

Discriminant validity

Discriminant validity provides the information about whether the scores from a measure of a construct are unique rather than contaminated by other constructs (Schwab, 2005). To assess the discriminant validity of the constructs the AVE of each construct was compared to their corresponding inter construct squared correlation as recommended by Fornell and Larcker (1981). Discriminant validity is given when the shared variance among any two constructs (i.e., the square of their intercorrelation) is less than the AVE of each construct. Table 6 shows the AVE exceeds the squared correlations with the all the factors.

Construct	Inter construct squared correlation
qav <--> qeff1	0.143
qav <--> qeff2	0.185
qav <--> qful	0.212

Construct			Inter construct squared correlation
qav	<-->	qpr	0.152
qeff1	<-->	qeff2	0.104
qeff1	<-->	qful	0.240
qeff1	<-->	qpr	0.291
qful	<-->	qeff2	0.271
qeff2	<-->	qpr	0.145
qav	<-->	trust	0.071
qeff1	<-->	trust	0.090
qeff2	<-->	trust	0.077
qful	<-->	trust	0.039
qpr	<-->	trust	0.072

Structural Equation Analysis

Table 7 shows the results of measurement models to test the hypothesis with regard to model paths. The first model, model 1 has examined the causal links of e-SQ and customer satisfaction. The second model, Model_2 checks the causal relationship between e-SQ and trust. Model_3, the third model checks the causal link between trust and customer satisfaction. Afterwards, Model_1 has been compared with another model i.e., Model_4 which has examined both the direct and mediated (indirect) causal links between e-SQ and customer satisfaction mediated by trust.

	Cmin/df	GFI	RMR	CFI	NFI	RFI	RMSEA
Model 1	1.7	.929	.013	.963	.921	.912	.040
Model_2	1.8	.928	.013	.959	.915	.905	.041
Model_3	2.4	.979	.013	.980	.967	.951	.054
Model_4	1.7	.920	.014	.959	.908	.899	.038

Table 7: Goodness of fit indices of the four models

Path Analysis

Considering the pattern of significance for the parameters estimated in Model 1, e-SQ has been found to be significantly related to customer satisfaction in the hypothesized direction.

In case of model 2, no significant relationships have been found in the identified paths among trust and customer satisfaction although some of the relationships are found to be in the hypothesized directions. However, e-SQ and trust are found to be positively and significantly related. e-SQ & trust and trust & customer satisfaction both are significantly related.

Path	Model_1		Model_2		Model_3		Model_4	
	Hypothesis	Coefficient estimate						
e-SQ → customer satisfaction	H1	.774***					H1	.761***
e-SQ → trust			H2	.529***			H2	.354***
Trust → customer satisfaction					H3	.315***	H3	.047

Note *** $P < .001$

Table 8: comparison of standardized path coefficients for models

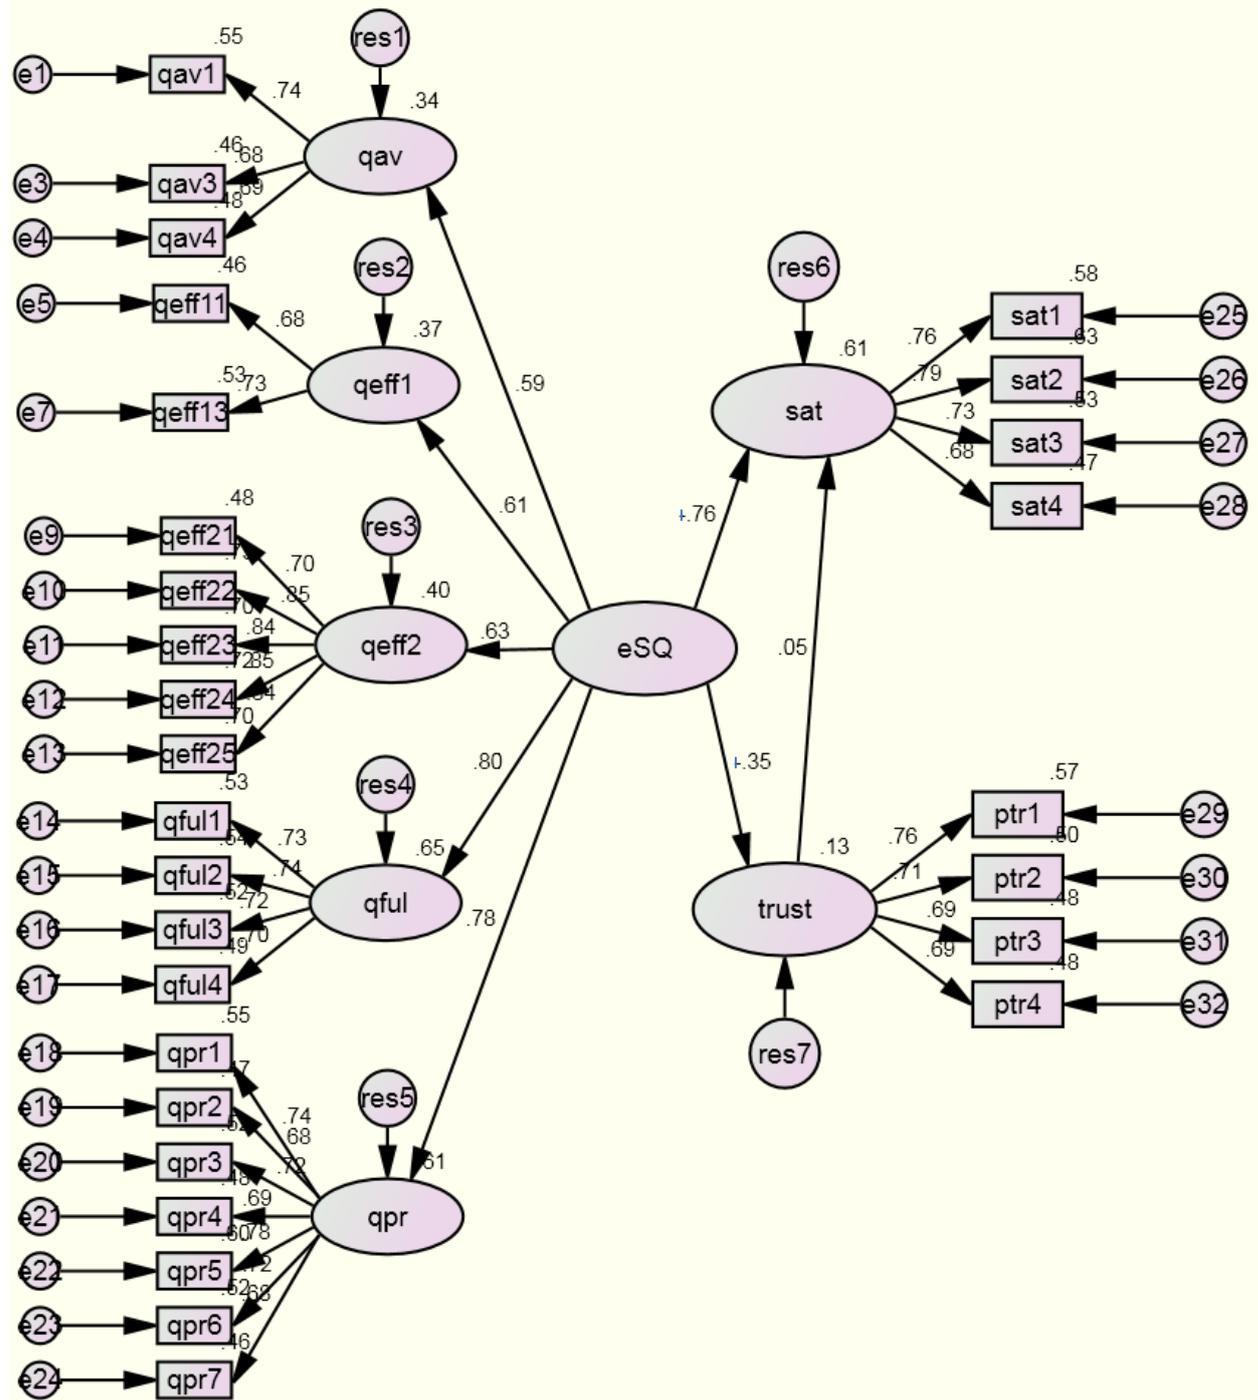

Figure 2 : The model of e-SQ influencing customer satisfaction and the mediating effect of trust

DISCUSSION

While several authors have emphasised the multidimensional nature of service quality and the relationships between customer satisfaction and customer trust, this research sought to establish the bridges between e-service quality, customer satisfaction and customer trust in the context of internet banking. Using a sample of Internet banking customers this research has tried to find the mediating effect of trust between service quality and customer satisfaction. It investigates whether the postulated causal relationships among the e-SQ and customer satisfaction vary in two measurement models for the same group of customers.

Data supported the proposed model_4, where direct paths from e-SQ to customer satisfaction and indirect paths from e-SQ to customer satisfaction as mediated through trust have been examined. The indirect path between trust and customer satisfaction has become non-significant. Therefore the model confirms that trust has no mediating effect between e-SQ and customer satisfaction. For Internet banking e-SQ is the antecedent of both customer satisfaction and trust. Hence, the management should primarily focus on e-service quality to enhance customer satisfaction and trust.

Model_3 confirms a positive significant relationship between trust and customer satisfaction, but that relation becomes insignificant as soon as a path is attached between e-SQ and customer satisfaction. This incident denies the fact that trust is a mediating variable between e-service quality and customer satisfaction. Again to accept trust as a mediator, the relationship of e-SQ to customer satisfaction must decrease substantially upon adding trust as a predictor of customer satisfaction. Comparing standardized path coefficient of H1 for Model_1 and Model_4, no such substantial change in coefficient value can be noticed.

While determining the imperatives of 'how to win customers' trust' the service provider(s) must focus on both present and future time frame. The construct of trust contains belief in the brand or company, which provides the customers an assurance of positive outcomes not only for the present but also for the future. But in the field of Internet banking this have proven to have no effect on customer satisfaction. Global Consumer Banking Survey 2012 by Ernst & Young has revealed that Customers are becoming less loyal and increasing the number of banks they use. The overall proportion of customers planning to change banks has increased from 7% to 12% since 2011. Sensitivity to fees and charges is the leading driver of attrition, cited by 50% of customers. Customers with only one bank have fallen from 41% to 31%, while those with three or more have increased from 21% to 32%.

The study has also shown customers want lower costs and better service. Improving fees and charges is the top priority, as cited by 22% of customers. Customers' second priority is to

strengthen online and mobile banking. Customers prefer online channels for simple transactions, but they also demand high-quality, personal service for more complex transactions and advice. Pricing and service quality remain critical to customer satisfaction.

The survey has revealed that In India, 72% of customers say their confidence in the banking industry has increased during the past year. 68% attribute the improvement to more personalized, innovative service from their bank.

83% of customers have two or more banking providers, although those with only one bank have grown by 5% since last year to 17%. Of customers who multi-bank, 48% do so to find the best products or services, and 47% to obtain the best rates and fees.

Therefore, the survey result by Ernst & Young 2012 also suggest that it is the service quality which is the still the main predictor of customer satisfaction in Internet banking in India.

In the e-SQ construct qful has the highest factor loadings which relates to the fulfillment of the service promises. Privacy is another major factor of e-service quality. System availability and efficiency has a relatively low weightage in determining quality of service in Internet banking.

			Estimate
qav	<---	eSQ	.554
qeff1	<---	eSQ	.615
qeff2	<---	eSQ	.570
qful	<---	eSQ	.876
qpr	<---	eSQ	.774

Table 9: Standardized Regression Weights of e-SQ

Nevertheless, the findings of this study have to be interpreted considering few limitations. First, data were collected only from selected public sector banks; so the results might not hold true for other banks providing Internet banking service. Second, data collection was limited to the customers of those banks who live in Kolkata, West Bengal India; so the findings should not be generalized for all the subscribers of the entire country. Third, the current study was a cross-sectional study but to determine the causal paths of the studied variables a longitudinal study would have been more appropriate (Poon, 2004). In addition, the influence of other major variables like price has not been taken under consideration of this study.

IMPLICATIONS

This research contributes to the progress of measuring the constructs of e-service quality (e-SQ) mainly adopted from the E-S-QUAL, satisfaction and trust. The items measuring these constructs in the Internet banking setting was tested and refined. The reliable and valid instrument confirmed in this research can be used by further studies detecting the relationships among these constructs in an extended context.

The findings also provide several managerial implications. The fundamental premise of the proposed research work model was to make banking service providers understand comprehensively the factors necessary to achieve high service quality that will significantly impact on customers' trust, satisfaction. Proper care should be taken to fulfill the service promises of Internet banking and privacy of the customers' informational data. By recognizing and analyzing these identified indicators, banking personnel will be better able to formulate and implement their strategic plans. The interpretation of the research model has the potential to help service providers better understand how customers assess the quality of service in Internet banking and how their service influence customer satisfaction and trust.

METRO CASH & CARRY UKRAINE: CHANGING HR STRATEGY IN LINE WITH BUSINESS STRATEGY

Kurdes, Natalia

Kyiv-Mohyla Business School, Ukraine, kurdes@gmail.com

ABSTRACT

This pedagogical case describes the complex interrelations between the choice of localization strategy by a German origin multinational retail corporation and the impact of this choice on local activities in every country. The concept of HRM strategy is the focus of this case. It demonstrates contemporary approaches to HRM strategy development (starting from the organization values and culture) and describes the challenges that the HR manager in a multinational corporation subsidiary can face in implementing strategic changes, as well as in changing roles from supporting business operations to business partnership relations. It also reflects the importance of understanding the HR manager's potential in this role. The case study might be particularly interesting for entry- and middle-level HR managers who could learn how the market requirements can be transformed into an appropriate HRM strategy, and how this strategy can be implemented through different HRM practices.

This case was written in Ukraine under the research framework of the SCOPES project (Swiss-Russian-Ukrainian institutional partnership 2011-2013).

Keywords: Business strategy, HRM strategy, HR business partner, people management

CASE DESCRIPTION

Changes in global strategy

METRO Cash & Carry is represented by more than 700 wholesale trade centers in 29 countries. More than 120,000 employees work for the Metro Group worldwide. The company's headquarters are in Düsseldorf (Germany). In 2011, sales revenue of the company reached about 32 million euros.

In 2011 a process of transformation started in METRO Cash & Carry. The program of changes included, first of all, vision, mission, values, strategy and culture of the company. In addition, the global management strategy was revised; as many issues as possible were given for consideration to the local management at the country representative office level. As the result, the Board of METRO Cash & Carry Ukraine retains the main responsibility and makes decisions on the company's business development in Ukraine.

Changes in business strategy in Ukraine

METRO Cash & Carry has operated in Ukraine for 10 years now, and today the chain is represented by 33 wholesale trade centers and a main office with a total workforce of 7,600.

Until 2009, the company grew mainly through a regional expansion, that is, through the opening of new trade centers. "Since 2009, this expansion has slowed down, and we are opening on average two trade centers every year. This fact, of course, reflected on the changes in the requirements for people, especially managers," said the Personnel Director of METRO Cash & Carry Ukraine Yulia Pilipenko. "This means that we moved from the expansion situation, where HR had been an administrative support for the business, to the situation in which we created HR strategy, playing the role of HR partner. This also led to the revision of our work standards".

The consequences of the global crisis were one of the reasons that prompted the company to change its strategy, by giving a vector to shift from extensive development to ensuring the growth through increased efficiency. However, this was not the only reason for the changes.

Another reason was the change in the competitive situation in each country, including Ukraine. When the company entered the market, the competition was significantly weaker, and in addition the consumers were ready to spend more money, rather than to save. But this situation has undergone major changes in the last 4 years.

The third important issue, which affected the changes in strategy, is the change in customers' needs. Business companies and private entrepreneurs are the key clients of the company. The crisis hit them heavily. Consequently, from now it is not sufficient for Metro as for their supplier just to provide high-quality products at its shelves accurately in time. The clients now expect that Metro will support them in their business development in a partner role.

METRO Cash & Carry has used a comprehensive strategic approach to the change challenge. People & Culture were highlighted as key company priorities at a global level, and special investments were assigned to develop them.

The reasons for the need to change the organizational culture

The key principle of the company's culture also has been (and remains) the fact that METRO is a big family. "Now we test the strength of our family atmosphere," says Yulia Pilipenko. "First of all, the new business strategy has challenged us with the issue of effectiveness. How well do we invest in any group of customers? Where do we need to re-focus? How much do we invest in our staff? Are our managers able to analyze the situation and make a decision? All this is again on the agenda. And it is not about how many hours you work. It's *what* you do and *how* you do it. This is the question. How do you work with suppliers? How do you work with your clients and with your colleagues? There are some things that can't be written in the job description. They all are connected to the soft competences, which, of course, are the hardest to measure, but they do significantly affect the results: the decision is wrong, time for contract is wrong, agreement's details are wrong. It all keeps adding to the result, which affects the sales.

HR issues of current importance

Facing the challenge of developing a new human resources strategy, you must understand your strengths and weaknesses in terms of HR management, to identify the current problems. The information on the findings of the Personnel Director of METRO Cash & Carry Ukraine, according to the results of her analysis of the current situation, is provided below:

1. There is the need to work towards the development of the company's image on the market both among customers and among potential employees. Such a conclusion was made with the help of the project of inviting university graduates for internship. It is called "Metro Leaders", and was started in 2011. After meeting with the students, HR professionals found that students do not know what opportunities METRO Cash & Carry might give them as an employer. Meanwhile, the company has a lot of advantages like clear rules for cooperation and compensation, good working conditions, the ability to gain international experience, the ability to grow quickly and increase your market value, the ability to have a career, etc.

2. The next problem can be formulated by a short quote. "When people are working in the Kyiv office, they feel that they have God's beard caught". Required changes directed to build an effective managing office, which would be oriented on *full assistance to the trade centers*. To emphasize this mission, the managing office was renamed the Store Support office. This change was followed by practical changes in the system of people management, together with using appropriate communication forms, aimed at achieving this mission.
3. Another focus of HR service aims to the changes in work with the talent pool. It should be said that the company has a system for the selection and development of employees with high potential. This system is aimed, first of all, at the training for the position of junior and middle management and is built on a global level.

At the same time new emphasis on effectiveness makes company management pay more attention to the staff of trade centers, improve the results of the evaluation and select and retain the most effective employees of the chain. "Some will remember that it was so good in the good old days with fixed compensations, and now it's too hard to live. But you will find a different opinion from those who are not ready to just stay in one place, who want to grow, who are ambitious, who want to be noticed, who want to be invested in, who want to build a career," the Personnel Director describes the situation. However, the company is interested in raising future representative office employees among those talented people who have been through the work in the trade center and have a deep understanding of the company business.

TASKS

1. Determine the emphases that the new business strategy and the existing situation poses for HR function of METRO Cash & Carry Ukraine.
2. Form and submit the HR strategy of METRO Cash & Carry Ukraine for the period of 2013 - 2014 in the context of its key areas and strategic initiatives.

TEACHING NOTES

Purposes of the case study

1. To study the reasons for the changes in HR strategy of the company

2. To study approaches to and methods of developing HR strategy with METRO Cash & Carry Ukraine as an example

Target audience of the case study

There could be entry- and mid-level HR managers, or non-HR middle managers that have the task of understanding the alignment of business strategy and HRM strategy in their companies.

Additional facts

Information on basic points of HR strategy of METRO Cash & Carry Ukraine and implemented strategic initiatives follows.

Introduction of performance management: This refers to people development management, based on work results for managers at all levels, as well as for non-managerial staff. The criteria for measuring employees' performance are key performance indicators (KPIs) and project goals. KPIs are divided into two groups. The first includes functional indicators that measure the quality of business processes. They are designed by a business unit which is responsible for the relevant processes. For example, the HR department develops indicators, which are then approved by the Board of Directors and which measure the results of the HR function. Other KPIs are financial performance indicators, reflecting the results of every department. These indicators are developed by financial control department. Each function has a list that contains both groups of factors, and this list is used to evaluate the performance of this function. Thus, the principle of "four eyes" is realized, which means self-control and performance control of the adjacent units for performance.

The reporting period for the result measuring is the year. The performance review is held semi-annually, and it looks like a discussion between a manager and his subordinate on interim results of KPIs and project goals. Performance management results are the basis for decision about employees' rotation and promotion.

Compensation policy: The taken course on performance evaluation is reflected in the compensation system. From wage-leveling the company switched to the principle of rewarding a contribution into the overall result. Thus, the level of earnings of employees occupying the same position will be different.

Compensation policy for the top management remains the prerogative of Düsseldorf.

Identification of talents within the company and attraction of outside talents: Potential evaluation is used to identify talents. We measure potential with several tools:

- The first is performance results. It shows whether the employee achieves his goals.
- The second is an assessment of six key competences. It shows the way an employee achieves his goals and whether his business conduct complies with corporate culture of the company or not.
- The third is development centers. For a certain level of positions, competence development centers are on a local level, i.e., held by Ukrainian HR management on their own. Exercises for development centers are developed by a consulting company which METRO works with at the global level. HR managers were taught the methods of development centers in the same company.

Starting from second level positions, managers go through competence development centers in international scope. Exercises used in learning are rather complex, and regional business leaders from different countries observe. An important element of such development centers is a cross-national, cross-cultural atmosphere, which allows evaluating the potential not only in terms of national culture and the local market, but in the global, international context. This tool allows you to compare the Ukrainian talent with talent from other countries and see what is necessary to develop for the Ukrainians to be successful in this international company.

Other important elements of talent management are meetings of top management (usually held at the end of the first quarter). They are held to discuss the best employees according to evaluation results who are suggested to be included in talent pool by their leaders. Every leader sees his candidate from a functional point of view, and colleagues provide an opportunity to see the potential reservist with cross-functional perspective. The outcome of these meetings is a list of employees who are enrolled in the reserve, and the list of potentials, in whose development company is ready to invest.

In order to attract talent from outside the company, the graduate internship program “Metro Leaders” was re-started in the company. Its aim is to select talents among universities graduates. The first 10 graduates who went through this program were employed in 2012.

Staff training and development: In 2011, METRO Cash & Carry Ukraine launched a program of mid-level manager development (SMDP). The first group has already completed their training, and in early 2013 the second group will start studying. The program was developed and conducted by teachers of INSEAD. It is aimed at developing the skills of project management, change management, the formation of the ability to work in a changing

environment and understanding of international development prospects of the retail segment. The program aims to ensure that its members will have the effect of “open eyes” and will be able to compare themselves to others, to improve cross-functional cooperation, and to understand the mechanisms of business development.

Similar programs for developing talent will also be in the future training plans.

It should be noted that the company plans to actively use not just training, but also the accumulation of relevant experience for the development of the necessary competences of employees. This means that special attention for the development of the staff will be on their involvement in the tasks of the level of complexity and the scale, which implies the need to rise above their current level of competence.

Development and changes of organizational culture: The head office offered an innovative tool to carry out the transformation processes of the corporate culture. This tool was developed by Oxford Leadership Academy. It implies that in order to change the results of the team, you should start with changing yourself (Self-awareness leadership). “This tool allows you to understand what your values are, what kind of leader you are, what you are able to do, and, finally, what do you need to change in your work in connection with the new strategy of METRO,” says Yulia Pilipenko.

All employees of Metro Cash & Carry Ukraine will study in this program in 2013.

Commercialization of the HR function: The meaning of this strategic project is that all the decisions taken in the field of HR would be based on business perspectives and on the efficiency calculation. This approach allows focusing on the implementation of solutions that are meeting business needs and are cost-effective.

**EMPIRICAL STUDY FINDINGS OF FOREIGN LANGUAGE
ADAPTATION OF THE INDIAN BUSINESS PROCESSING
AGENTS AND EFFECTIVE COMMUNICATION AT A
TRANSNATIONAL WORK PLACE**

Kyriakidou, Niki¹; Stewart, Jim²; Bobade, Anita P.³

ABSTRACT

The proposed study focuses on two important aspects of foreign language adaptation namely; the relationship between adaptation of foreign language (English) and its impact on the job effectiveness of the Indian Business Process Outsourcing agents. Also the study explores the relationship of age and adaptation of a new foreign language. The theoretical framework of the paper is based on the model suggested by Y. Kim's (1988, 2001). According to Kim (1988), Cross-cultural adaptation starts with communication, proceeds in and through communication, and is revealed in host communication competence, especially language competence.

The present study is part of a doctoral thesis, and reports its findings with respect to foreign language adaptation in a transnational workplace, the Indian Business Process Outsourcing Industry. It uses survey method and administers a structured questionnaire to more than 3000 BPO agents who have 2 years work experience. The analysis uses techniques like factor analysis and one way ANOVA to test the two hypotheses.

As regards the first hypothesis, language adaptation is important for effective communication. Thus the step to communication especially in a cross cultural environment, India scores well on this score. However a contradictory relationship is observed with respect to language adaptation and age. Thus the empirical data does not justify the hypothesis that, language adaptation is better at a younger age.

One of the policy implications of this study is that NASSCOM has funded new English language training schools to increase the supply of English speakers especially the "Queen's English".

Keywords : Business Process Outsourcing (BPO) agent , Language Adaptation, Effective Call.

INTRODUCTION AND BACKGROUND OF THE STUDY

Acculturation is not a new area of study, scholars have studied and researched since the 1930s. (Herkovits et al; 1936) Although, communication, as an important construct of the study of acculturation is a new phenomenon, it has been a crucial point of acculturation research. (Gordon, 1964; Kim, 1988, 2001). Kim has contributed extensive research toward defining acculturation from a communication perspective. Kim has also emphasized the link between host country communication competence and adaptation of the sojourner. Kim (2001) emphasizes a stress-adaptation-growth dynamic model that features the cyclic tension of constantly moving forward and drawing back in adaptation growth. Her model features the concepts of deculturation, acculturation, and assimilation. She believed that assimilation in the host culture was the only path for the sojourner. Further, according to Kim (2003), knowledge of the host communication system is primarily knowledge of the language, but this includes not just linguistic knowledge of vocabulary, syntax and phonetics; but also knowledge of social codes and the way language is used in formal and informal settings. This study uses Kim's model (2001) as the Indian Business Process Outsourcing (BPO) agent is a unique case of adaptation, where he/she would be living in their home country, yet interacting with the host country's clients during their working hours, throughout the globe. Hence they need to be sensitive to cross cultural adaptation.

The proposed study focuses on two important aspects of foreign language adaptation.

1. Relationship between adaptation of foreign language (English) and its impact on the job effectiveness of the Indian Business Process Outsourcing agents.
2. Relationship of age and adaptation of a new foreign language.

LITERATURE REVIEW ON FOREIGN LANGUAGE ADAPTATION AND ITS IMPACT ON JOB EFFECTIVENESS OF THE INDIAN BUSINESS PROCESS OUTSOURCING AGENT

Rapid developments in the Indian Economy post liberalization in 1991 have prompted Institutions like the World Bank to forecast that India would be the 4th largest Economy in the World by 2020(Budhwar, 2009). This has attracted a large numbers of foreign investors and companies to, India, after globalization. According to Budhwar and Sparrow (2002a), the trend of internationalization of business, globalization have all resulted in the growth of new markets and increased competition amongst firms at both national and international level. As such, in the present globalized era, the value of employees with cross-cultural skills and diverse demographic characteristics has increased. In order to maximize cross-cultural capabilities, language adaptation plays a pivotal role. Thus cross-cultural successes and failures depend on the communication processes in which the participants engage. Though not, much empirical evidence is available on the impact of cross-cultural literacy on the cost of doing business in foreign markets, it is fair to assume that cross-cultural literacy reduces the total costs of operating in foreign markets. (Arora, 1980).

The present study is focused on language adaptation as one of the aspects of cross cultural adaptation of the BPO Agents of India. Pal and Buzanell (2008) comment that, Business Process Outsourcing are unique workplaces as they work for multiple geographical spaces and different time zones. According to Pal and Buzanell (2008), a BPO agent works in transnational work place in a 24*7* 365schedule. A BPO agent,in India, has an anglicized names and feigned western accents, and handles credit card problems and troubleshooting computers, collect debts and conduct customer satisfaction surveys. Pal and Buzanell (2008) further comment that, Indian call center work involves employees' providing voice-to-voice service to clients dialing toll-free numbers primarily in North America, UK and Europe.

The Indian BPO Agent has to learn the American or the European accent, as the client demands, work at night to cater to U.S./ Europe time zones, and adjust to an altered social and family life. The Indian BPO Agent is expected to be conversant with day-to-day American and European issues to the extent that they are able to carry on casual conversations with clients (Mirchandani, 2004; Shome, 2006). Further according to Balatchandirane, (2004), the foreign communication system indicator concerns the ability of BPO agent to identify properly and realize messages from the foreign client environment in different situations of interactions. This vocal and non- vocal communication cannot be fully understood as the non

verbal aspect of the communication is missing. This aspect of BPO communication with their clients is a challenging task.(Balatchandirane, 2004). The study thus empirical tests the relationship between foreign language adaptation (English) of the Indian BPO agent and their success at the workplace.

As regards India, it is a multicultural society, which has cultural diversity and influences of many regions/ cultural background and hence Indians are very good at adapting least two to three regional languages during their formative years of education. (Kohli, 1990). Linguistically India is a diverse country and it is home of some hundred languages and dialects and, , eighteen languages have been “officially” recognised and placed under the Eighth Schedule of the Indian Constitution. (Pandharipande, 2002).

REVIEW ON FOREIGN (SECOND) LANGUAGE ADAPTATION

From the literature review on the subject of second language adaptation , there are many theories which are debatable. Badea (2001) cites, that there is a difference between second language acquisition and second language learning. According to Stephen Krashen, “Second language acquisition is the process by which children unconsciously acquire their native language, while learning stands for the “conscious knowledge of a second language, knowing the rules, being aware of them and being able to talk about them” (Krashen, 1982.page 69). Also, Vygotsky (1987) held that second language acquisition, is mediated by the learner’s first language and that to learn a second language at school and to develop one’s first language or mother tongue, involve two entirely different processes.

Vygotsky (1987) further states, that in learning a new language, one does not return to the immediate world of objects and does not repeat past linguistic developments, but uses instead the native language as a mediator between the world of objects and the new language. Vygotsky (1987) also argue, that, the conscious and intentional learning of a second language is dependent on a certain level of development in the native language; the process of learning a foreign language clears the path for the acquisition of higher forms of the native language; and learning a foreign language allows the child to understand his native language as a single instantiation of a linguistic system, as a result of which the child acquires a potential for generalizing the phenomena of his native language and for gaining conscious awareness of his speech operations and mastering them.

Moreover, Pecenek (2010), state, that there are many factors which impact the child's second language acquisition, which includes, age and, as a consequence, cognitive development, length and quality of the exposure time period, to the second language and the culture; attitude of the parents and linguistic- cultural environment .A theory developed by Krashen (1982), states, that in second language learning the principles of the UG (Universal Grammar) count only during the critical period, after which other learning mechanisms, not specific to first language acquisition, operate in the process of second language learning. Badea (2001), suggest, that, children acquire their native language without explicit learning, while for second language is usually learnt, though it may also be acquired or 'picked up' depending on the environmental setting and the input received by then second language learner.

Badea (2001), claims, that, initially, children use an internal linguistic guide towards any possible external linguistic information in the form of an inner template called Universal Grammar that "comprises all universal linguistic principles that pertain to all grammars and the way in which these are related" (Chomsky 1986: 56). Universal Grammar is also said to form the basis of all specific grammars of all possible human languages. There is a relationship of age, to second language acquisition. Age as an affective factor brings about different performance stages in second as well as first language learning. Traditionally, research in Critical Period Hypothesis and other variables has derived two major aspects of language learning--the younger, the better and the older, the better. Earlier, Studies (Snow and Hoefnagel-Hohle, 1982), have shown that adolescents and adults are in many ways better at learning a new language than children, except in the area of pronunciation. This is probably because, they are already literate in their first language and can use some of their knowledge about language and language learning when learning the second language. However, this doesn't answer the important question: What's the best age to learn a new language? This question, like most about language learning, cannot be answered so simply. It depends on the situation. In the paper titled , Critical period for language acquisition the authors (Snow and Hoefnagel-Hohle, 1982, pp 22) state that " For example, a child who is born to an American father and German mother living in the USA can start to learn both German and English from the moment he is born." This is probably the most favorable situation for anyone who wishes to speak two languages fluently as an adult. A child of school age who immigrates to the USA has no choice, and must start to learn the new language, English, as soon as he/ she arrives.

The words second language adaptation happens only after it is consciously learnt. In this paper, thus second or foreign language (English) has to be learnt and then after some practice would be adapted.

As per the educational policy of Indian states, most of the Indian at primary and secondary school study three languages of which one is the regional language (may or may not be their mother tongue), Hindi – the national language and English. (NASSCOM McKinsey Report, 2005). As language is the first step to effective communication especially in a cross cultural environment, India scores well on this score. As per the NASSCOM McKinsey Report (2005), India's English speaking manpower rates high in qualifications, capabilities, quality of work and work ethic. According to the norms of the BPO Industry in India, IELTS or equivalent score of 7.0 is an entry level qualification for a BPO Agent in India. (Merritrac Report, Oct 2007). Thus Indians are better adapting at learning more than one language in their formative years.

RESEARCH METHODOLOGY

Kraemer (1991) identified three distinguishing characteristics of survey research. First, survey research is used to quantitatively describe specific aspects of a given population. These aspects often involve examining the relationships among variables. Second, the data required for survey research are collected from people and are, therefore, subjective. Finally, survey research uses a selected portion of the population from which the findings can later be generalized back to the population. The present study, uses a positivist philosophy and survey as a tool for examining the relationship between acquisition of foreign language adaptation and effectiveness at work place. This survey is a part of doctoral thesis, for which, the respondents were Indian BPO Agents, who had at least 2 years of work experience in the industry. Before launching a pilot survey, observations of the BPO firms visited were documented. One of these aspects was of training given to the newly recruited BPO agent, whose training included neutral voice training, English grammar and other soft skills training, computer assisted language learning (CALL). The foreign language adaptation questions of the structured questionnaire were aimed at identifying the communication competence of the BPO agent. It would also assess the BPO agent's ability to identify properly and realize messages from the foreign client environment in different situations of interaction. (Balatchandirane, 2004).

The structured questionnaire which was administered to the BPO agents in India, was initially pilot studied, questionnaire redrafted which was suggested by the HR executives of the Indian BPO firms and when internal and statistically validated and vetted by the supervisory team at Leeds Metropolitan University, the data collection work was undertaken. The questionnaire covered four aspects of cross cultural adaptation, namely – language adaptation, cultural adaptation, life style adaptation and value adaptation of the Indian BPO agents. In this paper, the empirical findings of foreign language (English) adaptation are presented.

A Total number of 3041 BPO agents answered the structured questionnaire which was administered to them , during their coffee breaks. This survey was quite voluminous and was carried out from November 2009 to May 2010. The sampling technique used was convenience sampling. The present study empirically tested two hypotheses with respect to language adaptation of the BPO Agents in India.

The two hypotheses for language adaptation of the Indian BPO agent are :

(H₀): *Language adaptation is not an important factor for effective communication with the host country's clients for a BPO Agent.*

(H₀) : *There is no significant difference in Language Adaptation and Age.*

Thus in the present study the first hypothesis is about establishing or negating a relationship between English, a foreign language and its adaptation, as a tool for effective communication at the transnational workplace. The second hypothesis is about the relationship between age of the BPO agent and foreign language adaptation. The entry level qualification for a BPO Agent is class 12th pass which is equivalent to Grade X. Also the entry level qualification is passing a test of English similar to IELTS where the minimum acceptable score is 7.0 (Merit Trac Report, 2007) .

STATISTICAL ANALYSIS : RESULTS AND INTERPRETATION

	Frequency	Percent	Valid Percent	Cumulative Percent
1 Low Adaptation	954	31.3	31.3	31.3
2 Good Adaptation	1346	44.2	44.2	75.5
3 High Adaptation	747	24.5	24.5	100.0
Total	3047	100.0	100.0	

Language Adaptation of the BPO Agents – Frequency Table

From the above frequency distribution table, the study concludes, that the language adaptation of the BPO Agents to English as a foreign language is good. From the literature on second language acquisition, it is observed, that, for successful entry and continuous growth in a foreign market, effective communication with the unfamiliar business partner and adaptation to his culture is important. Globalization requires cross-cultural literacy, and successful management of diversity. (Ang, 2008).

TESTING OF HYPOTHESIS I, THROUGH FACTOR ANALYSIS.

	N	Minimum	Maximum	Mean	Std. Deviation
q12	3096	1	2	1.71	.453
q18n	3096	1	5	3.71	1.372
q18o	3097	1	5	2.77	1.388
Valid N (list wise)	3054				

Descriptive Statistics Table

Question no 12, was asked so as to know the medium of instruction in school, since the entry level qualification for a BPO agent is class XII th pass, in English medium the survey wanted to reiterate this general observation. Also, Q18 n, was, do you believe that language proficiency is important for effective communication at work place? The maximum response was very often. This is because while working in a BPO firm, the agents have a perception that communication would be possible only when they are able to have a command over this

foreign language. They spend more than 9 hours on the phone talking to, convincing and solving problems of the callers from across the globe; hence they believe that only when they are able to speak and understand English they would be effective at their workplace. As regards, Q18 o, was, do you speak English at home and with friends while communicating? The maximum response was often, thus the urban Indian BPO agent speaks English at home and with their friends while communicating, this also helps him/her to be at ease with a foreign language.

	Component
	1
Q12	.355
Q18n	.654
Q18o	.731

Component Matrix

Extraction Method: Principal Component Analysis. a 1 components extracted.

The Component Matrix gives a table which contains component loadings, which are the correlations between the variable and the component. Because these are correlations, possible values range from -1 to +1. According to this table, the Principal Component I is loaded with Questions 18 o, 18 n and 12, and all are positively correlated. Thus the 2 most important questions which were important from language adaptation from the survey were :

Question 18 (n) Do you believe language proficiency is important for effective communication? There is a positive relationship between effective communication and English language proficiency. The Indian BPO Agents believe that communication would be possible when they have proficiency in English and be effective in a transnational workplace. Question 18 (o) Speak the language that is taught for business purpose with family and /or with close Friends? There is also a positive relationship between speaking the foreign language English with family and friends. This would further strengthen the language adaptation and they would be more comfortable while interacting with the host country's clients/customers. Also the empirical data analysis, supports, the hypothesis, that, language adaptation is an important factor for effective communication with the host country's clients.

Thus the null hypothesis, (**H₀**): *Language adaptation is not an important factor for effective communication with the host country's clients for a BPO Agent*, is rejected.

Testing of Hypothesis II by using ANOVA

ANOVA

		25-30	.294*	.100	.010	.06	.53
*. The mean difference is significant at the 0.05 level.							

POST HOC TEST FOR LANGUAGE ADAPTATION

INTERPRETATION OF THE RESULTS

The last column (Sig) is P-value. Since P is <0.05 for both the variables (n and o) there is a significant association between age and n as well as o.

Also the Post Hoc Test Table compares significance of difference between each pair of age groups. Since P (see Sig) is <0.05 for the pairs (18-24 and > 30) and (25-30 and > 30) the mean of these variables are significant in these two pairs of age groups. There is no significance of difference between ages 18-24 and 25-30 in 'n' as well as 'o'. There is a significant difference for Language Adaptation for Age \geq 30 years. Thus the empirical observation, suggests that, Language Adaptation of English is higher at the Age group \geq 30 years. Thus there is a significant difference between language adaptation and age. At a higher Age \geq 30 years, the language adaptation is better. From, the empirical data analysis, it is evident, at a higher age, foreign language adaptation is better. Most of the literature on second language acquisition, supports learning second language at an early age.

DISCUSSION

Thus the empirical data does not justify the hypothesis that, language adaptation is better at a younger age. While studying the effect of age on foreign language acquisition, one contradictory relationship which was observed in the present study, was that the language adaptation and proficiency was better at a higher age. Most of the literature review; the support is for learning second language at an early age. This can be traced to the development of English as a language. Before Independence and till liberalisation of the Indian economy, students studied English either as a first language or second language at school and were taught the "Queen's English". Their grammar, pronunciations, vocabulary and style all were

confirming to Standard English. Before 1990's the students in schools, studied "Queen's English" or Standard English. Further, the role of English within the complex multilingual society of India is far from straightforward: it is used across the country, by speakers with various degrees of proficiency; the grammar and phraseology may mimic that of the speaker's first language. After liberalization in 1990's though the students studied English language at school, and wrote formal English, they spoke in hinglish – which was assimilation of English and hindi (national This aspect is due to the prevalence of a new language in India called hinglish, which uses national language – hindi and English together. A mix of Hindi (the official national language of India) and English (an associate official language of India) that is spoken by upwards of 350 million people in urban areas of India, since 1990's or after liberalization. Hinglish uses English sounding phrases which can be spoken and understood by an average illiterate person in India. For instance, Pepsi's slogan 'Yeh Dil Maange More!' (The heart wants more!), a Hinglish version of its international "Ask for more!" campaign." This observation is evident from the study, where the more senior BPO Agents, whose age was above 30, had proficiency in English as a foreign language and had greater adaptation than the younger BPO Agents. This also reiterates, the findings of Merit Trac Report, 2007 where the new BPO agents had a average IELTS score of 7.0 and 7.5 where as it was equivalent to 8.0 for older BPO agents. (Merit Trac Repor, 2007).

Thus we reject the second hypothesis that , there is no significant difference in language adaptation and age and conclude that there is a positive relationship between age and language adaptation. Thus in India, foreign language adaptation betters with age.

As regards the first hypothesis, Language adaptation is important for effective communication. Thus the step to communication especially in a cross cultural environment, India scores well on this score. As per the NASSCOM Mckinsey report (2005), India's English speaking manpower rates high in qualifications, capabilities, quality of work and work ethic. This places India ahead of competitors such as Singapore, Hong Kong, China, the Philippines, Mexico, Ireland, Australia and Holland, among others, each year; India graduates 220,000 software and computer science engineers. Bangalore, which is known as the Silicon Valley of India, produces 25,000 alone--almost as many as the entire U.S.A. Like the immigrants, the BPO Agents operating from India need to learn the communication patterns of the host environment,(acculturation), while some communication patterns acquired from their original culture have to be deleted "(deculturation). This process takes place by trial-and-error, where the BPO Agents gradually transform their personal communication patterns and achieves an increasing level of foreign country's communication competence.

CONCLUSION AND RECOMMENDATIONS

India's graduates were 3.7 million, in 2010; of these, the Indian BPO Industry provides employment to 30% of the urban young Indian between the age group 18 – 25 years. (NASSCOM 2010). NASSCOM has introduced a national assessment tool to help identify new talent for the ITeS industry, and its creation of a National Skills Registry. NASSCOM funded a new English language training schools to increase the supply of English speakers (Sengupta 2006). One of the implications of this study for policy makers for Indian BPO Industry is to recommend NASSCOM to establish recognized training institutes, on lines of IELTS training centers and re-introduce "Queen's English" especially for the BPO agents.

As regards the limitations of the survey, it is limited to visits in the city of Mumbai (Bombay) where the researcher is currently residing and does not cover other cities of India and the analysis should be limited to the city of Mumbai (Bombay). As Mumbai (Bombay) is a financial capital of India, it is a "global city" and as such the culture, the lifestyles and values of these residents are different as compared to tier II and tier III towns on India. To make it more representative the study could have included some tier II and III towns which have many BPO firms.

SUGGESTION FOR FUTURE RESEARCH

From a select group of BPO Agents, to whom accent neutralization training is given, a longitudinal study could be administered after three years to identify any patterns in the BPO Agent's foreign language adaptation through time.

MARKETING AND ORGANIZATIONAL LEARNING – EXPLORING THE CONNECTIONS

Lagrosen, Stefan

School of Business and Economics, Linnaeus University, Sweden,
stefan.lagrosen@lnu.se

ABSTRACT

In marketing theory, the traditional transaction perspective has gradually been replaced by an interest in relationships as highlighted in the development of relationship marketing and the service dominant logic of marketing. While transaction marketing focuses on an objective level of marketing, relationship marketing focuses on the process between the object and the subject in terms of their relationship. However, the perspective of the subject, the marketers themselves, has long been absent. Development of the marketers as subjects should constitute a learning process in the marketing organization. Learning processes in organizations are studied in the field of organizational learning.

The purpose of this paper is to explore the connections between marketing and organizational learning. The paper is conceptual and based on a literature review of theories of marketing history and development as well as organizational learning. It is found that there are important connections between the two fields and a tentative model combining them is proposed.

Keywords: Marketing, organizational learning, marketing history, marketing theory, relationship marketing, service dominant logic of marketing, self-actualization marketing

INTRODUCTION AND PURPOSE

Marketing theory started to emerge around the turn of the last century (Bartels, 1976). During the first half of the century a number of different marketing schools emerged (Sheth et al., 1988). One common factor in these early schools were that they focused on transactions between supplier and customer. In the latter part of the century, theories following a different

strand of marketing thought began to appear. It started with services marketing and industrial marketing in the 1970s and 1980s (Parasuraman et al. 1984, Ford et al.), followed by relationship marketing in the 1990s (Gummesson, 1999) and later in the early years of this century by the service dominant logic of marketing, SDL (Vargo &Lusch, 2004). One common feature of these new theories were that they were relational to their nature and focused on the relationships between supplier and customers as well as with other parties in, above or below the market (Lagrosen & Svensson, 2006). Svensson & Lagrosen (2009) argue that these groups of theories can be seen as existing on different conceptual levels regarding marketing which involves three entities: the subject (the marketer her-/himself), the process (the marketing process) and the object (the market). According to Svensson & Lagrosen, the early transactional theories focus on the objective level, the market while the later relational theories focus on the process level. However, they claim that the third level, the subject, the marketers themselves, have received insufficient attention. They have coined the term self-actualization marketing for this level and they suggest that the development of this level constitutes a learning process for the marketers. As such it should be connected to the related field of organizational learning in which profound learning in organizations is studied (Argyris, 1993). The purpose of this paper is to explore the connections between marketing and organizational learning. This connection has been studied by other scholars (e.g. Morgan, 2004) but never in the light of the levels of marketing proposed by Svensson & Lagrosen (2009). The rest of this paper will be structured as follows. First a very short overview of the history of marketing is presented followed by the model of marketing on three levels of profundity. Then, organizational learning is introduced and after that, its connections to the levels of marketing are explored. On this basis, a model depicting the connections is proposed and finally conclusions round of the paper.

A BRIEF HISTORY OF MARKETING THOUGHT

The early marketing theories had their roots in the subject of economics. The main difference was that the early marketing thought was more empirical, practical and descriptive. Only in the 1930s did marketing thought attain a more scientific level (Bartels, 1976). The focus of these early theories was restricted to marketing of physical goods (Engwall, 1992).

In education, courses in 'distributive industries' were created in 1902 and although they did not use the term marketing, they included many of the aspects that later came to be incorporated in the marketing field (Bartels, 1976). In 1905, the University of Pennsylvania

offered a course on 'the marketing of products' which is the first known example of marketing being included in a course title. The first comprehensive textbook in the subject was published in 1910 (Bartels, 1976).

The further development of the marketing discipline came to take place in the form of a number of different schools which originally were economic and non-interactive in their scope but later evolved into non-economic and/or interactive territory (Sheth et al., 1988). They focused on transactions and classifications of products seen from different perspectives (e.g. Copeland, 1923; Rhoades, 1927).

Later in the century, one school, the managerial school, came to dominate marketing thought (Sheth et al., 1988). This school was successful in co-opting fragments from other theories and structuring them into a practical framework for marketing management. As it focused on consumer products, marketing in general mainly became concerned with consumer markets (Engwall, 1992).

In the latter part of the century novel theories appeared which challenged the previous transaction-based marketing dominance. The first, which had been looking at marketing in industrial markets, and the second which had discovered the importance of services, both started investigating the peculiarities of their fields. One aspect that is common to these two lines of development is the significance of relationships. This has led to the emergence of theories regarding relationship marketing. Their proponents claim that they constitute a new paradigm of marketing utterly different from previous marketing theories, and incompatible with traditional marketing theory (Gummesson, 1999; O'Malley and Tynan, 2000).

Unlike many of the previous areas of marketing that almost completely developed in the U.S., service marketing is international marketing field. Grönroos (1990) argues that the original three schools of services marketing appeared in the form of one American, one French and one Scandinavian strand. At the beginning of service marketing, much time was devoted to explain and justify the differences between the marketing of services and products as the very legitimacy of the field was questioned (Brown et al., 1994). Initially, the characteristics of services as intangible, heterogeneous, inseparable and perishable crystallized as the most important factors (Gummesson, 1991). As the field of marketing has matured, this former relative consensus becomes more and more challenged by authors who claim that other factors such as the transfer of ownership is the real dividing factor (Lovelock and Gummesson, 2004).

Industrial marketing has always received less attention than consumer marketing, perhaps because it was considered less prestigious (Egan, 2001). In addition, it was considered rather straightforward. Research, in particular by the IMP group, highlighted the intricacies of marketing and has become an area of active research (Ford et al. 1998).

The interaction approach implies that customers and suppliers are considered active partners who seek, select, develop, manage and evaluate their relationship. This means that handling relationships is companies' main task (Ford et al., 1998). This approach also shows the importance of business relationships in the broader context of business networks. In a network the role and form of marketing has become ambiguous as all interactions have implications for marketing (Grönroos, 1994). In addition, these interactions take place at different levels and with so many people involved that they cannot be controlled in detail by senior management (Gummesson, 1999). In the network the "focal company" is studied in the context of its relations with, for example, customers, suppliers, distributors, competitors, co-operators (Ford et al., 1998).

Relationship marketing has been developed, particularly in the context of services marketing and industrial marketing. In addition, it has been influenced by traditional marketing and total quality management (Gummesson, 1999). In its early stages, relationship marketing has been seen as exclusively concerning services and business to business, but more recently it has made its entry into the consumer marketing (O'Malley and Tynan, 2000).

According to Brown et al. (1994), the advent of relationship marketing has led to a definite shift away from traditional marketing approaches. It came largely as a response to problems encountered in traditional marketing (Egan, 2001). As such, it has come to alleviate some of the recent criticisms against marketing (Schipper, 2002).

Since trust is an important part of any relationship, it has become an important concept in relationship marketing theory. Trust has the ability to reduce the risk (Selnes, 1998). Trust also means that business partners dare cooperate more closely, think more long term and become less sensitive to risk in the fear of opportunistic behavior by business partner decreases (Morgan and Hunt, 1994). Trust is also related to knowledge (Politis, 2003). The more knowledge the parties have about each other the easier it is to establish trust.

Recently, a strand of thought called the service dominant logic of marketing, SDL, has begun to challenge traditional marketing theories. The argument goes that this is not only a way of marketing services but a new way of regarding all marketing based on the value provided to

customers (Lusch and Vargo, 2006). Proponents of the service dominated logic argue that this is a completely new paradigm in marketing thinking that will replace the traditional goods dominant logic in the same way as the traditional physics has been revolutionized by the development of quantum physics (Vargo & Lusch, 2004). As SDL is relational, it can be seen as the logical continuation of relationship marketing.

LEVELS OF MARKETING KNOWLEDGE

In every activity there must be a subject, an object and a process connecting them. Thus, Svensson and Lagrosen (2009) argue that the traditional, transactional marketing theories are mainly connected to the object, the market, while the relational theories are concerned with the marketing process. Moreover, they claim that the third level, the subject, i.e. the marketers themselves are not treated in marketing literature and they propose a new strand of marketing thought, self-actualization marketing. They propose that developing this field should be connected to learning. Finally, they also depict the above marketing theories as existing on different levels where the objective level is most expressed and gross while the subjective is most subtle and profound.

Figure 1. illustrates this discussion of viewing marketing knowledge as one divided into three levels. The implications are relevant for the debate between traditional transaction-based marketing and relationship marketing. Svensson and Lagrosen (2009) contend that these approaches are not contradictory, but complementary. The question is not whether marketers and companies should pursue transaction marketing or relationship marketing. Successful marketers and companies need to do both. The merit of the theories in relationship marketing is that they open up a different level of understanding of marketing knowledge.

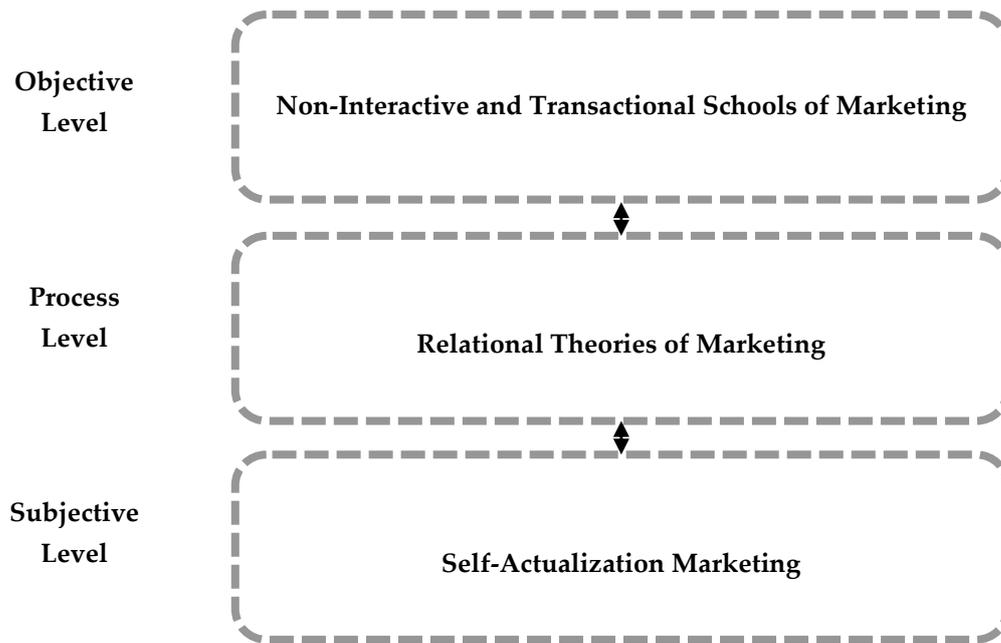

Figure 1: Levels of Marketing Knowledge (Svensson and Lagrosen, 2009)

ORGANIZATIONAL LEARNING

Organizational learning is a theory that has been created in order to encourage more long-term success in organizations. It can thus be seen as a counterweight to the short-term thinking which unfortunately dominate today's business world. An important part of organizational learning is learning of leaders. This is related to their emotional intelligence (Goleman et al., 2002; Grewal and Salovey, 2005). The emotional intelligence concerns the extent of your own emotions you have access to and how to relate to others on an emotional level. It has been shown that leaders can learn more efficiently and smoothly if they have a high emotional self-awareness, which is a dimension of emotional intelligence (Goleman et al., 2002).

In a somewhat similar way that Svensson & Lagrosen (2009) propose levels of marketing thought some scholars describe levels of organizational learning (Senge et al., 2005). The deeper levels of learning means that a greater understanding of a greater whole is achieved. If a genuine and profound learning is created in an organization, it will affect its fundamental values (Argyris, 1993; Argyris and Schön, 1996). This kind of profound learning is called *double-loop learning*. In contrast, *single-loop learning* merely leads to more superficial changes in behaviours and working practices, which means that it is less sustainable.

A learning organization is characterized by employees learning together in order to produce the results that they have a genuine desire for. Thus, new and more expansive patterns of thinking are created (Senge, 2006). For the organization to be able to absorb these new thought patterns it must, however, be permeated by trust (Senge et al., 2005). Often, attempts are made to change organizations through changes in the organizational structure, operation, technology, communications, etc. These changes can only be effective if they are related to changes in thinking and values among employees (Schneider et al., 1996).

Many researchers also argue that an organization is not an objective phenomenon. Instead, the organizations are social structures created by those who participate in them and regard them (Weick, 1979). From this perspective, organizational learning becomes even more important. It then becomes a means to create organizations. The actual organization and development of organizations is by learning. Learning requires trust. Lack of trust has been shown to inhibit in-depth learning (Argyris, 1993). It has also been shown that relationships that are characterized by trust in an organization means that the learning that takes place will be easier to practical use (Goleman et al., 2002).

The relationships in an organization are also affected largely by organizational culture (Bruhn, 2003). This in turn is related to national culture (Hofstede, 1997). Senge (2006) has formulated five disciplines of organizational learning:

1. Personal mastery. There are two aspects: First, constantly clarify what is important. Often we spend so much time manipulating the daily problems that our deeper purpose in life becomes obscured. Therefore, we must approach our lives as creative work directed toward higher ideals. Second, view reality more clearly. Many companies and individuals are living in a self-made web of illusions. Breaking out of this trap is a process of learning.
2. Mental models. Our behaviour is often unconsciously guided by deeply held internal images of the world around us. These images have a tendency to limit our thoughts and actions in areas that are familiar. Therefore clarifying these assumptions is a first step toward change. To achieve this, we need to slow down our thought processes; so that we can become aware of the mental models they are based.
3. Shared vision. A shared vision is a vision that people throughout the organization carry. With impressive power, it can be seen as a force in people's hearts. Archetypes, generic families of problems, focusing on which leads to more holistic changes than

focusing on specific problems can be used in this process (Gillies and Maliapen, 2008).

4. Team Learning. If the energies of the members of a team are aligned so that they work in the same direction, the result is extremely powerful. Usually, the individual members have different ambitions and priorities leading to a waste of energy. Adjusting the team requires dialogue and deep listening between members. It is a skill that can be developed through reflective practice.
5. Systems thinking. This is the discipline that carries the main argument according to Senge (2006). It is the discipline that integrates and provides the basis for the other four. This means that organizations should be regarded as open systems where all components interact with each other and with the environment. Consequently, systems thinking is the main basis for organizational learning. There is some interdependence between the five disciplines, and they must be seen as a system of interconnected relationships with links to external organizations (Bui and Baruch, 2010). Yet systems thinking is not a new feature in organization theory. It goes back at least to the original theories on a general systems theory of von Bertalanffy (1950). The benefits of Senge is that he has established systems thinking in terms of organizational learning, which should be particularly useful for the study of organizational change. The systems view can be used to identify system archetypes, generic families of problems, focusing on which leads to more holistic changes than focusing on specific problems (Gillies and Maliapen, 2008).

One thing that is often forgotten about knowledge is that much of it consists of so-called tacit knowledge (Polanyi, 1967). This is knowledge that exists among employees and that they do not normally express in words, and that may not even be expressed in words. Nonaka & Takeuchi (1995) have created a model for handling the transfer of knowledge between tacit and explicit forms. Four processes are included:

- Socialization refers to the transfer of tacit knowledge between people. This is largely related to the organizational culture and group processes. It is a process that involves a sharing of experiences and thereby creating tacit knowledge which may consist of common mental models or various practical skills.
- Externalisation is making tacit knowledge explicit. For this purpose, metaphors, analogies and models are useful. Often, even images are used, as tacit knowledge is usually difficult to express in words.

- Combination is the process which transmits explicit knowledge from one form to another. Typically, these are used for transforming various concepts into a more comprehensive system of knowledge. Within this framework traditional education also falls.
- Transferring explicit knowledge to tacit knowledge is called internalization. This is linked to organizational learning and "learning by doing".

COMBINING MARKETING AND ORGANIZATIONAL LEARNING

Several researchers have tried to connect marketing theory with organizational learning and market-based organizational learning has become a concept, particularly in relation to market orientation (Morgan, 2004), It has been shown that organizational learning can be an aide in the gathering of marketing intelligence needed for excellent customer service (Lee, 2004). Furthermore, organizational learning can be a useful tool when trying to make sense of vast data materials in database marketing (Bell de Tienne and Thompson, 1996).

On the other hand, outsourcing marketing functions may lead to impaired organizational learning regarding marketing aspects (Park et al., 2011) as organizational learning may be a way of connecting marketing with quality management (Bond III and Fink, 2003)

as well as increasing the speed of new product development (Menon and Lukas, 2004).

Although many efforts have been made to combine marketing and organizational learning, none has utilized the model of different levels proposed by Svensson and Lagrosen (2009). Nevertheless, as this model also addresses more profound levels of organizational thought, it ought to be particularly useful in this context. Our efforts to combine them has resulted in the model in Figure 2.

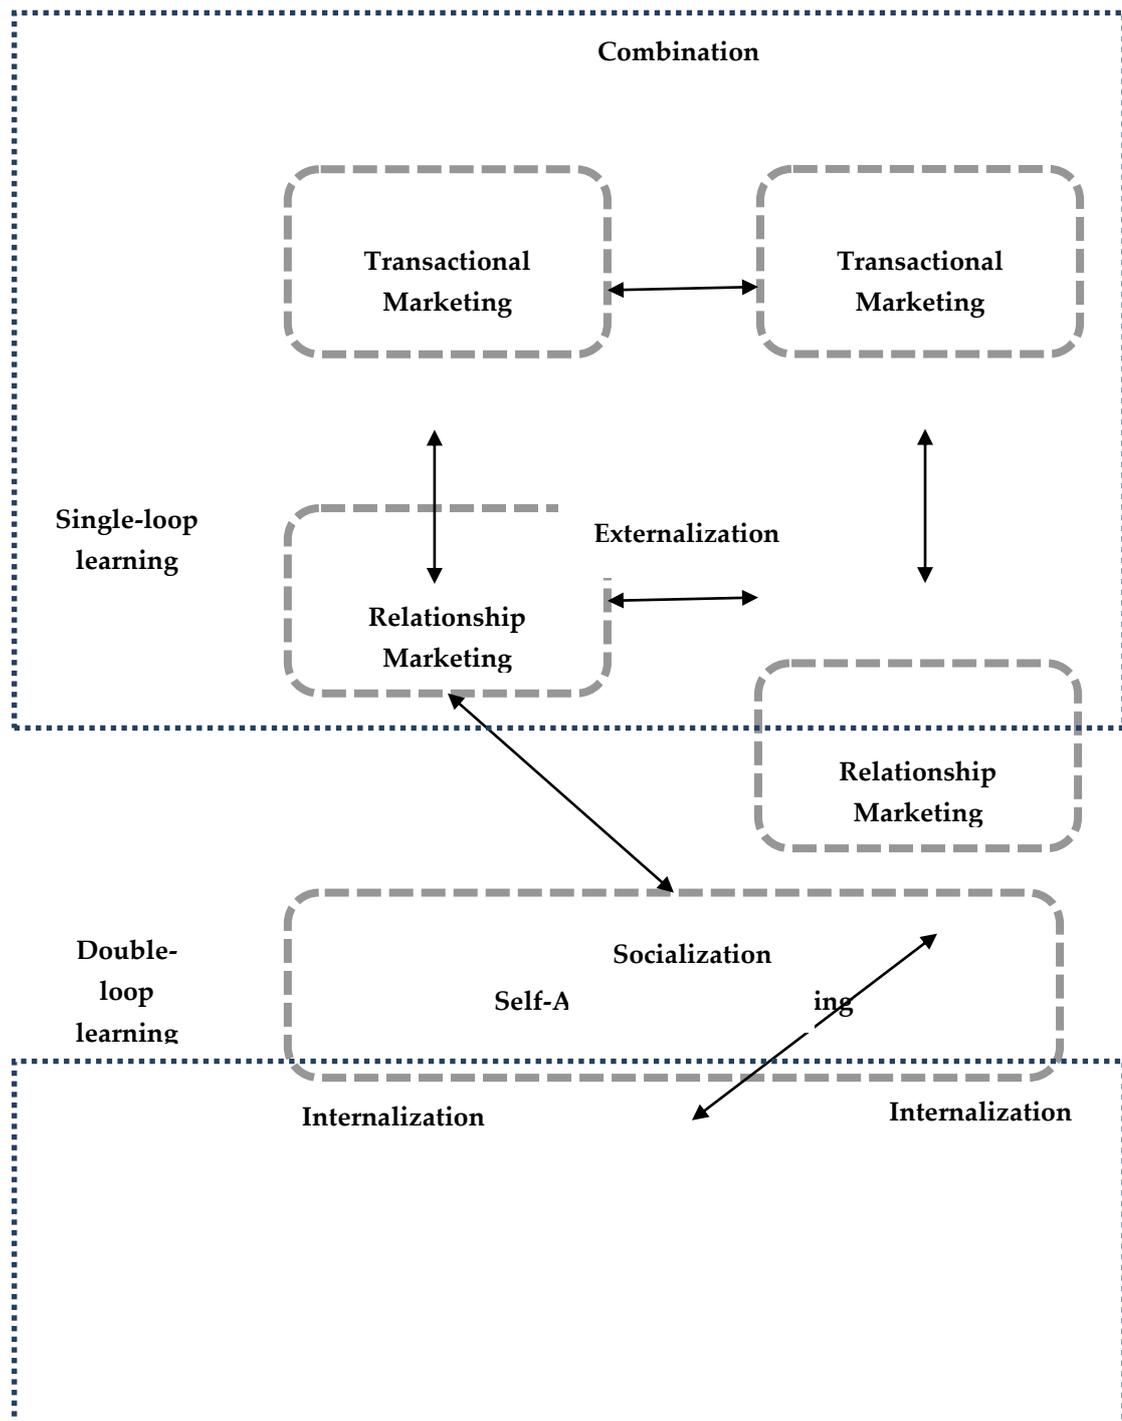

Figure 2. A proposed framework for study of the connections between marketing and organizational learning.

Regarding the combination with Nonaka and Taguechis (1995) framework of tacit knowledge, we make the following propositions. Transactional marketing mainly regards processes of combination as explicit and verbal or numerical arguments are used.

Relationship marketing occupies a key, middle, role in the model. Externalization of tacit knowledge as well as socialization are dependent on relationships between individuals in the marketing organization and its environment. Nonetheless, self-actualization marketing, which concerns our inner selves, is probably the only process in which internalization can occur.

Another aspect in the model is the connection to single and double loop learning. Transaction and relationship marketing concern learning on a more explicit level which may lead to changes in behaviours and activities. On the other hand, self-actualization marketing is related to our values, norms and inner assumptions. Thus, successfully carrying out self-actualization marketing requires profound level of the double loop kind.

CONCLUSIONS

The conclusions of this paper are basically contained in the model in Figure 2. We have shown that there are important connections between marketing and organizational learning. Moreover, in the model, we have related them to profound models of both marketing and organizational learning. This model should be useful as a theoretical vantage point for empirical studies into the connection between marketing and learning. In addition, it ought to be helpful for marketing managers by providing insights into the deeper functioning of their marketing activities in a structured way.

MANAGERIAL IMPLICATIONS

The conclusions of the paper should also be of interest for managers. The knowledge in the figure could bring additional understanding of the connection between learning and marketing which could aid managers in developing their long run marketing competence. When empirical research are carried out, the results should be of additional interest for managers.

ABSTRACT.

The present article is to examine effects of social and cultural norms on intrapreneurship. The research question is: how social and cultural norms affect intrapreneurship. First of all concepts of entrepreneurship and intrapreneurship are defined relying on a rich interpretation within the scientific literature. The classification and definitions of terms lead to the presentation of such concepts as internal and external entrepreneurship, followed by a table of Intrapreneurship indexes. To understand better the phenomenon of intrapreneurship and how it works, authors identify main differences and similarities between entrepreneurs and intrapreneurs, and only then factors influencing intrapreneurial activities via cultural and social norms are scrutinized, leading to the model of relations between preconditions for intrapreneurship and its created results. The scientific literature analysis contributes to a better understanding of the current situation regarding intrapreneurship and entrepreneurship in Lithuania and is the first of the series of researches carried on in Lithuania. It is not possible to correlate the present research results with the previous studies; however, the paper will serve as a solid theoretical and scientific background for the further studies on entrepreneurship and intrapreneurship in Lithuania. Thus, having the Global Entrepreneurship Monitor (GEM) methodology presented, the publication is enriched by a solid data from GEM, Lithuania (2011) on effects of social and cultural norms on intrapreneurship. The article is terminated by designing the conceptual model of symbiosis between social and cultural norms and intrapreneurship, which could be used in preparing further entrepreneurship-related publications.

Keywords: Entrepreneurship, entrepreneur, intapreneurship, intrapreneur, national culture, social norms.

INTRODUCTION

Cultural and social norms evolve in parallel with the accelerating globalization, which makes more difficult for organizations to adapt to the changing environment. Intrapreneurship is one of the main challenges for organizations, strongly related to the necessity for adaptation. The study of the role of cultural and social norms on intrapreneurship is important because *'Intrapreneurship plays a vital role in a country's economic growth and is critical to the economic development of both individual countries' and world trade. Intrapreneurship is not only associated with modern business ideals, it has evolved over time into a dynamic element of both developed and developing economies'* (Preez, 2005, p. 8).

Intrapreneurship is defined as entrepreneurship within an existing organization. (Sathe 2003; Thornberry 2002; Ferreira 2002; Scheepers 2009; Gautam 1997; Ulijn, Menzel 2004; Maier, Zenovia 2011; Antoncic 2007; Ahmad *et al.* 2011, 2012; Nicolaidis, Kosta 2011; Bosma *et al.* 2010; Cohen 2002; Möllers 2008). In the context of innovation, intrapreneurship is analyzed as a process that creates benefits for the organization (Seshadri, Tripathy 2006; Manimala *et al.* 2006; Mitchell 2007), highlighting the competitive advantage (Nicolaidis *et al.* 2011; Jarna, Kaisu 2005). Merrill *et al.* (2008), based on Manimala (2006), claim that one of the main barriers to intrapreneurship is the fact that organizations often block innovations, and this result leads to the failure of organizations (Merrill *et al.* 2008). However, in order to promote intrapreneurship it is necessary to create preconditions that can be defined as dimensions of the environmental, behavioural, organizational factors for potential intrapreneurs. (Karimi *et al.* 2011; Van Der Meer 2011; Alipour *et al.* 2011). These organizational and behavioural factors affect as key elements acting as a catalyst for intrapreneurship activities. Alipour *et al.* (2011), according to Kumar (2008), state that organizational culture is a vital element, which includes valuable opinions, belief, behaviour and norms, which influence the success of an organization. (Alipour *et al.* 2011). Menzel (2008, p. 59) based on Bloor & Dawson (1994) *'Not only national culture plays an important role for intrapreneurship, but also the influence of professional culture and its interaction with national culture. Professionals entering an organization bring in a large repertoire of cultural knowledge gained*

not only from the wider society, but also from their professional training and previous work experience'.

The scientific literature elucidates that cultural and social norms, formed in society, make an influence on the efficiency of intrapreneurship. This article is based on the GEM (Global Entrepreneurship Monitor) methodology and prepared with reference to the entrepreneurship study (2011). The study reviews factors that form an influence the intrapreneurship performance. The present paper looks at intrapreneurial processes from two perspectives. The first one analyses motives that help to encourage employees to involve in the intrapreneurial performance, and the second one analyses effects of cultural and social norms on the organizational efficiency, that act as a barrier or a catalyst for entrepreneurs in order to develop an intrapreneurship activity.

THE CONCEPT OF EXTERNAL AND INTERNAL ENTREPRENEURSHIP

Relying on Thornberry (2003), Mitchell (2007) points out that entrepreneurship is '*a primary action*' or a catalyst, which is based on innovations and usually makes an effect on radical changes, setting up subsidiaries or creating new companies. This action is described as an '*external effect*', while the concept of intrapreneurship encompasses the entrepreneurial behaviour within the organization. Intrapreneurship can be understood as an '*internal effect*' which in the organizational environment is seen as a set of required skills. In addition, the corporate entrepreneurship (Sathe 2003; Thornberry 2002; Ferreira 2002; Scheepers 2009), internal corporate entrepreneurship (Gautam 1997), internal entrepreneurship, intrapreneurship (Ulijn, Menzel 2004; Maier, Zenovia 2011; Antoncic 2007; Ahmad *et al.* 2011, 2012; Nicolaidis, Kosta 2011; Bosma *et al.* 2010) and (internal) corporate venturing (Cohen *et al.* 2002; Möllers 2008) are similar concepts of entrepreneurship within the organization.

Hill (2003), based on De Coning (1992) emphasizes that in the today's business world the term of intrapreneurship is becoming the key element in defining capabilities of organizations in the pursuance of some activities, emphasizing new and innovative services or products. Intrapreneurship can include non-profit organizations, corporations, hospitals, schools and universities. It should be noted that the way to a successful intrapreneurship is not only hazardous, but also hard. Developing the spirit of intrapreneurship in the organization covers exchanges of organizational culture through setting goals, feedback systems and implementation of results-oriented reward systems. Seshadri, Tripathy (2006, p. 20) note that '*Cost reduction and/or improved customer focus tend to be the primary objectives of*

innovation and intrapreneurship. At the level of an individual intrapreneur, the trigger for innovation could emanate from the desire to challenge oneself beyond the obvious. Intrapreneurs seeking to reinvent a company in order to increase efficiency may do so by removing 'unproductive layers' of bureaucratic hierarchy, harnessing the power of technology, proper delegation of authority and power or find other ways to improve efficiency and effectiveness'.

According to Mitchell (2007), promotion of intrapreneurship in the organization is the essential factor in both large and small organizations, despite the fact whether it is a newly established company or not. While highlighting one of the key advantages of intrapreneurship a competitive advantage for the organizations while creating innovations should be underlined. The author claims that organizations tending to promote intrapreneurship should set up systems in order to encourage, facilitate and support processes of intrapreneurship and create opportunities for the development of intrapreneurs' skills. Referring to Alipour *et al.* (2011) and Mitchell's ideas (2007) can supplement that the aim of intrapreneurship is to create a new company within organization, creating the added-value for the economy and improving the organizational performance. Thus, intrapreneurship is as a vital element of economic and organizational growth generating competitive advantages (Nicolaidis, Kosta 2011). *'Intrapreneurship acts as a path to pervasive innovation and is a driver to make business diversify and remain aggressive. When uncertainty and risk from the environment are the major threats for entrepreneurs, for intrapreneurs they can be advantages' (Ping-Yi, Huai-Zhi, 2009, p. 150).*

It emphasizes that enterprises have to find a way to measure the level of intrapreneurship and to promote it accordingly (Dejardin 2000). Hill (2000) states that intrapreneurship can be measured using the following six indexes such as Task Innovation, Intrapreneurial Employees, Structural Flexibility, Incentive Policies, Intrapreneurial Leadership and Intrapreneurial Culture Indexes (Annex 1).

Alipour *et al.* (2011) claim that intrapreneurship associates with the organizational perfection and the need to assess the intrapreneurship, which depends on the individuals' work and their personal characteristics, organizational structure, policies, leadership and culture. These factors act as barriers or catalysts to intrapreneurship processes. Hill (2003) introduces the construct of all indexes which help to measure a level of intrapreneurship. The construct of task indexes means that *'a successful organization demonstrates a high rate of introductions of new products, services and innovations or different ways of tackling problems at the individual and organizational level, in terms of the identification, development and exploitation of new opportunities' (Hill 2003, p. 56).* The intrapreneurial employee index analyses the number of

intrapreneurial employees who are innovative individuals and have the willingness to embrace new opportunities. The organizational structure encompasses an enterprise which tries to achieve an appropriate level of hierarchy within an organization. An advantageous organizational policy means *'an organization that offers employees opportunities, the encouragement, motivation, and incentives to experiment with new ideas without having the fear of being punished as a result of possible failure. The organizational leadership refers to the environment, is visionary and flexible, encourages the teamwork, and an intrapreneurial philosophy'* (Hill 2003, p. 56). Hill (2003) claims that the culture in the organization acts via the interdependence, low power distance, low uncertainty avoidance.

Thus, intrapreneurship and entrepreneurship are important factors because they act as factors driving the organization and economy. For this reason, it is necessary to understand the differences between the entrepreneur and intrapreneur in the context of entrepreneurship and intrapreneurship (Figure 1).

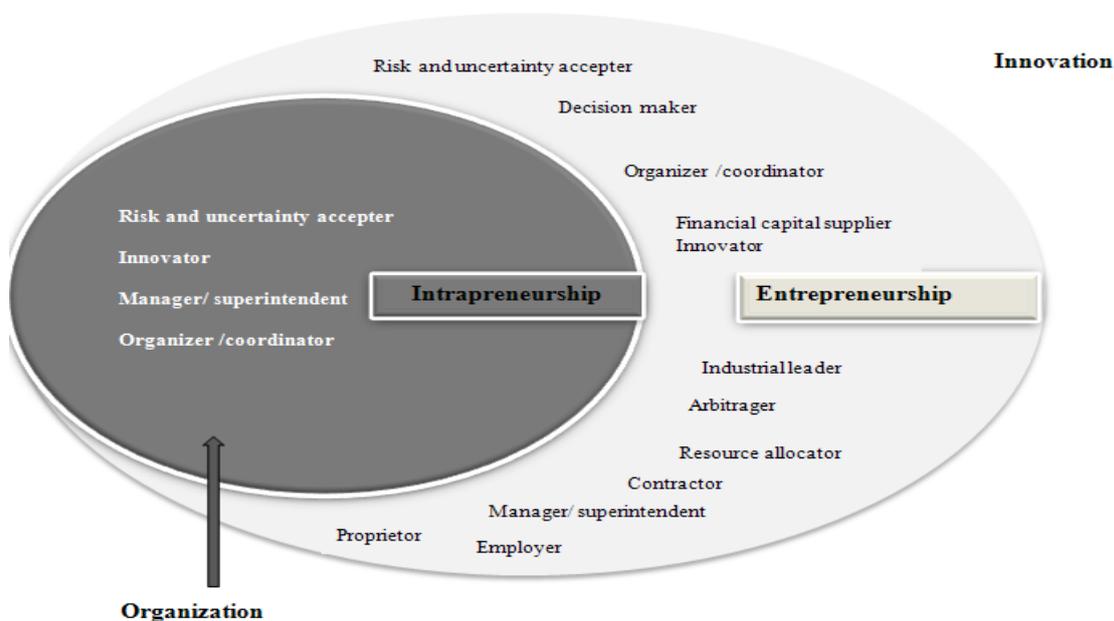

Figure 19. Differences between entrepreneurs and intrapreneurs in the context of entrepreneurship and intrapreneurship

Source: prepared by authors, based on: Ping-Yi, C., Huai-Zhi, S., 2009, p. 153.

Assessing characteristics of entrepreneurs and intrapreneurs four features out of twelve are the same as risk and uncertainty acceptor, innovator, organizer/coordinator and manager/superintendent. Maier, Zenovia (2011, p. 974), referring to Antoncic & Hisrich (2003), indicate *'that while intrapreneurs make risky decisions by using resources of a company, entrepreneurs make risky decisions using their own resources'*. Based on Antoncic's and Hisrich's (2003) and Davis' (1999) arguments, ensured that *'entrepreneurs prefer to develop a tacit*

knowledge in new organizations, instead of using procedures and mechanisms from other companies. On the other hand, intrapreneurs work in organizations that have their own policies, procedures, and bureaucracy' (Maier, Zenovia 2011, p. 974). In addition to this difference, Dejardin (2000), based on the Schumpeter's (1942) tradition, suggests that both entrepreneurs and intrapreneurs make 'a creative destruction' influencing businesses and economies.

FACTORS INFLUENCING INTRAPRENEURIAL ACTIVITIES VIA CULTURAL AND SOCIAL NORMS

The benefits of intrapreneurship can be defined as the organization's growth and macroeconomic evolution (Merrill *et al.* 2008). Within the organization there are three dimensions encompassing intrapreneurship activities via the organizational, behavioural, and environmental factors, whose level can depend on cultural and social norms. As a result, such benefits of intrapreneurship as a new corporate strategy, satisfaction levels, new markets, profitability, increased competitiveness, new products and a new inner process can be formed.

