## FOREWORD

The Annual Conference of the EuroMed Academy of Business aims to provide a unique international forum to facilitate the exchange of cutting-edge information through multidisciplinary presentations on examining and building new theory and business models for success through management innovation.

It is acknowledged that the conference has established itself as one of the major conferences of its kind in the EuroMed region, in terms of size, quality of content, and standing of attendees. Many of the papers presented contribute significantly to the business knowledge base.

The conference attracts hundreds of leading scholars from leading universities and principal executives and politicians from all over the world with the participation or intervention of Presidents, Prime Ministers, Ministers, Company CEOs, Presidents of Chambers, and other leading figures.

This year the conference attracted about 170 people from over 25 different countries. Academics, practitioners, researchers and Doctoral students throughout the world submitted original papers for conference presentation and for publication in this Book of Proceeding. All papers and abstracts were double blind reviewed. The result of these efforts produced empirical, conceptual and methodological papers and abstracts involving all functional areas of business.

Due to challenges associated with the COVID-19, the EuroMed 2020 conference had to go online this year. The EuroMed Academy of Business would like to wish you the very best during these challenging times. We want you to know how much we value and appreciate your contribution to the EuroMed community and we wish you and your families all the best. Our thoughts go to those who suffered from the disease, to their families and friends, and to the doctors and medical staff who are fighting day after day at the forefront of the pandemic.

We wish to all that this 'different' and unique conference will be both fruitful and stimulating, as it used to be during the last 12 years.

## ACKNOWLEDGEMENT

We have all worked hard to ensure that this new online experience will be a great one for all participants. Consequently, most of our annual regular activities were normally scheduled online, including the inauguration event and key note speeches, parallel presentation and discussion sessions, journal special issue paper development workshops, networking and collaboration workshop, research project and publication workshop and more.

Many people and organizations are responsible for the successful outcome of the 13th Annual Conference of the EuroMed Academy of Business.

It is acknowledged that a successful conference could not be possible without the special co-operation and care of the Track Chairs and Reviewers for reviewing the many papers that were submitted to this conference. Special thanks to the Session Chairs and Paper Discussants for taking the extra time to make this conference a real success.

The last but not the least important acknowledgment goes to all those who submitted and presented their work at the conference. Their valuable research has highly contributed to the continuous success of the conference.

## TABLE OF PAPERS

|   |     |
|---|-----|
| DRIVERS OF CUSTOMER SATISFACTION IN AIRLINE INDUSTRY IN (THE) SULTANATE OF OMAN: A CONCEPTUAL STUDY.....  | 26  |

## DRIVERS OF CUSTOMER SATISFACTION IN AIRLINE INDUSTRY IN (THE) SULTANATE OF OMAN: A CONCEPTUAL STUDY

Abdelfattah, Fadi; Dahleez, Khalid Abed; Samor, Akram; Al-Alawi, Abrar

Management Department, A'sharqiyah university (ASU), Oman

### ABSTRACT

Customer satisfaction is considered as a significant source of survival for any organization in today's intense competition. Specifically, passengers' satisfaction in the context of the airline industry is a significant driver to retain existing passengers, acquire new customers, and achieve airline firm success. This paper aims to develop a conceptual framework that explores the factors affecting passengers' satisfaction of Oman air services. Moreover, this paper is amongst the initial attempts to increase the understanding of the links between critical factors such as (service quality and airline image) and its relationship with passengers' satisfaction in the Omani context. In addition, the proposed framework also recognizes hedonic and utilitarian values as a mediating variable in the proposed relationship. Besides, the proposed model provides suggestions and recommendations for decision and policymakers to concentrate on specific variables which strengthen the relationship with the airline's passengers.

*Keywords: Customer satisfaction drivers, Service quality, Image, Hedonic & Utilitarian Values. Airline industry, The Sultanate of Oman.*

### INTRODUCTION

Oman air presents the national airline in Sultanate of Oman (Sukati and AL Mashani, 2019). Also, Oman airline collaborates with many Asian, African, and European airlines to offer higher levels of quality with a unique and diverse collection of choices for the passengers (Hussain, 2016; Jalagat, 2017; Sukati & AL Mashani, 2019). Extant research reveals that many empirical studies have been done in the Asian context, however there is an insufficient number of studies published on the standpoint of Omani airline passengers. In this respect, this paper aims to develop a conceptual framework which explores the factors that affect passenger's satisfaction with Oman air. Thus, this paper is amongst the initial attempts to increase the understanding of the relationship between critical factors such as (service quality and airline image) and passengers' satisfaction. In addition, the proposed framework also recognizes the hedonic and utilitarian values as a mediating variable in the proposed relationship. Moreover, this study may provide interesting and important implications for practitioners and

managers within the airport setting in understanding the main factors that reflect on customer satisfaction.

Globally, the increased growth in the air transportation sector has motivated airlines to develop their services and activities (Dahlgaard-Park, 2015; Jiang and Zhang, 2016; Saleem, Zahra and Yaseen, 2017). In this regard, airlines struggle to survive in stiff competition and grow with their business (Pabedinskaitė and Akstinaitė, 2014). Previously, airlines were solely relevant to governmental regulation that consequently outline how the national airline operate (Baker, 2013). Recently, the entrance of private airlines has changed the competition rules through setting prices recognizing the requirements of passengers safety and security (Gan, 2008; Baker, 2013; Hapsari, Clemes, & Dean, 2016). Therefore, a dramatic revolution emerged in the airline's sector leading to intense competition (Jiang & Zhang, 2016; Saleem et al., 2017).

Arif, Gupta and Williams (2013) claim that understanding customer needs and wants is the crucial element in maintaining customers. In this context, the service industry is extremely critical nowadays, where customers need and wants changes continuously (Saleem, Zahra, & Yaseen, 2017). The extant empirical research has proved that attracting new customers is five-time as costly as keeping existing customers (Batouei, Iranmanesh, Nikbin, & Hyun, 2019). Suki (2014), Hussain (2016) and Seo, Park, and Choi (2020) argued that such assertions create new challenges for airlines companies to deliver more customer value through improving service levels. Accordingly, the unique value rooted in the quality of services is the underpin weapon to survive in an increasingly competitive environment (Hapsari, Clemes and Dean, 2016; Jiang and Zhang, 2016) and improve passengers' satisfaction (Pabedinskaitė and Akstinaitė, 2014).

## **CONSTRUCT DEVELOPMENT AND LITERATURE REVIEW**

### ***Service quality***

Parasuraman, Zeithaml and Berry (1985) argued that the concept of quality is elusive and not easily interpreted, given that consumers have different perspectives of quality definition. For instance, quality could be depicted by diverse segments of customers as luxury, weight, shininess, and goodness. However, quality interpreted as "zero defects-doing it right the first time". Also, quality defined as the consistency of tangible or intangible product with customer needs (Gronroos, 1984; Parasuraman et al., 1985; Lewis & Mitchell, 1990; Sureshchandar, Rajendran, & Anantharaman, 2002). Moreover, service quality is measured and appraised relatively to the overall delivered level of service that matches the actual customer expectations (Hall, 1978; Lewis and Mitchell, 1990). Service quality is one of the most concepts that has been debated in marketing theories field, enlightened the concerning efficacy in its ability to achieve economic success (Sureshchandar, Rajendran and Anantharaman, 2002).

Due to the intense and global competitions, firms ought to capture the urgent need for delivering high-quality services (Parasuraman et al., 1985; Sureshchandar et al., 2002; Jayawardhena, Souchon, Farrell, & Glanville, 2007). Suki (2014) confirms that the standers of service quality measured by passengers via a series of interactions between airline's employees and its customers. Parallel to this, the SERVQUAL scale created to facilitate customer ability in the process of evaluating the delivery of services provided (Parasuraman, Berry and Zeithaml, 1993). Parasuraman et al. (1993), and Suki (2014) view five dimensions subject to SERVQUAL scale, namely: reliability, responsiveness, assurance, empathy, and tangibles. However, in airline settings, tangibles are portrayed by the physical appearance of surrounding facilities, equipment, machines, interior design, and communications materials which formulate a general atmosphere of the airline firm.

Consequences to the fact that airline passengers now have a broad range of choices among several airlines, the quality of services performed unarguably distinguish their competitive advantages (Hall, 1978; Lubbe, Douglas, & Zambellis, 2011). Lubbe, Douglas and Zambellis (2011) suggest that the imperative need to leverage the level of services is devoted to its positive impacts on airline passenger behavior and attitude.

### *Airline image*

The mental image that people immediately describes regarding a particular institution constitutes the overall organization image as described by (Gray and Balmer, 1998). Gotsi and Wilson (2001) illustrate that organization image consist of the integration of public ideas, beliefs, as well as individuals' impressions. Nevertheless, airline image evolved as pivotal criteria to establish a corporate sustainable competitive advantage (Gotsi & Wilson, 2001; Han, Lee, Chua, Lee, & Kim, 2019). In term of the service sector, corporate image play as a predictive factor in the perspective of customers in which they compress their expectations regarding organization services quality (Hwang & Lyu, 2020). To initiate a favorable institutional image, airline companies strive to raise employee's morality and enthusiasm towards dealing with organization passengers. Employee's productivity, behavior, and attitude are also considered a vital determinant of an airline success in maintaining a positive image amongst the public (Kim, & Severt, 2019).

However, the effect of favorable airline image embeds in the sequent impact of word-of-mouth influence and passengers desire to pay outstanding prices (Kaya, 2020; Oh and Park, 2020; Seo, Park and Choi, 2020). More importantly, airline image has a significant influence in preserving customer satisfaction (Lee & Cheng, 2018; Hwang & Lyu, 2020) consequently enhance customer retaining rate within the same company (Ju *et al.*, 2019; Pizam and Tasci, 2019). The intention to purchase airline services are associated with the airline reputation in providing its services during the flight (Gray and

Balmer, 1998; Kaya, 2020). Further, airlines firms are investing in their employee's skills and abilities in order to match it with a potential criterion of future airline image (Shin et al., 2019; Kaya, 2020).

On the other hand, scholars assured that the favorable image of airlines delivered in the situation of firm ability to be innovative and achieve constant development in the area of providing its services (Pabedinskaitė and Akstinaitė, 2014; Suki, 2014). According to Hussain et al. (2008) and Liou et al. (2011), to remain a high standard of safety within airline services performance, which could be balanced between airline reputation and consequently customer decision making towards preferred airline and willingness to pay tickets prices. Given the remarkable influence of the airline image (Kaya, 2020; Seo, Park and Choi, 2020), the current study emphasizes the impact of ideas and beliefs in modelling the effects of airline image.

### *Hedonic and utilitarian values*

Hedonic and utilitarian values embedded on the perceived value deemed among the essential concepts in realizing customer satisfaction (Shin, Kim and Severt, 2019). Perceived value is explained as customer appraisal of the extent in which utility and hedonic of product approached to their perception (Parasuraman, Berry, & Zeithaml, 1991; Chen, 2008) based on a comparison of what they received and given from the performed service (Parasuraman et al., 1991; Caruana, Money, & Berthon, 2001). Gruen, Osmonbekov and Czaplewski (2017) utility theory states that a bundle of product characteristics deliver a level of quality that creates a specific value to the customer than the disutility represented by the paid money. Furthermore, people differ in their evaluation of the hedonic value due to their recognition differences. Where value is commonly known as the range between perceived quality and price (Caruana, Money and Berthon, 2001; Chahal and Kumari, 2012). Interestingly, the utility value utilized by managers and practitioners to examine and predict customer intention to repurchase (Chen, 2008). Law (2019) demonstrates that hedonic value impacts positively on customer behavioral intention to retain and remain loyal to the company.

According to marketing literature, hedonic values represent the personal emotional criteria of customers' consumption behavior which aroused by fun and excitement. While utilitarian values are more task-oriented and functional-based, serving the economic behavior of the customer. However, because of current better-educated customers and the extreme change emerged in their demands; a reputation requirement is to not solely cover the basic needs of their customer (Levesque & McDougall, 2009). Whereas to remain competitive, airline ought to provide high standards of attention to their customers, combined with special experience (Kassim & Asiah Abdullah, 2010).

Kassim and Abdullah (2010) declared that customers are willing to feel that they are receiving valuable service, confirming the strong association between value and customer satisfaction. Several researchers

assured that establishing high-quality services that match customers expectation derived from the impact of customer consumption behavior and obtained from hedonic and utilitarian values during the flight ( Levesque & McDougall, 2009; Hussain, Al Nasser, & Hussain, 2015). In the same vein, Hussain et al. (2015) demonstrate that perceived value lies in the standards of quality offered by the airline firm. Consistent with Levesque and McDougall (2009) whose ascertain that if a customer spends less energy, time and money compared to a higher level of service performed by service providers, then the customer will attain at better hedonic value. Thus, applying these two values on the present study will help in expanding a comprehensive understanding of customer satisfaction.

### *Customer satisfaction*

Customer satisfaction is one of the fundamental elements of marketing (Barsky & Labagh, 1992; Kim & Lee, 2011; Baker, 2013). Since customer satisfaction emerged as a critical field in delivering customer needs, wants, and desire (Kim & Lee, 2011; Baker, 2013). Moreover, Customer satisfaction illustrated as reactional behavior to the fulfilment response of customers (Kim & Lee, 2011; Baker, 2013) that generate an overall judgement of the product or service characteristics ( Ekinci, Dawes, & Massey, 2008; Baker, 2013). Barsky and Labagh (1992) suggest that customer satisfaction is the pleasurable emotions delivered from the outcomes of the product.

Generic customer satisfaction is drawn from a multidimensional construct within the business (Lankton & Mcknight, 2012; Arif et al., 2013; Bruno, 2019). From another perspective, there is five factors outline customer satisfaction of the provided services; the core service performed (Gan, 2008; Baker, 2013), the involvement of human elements in the process of delivering the service (Ekinci, Dawes and Massey, 2008), the organization of service delivery, services tangibles, and lastly social responsibility engagement within the business (Huseman *et al.*, 2013). Nevertheless, prices of the airline services portray a general judgement of the quality of services (Kim & Lee, 2011) through comparison of the money paid and the quality of services offered, thereby influencing customer evaluation and satisfaction related to airline services (Ekinci et al., 2008; Sabatelli, 2018).

Despite the importance of price, service quality delivered to airline targeted customers considered one of the major influential factors in establishing passengers satisfaction (Yi, 1990; Oliver, 2013; Dahlgaard-Park, 2015; Bruno, 2019). On the contradictory, Gan (2008) clarify that airline service quality is not sufficient to guarantee customer satisfaction, where managers and first-line service providers should understand the determinants reflection on customers dissatisfaction (Ekinci et al., 2008) such as personal attributes and situation (Ekinci, Dawes and Massey, 2008; Kim and Lee, 2011). Several studies found that customer satisfaction considerably influenced by multiple factors (Mishra & Prasad, 2014;

Naidu, 2016). Therefore, this study proposed that service quality, airline image, as well as hedonic and utilitarian values, create passengers' satisfaction.

### *Service quality and customer satisfaction*

Sureshchandar et al. (2002) ascertained that sustained competitive advantage could be harvest from providing spectacular services that, in turn, will draw satisfied customers. In this case, there is no doubt of the conspicuous reflection of service quality on customer satisfaction (Hall, 1978) which is derived from the hedonic and utilitarian values that customers received from services (Pizam & Tasci, 2019; Shin et al., 2019; Kaya, 2020). Furthermore, to boost customer experience towards airline services, its significance to associate a positive interaction between the service provider and airline passenger (Hussain, 2016; Jalagat, 2017). Many researchers prove that pre-purchase expectations of the value from particular services encounter impacts on the process of customer estimation and his/her satisfaction of the service performance. Based on that, the following proposition can describe the relationship between service quality and passengers' satisfaction:

**P1. Service Quality has a positive and significant influence on passengers' satisfaction.**

### *The mediating role of airline image and hedonic and utilitarian values*

Service quality is an essential factor for formulating airline image to survive and achieve economic success in an increasingly competitive environment (Kozinets, Valck, Wojnicki, & Wilner, 2010; Suki, 2014; Han et al., 2019). Kozinets et al. (2010) and Ju et al. (2019) Proves that there is a strong relationship between service quality provided and firm financial revenues, as the impact of offering hedonic and utilitarian values of services is similar to the effect of advertisement. Thereby, quality influence the gained profit, which is linked to actual customer perception of airline image alignment to the standards of services performed (Ashraf et al., 2018). However, identifying customer perception of airline image aids service providers to lunch plans aims primarily to leverage the level of service quality and values (Suki, 2014; Shin et al., 2019; Seo et al., 2020) Thus, to grasp customer attention it is necessary to maintain positive corporate image presented by every influential member in the airline (Oh and Park, 2020).

According to Gotsi and Wilson (2001), a favorable airline image depicts a primary benchmarking tool to capture the uniqueness of value delivered to airline customers. Moreover, the primer cause behind customer choice of particular airline is the utility and entertainment values received from the airline services (Pizam & Tasci, 2019; Shin et al., 2019; Kaya, 2020) that is embedded in several aspects such as airline schedule, prices, furniture, food, and lounges (Cronin et al., 2000; Caruana et al., 2001; Gruen et al., 2017). However, customer tolerance of the received level of service depends on the minimum and

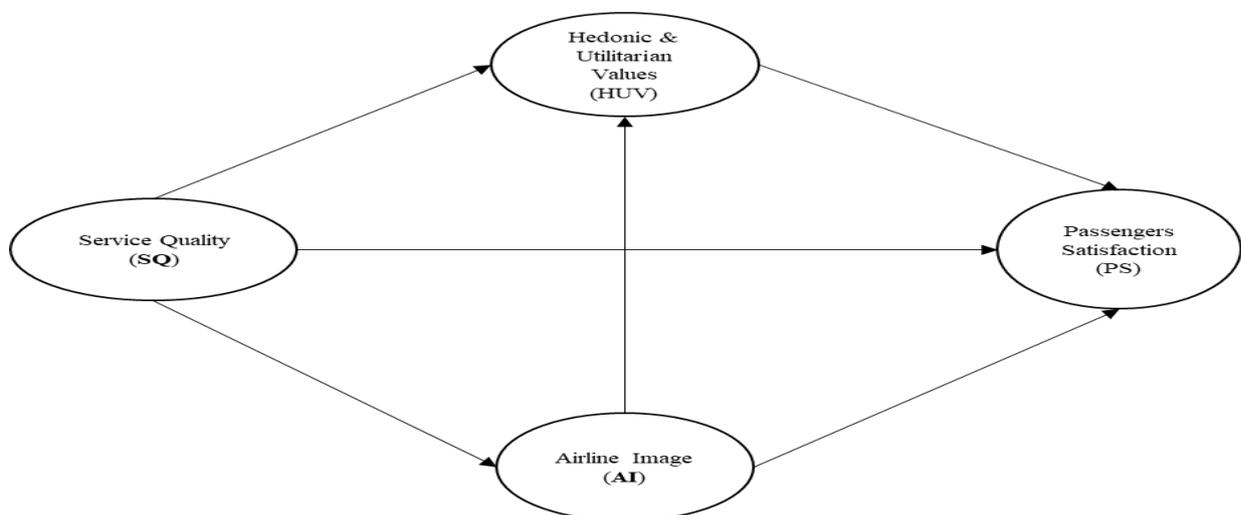

maximum level of hedonic and utility expected (Parasuraman et al., 1993; Suki, 2014; Pizam & Tasci, 2019). From customer's perspective, tolerance zone is between these two levels as the willingness to receive the airline services when an airline provides an outstanding service consistent with its image (Suki, 2014; Shin et al., 2019). Consequently, the researchers suggest the following propositions, which can explain the mediating effect of airline image, and hedonic and utilitarian values in the relationship between service quality and passengers' satisfaction:

*P2. Service Quality has a positive and significant influence on passengers' satisfaction when airline image plays a mediating role.*

*P3. Service Quality has a positive and significant influence on passengers' satisfaction when hedonic and utilitarian values play a mediating role.*

## CONCEPTUAL FRAMEWORK

After critically reviewing the literature, the researchers intend to discuss the most frequent and best matching the factors that formulate passengers' satisfaction. In this regard, the factors that are affecting passengers' satisfaction can be summarized as Service quality, airline image, hedonic and utilitarian values. As shown in **Figure 1**, both variables airline image, hedonic and utilitarian values are appeared on the conceptual framework as mediating variables in the proposed relationship between service quality and passengers' satisfaction.