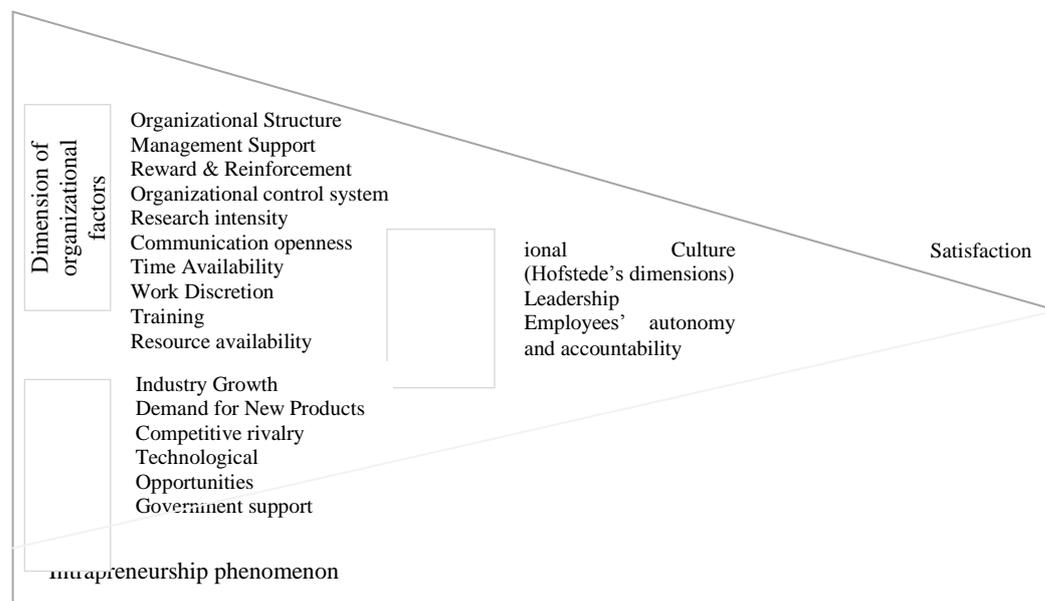

Figure 20. The relation between preconditions for intrapreneurship and its created results

Source: prepared by authors, based on: Karimi, A. *et al.* (2011); Ahmad, N. H. *et al.* (2012); Van der Meer, Arthur R. F. (2011); Alipour *et al.* (2011).

Relying on McGinnis' and Verney' (1987) argumentation, Ramsundhhar (2009) points out that in order to promote intrapreneurship in an organization, employees must not only

know, but also understand objectives of an organization. In addition, employees must understand the industry they work in. The authors claim that each organization must have a system which functions as a reward to employees for their innovative performance. Organizational rules should not restrict the freedom of employees because it impacts the level of innovativeness. Preconditions for intrapreneurship operate in three dimensions, i.e., the organizational, behavioural, and environmental factors. The first dimension is the organizational factors including the organizational structure, management support, reward & reinforcement, organizational control system, research intensity, communication frankness, time availability, work discretion, training and resource availability in an organization. Organizational factors act as the reason to encourage intrapreneurship among employees.

However, in order to accelerate the development of innovative processes workers' leadership and autonomy as well as accountability in the organization should be promoted. The third dimension encompasses environmental factors. The industry growth, the demand for new products, a competitive rivalry, and technological opportunities are the essential motives of contributing to the promotion of intrapreneurship in the organization. Thus, the current phenomenon of intrapreneurship results in the benefit for the organization and economy, creating a competitive advantage.

Pruskus (2003) indicates that by referring to the existing 'brains structures' Hofstede (2001) determines the behaviour of individuals. It is described as the 'Brain program'. If an individual 'installed' some values or attitudes in his/her childhood, it means that he/ she became the 'carrier of culture'. Young (2007), relying on Lewis' (1969) publications, points out that social norms are behaviour rules and communication with others. Hill (2003) shows that in the intrapreneurial organization the organizational culture acts via Hofstede's dimensions, i.e., Individualism versus Collectivism (IDV), Power Distance (PDI), Uncertainty Avoidance (UAI), Masculinity versus Femininity (MAS). The author discusses that an intrapreneurial organization should consist of collectivism, a low power distance, a low uncertainty avoidance, and femininity in the context of organizational culture. Thus, cultural and social norms are the key element for intrapreneurship.

According to Menzel (2008, p. 30) *'One may argue that, above all, intrapreneurship is basically a question of culture which is a question of the cultural background of the entire group of individuals involved. Such culture would be built around all principles related to the way an organization operates that will raise opportunities for creating profitable newness or difference in doing business. Yet, it is not fully clear how to define, measure, and implement such culture which supports intrapreneurship in industrial R&D.'*

The environment where social norms of collectivism exist 'We' self-awareness dominates. Thus, organizations and institutions affect an individual's personal life. It is also stated that an individual is emotionally dependent on institutions and organizations. '*Greater wealth brings more individualism and greater poverty more collectivism to a country*' (Gouveia, Ros 2000, p. 27). The power distance of social norms reflects the relationship between employers and employees, and if something goes wrong, the system is blamed, but not weaker individuals. The uncertainty avoidance of social norms concentrates on the tolerance for new things. Furthermore, individuals have the willingness to take an unknown risk. Hill (2003), based on Carrell, Jennings, Heavrin, (1997), points out that organizations promoting entrepreneurship within an organization have a low uncertainty avoidance, because the uncertainty is an integral part of life especially in the business world. It is noted that organizations tend to accept the unknown future and are willing to take risks. The social norm of femininity indicates that men and women should be gentle and caring about activities and relationships. Also, between genders there is minimal differentiation of emotional and social roles (Pruskus 2003).

Based on Trompenaars and Hampden-Turner, (2001), '*To influence or change the current culture or to implement a new culture the organization's or group's members must acquire a cultural knowledge, skills, or attitudes, thus, they must learn. Usually, cultural change processes require that people recognize the survival of the community at a stake*' (Menzel, 2008, p. 30; 31). Stull (2005), based on Krueger and Brazeal (1994), notes that norms and values make influence on intrapreneurship and Ping-Yi, Huai-Zhi (2009, p. 154) rely on Marcus and Zimmerer (2003) state that '*nascent intrapreneur is formed under the corporate culture and self-identification, not nature born. Current research found out that organization and policies are two important factors which will determine the success of intrapreneurship, so training program and employee education are critical*'.

In the case of Lithuania, intrapreneurial behaviour is affected by cultural norms, where '*The mobbing specificity is the feature of the Lithuanian mentality*' (Veinhardt and Zukauskas, 2010).. Cultural traits of materialism and post-materialism in Lithuania exist, i.e., and the individualism dominates. According to Štutiniene's (2008) study, within communities of local villages and small towns such traits of identities as the defensiveness, occurring in the form of insularity and ethnocentrism, dominate. Conservative attitudes and the fear of change play a major role making it difficult to adopt innovations.

METHODOLOGY

The investigation regarding the role of cultural and social norms on intrapreneurship is continued by presentation of the Global Entrepreneurship Monitor (GEM, 2011) methodology. The present article supports important aspects of the research problem already tackled in the scientific literature review by the data from GEM (2011), which is the largest dataset on entrepreneurship worldwide.

Global Entrepreneurship Monitor survey is the largest study in the world on entrepreneurship (covering 90 researchers' teams from different countries and conducted since 1999). The GEM data is gathered annually and is derived from two main sources: *GEM Adult Population Survey (APS)* and *GEM National Experts Survey (NES)*.

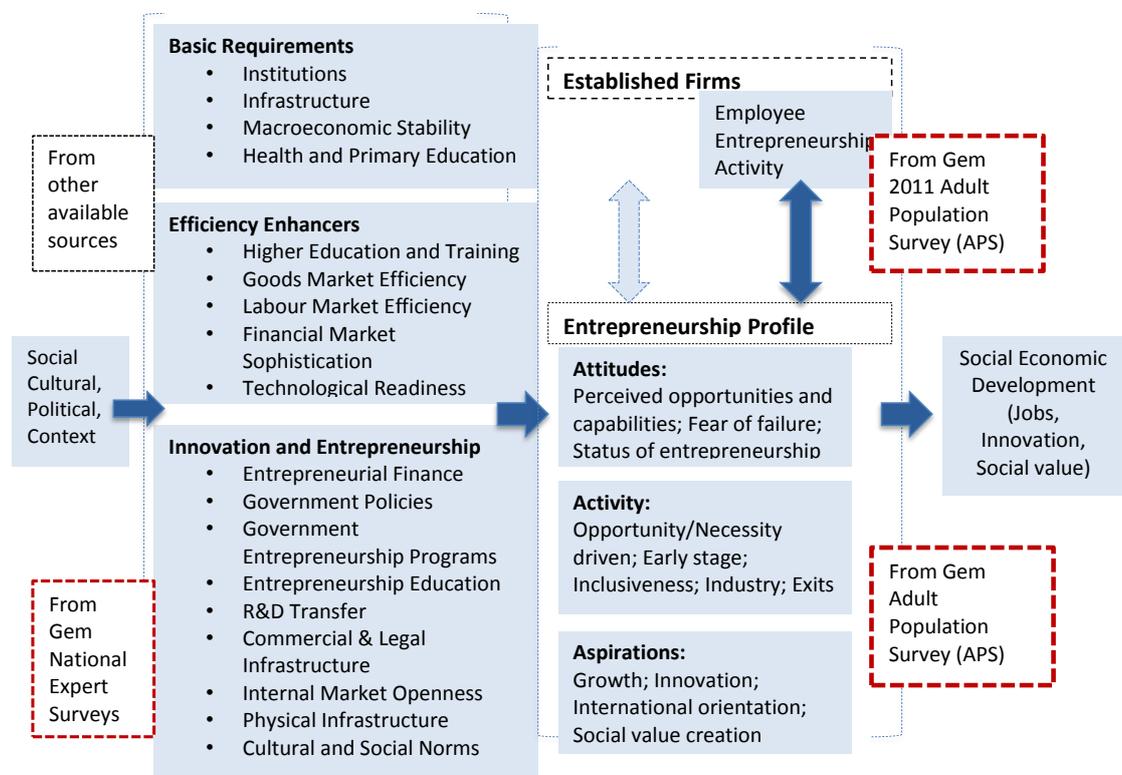

Figure 21. The GEM Conceptual Model

Source: GEM Global Report, 2011

The GEM model shows the institutional environment, the effect it has on entrepreneurship and on economic development. Two groups of conditions – basic requirements and efficiency enhancers, make an impact on entrepreneurship activity within the economies. Additionally, nine entrepreneurship framework conditions influence entrepreneurial initiatives and the rate and profile of entrepreneurship in different economies. The GEM Conceptual Model also illustrates the efforts of employee entrepreneurs, those who develop and lead new business

activities for their employers (i.e. intrapreneurship); this type of entrepreneurship was a special focus within this article.

Based on the Global Entrepreneurship Monitor methodology, countries were divided into three groups: 1) factors-oriented countries; 2) efficiency-driven countries 3) innovation-oriented countries. The study of entrepreneurship dynamics focuses on the transformation from one group of countries to another. GEM examines such entrepreneurship characteristics as motivation, innovation, competitiveness and growth potential.

Entrepreneurship is seen as a process, covering all the phases of the business cycle: from intending to start, to just starting, to running new or established enterprises and even discontinuing business. These surveys include the issue of new businesses, businesses ownership question or the motives for business terminating.

Survey Objective - the key purposes of GEM is to provide reliable data on entrepreneurship that will be useful in making meaningful comparisons, both internally and among countries with different economies over the time.

Lithuania has joined the project in 2011. During this time two waves of surveys were conducted. *GEM Adult Population Survey (APS)* and *GEM National Experts Survey (NES)* were conducted using Global Entrepreneurship Monitor methodology.

On the national level these two surveys allow monitoring the dynamics of attitude on entrepreneurs and entrepreneurship as well as the level of intrapreneurship in each country. This will provide the necessary guidelines for different sectors of economy in order to achieve the growth of social and economic welfare.

GEM APS Study in Lithuanian was conducted by independent market research company "RAIT" Ltd²³, ESOMAR member. Studies were conducted annually from March to July 2011 and 2012. Approximately 2000 respondents of Lithuanian inhabitants aged 18-64 years old were interviewed each year. The survey was conducted using telephone interviews (CATI) method. The sample of respondents was drawn using random representative sample from adult population of Lithuania. The standardized questionnaire developed by the GEM consortium (7 sections of questions about nascent entrepreneurs, owners, potential entrepreneurs, terminated business entrepreneurs, informal investors, intrapreneurship and innovation). The maximum possible statistical error $\pm 2,2\%$.

GEM NES focuses on the experts' opinion of financial support, governmental policies and programs, education and training, R&D transfer, commercial and professional

²³ The company was chosen by Lithuanian GEM team based on the evaluation of the vendor's research proposal.

infrastructure, market openness, access to physical infrastructure, culture and social norms, capacity for entrepreneurship, economic climate, work force features, political, institutional and social context.

Two GEM NES starting from 2011 were conducted in Lithuania (from April to July 2011 and 2012). 36 experts from 9 main sectors (financing; governmental policies; governmental programs; education and training; research and development transfer; commercial infrastructure; internal market openness; physical infrastructure; cultural and social norms) were interviewed each year. The NES sample comprises a minimum of 36 respondents, with four experts drawn from each of the entrepreneurial framework condition categories. Out of this sample, a minimum of 25% must be entrepreneurs or business owners, and 50% must be professionals. Additional aspects such as geographical distribution, gender, the public versus private sector, and level of experience are also taken into account in selecting the sample random representative sample. Each selected expert was approved by the global GEM team. The interviews were conducting using personal face to face interviews or using web interviews (CAWI) methods by the members of Lithuanian GEM team (International Business School at Vilnius University). A standardized questionnaire developed by the GEM consortium was used during the interviews.

In order to obtain more exhaustive information the combination of data from both surveys (APS and NES) is used. This method of analysis enables to get insights from population point of view about entrepreneurship as well as to get expert attitude toward specific situation in particular country.

Statistical data analysis was conducted using IBM SPSS Statistics software.

The raw data was sent directly to the GEM data team for inspection and uniform statistical calculations before being made available to the participating economies. All statistical calculation is done using SPSS program.

The quantitative research was carried out by the team of the International Business School at Vilnius University under the cooperation with the business-promoting agency 'Enterprise Lithuania' and the Ministry of Economy of the Republic of Lithuania.

Within the quantitative survey there were 2003 Lithuanian adults of the age group from 18 to 64 years interrogated. In terms of regional representation, the distribution of respondents reads proportions of regional spread at the country's level. Having the Lithuanian citizens' attitudes towards the entrepreneurs' activities and their education examined, next, perceptions of their career are tackled, then a special attention is paid to

social and cultural norms (including social support), which is terminated by the identification of opportunities and competences to start entrepreneurial activities.

The analysis of intrapreneurship calls researchers to examine the answers from two main groups of respondents, starting or helping to start the business, but still without the revenue received (N=255) and business owners (N=307). The expert interviews enclosed 36 experts that represented finances, governmental policies and programs, education and trainings, R&D, business and physical infrastructure, the market openness, cultural and social norms that led to an ingenious analysis how cultural and social norms affect the employees' entrepreneurship.

EFFECTS OF CULTURAL AND SOCIAL NORMS ON INTRAPRENERUSHIP IN LITHUANIA

Results of GEM, Lithuania (2011) clearly illustrated the importance of attitudes, values, rules, norms, perceptions, processes, organizations or structures on intrapreneurship. The societal perceptions of such concepts as the work security or the liberty in realizing his/her ideas emerge as important motives to initiate and execute entrepreneurial activities while being employed by a company. Nearly sixty percent of respondents are sure that the work security is more important than the liberty in realizing his/ her ideas (32,6% absolutely agree, 24,6% agree).

Social and cultural norms strongly impact main motives to start a business separately or 'under the roof of an employer'. 42,7% of respondents starting or helping to start a business, but still without the revenue received, intended to use a good business opportunity; nearly one third of entrepreneurs as the main reason to start their business identified the inexistence of better employment choices in the market, while 11% indicated the combination of great business opportunities and inexistent employment choices in the market. 7,3% respondents started searching for new opportunities already working in other companies. Other respondents as principle motives indicated additional revenues, the willingness to help companies, the demand for services, realization of a dream, health, and insufficient salary in a previous job, the application of a good practice in Lithuania or such social aspect as a life style. 48,3% of respondents mentioned a larger freedom as the most important motive to use the business opportunity. More than half of respondents were not working in addition to a business, and 84,2% were employed before starting a business.

Similar reasons are found among entrepreneurs who are already business owners and generate revenues. Among their motives to start a business they mentioned the desire to

do things they are capable to do, their interest in a new business, freedom, no fear of failure, present optimism at a microeconomic and macroeconomic levels, personal characteristics. For these reasons the majority of respondents (78,2%) were the business owners or managers themselves. It is interesting to note that 37,4% respondents that have already started generating revenues from their business are in parallel employed by other companies, and 82,6% were employed before starting their business.

Another important aspect of the social cultural context is the social image of entrepreneurs, their characteristics and the perception of the environment in favour for the business creation process. Though 43,8% of respondents disagree with the statement that Lithuanian entrepreneurs are honest, and it was difficult to evaluate the ethics and care of entrepreneurs, one third of respondents evaluate entrepreneurs positively. The energy is one of the most important entrepreneurs' characteristics: more than 70% of respondents agreed with the statement that Lithuanian entrepreneurs were energetic people, and 40% of respondents expressed the innovativeness as an important feature of Lithuanian entrepreneurs.

In spite of rather positive social image of entrepreneurs, respondents have a relatively negative opinion about the entrepreneurial environment. More than two thirds (70,5%) of respondents stated that over the last two years they did not know people who started business in their environment. Such answers were supported by the perception of business opportunities in their living environment in the upcoming 6 years: only 19% of respondents considered their living place as having good possibilities to start the business. Analogically, the two thirds considered their living place being not in favour to start a business. The negative perception of the living place was accompanied by a negative evaluation of their skills, knowledge and expertise necessary to start a business: only one third of respondents had evaluated their skills, knowledge and experience as suitable.

Such societal perceptions call for an important Hofstede's dimension (2003) which is the uncertainty avoidance, directly related to the question regarding the fear of failure to start a business. This social and cultural feature is a clear illustration how cultural and social norms influence determinants of entrepreneurship. 49,8% of respondents state that the fear of failure negatively affects their decision to start the business. The uncertainty avoidance and the fear of failure is also the barrier for those who believe having sufficient knowledge, experience and skills to start their businesses, and only 12,7 % of respondents, with no respect whether they do this alone or in teams, are involved in the process of the business establishment, are self-employed or sell products or services to others.

The propensity of the population to use modern technologies is another important social aspect, which in term of intrapreneurship appears as the necessity to change technologies or to use technologies of an employer for their own business initiatives. Though more than 63,9% involved in a business, but still without revenues, use technologies and apply procedures necessary for the creation of products and services longer than 5 years, a rapidly changing business environment, the progress of information technologies and a severe competition in global markets demand 25,9% entrepreneurs to renew technologies and procedures more often, as technologies and procedures last from 1 to 5 years, and 10,1% of respondents need to do this every year. A similar situation is among business owners who already earn revenues. Though 72,4% respondents that are business owners stated that technologies and procedures necessary for business were alive longer than 5 years, 19,4% of respondents needed to renew them in the period from 1 to 5 years, while 8,6% of respondents needed to make necessary changes annually. Nearly 45% respondents-business owners used technologies that were completely or partially related to the previous or current employer.

Another aspect of a social and cultural context is the willingness to use the previous personal or colleagues' experience in business initiatives. This particularly encourages intrapreneurial activities. For instance, the previous experience in a company helped 46,5% of respondents to form the business idea, and 13,4% of employers provided or intended to provide a support for the business development or a necessary physical infrastructure. The previous experience is also useful because 46,7% respondents who have established their businesses intended to employ their ex or present colleagues. For 51,5% respondents who started their business a previous job experience helped to build a business idea. However, 90,4% of respondents indicated that their current or previous employers avoid of providing their business with a financial support of physical infrastructure. 31,1% of respondents accentuated the importance of working in other companies and particularly intentions to employ their current or ex colleagues.

The willingness to use the previous personal or colleagues' experience in business initiatives is accompanied by the willingness to use financial resources related to current or previous colleagues or personal investments into other businesses. This in many cases derives from cultural and social norms. 58,8 per cent of respondents who invested in other businesses allocated those investments to their relatives, and 31,6% to neighbours and friends. Other 2,6% dedicated their investments to colleagues, and 6,1% to unknown people with a good idea.

The concept of intrapreneurship incorporates such important cultural and social norms-related aspects as the cooperation in the generation and commercialization of innovative ideas. It is not enough to generate ideas and evaluate business opportunities; often those ideas are unrealized because of the lack of initiatives to execute them. Only 10 % of respondents helped to execute ideas during the period of the last 12 months. 49,9% of respondents needed one year or more for helping to establish a business. 80,2 % of respondents were the principle or co-owners of their businesses; 61,3% established and developed their businesses in a group of two people, and 26,3% were three people in a team while starting their business. Thus, the cooperation emerges once again as an important aspect of a social and cultural context.

Social relations are an important condition for entrepreneurship and intrapreneurship as the constitutive part of entrepreneurship. 48,8% absolutely agree and 26,1% respondents agree, that dealing with partners provide with a lot of business opportunities. One third of respondents (33%) had difficulties to decide, whether they would understand better having other people managing or consulting, while 40% of respondents were fond of initiating changes in business processes.

Such intrapreneurship experiences as the generation and commercialization of innovative ideas are crucial in order to start a business themselves. 71,9% of respondents were involved in the generation and execution process of new entrepreneurial ideas over the last three years. 33,9% of respondents managed such processes, 53,6% helped to generate such ideas, and 12,5% executed, managed and supported such processes. 57,4% of respondents were continually preparing and executing ideas not stopping themselves at the generation stage: 37,8% managed preparation activities and execution processes, 48,9% helped to prepare and execute activities, and 13,3% were responsible for both functions.

Education and training are the precondition to positively impact intrapreneurial activities. However, the role of education and trainings, according to experts, is not sufficient in encouraging entrepreneurship. There is the lack of orientation towards entrepreneurship at secondary and primary schools (69% experts consider as negative), where the creativity, initiatives and autonomy are not sufficiently supported, and there is not the knowledge on economic and business principles provided. Colleges, universities and business administration trainings are slightly more efficient in preparing specialists ready to establish and develop their business (50% experts consider it negative). In parallel, a professional, vocational and continuous education is evaluated the best (only 36 % experts evaluated it negatively).

Intrapreneurship in Lithuania, based on respondents' opinions, is sufficiently supported. There is more 'From top to bottom' decision making model in use. Experts more disagree than agree that employees who want to start their business can use resources, knowledge, connections received in their job position. However these are only a few observations regarding intrapreneurship. To excel the present article the conceptual model of effects of cultural and social norms on intrapreneurship is presented below. Social and cultural norms could be translated into such factors as the propensity of the society to use modern technologies, social relations and co-operation trends, a social valuation of entrepreneurs, environment, knowledge and skills, perceptions of the work security and the liberty in realizing ideas or the uncertainty avoidance. These social and cultural factors should be shaped by the education and training, the media, governmental programs and policies as well as the financial support in order to boost the intrapreneurial culture in the country and organizations, with employees largely involved in the generation and commercialization of innovative ideas, having the motivation to start business separately or 'under the roof of an employer', to use, if possible, current or previous employers' technologies, employing current or ex colleagues, using colleagues' financial support and personally investing, applying personal and colleagues' experience and managing better their risk. All these aspects would be impossible without the organizational structure, management techniques and innovations climate supporting the intrapreneurship phenomenon.

The model of effects of cultural and social norms on intrapreneurship could be linked to the GEM conceptual model via the intrapreneurial profile, which composes attitudes, activity and aspirations. The first pillar of attitude, based on the GEM conceptual model, tackles the perceived opportunities and capabilities of employees, the fear of failure as well as the status of intrapreneurs within organizations. Within the model of Effects attitudes correspond to the second group of factors. The activity pillar contains the opportunity and necessity-driven motives to start intrapreneurial activities as well as different stages of intrapreneurship. This pillar is liaised to the third group of factors within the Effects model. The aspiration (growth, innovation, international orientation, social value) from the conceptual GEM model relates to the first group of factors within the Effects model.

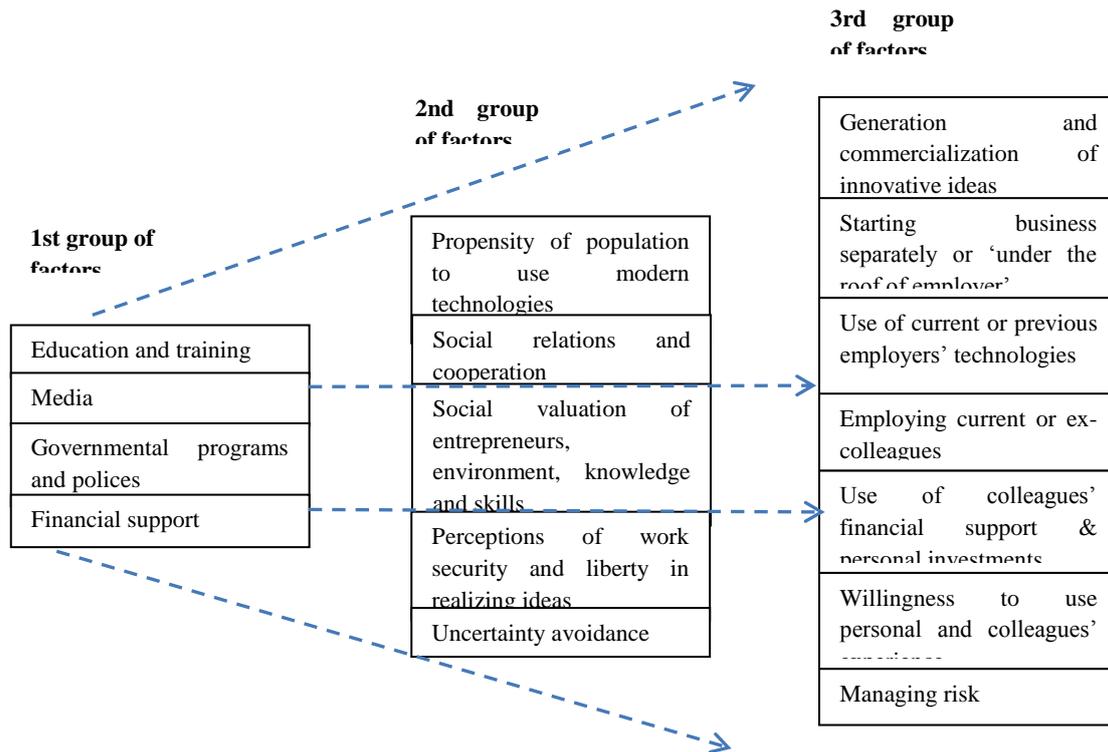

Figure 22. Effects of cultural and social norms on intrapreneurship

Source: prepared by authors, based on GEM, Lithuania (2011)

CONCLUSIONS

Intrapreneurship is a distinguished part of entrepreneurship which is related to employees' initiatives inside organizations. It covers both motives and barriers to start entrepreneurial activities while being employed by another employer and further development opportunities including possible synergy effects between the employing organization and the intrapreneurial unit. From the first impression, a high ranking of a country, based on intrapreneurship, means the fear of failure to start a business individually and manage the risk alone; however, it also calls for the innovation performance in employing organizations, where organizational structures and management techniques support employees' initiatives. Although entrepreneurship, based on respondents, is sufficiently encouraged, employees in Lithuanian companies that apply 'From top to bottom' decision making model not always feel the support from their employers getting permissions to use resources, knowledge and connections. Having the propensity of the public to use modern technologies, social relations, a social image of entrepreneurs, opinions about the environment, knowledge and skills, perceptions of the work security, the liberty in realizing

ideas or the uncertainty avoidance identified as main social and cultural norms-related factors, intrapreneurship should continuously be encouraged via the education and training, the media, governmental programs and policies as well as the financial support.

Owners should remember that employees-intrapreneurs (largely involved in the generation and commercialization of innovative ideas; having the motivation to start business separately or 'under the roof of an employer'; using, if possible, current or previous employers' technologies, employing current or ex colleagues; using colleagues' financial support and personally investing; applying personal and colleagues' experience and managing or not their risk) are not parasites in the eco-system of organizations. They can contribute with a great value-added, given the organizational structure, management techniques and innovation climate in favour for the intrapreneurship phenomenon.

There should be a more ingenious attention paid to cultural and social norms, as they directly and indirectly affect organizations' strategies, citizens' behaviour and attitudes, consumers' preferences and demands as well as complex and unique social relations in different economies. The beginning of important changes should begin at the beginning stage of the development of social and cultural norms of each country. Therefore, such factors as the early education on intrapreneurship should be emphasized and all the positive contributions from the employees' entrepreneurship examined.

MERGERS AND ACQUISITIONS WERE NOT A SOLUTION TO THE LIQUIDITY AND CAPITAL REQUIREMENTS OF GREEK BANKING SECTOR

Liargovas, Panagiotis¹; Repousis, Spyridon²

¹Department of Economics, University of Peloponnese, Greece

²Department of Economics, University of Peloponnese, Greece, spyrep@otenet.gr

ABSTRACT

Purpose - The purpose of this paper is to examine the impact of mergers and acquisitions on liquidity and capital adequacy of Greek banking sector during 1996-2004 when a large number of bank mergers and acquisitions took place and were completed.

Design/methodology/approach – By measuring liquidity and solvency with four financial/accounting ratios, of a sample of 26 Greek commercial banks during 1996-2004 and analyzing data of current Greek banking sector, we find interesting results about liquidity and capital adequacy of Greek banks.

Findings - Results indicate that liquidity and solvency ratios of Greek commercial banks during 1996-2004, deteriorate after merger deal but most of ratios (three out four) deterioration is not statistically significant.

Practical implications – Mergers and acquisitions during past (1996-2004) was not a solution to improve liquidity and capital adequacy requirements.

Originality – The paper presents an analysis of the impact of mergers and acquisitions on liquidity and capital adequacy of Greek banking sector and shows possible strategies to banks to improve current position.

Keywords: Banks, M&As, Operating Performance, Liquidity, Capital Adequacy, Greece

1. INTRODUCTION

One of the most important changes that have taken place in the Greek financial system since the mid-1980s is related to mergers and acquisitions of Greek banks. This was the result of Globalization and Europeanization of the Greek Financial System.

Globalization, as well as the process of financial integration within the European Union, leads to modernization of the Greek financial system, with interest rate deregulation, liberalization of cross-border capital movement and abolition of direct credit controls. The Greek financial system was deregulated in the mid – 1980s. Before that, it was over-regulated, as a result of the extensive government intervention in credit allocation, since the early 1950s. After 1987, the Greek financial system started to change. Before 1981, the Greek Central Bank used to impose limitations on commercial banks' credit expansion and interest rate ceilings. Two state-owned banks, National Bank of Greece and Commercial Bank of Greece, dominated almost the whole Greek banking sector. The 1989 Second Banking Co-ordination Directive gave banks the opportunity to operate as universal banking institutions, extending their business into financial activities other than traditional ones, such as insurance and investment services. Cost cuts, restructuring, mergers and acquisitions, followed the Greek banking industry after 1992. Greek banks started to internationalize their activities while at the same time competition and profitability increased.

The growing and more complex competition increased in the Greek banking sector as a result of a more liberalized regulatory framework, the emergence of new financial intermediaries and new information technologies. The process of globalization changed the Greek banking landscape and spurred the largest wave of mergers and acquisitions (M & As) so far.

In our study we are examining the period 1996-2004 because during 1996-2004 a large number of bank mergers and acquisitions took place and were completed. An analysis of the impact of mergers and acquisitions on liquidity and capital adequacy of the Greek Banking Sector is an interesting field especially during current economic crisis in Greece.

The next section of the paper provides a theoretical and empirical discussion of mergers and acquisitions. Section 3 presents the data and the methodologies used. Finally, section 4 provides the empirical results, while section 5 offers some concluding remarks.

2. THEORETICAL AND EMPIRICAL UNDERPINNINGS

The theoretical literature of mergers and acquisitions can be divided into three major categories. The first category includes synergy or efficiency, in which total value from the combined firms is greater than the sum of values of each firm. Increased value arises from increased efficiency (output or input) and increased market power (Berger, 1995; Goldberg & Rai, 1996). Hubris is the second category and it is the result of winner's curse, causing bidders to overpay while value is unchanged (Roll, 1986). The third category comprises those in which total value is decreased as a result of mistakes or managers who put their own preferences above firm's (principal-agent problem), "building empires" for self-interest opposed to the self-interest of the principal and the shareholders (Jensen, 1989; Hughes et al., 2003; Bliss & Rosen, 2001; Fogelberg & Griffith, 2000).

The empirical evidence concerning the evaluation of mergers and acquisitions is based on five different types of analysis namely, production functions, cost functions, use of accounting data, the efficient frontier approach and event studies (Matthews & Thompson; 2005).

Cornett & Tehranian (1992), examined the post-acquisition of large bank mergers between 1982 and 1987. They reported that the merged banks outperform the banking industry. Rezitis (2008), using a stochastic output function, found that the effects of mergers and acquisitions on technical efficiency and on total factor productivity growth of Greek banks are rather negative. Noulas (1997), examined productivity growth of Greek banking industry for 1991 and 1992, using the Malmquist productivity index and the Data Envelopment Analysis method (DEA) and found that, although productivity has increased for state and private banks, the sources of this growth are different. Siriopoulos and Tziogkidis (2010), examined the efficiency of Greek commercial banks through the period 1995-2003 and especially the reaction of banking institutions after significant events such as M&As, privatizations and the crisis of the Athens Stock Exchange in 1999, using DEA. They found that the Greek banking sector operated efficiently on average during the destabilization period.

Spathis, Kosmidou & Doumpos (2002), using multicriteria methodology (M.H.DIS and UTADIS) investigated the endogenous factors of Greek banks from their financial statements over the period 1990-1999, identifying financial ratios that affect classification of banks according to their size. Evidence indicated that large banks are more efficient than small ones. Also using the Promethee method to evaluate the performance of commercial and cooperative banks in Greece, Kosmidou & Zopounidis (2008), found that commercial banks tend to increase their accounts, to attract more customers and ameliorate their financial

indices, thereby becoming more competitive and maximizing their profits. Halkos & Salamouris (2004), applying a non-parametric technique (Data Envelopment Analysis) and exploring financial efficiency ratios for the period 1997-1999, found that the higher the size of total assets, the higher the efficiency of Greek commercial banks.

Mylonidis & Kelnikola (2005), using event study approach and a 20 days event window before and after announcement date for the years 1999-2000, showed that mergers create value on a net aggregate basis. Also by using operating performance methodology they found no evidence of performance gains resulting from bank mergers.

Athanasoglou & Brissimis (2004), employed operating performance methodology on revenue, cost, profit and productivity ratios in the pre-merger and acquisition period 1994-1997 and post-merger and acquisition period 2000-2002. They showed that merger and acquisitions positively affect merged banks' profitability as well as cost efficiency.

3. DATA AND METHODOLOGY

In our research, we use Operating Performance Methodology by following Pilloff (1996). The merger-related change in performance variable has been calculated as the difference between pre-merger adjusted performance for the consolidated bank involved in merger and post-merger performance for the same bank. Balance sheets, annual reports and financial statements were found on ICAP Database, Hellenic Bank Association, daily economic newspapers, banks' websites and banks' accounting departments.

Following Pilloff (1996), liquidity and solvency variables are examined with the use of 4 financial-accounting ratios, such as:

Liquidity Ratios

1. Total loans/Total deposits
2. Total loans/Total assets
3. Cash plus reserves plus securities/Total assets

Solvency Ratio

1. Total equity/Total assets

We apply the operating performance model specified above to an unbalanced panel of Greek banks studied over the period, 1996-2004, including a total sample of 26 Greek commercial

banks (11 banks were involved in mergers and acquisitions activities and 15 banks as non-merged). Greek co-operative banks and branches of foreign banks are excluded. We investigate whether merged banks are following a different pattern of efficiency change than non-merged banks. For this reason, a merged institution is treated as a different bank from the institution that existed before the merging process.

Our study includes information on six cases of mergers and acquisitions (5 banks were involved as acquirers and 6 banks as targets) that meet the following criteria, as stated by Pilloff (1996): a) merger was the primary transaction in which both the bidder and target were involved during the period from at least one year before the merger year to at least one year after it, with maximum two years before and after, b) during this period, no other merger was announced by either party, c) the regulator did not encourage or assist the acquisition. We limit the empirical analysis to the unconsolidated statements of commercial banks in order to reduce the possibility of introducing aggregation bias in the results. All currency variables are expressed in millions of Euros, in 1995 real terms and corrected for inflation (deflated by the Wholesale Price Index published by the National Statistical Service of Greece). A total of 19 (about 35.1 per cent) of the banks were observed during the 9 years.

The hypothesis tested is:

$$H_1: \Delta WR_x \neq 0 \quad \text{and} \quad H_0: \Delta WR_x = 0$$

where ΔWR_x is the weighted relative difference in variable x. The relative size according to total assets of bidders and targets, by using t-test or t-student is:

$$t(\Delta WR_x) = \frac{\Delta WR_x}{\frac{S(\Delta WR_x)}{\sqrt{N}}}$$

where $S(\Delta WR_x)$ is standard deviation of weighted relative difference in variable x and N is number of mergers and acquisitions.

4. EMPIRICAL RESULTS AND DISCUSSION

In Greece, employment in banking sector and number of bank branches has increased for the period 1996-2004 (Table 1), which reflects the dynamic of the banking sector and its growth. Also shows that banking services and products in Greece were distributed through the traditional way via branches, despite technological progress.

Table 1. Total number of employees and bank branches in Greek banking sector

	1996	1997	1998	1999	2000	2001	2002	2003	2004
Employees	48,029	48,165	51,213	49,902	53,655	52,628	52,962	54,184	52,533
Bank branches	2,192	2,296	2,520	2,455	2,748	2,794	2,922	2,939	2,885

Source: Hellenic Bank Association

Liquidity ratios illustrate how a bank can meet its liabilities from acid assets, exposure at loans and share of loans to total assets. Results from two out three liquidity ratios (Table 2) deteriorate after merger deal, but they are not statistically significant. Only “cash plus reserves plus securities/Total assets” deteriorates after merger deal, and it is statistically significant.

Solvency ratio or capital adequacy ratio, illustrate banks’ viability in the long run and indicate the source of funds (capital from shareholders, profits etc) that support operation (Table 3). “Total equity/total assets” of merged banks is lower from that of non-merged banks. Also the ratio deteriorates after merger deal but it is not statistically significant at 5% and 10%.

Table 2. Liquidity Ratios

	Total loans (except loans to banks)/Total deposits				Total loans (except loans to banks)/Total assets				Cash plus reserves plus securities/Total assets			
	Pre-merger	Post-merger	Average Difference	t-statistic	Pre-merger	Post-merger	Average Difference	t-statistic	Pre-merger	Post-merger	Average Difference	t-statistic
Average Bidders	19.8%	44.5%	8.7%	1.6	16.9%	38.6%	7.4%	1.9	19.4%	24.3%	-5.6%	-2.3
Average Targets	15.387%				13.8%				11.2%			
Average Non-merged banks	51.7%				40.8%				23.5%			

Table 3. Solvency Ratio

	Total equity/Total assets			
	Pre-merger	Post-merger	Average Difference	t-statistic
Average Bidders	0.05	0.07	-0.00	-0,60
Average Targets	0.02			
Average Non-merged banks	0.11			

Finding show that during 1996-2004, liquidity and solvency ratios deteriorate after merger deal but most of ratios (three out four) deterioration is not statistically significant. Liquidity ratios deteriorate after merger deal but two out three ratios are not statistically significant. Only “cash plus reserves plus securities/Total assets” deteriorates after merger deal and it is statistically significant.

Also solvency ratio to measure accounting capital adequacy deteriorates after merger deal but it is not statistically significant.

Results indicate that liquidity and solvency ratios of Greek commercial banks during 1996-2004, deteriorate after merger deal but most of ratios (three out four) deterioration is not statistically significant.

5. CONCLUSIONS

The purpose of this paper is to examine the impact of mergers and acquisitions on liquidity and capital adequacy of Greek banking sector during 1996-2004 when a large number of bank mergers and acquisitions took place and were completed. Finding show that during 1996-2004, liquidity and solvency ratios deteriorate after merger deal but most of ratios (three out four) deterioration is not statistically significant. Liquidity ratios deteriorate after merger deal but two out three ratios are not statistically significant. Only “cash plus reserves plus securities/Total assets” deteriorates after merger deal and it is statistically significant.

Also solvency ratio to measure accounting capital adequacy deteriorates after merger deal but it is not statistically significant.

As results show, mergers and acquisitions during 1996-2004 were not a solution to improve liquidity and capital adequacy.

Finally, we must bear in mind the limitations of relying on operating performance, because operating performance measures are subject to measurement problems (e.g. use of different accounting rules), are vulnerable to manipulative and discretionary choice of accounting rules, and the appropriate time lag in measuring performance improvement is not clear.

ANALYSING RISKS ASSOCIATED WITH EXTERNAL QUALITY ASSESSMENT IN HIGHER EDUCATION: A CASE STUDY ON ROMANIAN HIGHER EDUCATION SYSTEM

Lisievi, Petru

Faculty of Psychology and Education Sciences, Spiru Haret University, Bucharest, Romania,
lisip@spiruharet.ro; lisip52@gmail.com

ABSTRACT

"Should we not have to teach (Should we not have students), we could do a lot better on quality." This bitter ironic remark has been heard in every state funded or independent university in Romania for some years now.

It points out that complying with the demands of the current quality assurance system generates adverse effects on the quality of teaching and research.

The paper analysis the mechanisms by which quality constructs lacking validity, obsolete cultural models or conflicting interests may disrupt on-going academic work and trigger such adverse effects on quality of education programs. The analysis was carried out using the experience accumulated in Romanian Higher Education. Conclusions do not necessary apply to other education systems but may serve as a *caveat* on incumbent risks.

Among the risks identified by the paper are the following: a) Using a faulty construct on quality of education; b) Setting irrelevant and even detrimental quality standards; c) Depleting financial resources of universities; d) Depleting time, creativity and motivation resources of universities; e) Lowering capability of higher education institutions to respond to identified training and research needs; f) Raising levels of institutional anxiety and incertitude; g) Lowering attractiveness of higher education teaching and research; h) Restricting capability of managers to function as models for younger members of faculty or students; i) Allowing assessment judgements to be influenced by conflicting interests of competing institutions or individuals; j) Encouraging dishonest strategies to boost scientific productivity; k) Discouraging cooperation and communication between competing universities, departments or faculty members.

Keywords: Higher education, Quality of education, Quality standards, Quality of education assessment risks.

PROBLEM STATEMENT AND PURPOSE OF THE STUDY

The Law for Quality in Education was passed by Romanian Parliament in 2006 (Parlamentul României, 2006). The Romanian Agency for Quality Assurance in Higher Education (ARACIS) has been established within one month and became active in conducting quality assessment sessions beginning with the 2006-2007 academic year.

The longer this system was active in "assuring" quality, *the more frequent* have been formulated critical remarks on the quality of higher education. Such remarks came even from a Commission appointed by the President (România educației, România cercetării, 2007), and from President of Romania himself.

We have in a number of studies (Lisievi, 2009; Lisievi, 2011) analysed the impact of the quality assurance system on the Romanian Higher education and pointed out that it did not live up to its professed intentions.

We have found that this quality assurance system favoured control versus support, uniformity versus diversity, centralization versus academic freedom. We have also found that it diverted large financial, human and time resources from teaching, scientific activity and research. Instead of promoting an "evaluation culture", it generated a culture of preparing documentations and reports and rigging procedures for better scoring. Last but not least it did not provide support that would have been instrumental related to the demands is formulated.

We concluded that setting up a quality assurance system for higher education is not a risk free enterprise and that compiling a list of such risks might be useful.

This study builds on the previous findings to explicitly identify risks associated to setting up a quality assurance system.

IDENTIFIED RISKS

Using a faulty construct on quality of education

In both the provisions of the Law on Higher Education Quality and ARACIS methodology, the same construct is being used to define the quality of education: Quality means meeting the „expectations” of the “beneficiaries” **and** the “quality standards” (Parlamentul României, 2006, ARACIS, 2006, E).

Here we have at least two major problems: most international reports and even domestic publications on the quality of education (OECD, 1989, Lisievici, 1997, Lisievici, 2009) prefer to use the term "needs" instead of "expectations". Expectations involve *cognitive skills* like perceiving accurately, values clarification, making accurate predictions and sound decisions. The existence and levels of development of such skills become critical for the quality of expectations. Expectations might also be unreasonable, irrational, immoral or antisocial.

Secondly, "Quality standards" have not been developed starting from "Expectations" of beneficiaries, thus lowering the "construct validity" of the whole quality assessment process. Furthermore, no evidence is provided to show that observing "quality standards" leads to superior quality.

Setting irrelevant and even detrimental quality standards and performance indicators for quality of education

Performance indicator B.2.1.1. (ARACIS, 2006, E) states that, in order to demonstrate a good quality of a program of study, at least 70% of the graduates should find employment consistent with the level of their studies within two years from graduation. This vision seems consistent with a centrally planned state economy rather than with a free enterprise market economy. A free market economy would encourage graduates to use entrepreneurial skills in order to develop their own businesses and *become employers*.

This is just one of a long list of examples that suggest how persistent are the thinking patterns of the communist model of society, and how detrimental their impact is, not only on the quality of education.

Depleting financial resources of universities

The ARACIS methodology and subsequent regulations ask for an external quality assessment visit and a favourable decision on accrediting a program of study *before* a university may be allowed to enrol students for it.

For a postgraduate program, ARACIS would usually set an enrolment limit of 50 students per program. Out of the fees that an independent university *might collect*, should a program be accredited, 35-38% would be used in advance to cover the fees for the external quality assessment visit.

Having an independent university pay 35-38% out of the money that it *may or may not collect* for the first year from students of a program that *may or may not be accredited* does not seem to help improve the quality of education.

Depleting time, creativity and motivation resources of universities

The image bellow shows the documentation a university has to prepare for the domestic external quality assessment agency, for just *one program of study* (left – seven volumes with more than 1,500 pages), in contrast with the documentation prepared for a quality assessment visit of a team from European Universities Association for the accreditation of a whole university (right, less than 250 pages, annexes included).

Plate 1. Documentations prepared according to ARACIS versus EUA requirements

Generally, one set of self-assessment documents that should be submitted to the domestic external quality of education assessment agency amounts to 1,500 pages for a program of study. The volume of documentation for a University is even larger.

An average Faculty with 3-5 programs of study may have to prepare 2 - 3 such applications every year, as it may want to launch a new graduate or postgraduate program, to have accredited one that has already been authorised five years before, to obtain a better ranking for one that has already been accredited with “Limited confidence” grade, or finally, to renew accreditation after five years for another program. This would require about 5,000 pages of documentations be prepared every year, containing new documents, documents with formats revised by the quality assessment agency or updated documents.

The amount of work involved is huge and has a significant negative impact on time and talent management, creativity, motivation and institutional ethos.

Lowering capability of higher education institutions to respond to identified training and research needs

It may take months of hard and resource consuming efforts to prepare just one 1,500 pages application in order to have a new program of study authorised. Additional time will be lost waiting for the new academic year to begin and (eventually) enrol students. It is not uncommon to have all the work and prospective fees lost, while the idea will be used by competitors.

Raising levels of institutional anxiety and incertitude

In Romania, external quality assessment is not used as a basis for recommendations to improve education quality, but rather as a basis to decide on continuing or discontinuing the existence of programs of studies or even higher education institutions (ARACIS, 2006, E). Both grades allocated to programs of study or institutions and also consequences associated to grades *do not take into account the sources of funding*, for example budget allocations or tuition fees collected from students.

This generates a high level of institutional anxiety and incertitude. Faculty members become ever more preoccupied of their future occupational status.

Lowering attractiveness of higher education teaching and research

Faculty members see the content of their activity change to include ever larger sections of writing documentations and reports for quality assessment agency. There are indications that such components may occupy up to 60% of job related time (Lisievi, Ticuşan, Todor, 2012).

Apart from wondering about having a job in the near future, faculty members begin to wonder if their jobs are worth keeping.

Restricting capability of managers to function as models for younger members of faculty or students

Heavily involving the teachers in management positions in writing documentations and reports and preparing for visits from various external quality assessment teams, forces

managers to “delegate” their teaching responsibilities and become vulnerable on both professional and moral levels.

Chancellors and Deans sending their Assistants to teach is rather commonplace in Romania and is certainly not conducive to a sound academic climate.

In the real life, such persons are being paid for teaching they do not have time to deliver, while junior faculty members do not get paid for teaching they actually do.

Allowing assessment judgements to be influenced by conflicting interests of competing institutions or individuals

In Romania it is generally accepted that free competition and initiative are desirable and that the state is a poor administrator, *with the notable exception* of the education sector. Representatives of state funded universities feel they are entitled to a superior status and may use their position in assessment teams to consolidate this perception.

There has recently been an attempt to nominate the Chancellor of an independent university as Minister of Education. A large number of professors from state funded universities protested, arguing that there is a chance that support for independent universities from the government might eventually increase. Finally, the nominated Minister of Education had a state funded university background.

Encouraging dishonest strategies to boost scientific productivity

The need to score better in quality of education assessment generated, among other things, an increased pressure to publish in top international scientific journals. This led to setting up groups of 5-10 or more academic staff members using the following strategy: Each group member will prepare and submit a scientific paper to an international science journal, including *all the other members* of the group as co-authors. By the laws of probability, there will be a dramatic increase in the chances for every member of the group to score points as first author or co-author.

There seems to be a very recent development of this approach: Informal small groups of experts or consultants started to produce and sell ISI publishable papers. “Investing in one’s CV” has become a key phrase for people willing to use this strategy in order to climb to senior positions in universities.

Discouraging cooperation and communication between competing universities, departments or faculty members

Freely exchanging information and ideas is one key component of academic life. Misdirected and misused quality assessment in Higher education may generate communication blocks, status competition and conflicts and disseminate the idea that one's University will do better should competing universities cease to exist. The very essence of university may be as such corrupted.

DISCUSSION AND CONCLUSIONS

The idea of assuring quality in Higher education by setting up set of criteria and standards and then verifying to what degree the universities align to them seems, at first sight, reasonable and indeed very tempting.

However, "standard" and "standardization" are rather associated with uniformity, with efficient mass production, while quality is rather associated with creativity, diversity and freedom. High quality products of any kind are frequently "personalized", "custom made" or "client tailored". Having all the higher education institutions look alike and behave alike is an approach that is counterproductive from the quality point of view. Programmes of study that could appear of little relevance for the current social awareness may prove of extremely high value fifteen years from now.

Moreover, creativity and intuition are difficult to measure, before the culture system is ready to understand and accept the elements of novelty. We *cannot* measure what does not yet exist, nor processes leading to the creation of yet non-existent skills, competencies or academic qualifications.

The "Nutty Professor", usually the most creative and respected by the students does not fit into this quality assurance paradigm.

Attempts to boost the face validity of quality assessment and assurance by generating an ever larger number of standards and performance indicators will only lead to have the system collapse under the weight of activities not directly related to teaching and research.

Using a top-down strategy in setting up and implementing a quality assessment and assurance in Higher education will increase the number of potential risks.

The main risk will always be to obtain results that are completely opposed to the ones intended, by depleting institutional resources and deteriorating organizational climate, motivation and morale.

Such risks should always be acknowledged and assessed before, during and after putting in place a quality assurance system.

CORPORATE SOCIAL RESPONSIBILITY AND STAKEHOLDER STRATEGIES: THE IMPACT IN RISK MANAGEMENT

Lizarzaburu, Edmundo R.*

Universidad Esan, Perú, elizarzaburub@gmail.com

ABSTRACT

Nowdays, Corporate social responsibility has been studied by several authors, some of them focus in stakeholder theory, which has been proposed by many authors such as Freeman, 1984; Mitchell et al., 1997; Kaptein and Van Tulder, 2003 and Aguinis & Glavas, 2011. These studies have identified some relationships between financial results, management and development of business strategies. One of these strategies identify, is related to how the groups of interest impact in risk management and particularly in reputational risk in the organizations. This paper seeks to identify the theoretical framework related to these two variables (interest groups and reputational risks). Besides, the future study will focus in an emerging market country.

Keywords: Corporate Social Responsibility, Stakeholders and Reputational Risk.

INTRODUCTION

Corporate social responsibility (CSR) has become important in the strategic planning of businesses in the productive sectors such as mining and agriculture (Serenko and Bontis, 2009; Wagner, Lutz, and Weitz, 2009; Wartick and Cochran, 1985 Wood, 1991 and 2010; Werther and Chandler, 2006). These plans of CSR produce positive impacts on the business community and encouraging sustainable social and economic development in time (Galán, 2006).

It is noted that the presence of CSR in the extractive industries and production has been important in recent years, but only recently is being incorporated in the financial sector (Peloza, 2009, 2011, Lindgren, et al., 1999) to Because of the different social damage it has caused financial crises.

A review of literature shows two lines of research that are addressed in this document (Wartick, 2002; Fombrun and Van Riel, 2002, Dalton and Croft, 2003) and are applied to Peruvian financial entities. First, measure the impact of CSR on social and economic development of the community (Garriga and Melé, 2004), and secondly the importance of CSR in building corporate reputation (Rayner, 2003; March and Shapira, 1987).

The main aspect is about the impact and scope generated because, if the company decides to incorporate CSR into their strategic planning from the point of view of stakeholders, that is, considering all stakeholders associated with the company, then the perception of stakeholders on the actions and commitments of the company is positive, which strengthens the business reputation and reduce reputational risk.

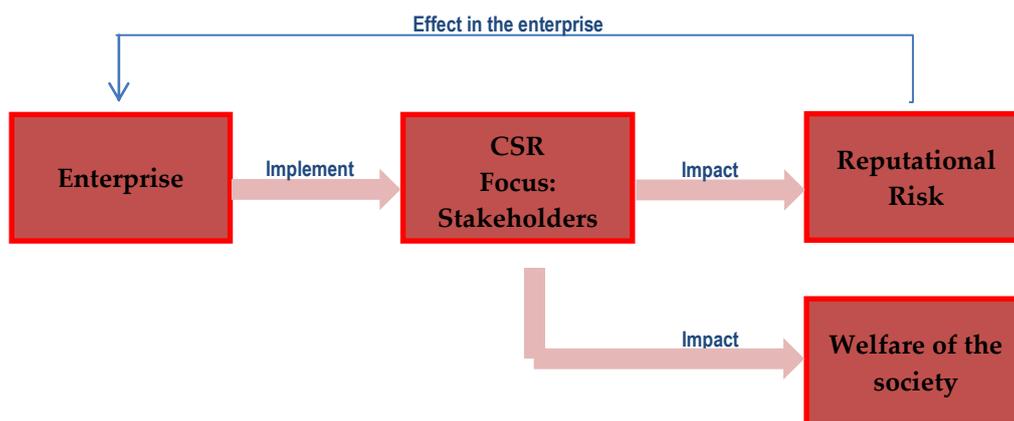

Also, two theories hold this research: the first is the theory of CSR from a viewpoint of stakeholders (Freeman, 1984; Mitchell et al., 1997; Kaptein and Van Tulder, 2003; Aguinis and Glavas, 2012), the second is the theory of corporate reputation and reputational risk associated (Marcus and Nichols, 1999).

Figure 1 shows the relationship between CSR and reputational risk. First, the implementation of plans under the focus of CSR stakeholders will have a significant impact on reputational risk and welfare of the community.

When considering all stakeholders associated with the company, then seek CSR plans intereres align with the business community, allowing these plans to meet the priorities of the community. At alcanzarce above reduces the probability of a particular interest group has not been considered, which will strengthen corporate reputation and reputational risk associated decrease.

Second, reputational risk will affect the welfare of the company as they have a lower risk of reputational this is expressed in better benefits for shareholders.

LITERATURE REVIEW

The literature review is based on two theoretical pillars. The first is the theory of corporate social responsibility. In this theoretical framework emphasizes the vision of CSR stakeholders. The second is the theory of business reputation, which is associated with reputational risk.

Theory of Corporate Social Responsibility

Corporate social responsibility is the continuing commitment of business to contribute to sustainable economic development, improving the quality of life of its employees and their families and the local community and society at large (World Business Council for Sustainable Development - 2000 (WBCSD)).

According McElhaney (2009), corporate social responsibility is defined as a business strategy that is integrated with core business objectives and core competencies of the company. In addition, the author indicates that CSR is designed to create business value.

The concept of corporate social responsibility is not new (De Bakker et al., 2006), but as an idea had already been taken into account in the early part of the twentieth century, the modern study was pioneered by Howard R Bowen et. al. (1953) who suggested that companies should take into account the socio-economic consequences of their decisions.

From the nineties and is not considered to corporate social responsibility as an isolated phenomenon within the company but cuts across the different areas of the organization (Manen, 2001).

Carroll et. al. (1979, 1991, 1999) establishes four levels of corporate social responsibility, as shown below (see figure 2).

Figure 2: Carroll's Pyramid

Source: Carroll et al, (1991)

Drucker (1996) complements this view by stating that each organization must assume full responsibility for the effect it has on their employees, the environment, customers and anyone or anything that extent, this is considered CSR²⁴. Based on the authors revised corporate social responsibility can be defined as how to manage or lead a company or organization in a manner that meets or exceeds expectations ethical, legal, commercial and public expectations that society has in relation to companies.

In short, according to the literature reviewed, CSR involves the simultaneous fulfillment of economic responsibilities, legal, ethical and philanthropic. In addition, CSR must take the business to make a profit, obey the law, be ethical and CSR behaves as a good corporate citizen. The following table shows research and studies realized on the basis of corporate social responsibility (see Table 1).

Table 1: Researches about the relationship between CSR and strategy and stakeholders

Studies on the relationship of CSR to Strategy	
Mc Williams et al. (2006)	Develop a conceptual framework are strategic implications of CSR
Studies of the relationship between corporate social performance and financial performance

Critical analysis of the influence of corporate social performance and financial performance corportivo connection	
Rowley & Berman (2000)	Conditions under which groups of participants perform their actions to influence the company

Source: Different authors

Elaboration: Own

Aligned with Garriga and Melé (2004), theories of CSR presents four common dimensions: benefits, political action, social demands and ethical values. Under this premise, the authors classified the theory in four blocks as the emphasis each theory does in any of the four dimensions: instrumental theories, political theories, integrative theories and ethical theories.

²⁴ Drucker, P. La gestión en tiempos de grandes cambios. Ediciones Gestión 2000 S.A. 1996, p. 83.

Instrumental Theories.

Under this approach the company is seen solely as a tool for wealth creation, and social activities as a means to economic performance. In this group of theories include two approaches (Friedman, 1970, Windsor, 2001; McWilliams and Siegel, 2001, Carroll, 1979).

The first refers to the maximization of shareholder value as the supreme criterion for assessing corporate social activities.

The second focuses on strategies for competitive advantage. This latter group of theories presents three approaches:

The first approach is the social investment in a competitive context (Roman and Slopes, 2008; Sen et. Al., 2001). Advocates of this approach argue that investment in philanthropic activities can be used to improve the context of a firm's competitive advantage as it usually creates social value than they can create individual donors or government.

The second approach is the perspective of the firm and dynamic capabilities based on natural resources (De Pelsmacker et al., 2005; Obermiller et al., 2009). This approach holds that a company's ability to achieve better results than its competitors depends on the interaction of human, organizational and physical over time and organizational and strategic routines by which managers acquire these resources, the modified , integrate and combine to generate new value-creating strategies.

Finally the third approach focuses on the strategy for the base of the economic pyramid (De Matos and Rossi, 2006; Narwal and Sharma, 2008), in which some authors see an opportunity to innovate more than a problem. One way of addressing this issue is disruptive innovation: products or services that do not have the same capabilities or conditions as those used by customers in conventional markets and, therefore, may not be introduced for new or less complicated between nontraditional customers with a low production cost and adapted to the needs of the population.

Integrative theories

In these theories the company focuses on capturing, identifying and responding to social demands. This claim social legitimacy and greater acceptance and social prestige. This group includes the management theories of social affairs, the principle of public accountability, the management of the groups involved (stakeholders) and corporate social action (Freeman, 1984; Mitchell et al., 1997; Kaptein and Van Tulder, 2003; Basu and Palazzo, 2008).

The management of socio-economic issues, defined as the processes by which the company identifies, evaluates and responds to social, economic and political factors that may significantly affect (Barone et al, 2000).

The principle of public responsibility. This principle holds that appropriate business behavior derived from relevant public policy, including the general pattern of social direction reflected in public opinion, emerging issues, legal requirements and formal execution or enforcement practices (Bowen, 1953).

The management of the groups involved (stakeholders), a people-oriented approach that influence or are influenced by policies and corporate practices. Its advantage is the increased sensitivity of the firm to its environment, but also a better understanding on the part of the agents of the dilemmas facing the organization (Aguinis and Glavas, 2012, Agle et. Al., 1999; Andriof et.al. , 2002; Baro, 2011).

Reputational Enterprise Theory

In the literature there is a range of definitions of corporate reputation, however, they all share one thing in common: that the expectations and perceptions of the stakeholders involved with the company determine the degree of reputation for this. The following table is indicative of the main definitions of business reputation.

Table 2: Corporate Reputation Definitions

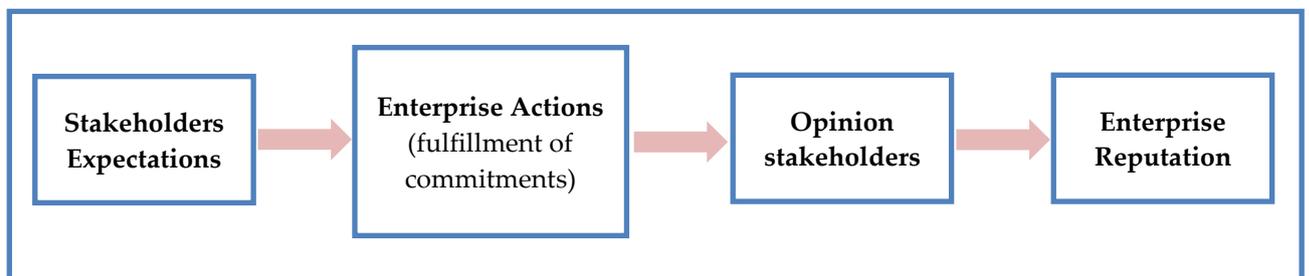

Author	Definition
Wartick (2002)	Adding perceptions of each of the participants on how the organization responds and meets the demands and expectations of the stakeholders of the organization.
Fombrun & Van Riel (2002)	Collective representation of past actions and results that describes the company's ability to deliver this value to various internal and external stakeholders.
Chun (2005)	Sum of the values that stakeholders attach to the company, based on their perception and interpretation of the image that the company communicates and behavior over time.
Ferguson, Deephouse y Ferguson (2000)	Knowledge of the true characteristics of a company and the emotions they feel towards it stakeholders.
Villafañe (2002)	Recognition that the <i>stakeholders</i> of an organization make corporate behavior through the degree of compliance with its commitments in relation to their customers, employees, shareholders and the community.

Fuente: Garicano (2011)

It is hoped that the various stakeholders have different interests and different expectations, so that corporate reputation depends on crossing those expectations with actual experiences resulting from compliance or non-compliance of the commitments made by the company.

In this regard, the company should consider in their strategic planning principles that will address the relationship of this with the stakeholders involved. By knowing the company, the interests of all stakeholders, then plans to undertake corporate social responsibility may contempar all those needs (interests). This will allow the perception of stakeholders on the actions of the company is good, which helps to improve the reputation of the company (see figure 3).

Figure 3: stakeholders expectations and corporate reputation

Elaboration: own

In line with the above, corporate reputation is the result of confronting what the company is committed to do, and what really makes and the view of the stakeholders in this regard. This means they must align objectives and the values CSR declared by the company, with the behaviors and actions developed by this and the expectations of stakeholders.

Reputational Risk

Reputational risk can be defined as the possibility of loss or decline in the reputation of an organization in a way that adversely affects the perception that the social environment has on it, and to be an effect of direct or indirect loss in the value of a company (Rayner, 2003; March and Shapira, 1987; Bebbington, 2007).

Reputational capital, understood as the reputation earned or accrued until today, is influenced by the interaction between the companies with interest groups (stakeholders). Thus, this reputational capital is created when managers convince employees to work with commitment, to consumers to buy their products and investors to buy their shares; grows

when managers convince analysts and media to praise the company and recommend its units, and finally destroyed when stakeholders lose confidence in the managers, products, expectations or jobs.

In line with Vizcaino (2010), reputational risk can be classified into two types:

The first is situational reputational risk, which is characterized as immediate, that is, it is impossible to anticipate RSC him to control the situation (Marcus and Nichols, 1999). For example, a terrorist attack.

The second is expected reputational risk, to which the company can anticipate RSC to plan communication strategies to employ in order to minimize the consequences. For example, a company that plans to close a plant communication campaigns carried out in good time to explain the reasons and try to minimize adverse reactions.

CSR AND REPUTATIONAL RISK

Reputational risk can be defined as the possibility of loss or decline in the reputation of an organization. This loss of reputation affects the perception that the social environment (including stakeholders) has on the company producing direct or indirect loss in the value of the company (Rayner, 2003; March and Shapira, 1987; Bebbington, 2007).

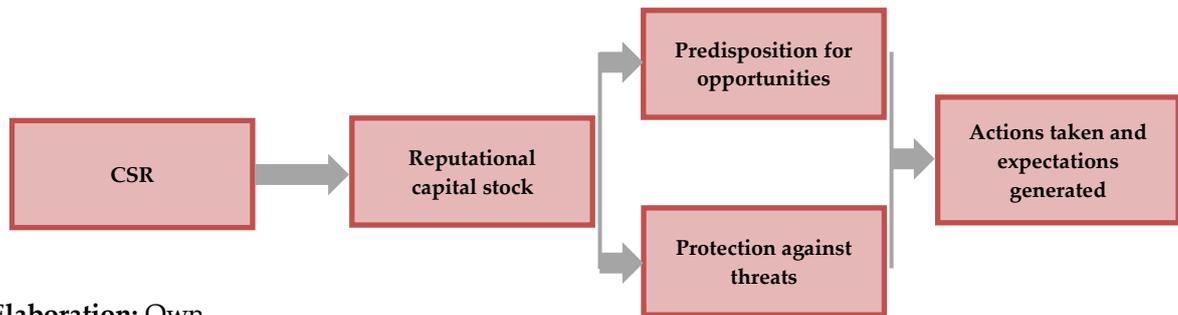

Vizcaino (2010) indicates that reputational risk can be classified into two types: the first is the reputational risk or immediate situational, that it is impossible to anticipate, such as a natural phenomenon (earthquake), which could affect the normal operation of the company. The second is the expected reputational risk to which the company can anticipate CSR activities in order to minimize the consequences. For example, a company that plans to close a plant communication campaigns carried out in good time to explain the reasons and try to minimize adverse reactions.

As above, CSR has an impact on reputational risk. Since the company's reputation depends on the perceptions of stakeholders, then each of them is a source of risk to be managed through the company CSR plans. In addition, the company should manage their relations in respect of these stakeholders (Pfeffer and Salancik, 1978; Turban and Greening, 1997; Wagner et. Al., 2009).

CSR is part of a cycle through which companies generate reputational capital, manage reputational risk and improve their performance. Companies invest in corporate social responsibility, which generates a reputation capital stock that is used for two purposes: firstly, it is a launch pad for future opportunities and, on the other hand, current safeguards

assets, acting as buffer against the losses (Knox and Maklan, 2004; Ruiz, 2012). Through CSR programs is given cycle consistency and managed the reputational risk (see Figure 4).

Figure 4: CSR and generated expectations

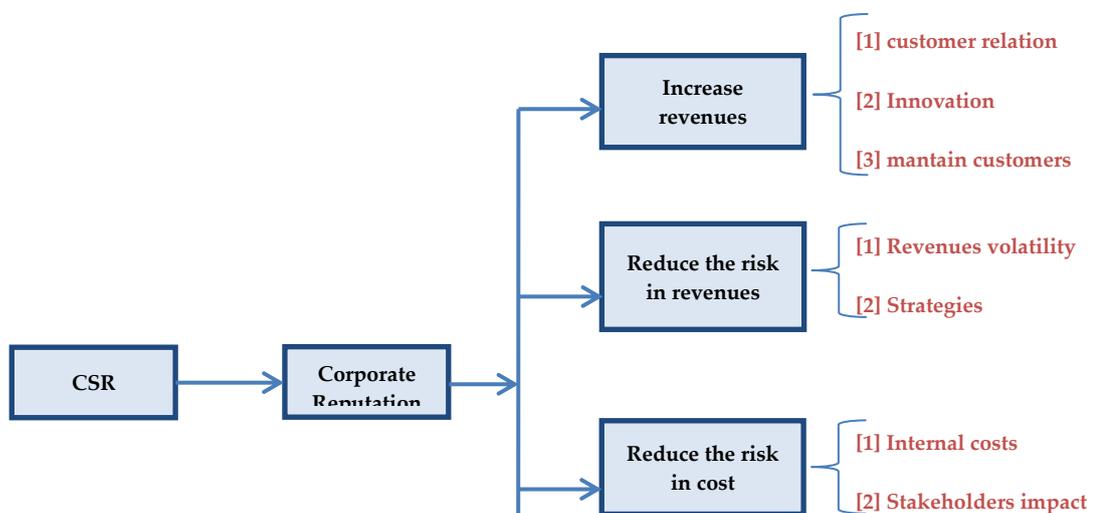

Elaboration: Own

CSR is part of a cycle through which firms generate reputational capital, manage risk and improve their performance reputation. Companies invest in corporate social responsibility, creating a stock of reputational capital that is used for two purposes: firstly, it is a launch pad for future opportunities and, on the other hand, current safeguards assets, acting as cushion against losses. Through CSR programs gives consistency to the cycle and manages reputational risk (see figure 4).

According to Knox and Maklan (2004), the final effects of CSR on corporate reputation pueden divided into four categories: earnings, risk associated with the loss of earnings, cost risk and cost reduction (see figure 5).

Figure 5: Effects of the relationship between CSR and corporate reputation

COMMENTS

The research will study the groups of stakeholders corporate social responsibility (CSR) strategy and the impact in reputational risk. It also can analyze the risk management (RM) from the perspective of standards such as COSO ERM II and ISO 31000 guidance and to what extent the GI impact on GR.

One contribution of this work is that it will consolidate not only the number but the types of stakeholders or "stakeholders" of the Peruvian financial sector companies.

Today, CSR has been studied and has been adopted in various organizations, but the importance of considering the stakeholders of an organization, in the management of risks is a rarely explored.

The implications that this work are large because it represents the beginning of an investigation that should allow detailed knowledge variables and factors that determine the behavior of interest groups, but the connections with organizational risk and their management in of financial markets.

Furthermore, it is expected that this work will consolidate standardization systems that are characterized by involving your group interested in developing internal plans to improve service and ensure business continuity, this being part of risk management.

A review of literature shows three important conclusions. The first is that CSR has a positive impact on the reputation of the company. This finding not only theoretical (between different conceptual approaches) but also empirically. However, found that research in this field are mainly oriented towards developed countries. This is important because it opens a line of research that involves the application of the theoretical framework of CSR and Corporate Reputation (CR) in developing countries.

Another conclusion is that among the various approaches to corporate reputation, which emerges as one who considers the perceptions of all stakeholders is the relational school. This is important because it allows integrating theories related to the RSC. From the literature

review found that this aspect has not been addressed the relationship between CSR and the CR from a stakeholder perspective.

Z – ALTMAN REVIEW. THE CASE OF BEVERAGE COMPANY IN LATAM

Lizarzaburu, Edmundo R.^{*1}; Berggrun, Luis²; Ostos, Jhony³

¹ESAN University, Lima, Perú, elizarzaburub@gmail.com

²Universidad Icesi, Colombia, lberggru@icesi.edu.co

³Universidad Esan, Perú, jostos@esan.edu.pe

ABSTRACT

In recent years, the growth in beverage industry has been important. Overall, statistics show that Latam companies have presented a good financial performance. However, this performance could be highly questionable and, questions like what is going to happen in the next years in the industry or how likely a failure or bankruptcy could be experimented and needs to be answered. So, in order to answer those questions, an analysis is done by Ivan Vonne, a senior analyst.

The method applied to this assessment is the Z-Score method developed by Altman in 1968. The literature review helped us to identify three types of Z-score, one developed by Edward Altman in 1968 called “Z-Score Model”, the other improved by Edward Altman in 1984 called “Company and Country Risk Models” for private companies and the last one improved by Altman, Hartzell y Peck in 1995 called “Emerging Market Scoring Model” (EMS Model) for non-manufactured companies and emerging market credits.

The paper, focus in a Beverage Industry. One company has been identified with operations in Peru and this company listed its equity in the Bolsa de valores de Lima (BVL, for its acronym in Spanish). The paper has an introduction about the Z- score literature, then it has an explanation about the Beverage industry in Peru and finally, the paper include the Z-score values of the company between 2009 and 2012.

Keywords: Beverage industry, financial strategies, financial statement analysis, Ratios, Z-score.

* The case was prepared with the collaboration of Miguel Angel Condor and Joselyn Kelly Avelino

1. INTRODUCTION²⁵

The Company “**Peruvian Beverage Inc**”²⁶ has decided to evaluate its performance in the previous periods in order to know the efficient level of the company’s operation in that time. In that way, the Chief Executive Officer (CEO) of Peruvian Beverage, Carlos Eley, has asked to his senior analyst, Ivan Vonne, to carry out a deep assessment of the company’s operation and know if it is possible that in the future the company will face negative trends.

With the aim to fulfill the assessment, Mr. Vonne will have to collect all available and necessary information that will be required to complete it. Due to the fast development of the market, Vonne plans to finish it in the next 20 days. In the same way, Mr. Vonne is bearing in mind the development of the industry to avoid any kind of mistake.

In addition, Peruvian Beverage, as other companies in the same industry, listed its equity in BVL (Bolsa de Valores de Lima) and, reports its financial statement to Superintendencia del Mercado de Valores–SMV (capital market regulator). Besides, the audited information is also available in the SMV web page.

In this way, Mr. Vonne requested a distress meeting, where the data gathered will be reviewed and some future projects will be discussed and beared in mind. The meeting was on January 10th of 2013 and was made up by Mr. Vonne, Carlos Eley (Financial area CEO of Peruvian Beverage) and Ronald Pantia (Vice-president of Peruvian Beverage).

During the meeting, Mr. Pantia introduced a brief history about the company performance, how they have grown since it was founded a long time ago. Likewise, he mentioned some successful agreements and failed projects that have been experienced. Despite of the good results in last year, Mr. Eley mentioned some financial distress recently experienced. In addition, Mr. Vonne talked about the Z-Altman Model, and explained who used it, how it works and how efficient it could be for the analysis.

2. LITERATURE REVIEW

The Z - Score model is the distillation into a single measure of a number of financial ratios duly elected, weighted and aggregated. If the derivative Z - Score result exceeds a calculated

²⁵*Class &Asociados S.A., Pacific Credit Rating.*

²⁶*The name of the company was changed for the case.*

score, the firm is classified as financially healthy, if it is below the cutoff, is typically seen as a potential failure (Altman, 1968).

Besides, Altman (1968) explains that the selection of the independent variables, Altman initially joined a group of 22 ratios that were applied to both subsamples of firms companies.

The selection of these ratios was based on the following three criteria:

- a) Because of its popularity in the literature,
- b) Relevance to the study power,
- c) For the innovative way that some ratios presented in the analysis.

Likewise, the 22 ratios were reduced to five factors that mediate: profitability, activity, liquidity and solvency.

For Altman, five factors were shown to be the best combinations for discriminating between bankrupt firms and companies without bankruptcy. However, this author indicated no basis to split into five categories your model, and if in fact these categories were the most representative at large and independent to predict bankruptcy.

In addition, the model was originally developed to analyze only industrial companies (construction and manufacturing), on the other hand it was applied to different models developed for retail and service businesses. As Peek & Rosengren (1996) recognize "is easy to identify a troubled bank at the time of its bankruptcy.

The Z - score Model, for some reason, seems to generate a lot of emotion and trying to prove they really work (Morris, 1997). However, much of the concern about its use is based on a misunderstanding of what is and what is not and what it is designed to do and not to do.

A brief explanation of the three Z - Altman models are going to be presented in next paragraphs:

- **Z-score Model.**

The final discriminant function is as follows:

$$Z = 0.012X_1 + 0.014X_2 + 0.033X_3 + 0.006X_4 + 0.999X_5 \text{ — — — — — (I)}$$

Where X_1 =Working capital / Total assets
 X_2 =Retained Earnings / Total assets

X_3	=Earnings before interest and taxes / Total assets
X_4	=Market value equity / Total liabilities
X_5	=Sales / Total assets
Z	= Overall Index

X_1 — *Working capital/Total assets*. This ratio, often found in studies of corporate problems, is a measure of the net liquid assets of the firm relative to the total capitalization. Working capital is defined as the difference between current assets and current liabilities. Liquidity and size characteristics are explicitly considered.

X_2 — *Retained Earnings/Total assets*. This measure of cumulative profitability over time was cited earlier as one of the “new” ratios. The age of a firm is implicitly considered in this ratio. The incidence of failure is much higher in a firm’s earlier years.

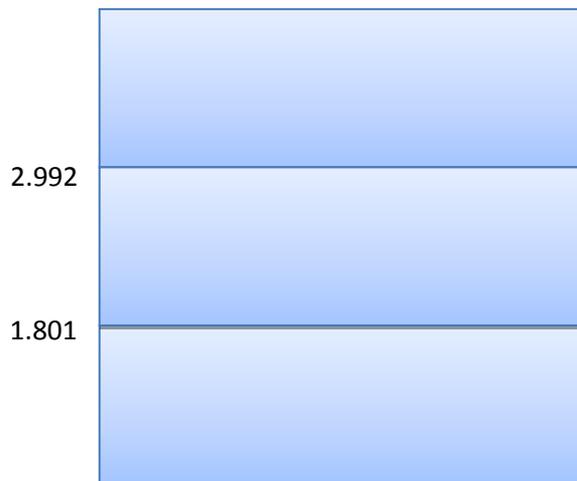

X_3 — *Earnings before interest and taxes/Total assets*. This ratio is calculated by dividing the total assets of a firm into its earnings before interest and tax reductions. In essence, it is a measure of the true productivity of the firm’s assets, abstracting from any tax or leverage factors.

X_4 — *Market value equity/Total liabilities*. Equity is measured by the combined market value of all shares of stock, preferred and common, while debt include both current and long-term. The measure shows how much the firm’s assets can decline in value (measured by market value of equity plus debt) before the liabilities exceed the assets and the firm becomes insolvent. It also appears to be a more effective predictor of bankruptcy than a similar, more commonly used ratio: Net worth / Total debt (book values).

X_5 — *Sales/Total assets*. The capital turnover ratio is a standard financial ratio illustrating the sales generating ability of the firm’s assets. It is one measure of management’s capability in dealing with competitive conditions. This final ratio is quite important because, as indicated below it is the least significant ratio on an individual basis. In fact, based on the statistical significance measure, it would not have appeared at all.

Source: Altman (1968)

In next Graphic, we can observe the solvency area. If the result is under 1.80 (Distress zone) the company is susceptible to bankrupt. If it is between 1.80 and 2.99 (Grey Zone) it is likely that the company will not bankrupt. If it is above 2.99 the company is highly probably to continue in the market and with good financial health.

Graphic N° 1 – Solvency Area (I)

- **The Z-score estimated for private firms**

In 1984, Altman edited 20 articles which tried to improve his model to measure the firm's risk. In that way, a lot of studies were carried out in countries highly industrialized such as Germany, Australia, France, Italy, United Kingdom, Japan and Israel. Finally, Altman called this new method as "Company and Country Risk Models". (Ibarra, 2001).

The final discriminant function is as follows:

$$Z = 0.717X_1 + 0.847X_2 + 3.107X_3 + 0.420X_4 + 0.998X_5 \text{ --- (II)}$$

Where	X_1	=Working capital / Total assets
	X_2	=Retained Earnings / Total assets
	X_3	=Earnings before interest and taxes / Total assets
	X_4	=Book value of equity / Total liabilities
	X_5	=Sales / Total assets
	Z	= Overall Index

X_1 — *Working capital/Total assets*. As in the original or first formula of Altman, this ratio shows the value of the company according to the total assets level. Most of the companies relate this results to its liquidity performance. As we mention previously, working capital is defined as the difference between current assets and current liabilities.

X_2 — *Retained Earnings/Total assets*. In recent years, this measure of cumulative profitability was considered one of the most important ratios for firms. Here we consider how long the company has stayed in the industry. It's likely to failure in a firm's earlier years.

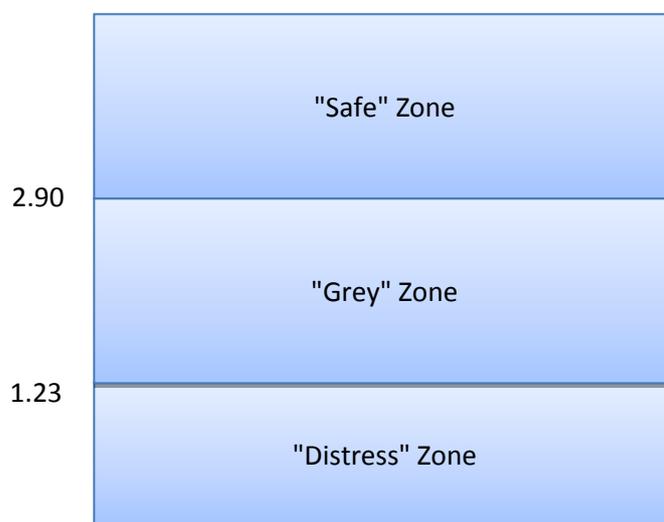

X_3 — *Earnings before interest and taxes/Total assets*. This ratio is a measure of the true productivity of the firm's assets, independent of any tax or leverage factors. So, it can show a more accurate result if accounts, such as interest and taxes that are related to liabilities, are not considered.

X_4 — *Book value of equity/Total liabilities*. Much of the firms do not have place in market stock. So, these kinds of firms cannot be assessed by ratio of Market Value equity. That is why after some studies, Altman figured out that consider the book value of equity will allow any kind of firm to be assessed under the new Z – Score model.

X_5 — *Sales/Total assets*. The return on assets (ROA) gives an idea as to how efficient management is at using its assets to generate earnings. However, this ratio is considered a weak ratio for the formula, because it barely is able to discriminate as a ratio.

In next Graphic, we can observe the solvency area. If the result is under 1.23 (Distress zone) the company is susceptible to bankrupt. If it is between 1.23 and 2.90 (Grey Zone) it is likely that the company will not bankrupt. If it is above 2.90 the company is highly probably to continue in the market and with good financial health.

Graphic N° 2 – Solvency Area (II)

- **The Z-score estimated for non- manufacturer industrial and emerging market credits.**

In 1995, during investigations with Hartzell and Peck, Altman adapted his model to emerging markets in order to bring forward a new global predictive indicator sole for this kind of markets. This new indicator was called "Emerging Market Scoring Model" (EMS Model).

“The final discriminant function is as follows:

$$Z = 6.560X_1 + 3.260X_2 + 6.720X_3 + 1.050X_4 \text{ — — — — — (III)}$$

Where	X₁	=Working capital / Total assets
	X₂	=Retained Earnings / Total assets
	X₃	=Earnings before interest and taxes / Total assets
	X₄	=Book value of equity / Total liabilities
	Z	= Overall Index

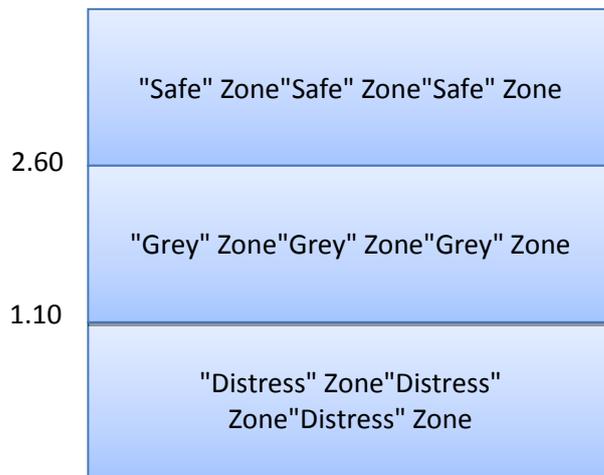

X₁ — *Working capital/Total assets*. This ratio measures the capital that the company owns and how well it is distributed in their assets. According to this ratio, investors can follow the performance of the company assessing the asset-s behavior.

X₂ — *Retained Earnings/Total assets*. This ratio measures the firm's ability to accumulate earnings using its assets. A higher ratio is preferable because it indicates that the company is able to retain more earnings. However, it is also related to the investors, because here the company discuss if earnings must be distributed or not.

X₃ — *Earnings before interest and taxes/Total assets*. Earnings before interest and tax (EBIT) to total assets ratio indicates a proportion between the measure that shows company's profitability and company's assets. In short, it represents general profitability of the company's assets.

X₄ — *Book value of equity/Total liabilities*. The book value of equity represents the equity of shareholders (from a balance sheet perspective) less the preferred stock. So, this result shows the value of the equity according to level of debt and the financial strength of the company just with the equity.

In next Graphic, we can observe the solvency area. If the result is under 1.10 (Distress zone) the company is susceptible to bankrupt. If it is between 1.10 and 2.60 (Grey Zone) it is likely that the company will not bankrupt. If it is above 2.60 the company is highly probably to continue in the market and with good financial health.

Graphic N° 3 – Solvency Area (III)

3. PERUVIAN BEVERAGE INDUSTRY²⁷

The availability of information in the industry is considered an important point for any kind of investment, and also it's even more important for the legal and regulatory aspects.

The food processing industry in Peru is made up of:

1. **Water treatment:** Water main component in the production of beverages. It is mainly obtained from underground wells. This is brought under to a purification and sterilization process, which uses a chemical treatment and various stages of filtration.
2. **Preparation of syrups:** At this stage, sugar and water are mixed, and "simple syrup" is obtained. Then, this is filtered at low pressure to remove impurities. Syrup essence is added to it. This last step gives the finished syrup.
3. **Mix, carbonation and filling:** More water is added to the finished syrup. Then, it is drifting towards hermetic tanks, where it is cooled and saturated with carbon dioxide. In this way, the mixture is ready to move to the filling machine, where it proceeds to bottling. The product, that reaches the filler, is pumped into the bottles, which are sealed with tight lids.
4. **Development of bottles:** The soft drink industry uses two types of containers: returnable and non-returnable. Investment in machinery is higher in the case of bottled of returnable containers, since it is necessary additional production lines to control the quality of them. It is estimated that the cost of installing a production line of returnable containers is 4 to 5 times more expensive than the one for a line of non-

²⁷Class & Asociados S.A., Pacific Credit Rating

returnable containers. However, despite of the initial investment is more expensive, these containers are more profitable in the mid-term, depending on the rotation that is giving to the complete returnable packaging. Note that in addition to the initial investment in machinery, there is an investment in the container package. Thus, the greater the number of rotations that give this package, less the amount to amortize on each rotation. It is important to indicate that at this stage there are high production quality controls, which generate additional costs.

5. **Inspection, packaged and palletized:** filled and capped bottles are inspected in two ways: i) electronic inspectors to automatically separate the defective bottles and ii) with illuminated displays that allow visual inspection and manual separation of defective bottles. The bottles, which pass inspection, enter a machine that puts them in their boxes to finally make them to order on the platforms.
6. **Storage and transport:** The mentioned platforms are stacked neatly and then be carried by trucks. Finally, trucks distributed platforms with soft drinks to the determined points of sale.

As shown in Table 1. Sales level of the company and Figure 1. Evolution of sales level of the company and annually growth in percentage, there has been a continual growth since 2005. This increase reflects a possible tendency towards growth in the next years.

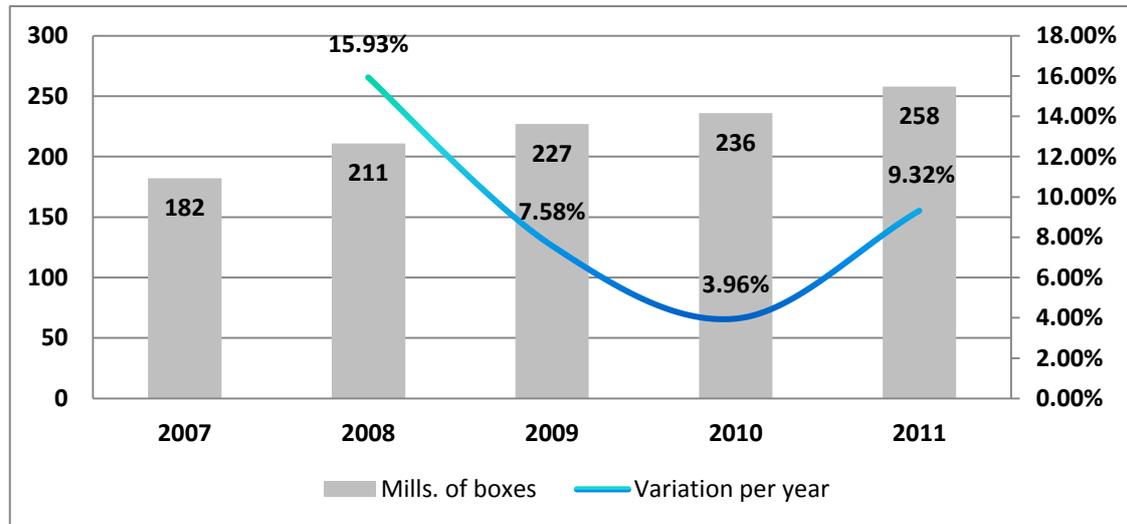

Table N° 1 - Sales level of the company

Year	2007	2008	2009	2010	2011
Mills. of boxes	182.00	211.00	227.00	236.00	258.00
Annually growth	—	29.00	16.00	9.00	22.00
Growth 11/10	9.32%				
Average variation	9.20%				

Source: Firm's annual report 2011

The Figure N° 1 - Evolution of sales level of the company (in millions of boxes) and annually growth in percentage files the amounts of boxes sold between the periods 2007 and 2011. In addition, as we can observe there is a growing trend in those 5 years assessed what means that the company is getting strong in the industry. However, the evolution per year had cut back on between the periods 2008 and 2010 and slightly increased in 2011.

Figure N° 1 -Evolution of sales level of the company (in millions of boxes) and annually growth in percentage

Source: Firm's annual report 2011

4. FIRM'S BACKGROUND AND OPERATIONS

Ivan looked interested in the explanation of industry. Nevertheless, he pointed out the importance of understanding company operations and knowing completely its financial situation in last periods.

First, he reviewed the information from BVL's web page (www.bvl.com.pe), SMV (www.smv.gob.pe) and the one provided by the firm. In those websites, he found relevant information about financial statements, cash flow and quotations of the diverse instruments that currently belong to the account.

It's important to mention some important facts of firm's history that belong to the firm Peruvian Beverage.

Peruvian Beverage inc. was founded by public deed in November 3 of 1928. The firm assumed the activities developed by Carbonated Beverages Factory established in 1910.

The principal activity of the firm is the development, bottling, distribution and sale of soft drinks, carbonated water, pulp and nectar. The company applies franchising to certain trademarks owned by companies related to the Group. When the company acquired shares of LATAM Bottler Company, in January 2004, the company became the exclusive bottler in the country.

Sales of the Company's products are made primarily to distributors in Lima and other cities within the country.

With respect to Stock market, the November 23, 2011, the Company entered into the international bond issue under rule 144A of the Securities Market Law of the Foreign Market for an amount of U.S. \$ 320 million to a rate of 6.75% and maturing on November 23, 2021. The earnings from this issuance were used internationally to restructure its liabilities and to finance its investment plan.

Commercial Management

The carbonated beverage segment is the most important in terms of sales volume, meanwhile the other categories have been showing higher growth rates in recent years, representing, in liters, 77% of sales volume and water categories, nectars and isotonic accounted for 16%, 4% and 1% by volume, respectively.

Our market share in the products we produce and sell at the end of 2011 was as follows:

Table N° 2 – Products participation

Participation	Line of Products
67.30%	Carbonated beverages
46.20%	Nectars
39.50%	Water
21.90%	Isotonic
15.50%	Energizing

Source: Firm's annual report 2011

The company has a market share of 67.30% carbonated beverages, about 6 times the share of its nearest competitor which has 12.20% of the market. It maintains leadership in the category.

This important market share is achieved in a scenario in which the company is recovering the value of the category, through the activation and marketing strategies that are being implemented by the company. Worth mentioning, the percentage of the market value of drinks was achieved in 2011, which shows the quality of our products that are preferred despite of its higher cost.

5. FINANCIAL STATUS

The financial information selected was obtained from the Peru Beverage's financial statements, which appear in its notes to the quarterly financial statements of the years 2010, 2011 and the first two quarters of 2012.

As we can observe in the Chart N° 2 – Assets composition 2012, there has been a reduce in accounts such as “Cash and equivalents” and “accounts receivable from related entities”. These minimal variations explains the reduce in last quarters of the total currents assets. On the other hand, the Non-current Assets has increased its value, what is mainly explained by the recurrent increase in accounts such as “Investment properties” and “Property, Plant and equipment (net)”.

Chart N° 2 – Assets composition 2012

Assets	31/03/2012	30/06/2012	30/09/2012
Current Assets			
Cash and equivalents	196,408	149,207	125,262
Other financial assets	148,460	166,491	161,957
Commercial accounts receivable (net)	151,239	149,099	169,619
Other accounts receivable (net)	24,561	31,616	29,832
Accounts receivable from related entities	68,485	69,720	31,131
Inventory	279,068	227,375	248,510
Prepaid expenses	14,268	12,761	11,703
Total Current Assets	882,489	806,269	778,014
Non-current Assets			
Other accounts receivable	21,613	21,539	21,556
Investment properties	112,062	111,964	157,438
Property, Plant and equipment (net)	1,133,268	1,154,553	1,182,556
Intangible assets (net)	1,223	1,079	904
Goodwill	305,555	305,555	305,555
Other Assets	2,177	1,926	1,954
Total non-current assets	1,575,898	1,596,616	1,669,963
TOTAL ASSETS	2,458,387	2,402,885	2,447,977

Source: Superintendencia del mercado de valores

In the following Chart, Chart N° 3- Liabilities composition 2012, the firm shows an increase in the account “Other Financial Liability” which seems to double from March to September. Besides, “Commercial accounts payable” represents around 40% of the Total Current Liability.

However, this last result explain less than the half of the Total Liability, since Total No current Liability is represented almost completely by “Other Financial Liability” which has been cut back on in less than a million in September.

Chart N° 3 – Liabilities composition 2012

Liability and equity	31/03/2012	30/06/2012	30/09/2012
Current Liability			
Other Financial Liability	36,424	47,879	75,669
Commercial accounts payable	280,904	290,168	308,821
Other accounts payable	121,207	94,506	111,068
Payable to related parties	117,483	80,172	67,493
Provisions	80,272	71,428	80,339
Liabilities for income tax	6,428	8,442	11,524
Total Current Liability	642,718	592,595	654,914
Non-current liability			
Other Financial Liability	1,031,294	1,006,537	970,578
Commercial accounts payable	2,930	0	0
Other accounts payable	0	20,250	18,053
Liabilities for income tax	38,968	37,828	39,597
Total No Current Liability	1,073,192	1,064,615	1,028,228
Total Liability	1,715,910	1,657,210	1,683,142

Source: Superintendencia del mercado de valores

What Chart N° 4 – Equity composition 2012 doesn't show much changes in last periods. Moreover, Capital maintains a recurrent level as well as Investment stock and Others Capital Reserve.

Favorably, the Accumulated profit has increased in last quarters. In addition, its structure is highly represented by the account "Capital" with more than 50%.

Chart N° 4 – Equity composition 2012

Equity	31/03/2012	30/06/2012	30/09/2012
Capital	580,981	580,981	580,981
Investment stock	71,966	71,966	71,966
Others Equity Reserve	13,819	7,266	7,500
Others Capital Reserve	8,682	8,682	8,682
Accumulated profit	67,029	76,780	95,706
Total Equity	742,477	745,675	764,835

As we can see in Chart N° 5 – Financial statement, in last quarters, the company filed a continual growth. However, it looks like in the first three months the company had a high sales level than in the others. Besides, "Cost of sales" represents around 67% of the Total common income activities.

It's important to highlight the same behavior in the "Net income of the exercise" as the "Total Common Income Activities". Also, it's important to mention that the company shows a high increase in the account "Difference exchange rate".

Chart N° 5 – Financial statement 2012

	31/03/2012	30/06/2012	30/09/2012
Total Common Income Activities	558,808	1,024,787	1,485,033
Cost of sales	-377,480	-694,518	-1,006,562
Gross profit	181,328	330,269	478,471
Selling and distribution expenses	-92,698	-177,344	-264,471
Administrative expenses	-22,309	-42,803	-66,108
Other operative income	10,999	22,902	29,389
Other operative expense	-21,018	-40,625	-69,595
Operating profit	56,302	92,399	107,686
Financial income	1,591	3,144	7,023
Financial expenses	-20,149	-43,940	-64,293
Difference exchange rate	10,441	12,490	44,325
Net income from participation	0	0	0
Net Book value	257	1,266	-442
Income before taxes	48,442	65,359	94,299
Income taxes	-19,497	-26,663	-36,677
Net income of the exercise	28,945	38,696	57,622

6. CALCULATION OF TWO MODELS OF Z-SCORING

The Z-scores used have the following structure:

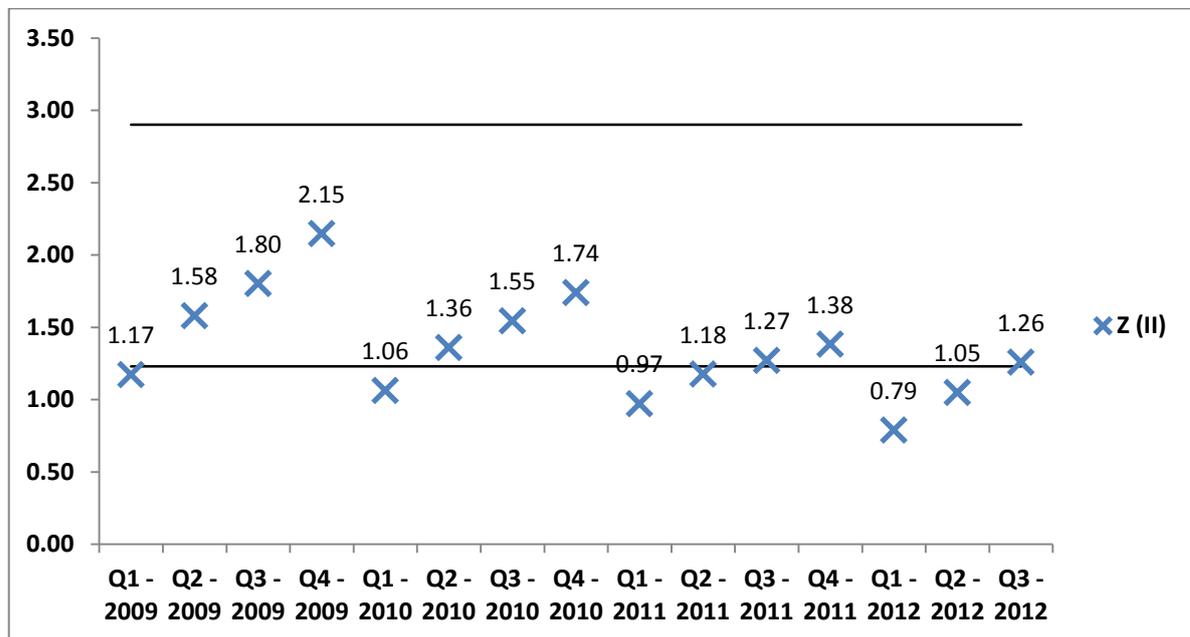

- **The Z-score estimated for private firms**

Using the formula (II) we have the next results:

Table N° 3 – Results of Formula (II) from 2009 up to September 2012

Period	Z (II)
Q1 - 2009	1.17
Q2 - 2009	1.58
Q3 - 2009	1.80
Q4 - 2009	2.15
Q1 - 2010	1.06
Q2 - 2010	1.36
Q3 - 2010	1.55
Q4 - 2010	1.74
Q1 - 2011	0.97
Q2 - 2011	1.18
Q3 - 2011	1.27
Q4 - 2011	1.38
Q1 - 2012	0.79
Q2 - 2012	1.05
Q3 - 2012	1.26

Figure N° 2 – Results evolution of Formula (II) from 2009 up to September 2012

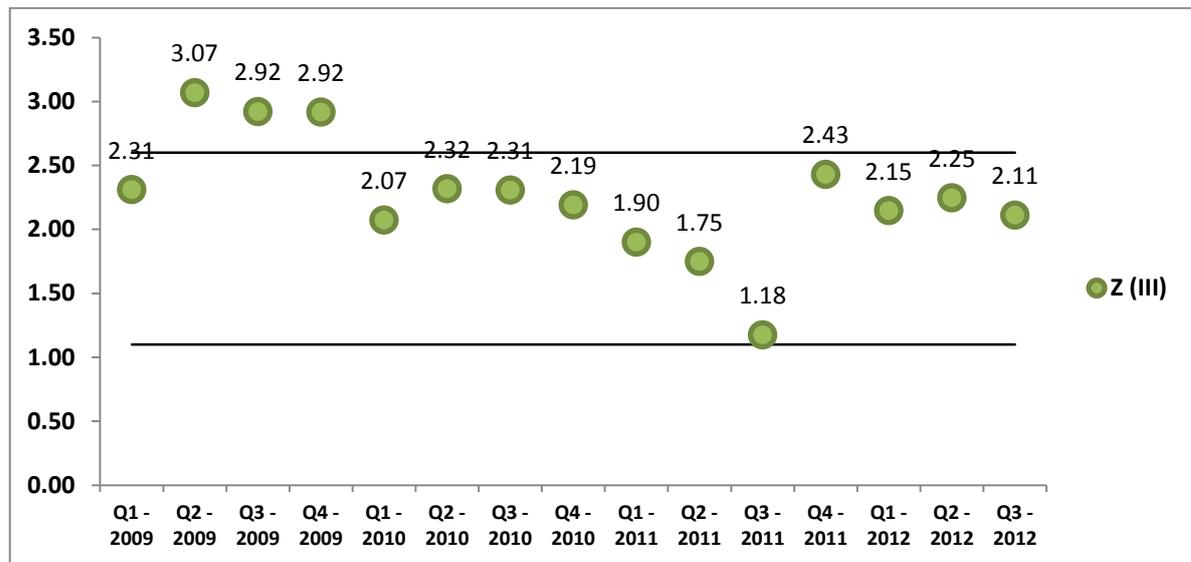

- The Z-score estimated for non- manufacturer industrial and emerging market credits.

Using the formula (III) we have the next results:

Table N° 4 – Results of Formula (III) from 2009 up to September 2012

Period	Z (III)
Q1 - 2009	2.31
Q2 - 2009	3.07
Q3 - 2009	2.92
Q4 - 2009	2.92
Q1 - 2010	2.07
Q2 - 2010	2.32
Q3 - 2010	2.31
Q4 - 2010	2.19
Q1 - 2011	1.90
Q2 - 2011	1.75
Q3 - 2011	1.18
Q4 - 2011	2.43
Q1 - 2012	2.15
Q2 - 2012	2.25
Q3 - 2012	2.11

Figure N° 3 – Results evolution of Formula (III) from 2009 up to September 2012

7. LIMITATIONS OF THE MODEL"

In a country like Peru, the financial figures may not reflect the reality of the business; it is possible that some data can be manipulated. The model itself can be a partial evaluation of any company as it only looks at financial data, and does not assess other important indicators such as market share, customer satisfaction, employee satisfaction, and other productivity indices, which are important for a further evaluation of the possibility of bankruptcy.

8. COMMENTS AND CONCLUSION

The credit scoring model developed by Altman is very useful in emerging markets, because it considers information that it is easy to access for the financial institutions. Besides, the formula II should be used with close information (ending year) in order to avoid problems with the results. The formula I could be used with quarterly information.

This paper investigates the Z score in a Beverage company over the time period 2009 – 2012 using yearly and quarterly observation intervals. About the company, the bankruptcy is not a real problem. In all case, the Z value is between the ranges called "Grey Zone" with a tendency to move to "Safe Zone"

A following study could be include more companies (for instance the companies listed in the Lima Stock Exchange Index) in the same country and compare it with others, for instance using MILA.

ABSTRACT

Previous researches are calling for more studies exploring the interaction effect of Aaker's (1991) brand equity dimensions and other variables on brand equity. Therefore, this study aims to contribute to the existing body of knowledge by examining the effect of seven variables on brand equity perceived by consumers. Findings reveal that brand loyalty, brand identification, trust, brand personality and brand awareness are the variables that have a greater impact on brand equity. Based on our findings, brand managers should be aware of the importance of building a brand regarding the way they communicate the features of the brand.

Keywords: brand equity, brand identification, perceived quality, trust, brand loyalty, brand awareness, brand associations, brand personality

INTRODUCTION

Brand loyalty has been a frequent research topic in marketing, special after works of Farquhar (1989), Keller (1993) and Aaker (1991). The concept of brand equity is often related to the Farquhar's approach (1989), which defines it as added value for the company, for the delivery, or for the consumer. Aaker (1991) defines as the sum of assets that are associated with the brand name, such as awareness, loyalty, perceived quality, as well as other proprietary assets. To Kapferer (1998), brand equity is a reflection of the consumer and a mental image of proposed values (brand identity). Keller (2003) claims that the basis of brand equity lies in brand knowledge and its positive associations. De Chernatony (2003) defines as a process, both internal and external to the organization, of offering a value proposal represented by the brand. Although in all these definitions the idea that brand equity adds value to the good or service emerges.

Previous researches have examined the effects of other variables on brand equity and its consequences (e.g., Yoo, Donthu & Lee 2000; Nam, Ekinci & Whyatt 2011; Loureiro & Miranda 2011). Nevertheless, to the best of our knowledge, no study has examined the

strength of the influence of brand identification, brand personality and relational variables on perceived brand equity in different consumption situations. The call for study the interaction effect of Aaker (1991) brand equity dimensions and other variables on brand equity has been pointed out in previous researches (e.g., Yoo, Donthu & Lee 2000; Nam, Ekinci & Whyatt 2011). Therefore, this study intends to contribute to the existing body of knowledge by examining the effect of seven variables on brand equity perceived by consumers.

The remainder of this paper is structured as follows. The next section presents the theoretical background of brand identification, brand personality, brand equity and the core assets of brand equity as proposed by Aaker (1991). Thereafter, the methodology of an empirical study is described, the findings are presented. Finally, the conclusions, limitations and suggestions for further research are drawn.

THEORETICAL BACKGROUND

Core assets of brand equity

According to Aaker (1991) and Keller (1993) there are four core assets of brand equity: perceived quality, brand loyalty, brand awareness and brand associations. More specifically, Aaker (1991) identifies four major consumer-related bases of brand equity and Keller (1993) proposes a knowledge-based framework for creating brand equity based on two dimensions: brand awareness and brand image, which integrate brand associations.

Yoo, Donthu & Lee (2000) demonstrated that the level of brand equity is related positively to the extent, to which brand quality, brand loyalty, brand associations and awareness are evident in the product (e.g., athletic shoes, camera film, and colour television sets). High perceived quality would drive a consumer to choose the brand rather than other competing brands. Therefore, to the degree that brand quality is perceived by consumers, brand equity will increase.

The concept of perceived quality has been broadly studied in the field of relationship marketing. Zeithaml (1988) defined perceived service quality as the customer's assessment of the overall excellence or superiority of the service. Grönroos (1984) defines service quality as an overall perceived judgment. Thus, perceived quality has been considered as an overall evaluation of the service. Despite Aaker's (1991) study recognises perceived quality as one of the components of brand equity, it does not specify whether this refers to goods or services and what dimensions should be considered. Therefore, in order to contemplate perceived quality for services, this study consider two dimensions: physical (functional) quality and staff quality (e.g., Ekinci, Dawes & Massey 2008; Grönroos 1984).

H1: Perceived quality has a positive effect on brand equity.

Brand awareness/associations are related to the strength of the brand node or trace in memory, as reflected by consumers' ability to identify the brand under different conditions (Rossiter & Percy 1987; Keller 1993). These awareness/associations represent the favourable, strong, and unique associations in consumer' memory. Brand associations and brand

awareness are positively related to brand equity because they can be a signal of quality and commitment and they help a buyer consider the brand at the point of purchase, which leads to a favourable behaviour toward the brand.

H2: Brand associations have a positive effect on brand equity.

H3: Brand awareness has a positive effect on brand equity.

Several researchers highlight that high brand equity is associated with high brand preference and loyalty (e.g., COBB-WALGREN, RUBLE, & DONTU 1995; Devlin, Gwynne & Ennew 2002, DE CHERNATONY, HARRIS & CHRISTODOULIDES 2004). The Chang & Liu's (2009) model empirically supported that brands with higher levels of brand equity would generate higher levels of customer brand preference. In turn, higher customer brand preference was associated with more willingness to continue using the service brand. Brand loyalty makes consumers purchase a brand routinely and resist switching to another brand. Hence, to the extent that consumers are loyal to the brand, brand equity will increase (Yoo, Donthu & Lee 2000).

H4: Brand loyalty has a positive effect on brand equity.

Trust

Trust has been studied primarily in the context of relationship marketing (e.g., Doney & Cannon 1997; Ganesan & Hess 1997; Morgan & Hunt 1994). Morgan & Hunt (1994, p.23) conceptualize trust "as existing when one part has confidence in an exchange partner's reliability and integrity". ROUSSEAU, BITKIN, BURT, RONALD & CAMERER (1998, p. 395) defined trust as a "psychological state comprising the intention to accept vulnerability based on positive expectations of the intentions or behaviours of another".

In their seminal work Ambler (1997) presents trust as an affective and not a cognitive, analytical construct which can be a proxy for brand equity. Hence, trust in a brand can positively influence brand equity.

H5: Trust has a positive effect on brand equity

Brand personality

Since celebrities started to endorse brands, personification of brands has existed. These people help marketers position their brands because they lead the consumer to identify themselves with the celebrity. It has long been recognized that brands, as any person, could have personality (Azoulay & Kapferer 2003). In literature it is claimed that we must discuss brand personality since individuals chose a brand the same way they chose a friend. Researchers go deeper, stating that individuals tend to attribute facets of personality to brands, talking frequently about them. As Aaker (1997) points out, brand personality is the set of human characteristics associated to a brand. Later, Azoulay & Kapferer (2003, p.151), improve this definition classifying brand personality as "the set of human personality traits that are both applicable to and relevant for brands". This improvement comes from the evolution of the studies associated to psychology and social sciences that concluded personality is described by traits that differ from cognitive aspects of the person, or from his or her skills and abilities (Azoulay & Kapferer 2003).

Jennifer Aaker (1997) developed the widely known brand personality scale, which identifies five possible dimensions or “sets of human characteristics associated with a brand” (p. 347), such as: Sincerity, Excitement, Competence, Sophistication and Ruggedness. These five dimensions are built based on the ‘Big Five’ human personality structure (Norman 1963; Tupes & Christal 1958) and include fifteen ‘facets’. However, this scale created by Aaker (1997) has been criticized. Azoulay & Kapferer (2003) argue that the scale is based on a loose definition of personality. GEUENS, WEIJTERS & DE WULF (2009) postulate that the scale includes characteristics such as ‘upper class’ which confuse ‘brand personality’ with ‘user profiles’. So, Geuens, Weijters & De Wulf’s (2009) five-factor, twelve-item measure of brand personality is organized to contain only personality items and, as matched to Aaker & Fournier’s (1995) scale, shows higher affinity to the ‘Big Five’ personality model. Alpatova & Dall’Olmo Riley (2011) research compare the two brand personality scales in their concise and operational versions (15 items versus 12 items for Aaker & Fournier’s (1995) and Geuens, Weijters & De Wulf’s (2009) scales respectively). Their results support Geuens, Weijters & De Wulf’s (2009) scale, which could be used for any product category and for analyses on an industry, individual brand and respondent level. Therefore, this study follows the Geuens, Weijters & De Wulf’s (2009) scale.

Taking into account that individuals associate themselves with those who have traits in common, it is logical to associate themselves with brands with which they identify. Hence brand equity “derives from the set of brand associations and behaviors that have been developed towards the brand” (Delgado-Ballester & Munera-Alemán 2005, p.188) it is possible to understand that brand personality may exercise a positive influence on brand equity.

H6: Brand personality has a positive effect on brand equity

Brand identification

From the organizational identification theory emerges the idea explaining why an individual becomes a member of a social group. Therefore, an individual tend to be part of a social group in which he/she feel identified and belonging (Mael & Ashforth 1992). Accordingly, consumers define their social identity by buying brands or associating with brands (Del Rio, Vazquez & Iglesias 2001). When the brands have a good reputation among the group to which the consumers belong or aspire to belong, they positively value those brands (Long & Shiffman 2000). Brand consumption also differentiates a consumer’s social identity from other social identities (KIM, HAN & PARK 2001).

Hence brand identification allows the consumer to integrate or dissociate with the group which constitute their social circle. Therefore, a consumer who identifies him/herself with certain brand will has more willing to stay close to that brand and will have proud to promote the brand and thus the perceived brand equity will increase.

H7: Brand identification has a positive effect on brand equity.

The model show in Figure 23 depicts the effect of seven variables on brand equity perceived by consumers.

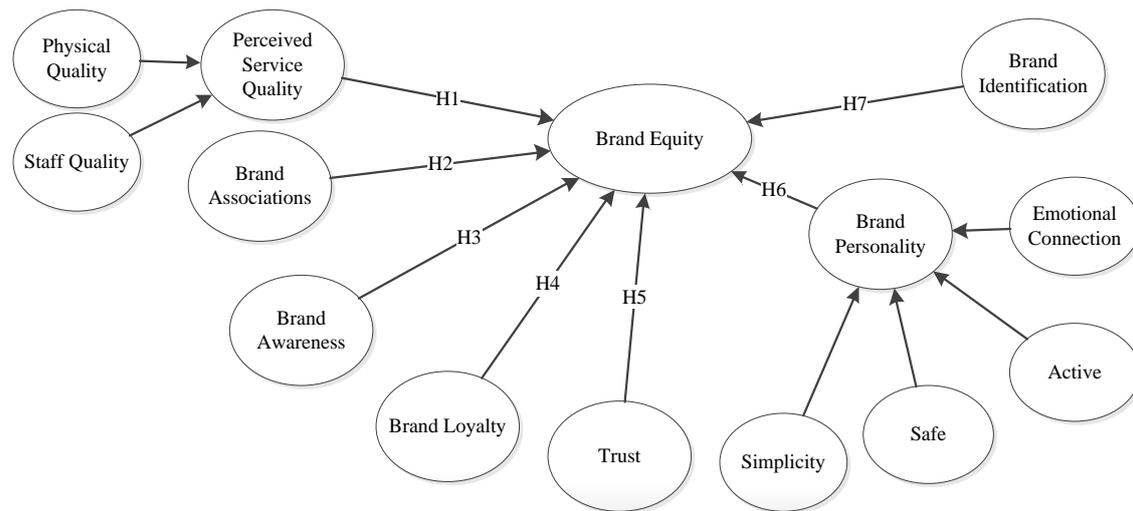

Figure 23: Hypothesized Model

METHODOLOGY

Measures

This study focuses on an empirical research with the sample target of the consumers of supermarkets, electricity and mobile communications brands. This choice was made thinking about the brand equity in service sectors.

In order to test the hypotheses previously defined, an online questionnaire was elaborated to be answered by consumers of those brands. Once made, it moved to the pre-test stage with the purpose of verifying the clarity of the sentences. Before collecting data a pre-test was made with a sample of ten students. Their suggestions were accepted and introduced in the questionnaire in order to keep it more clear (Walsh & Beatty 2007). The questionnaire has 41 items and each respondent was invited to answer the questions according to Likert scale from 1 (completely disagree) to 5 (completely agree). The items followed a random order so that the consumer did not associate the items to a specific construct.

The constructs were measured with multi-item scales. Brand equity was measured by using a scale from Yoo & Donthu (2001) and Lassar (1995). The perceived quality, brand identification were measured by using an established scale from Nam, Ekinci, Whyatt (2011). Brand personality was measured with a scale based on Aaker (1997), Geuens Weijters, De Wulf (2009) and Lin (2010). The construct brand loyalty came from the study of Yoo & Donthu (2001). Trust was measured by using 5 items based on paper of Delgado-Ballester & Munuera-Alemán (2005). In what concerns to brand awareness, this was measured by using a scale from Loureiro & Miranda (2011). Brand association is based on Azoulay & Kapferer (2003) and Chang & Chieng (2006) (see Table 13).

Construct	Item	Source
-----------	------	--------

Construct		Item	Source
Brand Associations	AS1	I think x service method is modern.	Azouly & Kapferer (2003); Chang & Chieng (2006)
	AS2	x has a professional and well trained staff.	
	AS3	x uses a modern design in their facilities.	
	AS4	Materials associated to x are visually appealing.	
Brand Awareness	BW1	Some characteristics of x come quickly to my mind.	Loureiro & Miranda (2011)
	BW2	I can recognize x among other competitors.	
	BW3	I can quickly recall the symbol or logo of x.	
Brand Loyalty	L1	x is my first choice	Yoo & Donthu (2001)
	L2	I consider myself to be loyal to x.	
	L3	Next time I will choose x	
Trust	T1	My overall trust in the products (good/service) of x is high.	Delgado-Ballester & Munuera-Alemán (2005)
	T2	x seems to be very helpful with regard to the interests of consumers.	
	T3	I consider the company and people who stand behind x to be very trustworthy.	
	T4	I believe that x does not take advantage of consumers.	
	T5	I have more confidence on the service of x.	
Perceived quality - Physical	QPh1	The quality of the facilities of x is extremely high.	Nam, Ekinci, Whyatt (2011)
	QPh2	From x I can expect superior performance	
	QPh3	The quality of the products (good/service) of x is extremely high.	
Perceived quality - Staff	QS1	Employees of x listen to me.	Nam, Ekinci, Whyatt (2011)
	QS2	Employees of x are helpful.	
	QS3	Employees of x are friendly.	
Brand Identification	BI1	When someone criticizes x, it feels like a personal insult	Nam, Ekinci, Whyatt (2011)
	BI2	If a story in the media criticizes x, I would feel embarrassed.	
	BI3	X reflects my personal lifestyle.	
Brand Equity	E1	I am proud of use (good/service) x.	Yoo & Donthu (2001); Lassar (1995)
	E2	Even if another brand has the same features as x, I would prefer x.	

Construct		Item	Source
	E3	If there is another brand as good as x, I prefer x.	
	E4	If there was a brand like x it would be smart not to change.	
Brand Personality - Safe	PSa1	I consider x honest.	Aaker (1997), Geuens, Weijters, De Wulf (2009) and Lin (2010)
	PSa2	I feel safe when I bought any product (good/service) of x.	
	PSa3	I see x as reliable for me.	
	PSa4	I feel secure when I consume something from x.	
Brand Personality - Active	PA1	X is dynamic.	Aaker (1997), Geuens, Weijters, De Wulf (2009) and Lin (2010)
	PA2	The marketing campaign of x is dynamic	
	PA3	X is active	
Brand Personality - Emotional Connection	PE1	X is tough to overcome.	Aaker (1997), Geuens, Weijters, De Wulf (2009) and Lin (2010)
	PE2	X makes me feel sentimental.	
	PE3	For using x I feel that everybody accepts me.	
Brand Personality - Simplicity	PS1	X is always simply	Aaker (1997), Geuens, Weijters, De Wulf (2009) and Lin (2010)
	PS2	I think x is charming.	
	PS3	x is ordinary in values it transmits.	

Table 13: The questionnaire's construct, items, and sources

Sample characterization

The online questionnaire was accessible from April 5th to May 31st of 2012. University students (from several universities in Portugal) were instructed to recruit five people to fill out the survey. Four of these five people had to be non-students and represent a range of ages, genders, and professions (based on method of Walsh & Beatty 2007). The data collection process lasted eight weeks. 152 people answered to the supermarkets brands questionnaire, 100 people answered to the electrical brands questionnaire and 163 answered to the telecommunication questionnaire in a total of 415 responses. Globally, most respondents fell into the 26–35 age group.

Data Analysis

A structural equation model approach using Partial Least Squares (PLS) was employed to test the hypotheses proposed in the current study. PLS is based on an iterative combination of the principal components analysis and regression (Chin 1998). PLS employs a component-based approach for estimation (Lohmoller 1989). PLS also places minimal restrictions on the sample's size and residual distributions and support formative factors (Chin 1998; Wold 1985).

In general, PLS is appropriate for explaining complex relationships because it avoids two problems such as inadmissible solutions and factor indeterminacy (Fornell & Bookstein 1982). In the present study, a non-parametric approach called bootstrapping was used to assess the precision of the PLS estimates and support of the hypotheses. 500 samples sets were created to obtain 500 estimates for each parameter in the PLS model (Fornell & Larcker 1981; Chin 1998). TENENHAUS, VINZI, CHATELIN & LAURO (2005) proposed a global measure of goodness of fit (GoF) for PLS path modeling, which ranges from 0.00 to 1.00.

RESULTS

A PLS model should be analyzed and interpreted in two stages. First, the measurement model or the adequacy of the measures is assessed by evaluating the reliability of the individual measures, the convergent validity, and the discriminant validity of the constructs. Then, the structural model is evaluated. In order to evaluate the adequacy of the measures, the current study used the aggregated data sets collected from offline and online stores, since the comparisons of the measure models for desegregated data do not show statistical differences. Item reliability is assessed by examining the loadings of the measures on their corresponding construct. Item loadings of scales measuring reflective constructs should be 0,70 or more, which indicates that over 50% of the variance in the observed variable is explained by the construct (WETZELS, ODEKERKEN-SCHRÖDER & VAN OPPEN 2009). In this study we verified that all item loadings exceed 0,70.

All Cronbach's alpha values are above 0,7, and all composite reliability values in Table 2 are above 0,8. All constructs are reliable since the composite reliability values exceed the threshold value 0,7. The measures demonstrate convergent validity as the average variance of manifest variables extracted by constructs (AVE) are above 0,5, indicating that more variance of each indicators are explained by their own construct. In order to be discriminant among the construct, the square root of AVE should be greater than the correlation between the construct and other constructs in the model (Fornell & Larcker 1981). Table 2 shows that this criterion has been met.

	Mean	C.R.	Alpha	AVE	1	2	3	4	5	6	7	8	9	10	11	12
1.Association	3,5	0,918	0,889	0,691	0,831											
2.Awareness	3,6	0,856	0,765	0,665	0,619	0,815										
3.Equity	2,9	0,908	0,864	0,711	0,572	0,477	0,843									
4.Trust	3,2	0,881	0,831	0,597	0,683	0,613	0,672	0,773								
5.Active	3,6	0,913	0,858	0,778	0,657	0,662	0,514	0,649	0,882							
6.B.	2,3	0,880	0,796	0,711	0,269	0,238	0,676	0,580	0,287	0,843						

identification																
7.Emot.con- nection	2,7	0,855	0,751	0,664	0,362	0,350	0,699	0,647	0,404	0,651	0,815					
8.B. loyalty	3,0	0,937	0,898	0,832	0,574	0,603	0,681	0,630	0,550	0,517	0,619	0,912				
9.Physical	3,5	0,869	0,798	0,623	0,619	0,695	0,671	0,616	0,603	0,443	0,581	0,688	0,789			
10.Safe	3,4	0,923	0,888	0,749	0,628	0,638	0,622	0,641	0,670	0,471	0,527	0,608	0,683	0,866		
11.Simplicity	3,4	0,877	0,789	0,704	0,613	0,677	0,607	0,696	0,678	0,470	0,548	0,610	0,634	0,617	0,839	
12.Staff	3,4	0,914	0,860	0,781	0,676	0,608	0,548	0,678	0,619	0,298	0,304	0,492	0,670	0,632	0,623	0,884

C.R. – composite reliability: AVE – average variance extracted

Diagonal elements in the 'correlation of constructs' matrix are the square root of AVE. For adequate discriminant validity, diagonal elements should be greater than corresponding off-diagonal elements.

Table 2: Measurement model and test for discriminant validity

The structural results are presented in Figure 2. All path coefficients are found to be significant at the 0.010 or 0.050 levels, except two: the relationship between perceived service quality and brand equity and brand associations and brand equity. Therefore, H1 and H2 are not supported.

However, as models yielding significant bootstrap statistics can still be invalid in a predictive sense (Chin 1998), measures of predictive validity (such as R^2 and Q^2) for focal endogenous constructs should be employed. The value of Q^2 (chi-squared of the Stone-Geisser Criterion) is positive, so the relations in the model have predictive relevance (Fornell & Cha 1994). The model also demonstrated a good level of predictive power (R^2), especially for brand equity, as the modeled constructs explained 76.5% of the variance in brand equity. In fact, the good value of GoF (see Figure 2) reveals a good overall fit of the structural model.

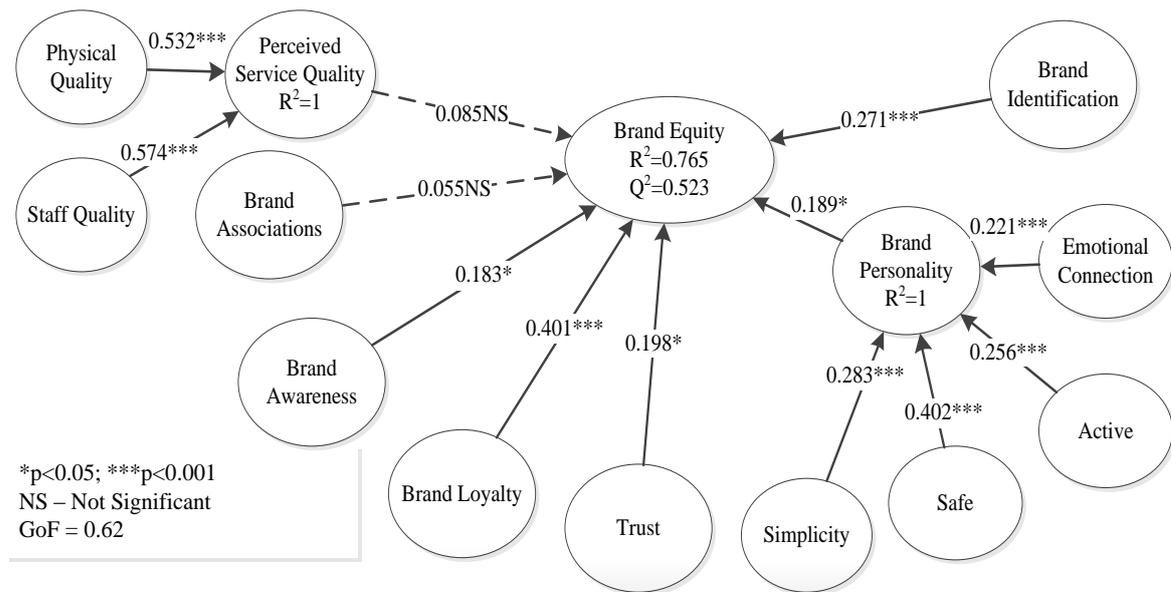

Figure 24: Structural Model

CONCLUSIONS AND IMPLICATIONS

This study contributes to the body of literature on consumer-based brand equity in two ways. Firstly, we drawing based on past literature a model to analyze the effect of seven variables on brand equity. Specifically, a conceptual model was proposed where, perceived service quality, brand personality, brand loyalty, brand identification, trust, brand associations and brand awareness are suggested as antecedents of brand equity. Thus, our study is the first attempt to measure the strength of assorted relational variables, and variables related with identification and personality on brand equity. Secondly, this study gives insight to support the proposed model in service industry.

The strength of the effect of brand loyalty and brand identification on brand equity is greater than the effect of other five variables analyzed. As Yoo, Donthu & Lee (2000) highlight, brand loyalty means that consumers purchase a brand routinely and resist switch to another brand. Hence, to the extent that consumers are loyal to the brand, brand equity will increase. More explicitly, when consumers have the good/service as their first choice, consider themselves loyal to a certain brand and intend to buy that brand in the next purchase, then the predisposition to have proud of use the service, prefer the brand instead of other brand with the same service and thought that consume that brand is better than another increase. As Long & Shiffman (2000) mention when the brands have a good reputation among the groups to which the consumers belong or aspire to belong, they positively value those brands. Therefore, a consumer who identifies him/herself with certain brand will tend to stay close to that brand and will have proud to promote the brand and the perceived brand equity will increase. Moreover, a consumer who feels a criticize to a brand like a personal insult, and feels embarrassed when see the media criticizes the brand and think that the brand reflects

him/her personal lifestyle is more likely to have proud of the brand, and prefer that brand instead of others.

As we have already seen, according to Aaker (1991) and Keller (1993) there are four core assets of brand equity: perceived quality, brand loyalty, brand awareness and brand associations. More specifically, Aaker (1991) identifies four major consumer-related bases of brand equity and Keller (1993) proposes a knowledge-based framework for creating brand equity based on two dimensions: brand awareness and brand image, which integrate brand associations. In our study, the results reveal that of this four constructs, brand loyalty and brand awareness are the only two with significant effect on brand equity. So, the loyalty to the brand, manifested by behaviours of first choice and next choice, keeps a central aspect to favour the brand equity. But, despite the importance of brand loyalty an even the brand awareness in our results, the perceived service quality and brand associations have importance, too.

In what concerns to the strength of the influence of brand identification, brand personality and trust on perceived brand equity, brand identification exercises a stronger effect on brand equity. So, consumers who feel embarrassed or a personal insult when is brand is criticized by someone or somewhere, and feels like the brand reflects his/her lifestyle, are more likely to have proud of the brand, and prefer that brand instead of others.

The current study is developed in a country living an economic crisis, where consumers tend to choice, more than ever, motivated by the price. In such conditions consumers are more willing to switch based on price. Even so, brand managers should be aware that brand loyalty and brand identifications can be very powerful in leverage the brand. Therefore, managers should be very careful when relate to their customers and communicate the identity of the brand in a way that goes directly to the core feeling, lifestyle and way of being of the consumers. Establish a good relationship, bonds, between consumers and their brands and demonstrate respect for the consumers' problems are essential to keep them, more than lower prices, even in time of crisis.

Limitations and Further research

This studies present several limitations which can be regarded as avenues for future research. First, the study was conducted just in services. Although the choice of these service brands have been planned intentionally, in a forthcoming research it can be extend to other brands or to brands of the same sector of activity in order to make comparisons between sectors.

Second, the data collected for the survey was limited to Portugal, using a snow ball process. Despite this technique is used in marketing field, especially in exploratory studies, we should be careful in generalization.

Third, the instruments used to measure the constructs can be improved or even expanded to consider other dimensions and other variables influencing the brand equity.

ABSTRACT

Population ageing is a general and growing phenomenon that poses significant challenges to society and governments in most European countries. To attenuate the challenge of demographic ageing, public initiatives have been launched to encourage older adults to remain active and to improve their quality of life. The use of ICT in general and the Internet in particular can be considered as an important facilitator of modern life. The purpose of this paper is to examine the potential role of the Internet on promoting active ageing by applying the Unified Theory of Acceptance and Use of Technology (UTAUT). Findings from this study demonstrate that the use and acceptance of the Internet as assessed by the UTAUT's dimensions have a positive impact on active ageing.

Keywords: ICT; Internet; UTAUT; Active ageing; Older People

INTRODUCTION

Population is getting older in most Western societies, posing demographic and socioeconomic challenges to society and public authorities. Recent data estimates that the number of people over 65 will reach 25% by 2020 while the number of people over 85 will triple by 2050 (European Commission, 2010). Resulting from a historical combination of declining fertility and falling death rates, which lead to an increase of life longevity (Walker, 2009), population ageing is leading societies to remarkable changes, particularly noticeable in the family, the labor and the market structures, as well as the individual itself (Powell and Cook, 2009). Thus, allowing older people to remain active and independent, as well as being valuable to society reflects an emerging awareness towards active ageing (European Commission, 2009). Against this background, ICTs in general and the Internet in particular can have an important role in achieving these goals by increasing the quality of life of older people (Gilhooly *et al.*, 2009; Czaja and Lee, 2007). The European Commission recognizes that ICTs can help older

people to overcome isolation and loneliness as it increases possibilities for reinforcing family and community ties, as well as extending social networks (European Commission, 2010).

Although extant research has examined the driving factors of Internet adoption among the elderly (Eastman and Iyer, 2004; Hough and Kobylanski, 2009), despite some exceptions (Gilhooly et al, 2009), few studies have analysed the role of ICTs in general and the Internet, in particular, as a mechanism to promote the active ageing process. Therefore, the purpose of this study is to examine the extent to which the use of the Internet by older adults impacts on the active ageing process.

LITERATURE REVIEW

Active ageing in the information society

The notion of active ageing emerged as part of the policy framework conceived by the United Nations and the World Health Organization (WHO) to address the demographic, economic and social challenges posed by an increasingly older population. Defined as “the process of optimizing opportunities for health, participation and security with the goal of improving life quality as people grow old”, active ageing is a complex notion often considered as a “new paradigm” of ageing (Stenner *et al.*, 2010) which has assumed, particularly in Europe, a distinctive approach (Walker, 2009). According to the definition provided by the World Health Organization (WHO, 2002), active ageing integrates *health, social participation and security of older citizens* as fundamental pillars.

As recognised by the Council of the European Union in the program *Ageing Well in the Information Society* (European Union, 2010), the use of ICT based products and services allow ageing citizens to live longer independently, and will provide opportunities for enhancing safety, security and healthcare. This is in line with other authors, who sustain that ICTs plays an undeniably role in the promotion of an active participation of elderly in society by allowing better health care (increasing life expectation and decreasing health costs); extending people active life in work; increasing productivity and lowering down costs with pensions; increasing social participation; reinforcing civil society, supporting independence; facilitating people involvement in social networks and also contributing to strength family and community ties (Hazer e Sanli, 2010).

According to Alm, Gregor and Newell (2002) ICT applications can benefit older adults in the following dimensions: i) Communication and social connectivity (technologies such as e-mail, video-call, and social networks can reduce loneliness and isolation); ii) Access to services and information (technologies provides access to: shopping online, public and social services without leaving home while minimizes eventual mobility constraints); iii) Promotes learning along life (technology stimulate the mind, which is a fundamental goal to achieve active ageing); iv) Tele-homecare and telemedicine (the availability of electronic systems and communication technologies can reduce long distances); v) Promotes activity and productivity (technologies may encourage and allow older adults to remain active for a longer period of time). Thus, technologies in general and the Internet in particular can enhance the quality of life of older adults, particularly by increasing social participation, decreasing levels of anxiety and depression, and improving cognitive skills (Slegers et al, 2012).

The Technology acceptance model (UTAUT)

Pew and Van Hemel (2003) maintain that there are many factors that may influence technology acceptance by old adults and, consequently, affect its success in the market. It is generally recognized that there are different believes and stereotypes associated to old adults capacities and their reluctance to change is likely to lead to negative attitudes concerning the use of new technologies. However, as Cazja (1997) demonstrated, older adults are usually receptive to the adoption of ICTs as long as they perceived them as useful, feel that they are easy to use and have adequate training (Pew and Van Hemel, 2003).

It seems worth noticing that technology adoption has been studied in several different ways by numerous authors over the years. The TAM model (Technology Acceptance Model) (Davis, 1989) has its origin in the theory of reasoned action (TRA) developed in a seminal work by Fishbein and Ajzen (1975). In essence, this model theorizes that the use of a technology is influenced by two major beliefs: perceived ease of use (PEU) and perceived usefulness (PU). While PEU can be defined as the degree to which a person believes that using a technology will be free of effort in a sense that he/she does not expect major physical and mental difficulties, PU refers to the prospective user's belief that using a particular technology will enhance individual performance (Davis, 1989). The proposed model originally developed by Davis (1989) represented an important theoretical contribution to understanding user behavior and acceptance of an information system, more precisely of a computer (Malhotra and Galletta, 1999).

Over the years, several acceptance TAM models were developed changing the original model proposed by Davis (1989). More recently, Venkatesh *et al.* (2003) have developed the so called Unified Theory of Acceptance and Use of Technology (UTAUT). Due to its capacity to integrate the different models of technology acceptance, the UTAUT model offers an important contribution to understand technology use and acceptance by proposing four key dimensions, designated as *performance expectancy, effort expectancy, social influence and facilitating conditions* (Venkatesh, *et al.*, 2003).

Therefore, for the purpose of the present study, the UTAUT model will be applied to assess the impact that ICT plays on active ageing (integrating the dimensions of health, security and social participation). With respect to the UTAUT model, Effort Expectancy is defined as “the degree of ease associated with the use of the system” (Venkatesh, *et al.*, 2003: p.450) and reflects the extent to which older citizens feel comfortable and find the Internet easy to use. Therefore, the following hypotheses covering the three dimensions of active active are proposed:

H1: Effort expectancy will have a positive effect on Social Participation.

H2: Effort expectancy will have a positive effect on Health Care.

H3: Effort expectancy will have a positive effect on Security.

Social Influence is defined as “the degree to which an individual perceives that important others believe he or she should use the new system” (Venkatesh, *et al.*, 2003: p.451). It relates to others’ opinions about the Internet adoption. Thus, the following research hypotheses are offered:

H4: Social Influence will have a positive effect on Social Participation.

H5: Social Influence will have a positive effect on Health Care.

H6: Social Influence will have a positive effect on Security.

Finally, Facilitating Conditions are defined as “the degree to which an individual believes that a technical infrastructure exists to support use of the system” (Venkatesh, *et al.*, 2003: p.453). In other words, it relates to environmental barriers or availability of resources that older adults may perceive in relation to the Internet use. Therefore, the following hypotheses are suggested:

H7: Facilitating Conditions will have a positive effect on Social Participation.

H8: Facilitating Conditions will have a positive effect on Health Care.

H9: Facilitating Conditions will have a positive effect on Security.

RESEARCH METHODOLOGY

The present study employed mainly a quantitative methodological approach, which was complemented by qualitative data in order to provide a more thorough account of the topic under study. The questionnaire was pre-tested on a small sample of older adults. These participants were invited to highlight any ambiguities or difficulties concerning the instrument of analysis while providing further suggestions for the questionnaire improvement. This procedure allowed the assessment of face and content validity. After the pre-testing stage, the questionnaire was personally delivered to a convenience sample in two senior universities located in two major northern Portuguese cities (Oporto and Braga). This approach proved to be particularly convenient due to ease of accessibility and cost-effectiveness. A total of 106 usable questionnaires were collected.

With regard to the measurement scales, the Internet acceptance was operationalized by using the UTAUT scale, which relies on four core constructs, namely, *Performance expectancy*, *Effort expectancy*, *Social influence* and *Facilitating conditions* (Venkatesh, Morris, Davis and Davis, 2003). Due to the nature of the study's population, we have decided to exclude the construct *Performance expectancy*. The behavioral intention, considered as the dependent variable was measured by the intention of older adults in using the Internet along the three dimensions of active ageing: social participation (8 items); health (7 items) and security (3 items). These items were measured through a five-point Likert-type scale (ranging from 1= Not very important; 5= Very important).

ANALYSIS AND DISCUSSION

The data was analyzed using SPSS 18.0 and PLS with SmartPLS 2.0 (Ringle, Wende, & Will, 2006). Although the measurement and structural parameters were estimated together, a PLS path modeling approach was analyzed and interpreted in two stages: 1) the assessment of the reliability and validity of the measurement model; 2) the assessment of the structural model. First, reliability and validity of measurement scales were examined. All composite reliability values exceed .70, evidencing a good level of internal consistency in the responses (Nunnally

& Bernstein, 1994). Similarly, the AVE for all constructs was satisfactory (above .50) (Bagozzi & Yi, 1988). Overall, measurement scales showed both unidimensionality and conceptual consistency. The standardized loadings and their associated *t*-values were also examined. Convergent validity is revealed by the large and significant standardized loadings. With regard to discriminant validity, we tested whether all the construct inter-correlations were significantly different from 1, and that the square root of AVE was greater than the variance shared among the latent constructs (Barclay, Thompson, & Higgins, 1995). All latent constructs satisfied this condition (Table 1).

	Mean	SD	R ²	1	2	3	4	5	6
1. Effort Expectancy	3.45	0.69	-	0.88					
2. Social Influence	3.13	0.74	-	-0.16	0.57				
3. Facilitating conditions	3.35	0.74	-	0.68	0.11	0.64			
4. Social participation	2.54	0.80	0.23	0.26	0.31	0.35	0.69		
5. Health	2.27	1.01	0.30	0.39	0.28	0.44	0.56	0.81	
6. Security	2.38	0.89	0.36	0.32	0.42	0.42	0.60	0.78	0.90

Notes: the diagonal (in bold) shows the square roots of the AVE; (-) Exogenous variable

Table 1: Variable means, standard deviations and correlations

Finally, in order to test the hypotheses previously formulated, the structural model was estimated. To test the weights' significance the bootstrapping technique was used. Goodness-of-fit in a PLS estimation is demonstrated, according to Chin (1998), by strong factor loadings (or correlations), significant path coefficients (higher than .2), and high R² values. In the present study, the proportion of the total variance (R²) of each endogenous variable explained by the model is 0.36 for security, 0.30 for health and 0.23 for social participation (Table 1). To assess predictive validity of the model constructs, each construct was blindfolded. The Stone-Geisser test results indicated that the model shows good predictive validity (Q² > 0). A Q² greater than zero implies that constructs have predictive relevance. Among nine potential relationships six are statistically significant (Table 2).

Path Coefficients	Sample mean	Standard	t
	(bootstrapp)	Error	Statistics
H1:Effort Expectancy→Social	0,216	0,115	1.80

participation			
H2:Effort Expectancy→Health	0,319	0,106	2.97**
H3:Effort Expectancy→Security	0,263	0,095	2.77**
H4:Social Influence→Social participation	0,349	0,075	4.45**
H5:Social Influence→ Health	0,307	0,085	3.54**
H6:Social Influence→ Security	0,450	0,071	6.26**
H7:Facilitating cond.→Social participation	0,170	0,135	1.29
H8:Facilitating cond.→ Health	0,202	0,104	1.96*
H9:Facilitating cond.→Security	0,200	0,109	1.78

* $p < 0.05$; ** $p < 0.01$

Table 2: Path coefficients

It seems relevant to notice that the social influence dimension is the only dimension that has a significant impact on the three dimensions of active ageing (social participation, security and health). As previously mentioned, the social influence comprises three major sub-dimensions, such as: image, social factors and subjective norm. Overall, the data support the hypotheses H4, H5, and H6. Concerning effort expectancy, which is associated with the degree of perceived ease of use and usefulness of the system, the data supported its impact on two of the three dimensions of active ageing (Health and Security). Thus, H2 and H3 are supported. The only dimension which was not supported was the relationship between effort expectancy and social participation leading to rejecting H1. With regard to the Facilitating conditions dimension, the data evidences a significant and positive impact on the health dimension, therefore, supporting H8. By contrast, H7 and H9 are not supported.

CONCLUSION AND IMPLICATIONS

The present study lends support to the view that ICTs in general and the Internet, in particular helps older adults in promoting active ageing by providing cognitive and rewarding activities and increasing their quality of life. Findings from this study demonstrate that the use and acceptance of the Internet assessed by the UTAUT's dimensions (effort expectancy, Social Influence and Facilitating) have a positive impact on Active ageing (Social participation, Security and Health). These results are consistent with the literature which emphasizes the pervasive dominance of Technology in social interactions. Yet, to generate real value in people's lives, the Internet needs to be effectively accepted and used by its potential users (Venkatesh, *et al.*, 2003). The study presents valuable implications for both public decision makers who need to conceive appropriate policies to facilitate Internet use and acceptance, and to marketers who need to customise their offerings to this relevant population segment.

CORPORATE GOVERNANCE OF NON-PROFIT ORGANIZATIONS- THEORY AND PRACTICE

Malý, Milan¹; Kubíček, Aleš²

¹Department of Management, Faculty of Business Administration, University of Economics, Prague, Czech Republic, maly@vse.cz

²Department of Management, Faculty of Business Administration, University of Economics, Prague, Czech Republic, ales.kubicek@vse.cz

ABSTRACT

The main aim of the paper is to contribute to the development of the theory and practice of the corporate governance of non-profit organizations. The methodology is based on comparison of the main parameters of corporate governance of for-profit vs. non-profit organizations. The main parameters were extracted from the basic literature sources describing the corporate governance systems of for-profit organizations as well as their characteristics. The characteristics of the parameters for non-profit organizations were refined from the authors' own research. Our data sample is represented by 192 public hospitals in the Czech Republic. They were analyzed as representatives of non-profit organizations. Based on our research we can state that the characteristics of the parameters differ in for-profit and non-profit organizations. In some parameters the characteristics differ distinctively, in others we can observe the tendency to convergence.

Keywords: non-profit organizations, public hospitals, characteristics, comparison, future tendencies

Acknowledgement: The authors would like to express their gratitude for the financial support of the University of Economics, Prague - the paper is one of the outcomes of the research project VŠE IG310013.

INTRODUCTION

Corporate governance theory today is concentrated mostly on organizations established to generate profit. Non-profit organizations and their role in the national economy are highly

important and very often underestimated; they create their own theoretical framework for corporate governance and its application. The main aim of this paper is to contribute to the development of the theory of corporate governance of non-profit organizations and to also show its practical consequences.

LITERATURE REVIEW

The issues of corporate governance are no longer restricted to for-profit organizations. Governance of non-profit organizations has started to be addressed in the last decade (e.g. reviews by Jegers, 2009, Bennington, 2010). The methodology of this paper is based on comparison of main parameters of corporate governance of profit and non-profit organizations and so literature review of both sectors is inevitable. However, literature regarding for-profit organizations is vast and generally known and therefore authors review existing literature of non-profit organizations and due to data sample consisting of public hospitals also hospital governance.

Non-profit organizations

One of the most fundamental distinctions between for-profit and non-profit sectors is the fact, that for the non-profit organization financial considerations, such as increasing shareholder value, form only one dimension of the mission statement (McFarlan, 1999). Non-profit organizations also cannot disburse profits that affect the very nature of non-profit organizations. Another important distinction may be the fact that non-profit organizations do not have real owners (Glaeser, 2003). Governance of non-profit organization differs, because decision-making process is not only influenced by economic interests of shareholders but interests of various stakeholders (Eeckloo et al., 2004).

In for-profit organizations we can see a clear division of the roles of principal as the owner on one side and the agent, hired manager on the other. Their roles are developing and according to Monks and Minow (2011) in the second half of the 20th century we could observe decreasing supervisory activity of the owners towards managers. Mostly from the institutional investors (e.g. pension funds) or widely dispersed minority shareholders, their activity in supervision of managers is unsatisfactory. According to Mallin (2010), the situation is slowly changing. Especially the activity of institutional investors is increasing and their role is transforming from portfolio investors into strategic investors, more actively collaborating with company management in creating company vision and mission, aims and strategy.

Facing the fact that most of non-profit organizations have no owner, it is necessary to identify

the objectives of principals and agents and detect potential agency problems (Du Bois, 2009). Board structure is another important difference between for-profit and non-profit organizations. Architecture of the boards is one of main characteristics of governance systems all around the world. In for-profit organizations we differentiate between two basic systems of organizational design of boards: a one-tier structure with a board of directors and a two-tier structure with a management board and supervisory board (Hilb, 2005). Since a one-tier structure is the predominant system, a majority of research is focused on the responsibilities and roles of the board of directors. Boards of for-profit organizations generally consist of between 8 to 14 directors, while non-profit boards tend to be much larger because they need to represent interests of many stakeholders (McFarlan, 1999).

An inseparable part of governance structure is committees which are responsible for particular areas within board of directors. A financial responsibility and transparency is no longer issue of only for-profit organizations. In the United States Sarbanes-Oxley Act from 2002 applies also to non-profits which are obligated to set up an audit committee out of independent members of the board. However, even in 2004 out of 128 largest U.S. non-profit organizations, 10 of them had not an audit committee and 36 percent of non-profits had audit committee that are not completely independent (Vermeer et al., 2006). Other most frequently observed committees are finance and nomination committees (Callen et al., 2003).

On the other hand, it is important to point out that organizations of both sectors also share similar difficulties. According to Glaeser non-profit organizations have governance problems that resemble the problems in for-profit firms, but are often far more extreme (Glaeser, 2003:39).

Hospital governance

Due to the fact that our data sample consists of public hospitals, literature namely focused on non-profit hospitals was reviewed as well. Within the governance of non-profit organizations the healthcare sector faces very specific challenges. According to Eeckloo et al. (2007) the term hospital governance refers to “the complex of checks and balanced that determine how decisions are made within the top structures of hospitals”.

Eeckloo et al. (2004) analyze whether and to what extent governance models existing in the corporate world can be implemented in the hospital governance. According to the authors corporate governance can provide a potential frame of reference, nevertheless the unique social aspects of hospitals, including a large diversity of stakeholders and the lack of clear business objectives, have to be taken into account.

Preker et al. (2007) elaborate the theory of agency in the health-care sector. The principal-agent relationship is easily identified in corporate world, while in the health care sector there are several principal-agent relationships on the various levels. *“This relationship exists between government and health funds; private owners and health funds (the private insurance company); private owners and private hospitals; government and public hospitals; health funds and hospitals; health funds and general practitioners; hospitals and hospitals-based doctors; patients and health funds; patients and hospitals; patients and general practitioners; and patients and hospital-based doctors.”* (Preker et al., 2007: 167). It is a rather unique characteristic of health-care sector that various parties constitute several agency relationships and the change in one pair of relationships will affect others. This characteristic is a consequence of non-existing owner in public hospitals as was explained above. The emphasis has therefore shifted to the large diversity of stakeholders (tax payers, patients, GPs, government authorities, health insurers, etc.) (Eeckloo et al., 2007).

The board of directors as a governing body plays a significant role in overall performance of hospital. Therefore, the relationship between characteristics of the board and hospital performance is analyzed similarly to empirical research existing in the for-profit sector. For instance, Jha and Epstein (2009) survey board chairs of 1,000 U.S. hospitals to examine the potential influence of hospitals' board on quality of care. Findings show that fewer than half (44 percent) of the boards rated quality of care as one of their two top priorities and that engaged boards are more likely to be associated with better performance.

DATA SAMPLE AND METHODOLOGY

The adopted methodology is a comparative analysis (Haas, 1962) which is based on comparison of for-profit and non-profit organizations. The main parameters were extracted from the literature sources, describing the corporate governance system of for-profit organizations (e.g. Mallin 2010, Monks, Minow 2011) and the literature review of non-profit organizations. The six following parameters are:

- characteristics of ownership structure
- ways of collecting capital resources
- organization aims and application of agency theory
- application of transaction cost theory
- application of stakeholders theory
- board structure and composition

Our data sample consists of 192 public hospitals in the Czech Republic as the representatives of non-profit organizations. This sample represents all non-profit hospitals in the country.

From the main aim of the paper we can derive the following two hypotheses:

H1: The characteristics of the parameters of the defined CG system differ in for-profit and non-profit organization.

H2: The development of the characteristics of the parameters of both systems tends to convergence.

DISCUSSION AND FINDINGS

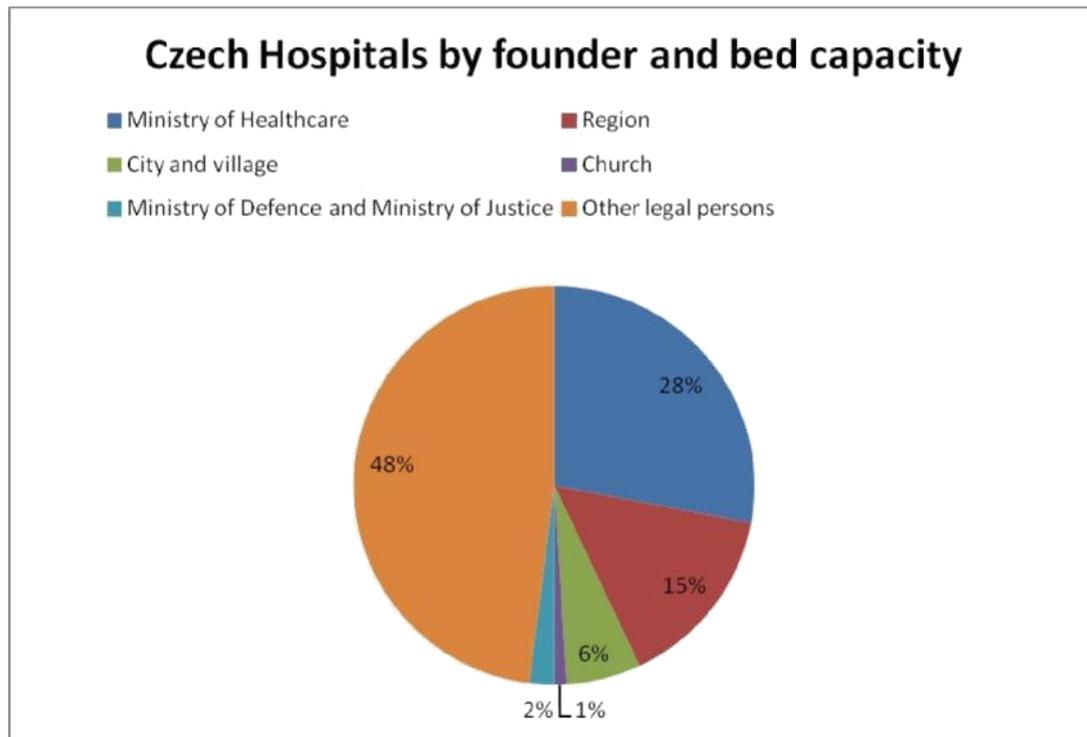

Our findings are concentrated in the following comparative analysis of different parameters.

Ownership structure

In for-profit organizations, the most common situation is when the so-called majority owner(s) is the decisive factor for strategic decision-making. There are two variants of majority owner; either he is closely connected with the bank or institutional investor and thus top management is heavily influenced by external owners, or the shareholders (owners) are broadly dispersed and all power is concentrated in the hands of the chief executive officers or managing director together with the whole board of directors. State ownership is rare, and is concentrated in a few monopoly companies (e.g. railway, post, sometimes strategic energy) and their incidental losses are covered by governmental budget.

In the case of non-profit organizations, i.e. the hospitals in our sample, in almost all cases, the owner is identical with the founder. The structure of the founders of the 192 hospitals is depicted on Picture 1.

In some non-profit organizations, the definition of 'real owner' is often very difficult; the owner is vague or simply does not exist. In these cases, 'real owner' is substituted by a so-called Administrative Owner, who is represented by special bodies (Board of Trustees, Board of Governors). The examples are faculty hospitals, hospitals founded by churches or foundations.

Picture 1: Czech Hospitals by founder and bed capacity

Capital resources

There are two main ways that for-profit organizations acquire the necessary investment capital: either through a capital market (IPO) when an active and liquid capital market exists or through bank credits, when capital market is relatively passive (Mallin, 2010).

Non-profit organizations do not rely on capital market and accumulation of capital by IPO. The usual method of obtaining initial investment capital is through founding organizations, sponsorship and charity, and rarely through bank loans.

Organization aims and application of agency theory

In non-profit organizations, our findings come to the conclusion that the situation is substantially different from for-profit organizations. Here, generating profit is not the priority goal but there is usually a set of goals, mostly social and partly economic, but as a rule, difficult to quantify.

Due to the unclear characteristics of the owner in non-profit organizations, diversified and

sometimes hardly specified aims result. Economic aims are of secondary importance (e.g. the aim of public university is the highest quality of education).

Non-profit organizations prefer implementation of stewardship theory instead of the agency theory. Stewardship theory is not based on the theory of “economic man” but on psychology and sociology. It comes from the idea that a manager does not follow his individual aims but is fully identified with the aims of the institution, and thus follows primarily its goals. Managerial benefit, in case he follows the company’s goals, is higher than following his own individual goals. Implementation of stewardship theory leads logically towards lower agency costs, because the supervision of managers by the owner is not so intensive. On the other side, however, there is a danger of managers abusing power.

Transaction cost theory

Transaction costs theory (Coase 1990) is currently mostly applied in corporate governance in two areas, i.e. in agency costs and outsourcing. Agency costs (Jensen, Meckling 1976) are practically used for creation of a mechanism, checking managers if they follow preferentially the interests of stakeholders instead of their own. Transaction costs determine the level when agency costs are still acceptable for the owners and lower than profit from managerial activities. Application of transaction costs theory on the company level was developed mostly by O. E. Williamson (1996), the Nobel Prize winner from 2009. The theory became more popular, mostly as a methodological tool for specification of a company’s optimal border and outsourcing. The method is used mostly for managerial decision-making when they must decide whether to produce a product or service within the organization or to get them from the market.

Unsatisfactory managerial control by the owners and low agency costs can lead to so-called “moral hazard” and an enormous increase of the company’s administrative costs. This problem is often connected with risky behavior of managers without any efficient risk supervisory by the stakeholders. This was not only the case of Enron, Worldcom, Parmalat and others, but also a lot of corporations in Central and East Europe have made similar mistakes. These negative experiences led for-profit companies to have higher level of agency costs. New, more effective, systems of managerial incentives were established. Higher incentives for managers were implemented in the form of higher bonuses, benefits and long-term incentives, e.g. share options.

On the other side, the owners increased monitoring of managerial activities through increasing the number of independent board members, representatives of the employees in boards as well as establishing of board committees for audit, risk management, remuneration, financial and others.

The other aspect of transaction costs theory – outsourcing plays an increasing role in for-profit organizations. It is possible to say that globalization, better communication, logistics and IT create very good conditions for its development.

In governance of non-profit organizations, as backed by the empirical results from our survey, we can state that agency costs are relatively low compared to those in for-profit organizations, and the supervising role is underestimated. The typical consequence of lower costs could be defalcation. Our findings have not found any attempts to do it in Czech hospitals. A possible explanation of the absence of fraudulent behavior of top managers (contrary to the other sectors of a transition economy) is stewardship theory, implemented broadly in non-profit organizations. The same situation with lower agency costs exists with the problem of incomplete contracting, where the ratio of unpredictable situations is much higher. The reason is that non-profit organizations operate in a less stable environment with more complicated relationships and often unpredictable behavior of political bodies on a governmental level.

The empirical data from our research in Czech hospitals show high instability of the political system without necessary consensus of the biggest political parties. This situation leads to substantial changes of the healthcare system with every change of the ruling political party. It happens practically every four years. But similar changes we can observe in other EU countries, as was indicated in the research of our university students (Jezek et al, 2009).

Agency costs in non-profit organizations are still relatively lower compared to those of for-profit organizations. There are still missing committees for audit, remuneration, and risk management. The independent members of the boards are absent; in addition, the representatives of employees in boards and supervisory functions are often underestimated.

The characteristics of the so-called administrative owner influence the original theory of agency costs. The roles of both partners, principal and the agent, are not so clearly defined and their roles are often overlapping. Motivation of managers is sometimes difficult because the organization's goals are difficult to quantify; instead of one clear goal, as in for-profit organizations (profit), there is usually set of different goals. Lack of quantitative criteria leads

to underestimation of the control of managers. The consequences are lower agency costs on one side but the danger of unclear financial transactions and defalcation.

Analysis of implementation of outsourcing in non-profit organizations on our sample of Czech hospitals shows its high importance. Certain activities are outsourced almost as a rule (catering, IT service, certain kinds of maintenance); in addition, outsourcing is spreading into other special areas, e.g. external expert screening of X-ray or CT scanning.

Stakeholder theory

Implementation of stakeholder theory, in which the main aim is to satisfy the expectations of all stakeholder such as customers, suppliers, employees, creditors, central and municipal governments, local community, social groups including shareholders – contrary to stakeholders theory concentrated on increasing the wealth of only shareholders (Mallin, 2010) – is more often in non-profit than for-profit organizations. Shareholder theory is, from its substance, close to the goals of for-profit organizations.

Non-profit organizations prefer stakeholder theory. The main reason for this application is the broad diversity of strategic goals, fulfilling the expectations of different participants. This theory is implemented in two versions. One is a classical version, in which a manager's task is to fulfill the expectations of all stakeholders and keep a very fragile balance among all participants even if their goals are contradictory, e.g. an employee's goal is a higher salary thus increasing costs and a shareholder's goal is higher dividends. The other is the so-called shareholder version of stakeholders theory, in which the managers try to fulfill the primary goal of the shareholders i.e. increasing their wealth through preferential fulfillment of the goals of other stakeholders. This version comes from the idea that e.g. higher salaries for employees contribute to higher efficiency of their work and higher profit, and consequently higher dividends for the shareholders.

Non-profit organizations prefer implementation of the classical version of the stakeholder theory, which is again closer to the substance of their main aims.

Board structure

We already mentioned that there are two basic systems of organizational design of boards: a one-tier structure with a board of directors and a two-tier structure with a management board

and supervisory board. For increasing the efficiency of their activities, both systems create special committees, assisting the boards. Their main task is to prepare data for the board meetings, elaborate the decision-making versions and their analysis. Board members then make the final decision (OECD, 2004). The typical committees are committees for audit, nomination, remuneration, risk, financial, executive.

To increase the supervisory role of the boards, for-profit organizations nominate, as board members, independent members and representatives of the employees. In non-profit organizations, we can find versatile structures as well as other bodies that usually do not exist in the for-profit sector, for example, board of trustees or governors.

The main modification is existence of the board of trustees or governors, which in many organizations substitutes the real owner and acts as administrative owner. In some hospitals, we observed only a supervisory board and management. Only in the hospitals with the legal form of joint-stock companies have we found classical two-tier structures with management board and supervisory board.