**Figure 1: Conceptual framework**

\*\* S.Q.: Service Quality; A.I.: Airline Image; HUV: Hedonic & Utilitarian Values; P.S.: Passengers' Satisfaction

\*\*This conceptual framework was developed based on critically review the related literature

## **CONCLUSIONS AND RECOMMENDATIONS**

The airline industry is widely diverse in conjunction with the diversification of business structure and the characteristics of multiple operations. This diversification derived from the intense competition to achieve its competitive advantages that adopt customers continuing change in their needs and desire. Nowadays, better-educated passengers formulate a challenge for service providers to align with passengers expected services. Moreover, service quality airlines image and perceived hedonic and utilitarian values sought as prominence influential factors that yield airline passengers satisfaction. Meanwhile, passengers' satisfaction as a consequence of service quality, airline image, and utility values have a significant role in generating positive word-of-mouth, leading to direct influence on mitigating advertisement expenses and leveraging airline market share and profit. Furthermore, to induce customer experience within a particular airline, practitioners must place more attention to extract an excellent level of services and engage innovation to differentiate their services and thereby boost the perceived value as well as positively induce brand image among customers.

## **PRACTICAL IMPLICATIONS**

This conceptual paper will enrich the existing knowledge of passenger's satisfaction in the context of the national airline by providing insightful knowledge for marketing researchers, managers and practitioners with an understanding of the primary determinant of passengers' satisfaction in providing and improving company strategies which seek to guarantee retention and meet passenger's needs.

## **LIMITATIONS AND SUGGESTION FOR FUTURE RESEARCH**

The current study only focused on exploring factors leading to passengers' satisfaction in the context of Omani airline without bearing in mind the fact that the airline industry involves various airlines due to the deregulation. Moreover, the absence of data generalization lacks evidence of quantitative data.

This study restricted by several limitations, which in turn provides avenues for future reviews and recommendations. Despite these restrictions, the current study paves the way for further empirical investigation. Therefore, new research should be conducted on service quality impacts on customer satisfaction and retention on more comprehensive categories of airlines, including low-cost airlines and legacy airlines. Additionally, as our study proposed airlines image and hedonic and utilitarian values as mediator variables, it is suggested to also examine the word-of-mouth as a mediator variable between independent variables and customer satisfaction. Furthermore, our paper could be extended by conducting the study empirically in Gulf countries due to the similarities of passenger's cultural

characteristics, which will provide us with the perspective of various customer populations. Finally, the study framework could be replicated in other industries such as education, healthcare, and hospitality to test the generalizability of the conceptual model.

## STORYTELLING ONLINE: ADDING VALUE TO THE CHILEAN WINE INDUSTRY'S GLOBAL EXPORTS

Ainsworth, Judith

Department of Marketing & Supply Chain Management, Temple University, Philadelphia, USA

### ABSTRACT

This study explored the website discourse of five Chilean wineries and revealed that storytelling strategies are important marketing tools. Warman and Lewis' (2019) model of the conditions necessary to fulfil the wine/place experience through the value chain was used as the conceptual framework with a particular focus on evidence-based storytelling that wine science can contribute to the wine/place experience for consumers of premium wine. A content analysis of winery estate website texts was carried out to investigate the storytelling phase of the wine value chain framework using a case study approach. Findings indicate that stories generate interest, provide knowledge, increase understanding of place distinctiveness especially for wine buyers who are less knowledgeable about the meanings of place of origin, but are requesting this information. The results provide evidence of a solid foundation for employing evidence-based storytelling as a tool that marketing executives can use to engage consumers both physically and emotionally. The results are particularly useful in formulating decisions about different communication approaches and how these approaches are often combined for better effect. Since purchase decisions are made according to consumers' frames of reference, managers may also need to consider that wine buying decisions are more of a learning process for international consumers who choose a Chilean wine.

*Keywords: Wine value chain, Evidence-based storytelling, Websites, Case studies, Chile, Wine, Content analysis, Authenticity*

### INTRODUCTION

Export performance of Chilean wineries is driven by high quality of wines, an established network of international distributors and marketing skills (Bianchi & Wickramasekera, 2013). Although these are important factors, as more luxury products are available on world markets, sales success is predicated on both mental and physical availability (Romaniuk & Sharp, 2015). Mental availability relates to a product's renown so consumers remember the brand and the reasons and occasions they bought that brand while physical availability means the brand is easily located so consumers can easily buy it (Sjostrom, Corsi, & Lockshin, 2016). For the former, firms must work to increase brand awareness through communication that creates the desire to own the product (Romaniuk & Sharp, 2015).

One way to ensure that consumers are aware of a brand, particularly the attributes and characteristics of a wine brand that differentiate it from other wine brands, is by communicating adequately online (Capitello, Agnoli, Begalli, & Codurri, 2014; Freitas Santos & Cadima Ribeiro, 2012) and on wine estate websites (Begalli, Codurri, & Gaeta, 2009; Ingrassia, Altamore, Columba, Bacarella, & Chironi, 2018; Morrish, Pitt, Vella, & Botha, 2017; Pollach, 2005). For discourse to contribute value to the wine value chain, Warman and Lewis (2019, p. 503) argue the need for evidence-based storytelling based on wine science that adds value to premium wine consumers' "demand for authenticity, and subjectivity, in their wine experience, by providing deeper understanding and enriching the telling of place stories." Because place has social, cultural and discursive qualities, place distinctiveness must be effectively communicated by wineries to socially construct the character of a wine region and link wine production to sensory qualities that stimulate consumers' emotions (Ingrassia et al., 2018).

Building on Warman and Lewis' (2019) wine value chain model outlined in the next section, this paper explores organisational discourse in promotional texts of five cases of Chilean wineries to reveal the linguistic choices and discursive positioning of each winery to create images of authenticity and cultural value (Poncini, 2007). The study explores how the Web, as a dynamic tool, applies storytelling and the discourse of authenticity to create a two-way relationship between the wine producer and consumers (Maguire, 2013). Understanding the distinctive features of terroir and provenance, consumers become more knowledgeable of how the characteristics of unique places express the distinctive sensory qualities attributed to the wine and add to the sensory experience of drinking the wine. Thus, storytelling and its value-added competitive advantage are significant and interesting topics for global business research.

The study has direct implications for brand managers and managerial practice. It identifies major themes communicated by wine estate websites that characterise brand authenticity, how this discourse builds organisational reputation and creates a unique brand identity for the global market (Riviezzo, Garofano, Granata, & Kakavand, 2017). Discourse studies of the wine value chain lead to a better understanding of how premium wineries create messages that influence consumer behaviour and loyalty (Goulding, 2000) and provide valuable knowledge for decisional purposes. In today's pervasive communication environment, online platforms and social communication via Web interaction allow managers to link a product's identity to consumer perception and interpretation of brand identity to develop and maintain a strong brand image (de Chernatony, 2010; Kapferer, 2008).

## THEORETICAL FRAMEWORK AND HYPOTHESIS DEVELOPMENT

This section outlines the conceptual model of the wine value chain and brand authenticity. Aligned with Sjostram et al. (2016), the study applies the term “premium” to integrate “luxury” and “premium” as both terms were found to correlate to the highest price tier.

### *Model of wine value chain*

Warman and Lewis (2019) articulated a conceptual framework to develop two-way co-construction of knowledge between the wine producer and the consumer in the value chain and described a set of four conditions necessary for a positive wine/place experience. Terroir and the wine making process are the first condition in the wine value chain. Second, the consumer needs to have confidence that the wine indeed comes from a specific and authentic place. This may be done, for example, through labelling so that the bottle of wine provides context to help understand the provenance of the wine. The third condition is knowledge of distinctive sensory qualities such as taste, aroma, feel and look. The wine needs to express a particular sensory experience. The final condition is knowledge of how place characteristics are expressed in sensory qualities. Consumers need to experience and distinguish this unique sensory quality of the wine related to the place of winemaking. To convey these conditions to a distant wine consumer, all actors along the value chain must understand how to communicate both sensory and meaning values that are crucial to the wine/place experience in an authentic and reliable manner.

Furthermore, the framework is proposed as a means of using wine science and research to contribute value to the premium wine value chain and to consumers. Consumers want to know the place quality of their wine, but usually lack winemaking experience and must rely on familiar terms such as geography, place, climate or varietal, rather than more detailed and complex markers (McCutcheon, Bruwer, & Li, 2009). More and more, consumers demand to know the “story” and meaning of a wine’s characteristics (Beverland, 2006; Mora & Livat, 2013). For example, organic labelling has been found to have a strong effect on committed organic consumers and is perceived to taste better, and be of higher quality, which also influences the wine purchasing habits of less committed organic consumers (Gassler, Fronzeck, & Spiller, 2019). In terms of sustainability, consumers want to know about the wine producer’s waste recovery, efficient water use, elimination of pesticides and other organic innovations in the winemaking process (Fiore, Silvestri, Contò, & Pellegrini, 2017). In other words, consumers demand more sophisticated knowledge that wine science can contribute to their understanding.

To respond to these consumer demands, expert knowledge actors including winemakers, wine producers and retailers influence the broader consumer appreciation of premium markets by contributing to “richer storytelling and deepening the experience of authenticity” (Warman & Lewis,

2019, p. 502). As a result, wineries emphasise the significance of the link between region identity and wine quality through storytelling and developing communication strategies (Ingrassia et al., 2018; Mora & Livat, 2013) that communicate the story up the value chain to consumers. Therefore, the following hypothesis is proposed:

H1: Chilean wineries in this study use evidence-based storytelling on their websites to communicate wine qualities and sensory qualities.

### *Brand authenticity*

Consumers are increasingly looking for authentic brands so that they can experience or engage with history through the brand (Hudson & Balmer, 2013; Wilson, 2018) or experience an authentic expression of a particular place (Beverland, 2006). Authentic products and experiences allow consumers to escape from a commercially exploiting consumer world (Grayson & Martinec, 2004). In addition, today's consumers want to know what is behind the bottle of wine in terms of sustainability and ethical standards. Retailers are requiring sustainability and ethical standards because consumers identify more and more with measures to ensure a green planet (Alessandri Abogados, 10 January 2018).

To explore the discourse of evidence-based storytelling in the wine value chain used by Chilean wineries, six attributes of authenticity are used to classify communication strategies (Beverland, 2006). *Heritage and Pedigree* narrates the story behind the firm and its production. *Stylistic Consistency* projects commitment to taste consistency for low-risk consumers, but also style consistency that may result in slight differences for variety seeking consumers. *Quality Commitments* refers to product integrity and commitment to continually make great wines. *Relationship to Place* implies that the region of origin is a core brand attribute so that when consuming a wine from a specific place, consumers experience the history or soul of the brand. *Method of Production* relates to the importance of knowing what went into the final product as well as knowing that an actual identifiable person used certain production methods to create the brand. *Downplaying Commercial Considerations* refers to understating marketing prowess and business acumen when promoting the winery and its wine.

Brand heritage is also examined by applying Hudson and Balmer's (2013) four dimensions of brand heritage. *Structural heritage* refers to past events that influence current brand claims in contrast to *implied heritage* that refers to a past that is implied by the current brand status. *Reconstructed heritage* refers to consumers recall of brands from earlier in their lives while *mythical heritage* means referring to historical elements that are fictitious but that allow consumers to escape to imaginary events. These factors relate to aspects of the product and brand that managers may exploit in the social co-construction of storytelling.

However, the reconstructed and mythical heritage dimensions pose a problem for the concept of authentic heritage. If true evidence of heritage and sincerity is lacking, then consumers should not accept reproductions or fiction in their search for authentic experiences. Premium wine drinkers understand that place-based stories are crucial aspects of authenticity of knowledge conveyed along the wine value chain. Therefore, wine scientists must grapple with the problem of how to insert technical knowledge into the world of winemaking which is founded on cultural heritage, tradition and myth (Matthews, 2016). To account for this dichotomy, the wine value chain model adopted in this study proposes that structural and mythical heritage may be complementary, and that place-based storytelling may be appropriated as a discursive strategy to reconcile the two. The more specific the information about the terroir of New World wines is, the more authentic and more valuable the wine appears (Moulard, Babin, & Griffin, 2015). Furthermore, consumers value technical elements and information when it is contextualised in stories (Mora & Livat, 2013). Thus, the two views become reconciled as wine consumers and brand managers co-construct wine/place knowledge leading to the development of place-based storytelling (Visconti, 2010). "Myth then becomes not the enemy of science, but rather a story to be deepened" (Warman & Lewis, 2019, p. 504).

Thus, stories are used as a positioning device to reach consumers' and capture their attention (Grayson & Martinec, 2004). If authentic products and services are relevant enough in their brand values and personality, they can connect with consumers on a deep level, even becoming part of the culture itself (Beverland, 2005; Holt, 2004; Morrish et al., 2017). Therefore, the following hypothesis is posited:

H2: Chilean wineries in this study use storytelling on their websites to build emotional feelings.

## RESEARCH DESIGN

A content analysis of texts taken from winery estate websites (Morrish et al., 2017) was carried out to investigate the storytelling phase of the wine value chain framework (Warman & Lewis, 2019) using a case study approach (Yin, 2014). This sampling method allows the researcher to discover patterns or divergencies of the constructs, relationships and strategies that managers choose to focus on to communicate the wine/place experience to consumers. To explore the content of website messages, these case studies are suitable to operationalise the framework because they consist of reliable discourse in relation to a specific context whose key elements can be considered an adequate description of the context. However, this method does not allow generalisability of results to other contexts. It does, however, allow for generating a qualitative information flow related to the specific contexts under investigation and thus can facilitate learning (Flyvberg, 2006).

Wineries for study were chosen from premium wine producing regions of Chile. Three wineries are located in Casablanca (Emiliana Organic Vineyards, n.d.; Kingston Family Vineyards, 2020; Veramonte, n.d.), one in the Leyda Valley (Garcés Silva Family Vineyards, 2019), a subregion of the San Antonio Valley next to and south of Casablanca, and one in Maipo (De Martino, n.d.). Details of market positioning in terms of principal vineyard location, subsequent acquisitions, organic/biodynamic and sustainability certification are provided in Table 1. An indication of a premium wine region is that Chilean wine companies without a presence in firmly established premium wine regions actively seek to include Casablanca and Maipo in their product portfolio as indicated by expansion to those regions (Overton, Murray, & Pino Silva, 2012).

| Winery                  | First planting | Denomination of origin<br>Subsequent vineyards   | Certified sustainable | Organic/<br>biodynamic |
|-------------------------|----------------|--|-----------------------|------------------------|
| Viñedos Emiliana S.A.   | 1986           | Casablanca Valley  | √                     | √√                     |
| Viña Veramonte          | 1889           | Casablanca Valley<br>Other valleys: Alto Maipo,<br>Maipo, Apalta, Colchagua                                    |                       | √                      |
| Viña De Martino         | 1934           | Maipo Valley<br>Other valleys: Limarí, Choapa,<br>Casablanca, Cachapoal, Maule,<br>Itata, Elqui Valley (1950m) | √                     | √                      |

Table 1. Summary details of cases

At each winery, a tour of the production facilities was undertaken to observe and ask questions involving the firm's history, guiding philosophy, important events in the life of the brand, marketing practices, positioning and production processes. Each tour lasted one hour on average. Notes from seminars given by the De Martino Market Development Manager, the Emiliana Export Manager Asia, and at the legal firm of Alessandri Abogados in Santiago, the lawyer for Wines of Chile, were consulted to provide further background and the current positioning of the Chilean wine industry. Although about 95% of Chilean wine is exported to 150 markets (Alessandri Abogados, 10 January 2018), the wineries chosen for this study represent differences in terms of volume of wine exported (Table 2), total value of exports (Table 3) and price per case (Table 4).

|                            | Volume  |         |         |         |
|----------------------------|---------|---------|---------|---------|
|                            | 2016    | 2017    | 2018    | 2019    |
| VINEDOS EMILIANA S.A.      | 831 642 | 791 489 | 650 195 | 713 125 |
| VINA VERAMONTE             | 108 898 | 103 782 | 96 039  | 93 483  |
| VINA DE MARTINO            | 108 665 | 86 144  | 88 503  | 73 107  |

| VINA GARCES SILVA LTDA.    | \$66,83  | \$81,92  | \$75,53  | \$90,99  |
| VINA KINGSTON FAMILY LTDA. | \$108,99 | \$156,13 | \$143,34 | \$161,78 |

Table 4. Average price per case by winery (Intelvid, 2020)

The data were augmented with information from a corpus of website texts. The information included promotional literature, corporate discourse based on tradition/innovation and more detailed historical context. An in-depth thematic analysis was carried out using the six attributes of authenticity (Beverland, 2006) identified for the luxury wine industry, the four dimensions of brand heritage (Hudson & Balmer, 2013) and the two distinguishing elements of method of production (Gundlach & Neville, 2012). This type of case-based research allows for rich data related to the theoretical framework of constructing evidence-based storytelling to communicate wine/place distinctiveness in the minds of consumers.

## FINDINGS

The analysis of website discourse revealed uniqueness and originality when telling stories of brand ideal or concept, brand history, product taste and brand origins for all five wine producers, and included structural, implied and mythical heritage dimensions for some producers. The findings are

categorised in this section according to the six attributes of authenticity with selected excerpts to illustrate the stories recounted on estate websites.