We can observe the following main differences between for-profit and non-profit organizations in the board structure: absence of the committees, unclear system of compensation and remuneration of board members, absence of quantitative indicators of the task for managers and board members and remunerations policy based on fulfillment of these indications (base salary, bonuses, benefits).

The main results of the analyses of differences of the systems of corporate governance in for-profit and non-profit organizations are depicted on the table 1.

		Characteristic				
Organization	Capital resources	Ownership structure	Organization aims and application of agency theory	Transaction cost theory	Stakeholder theory	Board structure
For-profit	Markets Banks	Major and minor owners, owner is clearly defined	Principal and agent roles, principal role of owner	Higher agency cost, internal planning, profit growth, importance of	Shareholders theory still dominant	One or two-tier structure, committees, long-term manager motivation of (share options)

				outsourcing		
Non-profit	Bank lends, charity, sponsors	Administrative owner, owner is unclear	Unclear separation of competencies, implementation of stewardship theory, owners role diminished	Lower agency cost, external cooperation, importance of outsourcing	Predominant stakeholders theory	Nonstandard structures, incomplete boards, boards of trustees or governors, committees not existing, low long-term managers motivation

Table 1 Characteristics of CG by parameters

CONCLUSION

In accordance with the main aim of our paper “to contribute to the development of the theory of CG of non-profit organizations and show as well its practical consequences” we tried to specify the main characteristics of the CG parameters in for-profit and non-profit organizations and indicate the similarities and differences in both systems.

The analysis of our sample of 192 public hospitals in the Czech Republic (full sample of all Czech public hospitals) allowed the verification of both of our hypothesis.

Hypothesis H1 “The characteristics of the parameters of the defined CG system differ in for-profit and non-profit organizations” was verified and confirmed practically in all parameters. In some parameters, e.g. “capital resources”, “ownership structure”, “organization aims and agency theory” and “board structure”, the characteristics differ distinctly; in the rest of parameters together with the differences there are some similarities. For instance, in the parameter transaction costs theory it is the characteristic “external cooperation”, or in stakeholders theory “the role of stakeholders” is important for for-profit as well as for non-profit organizations.

Hypothesis H2 “Development of the characteristics of the parameters of both systems tends to convergence” was confirmed only partly, namely in the following parameters: “ownership

structure" tending to higher privatization, "transaction costs" theory with outsourcing and "stakeholders theory" with the tendency of increasing role of different stakeholders.

On the other side in the parameters "ownership structure", "organization aims and agency costs" and "board structure" we indicated high diversity without any tendency to convergence.

FUTURE DEVELOPMENT

Based on our research, we may formulate the following tendencies for the future development of CG in non-profit organizations. Ownership structure will change in the way that the number of privately owned companies will increase. This tendency we can observe not only in the Czech Republic but almost in all countries. With regard to capital resources, we cannot expect any radical change in the financing of non-profit organizations. The current tendency to rely on charity and sponsors will be more and more important.

In organization aims and agency theory, an increasingly controlling role of administrative owners is expected to prevent abuse of managerial positions for self-interests and moral hazard. In stakeholder theory, we expect continuation of implementation of stakeholder views and an increasing tendency of the institutions toward corporate social responsibility and activities tending to fulfillment of the idea that an institution acts as a "good citizen".

The results of our comparative analysis correlate with the conclusions of other literature sources (Taranenko 2009, Hopt and Hippel, 2010) that in CG of for-profit and non-profit organizations we can observe the development of two relatively independent systems in harmony with the principal factors influencing them substantially. These factors are macro policy, economic and social policy, culture and public opinion. Our analysis, however, also revealed certain elements of convergence in for-profit and non-profit sectors that can indicate higher convergence in the future.

TEMPORALITY IN INTERGENERATIONAL TRANSITION: A PROCESS CASE STUDY OF A SMALL BUSINESS

Mari, Carlo¹; Meglio, Olimpia²

¹University of Molise, Italy, cmari@unimol.it

²University of Sannio, Italy, meglio@unisannio.it

ABSTRACT

Family business provide key infrastructure of wealth creation across the globe. One of the most important challenges family businesses face is the intergenerational transition process, an issue that has received considerable attention by scholars from diverse countries. Despite this great interest, academics are still struggling to understand such a process. In this paper we contend that a process orientation can prove a useful tool to shed new light on this phenomenon. In particular we provide a reading of the intergenerational transition through the different meanings actors apply to time. Evidence from a process case study point toward that founders and successors have a different perception of past, present and future and how they shape each other. This helps us to shed new light on the sources of difficulties family businesses face during the intergenerational transition process.

Keywords: family business, intergenerational transition, temporal issues, sensemaking, process approach

INTRODUCTION

Time seems to play a critical role in family business—a form of business that is built to last through generations. Conventional portraits of family business convey the idea that that it is built to last through generations. This explains the interest that intergenerational transition in family business has attracted from family business scholars from diverse countries (Brockhaus, 2004; Litz, Pearson & Litchfield; 2012).

Empirical evidence about this issue is mixed and supports the claim that the majority of family businesses fail to make it to the second generation (e.g., Le Breton-Miller, 2004). In an

attempt to further our understanding of the intergenerational transition process, a host of studies seek new variables able to predict a successful intergenerational transition,

We contend that this state of affairs reflects a positivistic mindset that still dominates the field and that has produced a low value added in terms of knowledge of substantive issues surrounding family businesses. In a similar vein, several family business scholars advocate for breaking down the prevailing paradigm of positive rationalist research ontology and epistemology that still dominates the field (Litz, Pearson & Litchfield, 2012) that proceeds by hypotheses testing on large samples, looking for the ultimate dependent, moderating or mediating variable explaining succession. As a consequence, the field seems marred by a set of standardized procedures that allow rigor but sacrifice a deep understanding of such an ambiguous process. Along with Dawson & Hjorth (2012) we call for a more nuanced understanding how organizational processes unfold over time the way they do and we intend to remedy to this state of affairs by proposing a different journey into the intergenerational transition that does justice to the ambiguities surrounding this process. Specifically, we want to put the spotlight on different interpretations of time different actors experience during the process. This paper aims to contribute to family business research by providing a more nuanced understanding of intergenerational transition, by asking “How do actors involved into intergenerational transition make sense of temporality during this process?”. We achieve this aim by investigating the different temporal schemes of actors involved in a intergenerational transition within an Italian small family company. We contend that unraveling the different interpretations of time may shed new light on this process and help us understanding the difficulties actors experience during this process.

The paper is organized as follows. In the next section we provide theoretical background about temporal issues in intergenerational transition. Then we describe the field study. Next we present and analyze findings. Limitations and future directions are provided in the concluding section.

READING THE INTERGENERATIONAL TRANSITION THROUGH A TEMPORAL PERSPECTIVE

In this section we review extant literature dealing with intergenerational transition in family businesses. Then we discuss the role of time in management and organization studies and propose our reading of the intergenerational transition based on the analysis of how the actors involved in the process make sense of temporality.

Intergenerational transition in family business research

Family businesses are by their nature temporally embedded, as they are built to last by passing the management and ownership from one generation to another, something that is generally referred to either as succession or as intergenerational transition process. Throughout this paper we use this latter label as we believe it better captures its meaning as well as its dynamic nature, being it a passage from one stage, subject or place to another.

As specified above, literature dealing with the intergenerational transition in family business is abundant.

To make sense of the variety of issues addressed and methods employed, we can classify studies as: 1) seeking to explain performance in family businesses; 2) focusing on the decision-making process; 3) investigating single constructs, such as commitment, or single actors, such as founders or successors; 4) approaching intergenerational transition as a process with the aim of developing a holistic overview.

Within the first category, analysis of the relationship between family issues and performance is a major focus among family business scholars. A range of factors is investigated with an aim to explaining or predicting successful intergenerational transition. Stewart & Hitt (2012) provide a detailed summary of 59 empirical studies published in the 2000s to assess the effects of family involvement on firm performance, concluding that the findings are inconclusive. This could be partly explained by the heterogeneity of family businesses that makes more useful to investigate how family and business factors interact and shape one other and determine a certain performance, as suggested by (Dyer & Dyer, 2009).

The second category comprises studies investigating the decision-making process during intergenerational transition. The main focus in this set of studies is on planning intergenerational transition in an attempt to offer practical guidance on how to make it successful (e.g. Sharma, Chrisman & Chua, 2003). Various scholars have raised concerns about the connection between planning and successful succession (Aronoff, 1998; Lansberg, 1999; Murray, 2003). Here we would like to outline that an emphasis on formulation processes is ill-suited to deal with behavioral factors that actually do affect how the intergenerational transition process evolves over time, above and beyond what has been rationally planned.

The third category varies a great deal, with studies addressing aspects such as communication between founder and successor (Janjuha-Jivraj & Woods, 2002), intra-family conflicts (Levinson, 1971), family cohesion and adaptability (Lansberg & Astrachan, 1994), the gender of actors involved (Harveston, Davis & Lyden, 1997), the role of family identity

(Zellweger, Nason, Nordqvist & Brush, 2013), successors' career expectations (Sharma, 1997), and desirable successor attributes such as commitment (Sharma, & Rao, 2000), analysis of which can be extended to include all the family members (Handler, 1989; Sharma, 1997). Taken together, these studies area step towards a more nuanced analysis of key concepts in intergenerational transition.

The fourth category includes studies addressing the intergenerational transition process in a more holistic way. Miller, Steier & Le Breton-Miller (2003) inductively identify three possible patterns of intergenerational transition—conservative, rebellious, and wavering—and discuss their possible impact on performance. Beyond this substantive contribution, the need clearly emerges for joint consideration of how family issues shape and are shaped by business ones.

The contribution of Cabrera-Suarez, De Saà-Perez & García-Almeida (2001) proceeds in the same direction with an integrative model incorporating the characteristics of the founder and successor (age and gender) as well as the family and the business context. The authors do justice to the multiple, concurrent and sometimes conflicting factors that recursively shape this process. The main flaw of this model is the fact that they focus on founders and successors, while there are several other stakeholders to take into account, such as professional managers, other family members, employees, and customers. All of these play a part in the intergenerational transition process, which is described as one of mutual adjustment by Handler (1990). Lam (2011) further develops Handler's view of intergenerational transition by pointing out that each individual play different roles simultaneously and putting forward the idea of multi-entity roles, which is a step towards comprehension of the ambiguities surrounding this process. In our view, the introduction of time and temporality can shed new light on and to better understand these ambiguities, as discussed below.

Introducing time and temporality in the study of intergenerational transition

Process scholars have long advocated for the inclusion of time in the analysis of organizational processes (Mohr, 1982; Pettigrew, 1992; Van de Ven, 2007). The word time summarizes a multitude of meanings and it is not surprising that the definition of time is itself ambiguous (Mari and Meglio, 2013). While Ancona, Okhuysen, and Perlow (2001) conceive time as a linear sequence of past, present and future, echoing the Newtonian view of chronological time according to which time flows linearly and independently from human action, other scholars have focused their attention on the ways people experience and make sense of time according to their lifestyles, reference systems and social norms (Chia, 2002).

According to this view, time can be conceived as lived experience that does not exist apart from human consciousness (Gherardi and Strati, 1988).

Today, after Lorenz's and Einstein's accomplishments, these opposing views are reconciled in that measurement methods for time are embedded, and therefore relative, to a specific reference system. A multiplicity of chronological times are thus dependent upon individual perspectives and frameworks. Any organization depends upon coordinating all these different times, but no organization can succeed completely. One way is to posit the existence of an overarching time, which is usually clock time. Another is to try to move to the non chronological notion of appropriate time, such as *kairos*. Still another option is to acknowledge that an organization includes a plurality of times.

An important step towards a deeper understanding of time in organizations, is to focus on temporality, that is to analyze how actors make sense of time in the context of the intergenerational transition. The notion of temporality, as used in this study, implies more than different conceptions of time, being it about the ways in which the passing of time shapes human actions (Hernes, Simpson and Söderlund, 2013). We share this view and we contend that if we persist in treating time as independent of human experience, we risk losing touch with that which makes us human, guides us in moral action, and gives meaning to our lives. More subjective approaches to time tend to see past, present and future as all rolled in together. Focusing the investigation on temporality in the context of intergenerational transition would eventually help us to understand where ambiguity comes from. The choice of our focus is driven by the awareness that "family firms are not only socially distinctive, but comprise a distinct temporal frame, with time particularly relevant for the co-production of sense and order. In these uniquely rich organizational environments, the (inherently mutable) heritage of the past, and the (ever changing) shared projections of the future, are both linked and enacted by actions in the present" (Drakopoulou Dodd, Anderson & Jack, 2013: 35).

THE FIELD STUDY

Our fieldwork approach to this study is case-based and processual (Pettigrew, 1992). In order to capture contextual complexity and depth (Dyer and Wilkins, 1991), we use a qualitative single case-study design (Yin, 1989). Since the focus of the research was on temporality and how actors in family business (founders and successors) experience the intergenerational process through the meaning they attach to time, the study was conducted as an

interpretative inquiry, with the aim of making interpretations from the inside (Brown, 1994, 1995).

The research setting is a small Italian service company operating in Southern Italy. Its core business is selling plumbing and heating materials both as wholesaler and as retailer. The first business accounts for 80% of turnover, while sales to end consumers represent the remaining 20%. 20 full time employees are currently working for the company.

Founded in 1976, the company is run by three shareholders—Luigi, Federico and Mauro—who are fully involved into the day-to-day managerial activities. Luigi is responsible for wholesales, Federico is responsible for retail sales, while Mauro is responsible for finance and procurement. Luigi, Federico and Mauro have no family linkage among them, and their spouses have been kept out of the company. However, they perceive themselves as a family company as they started off the business with the idea of ‘passing the baton’ to their sons or daughters.

As for the data gathering techniques we followed Lincoln and Guba’s (1985) suggestion that qualitative field methods are the best fit to acquire a type of data that is unattainable using other modes of inquiry (Smith, 2001). Such an approach usually delves more deeply into the organizations rather than skimming over their surface (Langley, 2009). We use the label ‘field research’ to describe the study of ongoing organizational life in its naturally occurring settings with first-hand observations from the viewpoint of a particular individual or group (Van de Ven and Poole, 2002). Its distinctive feature is that it takes place in the field in a natural social setting familiar to the subject (cf. Lofland et al, 2006).

We entered the field in “*medias res*”, with the three intergenerational transitions being at different stages of their developments. For this reason, we employed a partly retrospective and partly in real time research approach, with the aim of linking the past to the present and to future. In order to allow the different understandings of past, present and future as well as other temporal categories to emerge, we decided to investigate two units of analysis: the fathers and the sons/daughter(s).

The field work lasted three years, from 2008 till 2010. Access to the research setting was secured by a personal relationship of one of us with Antonella (Mauro’s daughter). This assured the collaboration of informants throughout the research process.

To improve our understanding of the field and the topic of interest a range of data, primary as well as secondary, was collected. Primary data were mainly collected through focused interviews. We interviewed the three founders, the three successors, along with other two siblings. Each informant was interviewed twice or more times, with each interview lasting on

average one hour. All interviews were recorded and transcribed with informants' consent. Furthermore, observations and informal talks supplemented interviews with field notes. Secondary data were mainly a chronology of events traced by one of the founders and minutes from key meetings.

In our analysis, we followed an inductive logic (Glaser and Strauss, 1967). This meant that we had an exploratory approach towards our data and aimed at structuring the data on an ongoing basis from a 'grounded' understanding of the phenomena in question. Our research design allowed us to contrast the linear view of time and different temporalities.

FINDINGS

In presenting our findings we will focus on the different, often competing, interpretation of time actors experienced during the process. The most important temporalities emerging from our field study are past, present and future and how they shape each other.

Although we recognize that past, present and future are strictly linked and the perception of one influence the perceptions of the other two, we will discuss them separately. We would like to start the discussion from how founders and successors experience the past.

Competing interpretations of the past

From the interviews it clearly emerges there is a different involvement with and attachment to the past. In founders' accounts there is a great attachment to the past, which brings with it a frequent recall of the beginning of their company. They all share the feeling that the past still exerts a great power on the present. This feeling can be best illustrated by the way they all evoke and depict the beginning of the company. They all refer to it as a jump into the unknown, they recall the initial sacrifices, but also the importance of the earthquake in their growth. The past is therefore described as containing difficulties but also opportunities they were able to identify and to exploit. Underlying this feeling is the strong belief that they were building something for their families, and their children in particular.

The past is lived in a different manner by successors .depending on their involvement into the family business during their infancy and youth While Antonella (Mauro's daughter) and Carlo (Luigi's son) were kept out of the business before joining the company, Ludovico (Federico's son) was constantly updated by his father about the company and was regularly brought with him at work. This gives to him a sense of having been there even when he was not involved into the management of the business. This does not result however in a sense of

superiority towards his counterparts (Antonella and Carlo), rather it probably affects the relationship with his father and the way he interprets the past. Besides their involvement, all successors live the past with mixed feelings: on the one hand, it represents the legacy of their fathers and they feel the responsibility to assure continuity to their company, on the other hand it represents a burden as it prevents them to change the ways “things are done around here”. The past is not really over, it is continually re-lived into the present through routines and practices. The ways things are done about here, that is how the present is experienced on a daily basis represents a sort of battle ground where competing frames fight against each other. The present is, as a matter of fact, the result of past choices, and therefore, future choices are constrained by past ones. Under this regard, there is a tension between generations. While founders do not even perceive the need to make changes, the successors believe that changes are urgent and the cost of inactivity is a crisis.

Competing interpretations of the present and the future

The present is viewed by founders as a transition time, with some processes ongoing but not ready to be completed. From founders' account it clearly emerges that the transition is *in fieri* and it follows its natural course; however, none of them seems to be ready to retire. What seems to be a shared feeling is the willingness to retire but the impossibility to do so, as the successors are not perceived to be ready to “receive the baton”. The present is therefore seen as a “frozen time”, with founders skeptical about successors' capabilities to run the business on their own, and the successors eager to replace their fathers. This reinforces the view of the present as a battle ground as discussed above. The present is, in fact, lived by successors as the outcome of past choices that are in some cases irreversible, thus implying that the range of possibilities are constrained by the founders' past actions. It is exactly in present time that different views emerge. An illustrative case in point is the meaning of speed attached by actors: having something done soon, say a new contact with a supplier or a phone call to a customer may take one month for a founder while just half a day for a successor. This reinforces the idea of the urgency of the change that is perceived by all successors and not understood by founders. This provides in our view an alternative understanding of possible sources of conflicts among generations during an succession process.

The sense of urgency and the compelling need for speed brings with it a different meaning attached to the future. In the context of the intergenerational transition the future is not simply about goal setting for sustaining growth, but also about the timing of the intergenerational transition, that is, the moment when the founders will retire and successors

will replace them completely. Again competing and often irreconcilable sense-making of future emerge. Founders seem to be stuck in the present, with no idea about the right time to retire, and not even a tentative timeline. Successors live this ambiguity with frustration as they perceive that they have fully replace their fathers in the daily management of the business, but feel constrained by their presence within the company. They all feel that as long as their fathers are within the company they are not allowed to implement any change.

CONCLUSION

In this paper we have provided a different, and more nuanced understanding of intergenerational transition in a small family business. We have achieved this aim by investigating how founders and successors experience past, present and future over the course of the intergenerational transition. The research setting is a small Italian company run by three different shareholders who are “passing the baton” to their sons and daughter. Analyzing the often competing meaning actors attach to temporalities a new understanding emerges of the conflicts between generations in a small family business.

RESEARCHING SOCIAL PRACTICES FOR UNDERSTANDING CONSUMPTION

Mari, Carlo

University of Molise, Italy, E-mail: cmari@unimol.it

ABSTRACT

The social practices lens provides a different perspective to the study of consumption emphasizing its role in social reproduction and changes rather than focusing on individual consumer choices or cultural structures (such as lifestyle), and also because it helps understanding how value is co-created among consumers and firms in innovation process.

So far conceptual and substantive contributions about social practices have been developed neglecting the inquiry around the methodological side. This paper tries to answer the following question: what research methods should scholars use when studying social practices in relation to consumption?

To achieve this aim, secondary data drawing on empirical studies about social practices and consumption are examined. Such a preliminary analysis shows that studying practices and consumption needs a twofold approach: the immersion in the ongoing social activities of some individuals or group, and the across-time perspective. To capture both, a longitudinal field research is proposed as the main inquiry strategy.

Field research means studying the ongoing practice life in its naturally occurring settings, and longitudinal approach helps seeing social practices from a historical developmental perspective.

Keywords: consumption, social practices, field research, longitudinal research, brand community

Social sciences have increasingly taken the concept of practice as their focus of study since the eighties. The range and scope of practice theory applications are very broad and include management and marketing studies as well. Scholars within management and marketing communities are turning their efforts to practice theory as a new perspective for advancing

knowledge. A growing number of conceptual and empirical works in accounting, marketing, organization, and strategy witnessed such an investment .

In marketing one of the main application of practice theory is focused on understanding consumption through a diverse lens that highlights it as part of accomplishing social practices. This approach is particularly useful because overcomes the weaknesses of current consumption research privileging either individual consumer choices or cultural structures (such as lifestyle), and also because it helps understanding how value is co-created among consumers and firms in innovation process.

The social practices lens provides a different perspective enabling to see consumption as embedded in social reproduction and changes. Scholars have been so far mainly concerned with the analysis of conceptual and substantive contributions a practice lens can offer, while the inquiry around the method domain remain relatively neglected. If we acknowledge that the concept of practice is a new avenue for understanding consumption culture, it makes sense to ask which specific research methods best fit it. It becomes a relevant question if scholars want to gather data that shed light on the relationship between consumption and social practices.

This is the void this contribution intends to fill, to develop further such a line of research providing a preliminary analysis of data gathering techniques that are best fit to a practice leans. This aim is captured by the following question: what research methods should scholars use when studying social practices in relation to consumption? To achieve this aim the paper provides an overview of different data gathering techniques and suggest a comprehensive framework to guide empirical research inspired by a practice lens.

The remainder of this paper is organized as follows. Firstly, a brief theoretical sketch about practice theory is presented. Then the paper analyzes the implications of applying a practice lens to the study of consumption. Next the paper describes different data gathering method and a proposal of an integrative framework that seasoned and novice researchers could rely upon when conducting a field study.

A THEORETICAL SKETCH

This paragraph offers a brief overview of theories of practice. The complexity of the topic would require a more comprehensive analysis, which is beyond the aim and scope of this paper. For this reason, the paper will attempt to clarify the concept of practice and provide a basic introduction of different theories of practice.

The concept of practice is not easy to grasp as it has diverse theoretical roots (Bourdieu, 1978; Giddens, 1979). This can be interpreted as a sign of versatility and richness of this lens. In an attempt to offer a systematic analysis of such an approach, a fruitful starting point is to draw on a few pieces written by further theorists that help us to navigate into the topic. Specifically, here it is useful to refer to Ortner (1984), Reckwitz (2002), Schatzki (2001, 2012), Shove and Pantzar (2005), and Warde (2005).

Ortner contextualizes the birth of practice theory in the field of anthropology and claims that the translation of Pierre Bourdieu's book published in 1978 marked the call for a more practice-oriented approach. He goes on in describing what happened:

'...a new key symbol of theoretical orientation is emerging, which may be labeled "practice" (or "action" or "praxis"). This is neither a theory nor a method in itself, but rather, as I said, a symbol, in the name of which a variety of theories and methods are being developed.' (Ortner, 1984, p. 127)

Ortner (1984) outlines that despite the great variety of theories of practice, they all share a common orientation based on the following issues: the view of the social world and the Marxist influence. From this one learns that a practice approach is elaborated in opposition to the dominant view of the social world that sees it as ordered by rules and norms, and minimizes the relevance of institutional organization and cultural patterning for understanding social life (Ortner 1984). In other words, practice scholars believe that the social world is produced and reproduced in the past, present, and future and are therefore interested in understanding the mechanisms through which (how) it happens.

The Marxist legacy emphasizes the social asymmetry between actors: this implies that action and interaction are guided by hegemony and symbolic domination. The social world is formed and deformed by "specific realities of asymmetry, inequality, and domination in a given time and place" (Ortner, 1984, p. 149).

The reading of practice theory offered by Reckwitz (2002) is as a type of cultural theory and is focused on explaining the relationship between human action and the social world. He focuses his attention on how the social world impacts on the practice, and how the practice in turn shapes the social world. This brings with it an understanding of the production, reproduction, and change of form and meaning of a given social and cultural world. From this one learns that practice is shaped by the social world through culture. This culture allows and enables people behaviors, yet it is again this culture that restricts and inhibits those behaviors. In sum, practice is a constitutive mechanism of the social world that is reproduced by practice through norms, values, and conceptual schemes that characterized

the ordinary living and little routines in social interactions. Changes in the social world are introduced (Ortner, 1984), alternatively, by a dominated group escaping the prevailing hegemony (that is a countercultural movement) or a failed reproduction (unsuccessful attempts to apply traditional practices).

Taken together these works suggest that a practice is anything people do that has intentional or unintentional political implications because the theory assumes the centrality of domination. The acting units are individual actors and their doings. Both becomes the important points for understanding the unfolding of events and the processes of change of the social world. A practice may have a dual temporal dimension: ad hoc decision making in the short term and plans or programs in the long term. The kinds of action that constitute the object of the theory are pragmatic decision making, active calculating aimed at changing the social world, as well as more routinized behavior that reproduces the social world. The human action, in practice theory, is driven by and accordingly understood by adopting two alternative explanations. The first, a psychological view that is based on individualistic and rational behavior, and the second, a social view that describes actors as concerned with the difficulties of their situations and trying to solve problems posed by those situations.

Social practices become thus the site of the social for practice theory and, consequently, practices are the basic units of analysis. A practice can only exist when the activities involved are performed by people, meaning that social practices have to be enacted.

Schatzki (2001) contributes to a more nuanced understanding of the social practice. More specifically, Schatzki (2001) distinguishes between practice-as-entity and practice-as-performance. The former are formed historically as a collective achievement, the latter highlights the enactments that reproduce and transform the practice over time. Such a distinction is generally accepted by scholars even though different versions are formulated. Ortner (1984), from his side, describes a practice as anything people do (that is doings), while Schatzki (2001, 2012) focuses on a more elaborated concept: an organized nexus of activity where activity is a set of doings and sayings organized by a pool of understandings (knowing how to), practical rules (explicitly formulated instructions), hierarchical structure of end-project-activity, and material entities. Reckwitz (2002) pulls together bodily and mental activities, knowledge, and things. Warde (2005) describes practice's components as understandings, procedures, and engagements. Shove and Pantzar (2005) include meanings, competences, and materials. These qualities of a practice are necessary to perform it and individuals act as carriers or hosts of a practice.

To summarize, the concept of practice, besides the different conceptualizations and underlying perspectives, is a complex phenomenon. It is exactly this complexity that makes this concept so attractive to scholars from a range of disciplines. Such complexity, however, poses methodological challenges, that is, selecting methods suitable to capture and render this complexity. With this observation at hand, the paper moves onto the analysis of different data gathering techniques.

APPLYING PRACTICE THEORY TO THE STUDY OF CONSUMPTION

The adoption of a practice lens, brings with it that consumption is an aspect of social practice since performing a practice requires material artifacts (Ropke, 2009). If consumption is conceptualized as integrated and embedded within social practices, it means studying how things and services are utilized (Harvey *et. al.*, 2001). The focus is on 'doing' rather than 'having' in relation to consumption. An example about the practical use of kitchens clarifies such a perspective:

'The kitchen table is symbolically important for some social groups, it being embedded in practices believed to sustain the moral well-being of the family, intimate relationships and friendships. Its use is subject to objective constraints, such as size of kitchen and number of household members. Other relevant factors reported included the times at which household members return home from work and school, and whether a meal was cooked using raw materials or a pre-prepared meal cooked in the microwave. Such routines and objective constraints influenced whether kitchen tables were deemed important, how they were used and how this affected related social practices revolving around sociality, eating and the organization of domestic routines.' (Harvey *et. al.*, 2001, p. 46).

Consumption is embedded within a given material culture and set of social norms. It follows from practice rather than vice versa (Shau *et al.*, 2009). 'Consumption is not itself a practice but is, rather, a moment in almost every practice' (Warde, 2005, p. 137). The engagement in the practice helps us understanding the nature and process of consumption. Individual pattern of consumption can be explained through the recruitment to a practice and the subsequent commitment to it. Consequently changing forms of consumption may be accounted for as changing positions within practices. The practice theory perspective provides a socio-structural explanation of consumption (Randles and Warde, 2006). This means that consumption is seen as one of vehicles through which social structures (such as class, age, gender and space) are shared, understood, misunderstood or contested. Moreover,

empirical evidence (Shau *et al.*, 2009) shows that consumer's enactment of practices creates value in brand-centered community. Such a collective process of value creation collaborates in the firm's innovation process. Customers and firms co-create value in brand communities and understanding practices that help building better brand partner becomes a key managerial goal. Customer engagement in collaborative value creation impacts on brand equity and firms should develop opportunities to foster such a collaboration. Specifically, studying activities by which consumers create value in brand community practices reveals crucial information for new product development, such as information on customer desires and information on how to best satisfy them. From a managerial perspective, firms should be strongly interested in understanding how to offer opportunities to grow customer competence, that, in turn, increase the likelihood of value creation through practices in brand communities.

METHODOLOGICAL IMPLICATIONS IN STUDYING CONSUMPTION THROUGH A PRACTICE THEORY LENS

How do scholars study social practices and consumption? To answer this question, the paper investigates what are the data gathering techniques scholars have so far employed to study social practice and consumption. To achieve this aim, a set of empirical articles drawing on social practice perspective was selected. Despite the set has no statistical significance, it still provides us with preliminary findings useful to clarify how studies were conducted so far. Such an approach is consistent with the initial contribution that the study intends to offer. The set includes 13 articles published from 1995 to 2012 in five academic journals as shown in Table 1, where they are arranged in chronological order and research methods employed are highlighted. The focus here is solely on data gathering methods used in the study based on what authors described in their article.

The set of articles shows two main features: most of the studies employ more than one data collection method and qualitative research methods are the prevailing approach. Looking into the data gathering techniques employed, it emerges that individual interview is the most used method (11 out of 13 studies), followed by participant observation (6 out of 13 studies) and secondary literature (6 out of 13 studies). In regard to secondary literature, it can be assumed that, despite authors did not mention explicitly this method, they conduct some kind of secondary data collection. Non-participant observation is less frequent in studying social practice and consumption (4 out of 13 studies). Further methods are quantitative approach based on survey (one study employed it with time diary technique)

and focus group (one study). A few studies are partially based on different versions of observation such as video recording, photography, and auto-photography.

Authors and Year	Journal, Volume, and Issue	Research methods
Holt 1995	Journal of Consumer Research 22 (June)	Non-participant observation
Shove and Pantzar 2005	Journal of Consumer Culture 5 (1)	Interview, focus group, participant observation, secondary literature
Cheng et al. 2007	The British Journal of Sociology 58 (1)	Time diary survey
Hand and Shove 2007	Journal of Consumer Culture 7 (1)	Interview
Watson and Shove 2008	Journal of Consumer Culture 8 (1)	Interview, non-participant observation, secondary literature
Gram-Hanssen 2009	Journal of Industrial Ecology 14 (1)	Survey, interview
Shau et al. 2009	Journal of Marketing 73 (September)	Interview, participant observation, non-participant observation, secondary literature
Sandikci and Ger 2010	Journal of Consumer Research 37 (June)	Interview, non-participant observation, secondary literature
Halkier and Jensen 2011	Journal of Consumer Culture 11 (1)	Interview, participant observation, auto-photography
Hargreaves 2011	Journal of Consumer Culture 11 (1)	Interview, participant observation
Magaudda 2011	Journal of Consumer Culture 11 (1)	Interview

Hui 2012	Journal of Consumer Culture 12 (2)	Interview, participant observation, secondary literature

Table 1 Examples of research methods

By reading the 13 articles, it also emerges the authors' attempt to uncover the practices through studying doings and sayings of the people involved. Such an approach helps composing practices according to their dual nature of entity and performance. Inquiry in social practice needs description of both basic elements and action performed by practitioners. This means to take into account elements and performance that are spatially and temporally dispersed entities (Schatzki, 2012). Moreover, empirical studies on practices emphasize the social dynamics into which consumption processes are embedded (Halkier and Jensen, 2011) and the individual consumer-practitioner is considered as a place for intersection of a plurality of practices. For example, the daily engagements of any individual

are a search for balance among the different practices in the social organization of time and space. Thereby, work practices, parental practices, transportation practices, food practices, leisure practices and so on can be seen as part of the same everyday life. To understand further social practices, it means to develop the trajectory that each of them develop over time. More specifically, practices have a history conditional upon time, space and social context (Warde, 2005). Thus, practices change their form due to the performance of practitioners that actively contribute to reproduction, reconfiguration and innovation.

It seems clear from both the theory and empirical evidence, summarized in Table 1, that studying practices and consumption need a twofold approach: the immersion in the ongoing social activities of some individuals or group, and the across-time perspective. In order to capture both, the paper proposes a *longitudinal field research* as the main strategy to inquiry social practices within the consumption context.

The label field research describes the study of ongoing practice life in its naturally occurring settings using first-hand observations from the viewpoint of a particular individual or group. Its distinctive feature is that it takes place in the field in a natural social setting familiar to the subject. The word longitudinal implies studying social practices from a historical developmental perspective. It means inquiring about a sequence of events or activities that describe how things change over time for understanding the dynamic of practice life.

Longitudinal field research is characterized by two elements (fieldwork and the prolonged engagement with the research setting) that suggest to collect data preferably by using a multi-technique approach to build evidence that is both broad and deep. This in turn means that going into the field and studying change over time can be conducted by adopting a comprehensive framework based on listening, observing and tracing as data gathering techniques (Mari and Meglio, 2013).

The listening approach is based on interviewing, which means understanding how informants make sense of their actions (Lofland *et al.*, 2006). It means that researchers try to access the internal lives of people and give voice to them through talk as the data source. Interviewing can be conducted at the individual and group levels; ideally, the two levels should not be considered as alternatives, but rather as complementary in cross-validating data.

The observation approach enables close access to and experience of the lives and activities of others (Lofland *et al.*, 2006). It means understanding evolving patterns of daily interaction and behaviour that shed light on the 'how' of practice life. Observation can be participant or

non-participant, according to the role played by the researchers. The former implies that they actually participate in the practice they are investigating. This may happen overtly (that is, acting as a temporary practitioner and asking permission to conduct the fieldwork) or covertly (that is, taking a practitioner role without disclosing the research aims). The latter requires the researchers to observe the phenomena but not take part in them. Moreover non-participant observation involves limited interaction between the people observed and the researchers.

The tracing approach to practice research provides a valuable way of studying key event chronologies spanning long periods of time, records of arguments and justifications, and logs of personal activities and events (Alaszewski, 2006). It takes the form of diaries and archival records, and may contribute to a better understanding of the practice life because it conveys data that are usually difficult to gather through the other approaches. Here, we refer to solicited diaries that fit the research aims rather than unsolicited documents that are already available, such as life histories or memoirs (Alaszewski, 2006). Archival records (Webb *et al.*, 2000) are written materials that can be produced by either public sources (that is, data periodically gathered for purposes other than scholarly ones) or private sources (data from personal archives).

CONCLUSION

Despite the previous proposal can only scratch the surface of how conduct research about social practices and consumption, it still provides an initial understanding of such a relevant topic. Our understanding of consumption through a practice theory lens need both a conceptual and methodological effort.

A practice perspective is a fruitful avenue for furthering our understanding of consumption that, in turn, increases the comprehension of how value is co-created in brand community practices. The social practice approach promises to offer fresh insight for both scholars and marketers focusing on activities by which consumers engage in practices and create value for them and firms. To fully exploit such a promise, however, it is essential to rely on data gathering techniques that allow for the immersion in the ongoing social activities of some individuals or group, and the across-time perspective. In order to capture both, the paper has proposed a *longitudinal field multi-method research* as the main strategy to inquiry social practices within the consumption context.

ORGANIZATIONAL INNOVATION IMPLEMENTATION THROUGH INTER-FIRM NETWORKS

Martin-Rios, Carlos

Center for Organizational Learning and Transformation, Rutgers University and Center for Management Innovation, Madrid, cmartinrios@cminnovation.com

ABSTRACT

This study untangles the impact on firm's innovation output of inter-firm knowledge interactions regarding network exchanges of managerial (organizational and administrative) knowledge. Specifically, we address how population-level mechanisms of exchange link with organizational-level mechanisms of implementation that lead to the adoption of innovations. The research questions serve to advance understanding of implementation of organizational innovation activities by means of participating in flows of managerial knowledge between firms under contractual relationships and in the absence of formal relationships. The study analyzes data from a complete network of 50 high-technology firms located in a science and technology park. The findings from this social network analysis show that the firms in the study actively engage in the sharing of organizational knowledge. Specifically, the results indicate the positive relationship between firm participation in networks of managerial knowledge and firm's innovation output. Participation in inter-firm knowledge networks appears to be an effective tool for obtaining organizational knowledge as well as for enhancing innovation outcomes.

Keywords :Antecedents of organizational innovation; managerial knowledge; knowledge acquisition; inter-firm networks; social network analysis

By participating in knowledge networks, firms are exposed, acquire and share knowledge relevant to their business. Through these knowledge interactions firms introduce different kinds of innovations (Tödtling et al., 2009). One of such forms of knowledge being shared is managerial (organizational or administrative) knowledge. This type of knowledge is critical for organizational learning and innovation (Uzzi & Lancaster 2003). Yet, to this date literature

in organization has not analyzed specifically its role in fostering innovation in organizational systems, structures, and practices. Most research on innovation has been traditionally linked to the acquisition and deployment of knowledge related to new technologies, products or services and focused on large, manufacturing firms and, not until recently, have scholars explored non-technological sources of knowledge (Sammorra & Biggiero, 2008) and their relevance on non-technological innovation outcomes in entrepreneurial, high-tech activities (Hipp and Grupp, 2005).

This lack of research on the topic may be explained, in part, because of the recent interest on aspects related to organizational innovation, conceptualized as *the introduction of a new management practice, process, structure, or technique into the organization that tends to improve the effectiveness or performance of the adopting organization* (Birkinshaw et al., 2008; Birkinshaw and Mol, 2006; Damanpour, 1991). Research has yet begun to uncover the antecedents, nature, and direction of organizational innovation dynamics. Despite substantial recent progress, it is evident that the relationship between managerial knowledge and organizational innovation is a complex, multifactorial process and that many important questions remain unanswered. Specifically: By what means do firms obtain managerial knowledge? How does its acquisition relate to organizational innovation outcomes?

This research intends to assess the relationship between the acquisition of managerial knowledge by means of firm participation in knowledge networks and firm innovation outcomes in the form of implementing organizational innovation initiatives. We intend to contribute to the innovation and social networks fields. Recently, this stream of research has developed a new line of inquiry, applying social network theory and analytical tools to the investigation of inter-firm knowledge flows and innovation decision-making, activities, and outcomes (Martin-Rios, 2012; Sammarra & Biggiero, 2008). We expect that firms taking part in both formal and informal knowledge networks will obtain higher knowledge returns in aspects related to management issues, which in turn will have a positive impact on the firm's ability to organizationally innovate.

We then adopt the social network perspective to analyze empirically how these factors favor inter-firm management knowledge sharing. Furthermore, we look into the relationship between managerial knowledge acquisition and implementation of innovative organizational initiatives by means of a survey questionnaire on organizational innovation practices. This analysis is especially relevant for the successful management of knowledge flows, particularly with respect to the levels of collaboration that are required for independent firms

to actually exchange management knowledge with each other and the expected positive impact of such exchanges on further implementation of organizational innovations.

The organization of this paper is as follows. The first section discusses the conceptual background for inter-firm knowledge networks and provides the analytical framework to be tested in this study. Next is an explanation of the social network research methods, followed by a report detailing the setting in which data on inter-firm knowledge were collected. The results section tests hypotheses regarding the consequences for firms of participating in collaborative inter-firm knowledge networks in terms of both knowledge acquisition and implementation of innovations. I collected complete network data from high-tech firms located in a science and technology park managed by a public university. These data set the stage for general observations on the managerial knowledge exchange dynamics between firms and firms' innovative activity. The final section provides concluding remarks and lines of future inquiry.

LITERATURE REVIEW

To date, few researchers have delved specifically into inter-firm flow of managerial knowledge and consistent research aimed at elucidating the effect on innovation outcomes for firms taking part in networks where management knowledge sharing may take place is still lacking (Martin-Rios, 2013). The paper's conceptual model addresses the transactional (formal) and embedded (collaborative) components of management knowledge sharing (see Figure 1). This model proposes that managerial knowledge flows across organizational boundaries for various reasons. It identifies potentially positive consequences for firms that participate in inter-firm managerial knowledge networks. Our study suggests that by participating in knowledge networks, firms try to satisfy certain knowledge needs related to their business activity, which in turn drive their organizational innovative initiatives.

Figure 1 Theoretical model

We propose that acquiring organizational knowledge is essential for organizational innovation initiatives to happen. One way firms can reap the required knowledge is by establishing relationships with other firms. The nature of those relationships can be either formal (i.e., contract mediated) or informal (i.e., collaborative, non-contract mediated). Collaborative interactions may lead to opportunities of multiple knowledge exchanges (Oliver, 2004). Thus, collaborative dynamics are associated with the establishment of interactive ties that potentially foster knowledge exchange, and specifically organizational knowledge. Therefore, this paper proposes that firms are more likely to engage in exchanging organizational knowledge with those firms with whom they have formal ties, as in the case of commercial agreements, and collaborative agreements. Accordingly,

H1. Ceteris paribus, the existence of formal agreements between independent firms is positively associated with managerial knowledge exchange and acquisition.

H2. Ceteris paribus, the level of collaborative interaction among independent firms is positively associated with managerial knowledge exchange and acquisition.

Organizational innovation (also labeled managerial, management, or administrative) is an important source of innovation with potential impact on the success of firms. By its very nature, this is the less discrete, more intangible, and organization-specific part of processes innovation (Damanpour, 1991). Its relevance is revealed in the growing amount of research on the subject (Mol & Birkinshaw, 2006; Vaccaro et al., 2012; Armbruster et al., 2008). Scholars contend that implementing organizational innovations is difficult as it questions existing practices and processes, as well as ingrained assumptions on the way things are (Birkinshaw et al., 2008). For this reason it is important to identify the way firms obtain knowledge about new organizational aspects, which in turn, may result in innovation initiatives (Sammarra & Biggiero, 2008). Accordingly,

H3. Firms that obtained managerial knowledge via participation in formal or informal knowledge networks are more likely to implement management innovation activities.

METHODS

The relational nature of the research questions under study determines this paper's focus on social network data. In this study, network data aims to capture the actual inter-organizational dynamics of HRM knowledge flows. Social networks have proven to be a powerful tool for understanding social dynamics and social structures tied to one or more types of interdependency. A network consists of a set of nodes (individuals, groups, organizations) with links representing specific types of relationships between them (Wellman, 1983). Links between pairs of nodes may represent a wide range of connections with one or multiple objectives (e.g., information acquisition and knowledge exchange). Social network analysis studies either *whole networks* (also known as *complete networks*) or *personal networks* (also known as *egocentric networks*). While the former of these refers to all ties that contain specific relations within a defined population, the latter indicates any ties that an agent may have—such as "personal communities". One of the main challenges when studying networks is to adequately specify their boundaries (Gulati, 1995). For the purposes of this study, I chose a complete network of firms, and the network I selected was not based solely on formal contractual relations (e.g., strategic alliances or subcontracting relationships). Rather, the focus is on a network based on multiple ties and a common affiliation within a technological community.

Research Setting

Science and technology clusters or "parks" emerged in the US in the 1950s in an attempt to increase the productivity of high-tech firms. The assumption behind this attempt was that the physical proximity or territorial agglomeration of firms, public administrations, R&D centers, and universities would provide potential benefits for firms. Following their success in the US, clusters spread to Europe in the 1960s and 1970s (e.g., Cambridge in the UK, Sophia-Antipolis in France, or Medicon Valley in Denmark-Sweden), and to Southern Asia in the 1980s and 1990s (e.g., A*START in Singapore). The science and technology park selected for this research is located in the metropolitan area of Madrid, Spain. Established in the year 2000 by a public university in conjunction with local, regional and national public agencies, the Park serves as a good example of a university park. It not only acts as a business incubator, but has also provided both institutional support for high-tech start-ups and basic services for long-established firms. Overall, the park comprises 38 firms, including start-ups, established

firms, and branches of multinational firms, 12 university spin-offs and developing business ventures, and six R&D centers including publicly funded research institutes, university funded research institutes and R&D consortiums between firms and the university.

Data Collection

We drew up a questionnaire to map knowledge flow among those people responsible for maintaining relationships with other firms. Assessment of implementation of innovative initiatives was performed with a second questionnaire. By administering two different questionnaires at two different points of time, we avoid response bias. We relied on accepted instrument development guidelines for the social network survey instrument (in particular Wasserman & Faust 1994). Surveys included a complete list of all firms in the Park (a total of 50). This roster method facilitates individuals' recall of typical patterns of interaction and has shown itself to be reliable. We asked each participating firm to mention the organizations with which they had exchanged information during the last year, what was important to them, and how. Relationships within the actual network between actors (firms) i , j and k can be transactional (based all or in part, on a formal agreement) or embedded (relational ties embedded in social attachments) (Friedman & Podolny, 1992; Uzzi & Lancaster, 2003).

We attempted to call each CEO in the sample by phone so that every organization had a 100% probability of being sampled. After explaining the overall aim of the study, we asked to interview and collect social network data from the most knowledgeable informant (Kumar et al., 1993) who could best assess the type of knowledge diffused and how. In several cases, the CEO referred us to another senior manager who was either formally or informally responsible for managing the firm's day-to-day relationships with other firms. In order to secure this sensitive information, the survey efforts required sponsorship and support from both the regulatory agent and firms located in the park. This survey procedure successfully ensured contact with all of the firms in the park, including spin-offs and consolidated firms.

Fieldwork lasted eight weeks and a total of 41 firms responded to the social network questionnaire, which represents a response rate of 82%. The remaining 9 firms either refused to participate after several telephone calls or could not be contacted. Since the study reports on the dyadic level, respondent firms were asked to report knowledge exchanges with any of the 50 firms of the whole population (by means of census, rather than by sample). Knowledge exchanges can be asymmetric; a firm may report exchanging knowledge with another firm that may not answer the survey. We chose to focus on the knowledge seeker's perception—

the non-missing value (when A answered that exchanged with B although B did not mention A). This was based on the assumption that knowledge exchanges between firms may involve several actors from each firm; so not every instance respondent may recall or be aware of certain exchange instances. The 2,450 ties (50x49) between these firms constitute the network data for the analyses. The firms have existed for an average of 17 years. Ninety per cent are small to medium-sized enterprises (SMEs), while 10 per cent are large enterprises with more than 200 employees and sales exceeding 15 million euros. Twenty-seven of the interviewed firms (74.3%) are in high-technology services, and thirteen (25.7%) are in high- or medium-high technology manufacturing industries.

Dependent Variables

Management innovation: Respondents were asked to indicate the extent to which their firms had been actively involved in any of the following innovation initiatives, as defined from previous research (Armbruster et al., 2008; Birkinshaw et al., 2008; Vaccaro et al., 2012):

- High performance work systems, which includes innovation initiatives in the following human resource practices: mission and corporate values, performance management systems, employee voice, training and development, intranet (employee portal), compensation and rewards, and career and promotion systems.
- Leadership and social responsibility initiatives.
- Business model innovation.
- Reorganization of work processes and structures (e.g. from hierarchical to flat, team-based structure).

The management innovation level of each firm was calculated by taking the average of the 4 items. The management innovation scale is assumed to measure the innovation effort in management or organizational initiatives. Cronbach's coefficient Alpha of this scale was 0.717. Because we used QAP regression analysis, which requires a square matrix, each firm in an implementation level was assigned the value of the group, so a 50x50 matrix was formed. We used this matrix as the dependent variable in the MRQAP analysis. It represents firms' level of implementation of management innovation initiatives between their own group and each external group.

Organizational knowledge: To investigate the patterns of managerial knowledge exchange in inter-firm networks, we asked each respondent to indicate “among firms included in the roster, those with whom your firm has shared information on management, organizational or administrative practices and processes in the previous six months”. Examples of the type of managerial knowledge included the following:

- Project management
- Total quality management
- Human resource management
- Finance and budgeting management
- Innovation management
- Production management

A “roster” question format was used. Respondents had to select their answers from a list containing all 50 firms in the Park. There was no constraint on the maximum number of selections that each respondent could make. We then input these data in matrix format to create an *inter-firm organizational knowledge sharing* matrix.

Independent Variables

Formal agreement. The firms had to indicate the extent to which they had formal agreements with other firms in the Park. These agreements could include commercial contracts, co-production, joint contracts or technology exchange agreements; the relationship thus had to be characterized by some formal agreement and to hold some specified right over the result of cooperation (Grandori & Soda, 1995). We then input these data in matrix format to create a formal agreement matrix.

Collaborative Interaction. The firms had to indicate the frequency of inter-firm collaboration with which they exchanged managerial-related knowledge with other firms in the Park. We then entered these data in matrix format to form a collaboration matrix.

Control Variables

Industry: We based the control variables on innovation and inter-firm literature (Mol et al., 2007; Sammarra & Biggiero, 2008), which assumes that similarity between firms increases the probability of establishing ties, engaging in certain exchanges of knowledge, and resulting in

innovative outputs. We controlled for the possibility that firms in the same industry may engage in more collaborative ties and more exchange of managerial knowledge than firms in other industries. We split *Industry* into two big groups: first into high-technology services (Industry 1) and secondly, into firms in high-to-medium-high technology manufacturing (Industry 2). Then, we operationalized *Industry* creating a 50x50 matrix, coding each firm as “1” if both organizations in the dyad were in the same industry and “0” if they were in different industries.

Internationalization: Since several firms in the sample were international from start-up, they may be inclined to use partners to overcome obstacles to internationalization. We used internationalization to assess the extent to which firms engage in informal sharing of managerial knowledge. As in the case of *Industry*, we created a 50x50 matrix, coding each firm to be a “1” if both organizations in the dyad were operating internationally and “0” if they were operating in different markets.

Analysis and Hypothesis Testing

We then processed the network data using the UCINET software package (Borgatti et al., 2002). To test the hypotheses statistically we used network regression, specifically the quadratic assignment procedure (QAP) multiple regression technique. This approach permits an analysis of relational data (in sociomatrices) and the results of this analysis can be interpreted in a similar way to the results of ordinary multiple regression. Network data do not satisfy assumptions of statistical inference, because relational data are systematically interdependent and autocorrelation is an inherent problem in this data; therefore, classical regression techniques, like ordinary least square, are not appropriate here. MRQAP provides a better alternative, as it allows direct comparison of matrix-level data and corrects the autocorrelation problem (Krackhardt 1987) and has been applied extensively in previous social network research. MRQAP is a nonparametric statistical algorithm that regresses a dependent matrix on one or several independent matrices. This algorithm first performs a standard multiple regression across corresponding cells of the dependent and independent matrices. Then it randomly permutes rows and columns of the dependent matrix and recomputes the regression. The algorithm then repeats the permutation regression process a high number of times (in this case, 12,000 times) to estimate the standard error for the

statistics of interests. This procedure determines whether the association between two matrices is a random occurrence and helps adjust for the autocorrelation problem.

RESULTS

As an introduction to the results, Table 1 shows the matrix of correlations among all of the variables in the model. Correlations with the managerial knowledge sharing involving the control variables are virtually nonexistent. Also, several independent variables are correlated with the dependent variable, but within acceptable limits in social networks for their inclusion in a regression model (see for example, Borgatti & Cross, 2003).

Table 1 QAP Correlation Matrix

Variable	mean	s.d	1	2	3	4	5	6
1 Organizational innovation	1.62	.64						
2 Industry (hi-tech services)	.28	.45	.022					
3 Industry (hi-tech manuf.)	.06	.24	.027	-.158*				
4 Internationalization	.26	.44	.052	-.137*	.121			
5 Formal agreement	.03	.18	.316**	-.003	-.028	-.005		
6 Collaborative interaction	.16	.51	.336**	.026	-.013	.010	.404**	
7 Managerial knowledge	.22	.89	.382**	-.050	.023	.063*	.359**	.408**

* $p \leq .05$

** $p \leq .01$

We then tested hypotheses 1 to 3 by conducting a Multiple Regression QAP (MRQAP) analysis. The coefficients presented in the table are standardized regression coefficients. In Model 1 we only entered the three control variables. The results in Table 2 show that, all alone, the controls have no direct effect on managerial knowledge acquisition. With reference to Model 2, the existence of previous formal agreements between firms ($\beta = 0.102$; $p < .001$)

significantly affects managerial knowledge acquisition after controlling for industry and internationalization. Hence, we find full support for hypothesis 1. Furthermore, Model 3 suggests that informal collaborative interactions ($\beta = 0.064$; $p < .001$) are related to managerial knowledge acquisition after controlling for industry and internationalization. These results provide full support for hypothesis 2. The amount of variance explained in Model 4 (39 percent of the variance) indicates that formal and embedded dimensions explain a substantial portion of the variance in the probability of inter-firm flow of managerial knowledge.

Table 2 Results of Quadratic Assignment Procedure Regression Analysis for Predicting Managerial Knowledge Acquisition

Predictors	H1: Partnership		H2 Relational	Complete model
	Model 1	Model 2	Model 3	Model 4
Control Variables				
Industry (serv)	.015	.021	.009	.014
Industry (man)	.021	.015	.008	.005
International	.022	.015	.007	.004
Network Variables				
Formal agreement		.325**		.167**
Collaborative interaction			.554**	.502**
<i>P</i>	.167	.000	.000	.000
<i>N</i>	2450	2450	2450	2450
<i>Adjusted R</i> ²	.003	.108	.309	.334

* $p \leq .05$

** $p \leq .01$

Next, we examined the relationship between managerial knowledge acquisition and organizational innovation implementation (see Table 3). Model 6 reveals that the standardized regression coefficients of managerial knowledge acquisition are significant. The amount of variance explained in Model 6 (33.4 percent of the variance) indicates that

managerial knowledge exchanges explain a substantial portion of the variance in the probability of implementation of innovative initiatives in organizational aspects.

CONCLUSION

This study aims to disentangle the effect of inter-firm knowledge flow in innovation outcomes related to organizational innovation. We argue that two key properties of inter-firm networks – formal agreements and social embeddedness – play important roles in acquiring organizational knowledge, which is essential for organizational innovation activities to happen. As summary of hypotheses testing for inter-firm managerial knowledge sharing, all our hypotheses are fully supported. They mainly depict how strategic and embedded dimensions, which are relational and instrumental, provide insights into factors determining inter-firm knowledge sharing and implementation of organizational innovation initiatives.

ABSTRACT

The aim of this paper is to present framework of the stakeholder management system for M&A deals, called the SUN Cube. The SUN Cube framework helps to identify the risk of integration and develop communication and engagement strategies for each stakeholder of a combined company. Suggested framework consists of four perspectives:

- **Run rate** is the ability of the stakeholder to take part in corporate constructive development and integration processes;
- **Transparency rate** is the possibility to create a future map for each stakeholder after integration.
- **Multiplication rate** is the rate of possible value maximization for the stakeholder in the neighbor industry after an M&A deal in the considered industry.
- **Transmission rate.** This is a rate that fixes the stakeholder's ability to pass to the new development stage in corporate business development.

Our conclusive hypothesis for further verification is – LESS discrepancy on target and actual results in all four perspectives (run rate, transaction rate, multiplication rate and transition rate) - MORE expecting synergy and integration can be achieved.

Keywords: M&A, post-merger integration, synergy valuation, stakeholder management system

INTRODUCTION

The importance of stakeholder relationship management for successful integration in post-merger management is not doubted, and although interest in stakeholders has grown substantially since Freeman (Freeman, 1984) published his work, we find a lack of papers that address stakeholder relationship management in M&A deals. There is especially a high need for a management system that can be used by M&A practitioners during integration process, because as we know by statistics 50% of M&A deals are not successful and as literature suggests mainly due to pure integration.

Stakeholder approach in post-merger integration in M&A deals comes to the first line management tool in achieving the target synergy results. There is a critical need for metrics which can trace the interests of all stakeholders, because to achieve success in integration it is no longer acceptable for management to focus solely on the needs of one or two stakeholder groups. Donaldson and Preston (Donaldson and Preston, 1995) noticed that the stakeholder theory establishes a framework for examining the connections, if any, between the practice of stakeholder management and the achievement of various corporate performance goals. Madhavan (Madhavan, 2005) in his paper mentions that “the M&A manager needs to manage seven sets of stakeholder expectations well.” He says that all the stakeholders are equally important, and up to 10% of customers can be lost during the integration period and poor stakeholder relationship management.

The aim of this paper is to present framework of the stakeholder management system for M&A deals, called the SUN Cube. The SUN Cube framework helps to identify the risk of integration and develop communication and engagement strategies for each stakeholder of a combined company.

LITERATURE REVIEW

Much research has been dedicated to strategies for managing stakeholders from the focal organization’s point of view (Savage et al.,1991, Jawahar & McLaughlin, 2001), as well as how stakeholders can affect the decisions of a firm (Frooman, 1999).

Researchers Neely and Adams (2001) describe a new measurement framework called “The Performance Prism” which addresses the drawbacks of the traditional measurement frameworks currently approached by organizations. The Performance Prism encourages

managers to take into account the wants and needs of all stakeholders of an organization, as well as to consider associated strategies, and processes. The creators of the Performance Prism provide three major reasons for the new framework to replace first generation models, such as the balanced scorecard. Firstly, it is not acceptable, nor feasible for the business to focus only on the needs of one or two stakeholder groups. Most existing approaches concentrate on the needs of the owners and the customers of a firm. Other stakeholders such as personnel and suppliers are usually neglected in the performance measurement frameworks. Secondly, the majority of performance measurement frameworks ignore the adjustments that must be made to the strategy of a firm, processes and capabilities in order to meet the stakeholders' needs. And finally, a firm can expect some contribution from its stakeholders. Performance measurement should consider whether stakeholders are delivering what a firm expects to receive.

Analyzed published M&A research in total of 443 papers, Scandinavian Journal of Management (2012) found out a significant transfer of focus from the focal firms in an M&A transaction to an accent on a network perspective to M&A. The question of the value created in M&A transactions through the interactions between M&A focal firm actors on the one hand, and external stakeholders on the other hand has been the center of attention.

Gomes et al. (2013) group pre- and post-merger critical success factors and also emphasize an importance of well-established communication at each stage of the deal and post-merger leadership aimed at effective integration.

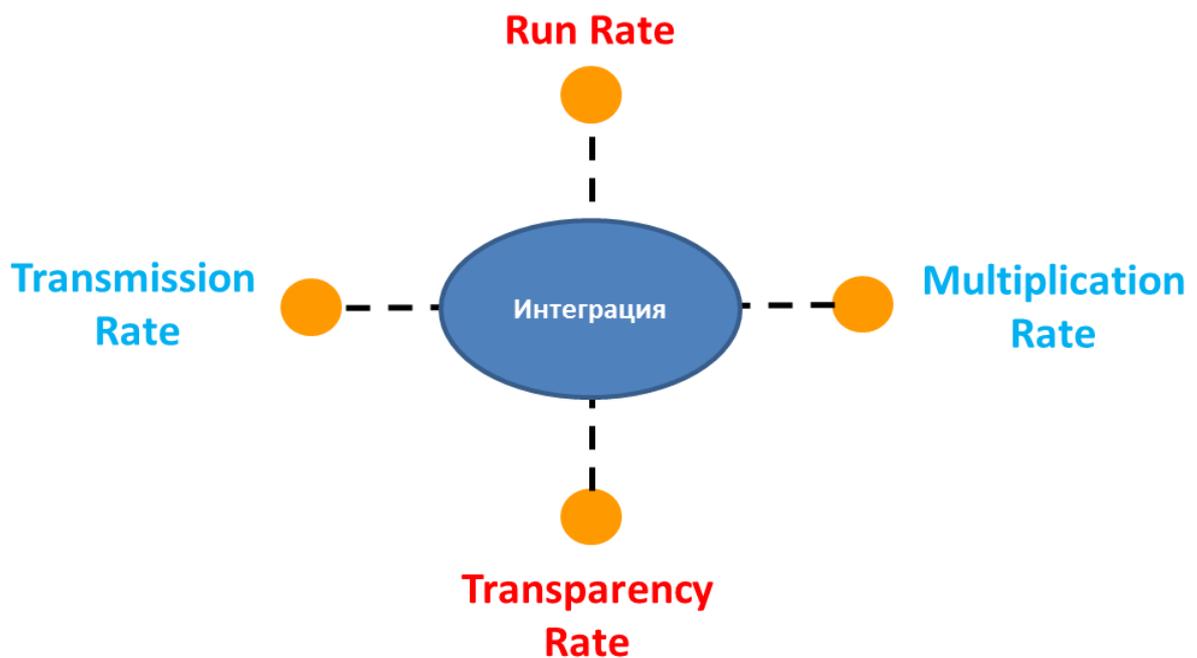

Success factors were also considered by researches Maire and Collerette (2011) who highlighted the factors that led to success in integration based on the case of the merger in private banking sector. According to them, successful integration management mainly rests upon capabilities in communication, organization and change management. As a methodology to manage the process they propose The 6S Watch List which is a framework comprising 6 interconnected areas: Strategy, Social, Structure, Speed, Success and Surroundings.

A model (PMI scorecard) provided by Rues and Voelpel (2012) with which corporate-level executives can balance different action fields, as our conceptual framework, goes in line with the trend of a second generation performance management framework. The authors of the PMI scorecard divide action fields by Strategic integration; Structural integration; Personnel integration; Cultural integration; Stakeholder integration. And they add content orientation:

strategic and structural integration. The major claim of the researches is to balance of the actor and content orientations during the PMI process. From their point of view, from the PMI content perspective, it is crucial to find the right strategic and structural direction in order to secure the best strategic competitive position. From the PMI actor perspective, it is necessary to ensure personnel, cultural, and stakeholder support on behalf of all the actors for the PMI process.

THE SUN CUBE MODEL

The SUN Cube is a new stakeholder management system which can be used in M&A deals and can be defined in 4 perspectives.

Each perspective is assessed from the angle of different levels of stakeholder. Stakeholder levels are:

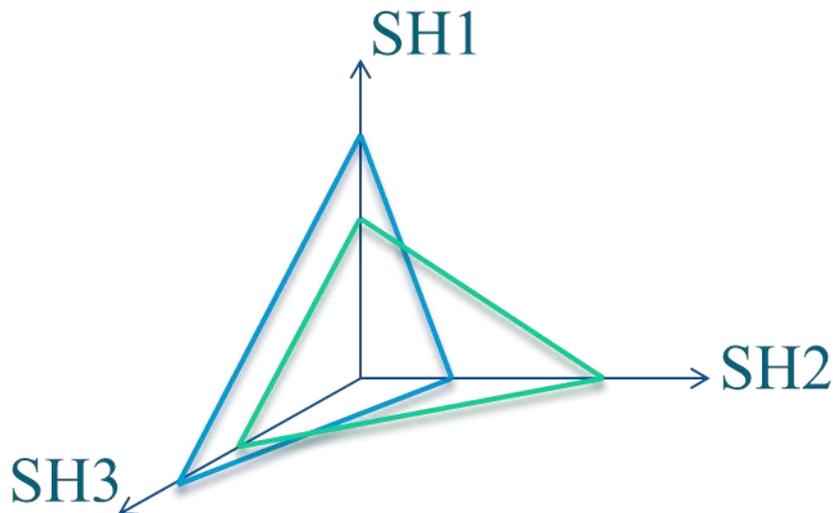

- 1st level stakeholders (SH1) – shareholders, top-management and personnel
- 2nd level stakeholders (SH2) – clients, suppliers and banks
- 3rd level stakeholders (SH3) – all other stakeholders

The SUN Cube scorecard is presented below. It shows target and actual values for each perspective, and perspective is decomposed by stakeholder level. Then the deviation in percentage is calculated, and an action to be taken to improve each perspective is provided.

The maximum target value for all the perspectives is 30, and the minimum is 0. We think that the higher the actual value is, the more controllable and manageable the synergy effects are.

Stakeholder	Target value	Actual value	%	Comment	Actions
Run rate	9	4			
SH1	3	1			
SH2	3	2			
SH3	3	1			
Transparency rate	9	7			
SH1	3	2			
SH2	3	2			
SH3	3	3			
Multiplication rate	3	1			
SH1	1	1			
SH2	1	0			
SH3	1	0			
Transmission rate	9	6			
Shareholders	3	2			
Top-managers	3	3			
Personnel	3	1			
Total by perspectives	30	18			

The target and the actual values can be visualized for each perspective as it is shown below.

Description of SUN Cube perspectives:

Run rate is the ability of the stakeholder to take part in corporate constructive development and integration processes. This KPI should mainly exist to test stakeholders' ability and readiness for constructive cooperation in M&A deal execution and integration development. We all know that the majority of M&A deals suffer from the so-called "corporate allergy." This is the case when, during the integration processes, two or more business structures cannot successfully merge and generate synergies from united operations due to failure to meet the interests of stakeholders.

Target and actual values are numbered using the following scale for the degree of stakeholder involvement:

0 – not involved

1 – Stakeholder is informed

2 – Stakeholder is actively involved in PMI team

3 – Decision-making part

Transparency rate is the possibility to create a future map for each stakeholder after integration. This is an essential KPI for the CEO to measure and understand how transparent and clear the future after M&A deal is for each stakeholder. Why are we mentioning this? The reason is that without a clear vision about what will happen with the stakeholder after M&A,

his position and controlling stake in the business, it is impossible to move on and accomplish successful M&A deals and post-merger integration. Before an M&A deal, it is highly recommended to create a future map for the stakeholder, which indicates the following information:

- Stake size after integration. This is the definition of the stakeholders' business scale revenue that should be proven after consolidation and integration. When we introduce an M&A deal and choose it as the right opportunity for future business growth, it should be as beneficial for each stakeholder as without M&A.
- Strategic & operational plan for a period of 3 to 5 years with financial and social KPI.

How can we diagnose and assess these KPI? We recommend 2 instruments:

- A specially devised questionnaire disclosing the transparency rate. This is a special form devised for the key stakeholders to be filled in with later analysis of their answers showing whether or not they clearly see the future and their role in the business after integration.
- Personal interviews with stakeholder representatives.

Target and actual values are numbered using the following scale for degree of transparency:

0 – not transparent

1 – transparent in the short-term (up to 6 months)

2 – transparent in the medium-term (from 6 months up to 1 year)

3 – transparent in the long-term (more than 1 year)

Multiplication rate is the rate of possible value maximization for the stakeholder in the neighbor industry after an M&A deal in the considered industry. This new specific KPI should help the CEO conducting M&A activity and integration to measure the stakeholders' personal capitalization rate in neighbor industries after the deal. It is true that while working in one industry in which we have core competences, we influence adjacent and neighbor industries that service our business model or invest in us. So in our case, when carrying out M&A, we should understand how this deal with future integration will increase the value of our stakeholders in neighbor markets by giving them extra benefits. This can be pre-look and out-of-the-box thinking. When increasing the value of our stakeholders, we need to be

concerned about their value increase in related and neighbor businesses, where they can also benefit. The existence of multiplication effects can be helpful in developing a communication strategy.

Target and actual values are numbered using the following scale for multiplication effect:

0 – no multiplication effect

1 – existence of multiplication effect

Transmission rate. This is a rate that fixes the stakeholder's ability to pass to the new development stage in corporate business development. By understanding the evolution of business values, we can propose 4 stages of corporate management philosophy (figure #2):

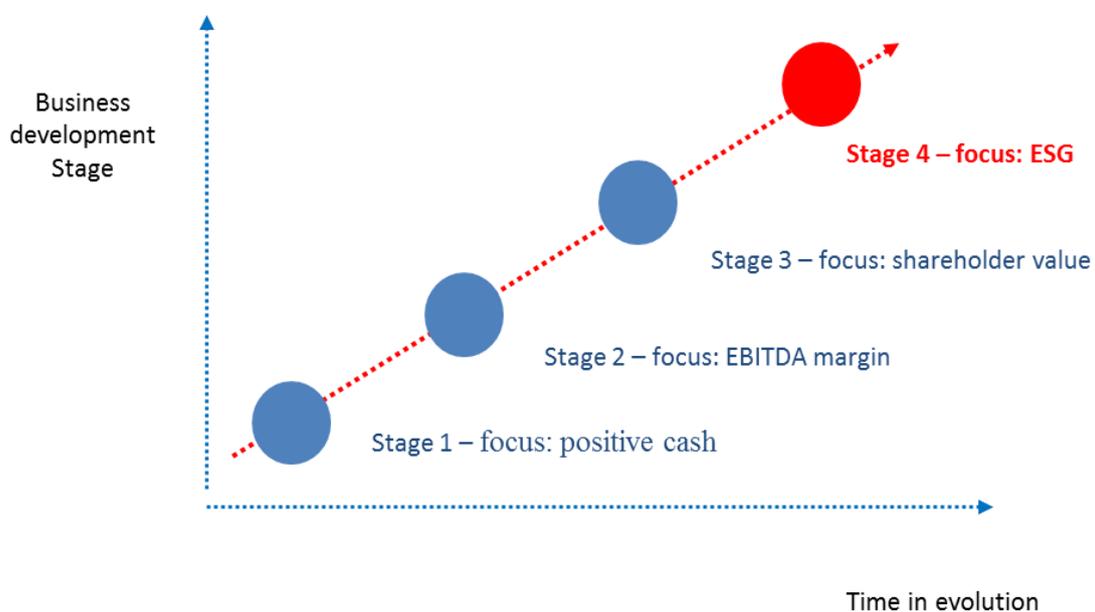

Figure 2. Evolution of business management philosophy

The last stage requires a completely different managerial philosophy of business development. By providing this specific KPI for CEOs, we help them understand the type of stakeholder and the main drivers that bring motivation to possible M&A deals. For the success of future integration, stakeholders should be on the same or similar page in terms of business development approaches, which are essential to create common value and a communication base. This indicator enables the CEO to understand the total stakeholder approach to business and avoid problems in integration. This rate should be measured using the 360C method of analysis, by which we can find out the main stakeholder's focus at the present moment. This KPI can stop M&A and prevent integration due to varying stakeholder

attitudes to business. The more stakeholders are at the same level of business focus and development stage, the better the possibility for future successful integration can be forecast. It is difficult to carry out successful integration if one stakeholder is at the ESG level of development and another is at the first – cash flow. Common understanding and a philosophical approach to developing business brings successful results for integration.

Transmission rate is the only perspective which is analyzed only for first level stakeholders.

Target and actual values are numbered using the following scale for transmission effect:

0 – positive cash flow orientation

1 – EBITDA orientation

2 – Market capitalization orientation

3 – ESG orientation (shareholder wealth maximization through stakeholder wealth maximization)

HYPOTHESIS

Our conclusive hypothesis for further verification is – LESS discrepancy on target and actual results in all four perspectives (run rate, transaction rate, multiplication rate and transition rate) - MORE expecting synergy and integration can be achieved.

CONCLUSION

Stakeholder approach in post-merger integration in M&A deals comes to the first line management tool in achieving the target synergy results. There is a critical need for metrics which can trace the interests of all stakeholders. In this paper we have developed further how the SUN Cube framework can be used in capturing synergies during the post-merger integration process.

Our next paper will be dedicated to methodological improvement of the suggested framework and hypothesis testing.

INCOME RETURN VS CAPITAL APPRAISAL: A TEST ON THE ITALIAN REAL ESTATE FUNDS

Mattarocci, Gianluca¹; Siligardos, Georgios²

¹Economics and Finance, University of Rome, Tor Vergata, Rome, Italy

²Banking and Finance, University of Rome, Tor Vergata, Rome, Italy

ABSTRACT

Introduction And Aims: The overall performance of the real estate funds can be therefore attributed to the capital appreciation and/or the income return. The rent income component, under certain conditions, is the less relevant for the institutional investors that manage a diversified portfolio following a medium-long term strategy.

The Italian property funds market has shown an enormous growth over the past few years, however, little is known about the key drivers of the property funds performance. This research aims to measure the impact of the two performance sources for the funds' performance and to identify the significance level of their main components.

Methodology: The paper considers the Italian market for the last decade and analyzes the annual reports of all public real estate funds, separating the appraisal return from the income return. By considering a wide time horizon, the paper evaluates if the role of income return and capital gain respect to the overall performance are more or less influenced by some characteristics of the fund (i.e. asset diversification, concentration, leverage, etc.).

Findings: The contribution of the income return and capital growth in the overall performance for the Italian real estate funds is not strictly related and the correlation is significantly lower during the crisis period. Furthermore the main drivers of the two income sources are not strictly comparable.

Keywords: Real estate funds, Income Return, Capital appraisal

1. INTRODUCTION

Literature about real estate investment vehicles performance evaluation tries to establish the differences between the performance of the underlying asset and the vehicle (Gilberto, 1990) and to point out some problems related to the un-availability of continuous market data for evaluating the price of the asset and the need to define carefully the appraisal value that normally is used instead of the market information (Geltner, 1991).

Real estate investments present unique features that could modify significantly their capability to generate net inflows during the life of the investment and/or to appreciate during the time horizon. Studies proposed in literature consider the relationship between macro-economics variable and overall performance components and demonstrate that income return and capital growth return do not show the same sensitiveness to some macro-economic variables (Le Moigne and Viveiros, 2008).

Empirical evidences show that performance achieved by real estate units could vary significantly among each investment and the difference is more clear if the capital growth is considered instead of the income return (Young, 1994). In fact comparison of real estate income return and capital growth return show that the former is more stable and less variable respect to the latter (Adair et al., 2006).

No studies considered the main features of real estate investment vehicles in order to explain the attribute of the income return or capital growth return to the overall return. Contrary to the REITs structure or other similar real estate vehicles, Italian real estate funds are characterized by rigorous standardization that ensure that the managed portfolio is independent to the asset and liabilities of the real estate fund manager (Biasin, 2003). The study investigates the role of income return and capital growth, without considering the managerial aspects that could bias the evaluation in case of the REITs. The paper evaluates if the income return and the capital growth is influenced by some characteristics of the fund (i.e. asset diversification, concentration, leverage, etc.), trying to give a specific weight to the key elements of the property funds performance.

Results obtained could represent a useful guideline for a portfolio manager in order to construct portfolios that allow to achieve the target performance during the life of the investment and/or at the end of time horizon.

This research is composed by an extended literature review in order to explain the income return and the capital growth for real estate investments through the portfolio perspective (section 2). The empirical analysis considers a sample composed by the Italian retail real estate fund market in the eight years between 2003 and 2010, followed by the methodology adopted, where have been measured the different types of performance and the explaining variables in order to interpret their dynamics and point out the main results (section 3). The last section of the paper comprises the conclusive comments and possible further implications.

2. LITERATURE REVIEW

The overall performance of a real estate investment could be related to the rent income and/or the capital growth of the value of the asset. The trend of the different drivers of the overall performance could be not coherent (Duncan, 2004) and so in order to construct a real estate portfolio is necessary to monitor the features that could impact on each of the drivers.

Looking at the capital growth, a fund manager has to evaluate the concentration of the managed portfolio in order to study the role of big and small properties in the fund. When the number of big real estate units increase (and so the portfolio becomes more concentrated) the risk return trade off could exasperate because of the risk exposure growing more than the expected return (Ziering and McIntosh, 1999)

Considering an international framework, empirical evidences demonstrate that trends in the value of real estate assets are highly integrated and so the choice to diversify internationally do not affect the variability of the capital growth performance (Pagliari et al. 1997). Contrary, the analysis of the effects of diversification among areas inside a country, demonstrates that in the major real estate markets the opportunities related to diversification are higher because the trend of real estate asset prices is significantly heterogeneous (McGreal et al., 2006).

Looking at the income return, empirical evidences in main world markets show that the performance is significantly different on the basis of the sector and the geographical area considered. In the residential sector the geographical features are not easily identified because of the market heterogeneity, instead other sectors (like offices) show more clear patterns (Jackson and White, 2005). Geo-sectorial diversification could be extremely beneficial into selecting the more producing real estate units, especially if the residential investment is underweighted, but there are some empirical evidences that show a significant increase in the

cost related to manage diversified real estate portfolio that could neutralize the benefits related to the diversification (Capozza and Seguin, 1999).

Size of the buildings could affect the ratio between the renting income and costs and normally bigger investments are characterized by better net performance due to the opportunities to rationalize the operative property management expenses through scale economies (Hartzell et al., 1986). The size has to be studied not only looking at the overall size of the investment but also at the number of tenants per building: *ceteris paribus*, the lower is the number of tenants the highest is the income return such as the economic impact of imminent vacancies (Kurzrock et al., 2009)

The size of the real estate investment vehicle represents the overall amount of money available for investment purpose and could affect both the income return and the capital growth of the investment (Baum and Devaney, 2008). Theoretically, the higher size allows to achieve higher level of diversification because of the higher number of buyable real estate units (Chaudhry et al., 2004). Another of the main advantages is the economies of scale on overhead expenses that are normally more significant for larger real estate institutional investors (Capozza and Lee, 1995).

The leverage policy of the real estate investment vehicle could affect significantly the capability to respect contractual payments and dividends expected by subscribers (Giannotti and Mattarocci, 2009). The evaluation of the risk exposure has to consider both the overall level of the debt and the interest cover ratio for each sub-period (Oppenheimer, 2000) in order to evaluate if the spread between cost of financing and return from the real investment is big enough to warrant the layering of the financial risk.

Another proxy, which frequently is correlated with the fund performance, is the level of an aggregate performance index. In a research dedicated to private equity funds, Kaplan and Schoar (2005) demonstrated that funds follow a performance that is close to the performance of the S&P 500. Gompers and Lerner (1998) investigated the aggregate performance and capital flows. The authors found that macroeconomic factors like past industry performance and overall economic performance as well as changes in the capital gains tax or ERISA provisions are related to increased capital flows into private equity. Morrell in 1995 sustained that indices in the property market such as IPD (International Property Databank) play a key role in investment management, from the definition of a fund's investment objectives, to the

setting and implementation of investment strategy, and the evaluation of historic performance.

3. EMPIRICAL ANALYSIS

3.1 Sample Description

The sample considers all retail real estate Italian funds in the time horizon 2003-2010 and for each fund have been gathered data about the overall yearly results, the income return and the capital growth return. The choice of the frequency of data is coherently with other studies proposed in literature that demonstrate that some problems exists in identifying a correct measure of the real estate assets value and normally the yearly time horizon allow to reduce the bias related to the appraisal estimates used in measuring the capital growth (Wheaton and Torto, 1989). In order to analyze the determinants of the income return and the capital growth we consider only the existing funds for which annual reports are publically available (Table 3.1).

Table 3.1: Italian real estate funds' market with annual report publically available

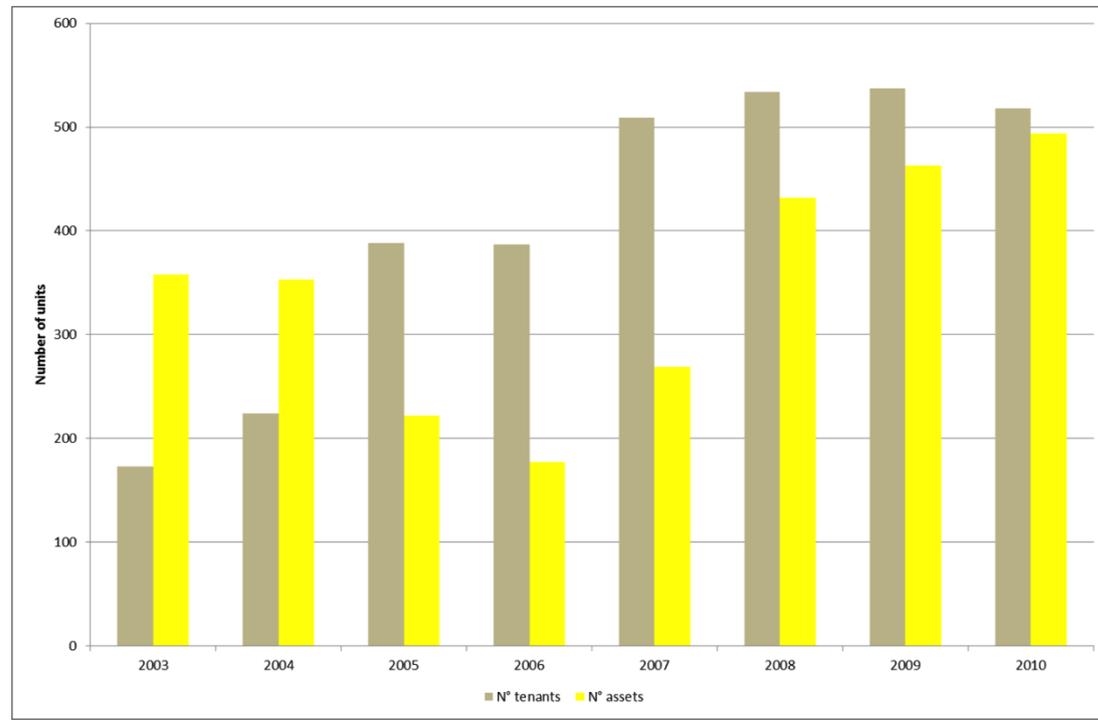

Real Estate Fund	Availability of data	Real Estate Fund	Availability of data
Atlantic 1	2005-2010	Invest Real Security	2003-2010
Atlantic 2 Berenice*	2005-2010	Investietico	2003-2010
Baglioni	2007-2010	Michelangelo	2003-2010
BNL Portfolio Immobiliare	2003-2010	Obelisco	2006-2010

Fondo Delta	2007-2010	Unicredito Immobiliare Uno	2003-2010
Immobiliare Dinamico	2006-2010	Valore Immobiliare Globale	2003-2010
Immobilium 2001	2003-2010	* Before 2007 the fund was named Berenice	

Source: Scenari immobiliari data processed by the authors

The sample considers 27 funds for the time horizon 2003-2010 and data collected attains the size of the rented unit (square meters) in their portfolio and rentals flows for square meter

paid by each tenant. The overall sample considered includes for each year at least 190 buildings and 180 tenants and the number is growing over time (Figure 3.1).

Figure 3.1. Number of tenants and assets.

Source: Funds' yearly statement processed by the author

The mean number of tenants for each real estate fund registered a growth rate over the years of the sample, with an exception for 2010. Instead, the number of assets followed a cyclic pattern, demonstrating in part that fund management is more interested to increase the number of tenants (increasing the income return and creating higher diversification levels) than the property assets. All the information related to each tenant and to each asset included in the portfolio are summarized computing some concentration measures for each portfolio managed.

3.2 Methodology

In order to analyze the role of the income return and capital growth for Italian real estate funds, a measure of each type of performance is computed starting from the information available on yearly annual report. Following methodologies well established in literature, measures of overall performance, income performance and capital growth standardized

respect to the market value of the real estate portfolio, are computed (Pagliari and Webb, 1995). On the basis of the characteristics of the Italian real estate funds the following formulas are computed:

$$\text{Income Return}_{it} = \frac{\sum_{i=1}^n (\text{Rent}_{it} - \text{Costs}_{it})}{\sum_{i=1}^n \text{MV}_{it-1}} \quad (3.1)$$

$$\text{Capital Growth}_{it} = \frac{\sum_{i=1}^n (\text{MV}_{it} - \text{MV}_{it-1})}{\sum_{i=1}^n \text{MV}_{it-1}} \quad (3.2)$$

$$\text{Overall Return}_{it} = \text{Income Return}_{it} + \text{Capital Growth}_{it} = \frac{\sum_{i=1}^n (\text{Rent}_{it} - \text{Costs}_{it}) + \sum_{i=1}^n (\text{MV}_{it} - \text{MV}_{it-1})}{\sum_{i=1}^n \text{MV}_{it-1}} \quad (3.3)$$

Where

MV_{it} = the market value of real estate unit i at time t . Coherently with the literature available and due to the lack of continuous time series of price for each building, the value is not a market measure but an appraisal one (Hartzell et al., 1987).

Rent_{it} = payments done in the year t by the tenants of the n buildings included in the portfolio.

Costs_{it} = maintenance cost for the n buildings included in the portfolio.

The first analysis proposed investigate the relationship between the income and the capital growth, furthermore considers the relationship between the mean value of each return component and measuring the correlation between the yearly value of each type of income.

The measures of returns previously identified are regressed respect to the main explaining variable identified in literature in order to test the different degree of predictability of each return measure such as to identify the main differences in the explaining variables. In formulas:

$$\begin{aligned} \text{Income return}_{it} = & a_{it} + b_1 \text{HHGEO}_{it} + b_2 \text{HHSECT}_{it} + b_3 \text{AUM}_{it} + b_4 \text{Leverage}_{it} \\ & + b_5 \text{Interest coverage}_{it} + b_6 \text{HH Tenant}_{it} + b_7 \text{Ipd}_{it} + e_{it} \end{aligned} \quad (3.4)$$

$$\begin{aligned} \text{Capital Growth}_{it} = & a_{it} + b_1 \text{HHGEO}_{it} + b_2 \text{HHSECT}_{it} + b_3 \text{AUM}_{it} + b_4 \text{Leverage}_{it} \\ & + b_5 \text{Interest coverage}_{it} + b_6 \text{HH Assets}_{it} + b_7 \text{Ipd}_{it} + e_{it} \end{aligned} \quad (3.5)$$

$$\begin{aligned} \text{Overall Return}_{it} = & a_{it} + b_1 \text{HHGEO}_{it} + b_2 \text{HHSECT}_{it} + b_3 \text{AUM}_{it} + b_4 \text{Leverage}_{it} \\ & + b_5 \text{Interest coverage}_{it} + b_6 \text{HH Tenant}_{it} + b_7 \text{HH Assets}_{it} + b_8 \text{Ipd}_{it} + e_{it} \end{aligned} \quad (3.6)$$

where:

HHGEO_{it} and HHSECT_{it} are Herfindahl-Hirsh indexes based on the product line data (Bradley et al., 1998): the former measures the proportion of assets invested in only one sector (Residential, Commercial, Offices, Industrial or Others) and the latter consider the diversification level under the geographical perspective (All Italian regions and foreign countries) in the overall portfolio.

AUM_{it} (Assets Under Management) is a proxy of the size of the real estate investment fund and represent the overall value of the asset under management at the time t.

Leverage_{it} is the ratio between total liabilities and total assets of the fund i at time t on the basis of the annual report data.

Interest coverage is the ratio between the interests paid and gross operating income at time t for the fund i.

HH Assets_{it} is the diversification Herfindahl-Hirsh index, based on the value of each asset respect to the overall value of the portfolio at time t for the real estate fund i. The measure takes the value one when the real estate fund is not diversified (Capozza and Lee, 1995).

HH Tenant_{it} is the Herfindahl-Hirsh based on the value of rent related to each tenant respect to the overall value of the renting income at time t for the real estate fund i. Differently respect to the existing literature (Des Rosier et al., 2009), the relevance of each tenant is not realized

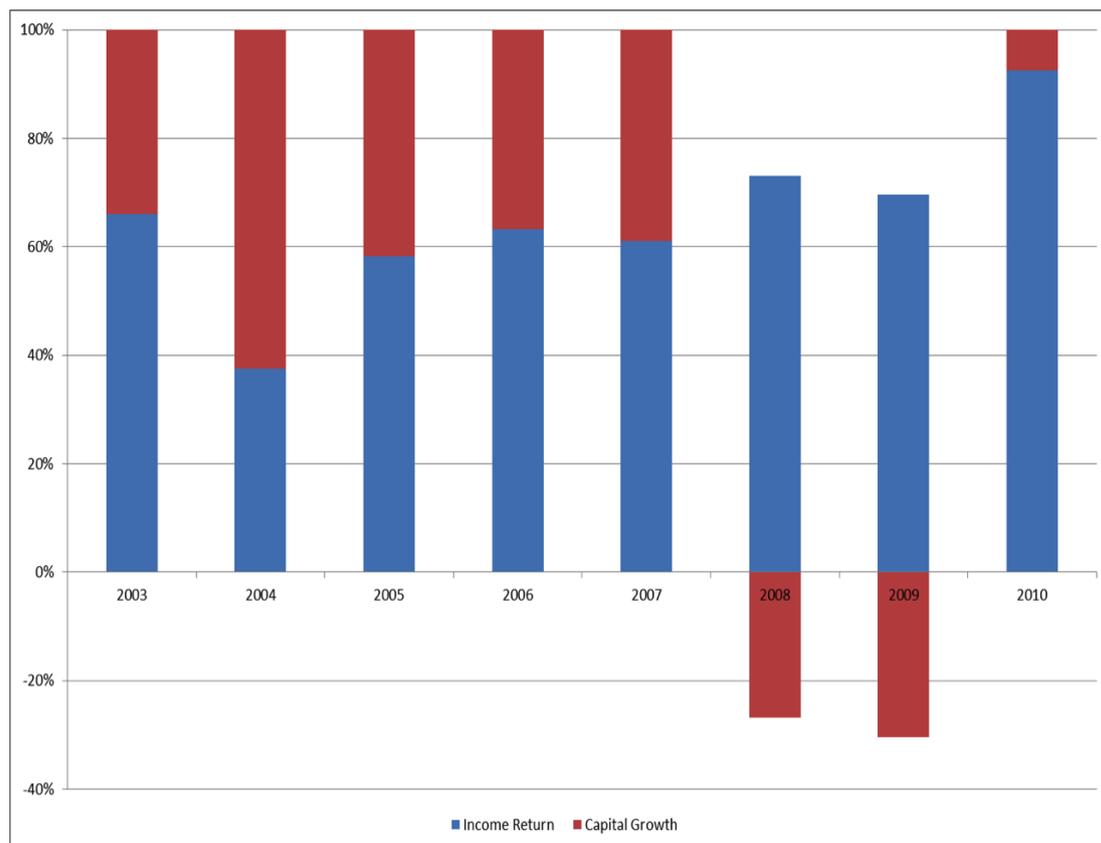

considering the square meters as a proxy for his/her relevance due to the high heterogeneity of the asset in the portfolio and the high variability of rent for square meter contractually established.

$Ipdt_{it}$ represents the index return excluding transactions and development provided by IPD (International Property Databank) for each performance measure, total return, income return and capital growth in time t .

3.3 Results

A preliminary analysis considers the role of the income and the capital growth return for the overall Italian market looking at the annual report of Italian real estate funds (Figure 3.2).

Figure 3.2: The role of income and capital growth for the overall Italian real estate fund market

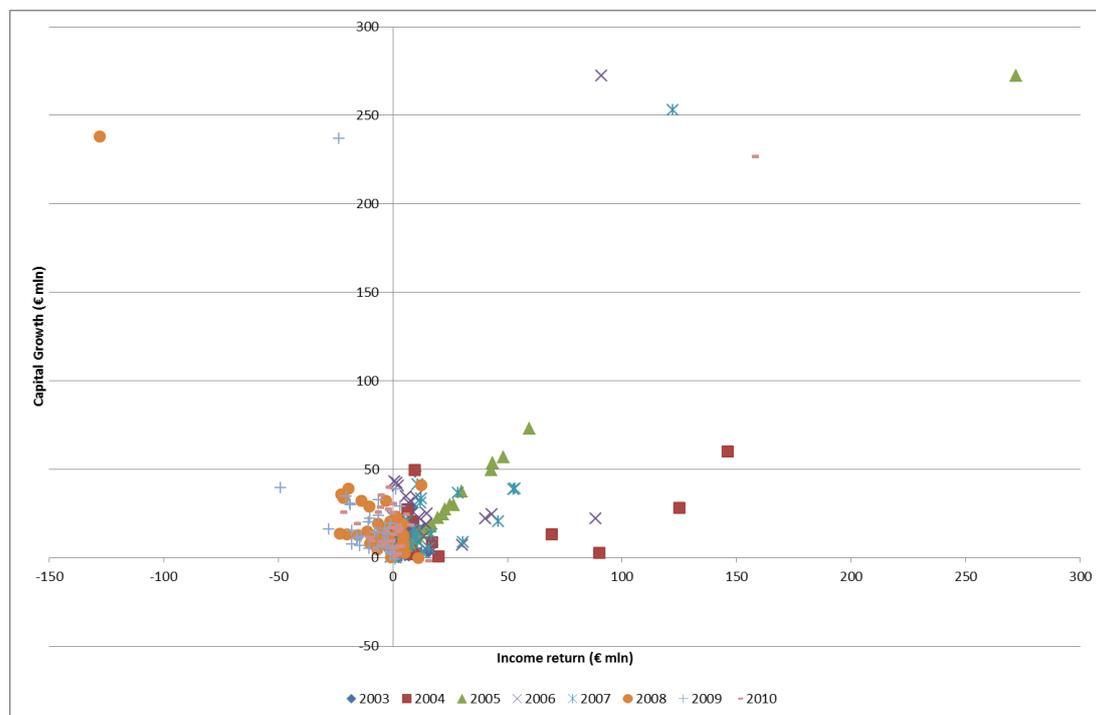

Source: Scenari immobiliari data processed by the authors

Looking at the overall Italian market the amount of net inflows related to renting assets represent (except for the 2004) the main source of income for the institutional investors. The capital growth role in the overall performance for the overall time period is around 35% and due to the crisis in the 2008 and 2009 the capital appreciation contribution to the overall performance is negative.

The relationship between income return and capital growth is heterogeneous among the sample considered and for each real estate fund the ratio between the two measures is significantly different (Figure 3.3). This result underlines the different approach that the fund management may have for each fund.

Figure 3.3. The relationship between income return and capital growth for each Italian real estate fund (time horizon 2003-2010)

Source: Scenari immobiliari data processed by the authors

Considering separately each real estate fund, the relationship between the yearly income return and the yearly overall return is inspected. Vehicles that are outperforming for the income return (capital growth) show a capital growth (income return) performance lower than the mean value and those funds that present a more balanced return are those that present both low level mean yearly income return and capital growth.

Considering yearly intervals and analyzing the performance achieved by each fund, summary statistics about the mean value, variance and correlation of each return component are computed (Table 3.2).

Table 3.2: Yearly summary statistics for income return and capital growth of Italian real estate funds

	2003	2004	2005	2006	2007	2008	2009	2010
Mean income return	0.53	0.50	0.69	0.76	1.09	2.07	26.82	25.71
Mean capital growth	7.75	29.11	26.89	16.76	19.01	-4.1550	-8.72	3.64
Variance income return	0.07	0.11	0.05	0.44	7.12	9.6661	2003.37	1799.37
Variance capital growth	24.74	2002.05	6133.71	532.82	1130.39	603.0236	113.10	1212.87
T-test H0 = mean difference significant	0.00%	0.69%	11.58%	0.03%	0.25%	13.0145%	0.00%	1.85%
F-test H0 = same variance	0.00%	0.00%	0.00%	0.00%	0.00%	0.0000%	0.00%	24.82%
Correlation	-0.20	-0.57	-0.40	-0.15	-0.13	-0.1885	-0.04	0.91
Correlation significance	0.10	0.29	0.20	0.08	0.06	0.0954	0.02	-0.46
Number of funds	14	20	23	31	36	40	36	36

Source: Scenari immobiliari data processed by the author

The value of the mean and variance is different among the two sample but only for the variance the two tailed F-test demonstrate a significant difference between the two return components while the t-test fails to identify a significant difference in the mean value. The correlation between income return and capital growth is always negative but the relationship is never significant, demonstrating that the main determinants of each feature are not strictly related.

In order to identify the different features that explain each type of performance, the sample had to be reduced only to the real estate funds for which all information about portfolio composition were available. The analysis proposed is a panel regression model and on the

basis of a Hausman test the random effect assumption is selected. Results obtained are summarized in table 3.3.

Table 3.3. Panel regression analysis for Italian real estate funds' performance

The model that allows to achieve the best result is the one based on the income return that show the highest statistical fitness (R²) and the fraction of variance explained (Rho) is also bigger. For all the models proposed the number of observation and groups is not high and so the lack of fitness could be partially explained on the basis of the lack of data. The model that

fits worse is the one constructed on the capital growth for which the trend is only partially explained on the basis of the regressors taken into account and probably the choice to include also some other macroeconomic variable could allow to increase the fitness. The lower statistical significance of the models that includes the capital growth is coherent with some empirical evidences proposed in literature that demonstrates the real estate market performance measurement could be biased from the specific characteristic of the appraisal values used in order to compute the capital growth (i.a. Gilberto, 1988).

The geographical-sectorial concentration affects significantly only the income return. The choice to diversify geographically gives clear margins of profit maximization (the negative sign refers to highly geographically concentrated funds), while the sectorial diversification is penalized because of the predominance of the office sector as the most profitable class in Italian market.

The main explaining variable of the performance achieved by a real estate fund is the amount of asset under management. Independently of the considered component (income return, capital growth or overall return), the higher is the amount of assets under management the higher will be the achieved performance because of the better rental opportunities and appreciation trend that affect the biggest buildings. The relationship between capital growth and size is well documented while the relationship identified between the income return and the size is only theoretically assumed in literature (Capozza and Lee, 1995).

Analyzing the debt sustainability, higher exposures normally affect negatively both the income and the capital growth performance because this choice introduces an extra constraint to the financial planning of the investment (Giannotti and Mattarocci, 2010). The relationship identified is significant especially for the income return when the leverage ratio is taken into account while for the capital growth and the overall return the relationship is not statistically significant.

Considering the tenant concentration, the choice to have some main tenants in the portfolio allows to reduce the cost of managing and monitoring the relationship with tenants. If the default does not occur, this strategy allows to maximize the result rationalizing the cost structure related to the investment done.

Looking at the asset concentration, the choice to diversify allows to obtain more stable return but the cost related to this feature is a reduction of the overall performance (Ziering and

McIntosh, 2000). Data show, a relationship coherent with this assumption but not statistically significant.

Concerning the global index performance it has been pointed out a positive relationship. From the analysis emerged that IPD index just as AUM is statistical significant for income return, capital growth and total return.

4. CONCLUSIONS

The contribution of income return and capital growth in the overall performance for the Italian real estate funds is not strictly related and the main determinants of their performance are significantly different. The common features that explain both the income and the capital growth are the amount of the assets under management and the global index performance. All the other variables identified in literature could impact differently on each performance component. Alongside the research it has been pointed out a trade off between income return and capital appreciation for the overall performance.

Models constructed on the income return identify a higher statistical significance respect to those constructed on the capital growth and the overall performance. The higher fitness of the model is related not only to geographical and sectorial features but also to the leverage policy and to the tenant concentration.

Studies on the characteristics of real estate units indicate that the capability to produce income and its variation is related to the buildings' age (Pagliari and Webb, 1992). International empirical evidences show also that the geo-sectorial classification could be significantly improved using more detailed databases such as that the results achieved with more detailed classification could vary significantly (Mueller, 1993).

Due to the higher relevance of income return on the overall performance for Italian real estate funds, the model proposed could be interesting for all Italian real estate funds manager. Implications of results obtained attain prevalently the asset allocation of real estate investment funds in order to construct portfolios that allow the profit maximization. On the basis of these results some guidelines on the diversification strategy and on the debt structure could be defined especially for the real estate investment vehicles that are interested to maximize the income return. For the capital growth gains, the only clear relationship identified is with the size of the assets under management. Furthermore the appraisal income,

tends to be more affected by macroeconomic variables as during economic crises it has been observed a clear reduction in its performance. The unexplained return components could be attributed only to funds' manager specific skills/strategies in selecting real estate units with the best perspectives in the appraisal growth.

ABSTRACT

This paper deals with the relationship between the Venture Capitalist and the venture backed company and investigate how it unfolds over time. To achieve this aim, we present evidence from three case studies where we employed a process approach. Our field study is partly retrospective and partly in real time and is based on two rounds of focused interviews with the entrepreneurs and the venture capitalist. Our findings show that several factors play a role, with confidence in the VC being essential to begin the relationship, and trust between the parties to continue it successfully. This relationship is also a learning experience for both parties: while the entrepreneur becomes acquainted with managerial tools to run a business on a daily basis and execute strategic actions, the venture capitalist learns how to effectively scout new attractive business ideas.

Keywords: venture capitalist, venture-backed company, innovation, process research

INTRODUCTION

Venture Capital (also labeled as VC) has increasingly been recognized as an important engine in economic development and as a vehicle for fostering R&D/innovation. Venture Capital is not a new phenomenon, as the modern venture capital industry started modestly, shortly after World War II. As recounted by Gompers and Lerner (2001), the industry struggled through a series of boom-and-bust cycles until the end of the '70s. However, since about 1980, the modern model of syndicated limited partnerships, investing funds largely derived from

pension portfolios, has transformed early-stage finance by increasing the availability of capital to young and risky firms.

Today, Venture Capitalists typically invest, manage, and return institutional investors' money by funding entrepreneurial companies, contributing to their development, and selling their stakes to public or corporate investors (Gompers, 1995; Gorman & Sahlman, 1989). More so than investors in well-established or publicly traded companies, Venture Capitalists actively manage the uncertainty associated with selecting and developing portfolio companies. Although market-wide variations or unexpected developments are difficult to foresee or manage, Venture Capitalists enjoy significant management discretion to reduce company-specific risk and enhance the company-specific returns in their portfolio (Dimov & Shepherd, 2005).

Existing research validates that, in addition to the financial resources that Venture Capitalists transfer to the venture, they add value to, and influence the strategic direction of, their portfolio companies through their involvement (e.g., Fried & Hisrich, 1994; Gorman & Sahlman, 1989; MacMillan, Siegel, & Subbanarashima, 1985 and MacMillan, Zemann, & Subbanarasimha, 1987; Sapienza, 1992; Sapienza & Manigart, 1996). Firstly, Venture Capitalists commit significant tranches of capital to firms with much potential but few assets beyond their founders' intellectual capital and business plans. This is an investment strategy that banks or other financial intermediaries are not organized to undertake. Secondly, Venture Capitalists carry out an extensive due diligence process before deciding in which firms to invest. Thirdly, because the due diligence process is itself iterative, entrepreneurs iteratively improve their business plans and, with the Venture Capitalists, develop a collective vision of how the firm should evolve. Finally, once the investment is made, Venture Capitalist(s) become partners in the venture and commit significant time to each portfolio firm by serving on its board of directors, helping craft overall strategy, assisting in the recruitment of members of the management team, and monitoring the growth of the firm (Large & Muegge, 2008). Because seasoned Venture Capitalists have been involved in a number of start-ups, they can provide valuable advice on avoiding the myriad pitfalls any rapidly growing firm can experience. It should be noted that because Venture Capitalists depend on profitably liquidating their investment within a time frame driven by their own fund's lifecycle, the interests of Venture Capitalists and founders are not always aligned.

A well-established VC community has played a critical role in the birth of entrepreneurial ecosystems across Silicon Valley or Israel in general, and Tel Aviv in particular. The entrepreneurial ecosystem refers to the environment in which entrepreneurship tends to

thrive. In order to create sustainable entrepreneurship, certain elements assume a critical role. Start-ups are most successful when founders have access to the human, financial and professional resources they need, and operate in an environment in which government policies encourage and safeguard entrepreneurship (Isenberg, 2010). Under such conditions, VC plays an active role in financing start ups as well as augmenting the managerial team with resources and capabilities that would be too expensive or time consuming for them to develop internally (Rossi, Thrassou, & Vrontis, 2011). From this one can argue that venture capital is dependent upon both institutional contexts as well as internal resources endowment.

In assessing the current state of research about VC, we can argue that the majority of studies is US-centric (see also Berglund, 2011). This means that empirical findings are related to US institutional conditions. This circumstance could make not meaningful, if not misleading, to apply them to different geographical and institutional contexts. Moreover, the majority of empirical studies is inspired by a variance approach, which is suitable to identify statistically significant correlations among variables, but it is ill-suited to capture how a certain phenomenon evolves over time. This makes useful to investigate how different institutional contexts and internal conditions interact and affect entrepreneurial ecosystems across the globe and how they co-evolve over time.

For this reason, we believe that it is timely and useful to investigate what is the actual role of VC in different geographical and institutional contexts and how the relationship between the Venture Capitalist and the venture-backed company evolve over time by employing a process orientation. This is the substantive and methodological gaps this paper intends to fill, by answering the following research question: How does the relationship between the Venture Capitalist and the venture-backed company unfold over time in different geographical as well as institutional conditions?

To answer this research question we present evidence from three process studies regarding the creation of start-ups, all located in Southern Italy, that enjoyed significant venture capital support. These three deals involve different types of entrepreneurs —one being a brilliant graduate in Drama, Art and Music Studies (DAMS) skilled in computer video; one regarding a large group of researchers affiliated to a university department; and a third one concerning two street-smart building materials wholesalers. These settings constitute, in our view, very different micro-environments, allowing us to explore the multifaceted performances of a specific entrepreneurial ecosystem. Through an in depth study of these three cases we can

provide insights about how, in different environments, creative thinking and bright ideas can be transformed in successful businesses and how venture capital contribute to innovative start-ups. Answering this question will allow us to analyze the venture capital deals as processes and unravel motives, learning mechanisms, and outcomes each party enjoys.

The paper is organized as follows. After a literature review on VC and its role in entrepreneurial ecosystems, we advocate for employing a process approach to the study of start-ups and venture capital deals. Next, we present empirical evidence from three venture capital deals. In the concluding section, we propose our own interpretation to findings, discuss limitations and provide future research directions.

VENTURE CAPITAL: THE STATE OF THE ART

Parallel to the increasing impact of VC on economic growth, the phenomenon has received a growing attention from scholars of different disciplines, spanning from finance to strategic management. Today, there exists already a vast amount of empirical studies, signaling that this is a rather well researched topic. In reviewing these studies we will focus our attention on the substantive issues being investigated and the methods of investigation being employed. For an alternative reading of existing literature, scholars are referred to Berglund (2011) who analyzes CV in terms of what VC knows, what is the value added, and the influence of institutional conditions on its behaviors.

In terms of issues investigated, the received literature about VC has mainly dealt with analyzing the differences between Venture Capital and Corporate Venture Capital to assess their contribution to innovative performance (Dushnitsky & Shapira, 2010; Peneder, 2010) or their effects on entrepreneurial learning (Berglund, Hellström & Sjölander, 2007). Other studies have focused their attention on analyzing criteria for selecting target firms (Levie & Gimmon, 2008) or with the role business plan actually plays in the scouting process (Kirsch, Goldfarb & Gera 2009). Research has also dealt with criteria pushing entrepreneurs to choose venture capital (Valliere & Peterson, 2007). Taken together, these studies signal that much effort has been spent trying to understand the decision to invest for both parties involved in the deal, while considerably less attention has been paid to how VCs actually support venture development once an investment has been made. Some scholars have raised concerns about the conclusiveness of findings emerging from existing research. Under this regard, Wijbenga, Postma, van Witteloostuijn, & Zwart (2003) outline that research on the ability of VC to create value is mainly descriptive with few attempts at theoretical explanation. Moreover, Busenitz,

Fiet, & Moesel (2004) contend that existing studies offer a coarse-grained understanding of VC and fail to conclude whether VCs typically add non-financial value. Empirical studies have also investigated the role of VC in different external conditions. Here we refer to Hargadon and Kenny (2012), who speculate about the possible role VC may play in promoting clean technologies in US, or to St-Pierre, Nomo and Pilaeva (2011), who assess the impact of VC in traditional French and Canadian manufacturing firms on capability development (market capabilities or innovation capabilities, or networking capabilities) or to Pinch and Sunley (2009), who study the role of the VC as knowledge disseminator in high-technology agglomerations. Moreover, other studies focus on patterns of VC in specific industries and geographical areas, such biotechnology start ups in UK (Rosiello & Parris, 2009).

If we are to summarize the current stock of knowledge, we can conclude that VC is not a homogeneous phenomenon; rather, it is contingent upon institutional conditions as well as personal characteristics of the entrepreneur as well as of the Venture Capitalist. Under this regard, Berglund (2011) contends that the majority of the studies aiming at detecting regional differences in VC behaviors are quantitative and fail to offer a deep understanding of VC behaviors in different contexts. We share this view and we contend that in order to improve our grasp of such a nuanced phenomenon it is fruitful to investigate concurrently external as well as internal conditions (the personal characteristic of the entrepreneur and the VC, and their relationship).

Studies analyzing the relationship between the entrepreneur and the Venture Capitalist focus on the possible sources of conflicts between the two parties and their effects on the relationship from the entrepreneur's point of view (Zacharakis, Erikson & George, 2010), or on the goal alignment problem after the deal (Türçan, 2008). These studies suggest that the relationship between the Venture Capitalist and the venture-backed firm remains a black box. Eesley, Hsu and Roberts (2011) attempt to fill this void. They analyze alternative approaches to the study of this relationship. They compare the contribution of literature on firm capabilities and the resource-based view (RBV) (Peteraf, 1993; Barney, 1991; Wernerfelt, 1984) of the firm with the literature on organizational economics Grossman and Hart, 1986; Hart and Moore, 1990). The former view emphasizes the primacy of assembling 'the right assets' while the other focuses on 'organizing assets the right way'. Building on these arguments, they suggest that the value created through what we refer to as the initial idea assets is contingent upon the firm's circumstances and the experience of the founders in creating efficient governance and contracting arrangements. They go on by calling for a more

thorough understanding of when specific types of assets and capabilities are important in driving performance under specific industry conditions.

While we share this view, we believe that to significantly improve our understanding of this “black box” we need to incorporate the temporal dimension in our analysis. We therefore propose that in order to further our understanding of the relationship among the Venture Capitalist, the venture-backed company and the knowledge transfer mechanisms within and between the two actors, a process approach could be a fruitful research orientation as it allows taking into account enabling and constraining influences from inner and outer contexts of the firm (Pettigrew, 1992). In such a way we are able to explore the influence of the Venture Capitalist on eco-systems.

THE FIELD STUDY

Our fieldwork approach to this study is case-based and processual (Pettigrew, 1992). In order to capture both complexity and depth, we use a qualitative case study design (Yin, 1989). “A case study is an empirical inquiry that investigates a contemporary phenomenon within its real-life context; when the boundaries between phenomenon and context are not clearly evident and in which multiple sources of evidences are used” (Yin, 1989: 23).

We analyzed a purposeful sample of three venture capital deals involving the same venture capitalist and three companies running very different business— one being a brilliant graduate in Drama, Art and Music Studies (DAMS) skilled in computer video; one regarding a large group of researchers affiliated to a university department operating in the field of biotechnology applied to human health (red biotech); and a third one concerning a smart manufacturing equipment for mortars and chemical products. Details about the three deals are arranged in table 1. These research settings were chosen as they provide evidence about three different micro-environments, which we could label respectively as “web-based” “knowledge-based”, and as “market-based” . In addition, a personal relationship from one of the authors secured a good access to both the venture-backed companies and the venture capitalist. Informants assured their cooperation throughout the course of the fieldwork.

Regarding the unit of analysis, we decided to investigate both the parties involved in a venture capital deal to understand how general and industry-specific knowledge is exploited by the venture capitalist and how the venture-backed company leverage internal resources and exploit external capabilities supplied by the Venture Capitalist.

As specified above, the units of analysis are two: the venture capitalist, and the venture-backed company. We enter the research settings *in medias res*, with the three deals were still ongoing. We therefore conducted a partly retrospective and partly in real time study.

In order to better understand how the relationship between the two unfolded over time, a range of primary and secondary data was collected. We collected primary data through focused interviews. We carried out two rounds of interviews with founders as well as with the venture capitalist investment manager. The first round of interviews took place in 2011 while the second one in 2013. In interviewing our informants we asked them to provide their own account of the relationship with the counterpart, focusing on issues of interest. These interviews were recorded and transcribed with their consent. Secondary data is mainly made up of internal memorandums from the Venture Capitalist, as well as press releases.

In analyzing data we took inspiration from Langley (1999), for process data analysis strategies, as well as from Miles & Huberman (1994), for qualitative data analysis procedures. “Process data consist largely of stories about what happened and who did what when—that is, events, activities, and choices ordered over time”, Langley (1999: 692) observes, outlining they are messy and ambiguous. We immersed ourselves within the data and we started off collapsing data into a chronological reconstruction of the three different deals. We then moved onto coding our empirical data. By codes we mean “tags or labels for assigning units of meaning to the descriptive or inferential information compiled during a study” (Miles & Huberman, 1994: 56). To create a list of codes we went back and forth between data and theory in an iterative manner. The next step was to identify patterns of codes, that is themes emerging from our data so as to account for both similarities and differences across the three cases.

FINDINGS

In presenting our preliminary findings, we will use time as a referent point, focusing on key events from initial and informal contacts to the present date. Along the time frame covered by our research—from late 2008 to march 2013—we may identify among three main phases: the pre-deal, the closing, and the post deal. In presenting our findings we will also focus our account on similarities and differences among the three cases.

The pre-deal phase comprises informal as well as formal talks between the two parties, with the Venture Capitalist assessing the business idea and the founding team trying to sell the business idea. This is a crucial phase with several factors playing a role. Despite the

differences among the three cases under investigation, given the lack of specialization of the Venture Capitalist, the relationship seems to follow a similar path. For Personal Factory and Mosaicoon, the encounter with the Venture Capitalist took place through a local incubator. In the Biouniversa case, it was a personal relationship between the investor manager of the Venture Capitalist and the academic team. This relationship has very likely eased a relationship that is generally described as difficult in existing studies, several of which report a bias towards academic spin off (see Munari & Toschi, 2010). In our case, the presence of a professor of strategic entrepreneurship worked as a facilitator between the two parties and helped what he refers to as the “hybridization” of the different types of knowledge and languages.

The different nature of the three business ideas required the VC to seek outside for technical competences during the evaluation process. To achieve this aim another Venture Capitalist, with technical expertise, was involved during the evaluation process. The network of relationships with other Venture Capitalists is therefore the means to access knowledge that it would be too time consuming or too costly to develop internally. This issue is a quite remarkable aspect as compared with entrepreneurial ecosystems where the density of potential entrepreneurs make it possible to achieve a specialization in a certain industry (biotech or nanotech, for example) or a geographical area.

The closing of the deal is perceived as the most difficult moment of the relationship between the two parties. During the negotiation phase, the three entrepreneurs were sensitive to almost all the same issues, although to a different extent. While in the case of Biouniversa the most delicate moment of the closing was the discipline of intellectual property rights, in the Mosaicoon and Personal Factory cases the issues of interests were much focused on the bad deliveries and the degree of autonomy in the daily management of the business.

The closing of the deal means the injection of funds but also the beginning of the entrepreneurial life, the phase during which the business idea is transformed into reality. Contrary to our expectations, although the investment is financed by venture capital, all the founders reported a great sense of responsibility towards the achievement of planned goals. An excerpt from Ugo Parodi Giusino’s interview effectively renders this concept “After the closing, you receive money and you can start running the business, and this is the most enjoyable part of the deal, at the same time you feel the pressure towards the attainment of goals”. This feeling has been described with different words by one of Personal Factory founders, when he recounts what he really learnt from the Venture Capitalist. He refers that the systematic reliance upon planning and controlling was the most important competence

they acquired from the Venture Capitalist soon after the closing of the deal. We found this issue quite remarkable as Personal Factory is a spinoff from a manufacturing company, which is expected to systematically rely upon management by objectives tools. In the Biouniversa case the absolute ignorance of how to run a business was eased by the assistance of the professor of strategic entrepreneurship within the founding team.

The relationship has been described as good and trustworthy by all parties. A tangible proof of this feeling is the second round of funding that has involved all our cases. This is in our view an indirect measure of the Venture Capital success, and of the confidence all our informants share in the effectiveness of this tool. Again an excerpt from the interview with Ugo Parodi Giusino clarifies this issue "The venture capital has been an accelerator of experience and learning. Without it I would have hardly achieved the same goals within such a short time interval". The confidence in the venture capital model has also been mentioned during the interviews with Luigi Tassone (Personal Factory) although with less enthusiasm. And the founding team of Biouniversa expressed the confidence into this tool by claiming that this experience was the door into a world that they would have never even imagined to discover.

In describing their relationship with the Venture Capitalist they all report a positive experience stressing the support in terms of managerial tools supplied, and assistance in identifying the competences and therefore job roles to recruit. Moreover they all report that their initiative gained more visibility and credibility due to the involvement of a Venture Capitalist. They are probably less enthusiastic about the network of commercial partnership they were able to actually access to through the VC involvement, and the assistance in negotiating loans with banks, which is perceived as rather poor by Luigi Tassone.

Looking into the VC's account of how the relationship unfolded over time, we find as much as the same issues reported by entrepreneurs and scientists. The scouting process generally takes place during institutional meetings with incubators or start-up competitions. Besides them, the Venture Capitalist on a regular basis promote and disseminate knowledge about venture capital through workshops and seminars. Interestingly, the investment manager reports that in many instances entrepreneurs are absolute beginners about the potentialities of venture capital. The lack of knowledge about VC might partly explain the low confidence in the VC as a strategic tool to favor entrepreneurship. The issue of confidence is of utmost importance for the Venture Capitalist. According to the investment manager, if an entrepreneur is skeptical about VC, it is very unlikely that first contacts will produce a deal. Even if a venture capitalist devotes its best efforts to explain pros and cons of the tool and

how it works, it is very unlikely that a skeptical entrepreneur turns out as an enthusiastic one. Confidence in VC is therefore perceived as a pre-requisite for both parties to initiate a deal.

As the relationship goes ahead, the VC could have difficulties in assessing the technological merit of the business idea. In such cases, VC can rely on external advisors, who, on a contractual basis, provide them with a competent assessment of the technology or the patent. As specified above, the current development of VC in Italy, and especially in Southern Italy, does not allow specialization into a specific industry or geographical areas. The relationship with external advisors mitigates this problem. The reliance on an external advisor does not prevent the venture capitalist from learning by doing. The experience counts, according to the investment manager, in that it makes the scouting process less time consuming and more effective. Such a learning process is however, still tacit, as no codification activity from previous experiences is carried out nor a repertoire of best practices has been elaborated by the VC team. Therefore, we can conclude that the learning process involves both the venture capitalist and the venture-backed company.

CONCLUSIONS

In this paper we have advocated for the usefulness of a process orientation as a research strategy to deepen our understanding the relationship between the Venture Capitalist and the venture-backed company in different institutional and geographical contexts. We have provided evidence from three process studies we conducted between 2011 and 2013. Our cases are entrepreneurial start ups all located in Southern Italy, each of them running a different business. The homogeneity of the geographical context and the heterogeneity of businesses allowed us to discern similar/different patterns in how the relationship evolved over time. Our findings suggest that, at least in Southern Italy, Venture Capitalist cannot afford to focus on single industries, such as life sciences or ICT. This poses peculiar challenges to their ability to manage such a diverse range of businesses. They are able to deal with this complexity by relying on an external network of specialized skills on a contractual basis. In terms of knowledge or skills they add to the venture-backed company, the founders all agree that they benefitted from an easier access to institutional relationships and from learning managerial principles. They provide evidence that the relationship evolved positively over time and that the engine was, in the beginning, the confidence in the VC itself, while over time, was the trust in the Venture Capitalists.

EXPLORING THE IMPLICATION OF JUNGIAN NOTION OF ORGANIZATIONAL PSYCHE: FACEBOOK AS A LIVING ORGANISM

Minulescu, Mihaela

National School for Administrative and Political Studies, Faculty of Communication and Public Relations, Bucharest, Romania, mihaelaminulescu@yahoo.com

ABSTRACT

In the frame of a complex psychological theory, the recent research introduced the notion of organizational psyche in organizational psychology. There are instruments and theoretical frames in Jungian psychology to study the underlying purposefulness in organizational psychodynamics. With this perspective, we are introducing the study of Facebook (FB) as a living organism.

We share with several other scholars the view what the human inclination to create an organization is the expression of a deep archetype: that is to say that all organizations share a deep meaning and intentionality that lie beyond the sway of the egos of individual organizational members. The organizational archetype lives at the heart of all organizations making it communality. In view of this theory we ask if the spreading of "share and relate" on social networking is the expression of an actual zeitgeist, an archetype of relatedness with two poles, positive and negative. We explore the studies on FB in order to specify what are the complexes, processes, structure, goals and environment of this particular networking organization that combine to make it unique.

Keywords: Facebook, organizational psyche, the archetype of organization

PROBLEM STATEMENT AND PURPOSE OF THE STUDY

The organizational psyche, like the individual psyche, is what organization seeks to become, the unfolding of its potential, and the movement towards integration and wholeness. The organizational self, like the individual, is anchored in its birth process, its reality and myth.

The enfolding of the organizational intrinsic self is filtered through the task system which defines its identity and survival. At the core of life forces, the archetypal Self analogous with the individual psyche, gives orientation and meaning and “serves as a significant source and as the channel of organizational energy. It embodies much of an organization’s innate capacity for wholeness” (Corlett & Pearson, 2003, p.19).

Building upon Jung's work, Carol Pearson has studied a system of archetypes that put a human face on the meaning structures that are correlated with success and fulfillment today. Studying archetypes and their expression in organizational psyche can make us better understand inter-individuals dynamics and the unseen triggers inside organization; increase communication between conscious and unconscious processes; trigger a greater sense of meaning and fulfillment in organization’s life; inspire and motivate people; cope more effectively with difficult people and difficult conditions; have greater flexibility to respond to the challenges of life; be more effective within our workplace and community context; have greater flexibility to respond to the challenges of social and economic life.

In this perspective, we treat FB community like a vivid and open organization. The archetype of an organization points the organization towards what it can become, proving a blueprint for the wholeness. The members of the FB organization collectively and unconsciously carry the characteristic archetype of organization into the psychodynamic life of organization and it becomes imperfectly manifested through them and their actions individual and collective, conscious and unconscious. The members of FB as a real actual phenomenon are sharing the same basic archetypal psyche.

FB was meant to be a social utility that connects people with friends. The FB creator embodied three ways to connect: like, comment, and share; each one pulls the person to express. Statistics on what people likes, prefer; a kind of finding people with similar opinions or rejecting the dissimilar ones. The commentaries gives the person the satisfaction of joining/and find people with similar attitudes, or to be taken into consideration, or to argue. There are events to organize, photos to share and comment, thinks to discover, ways of moving around the world without effectively moving. No other social community has been that booming ever than FB.

The Organizational Self expresses four life forces in two bipolar opposites: to nurture and develop people versus to achieve results, and to transform and innovate by learning versus to

maintain by stabilizing. The focus of this paper is to observe if these directions are active in FB phenomenon.

COMMON STUDIES AND STATISTICS ON FB

Initial research on social media's effects on human interaction has revealed the problem of the development of antisocial behavior, narcissism and all kinds of negative attitudes of bullying and manipulating enhancing negative emotions. Lately, studies revealed quite different tendencies, around more constructive attitudes, like empathy and compassions, learning and nurturing warm emotions. In view of these data, the paper intended to discover the basic unconscious archetype that used the opportunity of networking in organizing people around a specific unconscious actual need. We will analyze some of the recent studies on FB with the aim of exploring the psychic tendencies underneath the FB's organizational life to answer some cardinal questions as: have those who use FB more frequently less of a connection to real life? Is their self esteem low? Is the need for popularity versus loneliness the active drive? Is this belongingness a general need for: acknowledgement, attention, appreciation, and acceptance? We take as a fact that people are spending valuable time in their personal life maintaining relationships with people they don't really meet, perhaps to the exclusion of the offline friendships!

Some recent statistics shows that there are around 800 million people on FB, and on average, we will share 415 pieces of content on FB each year, upload 196 hours of video and send countless emails. There are now over 2.8 billion social media profiles, representing around half of all internet users worldwide. Overall, there are millions of people willing to share and belong to a huge organism.

DATA ANALYSIS

Is belongingness a general need for the big four A: acknowledgement, attention, appreciation, acceptance?

When considering why social media networks flourish, we have to start first to take into consideration human nature. It is human nature for people to want to connect with others. Social networking is an easy way for people to reach out and connect with other people, a

possibility to find like-minded people, to exchange ideas, to express. Now a days, social media have changed the way connect with each other. And this can have both a positive and negative impact of our self-esteem and sense of self.

One psychological topic of research was addressing the idea that social networking may enrich the interpersonal lives of persons who struggle to make social connections giving the opportunity for self-disclosure (which is a necessary component in the development of intimacy). A topic of research was if the FB could be especially beneficial for people with low self-esteem, who are normally hesitant to self-disclose and who have difficulty maintaining satisfying relationships. One larger research was dedicated to explore the self esteem hypothesis in connection with reduced perceived self-disclosure when posting on FB, and thus encouraging people with low self-esteem to express more openly. In three studies, Forest and Jood (2012) examined whether such individuals see FB as a safe and appealing medium for self-disclosure, and whether their actual FB involvement enabled them to join social rewards. They found that although people with low self-esteem considered FB an appealing opportunity for self-disclosure “the low positivity and high negativity of their disclosures elicited undesirable responses from other people”.

With the flourishing/globalization of the Internet, there comes important changes in how people think, share, become friends with and relate to one another in a very short time. Persons involved in FB/social networking, are, interacting in ways we never thought we would have in real life, and due to the fact that it is possible to make true, genuine and long-lasting relationships with like-minded people online, the difference between what constitutes a real friendship with a virtual one become somehow outdate. FB gives us access into another person's mind, so far as that person makes public their thoughts, ideas, feelings and desires. At times, we are perhaps more honest online, and especially on social networks, than we are in real life.

Some studies suggest that we are exactly the same on FB as we are in real life, but it is not necessarily the case. We might actually be even more of who we are online than in real life. FB proves to be in a very short time both a space of freedom as the people are free to be, to say and act whatever they think and feel. That is precisely the first question FB asks us when we go to our profiles, and the second invitation is to like, comment and share. We not only share information we also embody the medium itself and we cannot detach what we say on FB

from FB itself. The entire concept of communication shifts as the medium itself is the message (Eler, 2012).

FB statistics indicate that young people spend hours online each day, and their abilities to multitask and communicate are often misunderstood by older generations. Other statistics indicate that professional people use FB to confront opinions or and form professional networking. Some tested hypothesis is that people who are less popular or charismatic in the real world may somehow "compensate" for their lack of charm by over-indulging in virtual social networking sites with hundreds or thousands of connections/friends; they, unsurprisingly, spend more time in the virtual world than in the real world.

Negative side effects

Some of the negative side effects of FB use for young people that Rosen (2011, 2007) cited include: cyber bullying, addiction, sexuality, virtual friendships, and development of narcissism in teens that often use FB. The author points some indicators of the presence of other psychological disorders, including antisocial behaviors, mania and aggressive tendencies, in teens who have a strong FB presence; increased absence from school and likelihood of developing stomach aches, sleeping problems, anxiety and depression, in teens who "overdose" in technology on a daily basis, including FB and video games; lower grades for middle school, high school and college students who checked FB at least once during a 15-minute study period; lower reading retention rates for students who most frequently had FB open on their computers during the 15-minute study period. His findings were based on a number of computer-based surveys distributed to 1,000 urban adolescents and his 15-minute observations of 300 teens in the act of studying.

Inducing empathy in real life

Paradoxically, one of the more interesting findings from Rosen's research was the development of "virtual empathy": teens are developing the ability to show virtual empathy for distressed FB friends, and that empathy is actually well-received by friends, positively influencing their mood. This virtual empathy, Rosen says, can manifest into their real world. In this perspective FB contribute to improve adolescent emotional intelligence and socialization skills.

Personality traits disclosure

There are studies upon people in social networking exploring the personality traits. Traits like extraversion, emotional intelligence, and Machiavellianism have been explored in connection with involvement in social networking: extraversion, which accounts of the tendency to be socially involved, influence on others, be socially active; emotional intelligence, which enables people to identify and handle emotional states in themselves and other people, and to develop harmonious and nurturing "relations; and, Machiavellianism defined by collecting meaningless friends, people who may be "useful" from a career or self-interest perspective (Chamorro-Premuzic, 2010).

Two studies examining how personality traits are reflected in FB presented connections between the Big Five personality traits and self-reported FB-related. For example, extraversion predicted not only frequency of FB usage (Study 1), but also engagement in the site, with extraverts (vs. introverts) showing traces of higher levels of FB activity (Study 2). As in offline contexts, "extraverts seek out virtual social engagement, which leaves behind a behavioral residue in the form of friends lists and picture postings" (Gosling & al, 2011). These results suggest that, rather than compensating for their offline personality, FB users appear to extend their offline personalities into online FB involvements.

HOW ARE THE TWO ARCHETYPAL AXES EXPRESSED IN FB

The need to nurture and develop people versus achieving results.

There are studies focused on how people use FB. In a recent survey, an international sample of 1,026 FB users (284 males, 735 females) completed an online survey about their FB activity. Females, younger people, and those not currently in a committed relationship were the most active FB users, and there were many age-, sex-, and relationship-related main effects.

In terms of gender comparison, females spent more time on FB, had more FB friends, and were more likely to use profile pictures for impression management. Women and older people proved to engage in more online family activity. The data shows that relationship status had an impact on the FB activity for males, but little effect on the activity of females (McAndrew & Jeong, 2012)

The need to transform and innovate by learning versus maintaining by stabilizing.

More studies focused on the use of FB in academic and professional communities. Research on the potential of FB for improving student performance outcomes is just the beginning. A

study counted twenty-one journal articles that have empirical research studies on the use of FB for teaching and learning; most of the studies reported in the literature being descriptive and are conducted in higher education settings. Results show that the use of FB makes a difference in the students' affective outcomes. The authors suggest that more empirical research on effective use of FB for teaching and learning should be conducted in the future (Woo & al., 2011).

FB is emphatically a social network site, but the actual trends using it for teaching are increasing. A large study was dedicated to the role of FB and other social networking sites in education. Does FB threaten academic success? One research particularly indicates that FB-ing students may perform better than their unwired peers (Ellison, Steinfield, and Lampe 2007). Given increasing numbers of students on FB, there are increasing the ways the universities develop to enter that space.

A review conducted by Hew, 2011, focused on presenting a detailed account of the participants FB usage profile or the extent to which users are engaged in FB activities. The findings are organized into three sections that cover the major topics of current research: (a) students FB usage profile or extent of FB use (e.g., time students spend on FB each day, students motives for using FB, as well as various factors that may affect these usage profiles), (b) the effects of FB use (e.g., effects of FB self-disclosure on teacher credibility, effects of FB use on student social presence and discussion, and effects of FB on students academic performance), and (c) students attitudes toward FB. So far, the analysis concluded that FB has a little educational use, that students use FB mainly to keep in touch with known individuals, and that students tend to disclose more personal information about them on FB; hence attracting potential privacy risks upon them.

Paradoxically, as some studies blame the social networking phenomenon for increasing failure rates at universities, universities are simultaneously exploring ways to engage students via that medium. One study explores FB as an interactive point of engagement to support student transition to the university, even if it questions the ethics of using FB and recommends that it be used only as an additional point of engagement (Woodley, Meredith, 2012).

Educators and others are interested in the effects of social media on college students. A study in 2012 is using in particular a large sample (N=2368) of college students to examine the relationship between frequency of FB use, participation in FB activities, and student engagement. Student engagement was measured using different methods: a 19-item scale

engagement, time spent preparing for class, and time spent in co-curricular activities. The data indicate that FB use was significantly negatively predictive of engagement scale score and positively predictive of time spent in co-curricular activities (Junco, 2012).

CONCLUSION

FB flourishing over a relatively short time triggered a lot of research, studies, and surveys. Apparently there are about 3,702,363 entries when ask about studies on FB (www.mendeley.com).

This study explores the deep psychological needs that made FB a huge and attractive organization. We tried to explore if in its actual form it behaves like a vivid organism which triggered much more than the initial rationale. It develops from a social networking to enter in virtual every domain of modern world: professional discussion, academic teaching, business and marketing.

Which of the four life forces as bipolar opposites are answered by FB content?

In terms of benefits in networking, the two archetypal axes are congruent with the FB realities. The archetypal impulse to nurture and develop is fulfilled by developing contacts and relationships, FB forums that sustain a strong contact no matter space or time. The equivalent need to achieve results is fulfilled by exposure in forums to promote and draw attention to personal cause, or business and brands. The archetypal impulse to transform and innovate is expressed by opportunities for new/ future business, and to learn from experienced professionals. The equivalent need to stability is expressed in meeting the likeminded people with whom you may come together to discuss common interests.

FB behaves stirring the creativity and imagination of people from different cultural background, aims and personality traits. The deepest fears and the most cherished imaginings could eventually be meeting using the networking opportunities on FB. Underneath the movement there is energy with double poles: creating connections in the service of enhancing empathy and understandings, and using the messages to subtly control minds. The first direction could create a larger loving community in the service of preserving the planet, in the second could serve a enslaving in fears and manipulative. The more recent studies show a growing tendency toward creativity and education, as the need to transform and innovate by learning becomes manifest.

The second axe seems to develop more around the need to nurture and develop people who had less power in terms of social and political decisions.

As with living organisms, FB express the basic needs of the planetary development, and contains and express every bit of human psychic structure and behavior: adaptive and coping versus neurotic and pathological, conscious an intentional versus unconscious and unintentional, Logos and Eros as order and compassion, versus Prejudice and Power, and more, the tendency to escape human's control and develop along lines that preserve life on the planet.

ABSTRACT

Understanding the determinants of international performance, and in particular, export performance is key for the success of international companies. Research in this area focuses mainly on how resources and capabilities allow companies to gain competitive advantage and superior performance in external markets.

Building on the Resource-Based View (RBV) and the Dynamic Capabilities Approach (DCA), this study aims at analysing the effect of intangible resources and capabilities on export performance. Specifically, this study focuses on the proposition that entrepreneurial orientation potentiates the attraction of intangible resources, namely relational and informational resources. Moreover, we propose that these resources impact export performance both directly and indirectly through dynamic capabilities.

Keywords: Export performance, RBV, DCA, entrepreneurial orientation, relational resources, informational resources.

INTRODUCTION

Internationalization is a strategic option that contributes to the expansion and growth of entrepreneurial companies. International markets may be particularly competitive and export manager need to compete to the best of their ability (Morgan, Vorhies and Schlegelmilch, 2006). The ownership of strategic resources allows companies to gain competitive advantage. Recent studies have changed the focus of tangible resources to

intangible resources which have been shown to be more important from the strategic point of view and more relevant to business performance and success (Morgan *et al.*, 2006; Bakar and Ahmad, 2010). Moreover, research has focused on the dynamic capabilities as a source of sustainable competitive advantage (Teece, Pisano and Shuen, 1997; López, 2005; Teece, 2007; Wu, 2010), endowing the theory of resources and capabilities with a more dynamic approach.

Drawing upon the RBV and the DCA, this study aims to evaluate the interaction between entrepreneurial orientation and export performance, by examining the mediating effect of intangible resources (available for the international market) and dynamic capabilities.

The relevance of this subject is mainly due to the need for companies to understand the process that will enable superior performance in terms of exports. Although export performance has been object of a vast number of studies, it remains one of the of the least understood and most contentious areas of international marketing (Katsikeas, Leonidou and Morgan, 2000).

THEORETICAL FRAMEWORK

Resources and capabilities

The RBV draws upon the premise that strategic resources and capabilities enable companies to gain competitive advantage (Wernerfelt, 1984; Barney, 1991). Resources are tangible or intangible assets the company owns, controls or has access to in a semi-permanent basis (Helfat and Peteraf, 2003). There are different types of resources widely recognized in the literature, such as technological, financial, human, physical and organizational resources (Loane and Bell, 2006; Bakar and Ahmad, 2010). For Wernerfelt (1984), the concept of resource is limited to the attributes that increase the company's efficiency and effectiveness. Furthermore, resources should have some ability to generate profits or avoid losses (Miller and Shamsie, 1996). In this sense, the resources not only refer to the company's assets but also their capabilities (Henderson and Cockburn, 1994).

Capabilities refers to the firm's ability to perform a coordinated set of tasks, using organizational resources, in order to achieve a specific result (Helfat and Peteraf, 2003). For Amit and Schoemaker (1993), capability refers to the firm's capacity to mobilize resources, generally in combination, using organizational processes, to a desired end effect.

The RBV is based on the assumption that a firm's resources/capabilities must be rare, valuable, irreplaceable and difficult to imitate elements (Barney, 1991). Dhanaraj and Beamish

(2003), have studied three sets of resources and capabilities which influence and/or reinforce corporate strategy in external markets, namely entrepreneurial orientation, organizational resources and technological intensity. Their study confirmed that this set of strategic resources and capabilities has a positive impact in export activities and performance. Recently, research in this area has privileged the role of dynamic capabilities as source of sustainable competitive advantage (Teece *et al.*, 1997; López, 2005; Teece, 2007; Wu, 2010).

Entrepreneurial orientation

Covin and Wales (2012, p. 677) refers that “the phenomenon of an entrepreneurial orientation as a driving force behind the organizational pursuit of entrepreneurial activities has become a central focus of the entrepreneurship literature and the subject of more than 30 years of research”. Miller (1983) states that an organization with entrepreneurial orientation bets on the innovation of products and/or markets with some risk and acts proactively before its competition. For Lumpkin and Dess (1996, p. 136), entrepreneurial orientation “refers to the processes, practices, and decision-making activities that lead to new entry”.

Miller (1983) proposes that entrepreneurial orientation comprises three fundamental dimensions: innovation, risk taking and proactiveness. Lumpkin and Dess (1996) put forward two more dimensions to characterize the entrepreneurial process, namely, competitive aggressiveness and autonomy. Thus, according to these authors, the main dimensions that characterize an entrepreneurial orientation include a tendency to act autonomously; a willingness to innovate and take risks; a tendency to be aggressive toward competitors and proactive in terms of market opportunities. However, literature indicates that the dimensions most commonly used in research are: innovativeness, proactiveness and risk taking (Kropp, Lindsay and Shoham, 2008; Al-Swidi and Al-Hosam, 2012). According to Miller (1983), only companies that have a high level in all three dimensions of entrepreneurial orientation (innovativeness, risk taking and proactiveness) would be considered potentially entrepreneurial.

Informational resources

For Anand, Glick and Manz (2002) knowledge refers to any information, belief or ability that firms can incorporate into their activities. The main barrier to the

internationalization of small businesses is the lack of knowledge (Loane and Bell, 2006). The effective use of relevant, accurate and timely information is an important means to address many of the problems faced by firms operating in foreign markets (Katsikeas and Morgan, 1994). For these authors, knowledge is a resource referring to the acquisition and dissemination of information/knowledge about customers, competitors, distribution channels and export market. According to Grant (1996), knowledge is in fact the most important asset of a firm competitive.

Relational resources

Relational resources consist of the networks between the company and external entities such as customers, suppliers, competitors and government institutions (Davis and Mentzer, 2008). These resources are based on relationships, understood as promising sustainable competitive advantage, in that resources are distributed asymmetrically between firms, imperfectly mobile, difficult to imitate and have no substitutes available (Barney, 1991). Currently, the struggle for competitive advantage in a globalized economy increasingly revolves around the value of firms' networks (Davis and Mentzer, 2008). However, a firm must establish relations not only in terms of expected performance, but also for the improvement of capabilities that allow for the development of other resources (Arndt, 1979).

Dynamic capabilities

Several authors consider that the theory of resources and capabilities does not adequately explain how companies achieve competitive advantage in fast moving business environments (Teece *et al.*, 1997; Eisenhardt and Martin, 2000). In these business landscapes, technological change is fast, the nature of the markets and competition is difficult to determine and time-to-market is critical (Teece *et al.*, 1997). In versatile markets, capabilities must be dynamic, namely the firm must have the capability to renew competencies to continually ensure the consistency between the business environment and strategy.

Research focus has been focusing on dynamic capabilities as a source of sustainable competitive advantage (Teece *et al.*, 1997; Eisenhardt and Martin, 2000; Teece, 2007). For Teece *et al.* (1997, p. 515), the term dynamic refers to the "capacity to renew competences so as to achieve congruence with the changing business environment". These authors define dynamic capabilities as the firm's ability to integrate, build and reconfigure internal and external competences to quickly respond to changes in the current business environment. Given its

relevance, the theoretical approaches on recent dynamic capabilities have contributed to the distinction between capabilities and other resources available within companies (Teece *et al.*, 1997; Makadok, 2001) and a broader view of the theory of resources and capabilities.

Export performance

With the steady increase of business and international competition, understanding the determinants of international performance, mainly exports, has become particularly important, contributing to the development of several studies in this area (Sousa, Martínez-Lopéz and Coelho, 2008). However, the lack of a comprehensive theoretical basis for explaining export performance makes it difficult to integrate the results of different studies in a coherent body of knowledge (Morgan, Kaleka and Katsikeas, 2004; Sousa *et al.*, 2008). Sousa *et al.* (2008) conducted a literature review between 1998 and 2005, and concluded that considerable attention has been given to the determinants of export performance, contributing to the theoretical and practical advances in this field. However, according to these authors, the literature on the export performance presents itself as fragmented (consisting of numerous studies that characterize the adoption of a variety of analytical and methodological approaches); different (to investigate a considerable number of different determinants of export performance) and inconsistent (different reports, often contradicting the findings on the influence of various determinants of export performance, cause confusion and misunderstanding regarding the factors that significantly affect performance).

Morgan *et al.* (2004) confirm that export performance is strongly correlated with the positional advantage of the firm in the international market and that this is directly related to the availability of resources and capabilities for external markets. Similarly, Dhanaraj and Beamish (2003) concluded that resources are good predictors of export strategy (operationalized in terms of degree of involvement in foreign markets).

Sousa *et al.* (2008) analyzed measures of export performance, and concluded that despite the large number of measures of export performance (about 50), only a few were frequently used, namely: export intensity (share of exports in total sales), growth of export sales, export profits, export market share, satisfaction with export performance in general and perceived export success. On the other hand, measures less used were return on investment, quality of relationship with the distributor, customer satisfaction, and satisfaction with quality product/service compared to their competitors.

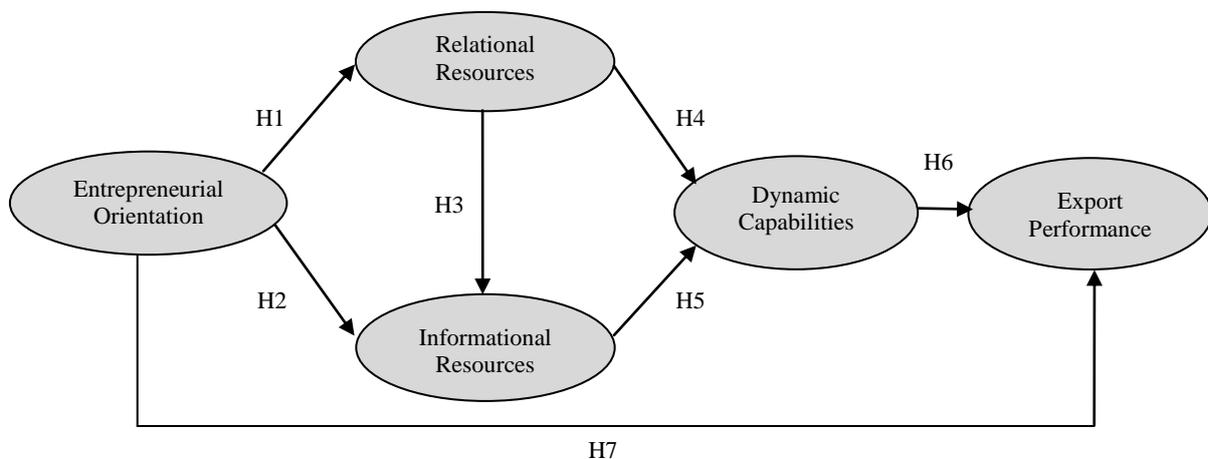

Another important aspect in the study on export performance is the unit of analysis. Katsikeas, Leonidou and Morgan (2000) and Sousa *et al.* (2008) find that most of the studies

analyzed used the company as the unit of analysis (export performance evaluated in the context of overall business activities in foreign markets); while for Cavusgil and Zou (1994) the unit of analysis in research in export performance should be “export venture”, defined as the combination of a single product or product line exported to the main market (Lages and Montgomery, 2004) as firms can have more than one product or product line, and each may have a different impact on export performance (Sousa *et al.*, 2008). The focus on “export venture” contributes to a more accurate assessment of the factors associated with superior performance in terms of exports (Piercy, Kaleka and Katsikeas, 1998).

RESEARCH MODEL AND HYPOTHESIS

Drawing upon the theory of the RBV and the DCV, this study aims to examine the relationship between different intangible resources and capabilities (entrepreneurial orientation, intangible resource and dynamic capabilities) in export performance. Specifically, we focus on the role of entrepreneurial orientation in the attraction of the intangible resources (relational and informational resources) and in the role of such resources in the development of dynamic capabilities. So, this study also aims to evaluate the impact of these resources and capabilities in international business performance, assessing how and to what extent these resources and capabilities influence export performance. Finally, the study aims to assess the mediating effect of intangible resources and dynamic capabilities between entrepreneurial orientation and export performance. Figure 1 presents the proposed research model and hypothesis.

Figure 1. Research model and hypothesis

METHODOLOGY

Research design and measures

This study uses the questionnaire method, which is consistent with the majority of the studies in the literature in the field of export performance (Sousa *et al.*, 2008). The questionnaire was applied online due essentially to the short response time regardless of respondents' location (Ilieva Baron and Healey, 2002).

The questionnaire includes two parts. The first part refers to information about the firm and its export activity and the second one consists of questions related to entrepreneurial orientation, intangible resources (informational and relational resources), dynamic capabilities and export performance (Table 1).

Table 1. Measurement scales used in the questionnaire

Construct	Dimensions	References
Entrepreneurial orientation	<ul style="list-style-type: none"> • Innovation • Proactiveness • Risk taking 	Covin and Slevin (1989)
Intangible resources	<ul style="list-style-type: none"> • Informational resources • Relational resources 	Morgan <i>et al.</i> (2006)
Dynamic capabilities	<ul style="list-style-type: none"> • Dynamic capabilities 	Wu and Wang (2007)
Export performance	<ul style="list-style-type: none"> • Export performance 	Okpara (2009)

In this research the unit of analysis used was "export venture" and the study was conducted with Portuguese exporters. The choice of a single country is consistent with the literature (Sousa *et al.*, 2008). Additionally the option for Portuguese firms is relevant given the country's economic situation and its strong dependence on exports (Sousa and Bradley, 2006; Lisboa, Skarmeas and Lages, 2011).

Given the high number of exporting companies listed in the Portuguese official statistics body (17,330 firms listed in National Institute of Statistics), we focused on exporting firms in the northern region (6,653 records). This is also consistent with the literature in that several studies restrict the analysis to certain regions of one country (Sousa *et al.*, 2008). The link to the online questionnaire was sent via e-mail to the 1,780 firms' senior managers and/or leaders of export activity in the database which had provided this address. Miesenböck (1988) considers that these managers are the most likely to respond to the questionnaire, given their direct involvement and responsibility in the export decisions. Moreover, Sousa *et al.* (2008) find that the data from most studies in this area were obtained from export managers.

During data collection, started in November of 2011 and ending in February of 2012, a total of 293 questionnaires were received, 265 of which were usable, representing a response

rate of 19.4% and 18% respectively, which is quite satisfactory since the average response rate of top management is between 15% and 20% (Menon, Bharadwaj, Adidam and Edison, 1999). The final sample includes only companies whose respondent confirmed to be responsible for the company's international activity.

Data analysis was conducted using SPSS (version 19) and LISREL (version 8.8).

Since the majority of responses were collected after follow-up, differences between groups were assessed. We compared the means for the respondents in the first group (first quartile) and second group (fourth quartile) for all variables included in the conceptual framework using Mann-Whitney U test, which is recommended when the distributions do not meet the criteria of normality (Nachar, 2008). Results show that although most of the late responses averages are higher than those of the initial responses, the differences are not statistically significant ($p > 0.05$).

RESULTS

The results are based in the responses provided by 265 exporting companies from various industries in the north of Portugal (44 companies are from the textile industry, 18 from the shoe industry, 15 from industrial equipments and products, 14 from house and furniture, 13 from the home apparel, and the remaining from various other industries).

To test the causal relationships between different constructs we used structural equation modeling (Hair, Anderson, Tatham and Black, 1998; Bentler, Bagozzi, Cudeck and Iacobucci (2001).

The analysis of the measurement model was evaluated in terms of constructs unidimensionality, reliability and validity (convergent and discriminant) (Table 2).

4. Relational resources	5.28	1.00	0.30	0.60	0.54	1.00	
5. Entrepreneurial orientation	4.03	1.47	0.52	0.25	0.36	0.28	1.00

All correlations are significant at the .05 level

Results show that (1) entrepreneurial orientation enhances the attraction of intangible resources, including relational resources and informational resources, (2) the presence of intangible resources is an important factor in the development of dynamic capabilities and (3) dynamic capabilities impact the export's performance. Furthermore, (4) entrepreneurial orientation impacts exports' performance.

Additionally, we have tested the mediating effect of intangible resources and dynamic capabilities. The significance of the mediating effect was tested using *Aroian* test (Baron and Kenny, 1986). Results confirm that entrepreneurial orientation has a significant indirect impact in dynamic capabilities through intangible resources. The indirect effect of entrepreneurial orientation in dynamic capabilities through relational resources is 0.11 (0.28x0.38; $p < 0.01$; $Z = 2.97$). The indirect effect of entrepreneurial orientation in dynamic capabilities through informational resources is 0.09 (0.23x0.41; $p < 0.01$; $Z = 2.83$). The indirect effect of intangible resources in export performance is 0.11 (0.38x0.29; $p < 0.001$; $Z = 3.70$) and the indirect effect of relational resources in export performance through dynamic capabilities is 0.12 (0.41x0.29; $p < 0.001$; $Z = 3.80$).

DISCUSSION AND CONCLUSION

This study proposes and tests a model according to which entrepreneurial orientation has a positive influence in intangible resources, namely informational and relational resources, and in the development of dynamic capabilities, which mediate the effect of entrepreneurial orientation on export performance.

Based on the responses to an online questionnaire for top managers of 265 exporting firms, we validated all direct relationships of the model and confirmed the mediating effect of intangible resources and dynamic capabilities in export performance. Specifically, we found that entrepreneurial orientation contributes to the attraction of intangible resources, that relational resources boost the development of knowledge and that these two types of intangible resources influence the development of dynamic capabilities. These results are consistent with previous studies in this area (Morgan *et al.* 2004; Wu, 2006; Wu and Wang, 2007) and with Morgan *et al.* (2004) argument that resources and capabilities are interrelated. The impact of resources in dynamic capabilities confirm Wu (2006) and the proposition that

resources are antecedents of the development of capabilities (e.g., Morgan *et al.*, 2004). The influence of dynamic capabilities in export performance is consistent with the results of Wu (2006) and Wu and Wang (2007) in their study with technological companies and internal market performance. Finally, H7, referring to the impact of entrepreneurial orientation in performance is consistent with a large number of studies (e.g. Miller, 1983; Covin and Slevin, 1989; Covin, Slevin and Covin, 1990; Lumpkin and Dess, 1996).

Export performance is positively affected (directly and indirectly) by entrepreneurial orientation, intangible resources and dynamic capabilities. Furthermore, dynamic capabilities, also mediate the relationship between intangible assets and export performance. Intangible resources have a significant mediating impact in the relationship entrepreneurial orientation e dynamic capabilities.

As with most studies, this research is not without limitations. First of all, there are limitations derived from the potential bias caused by the sample size and measurement. In this research, in line with previous studies, we used Likert scales 1 to 7 to evaluate the constructs, so that the majority of the answers are based on the subjective judgment of the respondents. Although a strong use of subjective measures to assess the performance of exports has been identified in previous studies, we must admit that some responses may not reflect the actual situation of the level of resources and capabilities available to “export venture” and the performance of exports. Additionally, although email is a commonly tool used, we cannot generalize the results to the total population, as the sample includes only companies form the north of Portugal.

It may also be argued that evaluating the different variables in this study based on the opinion of one respondent per firm may not accurately reflect the reality of companies, as more than one person may be involved in decision-making especially in large companies (Leonidou and Katsikeas, 1996).

In broad terms, the results of our study stress the importance of dynamic capabilities, which play a catalyst role both in the relationship between intangibles resources and entrepreneurial orientation as well as in the relationship between intangibles resources and performance. This conclusion partly validates criticisms to limitations of the RBV to explain firm’s competitiveness. In fact, without the ability to achieve new resource configurations as environmental conditions shift (Eisenhardt and Martin, 2000), resources are clearly insufficient conditions for competitive advantage. A clear understanding of how companies develop differentiated dynamic capabilities is paramount for managers, public bodies and researchers aiming at contributing for or firms’ competitiveness and performance.

ABSTRACT

Nowadays one of the biggest challenges for managers in the hotel industry is to provide and sustain customer satisfaction. While the reasons for the initial visit to a hotel may be due to factors partly outside of the control of hotel managers, the ability to create a satisfactory experience for the guest remains, to a considerable degree, in the hands of both the management and the hotel staff. It is vital for managers of hotels to have a good and clear understanding of exactly what the guests want. The crucial point of customer satisfaction is to identify the important attributes, considered by customers as their needs and expectations.

The main objective of this work is to propose the application of SERVQUAL in evaluating the perceived quality of service offered by hotels in the North of Portugal. The proposed conceptual model aims to analyze if: (1) the perceived service quality (five dimensions of SERVQUAL) directly contribute to customer satisfaction, customer-perceived value and brand image; (2) the brand image and customer-perceived value directly contribute to customer satisfaction (3) the brand image directly contribute to customer-perceived value; (4) the customer satisfaction directly influences the intention to return and WOM recommendation (Word-of-Mouth communication intention) and (5) the intention to return has a direct impact on WOM recommendation. This research is of particular interest to the literature on the hotel industry and to the practitioners, since there are no studies in this field which apply to the Portuguese hotel industry.

Keywords: Service quality; customer satisfaction; behavioural intentions; Hotel Industry; Portugal

INTRODUCTION

The hotel industry has in the last decades assumed a preponderant role in the Portuguese economy similar to that of other European countries. In this sense, and facing the socio-economic context the country is experiencing, hotels can significantly contribute to the sustainable development of the economy, as they represent the crux of the tourism industry. The manager of a hotel is able to successfully make the visitors feel at home, generates important income sources and simultaneously promotes the development of complementary industries (Ming-Horng, Jih-Lian, Yi-Chou and Chung-Lin, 2012). To do so, managers should consider how to attract customers as part of their management strategies, in order to remain competitive in the industry. The way to achieve a competitive sustainable advantage resides in providing a high quality of service which results in satisfied costumers (Shemwell, Yavas and Bilgin, 1998) and customer retention (Callan and Kyndt 2001).

In the literature, there are several studies that assess the service quality, brand image, perceived value and satisfaction, which have been recognized as the antecedents to behavioural intentions (Sumaedi, Bakti and Yarmen, 2012; Ryu, Han and Kim, 2008; Oh, 1999)

In this context, the main objective of this paper is to propose a methodology that allows for the examination of the antecedents and consequences of customer satisfaction, in the hotels in the North of Portugal. We specifically intend to present a conceptual model which aims to assess whether the overall service quality, in conjunction with brand image and perceived value, promotes customer satisfaction, intent to return and recommend services.

In this paper, after a review of the main literature on service quality, customer satisfaction and their behavioural intention, which also gives a brief description of the hospitality industry in the North of Portugal, we propose the conceptual model and research hypotheses, ending with the presentation of the methodology and the contribution of the research.

THEORETICAL BACKGROUND

A brief description of the hospitality industry in Portugal

The government of Portugal considers the hotel industry and tourism as a high-priority sector for the development strategy of the country. Portugal is one of the main tourist destinations in the world, therefore making the tourist sector a strong economic source for the national economy, namely at the level of wealth creation, investment and employment. In addition, the sector also has the function of boosting the development of complementary economic activities and in the same context, contributes significantly to the balance of current accounts which can, and should be expanded according to the National Tourism Strategic Plan of 2013 (Ministry of Economy and Employment, 2013).

It was in the nineteen seventies, when tourism had a strong growth at the international level, that Portugal became interested in the phenomenon of tourism. Notwithstanding, Portugal has had a strong increase in tourism from the 1980's and has maintained a positive growth, as can be verified in Table 1.

Table 1 - Guests and Bednights for 2006-2011 in Portugal (in millions)

Indicators	Years						
	2006	2007	2008	2009	2010	2011	AAGR
Guests	12.4	13.4	13.5	12.9	13.5	14	
Average Annual Growth Rate	-	8.1	0.7	-4.4	4.7	3.7	2.5
Bednights	37.6	39.4	39.2	36.5	37.4	39.6	
AAGR	-	4.8	-0.5	-6.9	2.5	5.9	1.1

Source: Figures compiled based on data from Statistics Portugal

As Table 1 indicates, the number of guests and bednights increased between 2006 and 2011 to an average yearly rate of 2,5% and 1%, respectively.

The principal international source markets of tourism in Portugal, from data of 2011, are the European countries. The United Kingdom is in first place, with a market share of about 16%, followed by Spain, Germany, the Netherlands and France. Two of the countries from the American continent, The USA and Brazil, are in the top 10 of the principal source markets. Brazil has a market share of approximately 3% and the USA of 1,5%. It needs to be mentioned that the national market has a share of 34% (Table 2).

Tourism is a sector which is greatly beneficial to the economy of the country. In Table 3, a gradual increase in revenue is shown, between 2006 and 2011. It is worth stating that, during this period the average annual increase of tourist revenue was 4,3%; business profits only

increased by 2,1% yearly, due to the pressure by tourists because of more choices available to them.

Table 2 - Top 10 Source Markets in 2011

Source Markets	Bednights	Market
Portugal	13499	34.10%
United Kingdom	6268	15.80%
Spain	3470	8.80%
Germany	3388	8.60%
The Netherlands	2003	5.10%
France	1929	4.90%
Brazil	1023	2.60%
Italy	922	2.30%
Ireland	865	2.20%
The USA	613	1.50%

Table 3 - Tourist Revenues and Total Profit - 2006-2011 (in millions of Euros)

Indicators	Years						
	2006	2007	2008	2009	2010	2011	AAGR
Tourist Revenues	6672	7393	7440	6908	7611	8146	
AAGR	-	10.8	0.6	-7.2	10.2	7.0	4.3
Total Profit	1741	1944	1965	1764	1808	1910	
AAGR	-	11.7	1.1	-10.2	2.5	5.6	2.1

Source: Figures compiled based on data from Statistics Portugal

As indicated in table 4, the rates of occupancy and the RevPar decreased during this period and have settled at 52% and 33 €, respectively, in 2011.

Table 4 - Room occupancy rates and RevPar for 2006-2011 (Rates and Euros)

Indicators	Years						
	2006	2007	2008	2009	2010	2011	AAGR
Room occupancy rates	57%	59%	57%	52%	51%	52%	
AAGR	-	2.0	-2.0	-5.0	-1.0	1.0	-1.0

AAGR	-	12.1	0.0	-13.5	0.0	3.1	0.3

Source: Figures compiled based on data from Statistics Portugal

Due to the fact that the Portuguese government believes the hotel industry and tourism represent a high-priority sector for the development of Portugal and, also based on the numbers from tourism, which unequivocally indicate that the hotel industry has shown positive growth during the past years, it is considered that the focus on service quality may

be the indispensable road that will serve as the “trampoline” for its sustainable development, and consequently the Portuguese economy.

Service Quality

Service quality has assumed a major role both in public and private institutions, as an indispensable requirement to client/guest satisfaction. There are two basic ways to define quality: one from the viewpoint of the service provider and the other from the client's perspective. The quality from the customer's perspective is the central objective of this study because it reorients the hotel managers to the customer/guest's needs. Firstly, it should be noted that the measurement of service quality is an important area of academic and scientific interest, which has assumed special prominence after the contribution of various authors (Parasuraman, Zeithaml and Berry 1985). These authors, who represent the American school, have designed an instrument for measuring quality of service, called SERVQUAL. Initially, the proposed model incorporated 10 dimensions of quality (tangibility, reliability, responsiveness, professionalism, courtesy, credibility, security, access, communication and customer understanding). However, these dimensions were revised and subsequently reduced to five (Parasuraman, Zeithaml and Berry 1988). The dimensions of courtesy, credibility, security, competence and communication have led to a new dimension: assurance, while the dimensions of understanding/knowing customers generated the dimension of empathy. A. Parasuraman *et al.* (1988) suggested the following definitions for the five dimensions:

- Tangibles: Physical facilities, equipment and appearance of personnel;
- Reliability: Ability to perform the promised service dependably and accurately;
- Responsiveness: Willingness to help customers and provide prompt service;
- Assurance: Knowledge and courtesy of employees and their ability to inspire trust and confidence;
- Empathy: Caring, individualized attention the firm provides its customers.