*Heritage and pedigree: structural, implied, reconstructed, mythical*

The discourse of history or pedigree associated with the winery, the wines produced, or some form of tradition was found in all six cases and sometimes overlapped in other sections of the website. Emiliana differentiated from the other wine estates with its significant focus on organic and biodynamic wine production and by referring to a past that drives its current environmental and social sustainability practices. The story goes that José, a family member, felt a bit sick out in the field, so he convinced the family to go organic (Emiliana Seminar, 2019). Nowadays, “Emiliana is characterized by producing only organic and biodynamic wines, so that helps to preserve the natural life balance, human beings and the environment. This results in healthier, unique and better quality wines.”

The discourse of Veramonte, Garcés Silva and Kingston is particularly effective in structuring a distinctive geographical heritage that has been grafted onto a “reconstructed rural economy, introducing wine where it was little in evidence previously” (Overton et al., 2012, p. 57). Focussing on a formerly sleepy valley consisting of rural agriculture, they make particularly good use of telling the stories of their structural heritage. De Martino also focusses on the heritage of the pioneering Italian family that settled in the Maipo Valley.

K: In 1906, “Gramps” [Carl John Kingston] joined the Cerro de Pasco Mining Company as an engineer [...]. Although he never struck gold, C.J. unearthed a large dairy and cattle ranch 12 miles from the Pacific Ocean in the western hills of Chile’s Casablanca Valley. [...] In the 1990s: While in graduate school at Stanford University, Courtney Kingston wrote a business plan that had little to do with cattle and traditional farming: She wanted to plant a vineyard in the far western hills of Casablanca.

The Veramonte website and the Garcés Silva website also tell stories referring to a mythical past. The socially constructed components of an imagined idyllic past use lexical items such as “spirit”, “born”, “fruit of the sun”, “life force” and “ocean view”, as these excerpts illustrate.

V: The spirit was born at the very moment that two worlds united, back in 1889. Cabernet Sauvignon vines were brought straight from France, bonding to Apalta’s unique soils. And in 1936, when Carmenère vines took root, the spirit grew stronger, filling the air with an inexplicable energy. [...] Those who wandered through the vineyards could feel it, though they couldn’t quite explain it. And so the locals began simply to call it Neyen, the Spirit of Apalta.

[...] Neyen, ancestral spirit of Apalta, is born from the Andes Mountains, fruit of the sun and centennial vineyards.

GS: In San Juan de Leyda there is a garden with an ocean view. A garden of vineyards from the Garcés Silva Family, a privileged place of granitic soils, where they say that flowers talk with the moon and the sea breeze cools the earth when its blows.

#### *Stylistic consistency*

Consistent taste is another attribute of an authentic wine. However, this leads to a paradoxical situation: either a standardised product of consistent taste or a brand that has slight taste variations. Concerning the latter, stylistic consistency may also refer to consistency of style for consumers looking for slight taste variations from the same varieties. Research has found that positioning winemaking as constantly innovating and perpetually creating has positive association with differentiating from other wines and winemakers (Klinger, Silveira-Martins, de Castro, & Rossetto, 2020). All five described stylistic consistency on their websites while four of the wineries positioned themselves as innovative, although in different ways.

V: The intrepid spirit of that first blend guides these wines and is constantly seeking new possibilities. Representing innovation, quality and originality [...] Though each year varies slightly, Neyen seeks balance, an elegant synergy between the characteristics of each variety.

#### *Quality commitments*

Commitment to quality is an important factor in consumers' purchasing decision making and thus, of instrumental value for producers in the co-construction of discourse that resonates with consumers. Commitment to quality stood out on the Emiliana, Veramonte, De Martino and Garcés Silva websites.

DM: Since the founding of our winery in 1934, we have worked to achieve wines that represent us as a family, a promise we have maintained until today. During our 80-year history, we have fulfilled our commitment to creating wines that reflect their origin, respecting the characteristics imprinted on them by the area from which they come.

#### *Relationship to place*

Vineyards in the Casablanca region capitalise on their proximity to the Pacific Ocean and being sandwiched between the Coastal Mountain range and the Pacific. These features often result in writing stories about the wine's personality reflected and influenced by the sea, as in these excerpts from the Garcés Silva website: "As if tossed by a storm at sea, ripe tropical fruit and grapefruit blend with mineral notes and luscious vanilla from its elegant oak treatment, for a wine with great aromatic complexity." The winery architecture is "inspired by its environment, the soft rolling hills between

the Coastal Mountain Range and the sea” and “terroir with a view.” Similar strategies were applied by all wineries.

*Method of production/ingredients and materials*

Although premium wine consumers want to know the methods used to produce the variety of wines and tastes, ingredients and materials are of equal importance, especially in the discourse of organic and biodynamic processes.

E: Each of our vineyards is an accurate reflection of organic practices based on the promotion of biodiversity and the absence of pesticides, herbicides and synthetic fertilizers. [...] The biodynamic calendar (based on the cycle and rhythm of the sun, the moon, the planets and their influences) is vital for our work; it’s our guide to organize different agricultural activities to obtain the best quality wines.

Distinguishing between method of production and ingredients reflects the brand managers’ discursive strategy of providing more technical information of the winemaking process to increase consumers’ knowledge and understanding of the complicated processes that combine to make a premium product (Gundlach & Neville, 2012). In this way, websites are valuable tools to convey the stories and value behind these processes (Mora & Livat, 2013). There are references to ingredients such as native yeasts, original vines and old vines as well as the well-known story of the “lost” varietal Carmenère, which was thought to be Merlot, then rediscovered upon comparison with the few remaining vines in Bordeaux.

V: Rich in history, the Cabernet Sauvignon vines were first planted in 1889, moving on to include Carmenère in 1936. These original, own-rooted pre-phylloxera vines from France continue to produce high quality fruit year after year.

There are references to material, the notion of craft and attention to detail during harvesting, fermenting and ageing aligned with perceptions of the higher value of handmade products over machine-made (Sjostrom et al., 2016). The websites include specific information and photos of the master winemaker and the vineyard teams. In addition, some innovations, such as terracotta amphorae, allow interesting two-way conversations. Winemakers need something different to talk about for consumers who are reading and looking for something different.

DM: Our principles are based on organic farming and early harvesting (in the Chilean context), with the goal of achieving balanced alcohol levels. Our fermentation are carried out exclusively with native yeasts, rendering unnecessary winemaking additives that can alter the resulting wine. Finally, aging is carried out in concrete or stainless steel containers, old barrels, large oak foudres (5,000 liters each) or ancestral terracotta amphorae.

Marketers also realise that consumers are asking about sustainable practices and social responsibility. Two websites, Emiliana and Garcés Silva, provide detailed information about sustainability in terms of water use, ecosystem services, energy savings, residual and waste management, and forestation. In addition to being proactive in protecting the health and safety of employees, Emiliana has established a Micro-enterprise Support and Training Program to give workers the necessary training and tools to create their future micro-enterprise to produce honey, olive oil, wool and hats, all of which are bi-products of the biodynamic process. Garcés Silva seeks to “build trustful and long-lasting relations with our staff in order to offer them a work environment that enhances their abilities, improves their quality of life, and allows them a suitable professional development.”

#### *Downplaying commercial motives*

Only one of the wineries made navigating to corporate information such as annual reports, essential data and other documents regarding corporate policies quick and easy suggesting that these wine estates downplay commercial motivations. While the emphasis on environmental and social sustainability might be construed as commercial motivation since many consumers are looking for assurance of sustainability standards and practices before buying, the discourse analysed in these cases would largely indicate that the wineries and marketing managers are primarily motivated by professionalism, tradition and a love of what they are doing.

## **DISCUSSION**

H1: Chilean wineries in this study use evidence-based storytelling on their websites to communicate wine qualities and sensory qualities.

Although the cases chosen for this study represent a variety of wineries in terms of size, export volume, wine production and style, the findings reveal that all five wineries use evidence-based storytelling throughout the wine value chain in the co-construction of knowledge. However, the strategies differ with some combining evidence-based storytelling with other dimensions of storytelling to stimulate emotions. To give an example, while all provide hard evidence of the ingredients, methods used and characteristics of the wines, De Martino focusses on evidence-based technical information, such as using old terracotta amphorae, to engage the consumer in sensory experiences which are necessary outcomes of the wine value chain (Warman & Lewis, 2019). This suggests that the discourse concentrates on more sophisticated wine connoisseurs, wine experts, the serious wine drinkers and collectors.

Emiliana’s commitment to organic and biodynamic vineyards and wine making processes permeated every page of its website with technical discourse while other pages conveyed information about its environmental and social responsibility practices. Garcés Silva also used organic and environmental

practices as discursive strategies to engage in evidence-based storytelling. This suggests that targeting the organic wine consumer is an important strategy, but also a strategy to convert non-organic consumers (Gassler et al., 2019). In addition, references to winemakers and the winery team are strategies to encourage consumer associations with the firm and its products and are used to support claims of reliability and trustworthiness (Pollach, 2005). Therefore, hypotheses 1 is accepted.

H2: Chilean wineries in this study use storytelling on their websites to build emotional feelings.

The findings reveal that all wineries use references to founding families and to contextual cues from historical eras (Wilson, 2018). These dimensions are more likely to produce reactions that are affective or introspective and are used to engage consumers in more intuitive emotional appeals. Veramonte and Garcés Silva also used mythical heritage to appeal to consumers' emotions and provide a means of escaping the real world. Veramonte captures interest by telling indigenous tales of spirits and ancient customs. Stories of innovation and a visionary spirit give rise to the "birth" of wine styles. Garcés Silva engages audiences through the use of metaphor and by treating wines as people, your best friend. It creates relationships with people of similar tastes who are looking for a unique experience based on place "with a view", more particularly "with an ocean view", to escape from every-day monotony. De Martino and Emiliana explain low-yield old vines that bestow distinct flavours. De Martino also emphasises high-altitude dry-farmed vineyards using horses for ploughing and axes for pruning vines. Along with images of these techniques, the discourse creates an emotional and unique sensory appeal to consumers. Therefore, hypothesis 2 is accepted.

## CONCLUSION, CONTRIBUTIONS AND FUTURE RESEARCH

This study explored the website discourse of five Chilean wineries and revealed that storytelling strategies are important marketing tools. They are used to provide evidence-based storytelling to engage wine consumers who demand to know the complexities of what goes into the bottle of wine. Warman and Lewis' (2019) model of the conditions necessary to fulfil the wine/place experience through the value chain was used as the conceptual framework with a particular focus on evidence-based storytelling that wine science can contribute to the wine/place experience for consumers of premium wine. Although place of origin is important in wine buyers' decision making (Johnson & Bruwer, 2007), it is a much more complex concept than simply the name of the region. To respond to consumer demands for more technical information, evidence-based storytelling of the wine estate's attributes related to region of origin provides deeper understanding of the region and how it contributes to wine qualities and sensory experience.

This research provides evidence of a solid foundation for employing evidence-based storytelling as a tool that marketing executives and consultants can use to engage consumers both physically and emotionally. The results are particularly useful in formulating decisions about different communication approaches and how these approaches are often combined for better effect. Executives may use these approaches to “make explicit connections between the selection of specific signals that are intended to trigger associations on the one hand, and the cognitive and behavioural effects that they are hoping to induce on the other” (Hudson & Balmer, 2013, p. 356). In this way, the findings may serve as a guide to assist brand managers to manage storytelling, strategic discourse and social co-construction of their brands. Thus, brand managers need to tell stories, since consumers perceive that information conveyed in stories is more valued, accessible and engaging (Mora & Livat, 2013; Moulard et al., 2015). Since purchase decisions are made according to consumers’ frames of reference, managers may also need to consider that wine buying decisions are more of a learning process for international consumers who choose a Chilean wine. They may need to consider engaging the emotions of those consumers through a variety of storytelling techniques.

Of course, this study presents some limitations. First, the findings are not generalisable to all wine producers in Chile as only five cases were considered. Second, the study was unable to determine if these discursive strategies accomplish two-way communication with consumers. A study asking premium wine consumers their perceptions of wine estate online discourse, visual representations and images of the wine and winery could reveal how successful these strategies are and if some are more successful than others. Another study could explore whether exposure to these wine/place stories enhances consumers’ sensory experience when drinking the wine from a particular winery from a specific region.

### ABSTRACT

Small and medium enterprises (SMEs) face strong competition with larger incumbents in a fast-changing globalized economy that undermines their financial performance. For this reason, operating in foreign market could be a valuable solution to pursue growth opportunities and improve their financial performance.

The purpose of the paper is to understand the relationship between SMEs internationalization and their financial performance, and whether this effect is moderated by the presence of ethnic minority ownership. Based on a sample of 10.326 high-tech manufacturing US SMEs, our study reveals a positive relation between the number of foreign markets where SMEs operate and their financial performance. In addition, we demonstrate that this effect is positively moderated by the presence of ethnic minorities in the SMEs' ownership.

Therefore, our findings provide evidence of the strong relationship between strategic choice, in the form of presence in foreign markets, and economic results, as well as on the influence exerted by individual-level mechanisms.

*Keywords: Small Medium Enterprises, Ethnic Minority Business, Financial Performance, Strategic Agility, Foreign Market Expansion, Ownership, Microfoundations*

### INTRODUCTION

Within a fast-changing globalized economy, small and medium enterprises (SMEs) have to face strong competition with larger incumbents (Singh, Garg, and Deshmukh, 2008), leveraging on strategic agility to be more competitive. Scholars refer to strategic agility as the ability to easily adapt in dynamic environments, create different business models, and offer firms alternative business opportunities (Doz and Kosonen, 2010).

Firms can manifest strategic agility by operating in different foreign markets (Doz and Kosonen, 2008). This is because operating in multiple countries involves flexibility and the ability to change direction in light of specific market needs (Sui and Baum, 2014). However, existing research lacks a clear

understanding of whether and how strategic agility, in terms of presence in different national contexts, influences SMEs' financial performance. This paper addresses this issue by posing the following research question: how does the presence in different foreign markets influence SMEs' financial performance?

Ethnic minority ownership, defined as the presence in the ownership composition of individuals from an ethnic minority group, may be a particular source of competitiveness (Carter *et al.*, 2010). Ethnic minorities in the ownership composition may have significant effects on the strategy-performance interaction, for example on the relation between the presence of a firm in foreign markets and its financial performance. To date, this represents an open line of inquiry, which leads to the second research question of this paper: how does ethnic minority ownership moderate the relationship between the presence in foreign markets and SMEs' financial performance?

The main purpose of this paper is to examine the impact of strategic agility (measured by the presence in foreign markets) on SMEs' financial performance (measured by SMEs operating revenues) and the moderating role of the ownership identity (measured by ethnic minority ownership).

The paper develops two hypotheses and tests them based on a sample of 10326 high-tech manufacturing US SMEs registered in the Orbis database. The results of the study indicate that the presence in foreign markets is positively related to SMEs' financial performance (and that this effect is strengthened when SMEs are owned by an ethnic minority). In particular, section 2 presents theory and hypotheses; section 3 describes data and methodology; section 4 shows the results, section 5 concludes the paper by discussing key findings, implications, and future research directions.

## **THEORY AND HYPOTHESIS**

### *SMEs, strategic agility, and presence in foreign markets*

Despite their small-scale output and relatively lower scale economies, SMEs are significant contributors to employment growth and innovation and play a critical role in the development of a country (Paul, Parthasarathy and Gupta, 2017). However, SMEs face many challenges while competing with large multinational companies (Paul, Parthasarathy and Gupta, 2017), such as the difficulty to obtain technological capabilities and skilled human capital (Czarnitzki and Hottenrott, 2011), high cost of product development (March-Chordà, Gunasekaran and Lloria-Aramburo, 2002), higher failure risks (Ropega, 2011), and the lack of effective selling techniques and market research (Hashim and Wafa, 2002). For this reason, a growth strategy by international market expansion may allow SMEs to replicate the market niches where they can possibly achieve a competitive advantage, and thereby improve their financial performance (Contractor, Kundu and Hsu, 2003).

SMEs active in different international contexts may ultimately present higher financial performance

than their not internationalized counterparts since they benefit from a broader geographic scope (Lu and Beamish, 2006). However, in order to gain these benefits, SMEs need to be strategically agile (Doz and Kosonen, 2010), namely capable to make strategic commitments, while staying nimble and flexible. This capability is indeed considered to be a mean by which organizations may perform better by transforming and reinventing themselves and by adapting to changing environments (Doz and Kosonen, 2010). Operating in foreign markets represents a form of strategic agility (Doz and Kosonen, 2010) since it entails dealing with different customers and different competitive environments (Okreglicka, Gorzeń-Mitka and Ogorean, 2015). For this reason SMEs expanding in foreign markets need to make their products suitable for each different market (Knight, 2001), taking advantage from being agile.

#### *Presence in foreign markets and financial performance of SMEs*

The presence of SMEs in foreign markets, which results from a process of adaptation and/or creation of new business opportunities in diverse countries, is likely to improve their financial performance. Indeed, it is well known that SMEs suffer from the current intensive competition that often leads to a small market share for such companies (Steiner and Solem, 1988). Conversely, SMEs that are able to operate in different international contexts may ultimately present higher financial performances than their not internationalized counterparts since they have more likely a larger operating market - benefiting from a broader geographic scope (Lu and Beamish, 2006).

Second, the process that has led to the presence of SMEs in foreign markets entails the necessity to make their products suitable for each different market (Knight, 2001). This means that SMEs have traditionally been able to identify specific customers' needs, augmenting their knowledge about the different operating markets, and putting themselves in a better position to sell their products. In fact, SMEs take advantage of a leaner and more flexible decision-making process and entrepreneurial dynamism (Paul, Parthasarathy and Gupta, 2017) favored by a flatter hierarchical structure that allows to accelerate decision-making and to be more responsive in adapting and modifying their businesses.

SMEs that have expanded their business in foreign markets may lessen the competitive pressure, find new growth opportunities, and more easily pursue a sustainable growth strategy. In this respect, growth by international market expansion is an important strategic option (McDougall and Oviatt, 1994), offering SMEs with the opportunity to discover new and less crowded market opportunities, thus improving their financial performance (Lu and Beamish, 2001). Specifically, the contribution to SMEs' financial performance derived by the presence in foreign markets is linear. By increasing sales through export activities, SMEs improve their financial performance. In turn, a higher sales volume provides the possibility of a higher production volume, which enables to achieve economies of scale and increase labor productivity (Martín Jiménez *et al.*, 1985; Grant, Jammine and Thomas, 1988; Lu and

Beamish, 2006). In this way, SMEs benefit from a double source of financial performance improvement: on one side, increased sales; on the other side, cost reduction thanks to the economies of scale. Therefore, it can be argued that:

*H1. The higher the presence in foreign markets, the higher the financial performance of SMEs.*

#### *The relevance of ethnic minority ownership*

Scholars have acknowledged that individuals may be a source of strategic agility (Arbussa, Bikfalvi and Marquès, 2017) This is true especially when they occupy ownership and top management positions, and can make firms adapt in dynamic and constantly changing environments (Lewis, Andriopoulos and Smith, 2014). Specifically, the governance mechanisms of owners affect strategic agility because organizational choices are often the reflection of the values and cognitive bases of powerful actors in the organization (Hambrick, 2007); moreover, ownership identity affects the way through which the strategy is pursued to achieve profit goals (Carter *et al.*, 2010). The ownership identity influences the proclivity to take risks and expand the scale and scope of a firm's internationalization efforts (George, Wiklund and Zahra, 2005; Oesterle, Richta and Fisch, 2013). Similarly, export orientation and performance are positively associated with the presence of a "returnee" entrepreneur (described as a professional returning to his/her home country after a period of education or work abroad with an acquired international experience and an expanded network of potential partners) (Filatotchev *et al.*, 2009).

#### *The moderating role of ethnic minority ownership*

In this context, cultural diversity in the ownership board has been underlined for its potential to affect the effectiveness of internationalization strategies (Bock *et al.*, 2012). Indeed, the presence of ethnic minority in the ownership structure strengthens the relationship between strategic agility and financial performance by bringing heterogeneity and multiple perspective and attitudes. There are several reasons for that.

First, according to a resource-dependent perspective, difference in ethnicity will very likely produce unique information sets that are available to management for better decision making.

Second, ethnic minorities show distinctive traits in terms of: natural trading instinct (Wauters and Lambrecht, 2008), achieving higher results (Meadwell, 1989), attention to the community (Jamal, 2003), access to a close network of potential partners (Ram and Smallbone, 2003), compliance with social value patterns. Eventually, the international strategy of minority-owned SMEs will increase the number of potential markets and trigger more business opportunities that can improve financial performance. Third, owners belonging to an ethnic minority are more prone to approach different foreign cultures (Freedman and Barth, 1970), and this is likely to be reflected across the whole organization given their

top-management position and the flatter structure of SMEs. Consequently, SMEs will experience increased effectiveness of operating in foreign markets, with particular regard to the possibility to understand, satisfy, and learn from more diversified, international customers (Altinay, Saunders and Wang, 2014). Fourth, the higher disposition towards external opportunities encourages and amplifies the process of learning from the new international contexts (Michailova and Wilson, 2008). Last, the general risk aversion of people belonging to ethnic minorities fosters the choice of pursuing (low-commitment and low-risk) internationalization strategies (Johanson and Vahlne, 2009).

Following the foregoing discussion, the presence of ethnic minorities in the ownership composition reinforces the expansion in foreign markets by SMEs, thus further increasing prospective benefits on financial performance. Stated more formally:

*H2. The relationship between the presence in foreign markets and the financial performance of SMEs is positively moderated by the presence of ethnic minority in the ownership structure.*

## **DATA AND METHODS**

### *Data collection*

Data for hypothesis testing were collected from the Orbis database (Bureau van Dijk). Specifically, a sample of high-tech manufacturing US SMEs was taken into account. It should be noted that the US context was chosen because US SMEs manifest a peculiar strategic intent to move into foreign markets to improve their competitive potential (OECD, 2004). Furthermore, ethnic minority issues are particularly evident in the US context, that is one of the countries with the highest variance of ethnicities, including ethnic minorities, thus allowing a better examination of the phenomenon of ethnic minority ownership (Froy and Pyne, 2011). The choice of focusing on high-tech manufacturing SMEs lies in the fact that market expansion is especially evident for such type of SMEs, as compared to SMEs belonging to low-tech and/or service industries (Spence and Crick, 2006).

In detail, for data collection, a search was made in the Orbis database for US companies classified as SMEs and belonging to high-tech sectors - as identified following sector industrial codes suggested by (Gomez-Mejia *et al.*, 2014). Among all the identified firms, the sample was restricted to 10.326 SMEs for which information on financial performance (in 2017) and ownership was available.

### *Variables*

The dependent variable of the study (*Financial Performance*) was measured as the natural logarithm of a SME's operating revenue (see Collins-Dodd, Gordon, and Smart, 2004). The independent variable (*Foreign Markets*) was calculated by counting the number of main foreign markets in which a SME operates (Ellis, 2007), as indicated in the Orbis database. The moderating variable (*Ethnic Minority*

*Ownership*) is a binary variable taking the value of 1 if a SME is recognized as minority-owned by the Orbis database – that is when a SME is at least 51% owned by, and whose management and daily business operations are controlled by, one or more members of a socially and economically disadvantaged minority group.

Control variables were added to improve the reliability of the analysis. First, firm age (*Firm Age*) (Sørensen and Stuart, 2000) computed as 2017 minus the incorporation year was considered. Second, a variable considering the firm size (*Firm size*) in terms of number of employees (Damanpour, 1992) was added. Third, in order to take into account the level of innovativeness of a SME, the number of patents it owns (*Innovativeness*) (Hall, Jaffe and Trajtenberg, 2005) was calculated. Fourth, the number of branch locations recorded worldwide by an SME (*Branch Locations*) (Hoopes, 1994) was taken into account. Fifth, regarding the ownership structure, information was gained on the number of recorded shareholders (*Shareholders*) (Amihud, Mendelson and Uno, 1999), included a dummy variable in case a SME is also a woman-owned enterprise (*Woman Owned*) (Piperopoulos, 2012), and considered the share of family owners who are also managers (*Family Management*) (Block, 2011). Finally, dummy variables controlling for an SME's main sector (*Dummy Sectors*) were included.

### Results

Table 1 and Table 2 show descriptive statistics and pairwise correlations respectively. Correlation values are all below 0.70, thus limiting multicollinearity concerns (Cohen *et al.*, 2003). An ordinary least square (OLS) regression with robust standard errors was used to test the hypotheses. Indeed, a cross-sectional dataset where the dependent variable assumes continuous, not censored values (Wooldridge, 2015) was built. Table 3 presents the results. Model 1 provides the baseline model, including control variables and the moderating variable (*Ethnic Minority Ownership*). Model 2 adds the independent variable (*Foreign Markets*). Model 3, the full model, includes the coefficient estimates of the interaction term *Ethnic Minority Ownership X Foreign Markets*.

Table 1. *Descriptive statistics*

| Variable                    | Mean  | Dev. Std. | Min  | Max  |
|-----------------------------|-------|-----------|------|------|
| 1-Financial Performance     | 6.40  | 1.16      | 5.52 | 8.92 |
| 2-Foreign Markets           | .017  | .38       | 0    | 19   |
| 3-Ethnic Minority Ownership | .13   | .34       | 0    | 1    |

N=10326; \*p&lt;0.10; \*\*p&lt;0.05; \*\*\*p&lt;0.01

According to model 1, the financial performance of SMEs is positively related to a SME's innovativeness ( $\beta=0.003$ ,  $p<0.05$ ), number of branch locations ( $\beta=0.099$ ,  $p<0.01$ ), firm size ( $\beta=0.037$ ,  $p<0.01$ ), and firm age ( $\beta=0.009$ ,  $p<0.01$ ), whereas it is negatively related to ethnic minority ownership ( $\beta=-0.061$ ,  $p<0.05$ ). Model 2 supports Hypothesis 1 since the linear term of Foreign Markets is positive and significant ( $\beta=0.038$ ,  $p<0.05$ ). For robustness, in a separate model, the presence of curvilinear effects was tested by adding the quadratic term of Foreign Markets. The quadratic term was found not significant, hence confirming the initial conjecture. Model 3 proves in line with Hypothesis 2. Indeed, the interaction term Ethnic Minority Ownership X Foreign Markets is positive and statistically significant ( $\beta=0.508$ ,  $p<0.05$ ). To gain additional insight into the moderating effect of Ethnic Minority

Ownership, a simple slope analysis (Toothaker, Aiken and West, 1994) was carried out. Different levels of Ethnic Minority Ownership - high (when a SME is ethnic-minority owned) and low (when a SME is not ethnic-minority owned) – were included.

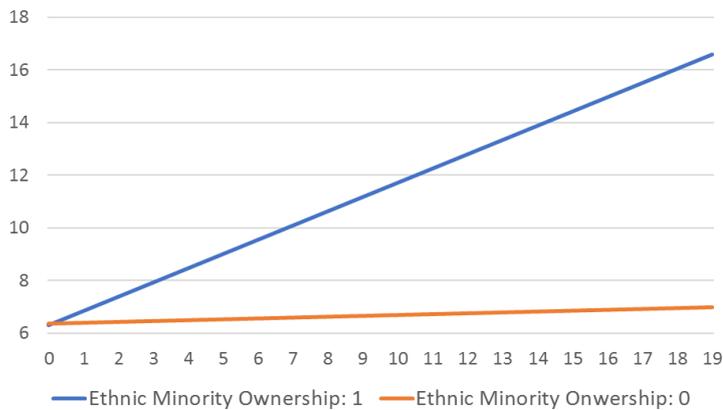

Figure 1. *Robustness check for the effect of Ethnic Minority Ownership*

Afterward, the effect of Foreign Markets on Financial Performance was plotted for both levels of Ethnic Minority Ownership (Figure 1). Figure 1 provides further support for Hypothesis 2 since higher financial performance manifests at the high level of Ethnic Minority Ownership.

## DISCUSSION AND CONCLUSION

Based on a sample of 10,326 high-tech manufacturing US SMEs, the present study examines the relationship between the presence in foreign markets and the financial performance of SMEs, revealing a positive and significant relationship, which can be ascribed to theories related to strategic agility. In addition, we also assessed the influence of the presence in foreign markets on SMEs' financial performance, showing that the presence of ethnic minority positively moderating the relation between the number of foreign markets and SMEs' financial performance.

The study contributes to literature of SMEs internationalization and financial performance, seen through the lens of strategic agility. Also, it adds to literature of strategic micro-foundations by providing the missing link between firm's internationalization and owners' identity. Indeed, the idea of the moderating role of the owners from ethnic minorities in the strategic agility-financial performance relation is here suggested; our research stands as one of the first attempts to consider this moderating factor on this relationship, especially in the SMEs context.

The present research addresses important implications for the practitioner side. First, we advise managers to expand into foreign markets, thus developing agility to compete in different environmental and market contexts, in perspective of a financial performance improvement. Managers are advised that they may elude the competitive pressure of the larger competitors by exploiting their

resources to expand in foreign markets. Second, practitioners should take advantage of the lean structure of SMEs where ownership and management often overlap (Brunninge, Nordqvist and Wiklund, 2007), and convert it into an advantage by assigning a major role to the human element in the shape of the owner, which plays a key role in a SME. Indeed, the ownership structure of a SME would be positively affected by the presence of an individual belonging to an ethnic minority, especially with a view to an internationalization strategy through foreign market expansion. This presence may give a positive boost to the expansion operations, adding a superior value to the process and empowering the internationalization strategy. This may mean that, in defining the ownership structure (for example, in the start-up phase), ethnic minority people should not be neglected, especially if a SME intends to operate or is already operating in different national contexts. In turn, these outcomes could be helpful for funding organizations and/or venture capitalists by providing them with an additional lens to assess the SMEs.

The widespread diffusion of SMEs and their increasing importance in any national economy (Amini, 2004) has attracted the attention of policy makers. These should be aware that it is important to stimulate SMEs' export orientation, maybe by facilitating the legal procedures to sell in foreign markets, hence favoring the connection between foreign countries through ad-hoc agreement, which may encourage such export orientation of SMEs, and introducing incentives for exporting activities. In addition, policy makers should consider the positive effect of ethnic minority on the strategic agility-financial performance relation for SMEs, thus supporting the inclusion of ethnic minorities in SMEs ownership, for example through a potential advantageous treatment.

### ABSTRACT

EMNCs have been taken significant interest in international business studies for almost two decades. Understanding EMNCs and their motivations for outward internationalization from different EM contexts is still relevant even if asset exploration view has been dominated the research domain so far. This study aims to find out whether market seeking and strategic asset seeking OFDI have any effect on the ownership level of Turkish MNCs in CBMAs by using the lens of eclectic paradigm and institution-based view. 351 completed CBMAs during 1990-2017 by Turkish companies have been analyzed to test the research model. The results of Tobit regression analyses have shown that both market seeking and strategic asset seeking OFDI has a positive effect on the ownership level of Turkish MNCs in CBMAs. However, institutional differences between Turkey and host countries do not moderate these relationships. This study indicates that OLI paradigm can still explain MNCs behavior despite the country of origin and context related issues. The study has provided evidence for practitioners that location specific motivations are important for ownership strategy in foreign subsidiaries. Besides, it shows that institutional environment would be considered as a more manageable constraint for EM firms in CBMAs.

*Keywords: Cross-border merger and acquisitions, emerging markets, institutional environment, Multinational Corporations, Turkey*

### INTRODUCTION

Emerging markets (EMs) have succeeded considerable amount of outward foreign direct investment (OFDI) after 1990s neo-liberal economic policies applied in these economies (Child and Rodrigues, 2005). For instance, OFDI of EMs for the year of 2018 has reached 417 billion USD by the huge contribution of cross-border merger and acquisitions (CBMAs) that is executed by emerging market multinational corporations (EMMNCs) (Meyer et al., 2018; UNCTAD, 2019). As other EMs, Turkey has succeeded significant CBMA activity with 2,63 billion USD value in 2017 to increase its OFDI (UNCTAD, 2018). The increased presence of EM firms' cross-border investments has inspired scholars

to develop new internationalization theories or to expand current ones to explain EMNCs OFDI. The most known ones of these theories are Dunning's (1988) OLI paradigm and Mathews' (2006) LLL paradigm. In addition to this, institution based-view has been used as a theoretical lens for explaining accelerated internationalization of EMNCs since EMs are generally known for their weak institutional environments (Hoskisson et al., 2000; Khanna and Palepu, 1997). This theoretical base has been widely used due to findings about EMNCs' escape motivation from underdeveloped institutional and market conditions in home countries for OFDI (Cuervo-Cazurra and Genc, 2008; Yamakawa, *et al.*, 2008; Ramamurti, 2012). In the case of Turkish MNCs, the increased amount of OFDI in recent years have generally directed to European and North American countries which also have more developed institutional environments (Deloitte, 2016). Besides, recent findings about Turkish MNCs have indicated that their cross-border investments have been generally shaped by market and strategic asset seeking motivations and equity ownership levels in foreign subsidiaries decreases as institutional distance increases (Ilhan-Nas *et al.*, 2018; Yaprak, *et al.*, 2018). Despite their significant contribution to global FDI, location specific motivations of EMNCs have not been investigated considerably so far. Moreover, the studies about CBMAs of EMNCs have been covered Chinese or Indian firms in general (Buckley *et al.*, 2007; De Beule and Duanmu, 2012; Ramasamy, *et al.*, 2012; Yang and Deng, 2017). For this reason, investigating OFDI motivations of EMMNCs from different contexts would enrich the related literature and give insights about how macro environment and context dependent factors would regulate these motivations.

This study has proposed to investigate the effect of location specific motivations on ownership level of Turkish MNCs' CBMAs and how institutional differences between host countries and Turkey affect these relationships. The research hypotheses have been developed through OLI paradigm and institution-based view. The research context of Turkey is suitable for this study since it is a mid-range emerging economy with considerable level of infrastructural and institutional development and has succeeded significant amount of OFDI after 2002 (Hoskisson et al., 2013).

## **THEORETICAL BACKGROUND AND HYPOTHESES DEVELOPMENT**

Dunning's eclectic paradigm has been the mostly studied approach and had the widest scope for more than 40 years in internationalization studies (Eden and Dai, 2010). Eclectic paradigm's main assumption proposed that firms can practice international production if they have ownership (O), location (L) and internalization (I) advantages. Firms would make OFDI when they have competitive advantages developed in the home country (O), can use these advantages in host regions like in home countries (L) and effectively use these advantages in those regions (I) (Dunning, 1998). However, OLI paradigm has been criticized by some scholars in international business (IB) studies due to its lack of

explanatory power for internationalization of EMMNCs since these companies do not possess ownership advantages like developed technology, brand reputation, financial assets and managerial knowledge as advanced country MNCs to operate in foreign countries (Bonaglia, *et al.*, 2007; Madhok and Keyhani, 2012; Ramamurti, 2012). As a consequence, theories like springboard perspective or linkage-leverage-learning (LLL) paradigm has been developed by scholars to explain internationalization of EMMNCs via asset exploration rather than asset exploitation (Luo and Tung, 2007; Mathews, 2006). Furthermore, accelerated internationalization of EMMNCs has composed of diverse internationalization modes like original equipment manufacturing (OEM), joint ventures (JV), CBMAs and greenfield investments (Child and Rodrigues, 2005; Yaprak, *et al.*, 2018). The most widely preferred entry mode strategy of EMMNCs for OFDI is CBMAs since these firms want to decrease negative effects of advantage asymmetries between them and advanced country MNCs (Buckley *et al.*, 2007; Madhok and Keyhani, 2012). This situation contradicts with OLI paradigm's main assumption about internalizing O advantages in the home country rather than host countries and incremental internationalization (Yeganeh, 2016). On the other hand, recent studies have proposed that MNCs can get O advantages like knowledge-based competences in the host country rather than developing them at home and added a new type of advantage called as institutional ownership (Oi) to explain internationalization of EMMNCs and the ability of a firm's designing abilities of its institutional environment (Buckley and Hashai, 2009; Dunning and Lundan, 2008). Another important proposition of OLI paradigm is related to the motivations of MNCs for OFDI. MNCs generally motivated by seeking new markets and strategic assets, accessing natural resources, increasing efficiency in operations while making OFDI (Dunning, 1998). Nevertheless, EMMNCs' OFDI motivations have been shaped by different contexts and can be summarized as seeking new markets to increase export, exploring strategic assets like global brand building, improving value chain and accessing natural resources for energy supplies. Natural resource and efficiency seeking OFDI may not be so important for EMMNCs since these firms have already exploit lower labor costs at home country and natural resources can get through contractual agreements with other countries (Buckley *et al.*, 2007; Gubbi, 2015; Dikova, *et al.*, 2019). Besides, accelerated internationalization of EMMNCs have been analyzed through country specific advantages (CSAs)-firm specific advantages (FSAs) framework which highlights the importance of country related competences like lower labor costs and necessitates to treat OLI paradigm's motivations in different contexts (Rugman and Verbeke, 2003). For example, Turkish MNCs OFDI decisions have driven by both strategic asset and market seeking motivations via exploiting both FSAs (financial supremacy, ability of value chain adaptations, learning skills and ability to use low-cost resources) and CSAs (adaptation capabilities to imperfect markets, strong

network ties, geographical proximity to key regions, government incentives, low-cost resources) (Yaprak, *et al.*, 2018).