SERVQUAL measures service quality from the customer's perspective of customer perceptions, through the amplitude of the discrepancy that exists between the expectations and perceptions of customers. Cronin and Taylor (1992) view that the validity of the use of expectations in the SERVQUAL model was called into question when consumers had no well-formed expectations and developed the SERVPERF scale which consists of the same 22

"items" of SERVQUAL, although centered only in measuring consumer perceptions regarding the quality of service. Despite the criticisms of SERVQUAL (Buttle, 1996; Cronin and Taylor, 1992), it remains the most widely used theoretical framework for measuring the quality of services so that, in the literature there are numerous studies that apply the SERVQUAL scale to assess quality of services across physical (Donnelly, Hull and Will, 2000; Mukherjee and Nath, 2005) and in digital environments (Pinho, Macedo and Monteiro, 2007, Wang and Tang, 2003). Despite the diversity of studies in many fields, in this study, SERVQUAL will be applied to the physical environment of hotels in the North of Portugal in a similar manner as that of other studies realized at an international level, in the area of the hotel industry (Khattab and Aldehayyat, 2011; Oh, 1999).

Customer satisfaction

Customer satisfaction is the outcome of the customer's perception of the value received in a transaction or relationships, where value equals perceived service quality, compared to the value expected from transactions or relationships with competing vendors (Blanchard and Galloway, 1994; Heskett, Sasser and Hart, 1990; Zeithaml, Parasuraman and Berry 1990). According to Gundersen, Heide and Olsson (1996), the crucial point of customer satisfaction is to identify the important attributes, considered by customers as their needs and expectations. As Valdani (2009) points out, enterprises exist because they have a customer to serve. The key to customer satisfaction lies in identifying and anticipating customer needs and especially in being able to satisfy them. Enterprises which are able to rapidly understand and to satisfy customers' needs, make greater profits than those which fail to understand and satisfy them (Barsky and Nash, 2003; Dominici and Guzzo, 2010). In order to be successful, especially in the hotel industry, managers must concentrate on retaining existing customers by implementing effective strategies towards customer satisfaction and loyalty, since the cost of attracting new customers is higher than the cost of retaining existing ones (Dominici and Guzzo, 2010).

Brand image

The concept of brand image has been widely studied by researchers in the area of marketing (Sahin and Baloglu, 2011; Kim and Kim, 2005). For Kim and Kim (2005, p. 549), a "brand symbolizes the essence of the customers' perceptions of the hospitality organizations". In

accordance with Sahin and Baloglu (2011), brand image is defined as the perception of customers about a brand or a product labeled with that brand. Different authors consider brand image as an important component of strong brands (Aaker, 1996; Kapferer, 1997) and a determinant in the obtainment of competitive advantages (Lim and O’Cass, 2001).

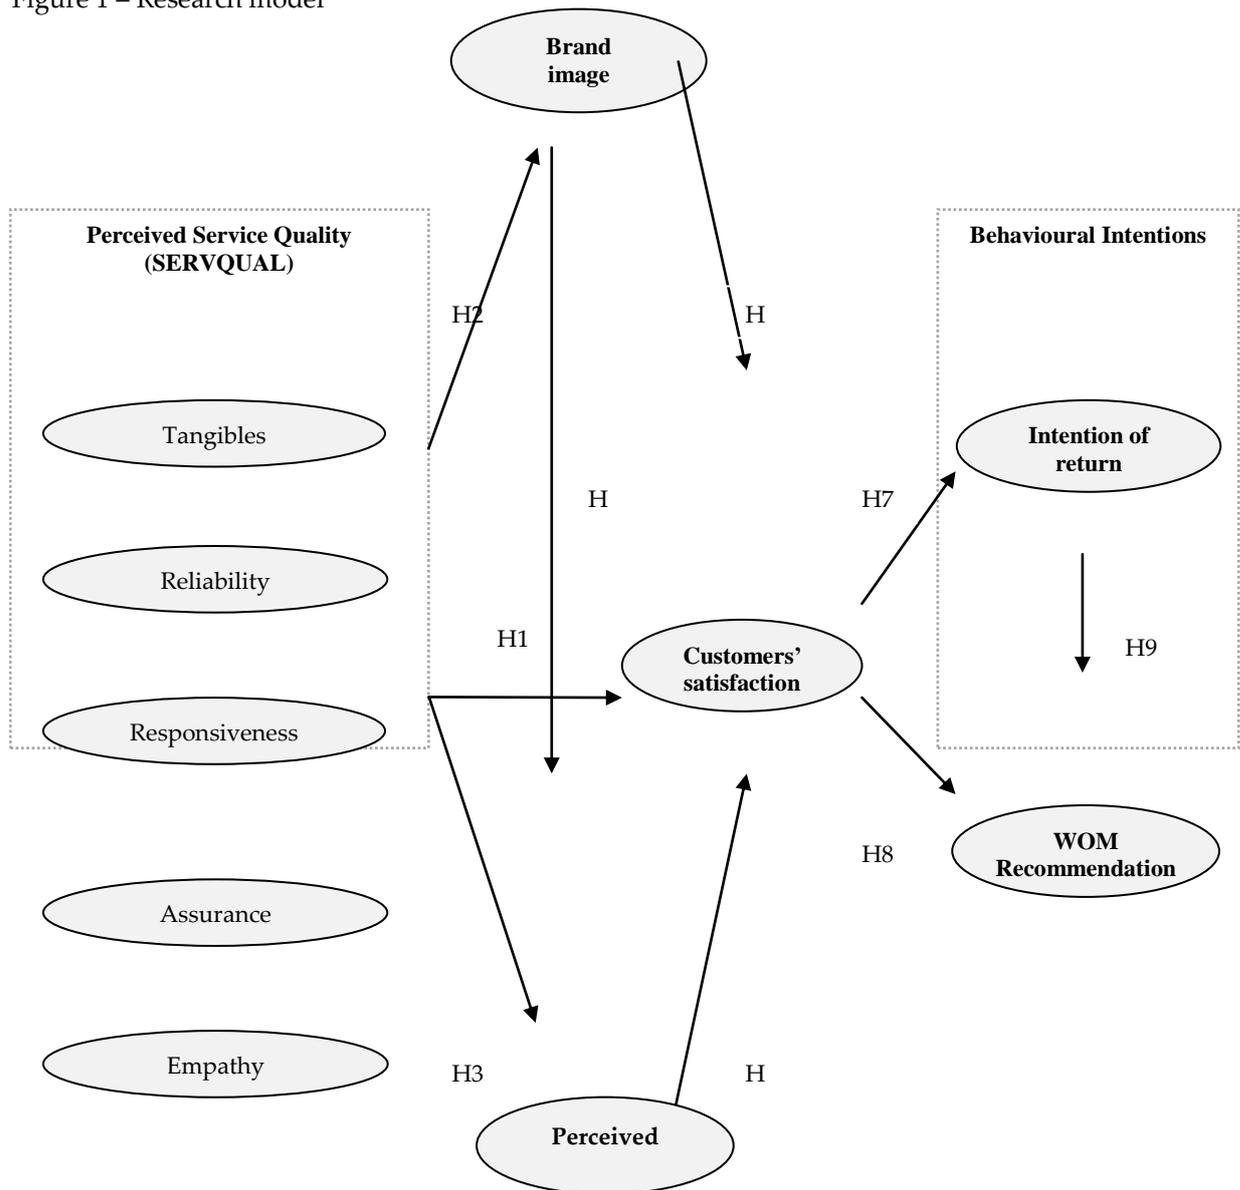

Perceived value

In the area of marketing, value is evaluated in the customer’s perspective (Dodds, 1991). Zeithaml (1988, p. 14) defines customer value (or customer-perceived value) as “the customer’s overall assessment of the utility of a product based on perceptions of what is received and what is given”. For Wang (2010, p. 254), “a customer’s perception of the value received from a service provider could motivate the customer to patronize the provider again”. In the conceptual model proposed by Zeithaml (1988), perceived value is a direct antecedent to the decision to purchase and a variable which directly depends on the perceived quality of service. Oh (1999) develops a model which adds perceived price as a variable antecedent to the perception of value and customer satisfaction, repurchase intentions and WOM recommendation as consequential variables.

Behavioural intentions

The literature suggests behavioural intentions as a construct which permits the evaluation of customer loyalty (Yang and Peterson, 2004). These are behaviours related to the intention to repurchase and even to the intention of recommending the product/service (Zeithaml, Parasuraman and Berry, 1996; Clemes, Gan, Kao and Choong, 2008; Lai and Chen, 2010; Sumaedi *et al.*, 2012). Customers frequently develop an attitude toward purchasing based on a prior service experience or, still, this attitude can also be influenced by previous information, based on the image of the hotel in the market and even by word of mouth (WOM recommendation) (Ryu *et al.*, 2008). In this sense, Chen and Tsai (2007) defined behavioural intentions as the visitor’s judgment about the likeliness to revisit the same destination or the willingness to recommend the destination to others. Based on this definition, behavioural intention in this study may be described as a stated likelihood to return to the hotels in the North of Portugal and to recommend the hotels to family, friends and others in the future.

Figure 1 – Research model

CONCEPTUAL BACKGROUND AND HYPOTHESES

The aim of this study is to, as Figure 1 indicates, propose a model that consists of evaluating the impact of: (1) service quality on customer satisfaction, brand image and customer-perceived value; (2) brand image on customer-perceived value; (3) brand image, customer satisfaction and customer-perceived value on behavioural intentions (intention to return and WOM recommendation) and (4) intention to return on WOM recommendation.

The hotel unit managers should focus their attention on customer/guest service quality evaluation as they must have actual knowledge that the service quality perceived by the client meets their expectations, as contended by Parasuraman *et al.* (1985, 1988). The main

objective of this study is to test the conceptual model shown in Figure 1, which includes four research hypotheses, as explained below.

The relationship between service quality and satisfaction has not been consensual in the literature as several authors argue that, on the one hand, both concepts are identical, while others consider them as distinct (Dabholkar, 1995; Dabholkar, Shepherd and Thorpe., 2000; Oliver, 1993). According to Dabholkar (1995), while evaluation of service quality is essentially cognitive, for its part, satisfaction integrates both cognitive and affective components. This author claims that these two concepts are distinct for recent consumers of a product. However, in the long run, the affective dimension tends to be blurred and to that extent, the concepts tend to overlap. Meanwhile, Ngobo (1999) also reinforces the distinction between perceived quality and satisfaction level of the three dimensions. Assuming that these two concepts are distinct, a question that immediately arises relates to the order of their occurrence in the mind of the consumer and as such, the causal relationship between them. In this regard Dabholkar *et al.* (2000) argue that, most investigators traditionally hold that consumer satisfaction results from a particular consumer's experience of a service which leads to an evaluation / attitude on the overall quality of service over a given period of time (Parasuraman *et al.*, 1988). Recently, however, the reverse situation has stood out as the most relevant. This position is particularly evidenced by Oliver (1993) who suggested that the quality of service should be an antecedent to consumer satisfaction irrespective of the experiential or the time factor. Similarly, Cronin and Taylor (1992) analyzed the effect of these concepts in both directions and concluded that the quality of service perceived exerts a greater impact on customer satisfaction than otherwise. Recently, several authors have considered service quality as an important antecedent to satisfaction (Pinho *et al.*, 2007; Ekinci, Dawes and Massey, 2008; Zhang and Prybutok, 2005; Chiou, Droge and Hanvanich., 2002; Saleh and Ryan, 1991). Most studies assessing the relationship of service quality on customer satisfaction demonstrate the existence of a statistically significant level in studies of the hotel industry.

Moreover, the literature suggests that perceived service quality positively influences perceived brand image (Oh, 1999) and the perceived value (Ryu *et al.*, 2008)

In line with this, and based on SERVQUAL, the following hypotheses are proposed in the present study.

H1: The perceived service quality by the customers has a positive influence on their satisfaction.

H₁₁ – The higher the tangibility, the greater the degree of the customers' satisfaction.

H₁₂ – The higher the reliability, the greater the degree of the customers' satisfaction.

H₁₃ – The higher the assurance, the greater the degree of the customers' satisfaction.

H₁₄ – The higher the responsiveness, the greater the degree of the customers' satisfaction.

H₁₅ – The higher the empathy, the greater the degree of the customers' satisfaction.

H2: The perceived service quality by the customers has a positive influence on perceived brand image.

H3: The perceived service quality by the customers has a positive influence on perceived value.

The study of image has received increasing attention in the literature on marketing (Chen and Tsai, 2007; Ryu *et al.*, 2008; Wu, Yeh and Hsiao, 2011), since it affects the individual's subjective perception (Chen and Tsai, 2007). In the area of hospitality, Ryu *et al.* (2008) confirm that the image of a restaurant positively and significantly influences the perceived value. Thus, this study proposes the following hypothesis:

H4: The brand image perceived by the customers has a positive influence on the perceived value.

The relationship between image and perceived value on customer satisfaction has gained little attention in the hospitality literature (Ryu *et al.*, 2008). These authors have evaluated the impact of the image of a restaurant and perceived value on customer satisfaction and they found a positive and significant relationship between these constructs. In this sense, we intend to propose the following hypotheses:

H5: The perceived brand image by the customers has a positive influence on their satisfaction.

H6: The perceived value by the customers has a positive influence on their satisfaction.

In reviewing the literature, we have found that marketing services have extensively researched behavioural attitudes (Sumaedi, *et al.*, 2012; González *et al.*, 2007; Ryu *et al.*, 2008; Oh, 1999; Dabholkar, 1996; Zeithaml *et al.*, 1996). Several concepts have been examined as antecedent factors to behavioural intentions, such as service quality (Brown, Churchill and Peter, 1993; Zeithaml *et al.*, 1996) and satisfaction (Sumaedi, *et al.*, 2012; Oliver, 1999). According to Liang and Zhang (2011, p. 156), “*it is generally believed that satisfaction leads to repeat purchases and positive WOM recommendations*”, assuming that if customers are satisfied with a product/service, they are more likely to continue to purchase it, and are more willing to spread positive WOM. Thus, we propose our seventh and octave hypotheses:

H7: Customer satisfaction positively influences intention to return.

H8: Customer satisfaction positively influences WOM recommendations.

According to Nadiri and Hussain (2005, p 471), “*service quality promotes customer satisfaction, stimulates intention to return, and encourages recommendations*”. Oh (1999) found a positive and significant relationship between intention to return and WOM recommendations. In this study we intend to uphold the following hypothesis:

H9: Intention to return positively influences WOM recommendations.

METHODOLOGY

A questionnaire will be designed as the survey instrument, which will include all the constructs of the proposed model, and used to investigate the hypotheses of interest. The questions in the questionnaire will be based on a review of the literature in the area of the hotel industry (Table 4).

Table 4 - Measurement scales

Construct	Dimensions (items)	References
Perceived service quality	Tangibles; Reliability; Responsiveness; Assurance; Empathy	Khattab and Aldehayyat (2011)
Brand image	Brand image	Kim and Kim (2005)

Perceived value	Perceived value	Adapted from Ryu <i>et al.</i> (2008)
Customer satisfaction	Customer satisfaction	Khattab and Aldehayyat (2011)
Intention to return	Intention to return	González, Comesaña and Brea (2007)
WOM recommendation	WOM Recommendation	Oh (1999) and Gonçalez et al. (2007)

This study will be applied to customers from a sample of hotels in the North of Portugal during the months of November and December 2013. Data analysis will be conducted using statistical software (version 19) and LISREL (version 8.8). To test the causal relationship between different constructs, we will use the structural equation model, given that the theoretical model includes the complex relationships between latent variables measured with different items that are presented simultaneously as independent and dependent variables.

CONTRIBUTION OF RESEARCH

The customer satisfaction process allows for significantly increased revenue from hotel units by obtaining higher occupancy rates and a better return on investments. With this in mind, the manager needs to know the real customer service needs and expectations, so that the service is tailored to the customer's satisfaction, in order to retain them and attract potential new customers.

Thus, this study proposes to develop and analyze a conceptual model that aims to explain the relationship between the five dimensions of SERVQUAL, brand image, perceived value, customer satisfaction and behavioural intentions (intentions to return and WOM recommendation).

Based on research conducted in bibliographic data bases, we have identified a gap in the literature about the hotels in Portugal, which relates to the knowledge of the factors affecting customer satisfaction and behavioural intention. It is hoped that this research will contribute to the development of the literature, politicians (wealth creation, economic growth, etc.) and managers of hotels (the survival and growth of hotel companies). From a practitioners' point of view, the understanding of the factors that influence customers' satisfaction and behavioural intentions, on the one hand, may contribute to the hotel manager's development when establishing strategies and contribute to the improvement of services

provided by the hotel and consequently increase profit, market share, and improve return on investment (Hackl and Westlund, 2000).

MANAGING INTERNATIONAL BUSINESS CONSTRAINTS THROUGH CORPORATE DIPLOMACY: AN ILLUSTRATIVE CASE STUDY

Monteiro, Rui Manuel¹; Meneses, Raquel²

² Faculty of Economics, University of Porto, Portugal, raquelm@fep.up.pt

ABSTRACT

Globalization has dramatically altered the landscape of international business. Consequently multinational corporations have increased their role, as well as their responsibility, within society thus facing the rising demands of the environment in which they operate, especially when engaging with foreign markets. A growing need has emerged for multinational corporations to be able to respond to this new, wider network of relationships that comprises old and new forms of international business constraints, which increasingly impact the performance of multinational corporations. Thus the question is how corporate diplomacy can be used as a management tool, whereby, if integrated into the overall strategy of the organization, it can help overcome and manage international business constraints that multinational corporations face today when operating abroad. The challenge, therefore, is assessing the ability of corporate diplomacy to build bridges between market and non-market environments, in order for multinational corporations to achieve their goals more efficiently.

Keywords: corporate diplomacy, international business constraints

INTRODUCTION

One of the main areas within international business, since work began in this field has been the study of theoretical frameworks and business practices that can help businesses overcome the intrinsic costs and risks they bear when engaging with foreign markets (cf. Hymer, 1960; Zaheer, 1995). Additionally, internationalisation models that also aim to reduce this problem using different approaches (Johanson & Vahlne 1977, 1990 and 2009; Johanson & Mattsson, 1988; Håkansson & Snehota, 1989; Hadley & Wilson, 2003, Schweizer *et al.*, 2010).

In the meantime studies in diplomacy have been increasingly related to economic issues (*e.g.*, economic diplomacy), and more recently to specific business practices of international firms, corporate diplomacy (Saner *et al.*, 2000; Steger, 2003; Saner & Yiu, 2005; Mulddon Jr., 2005; Sarfati, 2009). These focus on the problems that multinational corporations have to face regarding their relationships with the surrounding environment in which they operate, both market and non-market players, due to the growing impact they have on the actions and subsequently the performance of international business.

The aim of the this paper is to contribute to the literature regarding the application of corporate diplomacy in resolving the problems faced by corporations when engaging with foreign markets, in order to evaluate how this management tool can help international companies overcome, manage and minimize restrictions on conducting business internationally.

LITERATURE REVIEW

International business constraints have two main scopes, liability of foreignness and liability of outsidership. Corporate diplomacy is a recent concept that can help businesses overcome those liabilities when engaging with foreign markets and by doing so, achieve their goals more efficiently.

International business constraints

Hymer's (1960, published 1976) seminal work was responsible for the creation of the modern theory of international operations for large corporations. According to him, firms have additional costs when operating in a foreign market in comparison to local companies (Zaheer, 1995). These are the *costs of doing business abroad*. Thus, foreign firms have location disadvantages *vis-à-vis* local firms, which means that, by default, they have a lower chance of profitability and therefore of survival.

According to Hymer's (1960) theory, it is possible to identify three basic types of costs incurred by a firm operating in a foreign market: first, *costs of acquisition and communication of information in general* (*i.e.*, resulting from differences in culture, language, and the political, economic and legal environment, in addition to travel, transportation and coordination over distances and across different time zones.); second, *costs originating from less favourable*

treatment given by governments of the host country (e.g., protectionist policies); third, costs and risks arising from fluctuations in exchange rates (e.g., monetary policies).

Zaheer (1995), following Hymer's (1960) theory, coined the term *liability of foreignness* (LOF), which arises from costs of doing business abroad, *i.e.*, from the differences in the environment on multiple levels (political, economic, social, cultural, etc.), alongside the challenge of management across physical distances.

One of the most relevant internationalisation theories, that attempts to minimize the risks and costs that companies face in internationalisation processes, is the Uppsala Model (Johanson & Wiedersheim-Paul in 1975; Johanson & Vahlne, 1977, 1990).

This model consists in the firm's increasing involvement in international operations, which progresses via an interaction between, on the one hand, an increase of knowledge about overseas markets and operations and, on the other, a growing commitment of resources to foreign markets. The main goal being to minimize the fundamental factor associated to the internationalisation process: uncertainty (Johanson & Vahlne, 1990).

Strong emphasis is placed on *experiential knowledge* that can only be achieved through experience, which allows firms to perceive the possibilities of present and future endeavours.

According to this model, firms begin the internationalisation process by choosing the markets which they feel closer to in relation to psychological distance, *i.e.*, all the factors inhibiting the flow of information from and to the market such as differences in culture, business practices, education, language, etc. (Johanson & Vahlne, 1977).

The main limitation in the internationalisation process is the lack of knowledge, specifically experiential knowledge, at an international level, that can only be achieved by the firm itself (Johanson & Vahlne, 1977, 1990).

Håkansson & Snehota (1989) change the emphasis; away from the manner the firm assigns and organizes its internal resources, towards the way its own activities and assets relate to those of the other parties constituting its environment. This means that the firm is immersed in its context and therefore its actions are significantly constrained and consequently it is not an entirely independent entity.

The network model of organisation–environment interface is based on the continuous exchange of relationships between a limited number of players (suppliers, competitors and

customer) that create a series of links. As such, the network is a series of relationships between different organisations that, by being connected to each other, are able to share their specific knowledge in a win-win perspective.

The theory of internationalisation in industrial systems using the network approach of Johanson & Mattsson (1988) is based on the fact that the firm is dependent on resources controlled by other firms.

The success of a firm is, therefore, dependent on its relationships with suppliers, distributors, clients, public organisms, etc., alongside other firms. Thus there is an interdependence between the firm and other firms, and several other actors, so it is implicit that firms are mutually benefitted within the network, and therefore the firm uses network contacts to leverage their competitive advantages as well as minimise its costs and risks when engaging with foreign markets (Johanson & Mattsson, 1988).

This means that, when knowledge can flow, the firm gets to know the community and the community gets to know the firm. This is an osmosis process that reflects the increasing importance of the firm to be able to deal with its external environment and all its stakeholders - market and non-market related - because they are, in fact, a central component of business management in the XXI century.

Three basic types of knowledge are needed by firms within this process, according to Eriksson *et al.* (1997): *internationalisation knowledge*, *foreign institutional knowledge* and *foreign business knowledge*, the latter strongly related to the firm internationalisation knowledge, which concerns the understanding of foreign competition, distribution channels, business contacts, customer's needs and sales developments.

In line with network approach research Johanson & Vahlne (2009) revisited their original concept shifting their focus from the market view (Johanson & Vahlne, 1990), to the network view. Thus all aspects related to knowledge, learning, creating, trust and commitment building are now developed in this most recent view.

The authors now claim two main arguments based on the business network view: first, the existence of *liability of outsidership*, stating that markets are relationship networks in which businesses are linked to each other, and as such *insidership* in relevant networks is a precondition to successful internationalization; second, that relationships provide learning,

alongside trust building and commitment, which are indispensable requirements for internationalisation conquests (Johanson & Vahlne, 2009).

In brief, according to the revisited Uppsala Model of Johanson & Vahlne (2009), the contemporary business environment is made up of networks, so it is fundamental for firms to approach the business environment with this new perspective, so the liability is no longer of foreignness but of outsidership, *i.e.*, of not belonging to the network.

According to Schweizer *et al.* (2010) the decision maker, entrepreneur, faces *Knightian uncertainty*, *Marchian goal ambiguity* and *Weickian enactment*, therefore there is a need for the firm be intertwined in a network of relationships, in order to manage all these factors. This is done by engaging in exchange processes, the basis being experiential learning, and in doing so sharing resources, increasing commitments, building trust, etc., in order to reduce its risks and leverage its opportunities, in this case, by becoming international. Basically, *what happens happens in relationships*.

Corporate diplomacy

However it was only with the research carried out at the turn of the century by Saner *et al.* (2000) and Steger (2003) amongst others, who brought new breath into the subject, portraying initial corporate diplomacy, in title of his work, as a *core competency for global companies* and the final corporate diplomacy as *the strategy for a volatile, fragmented business environment*.

Saner *et al.* (2000) state that for international businesses to improve their effectiveness they should develop their own form of diplomacy, as an integrated function inside the organisation.

Corporate diplomacy management is imperative to deal with foreign country expectations, multiple pressure groups and international conflict demand, thus the need to link core businesses and the demanding political environment in which firms operate (Saner *et al.*, 2000).

Therefore Saner and Yiu (2005) describe corporate diplomacy as the management of interfaces between international corporations and their multiple business (clients, investors, employees, unions, etc.) and non-business counterparts (civil society organizations, media, political parties, governments, NGOs, etc.).

Hence corporate diplomacy is a nuclear skill in order to prevent confrontations (Steger, 2003) that will inevitably originate unpredictable losses at multiple levels for the company, as well as ensure a sustainable and long-term favourable external environment in each country where the multinational corporations do business.

In light of the above Steger (2003) characterises a setting where companies operate with *goldfish bowl transparency* where perception is reality and if there is trouble, wherever in the world they operate, this can have a global impact on the entire organization.

Nowadays international businesses need a *licence-to-operate* that is dependent on corporate diplomacy (Steger, 2003).

Steger's more recent research, amongst others (Amann *et al.*, 2007), describes corporate diplomacy as "the attempt to manage the business environment systematically and professionally, to ensure that business is done smoothly, with an unquestioned license to operate and an interaction that leads to mutual adaptation between corporations and society in a sense of coevolution" (p. 34).

Führ & Paixão (2009) portray corporate diplomacy as a process of permanent interaction of the corporation with its external environment pursuing their interests, its main focus being the internationalisation process, through the increasing engagement with foreign markets. The difference between corporate diplomacy and corporate social responsibility is clear. The former's main goal being to advance the business interests of the corporation abroad (viewed as a strategic management tool), and the latter's to apply social, environmental, ethical human rights into the business's operations (viewed as citizenship responsibility).

In this context corporate foreign policy is viewed as a business strategy to manage international stakeholders (Sarfati, 2009), and should be addressed from four basic angles (Sarfati, 2007): market, government, society and information, all of which affect the value chain of the corporation, regarding both primary (*e.g.*, marketing and operations) and support activities (*e.g.*, human resources and infrastructures).

In conclusion, international corporations can no longer rely only on market dimensions, they need to incorporate non-market elements into their overall strategy in order to be able to address the multiple actors that constitute the environment in which they operate and that increasingly affect their performance. Thus the need arises for their own form of diplomacy in

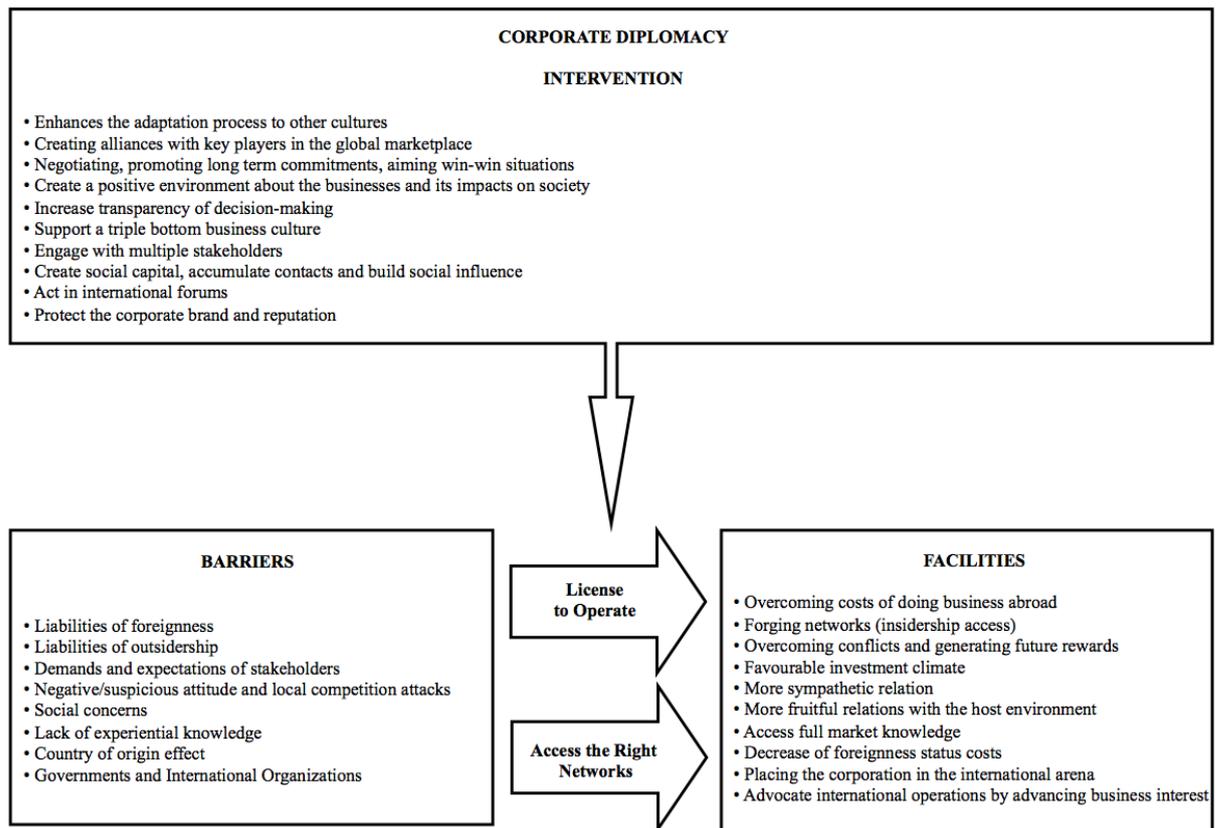

order to manage and overcome the new challenges of doing business in the global marketplace.

International business constraints vis-à-vis corporate diplomacy

Internationalisation can bring benefits to enterprises, but simultaneously generates disadvantages *vis-à-vis* indigenous firms, in the words of Hymer (1960), *costs of doing business abroad*, followed by Zaheer (1995) *liability of foreignness*, *i.e.*, that local firms have more and better access to market information, are more rooted in the local environment and do not face foreign exchange risks, so there is a need to overcome them.

When engaging with foreign markets, in addition to *liability of foreignness*, firms also face *liability of outsidership*. In other words by considering the business environment as networks of relationships there is a need to be within those networks in order to access the knowledge of the foreign environment that the network compiles and shares, and in doing so be more equipped to overcome international business constraints.

Nonetheless changes in the business environment and advances in the theoretical framework of internationalisation models, the evolution from firm view to industry view and more recently to an holistic view which includes the entrepreneur (Johanson & Wiedersheim-Paul, 1975; Johanson & Vahlne, 1977, 1990 e 2009; Johanson & Mattsson, 1988; Håkansson & Snehota, 1989; Hadley & Wilson, 2003; Schweizer *et al.*, 2010), together with business practices associated to the internationalisation processes, one constant remains, which is the need to cope with the foreign environment.

Today goes further beyond market-related interactions (customers, suppliers, competitors, etc.), and is increasingly more concerned with non-market interactions (local communities, pressure groups, trade associations, media, etc.), which indicates the need for a greater emphasis on relationships where corporate diplomacy can play a major role in helping companies overcome the identified international businesses constraints.

As you can see in Figure 1, corporate diplomacy focuses on the barriers (ex: country of origin effect, demands and expectations of stakeholders, social concerns, etc.) that firms face when engaging with foreign markets through the use of different tools that can help them overcome the intrinsic international business constraints of doing business abroad.

METHODOLOGICAL CONSIDERATIONS

However the related literature review and several concepts regarding the subject are not suitable to achieve the goals purposed by this paper. Hence there is the need for an exploratory study using a qualitative methodology, through a case study, in order to comprehend and explain the complex social process that is corporate diplomacy.

Therefore the primary source of information was a semi-structured personal interview (Rebelo, 2013), in the form of a non-intrusive questionnaire. The aim of which was to obtain information about the relevance of corporate diplomacy in the international business environment where the business operates, alongside corporate reports, media information, etc., in order to extend the data available, and consequently triangulating, which ensures the quality of the data and all the information. It's all about the case that best helps to understand the problem and the research question framed and that aims to raise questions and opinions of the participants (Creswell, 2010).

This tool enables the gathering of rich empirical data when the phenomena studied is not a standardized practice that can be evaluated by a given number of pre-established variables. Thus it aims to promote a narrative regarding the subject (Eisenhardt & Graebner, 2007), becoming a relatively spontaneous lecture, an expression of what the subject lived, in relation to something (Bardin, 2009).

One of the features of qualitative research is that it allows and is the best way to examine a real-life context, especially when the boundaries between phenomenon and context are not yet clear. Here the data collected should not be recorded in a narrative-writing approach but in a note-taking approach, *i.e.*, should be organised around the central subjects with data elements and not in random narratives (Yin, 1981).

The two main reasons for selecting this firm were, firstly, the basic condition of being international, and secondly, due to its sector, pharmaceutical, following one of the few empirical studies related to this field - Saner and Yiu (2005) about the largest Swiss Pharmaceutical and Agro-Industrial companies (ex: Roche and Novartis) - given the potential wide range of multiple stakeholders and thus the benefits of the practice of corporate diplomacy.

The connections that could be perceived, given the sector in case, where to: governments (national and foreign), governmental bodies (ex: health ministers, patent registration), regulators (ex: drug administration's), networks (corporate and institutional), international agencies (ex: World Health Organization), non-governmental organizations (ex: consumer rights), activists (ex: regarding test protocols), etc.

CASE STUDY - BLUEPHARMA

Bluepharma is located in the city of Coimbra (Portugal), and started activity in 2001. It began following the acquisition, by a group of professionals connected to the sector, of a former industrial unity belonging to the German multinational Bayer, after the decision to close its operations in Portugal. At the time the unit was responsible for the production of aspirin (Bluepharma, 2013).

Coimbra is very important to Bluepharma as it is also home to the University of Coimbra (with more than 7 centuries of history). The University represents a strategic asset to the company due to its source of knowledge (ex: research centres) and the capability to educate highly qualified professionals related to the area (Bluepharma, 2013).

Bluepharma's mission consists in offering high quality pharmaceutical products at competitive prices, to improve the quality of life of the population alongside diminishing the external deficit of the country in this sector (Bluepharma, 2013)

The company's has 3 main business areas: producing pharmaceutical drugs for their own and other companies, research and development alongside registration of pharmaceutical drugs and marketing of generic pharmaceuticals (Bluepharma, 2013).

Bluepharma's work has been increasingly acknowledged at an international level with multiple awards (ex: INSEAD Entrepreneurship Award for 2011/2012) and recognitions (ex: FDA approval in 2009) (Bluepharma, 2013), which explains its growing international presence, covering all world continents, opening this year its first branch in Mozambique (Santos, 2012).

To date it deals with 30 countries, chiefly in Europe, United States of America, Southeast Asia and Latin America, with foreign markets representing approximately 70% of its total sales, with around 60 products currently on the shelf (Rebelo, 2012b).

Following the research conducted, the main players in the Bluepharma's stakeholders universe were identified, both at an internal (national) and external level (foreign). At an internal level were the networks, governmental bodies and the community. The first related to their business strategy, the second to their sector and the third to their origin/location. At an external level was the perception of the country, by international players, of the sector's capability - beyond the existent industry *per se* (production) - of in-house resources regarding technology, knowledge and human resources.

At an external level the international business constraints faced by Bluepharma were related to the foreign perception of the country's abilities regarding the pharmaceutical sector as a whole, beyond the production capability, regarding three main pillars: technology, knowledge and human resources.

One can consider three vectors in this process of engagement with international markets: presence in international forums (ex: international specialised trade fairs), communicating (ex: publishing newsletters) and operating through the group sector (ex: cluster dynamic), where the key bottom-line is to be obtain a reputation following the work that was accomplished throughout the years.

By covering all these angles the firm was able to, among other things:

- forge networks (insidership access), therefore overcoming liabilities of outsidership;
- reverse the country of origin effect (foreign perception), opening new windows of opportunities besides *production per se* (ex: R&D projects);
- create alliances with key players in the global marketplace, and thus access key market knowledge (marketing intelligence), effective experiential knowledge and promote long-term commitments aiming for win-win solutions;
- strengthen the corporate brand, aiming to gain increasing international recognition for their entire range of expertise (eg.: registration of pharmaceutical drugs), alongside overcoming suspicious and negative attitudes due to being a newcomer in the international marketplace;
- become a player in the international arena, by participating in international organisations and forums, advocating their business interests.

At an internal level, it is very clear that networks lie at the heart of its business strategy and development through, among others institutional (eg.: University of Coimbra) and corporate associations (eg.: COTEC, Portugal Ventures). In the words of Bluepharma founder and CEO, Paulo Barradas, today's success does not lie in the secrecy but in sharing (Rebelo, 2012a).

Another form of network also indentified, and very important to ensure continuous innovation, crucial to the business' survival, is through the creation of new international business ventures, that mainly originate academic spin-offs (ex: Luzitin), by providing capital and know-how to them. Despite being small enterprises they have strong potential due to the

fact that they are highly knowledge intensive their main goal being to break new frontiers in the field that could have global market potential.

The second national stakeholder identified was governmental bodies, namely AICEP (Portugal Global - Trade & Investment Agency), the main goals of which are to capture foreign investment and promote companies abroad in their internationalisation processes or export activities. This is carried out namely through participation in state trade missions (which involves another group of stakeholders, government, usually foreign/economic Ministers alongside the Prime-Minister and the President), participation in international fairs and by providing marketing intelligence about foreign markets (AICEP, 2013).

Regarding this actor, the involvement of Bluepharma can be considered exhaustive, with participation in regular initiatives abroad promoting the sector in case. This is highly regarded by the organisation, due to involvement of a board member, responsible for internationalisation processes, supported by a specific division of the firm for this purpose: business development.

This enables the organisation to be in the front line of the efforts to promote the national economy, and in this case, the pharmaceutical sector in particular, by promoting private businesses in overseas markets (ex: Venezuela, in 2009, alongside other firms, headed by the Prime-Minister). As can be seen clearly there is a positive endgame as the success of the corporations will have a positive impact on the country's economy (ex: through more taxes, diminishing the trade balance deficit by increasing exports, etc.).

The third internal stakeholder identified was the community, and the reason for that lies in the origin of Bluepharma, Bayer's decision to close down its operations in Portugal. In doing so it would strongly impact three areas: employment, knowledge and market accessibility.

Regarding employment, it was possible to keep the operation firstly then to increase it after a few years, thus preventing hundreds of skilled labourers from losing their jobs. This is especially significant in a country that has witnessed their industrial base being wiped out in recent years, as the globalisation of production has provided a cheaper and skilled work force in other parts of the world.

Concerning knowledge, it was possible to build a bridge between the academic (University of Coimbra) and the economy (Bluepharma), by taking advantage of all the investment made in highly skilled labour (ex: pharmacists, researchers, etc.). Therefore it was able to leverage all

those assets, and not lose them through, for example, emigration processes, *i.e.*, brain drain, a negative force that also affects the country's economy and development.

In relation to market accessibility, the fact that in-country-production of drugs, and namely of generics, was possible became a strategic guideline of Bluepharma. Through price it was able to provide wider access to medicines, and therefore benefit the community as a whole, especially in a market where price has increasingly been a crucial factor in the population's access to health care in recent years, due to the economic downturn, alongside the effect of the aging population, especially in the western hemisphere.

Given the sector in case (pharmaceutical), the importance of the stakeholder *government* is crucial. They define the rules of the game within the marketplace (heavily regulated), where a single comma in a decree can make or break a market, as acknowledged by the CEO of Bluepharma (source), hence the perceived strong relations of this specific player.

Consequently, in order to avoid being viewed as lobbying or positive discrimination, there was a clear and strong detachment of any kind of relation in this context, and even tough criticisms of businesses that rely on government and government officials in order to prevail in the marketplace.

That said and acknowledged, it's clear however that all those in this sector need to have strong, good and continued links to this specific stakeholder. Despite not being in the value chain of the business, it has a very strong impact in the performance of the organisation - regardless of the intrinsic competitive advantages of the firm, *i.e.*, price, quality and capability to address market demand that must exist upstream - and thus the importance of the practice of corporate diplomacy, not as a *bottom-line* management tool but as a *support* management tool.

CONCLUSION

Nevertheless the main finding, that undoubtedly stands out within the research conducted, *i.e.*, the identification and importance of the main stakeholders of the firm (networks, governmental bodies and the community, alongside government), was the reaction to the concept, and above all, the praxis of corporate diplomacy, and by default the acknowledgment of the importance of the multiple stakeholders in the operations/results of the firm. It was, at first, very much defensive.

The perspective, of this reaction, was one of recognition of the existence and importance of engaging with all the various stakeholders, however that this is not the core of the firm's strategy and much less the reason for the success of the business. This is due to its internal competences (in the case in question stated as strong leadership, response to market needs, competitiveness and quality), viewing thus corporate diplomacy as a way to enhance these sustainable competitive advantages and never as a way to build upon them.

That said, there is a significant need, in the case in question, for the firm to clearly detach itself, in a first approach, from the relevance/impact of stakeholders, specially the non-market related, because the corporations image could be viewed very negatively in two distinctive ways: firstly, that the firm relies on the ability to engage with stakeholders (eg.: governments), which in turn enables it to make business; secondly: that the firm is affected by the action of stakeholders, that they interfere in their operations and subsequently in their results, *i.e.*, that the firm is dependent on external actors.

It is clear, in our view, that in reality all firms promote engagement with multiple stakeholders, that have more or less impact in the organisation's life, from governments (ex: law making) to the media (ex: good press). This assumption must be, on the one hand naturally acknowledged, following the 21st century intricate economic international environment, and on the other hand, be addressed professionally, *i.e.*, through the praxis of corporate diplomacy as an management skill, among many others, that integrated into the corporation's strategy enables it to be more efficient in achieving its goals.

The practice of corporate diplomacy clearly implies that there is a business, and that the business has core competences that enable it to be a player in the global marketplace. Thus the praxis of corporate diplomacy must be viewed as one, among others, management competence that an international corporation must possess in order to achieve, more efficiently, its full potential in the global economy, by engaging with all multiple stakeholders, market and, increasingly, non-market related, that have the potential to affect the organization bottom-line, in open and transparent relations. It is more damaging to try to minimise this context than by acknowledging it

As this a single case study, no inferences can be drawn from it, so there's a need to address several cases over several sectors, supported by a confirmatory study.

However more than derive generalisations, various viewpoints for analysis and a first analysis network relating 2 theories, that until now had remained separate, arise. (corporate

diplomacy vs international business constraints). Thus corporate diplomacy can be understood to be a very useful tool for companies to overcome certain obstacles in the internationalisation process. This is the main development that needs to be looked into deeper, in the future.

THE MANAGING AND STAGING OF FOOTBALL MATCHES IN THE ENGLISH PROFESSIONAL FOOTBALL INDUSTRY: AN EVENT LIFECYCLE APPROACH

Moore, Neil¹; Stokes, Peter²

¹University of Chester, UK, n.moore@chester.ac.uk

²Professor, University of Chester, UK, p.stokes@chester.ac.uk

ABSTRACT

Purpose: Although the English professional football industry has attracted considerable academic interest in relation to the tragedies and disasters which occurred at matches during the twentieth century, the bulk of this work has focused on the historical, social and economic factors which contributed to these events. As result a clear and coherent picture of the current state of event management practices in the industry is underdeveloped. This represents an important lacunae not least because of the identified health and safety issues but also for the effective and efficient development of the professional nature of English professional football. Such a model will be valuable for a range of stakeholders: stadium managers, security stewards, police authorities and not least fans and players. This paper aims to produce a clearer understanding of football match event management practices by developing and applying a Football Match Event Lifecycle Model.

Design/methodology/approach: This paper adopts an interpretivistic approach to generate primary field data which complements secondary data drawn from relevant literatures to produce and develop a Football Match Event Lifecycle Model. Primary data gathered from semi-structured interviews and non-participant observation is used to develop the model.

Findings: The results indicate that the Football Match Event Lifecycle Model is a potentially useful model and provides a valuable insight into the key processes involved in staging football matches. Moreover, it is an effective evaluative framework to explore and assess contemporary football event management issues.

Originality: This paper initiates the process of addressing an under-developed area in football event management. It develops a football event lifecycle model which

explores the processes and issues involved in the staging of English professional football matches.

Keywords: events management, football match event lifecycle model, planning, organizing, controlling, monitoring, evaluation, feedback and leadership

INTRODUCTION

A substantial amount of the work relating to the staging of English professional football matches focuses upon the dramatic, tragic and poignant disasters that occurred in the industry during the twentieth century. During this period thousands of supporters were injured and over 270 people died in stadium disasters in Britain (Inglis, 1987; Johnes, 2004; Walker, 2005; Smith and Elliott, 2006). The response of key stakeholders, governments, governing bodies, football clubs and supporters, was one of slow progress and relative inaction and consequently the staging of football matches remained unchanged for much of the twentieth century. As a consequence, event management practices were severely underdeveloped. A point emphasized by Gratton and Henry (2001: 67) who, when analysing the Hillsborough tragedy, described it as '...a failure in the stadium event system.' Given this observation it is surprising that scholarly activity in this area has not generated a comprehensive insight into the management practices required before, after and during the staging of a football match. At best works have produced only a fragmented picture.

In summary, although particular stadium management issues have attracted considerable academic interest, works have been focused upon the tragedies which befell the industry during the twentieth century. Analysis of the historical, social and economic factors which contributed to these events has been extensive; however, a clear and coherent picture of the current state of event management practices in the English professional football industry is missing. This paper aims to clarify the current state of football match event management practices by firstly developing, and then applying, a Football Match Event Lifecycle Model. The intention is to respond to an undeveloped space in football event management literature. The argument below aims to explore and contextualise materials that will work to provide information for a range of officials involved in the planning and managing football events.

LITERATURE REVIEW

The literature pertaining to the staging of football matches is dominated by accounts of the crises and disasters that occurred during the twentieth century. However, it was the tragic deaths of ninety-six Liverpool supporters in 1989 at the Hillsborough Stadium, and the subsequent Taylor Report, that acted as a catalyst for change. The requirement for all-seated accommodation in the top two divisions resulted in a large scale programme of building works (Elliott *et al.* 1999:20-21). Money diverted from the levy on the football pools was made available to the Football Trust, which in turn channelled the funds to clubs to facilitate stadium redevelopment (Ford and Heatley, 1994: 21). Johnes (2004: 144) estimated that over the period 1990-97 the rebuilding of football stadia in England, Wales and Scotland cost £500 million, £150 million of which was provided by the Football Trust.

Despite significant tangible evidence of change, Elliott and Smith (1999: 101) advise caution when attempting to assess the full extent to which clubs had progressed. They explored safety issues and crowd management in the early post-Taylor period and concluded that ‘...the football industry in the UK has learnt little from the disasters that occurred during the latter part of the 1980s and beyond.’ Here the inference is that football clubs have continued to miss opportunities to develop their event management practices. This is an interesting, if not contentious, comment given that since the recommendations of Taylor Report were implemented the English football industry has not witnessed any form of disaster approaching the scale of Hillsborough. Clearly, this could be due to good fortune; however, because a coherent picture of the true state of event management practices within the industry is lacking Elliott and Smith’s claim cannot be accurately assessed. Before moving on to explore contemporary event management practices it is necessary to briefly consider key aspects of the event management literature.

Event Management Literature

Although the practice of sport event management dates back to the ancient civilisations of Egypt, Greece and Rome, progress towards establishing the activity as a fully-fledged management function has been very slow (Elliot and Smith, 1993; Korstanje, 2009). Consequently the planning and implementation of events draws upon other, more well established management disciplines (see Masterman 2004; and Van Der Wagen 2007; Bowdin *et al.* 2010). In the remainder of this section the key contributions of Project Management, Service Operations Management and Logistics Management are considered.

Project Management

The field of project management has begun to emerge as an effective contributor to the management of events. This is emphasised by Van Der Wagen (2007: 193) who suggests that as events management matures it is increasingly adopting sophisticated project management techniques. Likewise, Emery (2003: 277) suggests that '...events management draws heavily upon the more well-developed discipline of project management'. Wild (2002: 257) explores this point further and argues that it is perhaps to be anticipated that there is a resonance between event and project management because 'An event is a project, since it is a finite activity in terms of the time spent in its duration and in the use of resources.'

According to O'Toole and Mikolaitis (2002:23) adopting a project management perspective when staging an event is advantageous because it offers a systematic approach that makes the management of the event explicit and encourages stakeholder accountability. However, on a more cautionary note, Bowdin *et al.* (2010: 285) argue that, traditionally, project management techniques are dependent upon clearly defined, stable environments and consequently they may be unsuitable for some types of events where there is a high degree of uncertainty and complexity (e.g. festivals). To remedy this problem they advocate avoiding management inertia by having a flexible project management approach with limited procedures and formality.

Emery (2003:277-79) also recognises the unique challenges posed by events management. His work focuses on sports events and he emphasises that in this context event management '...can be clearly viewed as a specialist type of project management, albeit a particularly complex one.' Emery synthesised his observations into the Life-Cycle Events Model shown in Figure 1.

Figure 1: Life Cycle Stages and Core Management Processes of Major Sports Events

STAGES	1) PRE-EVENT			2) EVENT	3) POST-EVENT	
SUB-STAGES	A) Ideas & Feasibility	B) Bidding Process	C) Detailed Planning & Preparation	A) Implementation	A) Clear Away	B) Feedback
CORE MANAGEMENT PROCESSES	<p>The diagram illustrates the core management processes across the event lifecycle. It features four horizontal rows of processes, each with arrows indicating their duration:</p> <ul style="list-style-type: none"> Planning: A solid arrow points left from the start of the Pre-Event stage, and a dashed arrow points right from the end of the Pre-Event stage to the end of the Event stage. Organisation: A solid arrow points left from the start of the Pre-Event stage, and a dashed arrow points right from the end of the Pre-Event stage to the end of the Post-Event stage. Leading: A solid arrow points left from the start of the Pre-Event stage, and another solid arrow points right from the end of the Post-Event stage. Evaluation: A solid arrow points left from the start of the Pre-Event stage, labeled "(Formative)". A solid arrow points right from the end of the Post-Event stage, labeled "(Summative)". 					
TIME LINE						

(Source: Emery, 2003: 279)

Key: ← Start of Management Activity → End of Management Activity
 Management Application

In keeping with mainstream project management approaches Emery’s model depicts the process as a lifecycle. He segments events management activities into three discrete phases – pre-event, event and post event. In addition he also incorporates the generic management

processes of planning, organising, leading and evaluation. Clearly, Emery's framework has value in describing and analysing the life-cycle which a 'one off' event passes through over time. However, in the context of staging a football match the model has elements which are of little or no relevance. For example, for a football match the Pre-Event stage would not include the 'ideas and feasibility' and the 'bidding process' elements. A further weakness of the model is that it does not adequately capture the importance that feedback has in informing all phases of the next match. In essence, Emery's model does not capture the repetition involved in the process and does not emphasise the importance of feedback.

Service Operations Management

From the Service Operations Management perspective the event organisation is seen as a system that transforms inputs (i.e. resources) into an output (i.e. the event) (Tum *et al.* 2006: 19). Organisational success is directly linked to the efficiency and effectiveness of the transformation process (Yeomen *et al.* 2004: 28). In keeping with this approach Slack *et al.* (2009: 27) suggest that resources can be classified as either transformed resources or transforming resources. The former are the resources that are treated or converted in some way and the latter are the facilities (buildings, equipment, plant and technology) and staff (operatives, supervisors and managers) who maintain the operation.

In the context of football, clubs use transforming resources, such as the stadium and players, to produce an output, the match, and as a consequence of this process the emotions (i.e. physiological aspects) of supporters are changed. The aim of the football club is to utilise transforming resources to deliver the event experience in the most effective and efficient way possible.

Logistics Management

Some theorists advocate adopting a logistics approach when planning and staging events. For example, Bowdin *et al.* (2010: 353), highlight that logistics has become a specialised area in mainstream management studies and that the discipline has a valuable contribution to make to the practice of events management. They go on to emphasise the complexity of staging an event and argue that the traditional approach to logistics management requires adaptation when applied in an event management context. Viewed from this perspective the organisation delivering the event is responsible for supplying the customer (i.e. engaging in effective marketing, providing tickets, managing entry and exit to the venue etc), supplying

the product (i.e. ensuring that key staff – performers, players, officials – attend) and supplying the venue (i.e. ensuring that it is fit for purpose) (Bowdin *et al.* 2010: 359-60).

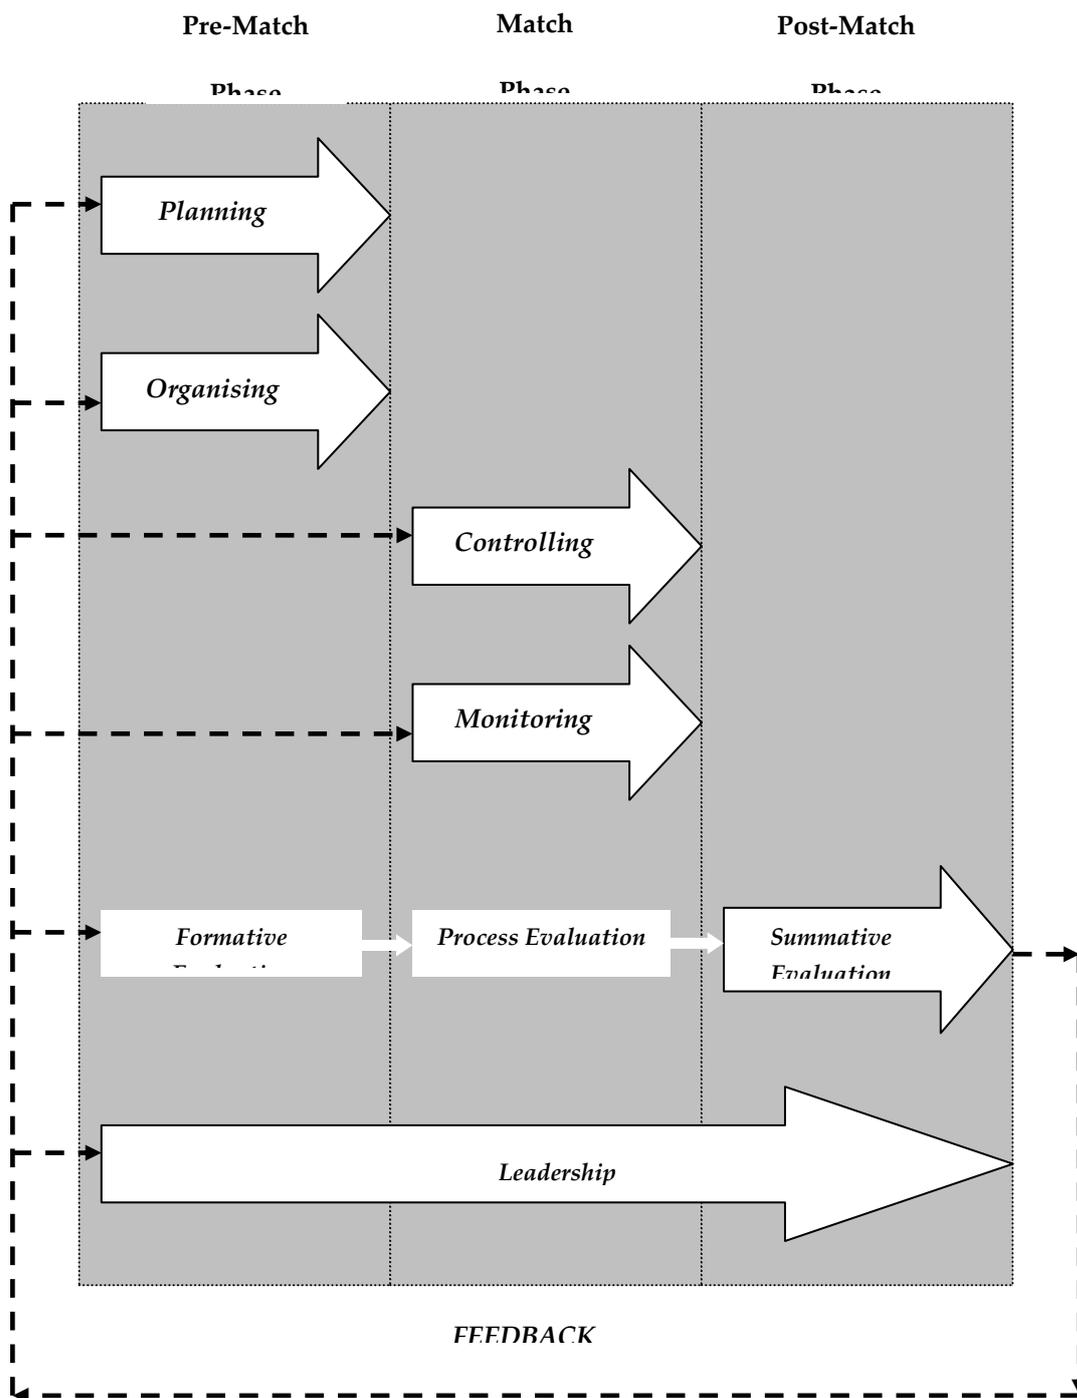

Westerbeek (2005: 196-97) concurs with this and goes on to comment that:

‘In the event management scenario this [the logistics approach] involves establishing coordinated systems, which ideally permit effective and efficient flows of people, information and other resources around the event venue...The ultimate aim must always be to create a safe secure environment for all..’

In summary, three perspectives on the management of events have been considered. From the project management perspective the event is seen to progress through a series of stages and key management activities are ascribed to each phase. The service operations approach emphasises that organisations are engaged in the transformation of inputs into outputs. In the context of sports events this involves using ‘transforming resources’, such as the stadium and players, to influence the emotions of supporters. The emphasis is on providing an experience. The logistics approach focuses upon the movement, or flow, of resources to, from and around the event venue. A key element of the approach is the management of safety and other forms of risk.

Although each approach has some value in helping to develop understanding of how a football match should be staged it is important to note that none of perspectives adequately capture the fundamental characteristic of staging an event of this type. Namely that a football match is both a single event and one of a series of very similar events for which standard procedures and processes can be put in place. In order to address this gap the remainder of this section draws upon these theoretical perspectives and synthesises them in order to develop a Football Match Event Lifecycle Model.

Figure 2: The Football Match Event Lifecycle Model

This model encompasses the key elements involved in staging a football match. It is valuable on two counts. Firstly, it clearly shows the interrelationship between the key management functions of pre-match, match and post-match operations. Secondly, because the model is depicted as a lifecycle which relies upon on-going evaluation and feedback, it emphasises that football matches are repeat events which provide clubs with an opportunity to refine and develop their event management operations. In the following sections the model is deconstructed and each phase is, and its associated management functions are, discussed.

Pre-Match Day Phase

The key management activities that take place during this phase are planning and organising. The importance of these functions is highlighted by Van Der Wagen (2007: 181), who comments that '...planning and organisation are the key elements that determine the success of an event.'

Planning

A number of theorists emphasise that planning is the bedrock on which successful event management is established. For example, Emery (2003: 271) argues that '...planning pervades all aspects of event management'. Tum *et al.* (2006: 25) insist that

'Detailed planning must take place prior to the implementation of the event. No event should take place without planning. If plans are made in advance and communicated well, then the event will be effective and efficient in its delivery. The greater the amount of time taken at this stage the better the event will be.'

The notion that time is an important aspect of planning activity is also highlighted by Van Der Wagen (2007:196), who observes that 'The nature of the event business is that most of the time is spent in planning and very little is spent in the execution phase.' In order to meet the challenge of successfully delivering an event in a timely and efficient manner planning activity must result in the formulation of written plans. Such plans are evidenced in a number of areas.

For example, Bowdin *et al.* (2010: 376) advocate that operational plans, which incorporate contact lists, site maps, running orders, evaluation sheets and emergency plans should be produced and issued to all of those working at an event in the form of an Event Manual. In the case of the Emergency Plan they argue that that this should be compiled from major incident and disaster plans and that procedures, demarcation of duties and the allocation of responsibilities should be agreed in writing with all relevant parties (emergency services, venue managers etc.) during the planning stage. Tum *et al.* (2006: 160) also focus upon the need for effective contingency plans and emergency planning. They argue that these should be integrated plans of action that are communicated to all those involved in staging the event.

Organising

Watt (1992: 25) suggests that organising involves

'The activities to be accomplished towards achieving the end objectives; the gathering together of these activities into relevant structures; and allocating the achievement of objectives, through these activities, to the appropriate groups or individuals.'

Here organising is shown to be the activity that structures and coordinates organisational effort. It is inextricably linked to planning and is necessary if plans are to be implemented (Westerbeek, 2005: 34). However, given the importance of this activity it is surprising that, according to Torkildsen (2010: 479), many event organisations are deficient in their ability to organise. He comments

'Unfortunately with many event organisations, the structures are poor and without coordination. The result is that informal dealings flourish...misunderstandings and miscommunications abound leaving many parts of the planning process to flounder.'

Match Day Phase

This is the implementation, or delivery, phase of the event. From a managerial perspective the focus here is monitoring and controlling the plans and organisational activity developed in the pre-match stage.

Controlling

Tum *et al.* (2006: 242) suggest that control is vital to successful events management because it '...keeps plans in line'. Cole and Kelly (2011: 225) directly link control to planning and organising. They comment

'If planning represented the route map for a journey, then organising represented the means by which one could arrive at the chosen destination. We can now add that controlling ensures that the travellers know how well they are progressing along the route, how correct their map is, and what deviations, if any, they need to make to stay on course.'

Cole and Kelly's comments offer an interesting perspective on the control of an event. The analogy that controlling is a vital part of progressing through a journey is congruent with the logistics approach to event management. Effective control is a vital element of this process. For instance control mechanisms, such as queue management systems and security procedures (e.g. accreditation passes for events staff to control access to sensitive areas of the event) are essential elements of an organisation's risk management strategy. Bowdin *et al.*

(2010: 298) also advocate a range of additional control methods, including reports and meeting, project status reports and delegation. Tum *et al.* (2006: 243) offer a similar perspective, but in keeping with Bowdin *et al.*'s advocacy of delegation, argue that events staff should be empowered so that '...control is exercised by each person at the lowest level possible' and consequently 'The event is then within the remit and authority of the staff responsible for it.'

Monitoring

Closely allied to the activity of controlling is monitoring. Bowdin *et al.* (2010: 414) suggest that 'Monitoring is the process of tracking an event through the various stages of implementation.' Here the emphasis is on evaluating the progress of different aspects of the event in order to make corrections if planned objectives are not being met (Westerbeek, 2005: 36). For instance, in the context of a sports event, monitoring may take the form of tracking the progress of supporters to and from the venue. Use of modern technology, such as closed circuit television, enables event organisers to quickly identify potential problems that may hinder the movement of supporters (e.g. traffic congestion). Early detection facilitates the use of appropriate control mechanisms, such as contingency plans.

Post-Match Day Phase

This phase begins after spectators have left the venue and clear away activities are completed. The primary focus of this stage of the lifecycle is effective evaluation. The Football Match Event Lifecycle Model shows that evaluation occurs at each stage of the event process; however, it is during the post-match phase that formative and process evaluation are synthesised with summative evaluation in order to generate feedback. This is then utilised to inform the staging of future events. Evaluation and feedback are very closely linked, consequently in this section both elements are considered together.

Evaluation and Feedback

According to Tum *et al.* (2006: 239) 'Evaluation gives event organisers the opportunity to look back on what has happened during the event, correct all that may not have gone as planned and build on what went right.' In terms of the timing of evaluation Tum *et al.* (2006: 241) observe that '...it is most common for evaluation to occur after the event.' However, they go on to suggest that to be effective evaluation must encompass all aspects of the event. This is congruent with the view of Torkildsen (2010) who advocates ongoing evaluation which is

present at each phase of the event lifecycle. Getz (2012: 363) develops this further and suggests that event organisers should institute three types of evaluation. He suggests that during the pre-event stage formative evaluation should be used to inform the later phases of the event. During the implementation, or delivery stage, he advocates process evaluation. This is derived from the monitoring of activities during this phase. Finally, he emphasises that in the post-event phase summative evaluation is necessary in order to gain an understanding of the overall success, or otherwise, of the event. Indeed, Bowdin *et al.* (2010: 371) explain that an event is not over until summative evaluation is complete.

In order to engage in meaningful evaluation feedback has to be gleaned from key stakeholders throughout the lifecycle of the event (Masterman, 2004: 83). Moreover, Westerbeek (2005: 42) argues that those events organisations which regard themselves as being engaged in continuous improvement must interpret feedback constructively in order to progress and develop.

Leadership

Leadership is the generic management activity that spans all phases of the model. In the context of events management effective leadership is regarded as being an essential success factor and involves integrating the needs of the individuals and teams operating within the organisation, with the specific requirements of the event (Westerbeek, 2005: 34; Bowdin *et al.* 2010: 34). Here the focus is upon developing a unity of purpose and ensuring that teams and individuals function effectively in order to achieve the tasks that make up the event lifecycle. The successful leader aims to achieve the best possible fit between available resources and the objectives of the event.

In summary, given the absence of a comprehensive evaluation of event management practices associated with staging contemporary football matches, extant event management, and associated, literature has been used to develop The Football Match Event Lifecycle Model. In the section following on from the Methodology the model is evaluated using primary data gathered from semi-structured interviews and non-participant observations.

METHODOLOGY

The research adopted an interpretivistic approach that utilized in-depth semi-structured interviews and non-participant observation. Interview data were gathered from four senior

key informants working in the English professional football industry (two Stadium Managers, a Local Authority Licensing Official and the Managing Director of a Sport and Leisure Risk Management Company). The sample was small, in part, due to access issues. Gaining access within English senior professional football contexts is notoriously difficult. This is due to the celebrity aspect of contemporary football and the fact that clubs are solicited by many approaches and offers to engage with them in a range of ways. Clearly, this will have implications for the possibility of generalizing extensively from the findings. Therefore, the intention here is to provide a focal study that seeks to develop insights from an in-depth – in situation case-type study rather than a broad and widely encompassing survey.

Interviewing began in July 2007 and ended in June 2009. Interviews lasted between sixty and ninety minutes and were tape recorded and later transcribed. Once complete, transcripts were returned to interviewees for approval. A semi-structured interview approach was deemed to be the most appropriate method because it enabled contributors to ‘tell their own story’, thereby enabling the interviewer to gain a more comprehensive understanding of the participants’ ‘world’ (Bryman and Bell, 2011: 477; Barbour and Schostak, 2005: 42-44; Polonsky and Waller, 2010: 131; Easterby-Smith *et al.* 2008, 88; Gray, 2009: 373). To this end, only a small number of pre-prepared questions were used during this interview phase. Here the aim was to encourage participants to provide a rich picture and consequently it was important to adopt a highly flexible approach which allowed interviewees to digress if necessary. The need for this type of flexibility was emphasised by Polonsky and Waller (2010: 106). They commented that ‘The method chosen should match the degree of flexibility you require in terms of informational needs’ and went on to explain that in ‘...exploratory research, you may need a method that provides room for respondents to give answers that the researcher may not have anticipated.’

Non-participant observation was undertaken in two English Championship football clubs: Club A and Club B. Observations conducted at Club A took place on an annual basis over a period of three years. On each occasion the researcher was given access to the key business functions of the club and consequently was able to develop a comprehensive understanding of how the organisation operated. Additionally, by working closely with the Chief Executive he was able to develop a valuable insight into managerial, cultural and structural aspects of the club.

Observations were organised differently at Club B. Here the researcher was able to shadow the club’s Stadium Manager over a six-hour period on a match day. This again provided a

valuable insight into the operations and activities of a football club. Shadowing enabled the researcher to observe a practitioner operating a 'real' world situation.

According to Saunders *et al.* (2009: 290) observation enables the researcher to attempt '...to get to the root of 'what is going on' in a wide range of social settings.' However, they argue that there are three inherent problems associated with this approach: subject error, time error and observer error. Subject error involves observing subjects who are not typical examples of the phenomena under investigation. In both clubs the potential for this error this was reduced by selecting subjects who are established practitioners in their areas of operation. For example, Club B's Stadium Manager was an experienced member of staff who had been in post for a number of years. In terms of time error, the risk here is that observations take place at an untypical time which does not provide a valid picture of the phenomena under investigation. Here again, the risk of this occurring was negated by observing stadium management on the day of a 'routine' game. Observer effects occur when the behaviour of the subject is influenced by the presence of the observer. Here the advice to the observer is 'to melt into the background' and thereby have as little involvement with the subject as possible. This was heeded and as a result, for instance, during the shadowing exercise in Club B the researcher resisted the impulse to ask questions, avoided eye contact with the subject and when sitting in the Control Room ensured that he was positioned as discreetly as possible.

The interview transcripts and the notes generated from observations were analysed through intensive reading and rereading in order to allow prevalent themes, issues and phraseology to crystallise. This process, combined with the overall approach to the research, acknowledged and embraced issues of reflexivity in the research recognising the relation and impact of the researcher on the researched and vice-versa.

RESULTS & DISCUSSION

This section synthesizes The Football Match Event Lifecycle Model with primary data. Here the constituent parts of the pre-match, match and post-match phases outlined above are used to evaluate the data.

Pre-Match Day Phase

Planning

Interviewee A (2007), a Stadium Manager at a Championship club, indicated that pre-match planning was an important activity. He explained that several planning meetings take place in the week prior to a match. He related that

'We've got a match tomorrow (Saturday) against Stoke and we had a briefing meeting last Thursday with the police. The police ask "What particular unique occurrences are happening at this game, as far as the club is concerned?" and I brief them. For instance, fans from other clubs may be travelling through or near to our city. On occasions, you may get supporters from neighbouring clubs who may want to try and converge around the ground. So, it's quite vital really for us to know what likely problems may occur on any particular day, and that meeting covers all that.'

Interviewee A also outlined the detailed planning that takes place forty eight hours before a game. At this time he conducts a 'Preview Meeting'. This involves bringing together the commercial and catering departments, the club's security company and club's Press Officer in order to '....prepare everybody for what they might expect and it has the effect of raising the 'ante' a little bit – to get the adrenalin running a little bit better – it is a good way to prepare.' Here the focus is clearly upon briefing the key departments, and staff, within the club in order to guard against complacency and to ensure that all parties are prepared effectively. Again, this indicates that planning is comprehensive and is based upon effective communication. Interviewee B (2009), a Local Authority Licensing Officer, corroborated Interviewee A's comment that a preview meeting was an important part of the planning process. He also mentioned the importance of contingency planning. He commented that 'Clubs have contingency plans, they have a format for dealing with potential problems, for example power cuts etc.' Interviewee A (2007) also explained that contingency planning was an important aspect of his role. He related that the club employs a Deputy Safety Officer on a part-time basis. The individual is fully trained and works with Interviewee A on a match day. In the event of him not being able to perform his role (e.g. because of sickness) his deputy can step in and take over.

Organising

Interviewee A (2007) and Interviewee C (2007), Stadium Manager of a Premier League club, both emphasised that organising the resources of their respective clubs was an essential, time consuming and challenging activity. Interviewee A (2007) explained that his role required him to be involved in organising activities that spanned the entire structure of the football

club. He outlined how one of his duties was to organise the on-going maintenance of the stadium and explained that he had to organise not only the repair of broken items, such as terrace seating and sanitary ware in the toilets, but also the cleaning and tidying of the stadium. In order to further explain the span of his organisational responsibilities Interviewee A (2007) went on to outline how he also has to organise the briefing of stewards on a match day. He commented

‘I brief the Steward Supervisors, who in turn cascade information to their teams. We have 250 or so stewards so it is quite a big operation. I meet the Supervisors at 12.40pm when we have a 3 o’clock kick off. I tell them what I have learned from the police and I outline any potential issues that they may need to be aware of.’

The breadth of Interviewee A (2007) responsibilities was further demonstrated when he explained how he was responsible for organising the safe passage of players to and from the car park. He said ‘The protection of players has become an issue over the last couple of games. I have had to change where they park and organise bringing them in through a new gate.’

Interviewee C (2007) explained how his organisational skills are challenged by the unique environment in which he operates. He commented

‘We are forever working to deadlines. So whereas your deadlines in an office block may slip by a week and it’s annoying, but not desperate. If we slip by a week – we don’t open the stadium and it gets noticed! The problem with football is that quite often how you start is how you carry on all the way through.’

This comment is interesting because it emphasises the need for clubs to have effective systems in place at the beginning of the season. Since procedures are repeated fortnightly, and opportunities to make alterations are limited, it is important that procedures are ‘fit for purpose’.

Match Day Phase

Controlling

Interviewee A (2007) offered a valuable insight into control at a football match. He said

‘Since Hillsborough, the responsibility for safety in a football ground is that of the club. The police work in partnership to support the club, but the only time that they

will take decisions is if an incident occurs inside the ground and they believe that they need to take full control. Then they will formally do so - a note will be made on the log and control will be handed over.'

The log is a 'live' document that is created during the pre-match phase and then updated during the match and post-match phases. Key incidents are recorded and the account is used to inform the writing of post-match reports and is also retained for use in the event of litigation and other legal proceedings.

During the match Interviewee A is located in the Control Room. He explained that, aided by technology (i.e. CCTV, radio communication etc), he '...runs match day from this room...' For example, he can speak directly to all stewards via a radio link and he can control the flow of spectators into the ground.

He explained that 'There are all sorts of things impacting upon safety now, and a lot of it is about getting greater control of spectators.' He outlined how the club had recently replaced their turnstiles with a 'smart card' system. He went on to say that this facilitates the control of spectators in number of ways. Firstly, in terms of flow, if a part of the stadium is reaching capacity the system warns operators in the control room and entrances can be quickly closed. He said

'I can look at the main Stand and know precisely how many people have come in at any time. For instance, if we did have a forged ticket problem, it might not be apparent until all of a sudden that screen was flashing at me - it starts to flash at 90 per cent and then becomes more intense if it's getting up to 97 or 98 per cent. I would look outside using the CCTV and if there were massive queues I would say to operator "Shut the entrance, there's something wrong!" - The last thing we would want is the Hillsborough situation where we've got more spectators in the stand than we should have.'

A second aspect of control is the use of a smart card system which can be used to prevent banned spectators from entering the stadium. Interviewee A (2007) commented

'If someone stands up and starts making racist comments or swearing or throwing punches we can make decisions ...if we suspend him all I have to do is deactivate his card. That's the power and control that you've got over spectators, and if you want to keep the place safe then that's absolutely vital.'

The extent of control was further illustrated during the non-participation observation conducted at Club B. On arrival the researcher was issued with an accreditation pass and was instructed to wear it at all times. This was signed personally by the Stadium Manager and enabled access to all areas. The researcher was assured that without this pass he would not be allowed to move freely around the stadium. This claim was not tested; however, by issuing the pass the club is clearly attempting to control access and movement around the ground.

Clearly, from an events management perspective the control of spectators has become more sophisticated. The desire for a safer environment has resulted in more extensive control measures being introduced by clubs. However, on a cautionary note Interviewee C (2007) explained that some control issues remained. He contrasted his Premier League stadium with that of Wembley, the English national stadium, and he argued that regular fans who attend his stadium every fortnight were more difficult to control because they quickly become familiar with their surroundings. He commented that 'Regulars don't follow signs – they go the quickest way that they've found. So you suddenly find people popping up in various places where they shouldn't be.'

Monitoring

Interviewee A (2007) gave a comprehensive outline of the various ways in which he monitors the progress of the event. For instance, he explained how CCTV systems enabled the monitoring of spectators as they made their way to the stadium. He said:

'You can literally watch away fans on their journey up the motorway, into the city centre and on to the Stadium. When the police helicopter is up it has a direct down link that streams images into this Control Room...if for instance there's a crash on the motorway and supporters are delayed this may present a safety risk ...By monitoring what's happening we could consider delaying the kick-off.'

A further perspective on monitoring was also provided by Interviewee A when he outlined how the stadium's sophisticated fire alarm system operated. He explained

'We've recently upgraded our fire alarm system...if a detector activates it will give you its precise location. We can quickly dispatch a steward to investigate and monitor the situation. Very, very quickly in this control room we're going to have a

full knowledge of what the problem is as soon as it gets brought to our attention. That wasn't available before...it's a lot better'

Post-Match Day Phase

Evaluation and Feedback

Interviewee B (2007) emphasised the importance of evaluation and demonstrated that he evaluated operations during each phase of the lifecycle. For instance, he explained that in one corner of the ground a hotel was being built. Prior to each match the progress of the development and its impact on the management of match day operations had to be evaluated. He commented that:

'The development of the hotel, the footprint of where they're operating alters match by match. Everybody needs to know how the project is developing – for instance it may be that it is going to affect the exit routes for the emergency vehicles if they have to attend the stadium. Things alter match by match.'

In terms of evaluation during the match phase Interviewee A related that he engaged in process evaluation by touring the stadium on a match day. He explained:

'On match day morning I get here at 6.30 am or 6.45 am –and I spend the first two or three hours touring the stadium. I check all the voids under the stands and make sure that nobody's shoved a box full of papers in there, for instance. We have TV platforms - I check all the platforms to make sure that nobody's been interfering with them. I make sure signage is where it should be. I do a lot of double checking and I tick them off as I do them. Somebody else, one of our maintenance team, checks that all of the entry and exit gates are operating correctly. This is all part of the big build-up on a match day.'

In the post-match phase he explained how summative evaluation is utilised. He said:

'At the end of the game, once all the spectators have left, the stewards will comb every aisle. The Steward Supervisors have a de-brief sheet to report any damage, any problems, and any issues. I get that sheet within 24 hours. I use the sheets to brief our maintenance team to ensure that things are repaired pretty quickly for the next game.'

These accounts show that interviewee A uses formative, process and summative evaluation to generate feedback which is used to inform future practices and procedures.

In summary, evaluation and feedback have been shown to be essential elements of the events management lifecycle. The Football Match Event Lifecycle Model emphasises this by clearly demonstrating how formative, process and summative evaluation are used to generate feedback, which in turn is then used to inform the management practices associated with each stage of the process. This approach provides a valuable insight into the way that clubs have become more flexible and responsive. The move to undertake on-going evaluation and gather feedback indicates that the club is prepared to respond to calls for change and consider the implementation of new initiatives.

Leadership

Both interviewee A (2007) and interviewee C (2007) explained that their role required them to display effective leadership skills. For instance, along with his role as Stadium Manager interviewee C also acts as the Duty Safety Officer on a match day. He commented that 'It all comes down to me. But everybody is very responsible, even the Directors ask whether they can or can't do things on match days.'

He contrasted this situation with what he encountered when he first joined the club in 1987. Suggesting that leadership was deficient he said

'In the past, you had a Safety Officer but it used to be the Chairman, a Director or the Club Secretary but it wasn't clear what job spec or background this person needed – it was usually the one who had had one less drink because they were the person responsible for safety.'

He also provided a valuable insight into the difficulties of coordinating the various groups and individuals within the football club. He recounted a particularly difficult time after the club had moved to its new stadium. He said

'Everybody wanted everything done there and then. I went to Heads of Department meetings – and I was bombarded with problems. It got so bad that I went to the MD and said "Can I bring a baseball bat to the next management meeting?", and he said "Why?" and I said "Well people might just as well hit me with it and I can get it over with!" But to be fair to him, he then sat down and said "Look, we will not get anywhere if we don't all work together and from then on it started to get better.'"

This account highlights the importance of effective leadership. With the help of the clubs Managing Director, interviewee C was able to overcome initial difficulties and proceeded to display effective leadership skills by effectively coordinating and integrating task, individual and team needs.

Similarly, interviewee A (2007) also displays effective leadership skills. For example, he leads the various planning meetings that take place prior to the staging of matches and he emphasised the need for all of the key people involved in staging the match to be brought together in order to discuss relevant issues. His awareness of the motivational potential of such activities was illustrated when he commented that they ‘...raised the ante a little bit’ and that they got ‘...the adrenalin running a bit better.’

In summary, effective leadership has been shown to be an essential component of the staging of a football match. Those who take responsibility for managing the event must display effective leadership skills and must be supported by senior staff within the club. The accounts provided by interviewee A and interviewee C indicate that club owners and directors have been prepared to delegate their power and influence; however, in the case of interviewee A the process appears to have gone too far because senior staff have attempted to abdicate, rather than delegate, responsibility.

CONCLUSION

In conclusion, unlike much of the football related events management literature this paper does not focus primarily upon the tragedies and disasters that occurred at football matches in Britain in the twentieth century. Rather its aim has been to develop a clearer understanding of contemporary regular event football match event management practices. This has been achieved by drawing upon mainstream event management, and associated, literature to develop a Football Match Event Lifecycle Model.