Markets with large in size have been preferred more by MNCs since they can offer economies of scale and effective distribution channels (Buckley *et al.*, 2007; Brouthers, *et al.*, 2008; Tolentino, 2010). Moreover, EMMNCs like developed country MNCs seek for new markets during their OFDI activities (De Beule and Duanmu, 2012; Amighini, *et al.*, 2013; Deng and Yang, 2015; Gubbi, 2015). However, findings about market seeking OFDI of EMMNCs are restricted to Indian or Chinese MNCs. For instance, Turkish MNCs prefer OFDI to escape saturated and uncertain home markets and they can diversify geographic risk factors by entering into bigger markets (Deng and Yang, 2015; Erdilek, 2008). Moreover, Turkish firms have been used to operate in uncertain institutional environments and expand though rent-seeking behavior in home country. As a result, they choose higher level of ownership to get benefits of market rent (Filatotchev *et al.*, 2007; Yaprak and Karademir, 2011). For this reason, Turkish MNCs would prefer higher level of ownership in CBMAs when entering in foreign markets with bigger sizes.

*H1: The level of ownership in CBMAs of Turkish MNCs would increase as the host country market size increases.*

Strategic alliances and JVs of Turkish MNCs with western MNCs during 1990s have amplified the ability of these companies to make international investments and to develop technology. However, they are still lack of global brand reputation, developed production technologies and extensive global distribution channels to operate in foreign countries (Demirbag and Tatoglu, 2008; Yaprak, *et al.*, 2018). For example, Arçelik has improved its brand reputation and technological assets via sequential and successful CBMAs in recent years (Bonaglia, *et al.*, 2007; Erdilek, 2008). In addition to this, Sabancı Group's acquisition of DUSA (a JV with DuPont) and Ülker's acquisition of Godiva are other instances of strategic asset seeking OFDI of Turkish firms (Aybar, 2016). The willingness to move upstream in global value chains and to get higher financial return while doing this would cause to choose higher level of ownership in CBMAs of Turkish MNCs (Yang and Deng, 2017; Yaprak, *et al.*, 2018).

*H2: The level of ownership in CBMAs of Turkish MNCs would increase as the host country strategic endowments increase.*

According to institution-based view, institutions reduce uncertainty in economic transactions by establishing legal and regulatory systems in an environment (North, 1990; Scott, 1995). Furthermore, the increased OFDI activity of EM firms in advanced markets have been generally driven by escape motivation from underdeveloped institutional environment and market conditions of home country in recent years (Cuervo-Cazurra and Genc, 2008; Yamakawa, *et al.*, 2008; Ramamurti, 2012). While wealthy customers in advanced markets are being called as "pull" factors, selective support of home

country government for big business groups, weak institutional environment and property rights and escaping motivation from bad home country image are called as “push” factors for accelerated internationalization of EMMNCs in the related literature (Yamakawa, *et al.*, 2008; Cuervo-Cazurra and Ramamurti, 2015). The more developed host country institutional environment would guarantee property rights and economic transactions for EM firms and this would also increase the CBMAs of EM firms in developed countries (Zhang, *et al.*, 2011; De Beule and Duanmu, 2012; Stoian and Mohr, 2016). Additionally, Turkish MNCs have preferred to make CBMAs in Europe and North America regions that have more developed institutional environments, mature markets and rich strategic assets in general (Deloitte, 2016). This indicates that as institutional distance between host countries and Turkey increases, CBMA activity by Turkish firms in these regions would increase. Even if Turkish MNCs have preferred lower level of equity ownership in institutionally distant countries (Ilhan-Nas *et al.*, 2018), they also prefer advanced institutional environments for international investments to gain higher market share and to build competitive advantages (Yaprak, *et al.*, 2018). Consequently, the desire of Turkish MNCs to control acquired company more would increase in advanced institutional environments for their strategic asset and market seeking CBMAs.

*H3a: The relationship between ownership level of Turkish MNCs and host country market size for CBMAs would be stronger when institutional distance between host country and Turkey increases.*

*H3b: The relationship between ownership level of Turkish MNCs and host country strategic endowments for CBMAs would be stronger when institutional distance between host country and Turkey increases.*

## METHODOLOGY

The sample of the study has been gathered through ZEPHYR and Thomson Reuters EIKON databases for completed CBMAs of Turkish firms. The sample consists of 351 completed CBMAs by Turkish firms between 1990-2017. Acquisitions with acquired ownership stake less than 10% has been eliminated from final sample since they have been treated as portfolio investments in the literature (Tatoglu *et al.*, 2014). The variables that have been in the research model have been summarized in Table 1.

| Variables                            | Measurement  | Source                           |
|--------------------------------------|--|----------------------------------|
| Ownership level                      | The percentage of acquired stake in CBMA of Turkish MNCs (Ranges between 10% and 100%) | Zephyr and Thomson Reuters EIKON |
| Host country market size             | LogGDP of host country   | Worldbank WDI                    |
| Strategic endowments of host country | Total patent registrations by both residents and non-residents in host country         | Worldbank WDI                    |

|                                 |  |  |
|---------------------------------|--|--|
| Institutional Distance          | The difference of Economic Freedom Index between host country and Turkey                             | Heritage Foundation                          |
| Business Group Affiliation (BG) | BG affiliates are coded as "1" and non-affiliates are coded as "0"                                   | Financial reports and web sites of companies |
| CBMA experience                 | Number of previous CBMAs by Turkish MNCs executed before related acquisition                         | Zephyr and Thomson Reuters EIKON             |
| Home country market size        | LogGDP of Turkey   | Worldbank WDI                                |
| Industry relatedness            | Coded as "1" if the target and acquirer company are in the same industry and as "0" if they are not. | Zephyr and Thomson Reuters EIKON             |

**Table 1. Summary of Variables**

## RESULTS

The research model has been analyzed through Tobit regression since our dependent variable is bounded between 10% and 100% (Chari and Chang, 2009; Deng and Yang, 2015). The findings of hypotheses testing have been summarized in Table 2. All control variables are tested through Model 1. While independent variables are tested through Model 2, 3 and 4, the effect of moderator variable is tested by Model 5 and 6. Due to missing values in some variables, there can be seen differences among observation numbers through Model 1-6. Among all control variables, only CBMA experience and home country market size have shown significant relationship between ownership level in CBMAs according to Model 1. While CBMA experience of Turkish firms has a negative relationship between ownership level ( $\beta = -0.029$ ,  $p < 0.01$ ), home country market size has shown a positive relation ( $\beta = 0.067$ ,  $p < 0.05$ ) with ownership level in CBMAs. H1 is accepted according to Model 2 as our results have shown a positive and significant effect ( $\beta = 0.059$ ,  $p < 0.01$ ) of host country market size on ownership level of Turkish firms in CBMAs. However, the association of strategic endowments in host country and the ownership level of CBMAs of Turkish firms has shown a weak support ( $\beta = 0.00$ ,  $p < 0.1$ ) for H2 in Model 3. This weak relationship has disappeared in Model 4 when both host country market size and strategic endowments are included into the model. Moreover, both Model 5 and Model 6 did not provide support for H3a and H3b that have proposed the moderating effect of institutional distance on the relationships between host country market size and strategic endowments and ownership level of CBMAs of Turkish MNCs.

| Variables                            | Model 1 | Model 2             | Model 3 | Model 4            | Model 5            | Model 6            |

## CONCLUSION

This study has aimed to find out how market and strategic asset seeking motivations affect the ownership level that is chosen in CBMAs of Turkish MNCs and the role institutional environment on these relationships. According to findings, when Turkish MNCs do market seeking OFDI, the ownership level in CBMAs would increase. Additionally, the hypothesis related to strategic asset seeking OFDI's positive effect on ownership level in CBMAs is partially supported. Nevertheless, there is no moderating influence of institutional distance between host country and Turkey on these relationships. These findings showed that both strategic asset and market seeking motivations can determine the level of acquired stake in CBMAs of Turkish companies. Moreover, our findings have indicated that theories like OLI paradigm developed for advanced MNCs can also be applied to examine EMNCs' internationalization strategies and motivations. Additional theoretical approaches can be merged with OLI paradigm to understand EMNCs OFDI motivations and context for future studies. Although OLI paradigm proposes natural resource and efficiency seeking motivations with strategic asset and market seeking motivations to explain MNCs OFDI decisions, our research model has not considered natural resource and efficiency seeking motivations to explain Turkish MNCs CBMA investments. The findings in the related literature have proposed that Turkish MNCs prefer OFDI to take advantage of market expansion while overcoming trade barriers and to access knowledge and technology-based resources in foreign markets. As a result, natural resource and

efficiency seeking OFDI is not considered in this study as determinants of Turkish MNCs OFDI (Erdilek, 2008; Eren-Erdogmus *et al.*, 2010; Yaprak and Karademir, 2011; Yaprak, *et al.*, 2018). On the other hand, future studies may include host country's natural resource base and efficiency advantages in research models as control variables. Measuring efficiency in host countries can be a burden for these studies.

Moreover, the insignificant moderating effect of institutional distance on internationalization strategy of Turkish MNCs in our study indicates that institution-based view can be operationalized with different measurements and contexts for future studies. Because institutional environment has been significant for EMNCs investments in host country as much as home country (Deng and Yang, 2015; Malhotra, *et al.*, 2016; Ilhan-Nas *et al.*, 2018; Dikova, *et al.*, 2019). Consequently, examining different institutional environment factors in detail may provide more definite findings for future studies.

The managers of MNCs from EMs can make more appropriate decisions when deciding about level of ownership in cross-border investments as an implication of this study. Moreover, policy makers and managers of EMMNCs can consider the relationship between strategic assets of the host country and their contribution to EMMNCs resource base in different levels of ownership according to findings of the study. Policy makers can encourage EM firms to invest in countries that both have market opportunities and strategic resources to transfer knowledge into EMs.

# DO EMPLOYEES VALUE CSR IN EMERGING ECONOMIES: IMPACT OF INTERNAL AND EXTERNAL CSR PRACTICES ON ORGANIZATIONAL COMMITMENT

Ataay, Aylin; Cemek, Elif

Galatasaray University Management Department, Istanbul Turkey

## ABSTRACT

This study examined the impacts of employees' perceptions regarding both internal and external Corporate Social Responsibility (CSR) practices on employees' organizational commitment separately. Further, the study also examined the contributory role of external CSR on the link between perceived internal CSR on employees' OC. The findings ascertain that positive impacts of employees' perceptions of customer, government, environment and employee related CSR practices on OC are consistent with the previous research findings. The current study contributes to the previous literature by investigating the impacts of both internal and external CSR initiatives related to the primary stakeholders in an emerging market context. This analysis also shows that when employees perceive that their firm also cares for external stakeholders and invests in external CSR activities, the positive impact of employees perceived internal CSR in other words employee-related CSR on OC becomes stronger.

*Keywords: Corporate Social Responsibility, external CSR, internal CSR, organizational commitment, emerging markets.*

## INTRODUCTION

There is a growing academic interest on Corporate Social Responsibility (CSR) strategies and activities of the firms over the past decades (Aguinis & Glavas, 2012). Majority of the academic research focused on the level of engagement of the firms towards CSR as well as the effects of these engagements on organizational level outcomes such as financial, market and social performance (Du et al. 2010; Greening & Turban, 1997; 2000; Lee et al. 2012; McElhaney, 2009; Paek et al. 2013; Scherer & Palazzo, 2011). However, current studies in the literature started to concentrate on the individual level outcomes of companies' CSR activities to accentuate the responsibilities of the firms defined beyond the traditional economic and legal ones (Aguilera et al., 2007; Ali et al. 2010; De Roeck et al., 2014; Gond et al. 2017; McWilliams et al., 2006; Mory et a. 2016; Rupp & Mallory, 2015). CSR "the managerial

*obligation to take action to protect and improve both the welfare of society as a whole and the interest of organizations"* (Davis & Blomstrom, 1975, p. 6) nowadays is described by a combination of firm's initiatives which are not only related to money-making or legal compliance but also necessitates the encouragement of ethical and good causes, establishing good practices and carrying out philanthropic activities and several scholars had investigated their effects on individual-level outcomes such as employees' organizational commitment (e.g. Glavas & Piderit, 2009; Ali et al. 2010; Gond et al., 2017; Kim et al. 2010; Lee et al. 2018; Maignan et al. 1999), employees' engagement (e.g. Glavas & Kelley, 2014; Caligiuri et al. 2013; Grant et al. 2008; Lu et al. 2020), employees' organizational identification (e.g. Carmeli et al. 2007; Farooq et al. 2014; Rodrigo & Arenas, 2008), employees' organizational citizenship behavior (e.g. Jones, 2010; Lin et al. 2010, Lyau, et al. 2010), and employee retention (e.g. Catano & Morrow Hines, 2016; Farooq et al., 2019; Jones, 2010). The aim of our study is to focus exclusively on these individual level outcomes, labeled by several scholars as micro-CSR (Morgeson et al., 2013) and to analyze the impact of firm-level CSR on employees' organizational commitment (OC), an individual-level outcome.

However, although the literature distinguishes between internal and external CSR, studies generally investigated individual level outcomes of CSR as a whole. In other words the internal and external CSR dimensions were not explicitly distinguished (Aguinis & Glavas, 2012; Mory et al. 2016). Most micro CSR research examining the link between CSR and diverse workers' behaviors has seldomly analyzed the differential impacts of internal and external CSR practices (Brammer et al., 2007; Mueller et al., 2012; Zhu et al., 2012). We propose that as the perceived external CSR appears to be others-focused whereas the perceived internal CSR appears to be self-focused this distinction is imperative from an employee point of view (Hameed et al. 2016). Consequently, these two façades can have a different influence on employees' related attitudes and behaviors. Therefore, as recognized by several researchers CSR is a multidimensional concept, the focus of this study will be on both the internal and the external CSR (El Akremi et al., 2018; Brammer et al., 2007; Werther & Chandler, 2010). In connection with the social exchange theory, we aimed to investigate whether internal CSR programs contribute more individually to the social exchange process compared to external one. Since internal CSR programs directly benefit the employees whereas external CSR initiatives generally engaged toward other stakeholders such as natural environment, investors, customers, local community and government (El Akremi et al., 2018); investigating the simultaneous impact of employees' perceptions of both internal and external CSR on the behavioral outcomes of employees becomes more important (Erdogan et al., 2015).

Consequently based on social exchange theory arguments, the main aim of the paper is to contribute to the accumulation of new insight on the CSR literature by investigating the link between

internal and external CSR practices and organizational commitment (OC). As the most of the CSR research focuses on developed countries and several scholars have called for more CSR research on developing countries (Aguinis & Glavas, 2012; Jones et al. 2014; Rupp et al. 2013), this study aim to shed light on the direct impact of internal and external CSR activities individually and in combination on employees' OC in an emerging market, specifically. Consequently, our research is conducted in Turkey relying on self- reported data from a small sample of employees.

Our investigation is based on the analysis of the direct connections between perceived internal and external CSR practices on OC. This study contributes to the extent literature by empirically exploring the impacts of CSR on OC from both employee and external stakeholders perspectives and by enlarging the current understanding on how various CSR initiatives affect OC, which is strong predictor of employee turnover (Catano & Morrow Hines, 2016; Farooq et al. 2019). The study of CSR in developing and emerging countries is a relatively under- researched area and these research questions, to the best of our knowledge, have been empirically surveyed in Turkey by very limited number of studies to date (Boğan & Dedeoğlu, 2019; Gürlek & Tuna, 2019; Turker, 2009a). This study aimed to tackle one of the key issues, which is to comprehend the utilization of CSR in different cultural context (Thang & Fassin, 2017). Inter countries comparative research on CSR has started to accumulated exponentially (Aguilera et al. 2007; Habisch et al. 2004; Maignon & Ralston, 2002; Matten & Moon, 2008) yet; studies are largely conducted in developed countries context and generally in USA and Western Europe. As the employees' attitudes towards and expectations from CSR are likely to be influenced by the values of the society, we can argue that the responses from developed and developing countries with respect to the CSR would be different (Chapple & Moon, 2005). We also aim to contribute to the existing literature by analyzing both individual and combined impact of internal and external CSR activities instead of focusing only on the impact of internal CSR practices on employee behaviors or employee level outcomes (Brammer et al. 2007; Turker, 2009a). The combined effects of both internal and external CSR activities on different employee attitudes and behaviors were relatively limited.

## **CONCEPTUAL BACKGROUND AND HYPOTHESIS**

### **Internal and External CSR in Turkey**

Research aiming on the organizational and individual level outcomes of CSR is relatively recent and scarce in Turkey. There is a very recent proliferation of studies exploring the impact of CSR initiatives on employees' commitment (Boğan & Dedeoğlu, 2019; Gürlek & Tuna, 2019; Turker, 2009a), on customer perceptions and behavior (Gürlek et al. 2017; Tascioglu et al., 2019; Engizek & Yasin, 2017), on firm value (Ural et al., 2019) and financial performance (Akben-Selcuk, 2019; Sila, 2018). It is

concluded that the companies in Turkey mainly carry out their social responsibility activities to gain legitimacy (Ozdora-Aksak, 2015) and to their corporate image or employee satisfaction (Gülsoy & Ustabaş, 2019). These studies were generally focused on CSR activities in general and didn't attempt to differentiate the impact of internal versus external CSR. In this regard, Ertuna, Karatas-Ozkan and Yamak (2019) found that international and family business group affiliated companies operating in Turkey were implementing CSR and sustainability practices largely in compliance with the headquarters strategy; however, these activities have been also adapted to Turkish context in order to be able to respond to some needs of external stakeholders to gain the legitimacy of the local community. They also reported that the owners' managers were more inclined to focus on external stakeholders of the firm whereas professional managers tend to invest more on internal CSR activities (Yamak et al. 2019). Küskü-Akdoğan and Bay (2012) found that firms in Turkey mainly agreed to the implementation of philanthropic activities on a voluntary basis. However, they stated that their philanthropic activities are not based on purely altruistic motivation and that firms also aim to gain benefit from these by public disclosure of this information in the mass media (Küskü-Akdoğan & Bay, 2012). On the other hand, it is stated that there is also some concerns about complying with the laws and sector regulations (Küskü, Zarkada & Fraser, 2004; Küskü & Aydın, 2006; Küskü, 2007). Accordingly, Küskü (2007) argued that companies carry out their environmental responsibility activities with the pressures arising from legal obligations rather than voluntary initiatives based on their own initiatives (Küskü, 2007).

### **Individual and Combined Impacts of Internal and External CSR on Organizational Commitment**

Current research focus on determining how CSR activities impact different stakeholders such as employees, consumers, investors, suppliers, and the government (Aguinis & Glavas, 2012) as firms started to invest extensively on them and implementing these initiatives to sustain their competitive advantages (Scherer & Palazzo, 2011). A firm's social responsibility initiatives and actions can be distinguished between internal and external CSR, which are directed at internal and external stakeholders, respectively (De Roeck & Maon, 2018; El Akremi et al., 2018; Hameed et al. 2016; Werther & Chandler, 2010).

Internal CSR focus on the internal stakeholder of firms, employees, and represents the strategies and practices of a firm that are related to its employees' physiological and psychological well being (Shen & Zhu, 2011; Brammer et al. 2007; Turker, 2009a,b; Verdeyen et al. 2004). These include concern for employees' health and safety, respect for human needs and rights, a positive working conditions and culture, considerations for work-life balance, opportunities for employee training and empowerment, encouragement for employee involvement and diversity and equality (Gond et al. 2017; Mory et al. 2016; Shen & Zhu, 2011; Turker, 2009a). These initiatives indicate the organizational

sensitivity to employee needs and initiate positive emotions and behavioral responses (Aguilera et al. 2007). Thus, companies' active involvement in CSR activities also increases employees' OC (Brammer et al. 2007; Lee & Bruvold, 2003; Meyer et al. 2002).

Blau's (1964) social exchange theory claims that all relationships in a social context are based on the various and continuous exchange between individuals. People are more inclined to establish a balance in these exchanges in terms of what they are giving to others and what they are receiving in return. The reciprocity is crucial in social exchanges and relationships (Takeuchi et al. 2009). Firms initiate social exchange when they offer them several economic and socio-emotional resources by engaging in internal CSR activities (Gould-Williams, 2007). Organizations aim to signal and show that they are sensible to their employees' needs, caring, benevolent and values employees since such positive social exchange and engagement is the key for the creation of strong and productive reciprocal relationships between the organization and employees (Farooq et al. 2017). It is expected that when employees directly benefit from employee oriented CSR activities, they will develop a stronger identification with and attachment to their organization and be more inclined to reciprocate by displaying behaviors such as organizational commitment (Ahearne et al. 2005; Bergami & Bagozzi, 2000; Kim et al. 2010; Paswan et al. 2005; Sen & Bhattacharya, 2001), which can be defined as "*the employee's psychological attachment to the organization*" (Meyer & Allen 1991; Meyer et al. 2002). Several studies found that organizations CSR activities focusing on employees' well being affect positively employees' OC (Aguinis & Glavas, 2012; Al-bdour et al. 2010; ALshbiel & AL-Awawdeh, 2011; Brammer et al. 2007; Lee & Bruvold, 2003; Lee et al. 2018; Meyer et al. 2002). Altogether, the above considerations lead to the following hypotheses:

*H1. Perceived internal CSR is positively related with employee's organizational commitment behavior.*

External CSR conveys to the social and environmental activities that support to reinforce the firm's reputation and legitimacy to build sustainable relationships with the firm's external stakeholders (Brammer et al. 2007; Carroll, 1979; Waddock & Smith, 2000). External CSR activities generally include volunteerism, social philanthropic activities, customer oriented marketing and environmental protection (Brammer et al. 2007; Chen et al. 2008; Cornelius et al. 2008; Farooq et al. 2017). Past research suggests that employees are more inclined to view and interpret external CSR efforts of their organizations as signs of a prosocial and cooperative organizational culture (Greening & Turban, 2000). Current as well as the prospective employees of a firm have been found to care about the external CSR efforts and respond them positively since they want to work for a reputable and respected employer and to be proud to associate with organizations that are admired by others (De Roeck et al. 2014; Jones et al. 2014). Even though external CSR directly target the firm's current employees and they are not direct beneficiaries of them, research suggests that such practices can

provide significant intangible benefits to employees; they will be more inclined to engage in OC (Newman et al. 2015). In light of the arguments above, we reason that employee perceptions of external CSR efforts will positively influence their organizational commitment. Thus:

*H2. Perceived external CSR is positively related with employee's organizational commitment behavior.*

Micro-CSR studies have emphasized that not every type of CSR activities necessarily influences employees same way and magnitude and there are differences on the impact of internal and external CSR activities on OC (Rodrigo et al. 2019). While there are more studies that empirically examine the association between overall CSR and organizational commitment (e.g. Brammer et al. 2007; Hofman & Newman, 2014; Mueller et al. 2012; Rego et al. 2010;), they fail to understand which CSR initiatives, internal or external, more important for the employee's OC. We argue that employee related CSR activities are more important than the external one however they contribute positively on the link between internal CSR and OC.

*H3. When supported with external CSR, the positive relationship between perceived internal CSR and employee's OC behavior would be stronger.*

## **METHODOLOGY**

### **Data collection and sample**

This paper used a questionnaire-based survey to collect data in Istanbul, Turkey. Participants are graduate students of Galatasaray University MBA programs. To be included in the survey, participants had to be currently working and have at least one year of full-time work experience. A total of 167 responses were used to test our hypothesis.

### **Measurements**

Employees' perceptions of external and internal CSR activities were measured by 10 and 12 items, respectively, using scales developed by Turker (2009b) and Shen & Zhu (2011). To measure internal CSR activities, we used three-component scale of Shen and Zhu (2011) which consist a legal compliance HRM dimension (to measure working hours; performance appraisal and reward and compensation; minimum wage; the equality in recruitment and selection, training and development; the compliance with labor laws regarding health and safety; no use of child or forced labor and appointing adequate employees to monitor labor standards in the global value chain); a employee-oriented HRM dimension (to measure adequate training and development opportunities; flexible working hours and employment programmers for achieving work-life balance; employee involvement and participation; workers' organizations participating in determining labor terms) and finally a general CSR facilitation HRM dimension (to measure appraising and rewarding employees'

contribution to CSR; appointing CSR staff; giving priority of employment to candidates who have family difficulties or made redundant, to local candidates in order to contribute to the sustainability of local economies and societies). The scale developed by Turker (2009b) was used to measure external CSR. 17 items and measures of this scale consisting CSR to social and non-social stakeholders (measuring investment for future generations; social programs; protection of natural environment; campaigns and projects for the well being of the society; support for NGOs), CSR to customers (measuring provision of full and accurate information about its products to its customers; protection of consumer rights beyond the legal requirements;) and CSR to government (measuring compliance with the legal regulations completely and promptly; payment of taxes on a regular and continuing basis) was used. Both scales are rated on a five-point Likert scale ranging from “strongly agree” to “strongly disagree”.

Organizational commitment is operationalized as “*the employee’s attachment to the organization*” (Allen & Meyer, 1990; Meyer et al. 2002), and it was measured using Meyer and Allen’s (1997) 17-item scale, which was adapted to Turkish and tested by Wasti (2000). We utilize this scale as past research has suggested its high reliability and validity for Turkey.

A reliability analysis was conducted to test the reliability of the scales. Cronbach’s alpha value for OC, internal CSR and external CSR measures were respectively 0.861; 0.776 and 0.902 for the scales. These values well exceed the minimum value of 0.70. Thus, it can be concluded that the measures have an acceptable level of reliability.

Although the previous studies found weak and inconsistent associations between demographic variables and OC (Turker, 2009a), information on participants’ work-related and demographic characteristics were further collected. The demographic information includes age and gender while work-related information includes participants’ current job position, his/her tenure in the current company and total job tenure as well as their job satisfaction level, which was measured by 20 items with Cronbach’s alpha value of 0.941.

### **Statistical analyses**

A descriptive statistical analysis performed to define participants’ work-related work-related and demographic characteristics. The impacts of the internal and external CSR on organizational commitment both individually (H1 and H2) and in combination (H3) were tested by a regression analysis.

## **RESULTS**

### **Characteristics of the participants**

55 percent of participants were female and they are young professionals. 76 percent of the

participants are younger than 30 years old. Most participants were non-managerial employees (65,9 %) in large companies (73,1 %). Regarding the tenure of the participants, on average participants had worked as a full-time employee for 42 months; they had been working for 30 months at their current company. They are generally working on service sectors (64,7 %).

### **The impacts of perceived corporate social responsibility on OC**

Table I summarizes descriptive statistics and result of the correlation analysis. According to Table 2, internal and external CSR are highly correlated with the OC in the sample. Also, internal CSR has shown considerable level of correlation with external CSR. High correlations can indicate multicollinearity problems but variance inflation factor (VIF) values are below 3 and this shows that multicollinearity is not a concern (Hair et al. 2010).

Table II provides the results of regression analysis with employee's organizational commitment level as the dependent variable. Model 1 has tested all of the control variables and only employee's job satisfaction level (Model 1:  $\beta = 0.606$ ,  $p < 0.01$ ) and firm size (Model 1:  $\beta = -0.194$ ,  $p < 0.01$ ) have shown significant relationships with the dependent variable. These results indicate job satisfaction level of employee has a positive effect on their organizational commitment level. The negative association between firms' size and organizational commitment suggest that employees feel less committed to their organization in larger firms.

H1 suggests a positive relationship between employees' perceptions on internal CSR activities and their organizational commitment level. The coefficient of the internal CSR is positive and significant (Model 2:  $\beta = 0.255$ ,  $p < 0.01$ ) which supports H1.

H2 proposes that perceived external CSR is positively related with employee's organizational commitment. The association between external CSR and organizational commitment is also positive and significant (Model 3:  $\beta = 0.206$ ,  $p < 0.01$ ). This result provides support for H2. The magnitude of the impact of perceived CSR appear to be different between internal and external CSR showing a greater value of the coefficient of perceived internal CSR than that of the external CSR. It is also worth to note that the adjusted R square for models is around 0.40, which is high for studies in this research area.

H3 has proposed that when supported with external CSR, the positive relationship between perceived internal CSR and employee's organizational commitment behavior will stronger. The results show a positive and significant (Model 4:  $\beta = 0.258$ ,  $p < 0.05$ ) association between overall CSR activities and organizational commitment thus H3 gains support. The combination of both internal and external CSR explains 25,8 percent of variances in employees' organizational commitment level.

## CONCLUSION AND DISCUSSION

Firms start engaging in CSR activities in recent years, as they have been recognized as important aspects affecting organizational outcomes. Yet, many firms still do not consider CSR as significant initiatives that need to be employed to guarantee employees motivation, engagement and commitment. Further, the employees' attitudes and opinion towards the unpretentious and straightforward engagement for and implementations of CSR initiatives was very questionable owing to the some historical trust issues. This paper aimed to understand the role of the company's CSR activities and practices in its individual- level outcomes such as employees' organizational commitment from employees' perspective in Turkey. As recent evidence distinguishes between "internal" and "external" CSR, depending if they address socio-environmental concerns of different stakeholders such as employees, customers, stakeholders, government and society. This study had taken into consideration the possible divergent effects on of both internal and external CSR on workers' perceptions and consequently on their organizational commitment.

In summary, the present study examined the impacts of employees' perceptions regarding two of the CSR dimensions (internal and external CSR) separately on employees' OC. Further, the study examined the contributinal role of external CSR on the link between perceived internal CSR on employees' OC. The findings support all proposed hypotheses. Positive impacts of employees' perceptions of customer, government, environment and employee related CSR practices on OC are consistent with the previous research findings. The current study contribute to the previous literature by investigating the impacts of both internal and external CSR initiatives related to the primary stakeholders in an emerging market context. This analysis also shows that when employees perceive that their firm also cares for external stakeholders and invests in external CSR activities, the positive impact of employees' perceived internal CSR in other words employee-related CSR on OC becomes stronger.

Nevertheless, the present paper also suffers some limitations. Future research can include other dimensions of CSR programs and evaluate the undertaken variables to enhance the generalizability in larger samples. Different firms have their featured organizational climate, values as wel as employee profiles. Subsequently incorporating more organizational and individual level variables related to their characteristics can allow future research to improve the generalizability of the results of the present study.

## SERVITIZATION AND PERFORMANCE. EVIDENCE FROM EMPIRICAL WORKS

**Augurio, Alessandro; Mazzoni, Clelia; Castaldi, Laura**

Department of Economics, University of Campania "Luigi Vanvitelli", Capua, Italy

### ABSTRACT

The phenomenon of servitization consists of the provision of services by manufacturing firms and it is one of the most important trend of the modern economy. Numerous works deal with servitization and many issues of the phenomenon are still open such as its impact on firms' performance. In fact existing studies about the relationship between servitization and performance evidence different results. By systematizing literature about the outcomes of servitization, the work brings to light several factors that the empirical studies show to influence the performance of servitized firms such as the organizational aspects, the firm's resources, the service portfolio and the external factors. The analysis of the factors is carried out by comparing the findings coming from the empirical works and it allows to identify strategic guidance that can make the investment less opaque and can reduce the uncertainty of the result of the strategy.

*Keywords: servitization, product-service systems, services, industrial services, manufacturing strategies, performance.*

### INTRODUCTION

The growth of services is a general phenomenon in the world economy (Buckley and Majumdar, 2018) and their provision by manufacturing firms has become a well-established trend in the last decades (Visnjic et al., 2018). Empirical studies evidence that today in many industries a significant number of manufacturing firms provide services that are attached to the product (Neely, 2008; Lay et al., 2010; Huxtable and Schaefer, 2016; Crozet and Milet, 2017). The shift from selling a product to the provision of a product service systems (PSS) is called servitization (Vandemerwe and Rada, 1988; Neely, 2008; Baines et al., 2009) and it consists of "the transition in business model from products to PSS, where product and services are bundled to generate higher use-value, pricing is based on value and capabilities support customer-dominant orientation" (Kohtamaki et al., 2018). Servitization is a new competitive strategy adopted by manufacturing firms (Baines and Lightfoot, 2013; Lee et al., 2016) that move downstream along the supply chain performing new activities (Wise and Baumgartner, 1999; Baines and Lightfoot, 2013; Rabetino and Kohtamaki, 2018).

Manufacturing firms are pushed to implement the servitization to catch new profits in the service market (Wise and Baumgartner, 1999; Kowalkowski et al., 2017a), to build a competitive advantage (Vandermerwe and Rada, 1988; Cusumano et al., 2015; Baines et al., 2017) and to answer to the more demanding requirements of customers (Oliva and Kallenberg, 2003; Baines et al., 2009).

The servitization entails the turn of the manufacturing firms' business model into a service-oriented one that is focused on the value in use that the customer can obtain (Pawar et al., 2009; Baines and Lightfoot, 2013). While the manufacturing firm turns into a capability provider, the main interest of the customer is now the continuity of the asset's availability and the provision of a wide array of services over the time rather than the ownership of the product (Baines and Lightfoot, 2013). The customer accesses to a bundle of product and services by paying according to the usage of the asset or to the achievement of an agreed performance (Pawar et al., 2009; Baines and Lightfoot, 2013; Visnjic et al., 2018). Furthermore, customers participate in the co-creation of the value by delivering inputs and feedbacks in order to obtain a tailored solution (Baines et al., 2009). As a consequence, the manufacturing firm is involved in long term relationships with the customers (Oliva and Kallenberg, 2003; Brax and Visintin, 2017).

Servitization brings about profound changes that make the transition hard to carry out (Martinez et al., 2010) and the real contribution of the strategy to enhance the firm's performance is still an open issue (Wang et al., 2018).

Due to the relevance of the issue [this paper aims to conduct an analysis of that part of the literature that is focused on the performance of the servitized firms in order to systematize common findings coming from the empirical works.](#)

The paper is organized as follows. Section 2 conducts a brief review of servitization literature with a focus on the main managerial issues. Section 3 presents the works about the impact of servitization on firms' performance. Thus, Section 4 presents the two main correlation models illustrating the relationship between performance and servitization. Finally, Section 5 focuses on the role of contingency factors that intervene on the relationship. Concluding remarks follow in Section 7.

## LITERATURE REVIEW AND MAIN MANAGERIAL ISSUES

Although it is not a recent phenomenon (Schmenner, 2009; Baines and Lightfoot, 2013), scholars actually start to deal with it only from the last decades with the important works of Vandermerwe and Rada (1988), that coin the term servitization, and Goedkoop et al. (1999) that define the concept of the PSS.

Since the beginning servitization is faced by different research communities coming from several disciplines such as marketing, operations, services, management, engineering and innovation

(Kowalkowski et al., 2017a). Literature is very heterogeneous (Augurio et al., 2018) and several managerial issues and concepts are still debated.

A first issue is the classification of the servitized business models. It can be observed that the archetypical classification of Tukker (2004) that identifies three main groups of PSSs is quite consolidate though it could be not capable of catching all the real cases (Van Ostaeyen et al., 2013).

Strictly related to the business model issue is the classification of the industrial services. The existing classifications focus mainly on the value proposition of services and the product-service interaction. By focusing on the value proposition, Mathieu (2001) distinguishes the services supporting the supplier's product (SSP), that aim at guaranteeing the functioning of the product and the accessing of the customer to the asset, from the services supporting the customers' action (SSC) that support the action of the client and are high-customized. Going to the concept of product-service interaction, this expresses the link between products and services that are provided by the manufacturing firm. Services are considered as more related to the product core business when their provision requires the same capabilities that are employed to make the products. The interaction has been also evaluated by looking at the cash flow generated by services. The cash flow of services can be either contextual or not simultaneous to the cash flow of the product (Benedettini et al., 2017).

Another important issue is the service transition that has been conceptualized by some scholars as a forward and unidirectional process that can be carried out either by a stepwise process (Vandermerwe and Rada, 1988; Oliva and Kallenberg, 2003) or by adding gradually services (Baines and Lightfoot, 2013; Brax and Visintin, 2017; Benedettini and Neely, 2018). However, other works question the idea of a linear and unidirectional transition that can be subjected to revisions and modifications (Kowalkowski et al., 2012). Firms can implement more strategies at the same time (Kowalkowski et al., 2015) and they can also reduce or even leave the provision of services moving back to a more product oriented offering by carrying out processes of service dilution or deservitization (Kowalkowski et al., 2017b; Valtakoski, 2017).

Finally, another important open issue is the financial impact of the servitization, which is the main object of this work. The next paragraphs will face this important issue.

## **THE ANALYSIS OF THE PERFORMANCE**

As highlighted in Section 2, scholars do not give a definitive response about the outcomes of servitization. In fact some studies evidence that servitization improves the firms' performance (Homburg et al., 2002; Gebauer et al., 2010, Visnjic Kastalli and Van Looy, 2013, Crozet and Milet, 2017; Lin et al., 2018) while others bring to light that firms struggle to gain the expected gains (Gebauer et al., 2005; Neely, 2008, Min et al., 2015) falling into the "service paradox" (Gebauer et al.,

2005). Neely (2008) and Benedettini et al. (2015) show even a higher rate of bankruptcy of servitized firms compared to pure manufacturing ones.

From literature, it emerges that servitization actually allows firms to grow in revenue and in value (Fang et al., 2008; Kohtamaki et al., 2013b; Min et al., 2015; Bohm et al., 2017) but the profitability is more uncertain. In some cases, the profitability ratios could have declining rates (Neely, 2008; Min et al., 2015) or could not change at all (Augurio, 2019). In particular, the profitability of sales and assets seems to decline during the service transition.

Due to this heterogeneity of results the studies about the outcomes of servitization are deemed as “inconsistent” (Wang et al., 2018) or “inconclusive” (Visnjic Kastalli and Van Looy, 2013).

The different results can be explained by several reasons.