Application of the model has illustrated its usefulness in evaluating pre-match, match and post-match event management activities and associated issues. In particular, the model provides a framework that facilitates the systematic evaluation of the key areas of event planning, organising, controlling, monitoring evaluation, feedback and leadership. Initial results suggest that there is congruence between the way that the football clubs stage their matches and the advice and guidance emanating from contemporary event management literature. Given the limited scope of the primary data considered in this study (i.e. a

relatively small number of interviewees and observations of event management practices at two football clubs) this is an interesting preliminary finding and suggests that the model should be developed further by applying it to a broader range of football clubs. Indeed it is anticipated that the next phase of the evolution of the model will involve a more extensive study which encompasses a larger number of football clubs and also an assessment of the model's suitability for application in other event management contexts.

MANAGERIAL APPROACH TO CULTURAL PPP

Moschogianni, Meropi¹; Gratsani, Athina²

¹Harokopio University - Business Administration, Hellenic Open University, Greece, meropi79@yahoo.com

²Harokopio University, Greece, ath.gratsani@gmail.gr

ABSTRACT

In the last two decades, Public - Private Partnership (PPP) has become an economic phenomenon and contributes significantly to the infrastructure projects in many countries. Cultural Heritage Management (CHM) is very important for cultural maintenance, and especially for museology.

The museums are of the greatest exponents of the culture of each country and contribute to the enhancement and promotion of the cultural heritage of each place. The cultural heritage is defined as the set of cultural goods. Thus, the use of PPP is imperative, as this model is closely linked to cultural market.

The challenge for this paper is to examine whether PPP is one of the key management tools for culture. In order to avoid possible failures, the management of such partnerships should be careful and, also, should be based on the dynamism of people employed in the management of PPP model. Although PPP is a legal tool, in fact it is a variation of contracts of concession, without abolishing them.

The contract concession, which is an administrative contract, is also important, as public law relationship is created and the privileges of public sector take precedence over private sector.

New public management (NPM), includes techniques mainly from the private sector, which are applied to the public management in order to increase performance on public services. In the NPM the administration of "contracting out" not only provides the possibility to a vehicle to burden the state budget less but also makes the simple viewer an active member. The NPM is another tool of modern society and its needs.

Keywords: Public - Private Partnership (PPP), PPP contracts, Cultural PPP, Cultural Heritage Management (CHM), Contracting out, Culture, Heritage, Museums, hypothesis, modernization

INTRODUCTION: BACKGROUND AND LEGAL DIMENSION OF PPP

PPP agreements are adequately specified and differ in a number of dimensions, such as law, ownership, abilities, products, end users and finally Risk and Revenue dimension (Venieris, 2007).

The term “Public - Private Partnership” (PPP) refers to forms of cooperation between public and private sector with a view to ensure funding, construction, renovation, management and maintenance of an infrastructure or service (Institute of Economic Structures 2005). In modern times this institution (PPP) emerged as an economic tool for governments in late 1980 (Kaissis A., 2006).

The contribution of PPP in the European market is of paramount importance, as it emerges as an economic phenomenon, especially when the government cannot undertake the execution cost. The execution of large projects in the UK in 1980 is an important one. Then, the example of France is characterized by the construction of projects with the method of partnerships in the fields of education, health, transport, security and building facilities. Hence, Decree 2004-559 in France established a new type of contract, the contract Public – Private Partnership Sector, which is characterized as administrative, due to global character, prior assessment, common undertaking of risks, and correlation between private pre-financing and diversified public payment (Maniatis, 2011, 2012).

Generally, special attention should be given to the study, the management of such project, at risk and limitation, if not prevention, of failures. (Galiotou and Maniatis, 2012). The field of influence, the development and promotion of public interest groups are main parts of PPP (Feilden 1998).

PPP should be treated as usual capital investments of government as it is vital, considering the inability of economies to finance major infrastructure projects with public funds. Countries such as Portugal, Spain and the Netherlands in Europe, as well as Australia, U.S.A and Canada, improved infrastructure and services through PPP (Graeme Hodge και Carsten Greve, 2005).

The law that determines the legal status and operation of PPPs is 3389/2005, which establishes two new bodies, the Inter-Ministerial PPP Committee and the Special PPP Secretariat. This law allocates the projects, that are constructed by PPP, in contributory or non-contributory and determines the procedure for the evaluation and approval of PPP projects. Also, it sets the warranty in contests and ensures a healthy and legitimate competition. European Union law dispositions complete the legal framework. It has been

recognized in the European level, that the use of PPP could contribute to the implementation of European Transport Network (Delitheou et al., 2010).

Particular attention should be given in the legal framework for PPP in Greece, in order to avoid malfunctions as in the case of the Paediatric Hospital in Thessaloniki. Nevertheless, it is argued that there should be an international law for the success of PPP, worldwide (Galiotou and Maniatis, 2012).

HERITAGE AND CULTURAL PPP

The balance between old and new, past and present, historical cultural memory and contemporary creation has been compromised (Lavvas and Karavasilis, 2003). Heritage can be benefited in the present, as it can be preserved for future use (MacDonald & Jolliffe, 2003). Cultural Heritage Management (CHM) is a major issue and a global phenomenon. CHM is the process of actions for the care of cultural heritage, which requires appropriate management strategies. Historically, the public sector, and not the community, undertook the case of inventory, upkeep and protection of heritage (Boniface, 1998, Jansen-Verbeke, 1998, du Cros, 2009).

CHM is an integral part of cultural heritage preservation, restoration, museology, and also, archaeological, historical and architectural research. CHM is based on the model of Environment Council of Australia and New Zealand, and is linked to the strategic management of the recognition of heritage sites, allocation of resources, protection, preservation and maintenance. The successful development of CHM should clearly establish the strategic management challenges. If a nation has an effective CHM strategy, then it should create an organization that will be responsible for strategy implementation, recognition, appreciation, protection, preservation, presentation and maintenance. The most important level of CHM model is the presentation of cultural heritage sites to the public, through which there may be economic benefits and promotion of regional economies. To this point, the need for creation of PPP arises, which is closely related to the cultural industry (Jurėnienė and Radzevičius, 2012).

Besides cultural heritage, landscapes are also protected by the Environment Code, to which Heritage Code refers. Urbanization has induced the need for protection of urban sets, historical neighborhoods and not just separate buildings. In order to avoid complete destruction of settlements, the Law of 4th August 1962, known as Malraux Law, created the protected sectors. It could not be omitted that the first law relating to the archaeology dates

back to 1941. Greece is characterized by particular archaeological sites. In comparison with Greece, the laws of France focus on modern architecture and not only on heritage (Maniatis, 2011). Generally, in Greece cultural heritage is protected by Law 3028/2002, while in France by Decree 2004-178.

Cultural PPP aim to the attainment of cultural equipment such as entertainment halls, theaters and libraries. Two successful examples of cultural PPP is the Theatre Archipelagous in Berpignan of France and the National Museum of Cultures of Europe and Mediterranean, in Marseille of France (Maniatis, 2012).

Generally, the contribution of PPP in culture is limited, when only 14% of projects are related to cultural heritage, while in Greece we do not yet have a successful example (Vassilakou and Maniatis, 2012).

The PPP model is based on the idea of outsourcing cultural and heritage sector responsibilities, such as the management and maintenance of museums. The dissolution of partnership is often the result of conflicting values between the two parties (interest in culture and heritage – interest in profit). When the private sector is interested to make profit and suspect that it will recover its investment after a long period, it can easily decide to discontinue the cooperation. Although this is one of the traps of PPP model, it is argued that the problem is not the models that are used by museums, but the dynamism of individuals employed in the management of these models. Thus, museums should consider: the passion of individuals for the museum operation, which is vital for the success or failure of the museum. There is a strong need for high level motivations and trained people with all necessary skills for the museum operation, but also with a vested interest in culture and heritage. In order the potential of this model to be exploited, the importance of the cultural heritage, the objectives and the opportunities that it can bring should be clearly defined. Moreover, governments should review the tax system for companies and individuals who contribute (eg donation of money, property, art and book collections, jewelry, etc.) to the creation and development of culture and heritage of their country. This would encourage the private sector and private sponsors of arts, culture and heritage to invest more in the development and maintenance of culture and cultural heritage institutions, such as museums (Nkosinathi G. Tomose, 2008).

PPP CONTRACTS AND MANAGEMENT

The management of a PPP case could give several opportunities, but the risks that should be resolved are more than those of a common project. (Galiotou and Maniatis, 2012)

Risk management is a process which aims, firstly, to avoid negative outcomes and, secondly, to identify emerging opportunities through the identification, analysis and response to significant risks on an ongoing basis. When a project team engaged in a risk management process should develop an action plan, so as to limit the probability of a risk happening or the consequences of a risk when it happens.

The risks of projects could be shared out in three ways: a) Transferred risks (risks transferred to the private sector), b) Retained risks (risks retained by the public sector) and c) Shared risks (risks shared between the private and the public sector) (Li Bing et al., 2005).

In the risk management process, identification, analysis, and management plan, should be involved in all of the above three types of risks.

The following table presents the three types of contracting out, in other words, the contracts between the public and private sectors, analytical Public works, Public Private Partnership and Concession. A very characteristic Concession project was the construction of the Channel Tunnel between England and France.

These three types are compared to each other for the duration, character (reciprocal or not), funding and repayment, functions and risks undertaken by each side.

Public works	Public Private Partnership	Concession
Short term contract	Mid-term or long term contract	Mid-term or long term contract
Usually selected for non-reciprocal scopes	Usually selected for non-reciprocal scopes	Usually selected for reciprocal scopes
Funding is carried out exclusively by the state	Funding is ensured by the private sector by the bank	Funding is ensured by the private sector by the bank
The repayment of the private sector is done by the public sector	The repayment of the private sector is done usually by the public sector, through or by both the users and the public sector	The repayment of the private sector is done usually by the users.
No risk for the private sector after the completion of the project	Task allocation between the public sector and the private one	Task allocation between the public sector and the private one

Table 1: Contracting out

SWOT analysis is a strategic planning tool used to analyze the internal and external environment, based upon current market conditions and anticipated future trends. The following analysis SWOT illustrates the strengths, the weaknesses, the opportunities and the threats of the cultural PPP.

Strengths	Weaknesses
Effective use of state assets to the benefit of all users of public services	Lack of understanding and acceptability in Public Sector
Improvement of service capacity	Risk of rising unemployment
Financial discipline	Working of force of two different legal status
Experienced workforce	Conflicting external influences
Improvement of location	Lack of Capital Funds
Energy partnerships	Old Infrastructure
Greater efficiency in the use of resources	Problem of decision making/ Bureaucracy
Gain in private know- how	Loss of (political) influence of the public sector
Speedy, efficient and cost effective delivery of projects	
Opportunities	Threats
Development of local financial markets	Lack of support from the Government to the private sector
Development of local labor markets	Lack of the accessibility from the private sector to the Government
Focus on cultural development issues	Legal malfunction
Challenge for investment	Increasing completion risks
Public Relations	Limited financial support
Increasing willingness to cooperate in a European and international level	Dependence on stability of political, economic and legal environment
Potential challenge for instance sponsorship	Insufficient capacities in technology based education
Co-operation with NGOs and small cultural companies	Inaccurate preliminary evaluations in the PPP pro suction
Expansion of marketing strategy	

Table 2: SWOT ANALYSIS

Public management is a merger of the normative orientation of traditional public administration and the instrumental orientation of general management" (Perry and Kraemer, 1983). The "New Public Management" (NPM) school of thought has influenced public management reform and introduced new managerial practices that put more emphasis on the market and transform the bureaucratic structures of public organizations. Generally, this movement could be seen as a transformation from public bureaucracy to one model of more flexible administration. When it began, in 1980, with emphasis on cost cutting, efficiency increases and straightforward "managerialism", this efficiency drive implied increased financial controls, more "command and control" systems and asserting management control over professions and workers. NPM in the Greek Public sector arrived

relatively slowly and still is in progress comparing to other countries such as UK, New Zealand, and Switzerland etc. (Philippidou et al., 2004)

EXAMPLES AND CASE STUDIES OF PPP MANAGEMENT

The examples below illustrates how the PPP projects are carried out all over the world. These projects secure, provide and enhance the cultural sector. The target of the following case studies is to evaluate realized projects, to show common requirements and learnt lessons in PPP.

Examples of the PPP	Results
The case of "Royal Armouries Museum Leeds", United Kingdom	The failure of the PPP contract was due to limited demand compared with the prediction, limited building capacity and the high prices.
The case of "Palace of Versailles", France	The failure was in ticket software, which was unstable and unsatisfactory.
The case of Maropeng, Johannesburg, South Africa	The failure was the expensive ticket fare and the position of Maropeng.
The case of "Soesterberg military museum", Netherlands	As part of the agreement, the private partner undertakes to ensure the protected landscape elements and in return for his investment will retain all income from visits to museum
<i>Table 3: Examples of the PPP</i>	

A) The case of "Royal Armouries Museum Leeds", United Kingdom

In December 1993, a sixty-year duration PFI contract was signed, between the Royal Armouries and the private company "Royal Armouries International plc (RAI)" for the construction, operation and custody of the new museum in the UK, in Leeds. The RAI would completely undertake the risk and revenue from visitors, parking and restaurant services. Important goal of public authority was to take care of promotion, new items acquisition, personnel supply for maintenance of items. The private partner undertook to build the new museum at a fixed price, participate in the cost, the operation and the maintenance of the building. When the museum opened, March 1996, began with losses because the number of visitors was lower than it was expected, so it was not able to cover the operating cost. Thus, in July 1999, after warnings from bankers of RAI and Bank of Scotland, the Armouries revised its agreement with RAI and assumed the responsibility for the museum operation. The Ministry of Culture was to help with 10,000,000 pounds to save the museum from definitively closing. The failure of the PPP contract was due to limited demand compared with the prediction (about 60% of expected levels during the first year of operation and 35% in 1999), limited building capacity (provision for 1,300,000 visitors annually with an average visit

duration 2.5 hours, while the number of visitors was from 600.000 to 650,000, with an average real visit duration 4 hours), and also high prices despite the warning of consultants (Legrand, 2005).

B) The case of “Palace of Versailles”, France

Failed example of PPP contract is the Castle of Versailles in France, the gardens of which are included in the "World Heritage List". During the contract the major failure, by the private sector, was in ticket software, which was unstable and unsatisfactory. By the end of the contract, the public Foundation of Museum and National sector of Versailles, took over the management of tickets reservation by using new technology systems (Maniatis, 2012).

C) The case of Maropeng, Johannesburg, South Africa

The Maropeng museum, in Johannesburg of South Africa, had public funding from Gauteng Provincial Government and managed by the Maropeng Africa Leisure (Pty) Ltd. Also, the University of the Witwatersrand (Wits) is responsible for some of the activities, as Maropeng participates actively in running the exhibits. Maropeng operates under the PPP model. Private sector covers operating and maintenance costs of the museum and faces the dilemma of achieving a balance between social obligations (to be recognized as a viable social institution) and economic sustainability. 75 to 80% of their budget is spent on salaries, leaving 25 and 20% for operation and maintenance costs. The total number of Maropeng visitors is about 82,000. In South Africa, less money is spent on social capital than in countries like the U.S.A and the United Kingdom. When someone carries the model in South Africa, they should think that tax incentives for individuals and businesses in order to support the museums are not as many as in the U.S.A and United Kingdom. This prevents further operation of PPP model, as well as private companies that invest in this model pay a lot of money for taxes, even if it is for public benefit. According to visitor numbers, Maropeng was one of the museums with the largest number of visitors in 2007. The expensive ticket fare and the position of Maropeng (outside the city, accessibility only by car) were proposed as limiting factors for locals to visit the museum. Public transport is not very attractive, and the taxi leaves someone few kilometers away from Maropeng. It seems that the museum is designed more for international tourists and a minority of South Africa citizens. The high number of visitors, has to do with the fact that it is something more than a permanent exhibition, but it is also an entertainment center. The PPP model has problems in its application and it has even threatened the stability of the museum. The Maropeng facing

problems of sustainability, and its commercial operators declared bankruptcy in 2007 due to severe operational losses. This is a kind of problem that arises when there are two or more partners with different interests trying to create a relationship with different values (Nkosinathi G. Tomose, 2008).

D) The case of “Soesterberg military museum”, Netherlands

In 1968, the Air Force Museum was founded at the birthplace of the Dutch Aviation, Soesterberg, with initiative of the Air Force personnel. In 1980, it was transferred to "Kamp van Zeist", and then returned to the airport Soesterberg, where it has become part of «'Defence museum complex». The Military Aviation Museum presents the history and development of the Dutch Air Force and its activities. A large area will be designated for exhibitions and events and the existing infrastructure will be used in part. Because of the special position in the heart of Heuvelrug, it will focus on the conservation and development of natural features, and even more on the sustainability of the project. The new museum includes workshops and warehouses, approximately 50,000 sq.m. and remains under the control of the Ministry of Defence. The Ministry of Defence outsources the project and Rijksgebouwendienst (Government Buildings Agency) ask for offers on behalf of Ministry Defence, with a partnership contract for 25 years, while property rights will remain in the public sector. Duties include exhibition spaces, halls, offices, public spaces and the outdoor spaces. As part of the agreement, the private partner undertakes to ensure the protected landscape elements and in return for his investment will retain all income from visits to museum (such as ticket sales, parking, advertising, franchising contracts etc.). The project refers to a long-term contract between public and private sector, where the private partner, apart from the risks of project revenues, is also responsible for the development of program activities (Cf. N.N., 2011).

RIGHTING THE RIGHT TO MUSEUMS

«*The museum is a place of free access to culture*»

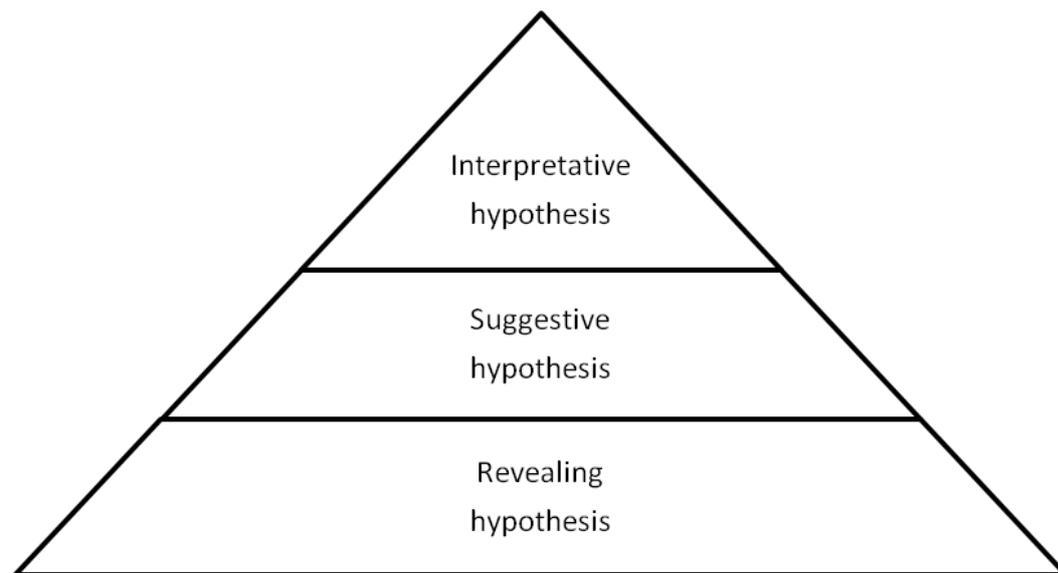

Georges Henri Riviere

According to the International Council of Museums (ICOM), the formal definition of museum is "a permanent institution, non-profit organization at the service of society and of its development, open to the public, which has the task of collection, study, retention, disclosure and items exhibition of human culture and environment with a view to study, education and entertainment."

In ancient times, the museum was a place, in which the arts, literature, music, poetry, philosophy and dancing were nourished since it was a "mosque" that had been dedicated to the worship of Muses.

The historical evolution of museums seems to be intercepted 160 years ago. The museum is a philosophy, a way of things' cooperation and process, but also a way of creating new worlds through the use of theatrical things, producing relationships and bridging worlds. Museums since their foundation are a theoretical practice, that is a philosophical, ideological and semiotic practice. It is time to reevaluate not only this that has been forgotten or put aside, but this, that was repulsed and is still repressed. Besides, this is confirmed by the words of a modern philosopher Giorgio Agamben: «*This is especially needed, if we want the artwork to regain its original position*». Moreover, the history of art and museology are based on the active art dismemberment, the commercialization and the weakening of dangerous forces that exist in art. The position of the viewer towards the items in a museum collection should be active, and provide place for dialogue, discussion and debate. Nevertheless, it is noted that museums, today, remain immobilized and without progression. (Preziosi, 1999).

In the following pyramid, we figure out the distinction and hierarchy of cases, involving all stages of museum exhibits. The revealing hypothesis, is located on the basis of the pyramid, refers to excavations. The next phase is the suggestive hypothesis that has to do with the public display of exhibits. Finally, of crucial importance, the interpretative hypothesis at the top of pyramid, emphasizes the importance and need for a space for democratic dialogue.

The archetype faction of "hypothesis"

CONCLUSION

Despite the controversies that are encountered during the implementation of PPP, it is concluded that PPP is a new legal tool for state to acquire infrastructure in order to exert social and cultural policy.

The cultural management through PPP aims, among others, to the continuous efforts in order to preserve the cultural and social cohesion that connects the past with the present and future. Museums are "cells" of democracy, so dialogue should be promoted, so their function should have as target the interests of society and the constitutional principle of freedom of art, and not to maximize the profit. Democracy is based on dispute and dispute is based on interpret. However, a major challenge would be grant the main function of museums with a view to improve services quality and enhance public rights, through the PPPs.

We ascertain that visiting museums can contribute effectively to the sustainability as also to the development since they will be able to sponsor other activities at the same time in favour of the citizens and the society, such as archaeological excavations.

The "contracting out" is a tool of a manager, an economist, an administrator. Law defines the framework but the politician will decide when and if it will be applied. We notice that a lot of politicians are afraid to apply it and specifically the private participation in vehicles of Public Sector. That way cultural organizations cease to be weights of the state budget since the sponsorship will be accomplished by the society itself.

Through "New Public Management" (NPM), an attempt for the modernation of the museum mission must be made, so to become a multipurpose cultural center. Everyone has the right to culture and, ideas must be evolved. Museums must not remain a "museum piece" but be seen as a challenge for another kind of civilization!...

DESIRABLE CODE OF CORPORATE GOVERNANCE FOR NON-LISTED COMPANIES – AN EXPERIENCE FROM PAKISTAN

Nazar, Mahreen¹; Nishat, Mohammed²

¹Department of Accounting and Law, Institute of Business Administration (IBA), Karachi, Pakistan, mnazar@iba.edu.pk

²Institute of Business Administration, Karachi, Pakistan, mnishat@iba.edu.pk

ABSTRACT

The code of corporate governance was introduced in 2003 for compulsory compliance by the companies listed on the stock exchanges in Pakistan. The code was devised as an enforcement mechanism giving powers to the stock exchange to delist companies not complying with the code. There has been an on-going debate whether this code could benefit all corporate entities in the country to curb corruption and undesirable practice in the corporate world whether listed or not. This paper looks into the legal structure present at the moment, areas of improvement and the present situation of non-listed and listed entities. This paper also proposes to make a case for observance of the code of corporate governance by non-listed companies/ corporate undertakings. The study is both analytical and empirical based on primary data collection of randomly selected corporate entities in Pakistan. The study also establishes whether complying firms have higher premier in their performance as empirically determined in Pakistan for listed companies (see Nishat and Mir, 2005 and Shaheen and Nishat, 2006). The research also evaluates the possible impact of proposed legislations on shareholder confidence, minority shareholder rights, transparency and financial health of companies.

Keywords:Corporate Governance, Small companies in Pakistan, Company Law, Non-Listed Companies Legislation, SECP Codes of Governance

INTRODUCTION

The aim of corporate governance is to align as closely as possible the interest of individuals, corporations and society. Corporate governance ensures transparency, justice, sustainable financial performance, access to external finance and foreign investment, increased shareholders' trust, fair treatment of the shareholders in a company, nation and economy. Efficient corporate governance practices result in healthier financial performance, reduced and controlled risk, better confidence of shareholders and investors and greater productivity. An effective and efficient corporate governance framework depends on the legal, regulatory, business and institutional environment.

To develop a market economy and a civil society in transitioning economies like Pakistan, the concept of corporate governance plays a very important role. This is primarily why we find a growing interest in the country for corporate governance. The Pakistani market is dominated by ownership concentration, cross-shareholdings, pyramid structure and the dominance of family business. However, driven by market leaders, suggestions related to enhancements are being pitched to attract foreign investments to help in the sustainable development of Pakistan, enhance the performance of the stock exchange, increase the transparency in financial reporting – in turn protecting shareholders' rights and encouraging healthier financial activities. Despite the growing interest, there is a surprising lack of consensus about why corporate governance is important.

The Securities and Exchange Commission of Pakistan (SECP) has been constantly attempting to foster investor confidence. Since its inception in 1999, it has been a major player involved in encouraging good corporate governance and creating an air of increased transparency and accountability in the corporate sector. The SECP also aims to safeguard the interests of all stakeholders, especially the minority shareholders. Financial reforms during the 1990s have influenced the pattern of capital structure, dividend policy, risk premia, and compliances to corporate governance (Nishat, 1999).

The SECP published its first Code of Corporate Governance in March 2002 which was subsequently incorporated in the listing regulations of the three stock exchanges and is now applicable to all public listed companies. The initiatives of SECP resulted in the creation of a public-private partnership in the form of Pakistan Institute of Corporate Governance (PICG) in 2004. With an aim to provide all major stakeholders an institutional platform to jointly study governance practices and identify the problems, PICG remains responsive to the external environment while coming up with a combination of legislation, facilitation, culture change, social values and changes in areas it found the necessity. The quest continued and in 2006, the Pakistan Corporate Governance Project (PCGP) was launched to improve corporate governance practices in Pakistan.

Since 2002, a number of corporate governance reforms have been undertaken globally. These reforms in areas including legislative reforms, stock exchange governance rules, corporate governance guidance and principles. Serving as a source of motivation for Pakistan, some of the major reforms undertaken include the OECD Principles of Corporate Governance, the Basel Committee on Banking Supervision (BCBS) Guidance on Enhancing Corporate Governance for Banking Organizations and the Sarbanes-Oxley Act in the United States.

The extent to which these global reforms are helping the cause in Pakistan is evident from the World Bank ROSC Report on Corporate Governance for Pakistan (2005) which highlights the encouraging improvement in the level of organizational compliance to the corporate codes despite initial resistance. More encouraging is the fact that the transformation has been led by market leaders including multinational companies, banks and notable family controlled corporations which are constantly creating more transparent and modern corporate governance structures. Increasingly, companies are arranging orientation seminars for their boards.

Despite the growing interest, most of the research in the area of corporate governance is done for developed economies due to the rich availability of data. In the absence of similarly active markets or corporate controls (Bohren and Odegaard, 2001), many developing economies like Pakistan are characterized by relatively weak investor protection and corporate law enforcement.

Earlier the link between corporate governance structure and the firm performance in Pakistan was empirically tested (Mir and Nishat, 2004). Poorly governed organizations exhibited lower operating performance, lower valuations and ultimately paid out less cash to their shareholders. On the other hand, better-governed firms had higher operating performance, higher valuations and paid out more cash to their shareholders (Shaheen and Nishat, 2006). Better managed firms also provide creditors confidence of more effective controls and financial process, effectively reducing the cost of debt for these organizations (Anderson et al. 2004). Shaheen & Nishat add to this literature by showing that firms with board sizes of between six and 15 have higher returns on equity and higher net profit margins than do firms with other board sizes. This could be applied to non-listed companies, whether having the code of corporate governance regulate than would inspire confidence in the company.

CORPORATE GOVERNANCE FOR NON-LISTED COMPANIES IN PAKISTAN

Companies Ordinance (1984) defines a listed company as a company or a body corporate or other body whose securities are listed, that is allowed to be traded on a stock exchange. Companies that choose not to fulfil this criteria are non-listed companies.

Due to the special needs that they may have, non-listed firms are sometimes viewed as requiring a separate set of corporate governance principles (Saidi, 2005). On account of the large variances found in the structures of non-listed companies, differentiating the recommendations for corporate governance in non-listed companies can be difficult. For the set of recommendations, it is assumed that every entrepreneur tries to bolster their own business rather than vesting the benefits of the business with themselves only.

The Code of corporate governance and Companies Ordinance outline the duties of the Board of Directors. These include taking decisions and making strategic choices in matters of prime value, including approval of the strategy, ensuring that the management and the shareholders take the initiatives which fall within their authority only. They are also responsible for appointing and giving advice to and succession planning for the managing director, the executive committee and the management. They have to supervise the financial and operational controls by means of an internal control system and delineating the dividend policy which afterwards is submitted for approval to the general meeting. They are also in-charge of protecting the interests of the company in the event of crisis and conflict.

The task of the board of directors must be distinguished from those of the general meeting, the management and the executive committee. The general meeting is competent for changing the capital structure, appointing and dismissing the directors, approving the annual

accounts, setting the dividend and so on while the management is entrusted with the operational running of the enterprise and the implementation of the strategy. The executive committee can be transferred power of the board of directors.

Balanced and independent composition of the Board of Directors

The code recommends the inclusion of non-executive directors even in non-listed companies according to the size of the organization. The outside directors are full-fledged directors charged with the fulfilment of tasks entrusted to the Board of Directors by working with the other directors. This collegiality entails that – with the exception of the committees – one must avoid meetings at which not all directors are present.

The outside directors benefit the system in a number of ways. They help provide an objective view of the enterprise, give impartial advice and increase discipline and the sense of responsibility with regard to reporting. They can play a major role in crisis situations, watch over the succession of the managing director and share their networks and relationships with the enterprise. They also provide for experience and knowledge transfer.

A high-performance (Senior) Management

In this code, the senior management should be defined as the group of all executive directors, the members of the executive committee (or management committee) and of the top management, in which one strives for optimal collegiality.

Principles for involved shareholders

In order to achieve the long-term strategy, the enterprise must be able to rely on shareholders who are prepared to make a professionally justified, but long-term personal commitment, adopt a coherent vision of the enterprise and are prepared to turn over the direction and supervision to qualified bodies.

Role of the shareholders

In the non-listed enterprise, shareholders are responsible of defining the values and monitoring that they are respected, defining the vision of the enterprise, establishing the financial objectives concerning growth, risk, profitability and liquidity of the share, appointing the board of directors and establishing the playing rules for their mutual interactions, whether or not in the form of a shareholders' agreement.

Promoting shareholder involvement

The Board of Directors (BoD) must enhance shareholder involvement, focusing minority shareholders as well, by taking actions that could include periodicals and timely communication of identical information to the shareholders. The BoD should also formulate recommendations that protect the continuity of the enterprise by making it more attractive for external stakeholders.

The Code should distinguish between the stakeholders such as bank and any other financiers, suppliers, customers, personnel, outside advisor(s) and the government .

In the interest of the continuity of his enterprise, an entrepreneur must also develop a vision about his relationship with the aforementioned stakeholders. These Codes help the enterprise optimize business performance and discourage any opportunism.

These Codes also provide a wide array of benefits. Bar associations and other private interest groups can draw on their own resources when participating in the drafting process. The participation in such a reforms project for corporate governance comes with high costs. However, the reputational benefits coming along with the creation of such a code make people place higher value to such participation.

Contrary to statutory laws, the drafting process involves disinterested lawmakers and experts who have their key concern in the attached reputation and enrichment of legal expertise. Since these experts attach more importance to values, the drafters of corporate governance codes will be less inclined to create value-decreasing statues.

Unlike statutory laws, which rely more on politically oriented decision-makers, the corporate governance codes rely on technical input from experts and produces a coherent set of rules that reduce opportunistic behaviour in the longer run. The codes facilitate the production and implementation of "best practice" principles and helps in meeting the needs of distinct firms as well as introducing norms that reflect the ever-changing dynamics of the business environment.

An effective corporate governance framework in banking sector can allow emerging markets demand that non-listed companies comply with the respective code as part of the process of credit rating and risk assessment (Berglöf and Claessens 2004; Saidi 2005). The downside to this approach could be increasingly complex regulations and overstretched regulators at the banking sector end. To overcome such a challenge, it would be more appropriate if policymakers direct their focus on flexible company law legislations that enhance private ordering and make it possible to emulate the most efficient contractual corporate governance mechanisms.

Financial accounting

Business participants usually prefer an organizational structure that defines the ownership form, contractual terms and internalized norms. Such a framework also paves way for the corporate governance framework for non-listed firms. The question then is choosing the most appropriate legal organisational form.

The most common organizational structure in the world is that of a limited liability company (55% of the businesses worldwide and 90% in OECD countries). In emerging and transitional markets too, this remains the most preferred form of business for non-listed companies. For such companies, the often mandatory periodic publication of the company's annual reports is the primary source of public information. These reports, however, sometimes may exhibit laggings when it comes to complete and transparent disclosures. The direct and indirect transactions between the company and the controlling shareholder can also affect the accuracy of the financial reports. IAS 24 and other accounting standards are increasingly being applied in various economies to reduce such cases. Disclosure should be limited to what is material, in other words to those elements which are significant for an assessment of the financial statements.

Minority shareholders

Publicly held companies are generally characterised by many small shareholders who are mostly interested in the share price and lack the expertise and competency to take part in the decision-making process. It is for this reason that for such companies, providing residual rights of control to shareholders would be a costly activity. However, the company law here allows shareholders an *ex ante* incentive to make incentives of financial capital while delegating the residual rights to management, thus separating ownership and control. This, however, does not entirely deprive the shareholders of every control right within the firm as they are provided with the right to information, dividend, the right to elect and remove managers and the right to veto substantial asset purchases or sales initiated by the managers, such as mergers and acquisitions.

In addition to this, the company also provides adequate framework to address concerns related to the organizational structure and the working of internal groups including aspects of decision making, representation nature and reaction to unforeseen problems.

Internal governance structure: board and management

Limited liability companies can be considered as a legal organisational form providing a differentiated management and control structure in which shareholders elect directors and participate in certain fundamental decisions while the Directors establish policy, select managers, perform monitoring functions, and act as the firm's agents.

A number of authorities lie with the controlling shareholders including the distribution of cash and property to confer benefits on shareholders, deciding on dilutive share issues and interested transactions, allocation of corporate opportunities and business activities, right to selective disclosure of non-public information (*e.g.* Johnson *et al* 2000; Choi and Talley, 2001).

In order to ensure that the separation of controlling power from shareholders does not give undue share of power to controlling shareholders, the company law helps to align the interests of both stakeholders (controlling and minority shareholders).

Fiduciary duties

Case law sometimes assumes that limited liability companies and partnerships are functionally similar and that entrepreneurs choose the former to take advantage of limited liability and tax benefits. This encourages advocates to propose modifications of exit rules for non-listed companies to enable the participants to enjoy the same exit options as found in partnerships. The argument also extends to the idea that such closely held firm settings encourage shareholders to owe each other a strict fiduciary duty of good faith and loyalty.

However, due to the vague nature, any breach of fiduciary duties may not be identified by an outside party, such as a court, consequently assisting in preventing opportunism to a limited extent (Easterbrook and Fischel, 1986). Having a prophylactic function, fiduciary duties can be found to foster the development and internalisation of trust and norms in a particular business relationship.

In limited liability companies, fiduciary duties for managers include taking assistance in matters of the company from a prudent person who manages his own affairs of equal gravity and being loyal to the company and limiting opportunistic or negligent behaviour. The fiduciary relationship extends to the shareholders as well.

Some scholars are of the opinion that strict and broader fiduciary duties could lead to counterproductive behaviour as well. In this view, broad fiduciary duties could encourage parties to engage in over monitoring at the expense of productivity (Talley 1999)

Enforcement of the duty of loyalty

It is often argued that having a set of fiduciary duties implemented without an independent and high quality judicial system can lead to results that are not desirable (Pistor and Xu, 2002). Transitional and developing economies often lack the required judicial system, and thus, improvement in the existing judicial system in such economies is of prime importance. The gap exists due to inadequate expertise, precedents and financial resources. Without the necessary improvements, the proposal could do more harm than good.

It is thus, essential, to have a narrow and clearly defined formal set of legal rules to define the scope of the duty of loyalty and related expectations from the business participants in the short and long term (Kaplow 1992). The law could define the roles of directors as caretakers and custodians keeping a check on opportunistic transactions.

Though appropriate, the law could cause a financial burden on smaller non-listed companies due to the associated costs (Saidi 2005). Some may even view these legal and corporate instruments as disproportionate and over-regulatory. These factors might impede the development of an efficient supply of legal rules for a range of firms. The cost involved

includes aspects like increased information costs, uncertainty, distortions in the signalling function of the corporate governance framework, decreased coherence of terms, erroneous gap-filling by courts and negative spill-over effects.

Considering that the associated costs may outweigh the derived benefits, it would only be wise to have a separate reform project for such companies (Saidi 2005). This will create a set of “delinked” corporate governance frameworks that are more suited to companies according to their needs. Development of such a set of Codes will be more beneficial for small non-listed companies which are characteristic of developing and transitional economies. It will, thus, help develop such markets in a better and managed way.

Briefly explained: the code for non-listed companies

Black and Kraakman (1996) have proposed an approach to drafting of company law. The approach in itself is self-enforcing. Although designed for publicly held companies, a related approach can be implemented for limited liability companies successfully. The proposed law has the potential to increase the available information for the shareholders (including minority shareholders) and create lesser reliance on judicial interpretations which are not very developed in transitional and developing economies.

For success in the longer term, the code should indicate all the transactions that would need prior approval and also the formal procedure for carrying out transactions. The proposed code offers participants a set of default terms that provide a practical framework and eliminates any associated cost burden. It also provides the business partners the flexibility to react and mould according to socio-economic changes. The proposed code also helps legal decision-makers, like courts, a simple and coherent set of terms making the legislation not only acceptable and low-cost corporate governance framework but also a simple tool for conflict resolution. The supply of clear and simple rules will arguably be regarded as value-enhancing (Easterbrook and Fischel 1991).

Public versus private information

Transparency and adequate disclosures are essential to discourage opportunism and promote trust in the corporate governance system. Mandatory financial disclosures of balance sheets, income and cash flow statements and external auditor reports are generally published for the benefit of shareholders and to provide confidence to minority shareholders particularly. The question then remains about the accuracy and reliability of the disclosures. The business form legislation should be implemented and administered by governmental lawmakers to promote trust and transparency. Pro rata distribution rights, pre-emptive rights and information rights must ideally protect minority shareholders. The lawmakers should focus on clear and simple fall-back provisions in the legislation for non-listed companies (Masten, 1988; Ayres and Gertner 1989). In this manner, not only the transaction costs will be reduced by the necessary

flexibility to amend the corporate contracts in view of changing socio-economic landscape will also be there.

RESEARCH METHODOLOGY AND DATA

The study is based on primary data collected through personnel interviews of 150 non-listed companies in Pakistan during February to July 2007. A structured questionnaire was prepared in consultation with legal practitioners and business community. A random sampling methodology was used to ensure representation of various categories of respondents which included non-listed firms operating in various businesses registered with Chamber of commerce. After scrutinizing and editing, 120 valid questionnaires were included in the analysis of awareness of corporate governance among non-listed companies in Pakistan.

DISCUSSION OF RESULTS

The respondents were covered from both manufacturing and services sectors. The number of directors reported by the non-listed companies varied from 2 to 8. However, the 28 percent reported as 3 directors each in their firm. 17 percent firms indicated less than 3 directors, thus qualifying as private firms. The remaining 55 percent reported number of directors as more than 4. According to the Companies Ordinance 1984, private, public listed and public non listed companies should have minimum of 2, 3 and 7 directors respectively. Private companies is defined as an entity which restricts the right to transfer its shares, limits the number of its members to fifty other than employees and prohibits any invitation to the public to subscribe for the shares (Companies Ordinance, 1984).

The desirable mix of board of directors includes a balance of executive and non-executive directors representative of the minority interests as well (Code of Corporate Governance, 2012). Only 10 percent of the respondents indicated a need to comply with such requirements. Out of 120 respondents 85 percent reported about the management awareness of the corporate governance regulations as applicable in Pakistan. Most of these respondents who indicated their awareness of applicability of corporate governance in Pakistan indicated that it will increase effectiveness in audit control, (76 percent); corporate disclosure (72 percent); and improved financial reporting (78 percent).

Only 35 percent of the respondents foresee a need for a Code of Corporate Governance for non-listed companies similar to one applicable to listed companies in Pakistan. They indicated that as a result of corporate governance application the audit control, corporate disclosure and financial reporting will be improved. The other factors which would be improved included compliance, risk management, approval procedures and documentation. About 60 percent of the respondents indicated that their management is voluntarily following some of the requirements of the corporate governance regulations and practices which included mainly control, documentations, and compliances. In all more than 40 percent

respondents agreed that following the corporate governance best practices resulted in achieving principles of transparency, accountability, independence and social responsibility in corporate culture of Pakistan. About 40 percent of the management respondents consider the cost of implementation of corporate governance in their firms would be costly business for them.

SUMMARY AND CONCLUDING REMARKS

In the segment of transitional and developing economies, the implementation of clear and judicially strong rules is costly and with the state of legislative system not ideal. However such codes are required for businesses to operate effectively. While the discussion on the need of such set of principles has gained momentum in such markets, the focus has largely remained publicly held large-sized firms. Considering that most of the companies in developing and transitional economies are smaller non-listed companies, a more systematic corporate governance approach is needed in this segment.

The aim of this paper was to analyse the needs of non-listed companies in Pakistan. We looked at the current legal structure and legal requirements for listed companies and recored the views of non-listed companies on whether these requirements are desirable for non-listed companies. This paper also tried to analyse different mechanisms for corporate governance system, their associated effectiveness and role that such a framework could play in non-listed companies. From a general consensus, it can be observed that rights and interests of minority shareholders and the opportunistic behaviour by controlling shareholders are two pressing issues that need a resolution.

It was also argued that a single legal framework is not suitable for across the board implementation for non-listed companies. The code needs to be flexible regarding nature of business operation and cost factors associated. This will lead to effective businesses that are better organized and managed effectively and also help enhance shareholder confidence and protect their rights

On the empirical level, majority of the participants showed their desire for some form of a code for reasons such as improved transparency, better audit controls and procedures, documentation and disclosure. There were concerns regarding the cost of compliance with the code, if such a code was issued.

We can therefore conclude that the majority of the executives of non-listed companies agree with the need for some form of code of corporate governance but there is room for discussion regarding the from this code needs to take and whether compliance will be a legal requirement or at the discretion of the company.

The way forward for research would be to investigate into the most suitable form of a soft code for the non-listed companies and whether some requirements be mandated by the Company Ordinance requiring an amendment in the legislation. Change in the legislation can fill the void by focusing more on corporate governance reforms in such markets where

smaller non-listed companies are dominant in terms of presence and as foreign investment recipients. The research also highlights that company laws can improve the performance of such companies by creating a set of processes to counter opportunistic behaviour.

The corporate governance codes form soft law that can easily translate into hard law constraints. Disclosure and transparency form key elements in any corporate governance system. The enforcement approach is another approach that aims to protect non-listed company investors. Investors are likely to switch to this mechanism if other gatekeepers are insufficient.

ABSTRACT

Purpose

The goal of this paper is to disclose the systemic institutional pattern of the involvement and participation of the enterprises and sectoral stakeholders in the designing and implementation of the Lithuanian Qualifications Framework (further named as LTQF) and national occupational standards. This goal is achieved by outlining the main groups of factors that define involvement of enterprises and sectors of economy in the designing and implementation of the LTQF and the analysis of the cases of the involvement of the two sectoral stakeholders (Association of the Chemical Industry and the Association of the Engineering Industries of Lithuania) in these processes

Design / methodology / approach

The research is based on the meta-analysis of the previously executed researches on the skills development in the enterprises, literature review, documentary analysis and interviews with representatives of the two associations of enterprises and policy makers.

Findings and originality / value

From the point of view of theoretical novelty and significance this paper provides new systemic and holistic insight to the institutional patterns of the involvement and participation of business in the development of the national system of qualifications. The practical importance of this paper is defined by the provision of useful policy learning materials for the development and facilitation of business involvement in the implementation of the National Qualifications Frameworks, occupational standards and related instruments.

Keywords: National qualifications framework, Lithuanian Qualifications Framework, occupational standards, sectors of economy, human resource management, human resource development

INTRODUCTION

Designing and implementation of the National Qualifications Frameworks (further named as NQFs) and occupational standards nowadays present very important trend of the national policies related to qualifications in many countries. Introduction and implementation of the NQFs and learning outcomes based occupational standards, as the instruments for management of qualifications in the system of education and in the labour market started in the UK in the eighties of the XXth century (development of the national qualifications framework of Scotland in the beginning of eighties, introduction of the National Vocational Qualifications in England in 1985 etc.), afterwards spreading to the English speaking countries worldwide. It is widely recognised, that the designing and implementation of the NQFs in the continental Europe was largely influenced by the European Qualifications Framework for Lifelong Learning and European Higher Education Qualifications Framework (Dublin descriptors) – the instruments of so called Copenhagen and Bologna processes - the European Union strategies for the development of the vocational education and training, higher education and lifelong learning and their contribution to the competitiveness of economies and human resources. The European Qualifications Framework (EQF), formally adopted by the European Parliament on 23 April 2008, is designed to offer a facilitating framework for comparing qualifications in different countries and NQFs are supposed to be referenced to, and aligned with, the EQF. Designing of the competence based Lithuanian Qualifications Framework (further named as LTQF) started in 2006 and the descriptors of the Framework were approved in 2010.²⁸ In the context of the introduction and implementation

²⁸ This framework is comprehensive and has 8 levels: the first 2 levels comprise unskilled and low skilled qualifications based on the key skills acquired on the workplace, levels 3 and 4 comprise skilled vocational qualifications, which are acquired in the VET schools or by independent learning in the workplaces and also demand general education, level 5 qualifications comprise of higher sets of vocational knowledge, skills and competences enabling to operate and manage technological work processes and technologies and acquired through independent continuing training and work experience, levels 6-8 comprise qualifications and degrees acquired in higher education and correspond to the Bologna Framework levels. The structure and contents of descriptors are based on the specifications of the activities – autonomy, complexity and changeability and the requirements of competences posed by these specifications.

of the NQFs qualifications tend to be understood by governments as standardised forms of recognition of acquired knowledge and skills with little regard for the differences in how qualifications are interpreted and approached by individuals and socio-professional groups, including enterprises and business stakeholders. Looking from this perspective the role and functions of qualifications, as well as of the different instruments related to usage of qualifications in the labour market highly depend on the involvement of enterprises and sectors of economy in their designing and implementation. The involvement of enterprises and sectors of economy in designing and implementation of the NQFs and the standardised descriptors of qualifications (further called occupational standards) largely influences the trust of learners and stakeholders in these instruments, thus defining their functionality. This involvement also presents the challenge and problem for the policy makers dealing with the different reforms and development of the national systems of qualifications. It requires to understand the factors and conditions that define effective involvement and participation of business in the development of national system of qualifications.

The goal of this paper is to disclose the systemic institutional pattern of the involvement and participation of the enterprises and sectoral stakeholders in designing and implementation of the LTQF and national occupational standards. This goal is achieved by outlining the main groups of factors that define involvement of enterprises and sectors of economy in the designing and implementation of the LTQF and the analysis of the cases of the involvement of the two sectoral stakeholders (Association of the Chemical Industry and the Association of the Engineering Industries of Lithuania) in these processes. The paper concludes with proposal of the principal model explaining the specificities of this involvement and its further role in the national system of qualifications of Lithuania.

The research is based on the meta-analysis of the previously executed researches on the skills development in the enterprises, literature review, documentary analysis and interviews with the representatives of the two associations of enterprises and policy makers. There were used the data of the previous qualitative studies about the skills development approaches in the industrial enterprises of Lithuania executed in the period of 2008-2010 and based on the exploratory case studies on skills development by interviewing managers and human resource managers of enterprises. In addition there were conducted comprehensive face-to-face interviews with the representatives of two associations of industrial enterprises responsible for the issues related to human resource development and qualifications.

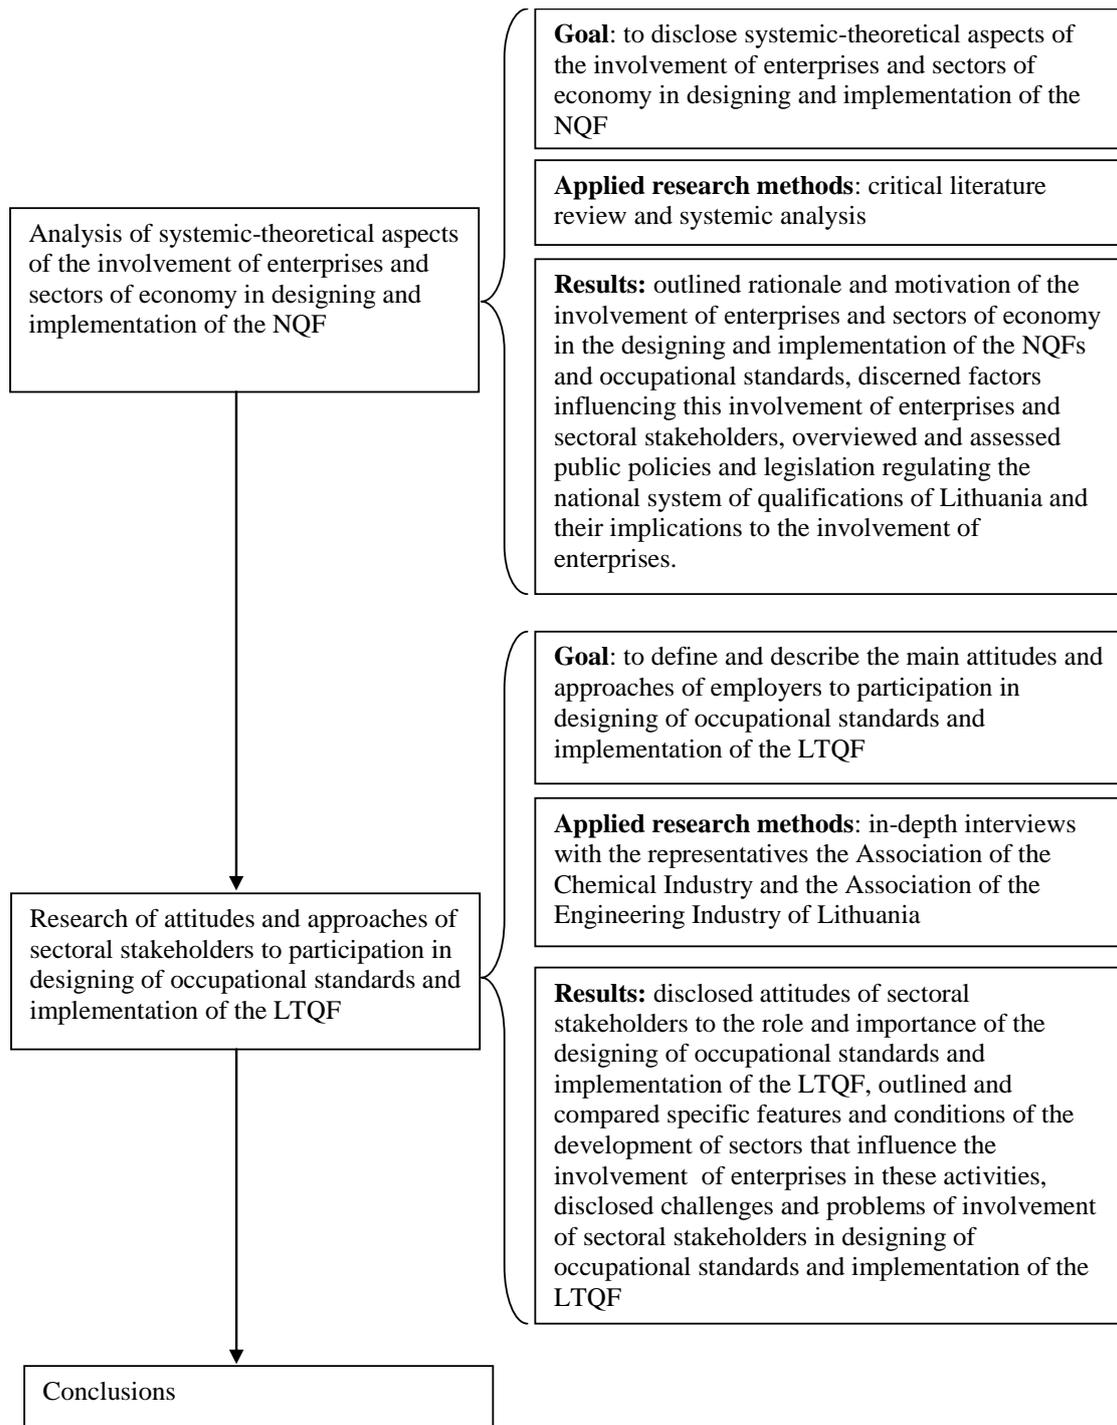

Fig. No.1. Stages of research

From the point of view of theoretical novelty and significance this paper provides new systemic and holistic insight to the institutional patterns of involvement and participation of business in the development of the national system of qualifications. The practical importance of this paper is defined by the provision of useful policy learning materials for development

and facilitation of the involvement of business in the implementation of the NQFs and related instruments.

1. SYSTEMIC-THEORETICAL ASPECTS OF INVOLVEMENT OF ENTERPRISES AND SECTORS OF ECONOMY IN THE DESIGNING AND IMPLEMENTATION OF THE NQFS AND OCCUPATIONAL STANDARDS

1.1. Rationale and motivation of the involvement of enterprises and sectors of economy in the designing and implementation of the NQFs and occupational standards

NQFs are the national policy instruments, facilitating optimisation of the exploitation and usage of qualifications in the country through different impacts: increasing consistency of qualifications, improving their transparency for individuals and employers, increasing currency of single qualifications, broadening of the range of recognised learning forms, establishing a national/external reference point for qualifications standards, clarifying of learning pathways and progression, increasing portability of qualifications in the labour market, enhancing greater coherence of national reform policies related to qualifications, creating a stronger basis for international cooperation, understanding and comparison of qualifications, enhancing realistic expectations of learners and users of qualifications (Changing qualifications, 2011). These instruments are developed from a national decision to establish a common framework of qualifications to strengthen commonality across different qualifications by specifying qualifications in terms of standards, levels and outcomes (Allais, Raffe, Young, 2009).

Why enterprises and sectors of economy should be interested to take part in the designing and implementation of the NQFs and other related instruments, such as occupational standards? We can presume, that the rationale and motivation of their participation should be based on the following functions and features of these instruments:

1. Applicability and usage of NQFs and occupational standards in the human resource management and development strategies of enterprises. Here the enterprises and sectoral stakeholders consider, to what extent, where and how they can use the NQF and occupational standards as instruments in the concrete functions of human resource management

(recruitment, selection, assessment or performance, organisation of continuing training and skills development of staff, assessment of performance, wage setting, etc.). For example, human resource managers of enterprises may intend to use NQF level descriptors or occupational standards as reference materials for the screening and selection of candidates in recruitment, for the designing of the continuing vocational training and skills development programmes or for the assessment of performance. If such motives prevail, then the representatives of enterprises and sectors would see ensuring the practical application of these instruments for the different human resource management practices and processes as the priority of their involvement in their implementation.

2. Increasing institutional power of enterprises and sectors in the systems of education, employment and industrial relations. In this case the enterprises and sectoral stakeholders seek to establish themselves and strengthen their positions in the different decision making processes influencing the development of the systems of education, employment and industrial relations. National Qualifications Frameworks and occupational standards provide quite convenient platform for enterprises and sectors of economy to increase their influence over these processes. Looking to the current reforms of qualifications in the different countries there can be noticed the changing role of employers in the reforms of qualifications. Allais, Raffe and Young (2009) indicate, that the shift from the institution-based approach to learning outcomes-based approach in the reforms of qualifications reflects strive to change the power and autonomy of the stakeholders of the system of qualifications by decreasing the power and autonomy of providers of training and increasing the power of 'users' of qualifications – employers and learners. Employers increase their role by becoming the main providers of information on the skills needs, raising many issues about the readiness and willingness of employers to take part in these processes, as well about the perspective orientation of their perceived skills needs. The interests of the enterprises and their representatives to participate in the implementation of the NQFs and occupational standards might be also related to their intentions to exercise bigger control or to influence the spheres of the usage of qualifications, especially in the wage setting or workforce migration.

3. Importance of the National Qualifications Frameworks and occupational standards for the strategies of the human resource management and development in the sectors of economies. Enterprises and sectoral stakeholders in the context of economic globalisation and increasing international competition might consider the NQFs and national occupational standards as the measures that can be used for the strategic development of human resources in the sectors with the active involvement of the public systems of vocational training and higher

education. For example, the sectoral approach in development of the national occupational standards can be important to ensure long-term preparation of skilled workforce for the sector.

1.2. Factors influencing involvement of enterprises and sectoral stakeholders in the designing and implementation of the NQFs and occupational standards

Having considered the rationale of enterprises and sectoral stakeholders to take part in the designing and implementation of the NQFs and occupational standards now we can turn to the nature and contents of this involvement. Referring to the theories of varieties of capitalism and institutional development we presume, that the involvement of the enterprises and sectoral stakeholders in these processes can be defined by the following factors:

- dominating competition strategies of the enterprises and their impact to the skills needs;
- existing institutional patterns of social dialogue and wage bargaining in the sectors and national economy;
- public policies and legislation regulating the national system of qualifications.

Further there are analysed general theoretical aspects of these factors looking into how these factors influence the participation of enterprises and sectoral stakeholders in the implementation of the LTQF and designing of national occupational standards.

Dominating competition strategies of enterprises, resulted skills needs and their implications to the involvement of enterprises and sectoral stakeholders in the designing and implementation of the NQFs and occupational standards

The competition strategies of enterprises influence their skills needs and, in turn, the interests of enterprises and sectors of economy in the implementation of the NQF and occupational standards. If the enterprises choose to compete on price and low labour costs, they would hardly be interested in the instruments and measures aimed to improve the skills potential of the present and future employees. Moreover, such enterprises may perceive NQFs and occupational standards as the instruments for the national regulation of the quality of workforce skills and competences, that limit access of unskilled and low-skilled workforce to many occupations and workplaces enhancing the skills development and, subsequently,

raising the skills level and costs of workforce. Only for these reasons the enterprises competing on price and low labour costs would abstain from (if not oppose to) the standardisation of qualifications on the national level and their ranking with the help of NQF. Competition which is based on the quality and high added value of products and services facilitates different attitudes of enterprises, because such competition usually demands proactive approaches in such fields as recruitment, staffing and human resource development. Here the NQFs and occupational standards can be perceived by the enterprises as helpful instruments in seeking to satisfy current and future skills needs. Mixed approaches in competition, when the enterprises apply differentiated competition strategy based on price and quality in the different business activities may lead to the differentiation of attitudes towards the participation of enterprises in the designing of occupational standards and implementation of the NQF. For example, such enterprises could be highly interested to contribute to the designing and development of standards for higher qualifications that are needed for the strategies of competition based on quality, but could abstain from the standardisation of qualifications in the lower skilled occupations, because it is not favourable for the human resource management adapted to the competition on low labour costs. What could be the impact of the increasing pressure of economic globalisation on enterprises to compete both on price and quality due to the global „price and quality“ revolution (Brown, Lauder, Ashton, 2011) ? First of all, it could increase the interest of enterprises in occupational standards and the NQFs, because in such circumstances the enterprises face a big challenge to get and sustain high-skilled human resources at the most competitive price and costs. Standardisation of qualifications by NQFs and especially occupational standards can help to attract and train needed human resources in more rational and economic way. The need to compete both on price and quality also makes enterprises more dependent on the public systems of initial vocational education and higher education in securing the provision of high skilled workforce. However, other responses of the enterprises to these challenges could be expansion of outsourcing and shifting of the workplaces (including those requiring high skills) to the countries of cheaper workforce, what can decrease their interest in the implementation of the NQFs and occupational standards. In the countries that receive outsourced workplaces (to some extent it is also pertinent to Lithuania) the demand for skilled and highly skilled workforce can increase, subsequently fostering the interest of enterprises and sectors in the occupational standards and the NQFs.

Looking to the competition strategies of the enterprises of Lithuania there can be noticed rather strong domination of the strategies of competition based on price and low labour costs.

According to the statistical data of „Statistics Lithuania“, in 2012 *almost a quarter of full-time employees of accommodation and food service enterprises and one fifth of full-time employees of other service activities enterprises earned the minimal monthly wages (over the year, their number dropped by 9.5 and 5.2 percentage points respectively). The greatest number of full-time employees earning the minimal monthly wage was recorded in wholesale and retail trade (20.3 thous.), education (13.6 thous.), and manufacturing (13.2 thous.) enterprises, since the majority of employees in the whole economy work in the said activities (Statistics Lithuania, <http://www.stat.gov.lt>).*

Domination of the competition strategies based on low labour costs has been largely defined by the various factors of economical and institutional development, especially by the specificities of the transition to the market economy with the top-down formation of capitalist relationships, when the former political-bureaucratic elite took important part in privatization process. As it is noticed by Norkus (2008), such pattern of privatisation did not bring new capital or managerial competences and caused the processes of economic involution which manifested itself as decline of industry, technological downgrading of the production, when enterprises which former produced high technology or high quality products which can be competitive in the export markets shifted to the production of primitive products for the local market. Other important factor was domination of the enterprise organization as company limited by shares, that did not create any additional incentives and interests of the owners to compete on the quality and to invest in the competence development of the employees (Norkus, 2008). Besides, many enterprises faced different challenges related to the shortage of financial resources and difficulties in accessing the European markets.

The enterprises responded to the challenges of market competition in the different ways that had different implications to skills development. For example, big industrial enterprises, which were leading producers of certain products in the Soviet Union (sectors of shipbuilding, chemical industry, food industry, etc.) used **to sustain and further develop their activities in the same field as before restructuring**. They seek to compete in the international markets by improving the quality and choice of products and offering attractive prices. However, competition on price creates big challenges in the sustaining skilled workforce. For example, the sector of shipbuilding constantly experiences the poaching and shortage of skilled employees and face important difficulties to sustain production of ships. To deal with this situation, shipbuilding enterprises orient their production to the building of specialised high quality ships and invest in the modern production technologies. However, the lack of skilled workforce in some cases makes shipbuilding enterprises to shift from the

shipbuilding to the subcontracted production of sub-assemblies and units requiring lower skills levels (Zavackienė, 2010). Quite often the enterprises, that sustain and further develop their activities in the same field as before economic restructuring perform the training mostly reacting to emergence of different immediate needs and requirements, such as changes in technology or legal requirements. Training and skills development are considered as source of costs which can be cut in case of necessity or unfavourable economic situation. For example, economic recession in 2009-2010 drastically cutted the own funding of training of employees in many enterprises. Shortages of skilled workforce and increasing competition for the skilled human resources due to emigration and EU integration push these enterprises to be more active in the training of new employees (establishment of enterprises training centres in the shipbuilding) and 'to import' workforce in order to remain in business.

Concerning the ways of provision and development of skills, reactive approach to training and constant skills needs enhances application of traditional and economic ways and methods of skills development, which ensure operative provision/acquisition of skills and do not require big investments and organizational efforts (eg., on the job training). Constant important shortage of skilled labour and mismatch between the needs of workplace and profile of skills provided in the initial VET and higher education institutions sometimes force these enterprises to take active part in the initial training by establishing their own training centres (shipbuilding enterprises) or signing concluding agreements with the VET and higher education institutions in the field of apprenticeship, practical training etc.

Exploitation of the outcomes of skills development and their impact to the performance of these enterprises are limited by comparatively high mobility of workforce and fluidity of staff. Constant shortage of skilled workforce sharpened by the dynamic changes in the products market also force these enterprises to focus on the short-term provision of skills, largely ignoring their long-term impacts to the performance of enterprise.

Other enterprises decided to improve their competitive positions by *introducing new products and services*. **Shift to the new products and services** during the economic restructuring depended on many different factors, such as loss of the former markets and customers, changed needs of the market, technological changes and breakthroughs. The shift to the production of new products and services sometimes is based on the enterprising initiatives of managers to find new promising niches of activities which can be developed by using existing skills, competences and experience of employees, as in the case of one enterprise working in the production of equipment for food and chemical industry. In the

Soviet period this enterprise produced industrial laundry equipment. Collapse of the Soviet planned economy and shift to free market brought significant challenges such as the loss of the former customers and users in the former Soviet Union and Central and Eastern Europe and facing new demands of market in terms of quality and quantity of products. Enterprise tried to find new markets and to converse to the production of the new products, where would be possible to apply existing technological competences and know-how. Analysis of the available technological competences, such as mechanical processing and welding of stainless steel, designing of equipment, etc. helped to identify new field of activities, in which these competences and know-how could be applied – production of the equipment for food, beverage and chemical industry. This shift to the new products also implied important changes in the organization of production – transfer from the standardised serial production to the production of customised and non-standard products. There appeared wider range of work situations due to the increased variety of product types and specifications. Production of non-standard products required higher developed capacities of operators to make operative decisions about quality assurance, solution of different operative technological problems. It also required more intensive consultations and cooperation between the workers and engineers, designers and other specialists and facilitated development of related functional skills and knowledge.

Skills development needs in these enterprises depend on the following factors:

- 1) The extent to which available pool of skills can be applied in the production of new products or can be used as a basis for reskilling or upskilling of workforce according to the new production needs. Shortage of skilled workforce and limited competition capacity for the skilled workforce in the European or global labour market make these enterprises very dependent on the available pool of skills (the case of production of equipment for food industry).
- 2) The type and origin of the know-how needed for the introduction of new products, as well as accessibility of this know-how.
- 3) The type of new products and new production. For example, transfer from the standardised serial production, which was very common in the planned economy to more customized and non-standard products increased the needs of transferable practical knowledge and skills due to the widening of the range of work operations and increased variety of product types and specifications.

Introduction of the new products and services requires accumulation and sustaining of the pool of related new knowledge, skills and competences in the enterprise. This new pool of knowledge, skills and competences is constantly accumulated through the measures of continuing training, work experience, international contacts and exhibitions, technological cooperation with customers and suppliers. Very often it is concentrated in the small groups of employees, then disseminating this know-how and skills to the other employees at the needed extent. This is also a case in the analysed industrial enterprise producing equipment for food industry. Such approach of the exploitation of know-how and skills provides bigger safety for the know-how and human capital of enterprise in the context of increasing poaching and workforce migration.

The shift from the former production of original products to the subcontracting was quite typical for many industrial sectors, such as shipbuilding and textile. In many cases production for subcontracting constituted only a part of the activities of enterprises besides the production of their original products or provision of services. Outsourcing and subcontracting was one of the principal possibilities for the industrial enterprises to enter the new markets of Western Europe and to develop the “western” direction of their exports, ensuring the means for survival in the market.

Shift from the production of original products to the subcontracting amongst other reasons can also be caused by the shortage of skilled workforce. As it was mentioned before, in the sector of shipbuilding emigration of skilled workforce and its shortage in the local labour market made some enterprises to abandon the production of ships and to shift to the production of different subassemblies on the subcontract basis. In this case many enterprises choose the option to adapt its production process to the downgraded skills level of human resources instead of searching the ways to upgrade the skills with the measures of continuing training or skills development. Skills development approaches in such enterprises also depend on the level of added value and skills requirements related to the complexity of subcontracted products and services. Outsourced production of simple, low added value products usually do not bring new know-how and do not require skills development. If the outsourced production is more complex and different from the original production it can bring new know-how and enhance development of more proactive approaches of enterprise in the skills development. Sometimes outsourcing includes extensive transfer of know-how and skills from the contractor to subcontractor by implementing systemic and comprehensive

training measures. It can essentially change the approaches of such enterprises to training of employees enhancing emergence of the new cultures of training and learning.

The main factor, which influences skills development needs in this case is the contents of outsourced activities (complexity) and features of outsourced products. In case of outsourcing of low added value production there are exploited existing skills without any significant needs and requirements of new knowledge and skills. If subcontractors succeed to get the orders of more complex products and services requiring higher skills, there usually emerge new skills needs together with better possibilities of provision and it's funding. For example, outsourcing enterprise organises the training of the employees of subcontractor, or higher revenues from the subcontracting permit to invest in training. In this case there is also a clear domination of the skills development needs of enterprises over personal skills development needs of employees, because skills needs and contents of training usually are very closely related to the requirements and specifications of subcontracted production.

Skills development in the new enterprises working in the high skills sectors (biotechnological industry, mechatronic industry). Many enterprises in the high skills sectors established themselves in the initial stage of the economic restructuring and transition in the first years after the re-establishment of independent state. These enterprises were established by the young entrepreneurial engineers or researchers, seeking to develop and market new intellectual products and services. In some sectors these enterprises emerged from the former institutes of scientific research established in the Soviet period. This is a case of the enterprises in the biotechnology sector, which originated from the departments of the institute of scientific research of applied enzymology established in Vilnius in 1975. These enterprises experienced fast growth and development, many of them today are acquired by the leading international companies. The emergence of new high skills sectors implied development of new occupations related to development and implementation of innovations and innovative products.

Attitudes and approaches of these enterprises to skills development of employees are proactive and strategic. Special attention is paid to the cooperation between enterprises and higher education institutions in the field of internships and career design of the students and graduates.

Creativity and open mindedness of employees to the new ideas and possibilities is one of the most important qualities for these enterprises. Therefore in human resources recruitment and development these enterprises prefer to 'get' from the educational institutions widely

educated and open minded people with solid and rich knowledge base and then to help them to acquire needed specific skills and competences in the work process and through on-the-job training.

Skills development in these enterprises is oriented to the generation and implementation of different innovations. The initiatives and autonomy of employees in skills development are very important features. Demand of initiativeness, creativity and open-mindedness in creation and implementation of innovations sometimes lead to the preference of recruitment of the new employees rather than retraining and upskilling of the existing pool of human resources. As it was noticed by the representative of enterprise working in the field of mechatronics, in case of emergence of the new field of activities it is much more advantageous to hire new employees from the graduates of educational institutions, rather than to retrain and upskill available employees. First of all, graduates are much more open minded to new ideas, they do not have any reservations or precautions, which are shaped by the professional experience and continuing training. Therefore they are more creative and easier accept new knowledge and new ideas.

Skills development needs in these enterprises are related to the processes of research and development. Skills needs very often develop in parallel to the creation and implementation of different innovations. Therefore, skills development needs in these enterprises correlate with the needs of the new sources of knowledge and ideas. The importance of solid knowledge base and creativity for the activities in these enterprises enhance their cooperation with universities in the organisation of internships, equipping of laboratories, etc. For example, there is developed strong cooperation of the biotechnological enterprises with the universities in the field of organization of studies, practical training of students, even co-funding of studies. However, the current regulations of admittance to higher education studies permitting the candidates to apply in parallel for the different study programmes, according to employers, do not facilitate enrollment of motivated students and have detrimental effect on the quality of studies.

These enterprises in their human resource development prefer those ways of skills development which are favourable for generation and development of new ideas and their implementation. Some enterprises send their specialists for training to foreign countries or foreign experts are invited to the enterprise for the purpose of training, as it was admitted by the representative of the biotechnology enterprise. Another important source of learning is visiting of the different exhibitions, trade fairs and scientific conferences, which is very

favourable for the emergence and development of the new ideas and innovations. Special attention is given to the development of key skills and extrafunctional knowledge, such as entrepreneurship, know-how in economy and management. Scientific staff and engineers often lack this kind of knowledge and skills and it limits their capacities to create and implement innovations. The outcomes of skills development are used in the creation and implementation of the innovations. Dissemination of acquired know-how and ideas is very important factor for the emergence and development of new ideas. Therefore these enterprises implement different measures for the dissemination of know-how and experience. For example, in the interviewed enterprise of biotechnology, the know-how acquired in the continuing training and different conferences are disseminated and shared through reporting of participants of these events.

Despite of intensive competition for high skilled specialists in the international labour market these enterprises do not experience important losses of human resources, because they succeed to create attractive jobs and careers for high skilled employees.

To summarise there can be outlined the following implications of the above analysed strategic approaches of competition to the interests and possibilities of enterprises to involve in the designing and implementation of the LTQF and occupational standards:

Strategies of competition	Interests of enterprises to involve in the designing and implementation of the LTQF and occupational standards	Implications to the possibilities of enterprises to involve in the designing and implementation of the LTQF and occupational standards
Strategies of big industrial enterprises to sustain and further develop their activities in the same field as before restructuring.	Dominating reactive approaches to training focussing on the solution of the current challenges and problems of human resource management imply the focus of interest of these enterprises on the immediate usage of the LTQF and occupational standards for effective solution of the current problems in the fields of staffing and recruitment. The lack of visibility of possibilities for immediate and concrete usage of these instruments for the solution of existing skills shortages seriously hampers	Focus of management only on the current challenges and problems of human resource management limits the possibilities of enterprises to engage in the development of more strategic and long-term oriented measures, such as qualifications frameworks of occupational standards. Very limited financial and human resources of the enterprises limit their possibilities participate in the designing and implementation of the LTQF and occupational standards and require additional support from the

	<p>the interests of these enterprises to participate in their designing and implementation.</p>	<p>state. One of the most important external challenges for the involvement of such enterprises in the designing of occupational standards and LTQF is uncertainty on how these instruments that enhance workforce mobility will influence the practices of poaching of skilled workforce in the internal and international labour market.</p>
<p>Strategies of competition based on the shift to the production new products and/or provision of the new services.</p>	<p>Longer-term orientation to the management and development of human resources increases the interest of enterprises in the occupational standards and the LTQF. Their interest is also related to the needs of the new skills and qualifications and their availability in the labour market. In order to rise their interest it is important to demonstrate how and to what extent the occupational standards and the LTQF will help to expand the supply of skills and qualifications in their fields and activity, as well as to ensure the quality of these skills and qualifications.</p>	<p>Implementation of such strategies of competition requires significant investment of financial, human resources and time. Intensive activities and exploitation of the available human resources can limit the possibilities of the representatives and experts of such enterprises to participate in the designing and implementation of the occupational standards and the LTQF.</p>
<p>Strategies of competition based on the shift from the former production of original products to the subcontracting.</p>	<p>Depends on the type and features of the subcontracted products and services. If the subcontracting is based on the lowest possible labour costs and the exploitation of the available pool of skills in the enterprise, this strategy would enhance enterprises to abstain from the development of occupational standards and the LTQF, because these instruments enhance skills development and, consequently, can facilitate increase of labour costs. If the subcontracting involves execution of the complex orders and requires new skills and</p>	<p>The scarcity of financial and human resources limits the possibilities of these enterprises to be more actively involved in the designing and implementation of the LTQF and occupational standards. The state support (especially financial) is very important to get these enterprises involved. Other important limitation could be fastly changing profiles of skills needs of workforce due to the changes of activities implied by the diversity and change of products and services produced for contractors. Such instability could make the identification and forecasting of</p>

	qualifications, it can increase the interest of enterprises in the occupational standards and the LTQF.	skills needs very complicated. It could also make enterprises more interested in the „modularised“ and flexible qualifications.
Strategies of competition typical for the newly established enterprises in the high skills sectors	The interest of these enterprises in the occupational standards and LTQF can be limited due to the fact, that their human resource management and development strategies are very individualised and based mainly on the bilateral cooperations with the universities and research institutions. If the occupational standards and the LTQF are viewed primarily as the measures for the state regulation of qualifications, it can significantly reduce the intentions of these enterprises to contribute to their development. Besides, the activities of such enterprises very often are strongly dependent on the different international standards and regulations of qualifications and skills. For this reason the extent of links and references of occupational standards to international qualifications and the referencing of LTQF to the international sectoral frameworks of qualifications can be very important factors increasing the interest of these enterprises to cooperate.	One of the main factors, that limit the possibilities of these enterprises to contribute to the development of the occupational standards and the LTQF is that they are very few and not representative in terms of number of employees in the national economy. It permits for these enterprises to solve their human resource problems by direct bilateral cooperation with the universities and research centres reducing the need for the national level instruments related to qualifications. Other limiting factors are related to the specific features of the work processes in these enterprises, that hinder the possibilities of standardisation of knowledge, skills and competences. The important role of creativity and innovations in the activities of these enterprises also contradict to the standardisation and rigidity implied by learning outcomes or competence based occupational standards.

Table No. 1. Implications of the above analysed strategic approaches of competition to the interests and possibilities of enterprises to involve in the designing and implementation of the LTQF and occupational standards

Competition and human resource management strategies have both enhancing and suppressing influence to the interests and intentions of enterprises to participate in the designing of occupational standards and implementation of the national qualifications

framework. Other important factor is the variety of institutional patterns of social dialogue and wage bargaining.

Existing institutional patterns of social dialogue and wage bargaining in the sectors and national economy and their implications to the involvement of enterprises and sectoral stakeholders in the designing and implementation of the LTQF and occupational standards

Analysing existing institutional patterns of social dialogue and wage bargaining in the sectors and national economy in Lithuania there can be outlined the following typical features:

- decentralised and individualised wage-setting process;
- weak organisation of trade unions and employers organisations with the shortage of human resources and expertise, that are needed for the participation in the processes and policies related to qualifications and training;
- absence of sectoral agreements or arrangements, that would regulate designing, provision and awarding of qualifications;
- formal social dialogue the national level through the established tripartite councils and institutions.

Decentralised and individualised wage-setting process is based on the individual negotiations between employers and employees. Collective bargaining in wage setting is almost absent. It is strongly related to the domination of the liberal market paradigm in the human resource management of the enterprises leading to rather high extent of poaching of skilled employees and low incentives to invest in the continuing vocational training and skills development. Highly strenuous and complicated industrial relations demand trade unions to invest almost all their efforts and human resources to the negotiations with employers in the field of wages, labour security and work conditions. For this reason the questions related to education, skills and qualifications become secondary in the agendas of trade unions activities (Tūtlys, Spūdytė, 2011)

The organisation of trade unions and employers organisations is weak and the bodies representing these stakeholders lack human resources and expertise, that are needed for the participation in the processes and policies related to qualifications and training. It leads to fragmented and unsystemic participation and involvement of these stakeholders in the sectoral and national administration of skills formation system and qualifications. Employers' organisations and enterprises usually have more power than trade unions in the

fields and issues related to employment, qualifications and skills development, but they often lack the expertise and know-how in this field. It implies very different capacities of stakeholders to participate in the designing of occupational standards and implementation of the LTQF. In turn, the different capacities of stakeholders to participate in these processes will require, that some stakeholders would temporarily take the responsibility to represent and defend interests of the other social groups (usually not represented by these stakeholders), which can not be sufficiently represented in the process of the reforms of national system of qualifications. For example, state authorities are expected to represent and defend the interests of employees in the implementation of the LTQF until the trade unions will be ready to take over these responsibilities. It means stronger orientation to the centralised national approach in the process of implementation of the LTQF and other instruments of the national system of qualifications with smaller responsibilities of sectoral stakeholders. Looking from the other side, there is also a high probability, that the involvement of the above mentioned sectoral stakeholders and, consequently, strength of the referencing of VET and higher education curricula to the sectoral needs will be very diverse and depending on the specific situation of sectoral labour market (supply and demand of skilled workforce), as well as on the experiences of the sectoral stakeholders in the fields of VET and higher education. Thus, the involvement of employers and trade unions in the designing of occupational standards and implementation of the LTQF is expected to be more active in the sectors with bigger deficit of skilled workforce and more rich experience of the participation of stakeholders, such as the sector of international freight transport, engineering industry, light industry.

There are no *existing sectoral agreements or arrangements, that would regulate designing, provision and awarding of qualifications*. The sectoral employers' organisations also do not execute skills needs analysis or forecasts. For this reason the involvement of the sectors in the implementation of the LTQF and occupational standards will be ensured and sustained only by the formally and purposefully established new institutional structures, such as below analysed Central Professional Committee and sectoral professional committees.

Although *formally the social dialogue is present at the national level through the established tripartite councils and institutions*, the above mentioned weakness of the social partners (especially trade unions) enhances development of rather centralised approaches with the strong role of the Government in the management of the system of qualifications. It leads to the excessive bureaucratic and controlling attitudes of responsible state institutions and can risk jeopardising effective long-term implementation of occupational standards and

descriptors of the LTQF as instruments trusted and used by the enterprises and sectoral stakeholders.

Industrial relations systems of post-socialist countries and societies can be characterised by the same types of structural, regulatory and institutional asymmetries of industrial relations outlined by Regini (Winterton, 2007). However, the origin and contents of these asymmetries are rather specific, as well as the implications of these asymmetries to the involvement of social stakeholders in the designing of the occupational standards and implementation of the National Qualifications Frameworks.