First, results depend on the different ways to measure both servitization and performance. Due to the difficulty to obtain the share of revenue coming from services (Gebauer et al., 2012), scholars generally measure the servitization on the basis of primary data that bring to light the strategic service orientation degree of the organization (Homburg et al., 2002; 2003) or the emphasis put on services by firms (Kohtamaki and Partanen, 2016). At the same time, scholars use another approach based on the count of the number of services that are provided by firms as it emerges by the analysis of their business description (Neely, 2008; Benedettini et al., 2017). Going to the performance, it is measured in term of revenue/sales (Neely, 2008; Eggert et al., 2014; Kohtamaki and Partanen, 2016; Bohm et al., 2017), firm’s value (Fang et al., 2008; Min et al., 2015) and profitability. The most common profitability ratios are the return on sales (Gebauer et al., 2010; Suarez et al., 2013, Kwak and Kim, 2016; Souza Junior et al., 2018), the EBITDA on total sales (Ambroise et al., 2018) and the net profit on total sales (Neely, 2008). Finally, the impact of the servitization is also evaluated by looking at the risk of the strategy that is measured as the number of bankrupt servitized firms (Benedettini et al., 2015).

Second, quantitative studies evidence that service strategies contribute to boost the firms’ performance only if the servitization degree meets a certain level. The relationship between the intensity of servitization and the performance is not linear (Fang et al., 2008; Cusumano, 2008; Kohtamaki et al., 2013b; Suarez et al., 2013; Visnjic Kastalli and Van Looy, 2013).

Third, many internal and external factors intervene on the relationship between servitization and performance, and each work analyzes only some of them (Zomer et al., 2017).

The next two sections will analyze in-depth the models of correlation and the contingency factors in order to systematize those aspects that influence the outcome of servitization as it evidenced by scholars in their works.

## MODELS OF CORRELATION

As told before, several works evidence that the relationship between servitization and performance does not appear linear (Fang et al., 2008; Cusumano, 2008; Kohtamaki et al., 2013b; Suarez et al., 2013; Visnjic Kastalli and Van Looy, 2013).

It is possible to identify two main models. One of them evidences a U-shaped correlation between servitization and performance suggesting the idea of a strategy that needs time to pay-off because it requires a period of settlement. In the beginning the performance could be negative for low level of servitization, starting to increase only when an inflection point is overcome and the initial investment starts to pay-off (Fang et al., 2008; Kohtamaki et al., 2013b; Suarez et al., 2013).

Fang et al. (2008) observe that only when the service sales account for the 20-30% of the total revenue there is an increase in firm value. Servitization suffers the consequences of the initial organizational changes such as the conflicts within the organization and the switch of resources from the product business to the service business where firms lack of experience and the likelihood of failure is not low. As the servitization advances, the experience should help firms better manage the new business and adapt the organization.

Kohtamaki et al. (2013b) evidence an increase in the sale growth for those firms whose offering is strongly focused on services. According to this vision servitization worth to be carried out when manufacturing firms increase the offering of more advanced and high customized solutions of services. Suarez et al. (2013) state that in the software industry servitization pays off only if the manufacturing firms carry out a remarkable transition as the inflection point is achieved when the share of services account for the 56% of the total sales. The service business needs to be relevant in order to increase the profitability.

Instead, Kwak and Kim (2016) evidence an inverted U-shape relationship in case of SMSs. SMSs benefit from servitization only for low level of servitization because further expansions deteriorate the profitability due to the rise of the political and transaction costs and the loss of opportunities of investment in the product business because of the switch of resources to the service extension.

Other models bring to light more complex relationships. According to Cusumano (2008) servitized firms in the software industry increase their performance only if services account for less than 20% of the revenues or more of the 60%. Low level of servitization means the provision of basic services as the maintenance. After that, further expansions of the service business deteriorate the performance because new and more complex services such as the strategic consulting and training begin to be provided. When services exceed the 60% of the revenues, manufacturing firms can exploit the economies of scale and the experience to provide services more efficiently and thus the performance improves again.

Instead Visnjic Kastalli and Van Looy (2013) evidence a positive S-shaped correlation. In the beginning the servitization is less costly because it is based on basic services such as spare-part activities. However, when servitization advances firms have to augment the investments in the services business and the profitability slows down. The advantages of the economies of scale and scope and the learning effects can be exploited only for high level of servitization.

## CONTINGENCY FACTORS

Many works have been focusing on the role of contingency factors that intervene on the relationship between servitization and performance.

From the analysis of literature, the contingency factors can be grouped in four categories. Three refers to internal factors such as the organizational aspects, the firm's resources, the service portfolio while only one concerns the external factors.

### *Organizational aspects*

Several organizational factors are explored in literature. One of them is the degree of the service orientation of firms that is conceived as a critical factor both at the individual and the organizational level. The performance of servitized firms is enhanced by the development of new set of values and behaviors among those individuals who are involved during the service transition such as the management and the employees (Homburg et al., 2002, 2003; Gebauer et al., 2010; Kohtamaki et al., 2015). The management commitment during the service transition is recognized to influence positively the firms' performance (Gebauer and Fleisch, 2007, Antioco et al., 2008; Zghidi and Zaiem, 2017). Same importance is given to the human resource that is in charge to provide services. The activities of customer treatment (Antioco et al., 2008) and demand-side search (Zhao et al., 2017) are necessary to guarantee a better service provision and to meet the customer satisfactions. The key role of the human resource has pushed scholars to investigate the influence of human resource management practices such as training, recruitment, assessment and compensation that are capable of influencing positively the relationship between servitization and performance (Homburg et al., 2003; Antioco et al., 2008; Kohtamaki et al., 2015; Zhao et al., 2017). These practices by improving the service provision enhance the quality of the customer relationship and thus the profitability (Homburg et al., 2003).

On the contrary, the impact of the choice concerning the organizational structure is less investigated by scholars. Gebauer et al. (2010) state that the separation of the service business from the product business does not seem to have any impact on the performance. On the contrary Oliva et al. (2012) evidence a positive mediating effect of the separation on the relationship between managerial commitment and firms' financial performance.

Finally, the firm's size investigated by Neely (2008) intervenes on the relationship between servitization and performance as well. In particular, servitized firms with more than 3,000 employees experiment a reduction in profitability due to the higher costs of the human resource. On the contrary, under that number of employees, firms easily succeed in improving their performance.

#### *Firm's resources*

As told the service transition is not easy and its success depends on a solid initial financial condition (Fang et al., 2008). However firms with unhealthy conditions can benefit from the existence of strong relationships with suppliers to collect resources (Bohm et al., 2017). In fact the development of specific network capabilities to manage interfirm relationships enhances the relationship between servitization and sales growth because firms can access to various resources easier (Kohtamaki et al., 2013b).

As a customer centric business model, the role of the customer relationship management on the performance has also been investigated. The relational capital, that is embedded in the relationship between the servitized firm and its own customers and it is based on trust, respect, and friendship, moderates the relationship between the provision of R&D services and profit (Kohtamaki et al., 2013a). Instead the relationship between the provision of knowledge-intensive business services and sales is enhanced by the activation of learning process and sharing of information between firms and customers (Kohtamaki and Partanen, 2016).

#### *Service portfolio*

The outcomes of servitization are strictly linked to the composition of the service portfolio. This last is analyzed by looking at the number of the provided services and the degree of completeness of the provision that can be extended from basic services to complex solutions passing through intermediate services. Scholars evidence that the increase of the breadth reduces the profitability while the increase in completeness allows to reach a better performance by allowing the exploitation of higher margins and a superior market value (Visnjic et al., 2012). Kwak and Kim (2016) evidence that the most profitable services are those that provide specific solutions to meet the customer needs such as process operation, outsourcing and technical consulting.

Other works focus mainly on the typology of services by adopting the Mathieu's classification (2001). Antioco et al. (2008) state that SSPs boost the service volume while SSCs can only improve the relative product sales. Furthermore, SSPs and SSCs seem to affect revenue and profit in different ways. SSCs directly influence both revenue and profit while SSPs act only indirectly (Eggert et al., 2014). Furthermore, SSPs and SSCs influence positively the long-term performance according to the degree of product R&D. The formers increase the firm's long-term profitability in case of high intensity of R&D activities. On the contrary, SSCs have a positive effect on the firm's long-term profitability with low level of innovation (Eggert et al., 2011).

The service business has been also investigated by looking at the proximity of the service business with the product business. According to Fang et al. (2008) closer the service business to the product business stronger the relationship between servitization and performance. Other works evidence that the proximity influences also the idiosyncratic risk of listed firms as well as the general exposure to bankruptcy. In the first case, firms that add services that are close to the product business can avoid the negative effect on the firm risk that comes from the decision of implementing servitization (Josephson et al., 2016). In the second case, servitized firms tend to be more exposed bankruptcy when the provision is based on services that need to be sold with the product such as retailing, distribution, and financial services (Benedettini et al., 2015).

#### *External factors*

The relationship between servitization and performance is also affected by business sector's specific features (Zghidi and Zaiem; 2017). Fang et al. (2008) prove that the industrial turbulence moderates those relationship. The outcomes of the servitization are also influenced by the level of the development of the countries. In developing countries manufacturing firms that add services first gain high profits (Moreno et al., 2020).

## **CONCLUSIONS**

Some focal keys can be drawn from the conducted activity of literature review.

It is rather difficult to foresee predetermined results in front of such complexity due to the heterogeneity of measurements, contingencies, and chosen industries. Furthermore, the performance of the servitization is strictly linked to the intensity of the process. However, general guidance can be drawn from the empirical works.

First, the development of service orientation is confirmed in several studies as one of the key elements for profitability. Its implementation requires huge investments to revise the structure that need time to be recovered. In fact firms often find the main difficulties right after the adoption of servitization or during the phase of further expansions of the service business. In case of great organizational changes servitization needs time to pay-off and the management should monitor especially the cost of the human resource.

Second, the profitability depends also on the service offering. Some services are more distant from the product business and their provision forces firms to develop new skills and competences and thus further investments. On the contrary, other services can be provided by using the existing competences and structures without additional investments. In this way a quicker return on investment is possible. Regarding the profitability of service categories, works evidence that advanced services based on strong and intense customer relationships can guarantee higher margins and the

price models can smooth the cash flow over the time. On the contrary, basic services tend to act as a strategic support of sales.

Third, the management of the network is considered a strategic capability to access to new resources and thus to increase performance (Bohm et al., 2017; Kohtamaki et al., 2013b). Same for the customer relationship that need to be nurtured on trust and a continuous information sharing (Kohtamaki et al., 2013a; Kohtamaki and Partanen, 2016). Firms that create strong relationships with other actors easier achieve a superior performance.

Fourth, the performance is related to the external contest that is not much studied yet and thus no guidance can be drawn at the moment. This factor need to be more investigated.

Considering the situation of high uncertainty of results and the peculiarity of services, managers should carry out an initial analysis of the adopted strategy in order to better plan servitization. The analysis could start from the identification of the specific features of the firm's strategy per each of the proposed four clusters of guidance. In this way, a sort of strategic dashboard can be used as a further instruments to reduce the uncertainty of the performance, make the picture of the investment less opaque and help the management to better calculate the payback period of the investment.

## FACTORS DRIVING CUSTOMER KNOWLEDGE SHARING ON ONLINE SOCIAL NETWORK

**Baima, Gabriele; Santoro, Gabriele; Gorla, Mirko**

Department of Management, University of Turin, Italy

### ABSTRACT

Sharing of knowledge among customers can be strategic for businesses, especially if controlled, analysed and conveyed. From this point of view, social media is a powerful tool both for sharing knowledge among customers, but also for businesses. Moreover, there seems to be a lack of studies regarding the factors influencing the willingness of customers to share knowledge about products and services on online social networks. The aim of this paper is to explore the factors driving customers to share knowledge about products and services on social media platforms. As such we provide a quantitative study testing several relationships. We have grouped and tested 2 groups of variables, namely psychological and behavioral, aiming to understand which key factors push the customers to share knowledge about products and services on social media. Overall, the findings suggest that the factors that influence most customers to share knowledge are not those related to behavior in online platforms, but the ones related to psychological traits. This study provides both theoretical and managerial implications.

*Keywords: Knowledge management, customer knowledge sharing, social media, consumer behavior.*

### INTRODUCTION

The current competitive environment has been defined by many as “hyper turbulent”, since it is characterized by increasing uncertainty and growing in the speed of change (Singh et al., 2019).

The prevailing trend in this environment regards the globalization of the markets, in which companies have to face new challenges and dynamics (Del Giudice et al., 2018). In a scenario of “digitalization”, the introduction of new technologies fosters the exchange of ideas and knowledge between customers but also between customers and companies (Santoro et al., 2018).

In this context, the focus of recent research streams has shifted to the centrality of “knowledge” as the main resource for organizations, as the only source of a stable and sustainable competitive advantage since it is harder to imitate (Van Den Hooff, 2004; Scuotto et al., 2017). In particular, the creation and

the intra- and inter-dissemination of knowledge among different organizations are more and more valuable activities for business (Del Giudice et al., 2017).

These studies follow the knowledge-based view (KBV), according to which knowledge is the most strategically important resource for both competition and innovation (Grant, 1996; Kessler, 2003).

Hence, the literature suggests that value is often created through knowledge flows within the company but also with external entities such as suppliers, partners, governments but above all customers (Ardichvili et al., 2003). Against this backdrop, acquiring knowledge from customers allows to improve products, to retain the customer and to build sustainable competitive advantages (Xu & Walton, 2005).

Other studies underline the importance of sharing knowledge among customers, which can encourage the growth of knowledge about a particular product and / or service, brands and new trends (Wu & Sukoco, 2010), thus enhancing the overall value for the business. Therefore, this sharing of knowledge among customers can be strategic for businesses, especially if controlled, analysed and conveyed (Ciampi, 2014). From this point of view, social media is a powerful tool both for sharing knowledge among customers, but also for businesses, which can analyze content shared by users and adapt strategies (e.g. business and functional) accordingly (Neeley & Leonardi, 2018; Papa et al., 2018). In particular, with social media platform, the relationship between customers and retailers has changed significantly. Moreover, social media platforms have provided customers with the opportunity to control what, when, where, and how they will interact with retailer (Lee et al., 2006). Literature recognizes the importance of customer as a source of knowledge (Davenport and Jarvenpaa, 2003; Rowley, 2004) and advocates the increasing value of investigating customer knowledge management for several reasons (e.g. enhancing a company's competitive advantage. Through the comments posted on the social media pages of the brands, consumers continuously exchange experiences, ideas and knowledge about products/services. Given the prominence of this social media platform, customers interaction deserves serious attention of researchers and practitioners. However, only limited research on customer knowledge sharing in social media platforms has been published to date. For example, Wasko & Faraj (2005) have analyzed how individual motivations and social capital influence knowledge contribution in electronic network. In addition, Chan & Li (2010) explored why customers help each other in virtual communities, demonstrating that reciprocity has critical effect on the social media communities. Lee et al. (2006) explored the factor that drive knowledge sharing among customers in web-based discussion board. However, the mentioned studied is qualitative and exploratory in nature. Moreover, there seems to be a lack of studies regarding the factors influencing the willingness of customers to share knowledge about products and services on online social networks. Therefore, this paper aims to explore the factors driving customers to share knowledge

about products and services on social media platforms. As such we provide a quantitative study testing several relationships. We have grouped and tested 2 groups of variables, namely psychological and behavioral, aiming to understand which key factors push the customers to share knowledge about products and services on social media. As a consequence, this paper tries to provide an answer to the following question: *“What are the characteristics and factors that drive customers to share knowledge about products and services?”*

## LITERATURE AND HYPOTHESES

Social media are generally defined as being “a group of Internet-based applications that build on the ideological and technological foundations of Web 2.0, and that allow the creation and exchange of user generated content” (Kaplan & Haenlein, 2010, p. 61). Social media allow users to interact easily in order to share content, information and knowledge with each-other (Leonardi et al., 2013).

Hence, social media is a tool to bridging people together and facilitating communication (Michaelidou et al., 2011).

Rambe & Nel (2015) have described social media as a range of applications that bring users together in a digital sphere. These include activities such as viewing online videos, live chatting, commenting on other people's content, reading and sending instant messages, creating, searching for and sharing information and knowledge, and playing virtual games (Hajli & Lin, 2016; Rambe & Nel, 2015). In fact, the availability of these powerful platforms allows individuals to create content, unique and identifiable profiles, status updates, publicly articulated online sites, chat rooms and related discussions (Everson et al., 2013; Ellison et al., 2015; Eid & Al-Jabri, 2016). Moreover, social media are tools for knowledge sharing that allow users to create or change content (Chomsky, 2012). As such, knowledge sharing is a process of exchange of knowledge between individuals (Chen & Hung, 2010; Chen et al., 2013). Scholars have defined knowledge sharing as “the provision of task information and know-how to help others and to collaborate with others to solve problems, develop new ideas, or implement policies and procedures” (Wang & Noe, 2010) and as “the communication of knowledge from a source in such a way that it is learned and applied by the recipient”. In this context, social media play an important role, because it facilitates knowledge sharing, and help the diffusion of information among people and society. Thus, social media create a virtual space that supports knowledge sharing activities (Kwahk & Park, 2016).

Social media is an important tool that make possible users to join together freely, who can exchange information and knowledge, express review and comments about services and product in order to ameliorate customers' experiences (Kaplan & Haenlein, 2010; Shang et al., 2011). This sharing of

knowledge among customers can be strategic for businesses, especially if controlled, analysed and conveyed (Lee et al., 2006).

Therefore, customer knowledge sharing about products and services on social media can be seen as the magnitude of knowledge flows about products and services that circulate on social media and online platforms.

Despite these premises, the customer's behaviour in knowledge sharing is unique and therefore difficult to decipher. This because each customer has different reasons for knowledge sharing on social media.

The next section discusses and proposes some reasons and characteristics that lead to knowledge sharing on social media, followed by some research hypotheses.

### *Informational influence*

Social influence has long been recognized as an important force shaping an individual's customer behavior. Two primary types of social influence have been identified in the literature: informational and normative (e.g. Bearden & Etzel, 1982; Bearden et al., 1989, 1990). Informational social influence is "an influence to accept information obtained from another as evidence about reality" (Deutsch & Gerard, 1955, p. 629). In the social media context, the more the people are informed with a certain product/service and tend to accept information obtained online, the more they will share information and knowledge. In other words, the more it is believed that pre-purchase information is important, the more it is believed that sharing knowledge on social media is important and therefore the more the customer will share knowledge on these platforms.