Structural asymmetry between labour and capital in the industrial relations in Lithuania is expressed as domination of capital in the industrial relations. The implications of this domination to the designing of occupational standards and the LTQF are twofold. From the one side, it increases the importance and role of employers in defining the needs of skills and qualifications, leading to the expectations of their active participation in designing of occupational standards and implementation of the LTQF. From the other side, domination of employers in industrial relations and weak influence of trade unions in the field of skills development and qualifications create favourable conditions for the low pace human resource management and development strategies based on the sustaining of the status quo in the field of skills and qualifications of workforce, competition on the low labour costs and low incentives to invest in training and skills. In these conditions the involvement of employers and enterprises in the implementation of the national policy instruments for development of human resources becomes very dependent on the presence of immediate skills needs of enterprises and challenges or obstacles in satisfaction of these needs. If the present skills needs are satisfied or can be easily satisfied by the enterprises themselves, the incentives of enterprises to take part in designing of occupational standards and implementation of the LTQF will be low.

Regulatory asymmetry in the labour market caused by the imperative role of state is important in the most post-socialist countries due to the undeveloped social partners, lack of mutual trust and agreement between these partners what seriously limits their capability to regulate industrial relations and labour market. There can be noticed certain combination of the strong formal regulatory role of state and big influence of employers in the industrial relations, when the state plays rather ambiguous role – from the one side, it seeks to contribute to the

defence of rights and interests of employees through the labour legislation and social policy, from the other side it seeks to support the employers and attract investors in implementing liberal economic agendas. As it is noticed by many researchers, in this light occupational standards and NQFs can be regarded by the Government and stakeholders as attractive instruments, that can help to regulate many complex questions of employment, social policy and education access without requiring strong direct regulation from the state (Young, Allais, 2009; Grugulis, 2007). However, such regulatory assymetry can significantly increase the influence of state and employers in the designing of occupational standards and NQFs.

Institutional assymetry in the labour market and industrial relations derived from the tendency for rule and practices to endure is rather weak in the post-socialist countries, because the real influence of the formally established tripartite institutional settings is low due to the lack of expertise, experience and capacities of stakeholders. The endurance of rules and practices of institutions is also weak due to the transitional character of the institutional models of industrial relations and labour market. It did not create conditions for the continuity of the development of institutions and implied rather abrupt changes of institutions and rules of their functioning. Many institutions and institutional settings were established through policy borrowing. For example, many tripartite institutions in Lithuania were established by policy borrowing from Germany and Nordic countries. The local socioeconomic and cultural context has restricted it's effective functioning. One of the main implications of this situation for the involvement of employers in the designing of occupational standards and implementation of the national qualifications framework is the adaptation of the schemes and approaches of social partnership used in the other countries. The model of social partnership *in design of qualifications and professional standards is shaped by applying the experience of different countries – UK, Scandinavian countries, France, Germany etc.* The main factors, limiting the policy borrowing in this field are the costs effectiveness of the borrowed examples and their suitability for the small country. If the example of social partnership in designing of occupational standards implies complex and costly schemes and mechanisms of cooperation and includes requirements of private investment or co-investment of employers, it becomes unattractive and difficult to apply.

1.3. Public policies and legislation regulating the national system of qualifications of Lithuania and their implications to the involvement of enterprises in the designing of

occupational standards and implementation of the Lithuanian Qualification Framework

The measures of public policies and legislation regulating the national system of qualifications in Lithuania are strongly directed to the solution of the existing skills mismatches in the labour market.

Labour market of Lithuania today is characterised by large asymmetries between the supply and demand of skilled workforce and rather deep structural unemployment, when even in the situation of high unemployment enterprises can not find suitable skilled human resources and look for the possibilities to recruit specialists from abroad. According to the data of Statistics Lithuania, the share of unfilled workplaces decreased with growing unemployment in the period of economic crisis, but now increases again:

Year	2008	2009	2010	2011	2012
Unemployment level %	5,8	13,7	17,8	15,4	13,2
Free workplaces (% from the total workplaces)	1,7	0,5	0,6	0,9	0,9

Table No. 2. Unemployment level and share of free workplaces in Lithuania. Source: Statistics Lithuania (<http://www.stat.gov.lt>)

Other feature of the Lithuanian labour market is rather high level of over-qualification, when about one fourth of the university graduates have to occupy the workplace demanding vocational qualifications. It is obvious, that the current employment situation does not facilitate effective usage of the human resources in the labour market and does not lead to the development of the human capital in society.

How the foreseen institutional model of the implementation of the LTQF and introduction of occupational standards match the above described features of the involvement of social stakeholders in the national system of qualifications? This question can be answered by

comparing the outlined features of the social dialogue with the requirements for the involvement of stakeholders posed by the public policy decisions of the implementation of the LTQF and introduction of the occupational standards.

Foreseen institutional model of the implementation of LTQF and introduction of occupational standards is based on the tripartite principle of involvement of social stakeholders. There is also centralised coordination of the functions and cooperation of stakeholders. Under the order of Ministry of Education and Science there has been established the Central Professional Committee, consisting of the representatives of employers organisations, chambers, trade unions organisations, providers of the initial VET and higher education and government bodies. The order of the Minister of Education and Science foresees the following main functions of the Central Professional Committee (Valstybės žinios, 2010):

- initiate the drafting of the legal acts needed for sustaining and development of the national system of qualifications and the discussing of the laws and legal acts regulating the system of qualifications;
- provide counselling for the Qualifications Regulation Body (Centre for Development of Qualifications and Vocational Training) on the issues of qualifications and skills needs;
- approve the establishment of sectoral professional committees and to advice the number of members of these committees;
- define the priority sectors of economy for the formation of the system of qualifications (for the designing of occupational standards);
- advice the Qualifications Regulation Body (Centre for Development of Qualifications and Vocational Training) concerning the designing of occupational standards and referencing of qualifications to the EQF;
- initiate updating of the LTQF;
- discuss the disputable questions concerning formation and development of the system of qualifications and provide solutions;
- approve the annual plan of designing of qualifications prepared by the Qualifications Regulation Body (Centre for Development of Qualifications and Vocational Training);
- advice concerning the accreditation of the competence assessment bodies;
- discuss the strategic issues and questions of the system of qualifications.

Most of the functions of this Committee are related to advisory role with rather limited influence for the decision making in the field of designing of occupational standards and implementation of the LTQF.

The sectors' professional committees (17) are established referring to the principle of competence of members and not to the principle of balanced tripartite partnership. These committees consist of the representatives of employers, Professional organisations, trade unions, providers of VET and higher education, Government bodies. The main responsibilities of sectoral professional committees consist of (Valstybės žinios, 2010):

- ensuring the conformity of qualifications to the needs of a given sector (together with the Qualifications Regulation Body);
- providing advice to the Qualifications Regulation Body concerning the sectoral qualifications and related competences;
- defining priorities for the designing of occupational standards in the sector;
- providing advice to the Qualifications Regulation Body concerning the designing of occupational standards;
- approving the designed occupational standards or VET standards;
- approving the initiation and designing of the curricula of formal VET leading to the acquisition of qualification;
- evaluating the conformity of the VET curricula to the requirements of occupational standards and VET standards;
- providing advice to the Qualifications Regulation Body concerning the continuing training of VET teachers .

Looking to the principles of the establishment of these committees, their roles and responsibilities there can be noticed the attempt to combine the centrally state regulated approach in the implementation of the LTQF with the delegation of responsibilities to the sectoral stakeholders. The main decision making and coordinating power belongs to the Centre for Development of Qualifications and Vocational Educations as Qualifications Regulation Body.

It also indicates more or less top-down way of the involvement of sectoral stakeholders in the processes of designing of occupational standards and their referencing to the LTQF.

This approach in principle matches the needs of the current situation, when due to the insufficient development of capacities and expertise of employers, trade unions and other stakeholders the Governmental institutions and specialised bodies have to play more important role not only in the coordination of activities, but also in providing know-how and

expertise. Such institutional model implies a bit passive roles of employers because they do not have important responsibilities related to sustaining of established institutional bodies and development of their functions. The funding of established institutional framework for the implementation of the LTQF and occupational standards only from the state budget could also impede the development of the co-ownership of these instruments shared by the state and different social stakeholders.

From the other side, the existing legal and institutional arrangements of the designing of occupational standards in Lithuania are open for the initiatives of the employers and other stakeholders to participate in this process. As it was expressed by the interviewed representative of the Centre for Development of Qualifications and Vocational Education - institution responsible for the coordination of the designing of occupational standards and implementation of the LTQF:

The possibilities will be provided to all stakeholders, but the initiative to take part in the design of qualifications should come from the stakeholders (trade unions) themselves. We can not impose anything from above, if there are no initiatives from the trade unions themselves. Employers already expressed their initiatives and interest.

There is quite wide agreement and consent amongst policy makers, that employers must play the key role in the process of design of qualifications. It is rather generally accepted, that qualifications are designed and assessed by the world of work, referring to the existing and future needs of the professional activities. This idea is rather clearly expressed both in the concepts of qualifications and competences, as well as in the conceptual design of the descriptors of the Lithuanian Qualifications Framework. It is foreseen, that the system of occupational standards will consist of the sets of qualifications structured according to the needs and requirements of the sectors. It will require to undertake sectoral approaches in analysing the structure and contents of the existing systems of occupations and qualifications. Designing of qualifications is planned to follow the hierarchical structuring of qualifications by using levels descriptions of the LTQF. The Government decree of the 4th of May 2010 No.535 on the approval of the level descriptors of the LTQF foresees, that „13. *By following the order prescribed by law, there can be introduced sub-levels of qualifications related to the experience of professional activity in order to enhance the professional development of employees.*“ (Valstybės žinios, 2010). This legal statement permits to sectoral stakeholders to establish their ‚sub-levels‘ of the LTQF in cases, when the qualifications in the practices of human resource management and development of the sector are structured in different way, than the structure of levels of the LTQF. This clause of the government decree opens the possibility for

the sector-based implementation of the LTQF, when the ‚placement‘ and referencing of qualifications to the LTQF levels is executed following the needs and requirements of activities in the sector and practices of human resource management and development in the sectors.

The endurance and systemic involvement of enterprises in the designing of occupational standards also depend on their participation in the provision of training and assessment of competences. The role of sectoral stakeholders in the provision of training and qualifications can be significantly increased by the introduction of apprenticeship in the initial VET. The law on Amendment of the Law of Vocational Education and Training issued in 2007 legally introduced apprenticeship as the pathway of initial VET. It provides the legal possibilities for enterprises to become responsible for the provision of both theoretical and practical training. Enterprises can sign the contracts with schools for the provision of theoretical training. This form of training is still on the experimental phase and not yet implemented, because most employers, especially small and medium size enterprises are not yet capable nor ready to take all the responsibility (including funding) for this strand of vocational training. Successful introduction of apprenticeship in the separate sectors could become important factor enhancing stronger participation of enterprises in the development of the system of qualifications.

2. PARTICIPATION OF ENTERPRISES IN THE DESIGNING OF OCCUPATIONAL STANDARDS AND IMPLEMENTATION OF THE LTQF - ATTITUDES AND APPROACHES OF SECTORAL STAKEHOLDERS

The attitudes and approaches of sectoral stakeholders to involvement in designing of occupational standards and implementation of the Lithuanian Qualifications Framework were researched by interviewing representatives of the sectoral employers associations in the chemical industry and engineering industry. There were interviewed the representatives and experts of the Association of the Chemical Industry and the Association of the Engineering Industry of Lithuania.

Interview questions addressed three main issues:

1. Sector specific reasons and rationale for the involvement and participation of enterprises in the designing of occupational standards and implementation of the LTQF.

2. Experience of the sectoral organisations and enterprises in the sector in the field of designing and implementation of the instruments for national or sectoral regulation of qualifications.

3. Obstacles and problems for the active involvement and participation of enterprises in the designing of occupational standards and implementation of the LTQF.

Research disclosed, that in general the involvement and participation of the enterprises and sectoral stakeholders in the designing and implementation of the LTQF has been very limited so far due to the following reasons:

1) In the process of designing of the Lithuanian Qualifications Framework back in 2006-2008 the enterprises and sectoral organisations were involved to a very limited extent. There was obvious lack of discussions of the proposed projects of the qualifications framework in the sectoral employers organisations and the sectoral perspectives and attitudes to designing, provision and awarding of qualifications were not considered. Very few experts of human resource management from the enterprises were involved in the process of designing of the LTQF descriptors thus limiting consideration of the human resource management practices and problems in setting the contents and structure of LTQF descriptors.

2) Although the suggested approach of the implementation of the LTQF and occupational standards is strongly oriented to sectors, sectoral stakeholders see no concrete measures and resources for their involvement and participation in these processes. It leads to very episodic and fragmentary role of sectoral associations and enterprises in the designing of occupational standards and implementation of the LTQF.

3) There is a lack of clearly defined agenda and programme of the implementation of the LTQF with the foreseen sources of funding and human resources with clearly defined functions of enterprises and sectoral associations.

The research also disclosed certain sector related specificities of the attitudes of sectoral organisations that are discussed below.

2.1. Chemical industry

According to the interviewed representative of the Chemical industry association, the interest of involvement and participation of this sector in the development of occupational standards and implementation of the LTQF is not based on the specific short-term skills needs of the

enterprises or skills shortages, but rather on the understanding the importance of these instruments for the long-term human resource development of the sector.

Today chemical industry in Lithuania does not experience shortage of skilled employees due to many different factors.

First of all, big industrial enterprises of this sector evolved from the vast industrial complexes that influenced emergence and development of the towns and urban communities in the Soviet period (before 1990). Today these towns and urban communities are less dependent on the survived big enterprises, but still they influence comparatively low turnover of employees due to the limited choice of workplaces in the other sectors and enterprises. Most of the big chemical enterprises work effectively and profitably and are capable in offering competitive wages and salaries to their employees. The enterprises in general are satisfied with qualifications and skills of employees, that correspond to the work process requirements.

Secondly, the shortages of skills and qualifications in enterprises are satisfied through their direct contacts and cooperation with the education and training providers. The sector of chemical industry has developed a kind of it's own system of training of specialists based on the direct cooperation between the enterprises and training providers. Enterprises conclude the contracts with initial VET providers, universities and their students, pay the grants and sholarships to those students in return for their obligation to work in these enterprises after the graduation. In this way their main task is to motivate young people to choose the careers that correspond to the needs of enterprises. Besides, big enterprises of the sector have their own training centres. For example the training centre of the concern *Achemos grupė* is responsible not only for the continuing vocational training and skills development of the employees, but also for the initial vocational training of the needed skilled workers, when there are no other providers of needed qualifications in the national system of initial VET.

There are many foreign capital enterprises in this sector and the decisions about development of these enterprises, implementation of technological and organisational innovations and satisfaction of skills needs are taken abroad. Very often these enterprises satisfy their needs of skilled human resources by bringing employees from abroad, especially in case of high skilled employees. In this way they become independent from the national system of initial VET and higher education in their human resource management.

Some challenges for the designing of occupational standards in this sector are created by the contents of work processes. The work processes in the chemical industry can be characterised

by the stability of technological processes and rather narrow uniqueness (specificity) of workplaces in the companies. It leads to the bigger attention of human resource management to the development of specific workplace related knowledge and skills making serious obstacles for designing the descriptors and standards of qualifications. Narrow specificity of occupations and their strong dependency on the unique technological processes and workplaces in the enterprises significantly increase the variance of work processes by making standardisation of qualifications very challenging and expensive undertaking. There is also a fear, that the standardisation of qualifications on the national level can create additional obstacles for the low-cost 'import' of the workforce from the third countries, if the occupational standards will be applied as measures for the regulation of the workforce quality.

Analysing the main obstacles and problems that impede the participation of sector's enterprises in the designing of occupational standards and implementation of the LTQF, the interviewed representatives of the Association outlined the following ones:

1. There is a lack of understanding of the need and importance of these instruments for the human resource management of enterprises. Current human resource management processes and practices in these enterprises do not demand such instruments.
2. The enterprises can not or do not wish to invest their assets and resources in the development of these instruments and they do not see the guarantees of public funding in this field.
3. The designing and implementation of the national occupational standards is too complex and time consuming activity, what makes it too rigid in the face of fast technological and organisational change in the sector. For this reason it could be difficult to persuade enterprises to support this activity, because they can satisfy the human resource needs in more simple way - by 'importing' needed specialists from abroad, especially from the cheaper workforce countries.
4. Enterprises do not notice, that their involvement and participation in the designing of occupational standards and implementation of the LTQF is regarded as important by the state institutions that coordinate these projects.

2.2. Engineering and machinery production industry

As it was noticed by the interviewed representative of the Association of the Engineering Industry of Lithuania LINPRA, the skills shortages are one of the most important problems

influencing the strategical development of the engineering and machinery production industry in Lithuania. There can be noticed the shortage of skilled workforce of all levels of qualifications:

Today the industry is capable to deliver high quality services of production and manufacturing to the foreign buyers, but is still not capable to create own products that provide higher added value. It means, that the current state of skills of workers and middle level employees is sufficient enough to achieve competitive quality of subcontracted products and production services (it does not mean that there are no shortages of skilled or medium skilled workforce), but the shortage of high skilled specialists who create the new products (engineers, product designers, product managers, etc.) in many enterprises does not permit to seek for the strategic breakthrough from subcontracting and execution of production services to the production of their own innovative and high quality products.

LINPRA takes active measures to solve the problems of skills shortages and notices some trends, which permit to expect the positive change of the situation. For example, it participates in the national project for the development of technological competences of vocational teachers from initial VET schools and lecturers of the universities of applied sciences, where employers play important role in defining these competences.

The interviewed representatives notice various ambiguities and controversies concerning the role of employers in defining competences and learning outcomes, because the priority of employers and their associations in this field is rather strongly contested and questioned by the providers of education and training. One of the main debated issues is the influence of employers and providers of education and training in defining the skills needs and contents of curricula. The vocational teachers in Lithuania have rich experience and expertise in curriculum design, because they have had wide autonomy in this field. Therefore, they also have rather strong opinion about the contents of vocational curricula and it's reference to the skills needs. Representatives of employers succeeded to find common positions with VET teachers when discussing the issues of skills needs. As it was expressed by the interviewed representative, *although there were some tensions and disagreements with the representatives of initial VET about who and how should define the training and skills needs of teachers and trainers we succeeded to find effective compromise.* In case of universities the situation is more complicated:

Our influence in defining learning outcomes in the higher education curricula is very much limited by the strong autonomy of universities, especially what regards curriculum design and organization of studies. Despite the fact that some universities are the members of our association, our possibilities to transmit our skilled needs to the design of the study programmes are very narrow.

What regards the standardization of qualifications in the engineering sector, the interviewed representative outlined the following issues:

1. The contents of the work processes, that are typical for the engineering industry is very much universal and to some extent even identical in the different countries due to the similarity of the applied technologies and approaches of work organization. It creates opportunities to use the standards and descriptors of qualifications developed in the other countries for designing of the occupational standards in Lithuania. Specificities of the work processes in the enterprises of Lithuania are very few and these are not significant, when considering the universal trends of the technological and organizational development of the work processes in this sector (automation of production, development of nanotechnologies, etc.). It implies the importance of the analysis of profiles and descriptors of qualifications used in other countries, as well as research of the common trends of the technological and organizational development of work processes when designing occupational standards. From the one side, it requires to apply the higher expertise of researchers, but from the other side it decreases the weight of the information obtained by interviewing the experts from the enterprises of sector and the need of such information.

2. One of the typical features of qualifications in the engineering sector is high level of their internationalisation. There can be mentioned the initiatives of the European Federation of the National Engineering Associations FEANI in establishing the EUR ING title designed as a guarantee of competence for professional engineers, in order to facilitate the movement of practicing engineers within and outside the geographical area represented by FEANI's member countries and to establish a framework of mutual recognition of qualifications in order to enable engineers who wish to practice outside their own country to carry with them a guarantee of competence (<http://www.feani.org>). Other example of international qualifications can be found in the field of welding. Here the European Welding Federation and the International Institute for Welding) achieved to harmonise national standards and qualifications offering different types of international welding qualifications and certifications (Cedefop, 2012). Due to high level of internationalisation of the qualifications in this sector, the interest of the Engineering Industry Association of Lithuania is to ensure, that the designed occupational standards could be smoothly referenced to the existing European and international standards and regulations that regulate qualifications in the sector:

It is absolutely necessary to ensure strong integration of our qualifications in the European structures and frameworks of engineering qualifications. This is necessary in order to ensure the quality and

international recognition of engineering qualifications provided in Lithuania, as well as to facilitate their attractiveness for learners and to enhance the quality of skills and competences of our employees. Of course, it can also create additional possibilities for the emigration of the holders of such qualifications, but the isolation of qualifications or „invention“ of country-specific qualifications or standards can not solve the problem, because it would enganger international competitiveness of the enterprises.

For the same reason LINPRA would support the idea of European sectoral framework of qualifications in engineering, metalworking and machinery production. Meanwhile the Association is ready to cooperate in the designing of occupational standards and implementation of the Lithuanian Qualifications Framework. Association is ready to delegate the experts from the sector for the designing of occupational standards and development of the national curricula of vocational education and training. However, for these activities external (public) funding is needed.

DISCUSSION AND CONCLUSIONS

We have outlined three main groups of factors that influence involvement and participation of employers in the designing of occupational standards and implementation of the LTQF:

- Factors related to the competition strategies of enterprises and their influence to the human resource management and development strategies and practices.
- Factors of existing networks, practices and patterns of social partnership in the field of initial vocational education and training and higher education in Lithuania.
- Factors of state policy in the field of human resources planning, labour market and education.

Dominating competition strategies and patterns in the enterprises, especially competition on price and low labour costs present a lot of challenges for the involvement of enterprises in the development and implementation of the national level human resource development instruments, such as occupational standards and LTQF designed to enhance competitiveness and quality of human resources. It is related to the direct contradiction between the mentioned designation of these instruments and the interests of enterprises that compete on price. These contradictions not only reduce the interests of enterprises to take part in the designing and implementation of these instruments, but also, when such enterprises are

involved, may increase the orientation of occupational standards and the LTQF to the satisfaction of the current skills needs and reduce their power to enhance skills development of human resources. The shift towards the competition on quality and innovations change the attitude of enterprises to the skills needs increasing their interest to have and to use above mentioned instruments in their human resource management practices, as well as to gain more power and influence in the cooperation with the education and training providers. It implies, that the designing of occupational standards and implementation of the LTQF should seek of higher involvement of enterprises competing on price and innovations.

Existing institutional patterns of social dialogue and wage bargaining in the sectors and national economy in Lithuania are characterised by decentralised and individualised wage-setting process, weak organisation of trade unions and employers organisations, absence of sectoral agreements or arrangements, that would regulate designing, provision and awarding of qualifications and overly formal social dialogue on the national level through the established tripartite councils and institutions. Such situation inevitably increases the regulatory and coordinating role of state in the designing of occupational standards and implementation of the LTQF. Increased role of state, as a compensation of the weaknesses of social dialogue could be effective in the short term perspective, because it may enhance more smooth and quick decision making process and may help to defend better the interests of the groups, that are represented in the social dialogue by the weaker and less influential stakeholders (eg., interests of employees). However, in the longer perspective the strong influence and regulatory role of state may discourage and demotivate social partners from more active participation in designing of occupational standards and implementation of the national qualifications framework. It may also narrow the space for the development of their know-how and experience in these fields. For this reason it is very important to make efforts in the capacity building of social partners in the designing of occupational standards and implementation of the LTQF, what would permit to delegate them more responsibility in this field.

State policy in the field of human resources planning, labour market and education is strongly oriented to the issues and problems of labour market and existing skills mismatches. The institutional model of the implementation of LTQF and introduction of occupational standards foreseen by the policy makers is based on the mix of the openness of these instruments to the needs and interests of stakeholders, tripartite principle of involvement of social stakeholders and centralised coordination of their functions and cooperation. There

can be noticed the attempt to combine the centrally state regulated approach in the implementation of the LTQF with the delegation of responsibilities to the sectoral stakeholders. While such approach in principle corresponds to the above discussed state of the social dialogue and capacities of social stakeholders to contribute to the designing of occupational standards and implementation of the LTQF and might be effective in the short run, it may also lead to the embedding of the passive attitudes and secondary roles of employers in this process (especially in the maintenance of these instruments) in the longer perspective.

Research disclosed the feeling of sectoral stakeholders, that they were largely ignored in the initial stages of the designing and implementation of the Lithuanian Qualifications Framework, especially missing more comprehensive discussions about these instruments and their contents within and between the sectors. It also disclosed rather different attitudes and approaches of sectoral stakeholders to involvement in designing of occupational standards and implementation of the LTQF. When the sector does not experience significant challenges in the field of skills and human resources or when these challenges and problems are being sufficiently effectively solved inside the sector by the efforts of sectoral organisations, enterprises and providers of training (as in case of chemical industry), there is no big interest in the national instruments of human resource planning and management in the short-term perspective. In this case involvement of sectoral employers' organisation in the designing of occupational standards and implementation of the national qualifications framework is more based on the understanding the importance of these instruments for long-term human resource development and from the other side it is based on the interest to sustain and increase the influence of sectoral stakeholder in the national policies related to skills development. The attitude of enterprises to the standardisation of qualifications and their structuring with the LTQF is very reserved and to some extent pessimistic, seeing from these instruments more threats and risks than the benefits. On the contrary, when the sector faces significant skills shortages or when there is a clear understanding of the necessity to improve and upgrade of the existing structure and contents of skills of workforce seeking to achieve technological and economical breakthrough (as in the case of engineering and machinery production industry), the sectoral stakeholders are much more interested to take part in the designing of occupational standards and implementation of the LTQF. In this case sectoral employers organisation regards these instruments and their utility from the perspective of the long-term strategies of human resource management and development. The attitude of sectoral stakeholders to the occupational standards and LTQF is more optimistic and

proactive, especially stressing the importance of the strong integration of designed qualifications with the existing international and European frameworks of qualifications in order to enhance international recognition of local qualifications and trust in these qualifications and human resources.

ABSTRACT

During the last decade we have witnessed multiple dramatic changes in the human behavior and practices due to the extremely expansive proliferation of the Internet technologies. One of the key technologies that has generated crucial changes was the introduction of Learning Management Systems. We find evidence from almost every university web site that a lot of the subjects are thought not only in a standard face-to-face mode but are also suggested as an e-learning content. Respectively the academic community is attracted by the opportunities to research the multiple domains that are impacted. This paper presents an approach for expansion of a learning management system with the goal to make it select an optimal learning path that is customized according to the specific behavior and performance of the user. The algorithm that is used implements elements from the theory of the intuitionistic fuzzy sets which are very appropriate for modeling of human perceptions and behavior.

Keywords: Intuitionistic Fuzzy Sets, Learning Management Systems, Intelligent learning, Similarity Measures.

I. INTRODUCTION

The successful carrier or business initiative in the contemporary knowledge based economy is almost always predetermined by active and consistent learning endeavors. However the high intensity of the professional and social life as well as the flood of the novel knowledge to be acquired make the task for personal development more and more complex. Multiple of the business and the educational institutions have adopted the e-learning as a core method for knowledge management. The expansion is observed in the rate of adoption and utilization of e-learning in all of its kinds (ITC, 2012). Nowadays one electronic learning environment

provides not only one-way but also two-way and multi-way interaction between tutors, learners and the e-learning content. The dynamics of user behavior is a subject for research of multiple studies (Macfadyen L. P., 2010), (Black E. W., 2008), (Huang Y., 2008), (Canales A., 2007). There are multiple publications and groups also in Bulgaria that focus on different LMS-related research domains (Tuparova D., 2007). Some of the studies (D. Denev, 2006), (P. Phobun, 2010) target to develop a guided learning process customized to each user based on assignment of the user to pre-defined models of learning or to algorithms that monitor his activity. Another domain for research is the grading process - how the e-learner is assessed on the basis of his activity in the system or/and on the basis of some examination. There are also suggestions that are based on the apparatus of the intuitionistic fuzzy sets (IFS) (Shyi-Ming Chen, 2013) however most of the methods imply human involvement in the appraisal process.

This paper suggests an approach for automatic assessment of the intermediate tests which are usually given to the e-learner in the milestone locations of an e-learning course. The results on these intermediate tests are often used just by the learner for self-assessment. However our goal is to use them as checkpoints that the LMS will use in order to determine if the user is ready to continue forward with the next topic in the course or he/she should go back and do some more reading on the previous subjects. The suggestion is based on an extension of the e-learning system with utilities that capture and store intuitionistic fuzzy data. We propose an algorithm to assign intuitionistic fuzzy grades to the intermediate test results based on additional information that we collect during the answering process. The intuitionistic fuzzy grades measure how much was the learner confident in his answers. Such an extension of the standard assessment of an answer as true or false provides an opportunity for a better suggestion for the next step in the course. Moreover as a future work this approach could be extended to support also the final assessment of the student.

II. PRELIMINARIES

In (Atanassov, 1999) Atanassov defines an intuitionistic fuzzy set (IFS) A over a finite universal set E as an object having the following form:

$$A = \{ \langle x, \mu_A(x), \nu_A(x) \rangle \mid x \in E \},$$

where the functions $\mu_A: E \rightarrow [0, 1]$ and $\nu_A: E \rightarrow [0, 1]$ define the degree of membership and the degree of non-membership of an element $x \in E$ to the IFS A . The following condition holds:

$$0 \leq \mu_A(x) + \nu_A(x) \leq 1.$$

Larger values of μ denote higher degree of set membership while larger values of ν denote lower degree of set membership. The set E is called universe of discourse. The value of $\pi_A(x) = 1 - \mu_A(x) - \nu_A(x)$ represents the degree of hesitation (or uncertainty) associated with the membership of an element $x \in E$ in the IFS A . We call this value intuitionistic fuzzy index (or degree of non-determinacy / uncertainty) of the element x to the IFS A . If $\pi_A(x) = 0$, for all $x \in E$, then the IFS A is reduced to a fuzzy set.

The IFS theory is very appropriate for modeling of human behavior as it usually implements some degree of hesitation. We have identified opportunity to measure the uncertainty of learner's confidence while he answers the intermediate test questions in an e-learning course.

The empirical data collected from the process of learning in a virtual environment are stored in an Intuitionistic Fuzzy Relational Database System (IF RDBMS) (Kolev B., 2005), (Kolev B., 2005). The data are analyzed by utilizing specific operators over the intuitionistic fuzzy records that are considered as elements from the universe over which are defined the intuitionistic fuzzy sets (IF sets).

The paper is organized as follows. The next section presents architecture of the system. The following one exposes the algorithm that is used to define an IF set for the purposes of this study. The fifth section gives an overview of the method that is used to evaluate an intermediate test and to appraise if the current knowledge of the learner is good enough to continue with the successive course topics or he/she should be brought back to read again a previous chapter of the material.

III. ARCHITECTURE OF THE SYSTEM

The authors have decided to use as a LMS Moodle due to several reasons: it has a GNU General Public License; it is widespread in Bulgaria and worldwide; it is among the most

advanced learning management systems. The empirical data collected from the process of learning in the Moodle environment are stored in a relational database management system (RDBMS). Due to the specific requirements the RDBMS should have been able to store and process IF data. Moodle was installed over an instance of the relational database management system PostGre because there is a module which is an IF extension of the PostGre RDBMS that implements operations from the IFS theory. Thus it facilitates the storage and the analysis of IF data.

IV. ASSIGNMENT OF THE INTUITIONISTIC FUZZY DEGREES TO THE ANSWERS OF THE TEST QUESTIONS.

Each learning course usually consists of several topics that learning objects (LO) (Gerard, 1967). Apart from the subject-matter and the practice items each learning object should have also intermediate and final tests to evaluate what the student has learned. We suggest an approach for automatic assessment of the intermediate tests and use the assigned grades to determine the next topic that will be presented to the learner – a new one or an old one that should be revisited.

An intermediate test is usually composed of several questions. The Moodle LMS presents opportunity to choose between different types of questions. For the algorithm it is not important which type of question is used. The important thing is that a question has to be filled in for some limited time. The student is informed that he has a time limit to provide the answer however the specific time is not presented to him. As each question has a different difficulty its assigned time limit is different. One question is considered as one element from the universe of disclosure used to define an intuitionistic fuzzy set A_{ij}^m for an intermediate test:

$$A_{ij}^m = \{ \langle x, \mu_{A_{ij}^m}(x), \nu_{A_{ij}^m}(x) \rangle \mid x \in E \}$$

Where i is an identifier for the student, j denotes the chapter of the course (i.e. is identifier for the test) and m states the attempt that the student is doing for this test. The membership and non-membership degrees are assigned when the student answers a question. When the answer is correct the membership degree is set initially to 1 and respectively when the answer is not correct the non-membership degree is set initially to 1. Next we calculate the hesitation degree $\pi_{A_{ij}^m}(x)$ and correct the initial values of the membership or non-membership degree. The hesitation degree is calculated on the basis of

the time that the student has spent on the answer of a question. We have conveyed a preliminary survey on a group of 75 students to find out the sample of answering times for each question. We consider that the hesitation degree $\pi_{A_{ij}^m}(x)=0$ if the answer to a question x_p is correct and the response time is within the interval $[0;t_p^{avg}+\sigma_p]$ where t_p^{avg} is the average time and σ_p is the standard deviation for the answering time of the correct answers for the question x_p received from the preliminary survey. If the answer is provided slower than we assign a hesitation degree different than zero and respectively lower the membership degree - the bigger is the time spent on an answer, the bigger is the hesitation degree. The exact formula that is used for the calculation is:

$$\pi_{A_{ij}^m}(x_p) = \frac{|t_p - t_p^{avg} - \sigma_p|}{t_p^{max} - t_p^{avg} - \sigma_p} * 0.5,$$

where t_p is the answering time to the question x_p in the current attempt of the student and t_p^{max} is the maximum available time for this question. Then the initial value of the membership degree is corrected by subtracting the value of the hesitation degree:

$$\mu_{A_{ij}^m}(x) = 1 - \pi_{A_{ij}^m}(x)$$

As the answer is considered correct the membership degree varies in the interval $[0.5;1]$ and the hesitation degree – in the interval $[0;0.5]$. Respectively when the answer is wrong the hesitation degree denotes the fact how much this wrong answer means that the student does not know the correct answer. We consider that if the student has provided a reply within the interval $[0;t_p^{avg}+\sigma_p]$ he/she was sure that the provided answer is the correct one. Respectively if the reply has taken longer time the student was more hesitated. Thus for the non-correct answers the initial value of the non-membership degree is corrected:

$\mu_{A_{ij}^m}(x) = 1 - \nu_{A_{ij}^m}(x)$. In the framework of these admissions the non-membership degree could take a value in the interval $[0.5;1]$ and the corresponding hesitation degree falls again in $[0;0.5]$.

V. EVALUATION OF AN INTERMEDIATE TEST

Upon a completion of an intermediate test the system has generated IF degrees for each of the questions and the respective IF set was defined. For example, if the test is composed of 5 questions then its respective IF set is:

$$A_{ij}^m = \{ \langle x_1, \mu_{A_{ij}^m}(x_1), \nu_{A_{ij}^m}(x_1) \rangle, \langle x_2, \mu_{A_{ij}^m}(x_2), \nu_{A_{ij}^m}(x_2) \rangle, \langle x_3, \mu_{A_{ij}^m}(x_3), \nu_{A_{ij}^m}(x_3) \rangle, \langle x_4, \mu_{A_{ij}^m}(x_4), \nu_{A_{ij}^m}(x_4) \rangle, \langle x_5, \mu_{A_{ij}^m}(x_5), \nu_{A_{ij}^m}(x_5) \rangle \}$$

We consider that the totally correct answer set of an intermediate test has the following IF set associated:

$$A_j^{best} = \{ \langle x_1, 1, 0 \rangle, \langle x_2, 1, 0 \rangle, \langle x_3, 1, 0 \rangle, \langle x_4, 1, 0 \rangle, \langle x_5, 1, 0 \rangle \}$$

We need to compare the two sets A_j^{best} and A_{ij}^m to measure how much the specific answer set of the given attempt of the intermediate test is close to the totally correct answer set. To do that we employ a technique from the IFS theory for calculation of a similarity measure between two IF sets. We use the similarity measure defined in (Boyadzhieva D., 2010) as follows:

$$\psi_q^{n,s}(A, B) = \frac{(\delta_{q,B,A}^{n,s} + 1 - \delta_{q,A,B}^{n,s})}{2}$$

where $q=\{1,2,3\}$ is the index that designates the norm, $n=\{1,\dots,34\}$ is the number of the negation, $s=\{',''\}$ designates the first or second type of subtraction for the given negation, A and B are the concrete IFSs that are compared, $\delta_{q,A,B}^{n,s}$ denotes the respective subtraction of the two IF sets A and B .

We have chosen $q=3$ which is the norm $\eta_{3,A}(x) = \frac{\mu_A(x) + 1 - \nu_A(x)}{2}$, $n=1$, $s=\{''\}$ and thus we could rewrite the formula like this (just to note that for the first IF negation the first and the second types of subtraction coincide):

$$\psi_3^{1,'}(A, B) = \frac{(\delta_{3,B,A}^{1,'} + 1 - \delta_{3,A,B}^{1,'})}{2}$$

As a result of the calculation of the similarity measure we could say which one of two compared IF sets has better intuitionistic fuzzy degrees and to know the extent of similarity.

In our case it is clear that the IF set A_j^{best} will be the one with better intuitionistic fuzzy degrees however on the basis of the specific value of the similarity measure we will be able to say how much similar is the current answer set for an intermediate test to A_j^{best} . We have to note that the similarity measure is a crisp value and thus it is easy to set a marginal value that will differentiate what the LMS will suggest to the learner – to continue with the next topic or to revisit a previous one. The following properties hold for similarity measure $\psi_q^{n,s}(A, B)$:

- a) $0 \leq \psi_q^{n,s}(A, B) \leq 1$
- b) If $\psi_q^{n,s}(A, B) < 0.5$, then the IF grades of the set A are better than those of the set B .
- c) If $\psi_q^{n,s}(A, B) > 0.5$, then the IF grades of the set B are better than those of the set A .
- d) If $\psi_q^{n,s}(A, B) = 0.5$, then the IF grades of the sets A and B are equal.

The algorithm that is implemented in the LMS of this study uses as a first IF set of the two to be compared the A_j^{best} set. Thus we could fell in cases b) or d) of the above ones and the similarity measure will be always less than or equal to 0.5. The values closer to 0.5 mean that the student has scored better. We have to note also that the worst similarity measure within the specified admissions is 0 – it happens when the answers to all questions are wrong and they have been provided within a time that does not exceed one standard deviation of the mean. When all questions are wrongly answered but all these answers have been provided at the last possible moment of the time given the similarity measure is 0.125. This number designates that the current answer set is far from the best answers but it also incorporates the information that the student was not confident in these wrong answers – i.e. he/she needs to revisit the previous topic but probably he/she already knows more than the student whose answer set has a similarity measure 0.

For example let's calculate the similarity measure for the first attempt of the first intermediate test performed by the student with id 23. Table 1 lists the records that represent this answer set. The respective membership and non-membership degrees that are assigned to each answer are presented in columns mship and nmship.

	mship double precision	nmship double precision	student_id bigint	question_no smallint	attempt_no smallint
1	0.7	0	23	1	1
2	0	0.5	23	2	1
3	0	0.2	23	3	1
4	0.5	0	23	4	1
5	0.6	0	23	5	1

Table 1. Records that represent the first attempt to the first intermediate test by a user with id 23.

The query that is presented on Listing 1. is executed from within the LMS against the IF database. There are several functions that implement operations from the IFS theory and are available in the IF module that extends the PostGre database (NORMS3, diff1).

```
select          AVG(NORMS3(d1."mship",    d1."nmship"))    as    d1_distance3_1,
AVG(NORMS3(d2."mship", d2."nmship")) as d2_distance3_1,
              (AVG(NORMS3(d2."mship",    d2."nmship"))+1-AVG(NORMS3(d1."mship",
d1."nmship")))/2 as similarity
from (select question_no, MSHIP, NMSHIP from ifs_interm_quiz1_best
      diff1
      select question_no, MSHIP, NMSHIP from ifs_interm_quiz1_attempts where
student_id=23 and attempt_no=1) as d1,
      (select question_no, MSHIP, NMSHIP from ifs_interm_quiz1_attempts where
student_id=23 and attempt_no=1
      diff1
      select question_no, MSHIP, NMSHIP from ifs_interm_quiz1_best) as d2;
```

Listing 1. The query that is executed to calculate the similarity measure between the IF set constructed for the attempt presented on Table 1 and the IF set A_1^{best} .

The similarity measure is $\psi_3^{1'}(A_1^{Best}, A_{23,1}^1) = 0.305$.

We have decided that 0.33 is a good marginal value against which the system will compare the similarity measure in order to decide what step to suggest to the learner. Thus the similarity measure 0.305 will make the student go back in the course. Let's see a few more of his next attempts to pass the intermediate test. Table 2 presents the second attempt to the first intermediate test of the same user.

	mship double precision	nmship double precision	student_id bigint	question_no smallint	attempt_no smallint
1	0.5	0	23	1	2
2	0	0.5	23	2	2
3	0	0.5	23	3	2
4	0.5	0	23	4	2
5	0.5	0	23	5	2

Table 2. Records that represent the second attempt to the first intermediate test by a user with id 23.

The similarity measure for this attempt is $\psi_3^{1'}(A_1^{Best}, A_{23,1}^2) = 0.275$. Looking at the IF degrees in Table 2 we could conclude that the student has pondered too much on each question and that's why the similarity measure is lower than the one assigned to the first attempt although the proportion of correct/non-correct answers is the same.

Table 3 lists the data collected during the third attempt of the same user for the same test.

	mship double precision	nmship double precision	student_id bigint	question_no smallint	attempt_no smallint
1	0.7	0	23	1	3
2	0	0.1	23	2	3
3	0	0.2	23	3	3
4	0.8	0	23	4	3
5	0.7	0	23	5	3

Table 3. Records that represent the third attempt to the first intermediate test by a user with id 23.

The similarity measure for the third attempt is $\psi_3^{1'}(A_1^{Best}, A_{23,1}^3) = 0.345$ which is greater than the threshold value 0.33 thus the LMS suggest to the student to go to the next section.

CONCLUSION

The paper has suggested a new way for automatic test evaluation in a LMS framework employing principles from the IFS theory. The method is able to capture the confidence of a learner based on his answers to questions provided to him by the e-learning environment. The assessment of the intermediate tests is used to suggest the next right step for the specific user at the specific state. The grade that is received could designate that the student should be brought back in the course and reread some of the material. As the decision is taken on the basis of both intuitionistic fuzzy degrees there could be situations when the student has answered correctly a substantial number of test questions but due to the fact that his/her answers were not pointed out with a high confidence the user is sent back to revisit the previous chapter of the course. Analogously there could be cases when a lower number of questions have been answered correctly but because the system has detected high confidence

the user is allowed to continue forward. A further scope for research could be to extend the application of this method to other milestones in an e-learning course or to include other tacit features of the user behavior in the learning management process.

MULTISKILLING IN THE HOSPITALITY INDUSTRY IN SOUTH AFRICA AND ADJACENT COUNTRIES

Nicolaidis, Angelo

Vaal University of Technology, South Africa, Pythagoras13@hotmail.com

ABSTRACT

As the southern African Hospitality Industry strives to become globally competitive, multiskilling is increasingly pursued as a means of increasing employee competitiveness. This study assesses the current state of multiskilling and explores some ways in which practical initiatives could be taken further to promote multiskilling and make it more effective. The purpose of the paper is to ascertain the current state of affairs in hospitality operations in a sample of five southern African countries using both quantitative and qualitative approaches. It also stresses the vital importance of developing effective multiskilling opportunities and practices. Some practical ideas are provided to assist in this regard. Multiskilling at the level of the industry is an ongoing process and a huge challenge and it relies on the passion for the industry of all employees and other stakeholders. The study also concludes that all hospitality industry managers have an invaluable role to play in the promotion of employee multiskilling which cannot be over-emphasised, failing which there will be a negative impact on the efficiency and effectiveness and ultimately profits of hospitality industry enterprises in southern Africa.

Keywords: hospitality industry, flexibility, staff utilization, multiskilling, efficiency, southern Africa.

1. INTRODUCTION

The hotel industry and the effective management of the human resources are of huge economic importance for South Africa and the immediate region, especially given that the number of international arrivals is increasing annually although it is not always as much as was expected. The literature suggests that multiskilling is considered to be an effective operational strategy to resolve concerns including insufficiently qualified employees and the high employee turnover rates that plague the industry. However, the question arises as to

how relevant multiskilling is in Hospitality businesses *per se*. One key question is whether hotels do use multiskilling. Another key question is in which areas precisely, should hospitality operations seek to multi-skill employees, if at all and if so does it lead to greater efficiency. There is clearly a need for hotels and industry players to leverage on technology, and to skill their workers to be able to handle multiple tasks, and thus also to streamline their operating processes. This article analyses why multiskilling is critical but often fails in its quest to assist hospitality companies to obtain a strategic competitive global advantage. In similar vein to what happens in most countries, skill development across the board is undoubtedly a significant factor in determining the competitive advantage of South Africa and since she is undoubtedly the tourism giant of the region, her industry was focussed on in particular in this research.

Hospitality is part and parcel of the tourist industry and tourism is the fourth largest generator of Gross Domestic Product (GDP) in South Africa after mining, manufacturing and quarrying (Taal, 2012. www.lrs.org.za). Hotels and other forms of accommodation operate in what is really an unpredictable global environment. There are large fluctuations on both the supply and demand side. Most of the customers emanate from the ranks of business and recreational travellers who seek accommodation in either hotels, guest houses, bed & breakfast enterprises, inns, time-sharing of apartments at certain resorts, eco-friendly nature and game lodges, camping sites caravan sites or other overnight accommodation. This also impacts on the food and beverage sector which includes restaurants, coffee shops, tearooms, fast food outlets as well as a wide range of catering services. The hospitality sector has grown rapidly over the last few years and it is now one of the fastest growing sectors in the economy.

In 2008 South Africa, like many other countries, was affected by the global recession. However in the latter part of 2011, the hospitality market suddenly began to suggest signs of improvement (CATHSSETA, 2010). The summer 2011-2012 season was the strongest it has been for a number of years. Clearly the impact of the FIFA World Cup 2010 cannot be underestimated. South Africa has also been promoted as a desired global convention destination and the country is guaranteed at the least, 200 international conferences during the next few years, which should attract approximately 300 000 visitors. After the FIFA World Cup 2010, the number of travellers continued to soar, rising by 4.3% to 13.77 million. Given this increase the number of foreign overnight visitors is projected to increase by at

least a 4.6% compound annual rate to attain some 10.45 million by the end of 2016 (South African hospitality outlook: 2012-2016 PricewaterhouseCoopers Inc. www.pwc.com/za/hospitality-and-leisure).

In South Africa in 2009 the hospitality and tourism sector generated R179 billion of economic activity and 45 000 jobs through direct employment and just over one million jobs, representing 7.6% of the total employment of South Africa (Taal, 2012. www.lrs.org.za). However, in the South African context, a major human resource challenge facing the hospitality industry, is the high staff turnover rates. This also constitute one of the key issues affecting service quality delivery. Unfortunately large number of employees consider hospitality work to be a pass-through to a job in a different and higher level industry, rather than as a life-time career commitment. There is also low morale and poor motivation levels which are decisive contributory factors to the high employee turnover (CATHSSETA, 2010). The need to develop appropriate retention strategies is imperative if this predicament is to be at all solved. One effective approach could be the multiskilling of employees as a means of motivating, incentivising and encouraging them to stay in the industry as a lifelong commitment. Ottenbacher and Gnoth (2005) argue that the effectiveness of a hotel's approach to managing employees is a critical source of sustainable advantage-hence, employees must be highly skilled and even multi-skilled. By multiskilling employees, hotels' can benefit from increased levels of productivity, greater service quality provision, and higher levels of employee retention. From the employees point of view, they are empowered with new skills and generally benefit from greater job satisfaction, increased remuneration, and greater opportunity for promotion (Riegel, 2002).

Veldsman (1994) has suggested that a diagnostic process be followed in ascertaining what an organisation needs to do to achieve effective transformation into a highly competitive global environment. What can be done to make an organisation more effective and efficient, and how can employees be made more competent and capable of meeting the ever-changing needs of organisations is now critical to success (Stalk et al, 1992). Each organisation is of necessity, required to clarify the criteria in terms of which business is conducted including *inter-alia*, quality of service, speed, innovation, cost and responsiveness (Galbraith & Lawler, 1993). There are no immediate panaceas for the ills plaguing organisations and so consideration must be given to the relative influence of remedies that are sought which would satisfy the criteria of the organisation. What is critical is that the strategic intent,

architecture and employees in the organisation must be carefully considered before any value-adding remedy is implemented. While the benefits of training are not immediately linked with financial performance, hoteliers in South Africa must be made to understand that employee training and especially multiskilling has benefits on service quality that in turn, influences both the competitiveness and financial performance of their operation. Remedies must be sought to improve profitability and multiskilling is for example, one such remedy intended to extend the range of skills of individual employees so as to improve their labour flexibility as they seek to react to workplace changes that affect them and the employer (Clark, 1989). A flexible multiskilled employee base has been identified as the most significant contributor to the development of human resources in reaction to a world in which there are many competitive, technological and labour supply pressures (Kalleberg, 2001; Knox & Walsh, 2005)

2. DEFINING MULTISKILLING

To lay a foundation in which this discourse can take place, it is necessary to define the term 'multiskilling' which is viewed from a number of diverse perspectives. Generally speaking, multiskilling is the attainment of supplementary task-related skills and knowledge, which empower an individual to perform a broader range of tasks and functions within any organization. Cordery (1989, p.13) states that: "Programmes of multiskilling generally involve workers on a particular occupational, craft or skill category progressively picking up the capability to perform additional tasks, usually performed by workers in another functional or occupational area within the organisation". There are three distinct types of multiskilling. Firstly, there is Cross-skilling, which relates to the acquiring of skills of a similar level of complexity but beyond the usual boundaries of the traditional operations. Secondly there is Vertical multiskilling which relates to the acquiring of extra skills at a higher level of difficulty, and thirdly, there is horizontal multiskilling which relates to acquiring other skills which are similar in levels of complexity (Wood, 1993). It is important to ascertain if employers know the exact competences they expect from the employees and only when their expectations match their perception, does service quality result which ultimately benefits the guests and the business (Ladkin, 2005).

Multiskilling is considered to an important tool to assist hospitality industry operations to cope with problematic environmental changes but a return on investment in it is only

possible if employee needs in the workplace are correctly identified and if employees are truly committed to, and passionate about their work. However, according to Ingram & Fraenkel (2006), despite the fact that multiskilling can improve service quality, it may also to an extent lower productivity by reducing the number of “point of service” staff. Training for multiskilling benefits hospitality operations, as the employees in attendance are capable of performing other tasks in shifting situations (Huang & Cullen, 2001). It also leads to greater economic success, enhanced productivity and greater profit margins, and more importantly lower levels of employee turnover in an industry that is plagued by inordinately high turnover rates of employees especially in peak seasons (Marchante, Ortega, & Pagan, 2006). Many hotels try to bridge the skill gap by taking on either part-time or casual employees (Lai & Baum, 2005). Multi-skilled employees are able to serve a business in a wider range of operational areas which cut across traditional occupational boundaries. by having an increasing pool of skills and concomitant loss of emphasis on job demarcation (Matias-Reche & Fuentes-Fuentes, 2006).

3. WHY MULTISKILLING IN THE HOSPITALITY INDUSTRY?

Multiskilling indicates practical ways in which existing employee workforces can be rationalised through optimally utilizing them so that employee costs can be operationalised, thus leading to greater efficiency and greater profits. Flexible employment practices and the integration of culturally diverse workforces in the hospitality industry are relatively new trends that can cause considerable challenges and opportunities for many countries in the SADC region. The manner in which these issues are handled strategically is becoming a vital issue for human resource managers in hospitality operations to consider. This is particularly relevant given that it is expected that the total number of travellers to South Africa will rise to 16.85 million by 2016, representing a 4.1% compound annual increase from 2011. This increase in travel and tourism will stimulate growth in the hospitality industry in the next five years and hospitality operations will have to have effectively skilled employees in place. In order to meet the demand of providing service quality excellence, employees will need to be multi-skilled. Central to the notion of multiskilling will be the development of formal enterprise-based skills training initiatives that will make provision for both horizontal and vertical skilling. Powell and Wood (1999) state that one of the most noteworthy problems in the hotel industry worldwide is the “brain drain” since the skills and qualifications gained in hotel sectors are effortlessly transferable to others. A continual and steady economic growth

rate both locally and abroad will hopefully assist the average hotel occupancy rate to improve and this is expected to increase by 9.1% to 62.1% in 2016, boding well for the industry (South African hospitality outlook: 2012-2016 PricewaterhouseCoopers Inc. www.pwc.com/za/hospitality-and-leisure). Consequently, employees should acquire the requisite skills which will eventually allow them to perform all the required tasks of a number of jobs both within and without their current functional areas of operation, when the need arises to do so. Competence in a variety of skills is desirable but employees should be given incentives so as to motivate them to acquire extra skills. Multiskilling will enhance the capabilities of employees and serve to strengthen the employers competitive advantage. Not only the employees, management and the organisation will benefit from multiskilling, but customers and guests will also benefit because of the quality of products and services received (Sommerville, 2007). Some operations refer to multiskilling as cross training. This ensures the employees obtain knowledge and skills from other departments and increases their ability to adjust to be able to work in these departments at short notice if and when a need arises, or as a matter of course (Walker, 2007).

Multiskilling is used by many international hotel groups as well as local and regional groups to enhance the skills of employees and also serves the role of grooming them for supervisory positions and is thus also linked to monetary incentives. Consequently when employees upgrade their skills their salaries are also upgraded. There is of course the primary notion of focussing on quality service provision. The multiskilling training of employees together from diverse departments cultivates a team spirit and this promotes higher operational efficiency as the various departments coordinate their activities especially during peak tourism periods. When information and skills are shared across departments, new skills are taught and knowledge is increased and so an effective learning culture is the result. Multiskilling is thus generally perceived to be a very cost-effective way to enable hotels to deal with the cyclical discrepancies in the demand for seasonal employees (Baum, 2006). Multiskilling, cross deployment and the use of the latest technology are generally at the pinnacle of the initiatives that most hotels are looking at to increase the levels of productivity of their employees.

It is important that the competency and skill levels of all multiskilled trained employees should be uniform so that no function is lacking in terms of guest expectations and service quality provision. A major benefit of multiskilling across hotel departments for example, is that allows flexibility of employees and provides supervisors with extra time to allocate team

members important and pressing tasks especially when large amounts of guests are expected. The ongoing success of hospitality operations in general relies heavily on the efficient and effective implementation of daily operations (Hrebiniak, 2005). According to Hinkin and Tracey (2000), employee turnover in the hospitality industry has been one of the biggest concerns for a number of years and it results in high direct expenditure as well as intangible costs (Woods and Macaulay 1989). The direct expenditure includes the administration costs of regular employee resignations, attracting new and efficient employees and recruiting and selection as well as seasonal hiring. The intangible costs comprise lost-man-hours, sub-standard service quality provision, and especially very low morale which all adversely affect a hotel's reputation if left unchecked (Hinkin and Tracey, 2000). Riegel (2002) maintains that high employee turnover is the outcome of an intricate chain of factors, including job satisfaction and organisational commitment to maintain an employee base. There is no doubt that hotels in particular, but also other hospitality enterprises, need to vigorously promote a culture in the workplace which promotes the notion that when employees assume positions that they do so on a permanent basis. Long-term employment must be promoted as the required and preferred option by especially managers as only in this way can a strong internal labour market develop.

Many employees leave since they feel they do not have the required skills and they thus become unhappy at work and seek other forms of employment which appear more rewarding and attractive to them (Mobley, 1982). Hinkin and Tracey (2000) explain that poor supervision and training, badly planned working environments, as well as poor rates of compensation cause the high rates of attrition in the industry workforce. Cheng and Brown (1998) explain that hotels need to effectively induct and socialise employees as this is generally not happening in hotels worldwide. Furthermore they require training and personal development that highlights the desire of a company to invest in their employees which in turn should lead to an increase in employee commitment and to job satisfaction in general. Multiskilling training can help reduce employee turnover rates since employees will increasingly find meaning in their work and be able to cope with challenges on a day-to-day basis. Employees will become more creative and innovative and be satisfied even though their salaries and conditions of employment may not be as they desire them to be (Kelliher & Riley, 2003). Heskett *et al.* (1990) propose that service organisations need to 'become employers of first choice...develop and retain such people through...ministering'. This notion is furthered by Schneider and Bowen (1993) who explain that the customers'

experience is the central issue in appreciating service quality provision. Their research also advocated that the solution to managing the customer's experience of service quality provision is to manage employees' experiences in their place of employment. Hence where multiskilling is in place, employees more likely to be positive and more receptive to customers and their needs and wants. Multiskilling empowers employees and helps them to better understand their work in the broadest sense and it encourages self-confidence and self development. They are able to learn a wide range of problem solving skills and generally makes them more productive. In terms of managerial benefits, it aids in the maintenance of desirable standards and makes it easier to identify possible promotion candidates. It also leads to improved profitability and reduces the risk of accidents at work and violations of safety issues. Wastage is minimised, especially in food and beverage operations.

Boella and Goss-Turner (2005) state clearly that any organisation's primary objective is to provide service quality. This necessitates that all employees must initially be carefully selected, sufficiently trained, and motivated to be committed to service quality provision. Multiskilling will essentially better equip the employees to provide more effective and efficient service, but also allow for service which is more personalised and which makes a difference to the guests' perceptions and experiences. Where there are job vacancies, these can also be promptly filled by multi-skilled employees and this facilitates both the sideways and upward mobility of employees from one post to a different one (Matias-Reche & Fuentes-Fuentes, 2006). Multi-skilled employees are able to move with ease from one task to another as they are skilled to perform a variety of jobs and participate in decision-making and thus add value to the organization as a whole (Kalleberg, 2001). Based on personal experience, there appears to be a chronic shortage of skills in many hospitality staff and this possibly suggests that these are not imparted to employees during their training. In other words the requisite skills are lacking and this invariably impacts negatively on the industry. Davids and Fredericks (2004, p.6) state that multiskilling is the acquirement of skills, knowledge, competency, and experiences, which empower the individual to perform tasks beyond the scope of their immediate job requirements. Multiskilling thus endows the organization with highly flexible and adaptable employee, and thus provides for a more greatly skilled team of employees. Haas, Rodriguez, Glover, & Goodrum (2001) state that productivity in organisations can be increased by 5% or more where multiskilling exists. There is also a possible 35% reduction in total hiring of employees as a result of multiskilling and the financial benefits of this aspect are thus clear.

Essentially, competent employees contribute to enhanced customer satisfaction amongst other things (Nwenre, 2005). Employees should have a range of skills and attitudes that affect a major part of their jobs (Nwenre, 2005) which impacts on service quality excellence. The literature suggests that employees who are functionally flexible through the effective practice of multiskilling are far less likely to be part of a high turnover rate of staff (Hoque, 2000; Kelliher & Riley, 2003). Consequently multiskilling training can lead to greater functional flexibility and thus help hotels to often vexing and difficult labour market. Research has shown that especially five star hotels are always seeking to improve their internal labour market through making improvements in skills training provisions and employee career development programmes (Knox & Walsh, 2005) and so, multiskilling training is commonly utilised in the hospitality industry in southern Africa. It is viewed by many managers as a labour deployment strategy that enhances the productivity of employees (Nankervis & Compton, 2006).

4. WHICH SKILLS ARE REQUIRED?

A number of researchers have explained that in diverse countries the employers may expect employees' to possess a different set of skills in the workplace. Cotton (2002) has isolated a number of skills and competences that hospitality employees are expected to have, including people management, persuasion, communication, relationship-building, planning and organizing, analyzing information, decision-making skills, commercial acumen and flexibility. In addition to a set of desired skills being taught, there is also a need for example, to develop attainable career paths for employees so as to increase employee commitment. This will also aid in the drive to retain employees who are well qualified. A number of skills are desirable, but Gilmore and Gregor (2001) have recognized that characteristics such as integrity, honesty, adherence to an ethical code of conduct, suitably attired employees, fairness, respect and harmonious working relationships are important skills to impart. Being punctual, careful, reliable and trustworthy were also considered to be appropriate professional behaviours. Multiskilling would undoubtedly provide for the acquisition of valued skills, but this is only possible if the job design, work organisation, management commitment and empowerment to use the skills obtained are in place. The absence of these aspects will impact negatively on the outputs of the multi-skilled employee who is thus wasted. Of course, all required skills are fine-tuned by learning and constant practice and

interaction with other employees. Teamwork is another crucial skill in hospitality and should be part of multiskilling and cut across departments if there is to be a sustainable quality of service. Multiskilling also offers front-line managers the prospect of learning new skills and provides for job variety. Organizations tend to be more productive where there is labour flexibility. This also allows hotels to manage in service environments that are unstable due to a plethora of impacts from the macro-environment. Multiskilling should initially encompass employees from middle management down to the most basic levels in each of the departments of a hotel, including the front desk, housekeeping, laundry services, engineering, stewarding, culinary or food and beverage service and even security and health and safety aspects.

Managers also require multiskilling in both technical and generic aspects of work. In a nutshell, managers should possess the knowledge and skills that enable them to function effectively. The generic managerial competences allude to a manager's ability to self-regulate and self-control themselves in their job development. Many managers are also unable to meet their responsibility for training and skilling of staff because they themselves lack the knowledge and skills required to be effective trainers. Managers lack competence in skills and knowledge and this is a huge gap in their technical ability. Especially financial management and computer skills were found to be lacking according to Agut *et al.* (2003) in a study of Spanish hotels. Other skills requiring attention through multiskilling, included communication and motivational skills, understanding of the hotels mission and vision, and the expectations and behaviour of different types of guests. People management skills were also found to be lacking as were problem solving, control of information and decision-making. Food and beverage skills and other functional skills such as housekeeping and customer care were also in need of a revamp. Agut *et al.* (2003) also found that all employees, irrespective of rank, lack even the most basic understanding of the levels of service expected by all guests but especially international guests.

As a work philosophy, on-the-job training is an intrinsic aspect of multiskilling. It requires outlays of time, effort and financial investment. It is important that the entire process be carefully monitored and evaluated on a regular basis. A positive attitude on the part of employees is required for success and they should desire the acquisition of new skills and an opportunity to grow in the workplace. However for this to happen there should be a 'primary' multiskilling conducted in the same discipline where the employee currently serves

and in which he or she has displayed ability. This means that specialisation is not watered down but rather that the quality of service is improved. Employees must be tangentially empowered to act on guest needs and wants even though what they are asked to do is not be directly related to their job description.

Employees also require a measure of autonomy, responsibility and should be given regular feedback relating to their newly acquired skills. Research conducted by Burgess and Aitken (2004) in their survey of employers ascertained that functional skills, conflict resolution skills, computer skills and basic good work habits were the expected skills employees should possess. Additionally, they also made known what were considered to be chronic skills shortfalls including chef skills, kitchen control, general housekeeping, management techniques, sales techniques and most importantly customer service quality provision. The latter skill is rated as having the greatest impact on a business as a result of multiskilling consequently this skill as well as others should be imparted by industry. Only when employees have attained thorough skills, will quality service improve. After the reviewing of a total of 18 hotels ranging from 4 star -5 star ratings, other skills were also identified by the researcher as requiring training. There should also be a focus on the development of skills in areas such as language, non-verbal communication and business etiquette, adaptation skills, cultural skills, host culture values and stress management. Language usage and service quality provision were especially found to be lacking and in need of urgent training. It is desirable that at a moments notice, employees should be able to step forward to perform functions outside their disciplines in other departments.

5. SERVICE QUALITY PROVISION

Service quality is the primary factor which creates competitive advantage in the hospitality industry. Consequently, any operation that does not make efforts to continually improve its service quality will certainly lose ground. All hospitality operations are service-oriented and so, service quality provision is a major concern. Service quality is defined as the gap between the customer's expectation of a service and the customer's perception of the service actually received (Boella & Goss-Turner, 2005).

Service delivery is often variable and difficult to standardize due to the personal nature of the contact between a customer and an employee. Employees may often vary in interpretation of what precisely a customer is asking, but even though service may be intangible, its quality is reflected across five broad dimensions: tangibles (appearance of physical elements),

reliability (dependability, accurate performance), responsiveness (promptness and helpfulness), assurance (competence, courtesy, credibility and security), and empathy (easy access, good communications and customer understanding) (Boella & Goss-Turner 2005, p. 297). The five dimensions of service quality that are mentioned here, originate from the SERVQUAL (Parasuraman et al., 1985, 1988) service quality measurement instrument. It is thus important that multiskilling at least attempts to standardize the intangible elements of the average service encounter to an extent scripting what employees' say, and so training must essentially include words and phrases that are likely to be used in service provision. Customer expectations of service quality are an important definition aspect of service quality when these are set against the experiences of the service (Lashley, 1997).

6. LANGUAGE SKILLING

Language training is very important since many South Africans speak English as a second language. Efforts should thus be made to teach employees simple phrases or terms that have subtle meanings. Many terms in indigenous languages have no English equivalents, so knowledge of their approximate meanings will serve the purpose of saving much time in explanation in dealing with especially customers. A hotel employee speaking English relatively well will invariably make a good impression on customers and will also forge stronger ties between him/herself and the management. Improved language proficiency is thus critical. Service interactions involve a variety of critical incidents where employee responses are fundamental to a customer's satisfaction or otherwise with a service provided. In this context, language usage and understanding is critical.

7. FUTURE OF THE SOUTHERN AFRICAN HOTEL INDUSTRY AND CHALLENGES

Much optimism prevails in the industry and as a result various companies in the sector are seeking to refurbish and expand their properties. The Hospitality Partners Association issued a report in February 2012 in which they stated that a number of international brands seeking a foothold in Africa through South Africa. The large groups including Accor, Starwood and Hilton have announced aggressive development plans in Sub-Saharan Africa in particular (Taal, 2012). The hospitality industry in South Africa, and across the globe, is a labour-intensive industry and working conditions are hampered by often extensive and irregular working hours. This is of course exacerbated by relatively low wages and a for the most part

a lack of job security which permeates the entire industry (SA Tourism, 2007). CATHSSETA (Culture, Arts, Tourism, Hospitality and Sports Sector Education and Training Authority), maintains that Hospitality is a sector that employs the highest percentage of black people, and in excess of 70% of employees are black. The majority of them are in the lower skilled occupational categories so it is evident that multiskilling is even more crucial. In fact 30% of labour in the hospitality sector in South Africa is classified as unskilled. The Department of Labour is the primary department for national skills development in South Africa. The National Skills Development Authority (NSA) and its extensive network of 24 Sector Education and Training Authorities (SETAs'), including the CATHSSETA, deals with skills development within specified sectors such as hospitality. The Department of Education also has a directive for curriculum development, schooling and other educational institutions. Thus, there is thus essentially a close relationship between education and skills development of hospitality employees in South Africa and adjacent countries since many students and employees from these countries come to South Africa to further their studies and careers. CATHSSETA thus plays a facilitation and co-ordination role between industry and higher education institutions to align education with the many needs of a burgeoning industry.

The South African hospitality sector engaged just over 112 000 employees in 2010, and this is a steadily increasing number according to the CATHSSETA. In the CATHSSETA hospitality sub-sector, business is represented by a number of employer associations including, Culinary Arts Association of South Africa (CAASA), Federated Hospitality Association of South Africa (FEDHASA), Housekeepers Association of South Africa (HASA), National Accommodation Association of South Africa (NAASA) Restaurant Association of South Africa (RASA) and South African Chefs Association (SACA). These are employer organisations and each one is a key skills development stakeholders. Many of them are active in CATHSSETA ranging from board to chamber committee level and each of them provides sub-sector specific expertise, knowledge and input into all CATHSSETA skills development initiatives and projects which are undertaken. The efforts of these role-players is noteworthy but more needs to be done.

CATHSSETA states that there is a shortage of skilled people in general to fill certain positions such as for example Operational Managers, Pastry Chefs and Head / Executive Chefs. Skills shortages in other vacant positions do not necessarily exist because there are no skilled people to take up the positions but because they do not have the additional skills that are required for such positions. In other words there is a lack of industry specific skills and this

also includes Trainers / Facilitators. CATHSSETA has also determined that qualifications to address the scarce and critical skills in the Hospitality sub sector do exist for all levels ranging from Senior Management positions to even the most basic occupational levels. The problems that were identified with the Hospitality related qualifications were in most cases with the packaging of course material and course content lacking essential aspects for the industry which result in skills gaps for the future employees who acquire these qualifications. There are thus a large number of challenges that hamper the provision of skills in the hospitality sector (CATHSSETA, 2010). There is also a skills mismatch in that the qualifications available within the hospitality sub-sector for example, have a relevant title but the content is not what the industry requires in a particular occupation. For example a qualification in Hospitality Management has different course content to what its title reflects and far greater emphasis is spent in such a course on Food and Beverage operations and management is sidelined. Such aberrations make multiskilling even more critical.

Productivity needs to improve in the industry and employee speed and outputs require re-energising. Strategies must be devised which consider an aging workforce and existing workers must be encouraged to boost their adaptability and hunger for learning new skills. Ways need to be sought to consider the needs of especially women who are wives and mothers in the workforce who are expected to work very arduous shifts in many cases. It is clear that in the years lying ahead, the majority of the workforce will comprise non-traditional employees, many emanating from other SADC countries. The challenge is to teach them the latest technology and to skill them in as many operational areas as possible. Without such training and skilling, it is unlikely that the increased expectations of more demanding customers will be satisfied as they use hospitality products and services that cost them money. Quality service provision will continue to be an issue that will also have a direct impact on multiskilling trainers.

8. METHODOLOGY

A quantitative methodology was adopted in this research (Neuman, 2006). However, aspects were qualitative, i.e. investigating the perceptions of employees on multiskilling initiatives in the hotel industry. A qualitative approach is, according to Creswell (2003) appropriate for an exploratory and descriptive study. It was thus deemed appropriate to use an extensive exploratory survey to gain required information (Frazer & Lawley, 2000). The main purpose

of quantitative research is to determine the quantity or extent of a phenomenon, in this case multiskilling, in the form of numbers. The research may be a single investigation or a range of informal studies intended to provide background information. The aims of the research investigation were communicated to the respondents as comprehensively as possible as well as the anticipated consequences (Brynard & Hanekom, 2008). This exploratory research would assist in diagnosing the dimensions of multiskilling use and would thus enable successive research projects to be accurate. The survey was intended to acquire information about the opinions of employees and their attitudes or even previous experiences by asking them questions and tabulating their answers. The goal was to establish the views of a large population by surveying a sample of the population namely, hospitality employees. This was thus in a sense a normative survey. The primary research question was to ascertain whether or not training for multiskilling was common in the hospitality industry. The survey would also test the extent to which multiskilling led to organizational efficiencies and which skills were needed the most.

Sample size is generally an issue of concern for the researchers in quantitative research due to the cost and efficiency involved in the research (Ruane, 2005). A non-probability convenience sample was chosen as there were respondents that were easy for the researcher to access-this is often referred to as an available subjects sample. A priori power analysis was used to ascertain the sample size as this ensured that the researcher did not waste time and resources carrying out a study which has very little chance of finding a significant effect, and also ensured that time and resources were not wasted by testing more subjects than was necessary in order to detect an effect that would be similar to that uncovered by surveying a larger population. The sample selected was however, representative of the larger population and included all the elements of the population. Males and females were included from a multi-cultural population of approximately 10 000 employees and the number of respondents was 450. The desired sample size of this research was 450 samples as suggested by De Vos *et al* (2002), which were collected through the participation of the eighteen, 4-star and 5-star hotels in southern Africa that were willing to participate in this research. The processes the researcher was testing were assumed to be so basic and universal that they could be generalized beyond such a narrow sample. Employees from eighteen hotels were thus surveyed in this research, in countries including South Africa, Zimbabwe, Swaziland, Mozambique and Namibia of which seven were part of international chains.

The sample population consisted of front-line managers in the industry including supervisors and managers who work in or across the departments of food and beverage operations, front office, human resources and housekeeping. The sampling scale focused on eighteen, 4-star and 5-star hotels because they were considered to be investing considerably more in training as a quality measure when compared to other hotels. The survey questionnaire was emailed to the possible respondents as this is a common method to survey members of any organization (Zikmund, 2003). Such a survey in the hospitality industry may expose the gaps in education and training and therefore be used to identify the competencies required in the industry that lead to employee empowerment, better quality service provision and may also encourage employees to remain in an industry where employee turnover rates are high.

The questionnaire used in this research was a standardized, multi-client attitude and usage study which contained 20 questions relating to multiskilling (see Figure.2). Respondents had to answer questions relating to multiskilling in their place of employment. The respondents were selected from a range of business cards and names and emails provided by managers who were willing to be involved, and were in the possession of the researcher, as well as a personal database, consisting of names and e-mail addresses of other relevant hospitality employees. Each of the respondents was sent an e-mail explaining the nature of the research as well as a request to participate by responding to the 20 questions. They were also assured that their responses would remain anonymous- thus it is more likely that they would be more truthful than they would be in a personal interview when addressing sensitive issues. A major weakness of research using a survey is that it depends on self-report data and there is often intentional deception on the part of respondents. There is also the problem of questions that are poorly worded and possible memory lapses by respondents.

9. MEASUREMENT

The questionnaire comprised general questions in regard to employee personal details, using both nominal and ordinal scales. The survey also covered questions highlighting age and gender (Brace, 2004). Questions relating to employee multi-skills training actions in their place of employment were also posed, followed by questions which were aimed at obtaining employee attitudes and perceptions to this training, if any. Yes/No responses were required as well as marking options with an X. There were also basic questions requiring short written responses and listing statements in order of importance.

The survey covered questions which were piloted to a sample of ten employees in a preliminary investigation. Comments and criticism of the pilot group were noted and carefully considered in the final choice of survey questions. The result of the preliminary investigation thus highlighted where modifications were required so that the final survey could be acceptable and this helped to ensure that data obtained would be both valid and reliable. The survey had to be couched in language which was intelligible to all respondents.

The Statistical Package for the Social Sciences (SPSS) was used to examine the accuracy of the data since this allowed results to be analyzed, and frequency and percentages were used to show a direct and understandable analysis which increased the reliability of the results. SPSS thus provided a measurement of internal consistency (reliability) of the test items called Cronbach's alpha. The higher the correlation among the items, the greater the alpha. The high correlations implied that high (or low) scores on one question were associated with high (or low) scores on other questions asked in the questionnaire. In this case, the Alpha was 0.78, indicating that the questionnaire was perfectly reliable. Most of the participants were thus consistent in the way they responded to the various questions, the scale thus yielded consistent results and was considered reliable. This was an interesting find since the respondents were from diverse educational backgrounds and were expected to have very different views.

10. DEPENDENT VARIABLES

Two dependent variables i.e. the response that was measured, were examined in this study namely the rate of response of the respondents and the quality of their responses. These variables were thus the presumed effect and refers to the status of the outcome in which the researcher was interested.

Number of valid responses

The response rate= _____

Total no. of respondents approached

A high response rate is likely to reduce biases, however one not overlook other types of bias which cannot be overcome by achieving a high response rate. Where self-completion surveys

are completed it is highly likely that potential respondents with low literacy levels will not respond. However, in this study there were 382 valid respondents for subsequent analysis since 68 respondents did not respond. The response rate was thus 84.88%, which is a fair response rate, but it still does not guarantee that the results were totally free of bias. The researcher thus only considered the percentage of questionnaires that reached the respondents, and e-mails that were undeliverable were excluded.

The researcher tried to increase response rate by phoning or faxing those to whom e-mail was undeliverable. The length and difficulty of the survey was also minimized and the format was simple, ensuring questions are not ambiguous and had clear instructions. In ascertaining response quality the comprehensiveness and correctness of the responses was considered (Goetz *et al.*1984). The former was measured by the number of non-opinions provided by respondents as well as the number of partly finished questionnaires.

Bias was also considered as an important factor. All design for data collection in surveys' for example, is to an extent biased in that it will, systematically, exclude less favourable responses and inadequate survey design may sometimes result in biases. One such bias issue in this survey questionnaire was that it was in the English language and not translated into each of the official languages of South Africa and so a language barrier bias may have existed to an extent. To reduce bias, the researcher thus asked simple questions and very few were open-ended.

Generally, the measurement was estimated to be both reliable and consistent and will not likely change every time when the testing is the same with the same subject. The measure measured what it intended to analyze and was thus valid in that the relationship between the test and behaviour of the respondents was similar.

11. RESULTS AND FINDINGS

The collection of the data took place from August 10, 2012 to November 15, 2012.

The profile of the respondents demonstrated a gender balance of 53% male (n=203) and 47% female (n=179) respondents. Some 30.36% (n= 116) of respondents were between 18 and 25 years of age, while 40.05% (n=153) fell in the age range of 26–45 years, 29,5% (n=111) were in the range of 46–64 years. Only 0.5% (n=2) of the respondents were over 65 years of age.

In terms of educational attainment, 27.48% (n=105) completed higher education, 6.8% obtained a mid level of education (n=26), and 65.7% (n=251) only had minimal education.

On average, it took respondents 8 days to complete and return the questionnaire.

In total, 450 e-mails were sent out. 68 of those e-mails were undeliverable, which left 382 usable e-mails, from which we received 382 completed questionnaires. This yielded a net response rate of 84.88%. Previous hotel or hospitality industry experience was found to be as follows: 11 employees had 0-2 (2.87%) years experience, 144 had 2-6 years experience (37.69%), 119 had 7-10 years (31.15%) experience and 108 had greater than 10 years (28.27%) experience. A total of 85 employees (22.25%) were in their current employment for less than one year. 194 (50.78%) were at their place of employment for over a year and 81 (21.20%) for more than 5 years, while 22 (5.75%) were at work more than 10 years.

Of the 382 respondents, 344 (90.05%) were in the middle to low levels in the hotel hierarchy, while 38 (9.95%) were in the upper management levels. A total of 319 (83.5%) of the employees responded that they had some form of limited training on an irregular basis including a little multiskilling in the sense that they had exposure to different tasks in their department or that they underwent brief alternation in other departments. A total of 31 (8.11%) stated that training was regular and included multiskilling training actions for their functional area or department and to an extent included other functional areas as well and that alternation to other department was involved and for longer duration. Based on comments made by some employees, multiskilling training appears to have been conducted when it was believed that there would be a shortage of appropriate employees to perform certain tasks and when there were high employee turnover rates, and this was just before peak seasons. Effectively serving guests and satisfying their needs, language proficiency and interpersonal communication were identified as the most common areas in which skills were trained. Despite 105 employees indicating that they had university or college education in hospitality, many felt they were not adequately trained during their university education and that their levels of on-the-job competence were limited. Since the hotels selected had somewhat different Standard Operating Procedures (SOP) this made multiskilling and re-training necessary. This highlights the need for higher education providers to provide more efficient training for their students while at university or college and also emphasises the importance of a Work

Integrated Learning component in any course related to the hospitality industry. 68% (259) felt that skills training activities enabled them to work in different functional areas and were thus more flexible. The employees who believed they were multiskilled believed that they were able to produce higher service quality than their colleagues who were not multiskilled. These employees were able to respond promptly to individual guest needs.

The initial training received was considered to be simply routine by 279 (73%) of employees while 33 (8.6%) felt it was important and 28 (7.3%) felt it was necessary. 42 (10.9%) respondents maintained that multiskilling was simply not important to them. The frequency of multiskilling training was also varied. A total of 23.29% of employees reported daily training of about one hour per day including multiskilling, 41.88% once a month for between 1-3 days, 23.82% once per annum for about a week, 8.6% twice per annum for about 6 days in total or more but not more than 8 days.

The respondents indicated that their multiskilling training involved mainly professional training, customer services and dealing with guests requests as well as language skills and attitudes to work. They stated that the multiskilling was used to assist them to receive knowledge and skills sets on work conducted in other departments. For example, some waiters reported that they were trained and multiskilled in housekeeping operations or as security or health and safety employees. Generally, most of the respondents praised the level of multiskilling training they received and believed training to be useful and well planned. Others felt that the training was part of their everyday work and were annoyed at having to remain after hours in many cases, to re-learn aspects of work in other departments that they already had training in. A greater diversity in training was desirable and it would be prudent of managers to take note of the complaint that very often, training was considered by some respondents to be time consuming and not at all building their self-confidence or developing them in any way.