*H1. The willingness to accept information obtained from another positively influences the willingness to share knowledge about products and services in social media.*

### *Perceived usefulness of online reviews*

Perceived usefulness of online reviews (PUOR) has been defined as "the degree to which customers believe that online reviews would facilitate their purchase decision-making process". There is empirical research on the effect of perceived usefulness on usage intention (Davis et al., 1989; Moon & Kim 2001). For example, Moon & Kim (2001) argue that perceived usefulness has a significant effect on the intention to use the Internet. Therefore, we might assume that the more the online reviews are perceived useful, the more the customer will be willing to use social media and share knowledge on them. In fact, a higher usage of social media could be an antecedent of knowledge sharing on social media. In other words, the reason people share knowledge online is that they find them useful. These arguments offer a rationale for the following hypotheses:

*H2: Perceived usefulness of online reviews is positively related to customer knowledge sharing about products and services on social media.*

### ***Usage frequency of online reviews***

Researchers on online customer behavior (e.g., Liao & Cheung 2001) suggests that there is a positive relationship between Internet usage levels and Internet shopping. For example, Liao & Cheung (2001) demonstrated that Singaporeans who use the Internet more often are more willing to make purchases over the Internet. This result can be explained by the uses and gratification theory (Ruggiero, 2000). Hence, literature suggests that customers who use more internet and social media make more purchases online according to the gratification theory. Thus, it is reasonable to infer that those who use more Internet make more purchases online and therefore will be more likely to make online knowledge sharing. Thus, we propose the following hypothesis:

*H3: The usage frequency of online reviews on social media is positively related to sharing knowledge about products and services on social media.*

### ***Helping others***

Customers may receive intrinsic benefits from contributing knowledge. Knowledge is deeply integrated in an individual's personal character and identity (Priyadarshi & Premchandran, 2019). Self-evaluation based on competence and social acceptance is an important source of intrinsic motivation that drives engagement in activities for the sake of the activity itself, rather than for external rewards (Bandura, 1986). Thus, individuals may contribute knowledge in social media because they perceive that helping others with challenging problems is interesting, and because it feels good to help other people (Kollock, 1999). Prior research in social media suggests that individuals are willing to contribute knowledge to others because solving problems is challenging or fun, and because they enjoy helping others (Wasko & Faraj, 2000). The most experienced and passionate customers of certain products and services are more willing to share knowledge and information about those products and services because they want to share their knowledge and experience about products and services. Therefore, we propose the following hypotheses:

*H4: Individuals who enjoy helping others will contribute more to share knowledge about products and services on social media.*

### ***Customer Susceptibility to Interpersonal Influence***

Customer susceptibility is defined as the tendency to learn about products and services by seeking information from others (Bearden *et al.*, 1989). Scholars in customer research have documented the effect of interpersonal influence upon individual decision processes (Cohen & Golden, 1972).

Customers highly susceptible to interpersonal influence have been shown to be more influenced by others when making purchase decisions (Schroeder, 1996). Customer susceptibility can be utilized in the context of social media. An individual with a greater propensity to be influenced by others in social media platform, is likely to share experience and information in social media than an individual who is less susceptible to influence.

Thus, we propose the following hypothesis:

*H5: Customer susceptibility to interpersonal influence is positively related to customer knowledge sharing about products and services on social media.*

### ***Social Bond and Subjective Happiness***

The social bonds that social media members establish with others and the individual enjoyment represent customers' experiences through online interactions. Wikström et al. (2002) suggest that customers need social space in which they can feel close, safe, and happy through social interactions. Social media interactions offer intimate social support (Rheingold, 1993) that facilitates problem solving. Literature suggests that customers who receive social support tend to be grateful and demonstrate reciprocating behaviors to demonstrate their appreciation. Similarly, Wasko & Faraj (2005) show that people with high strong social bonds contribute more to the development of virtual community by helping other members, such as sharing knowledge and information with them. Subjective happiness also affects reciprocating intentions. According to Martocchio & Webster (1992), happiness (which they call playfulness) involves a subjective interaction experience such as pleasure and involvement with the computer. According to Dholakia & Bagozzi (2006) people are more willing to participate in online communities if they have positive emotions of happiness and delight, and the technology acceptance model demonstrates that enjoyment is a critical intrinsic benefit that strengthens users' positive attitudes toward using computer technology (Koufaris, 2002). Moreover, people who experience enjoyment from a network are more likely to contribute resources to that network (Wasko & Faraj, 2005).

In a nutshell, customers who gain resources (the social support and enjoyment) through the experiential route of social media interactions are more likely to reciprocate and share knowledge within the social media community.

*H6. The strength of social bonds that customers establish in the social media community positively influences the willingness to share knowledge about products and services in social media.*

*H7. The extent of individual enjoyment that customers experience in the community positively influences the willingness to share knowledge about products and services in social media.*

### *Reciprocity*

According to Wasko & Faraj (2005) knowledge contribution is facilitated by motivation, structural capital, cognitive capital and relational capital. Relational capital exists also when people trust others within the collective (Putnam, 1995). Members of a community contribute helping other members, even strangers, simply because everyone is part of the collective and all have a collective goal orientation (Leana & Van Buren, 1999). One dimension of relational capital is reciprocity (Wasko & Faraj, 2005). Reciprocity is when individuals usually reciprocate the benefits that receive from others (Shumaker & Brownell, 1984). Prior research indicates that knowledge sharing in social media is facilitated by a strong sense of reciprocity—favors given and received—along with a strong sense of fairness (Wasko & Faraj, 2000). Indeed, people note that if they receive help from others (or draw from the public good), then it would be fair to help others (contribute to the public good) (Wasko & Faraj, 2000). Thus, when there is a strong norm of reciprocity in the collective, individuals trust that their knowledge contribution efforts will be reciprocated, thereby rewarding individual efforts and ensuring ongoing contribution. This leads to the following hypotheses:

*H8: Individuals guided by a norm of reciprocity will be more willing to share knowledge about products and services on social media.*

## **METHODOLOGY**

### *Data, sample and variables*

A quantitative method involving a survey approach to test our research hypotheses and give an answer to the research question was chosen. Data was collected using an online platform in order to reach a wide range of respondents. Before sending the questionnaire, a pre-test was done with a random sample of 10 people who accepted to participate in such a test. Accordingly, the questionnaire was amended to make all the questions clearer. Respondents were informed that the purpose of the research was to “explore customers’ knowledge sharing attitudes on social media”.

Then, the questionnaire was sent via email and through social media to different areas of Italy, which is the context of analysis, in order to find a heterogeneous sample. In total, we received 204 responses from Italian customers between May 2019 and July 2019. The questionnaire was developed in Italian and authors translated the questions taken from the literature. We therefore employed the translation-back translation procedure suggested by Van de Vijver et al. (1997) to ensure consistency.

Respondents were told that their responses would remain anonymous and confidential. All the questions and variables were taken from the literature (Table 1 and Appendix).

**Table 1. Variables**

| Variables                | Explanation   | Role                 | Reference                       |
|--------------------------|---|----------------------|---------------------------------|
| CKS                      | 4 items / 5-point Likert scale  | Dependent variable   | Munar & Jacobsen (2014)         |
| Age                      | Age in years  | Control variable     | Balabanis & Siamagka (2017)     |
| Gender                   | 0 if female; 1 if male  | Control variable     | Balabanis & Siamagka (2017)     |
| Educational background   | 0 if he/she is not graduated; 1 if he/she is graduated or has a doctorate | Control variable     | Balabanis & Siamagka (2017)     |
| Posted online review Y/N | Dummy variable  | Control variable     | Punj, G. N. (2013)              |
| Posted reviews           | Average number of reviews per month                                       | Control variable     | Ridings, Gefen, & Arinze (2006) |
| INFO                     | 4 items / 5-point Likert scale  | Independent variable | Mangleburg et al., (2004)       |
| Helping                  | 3 items / 5-point Likert scale  | Independent variable | Wasko & Faraj (2005)            |
| Reciprocity              | 1 item / 5-point Likert scale   | Independent variable | Wasko & Faraj (2005)            |
| Social Bond              | 3 items / 5-point Likert scale  | Independent variable | Chan & Li (2010)                |
| CSII                     | 3 items / 5-point Likert scale  | Independent variable | Park & Lee (2009)               |
| PUOR                     | 3 items / 5-point Likert scale  | Independent variable | Park & Lee (2009)               |
| UFOR                     | 3 items / 5-point Likert scale  | Independent variable | Park & Lee (2009)               |
| Subjective Happiness     | 3 items / 5-point Likert scale  | Independent variable | Lyubomirsky & Lepper (1999)     |

Finally, we included several control variables, such as respondents' age, gender, educational background, posted online review Y/N and numbers of review per month, which were taken from the literature (Ridings et al., 2006, Punj, 2013, Balabanis & Siamagka, 2017).

### *Preliminary assessments of scales*

The items and variables were assessed for validity via confirmatory factor analysis (CFA) using SPSS software. We ran a CFA using principal component extraction with varimax rotation for the following variables: customer knowledge sharing (*CKS*), informational (*INFO*), helping, social bond (*SB*), customer susceptibility to interpersonal influence (*CSII*), perceived usefulness of online reviews (*PUOR*), usage frequency of online reviews (*UFOR*), subjective happiness (*SH*). For the *SH* variable, after the CFA analysis an item was removed because it was not consistent.

## FINDINGS

We implemented four regressions models to test the hypotheses (Khlif & Guidara, 2018; Papa et al., 2018), starting from the sole control variables in Model 1. Model 2 adds all the independent variables which has the following effects on the dependent variable: for the variables *UFOR*, reciprocity, *SB* and *SH* we found a positive and significant effect on the dependent variable, allowing us to accept HPs 3, 5, 6, 7. By contrast, for the other variables *PUOR*, *CSII*, helping and *INFO* we found a non-significant effect, thus HPs 1, 2, 4, 8 are not supported. Furthermore, in order to see potential changes in the findings, we divided the independent variables in 2 different categories named “behavior in online platform” which includes *INFO*, *PUOR*, *UFOR* and the “psychological traits” which includes Helping, *CSII*, *SH* and reciprocity. In Model 3 we added to control variables and all the “behavior in online platform” variables, and we found a non-significant effect for all the variables. This means that the variable *UFOR* loses its strength. In Model 4 we test the “psychological traits” variables, in which the effect is positive and significant for the following variables: *CSII* (0,230\*\*\*), *SB* (0,367\*\*\*\*), *SH* (,130\*\*) and reciprocity (,197\*\*\*). The only variable with a non-significant effect in Model 4 is Helping.

Source: own elaboration

Overall, the findings suggest that the factors that influence most customers to share knowledge are not those related to behavior in online platforms, but the ones related to psychological traits. In fact, CSII has a positive effect on CKS, which means that the customer shares information on social media when he/she tends to consider others' opinions when buying products/services. In addition, we have identified that the more a customer has strong ties with other members on social media, the more he/she will tend to share information with them, believing their participation in social media to be of key importance to other members. An interesting result that has emerged is that customers who are more self-confident and trying to enjoy life are more willing to share experiences and information on social media. Moreover, reciprocity plays an important role in the CKS, in fact if a customer knows that other members will help him/her, he/she thinks that it important to help other members and help the whole community. Contrary to expectations, the enjoyment of helping others in shopping activities in social media is not related is not a key factor that drive consumer to share knowledge in social media.

If "psychological" variables confirm our hypotheses, all the "behavioral" variables do not, except for one. Indeed, only for the UFOR variable we found a significant effect on CKS. This means that the more customers consult online reviews and the more they are willing to share knowledge about products and services on social media. Customers who do the most knowledge sharing are those who read so much online but don't necessarily think that all reviews are useful. In addition, we found that the attitude of asking for information about products/services before buying or to be influenced by friends is not an antecedent of knowledge sharing on social media platforms.

## DISCUSSION

Literature has shown growing interest in social media and knowledge sharing tools (Hajli & Lin, 2016; Rambe & Nel, 2015; Papa et al., 2018). However, there seems to be a lack of studies regarding the factors influencing the willingness of customers in sharing knowledge about products and services on online social media. For example, Lee et al., (2006) explored the factor that drive knowledge sharing among customers in web-based discussion board. However, the mentioned studied is qualitative and exploratory in nature and do not focus on knowledge about products and services. Therefore, to bridge this gap, this paper wants to explore what factors drive customers to share knowledge about products and services on online social networks. As such we provide a quantitative study testing several relationships. In doing so, we have explored the relationship between factors related to psychological and behavioral characteristics and customer knowledge sharing about products and services on social media.

## IMPLICATIONS AND CONCLUSION

Our findings help us to provide additional implications for the current theories. First, we contribute to the literature on knowledge management and knowledge sharing (Del Giudice & Della Peruta, 2016; Del Giudice et al., 2017; Scuotto et al., 2017), underlining the importance of online customer knowledge sharing on social media, which is related to the sharing between customers that brings value to the company and its brands. Second, we add to the “consumer knowledge sharing” stream of literature (Lee et al., 2006) by indicating that there is a positive relationship between psychological traits of customers in social media behavior and the customer knowledge sharing. More specifically, we suggest that bonds between people play an important role. In fact, when a person has many “virtual” relationships, they tend to share more information/experience on social media about products/services they are familiar with or have already purchased. Moreover, our data confirm that people are more willing to participate in online communities if they have positive emotions of happiness and delight (Dholakia & Bagozzi, 2006) and are also more willing to share information about products and services. Moreover, confirm that knowledge sharing in social media is facilitated by a strong sense of reciprocity.

Our findings help us to propose some managerial implications, especially for marketing managers. The proliferation of web-based platform brings tremendous impact on the retail industry (Lee et al., 2006). In particular, the explosion of social media platform, and in particular the possibility to sell directly through this platform (e.g. Instagram) provides retailers with wider opportunities to gain specific information of customers. In addition to the descriptive knowledge of customers, brands now can gain insights from the conversations or experience shared among customers in social media

platform, specifically in their social media pages. This knowledge is particularly important for brands and retailers to take competitive advantage over their competitors. Moreover, it is useful to comprehend what drives customers to share their knowledge in social media platforms. This quantitative study has identified some key elements of customer knowledge sharing in social media conversations. Building upon the findings of this study, we provide some generic guidelines for social media manager and retailers for promoting customer sharing in social media pages. For example, regarding our variable “enjoyment of helping”, social media manager goal should be to raise the level of enjoyment that the contributors experience as they help others. To reach this goal, social media managers should focus on enhancing and encouraging knowledge sharing. For example, rewarding those who share more knowledge or highlighting the most relevant comments. Another example should be related to the key element of reciprocity. In fact, social media manager should raise perception of reciprocity in the social media conversations, through recognition mechanism, where they can get recognized for their expertise during their participation and contribution (Lee et al., 2006).

## MOBILE PAYMENT SYSTEMS: ADVANTAGES AND FUTURES

**Bălțoi, Ion-Costel-Marius**

Doctoral School of Economic Informatics, Bucharest University of Economic Studies, Bucharest, Romania

### ABSTRACT

Nowadays, everything evolves with the help of technology. We live in a society with a high degree of adoption of new technologies, trade is present everywhere, and companies have passed the period when trade is practiced only in physical stores; is now looking for new opportunities to grow its business and satisfy customers by offering the easiest ways to purchase products. One of these growth opportunities is represented by mobile payment services that can bring businesses a major advantage on the market, both through ease of payments and by reducing cash costs. The research methodology is qualitative; a number of resources currently available in the field will be researched, and the technical experience in the integration of mobile payment systems will be helpful in presenting the payment system models. This paper presents the advantages of mobile payments (comfort, numerous use cases, compatibility with other platforms, increased security and data confidentiality, flexibility, speed in processing or lack of human error), as well as the essential features they have and differentiate on the market (simplicity, universality, security, costs, speed, interoperability, global payments). Also, below will be presented the most common payment models depending on the number of actors involved.

*Keywords: payment systems, mobile payments, payment models, mobile payment services*

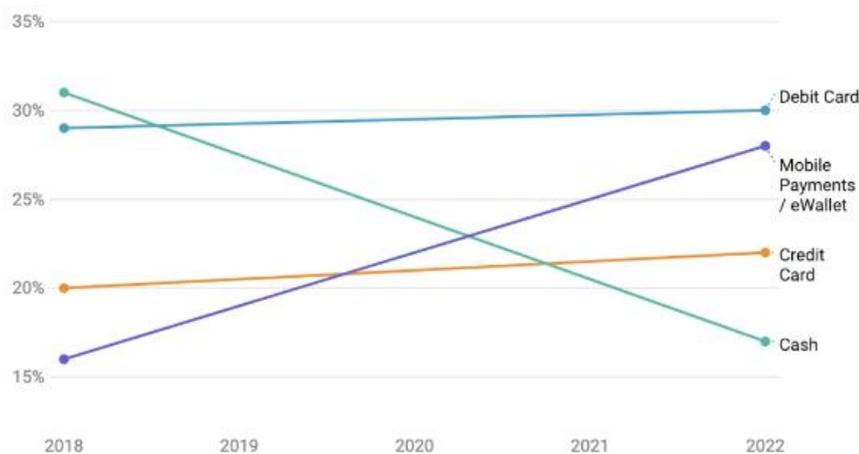

### INTRODUCTION

Payments have always been one of the main components of trade. Since then, the ways in which payments are made have constantly evolved and taken various forms. Whether we are talking about product-to-product exchanges, metal coins or paper banknotes, bank accounts or electronic wallets, the method of payment has become easier and easier, offering people various possibilities.

Mobile payments can be defined as "payments for goods, services and invoices with a mobile device using wireless and other communication technologies" (Dahlberg, et al., 2008). A similar definition is provided in (Pousttchi, 2008) and involves "the authorization or completion of payment processes through mobile communication techniques and devices".

In the usual sense, mobile payments represent the use of mobile devices to make the payment of the value of purchased goods and services, either online on the seller's website or through the mobile application or at a POS terminal. There are many ways in which payment can be initiated, among them we can list SMS, mobile application, browser, NFC or QR Code (Medici, 2018).

Over the last decade, payment methods have developed at a fast pace, stimulating trade growth by facilitating payments and offering new payment methods. Thus, from bank accounts and deposits, credit cards and checks, electronic payments have entered a new stage represented by electronic payments through mobile devices. Thus, electronic payments are developing with new providers and payment platforms, and as consumer behavior evolves, the concept of omnicommerce (payment by the same method, regardless of whether the purchase occurs in the store, online or through a mobile device) becomes more and more present, increasing the need for small retailers to adapt to the market by providing fast and secure payment solutions, and accepting mobile payments, helps increase customer satisfaction.

**Figure 1. Utilization rate statistics for payment types (VUBO Ltd, 2020)**

The graph shown in Figure 1 presents the evolution of the utilization rate of various types of payments in the period 2018-2022 worldwide. Thus, we notice that the utilization rate of mobile payments has an increasing trend; at the same time, the cash utilization rate decreases (mobile payments will double in volume over the next 5 years, and the share of cash will be reduced by half). We can also see a steady increase in the use of debit and credit cards, but much smaller than the percentage increase in the use of mobile payments.

The first part of this paper presents electronic payments, the forms they can take, as well as a series of statistics that highlight their importance in society. Next, the advantages of mobile payment systems will be presented; due to these advantages, mobile payment systems have become increasingly popular, becoming widely used and having the potential to grow rapidly.

The third part presents the characteristics of mobile payment systems, as well as the most used models currently on the market. It should be noted that in the process of integrating mobile payment systems into various services, the requirements of market regulators must be considered.

The last part presents the conclusions of this paper and will create the necessary context for future research in this field of perspective, which is developing rapidly in all geographical areas of the world.

## **LITERATURE REVIEW**

With an increasing number of users of smart devices and mobile payments, payment engines like Samsung Pay, Pay Android, Apple Pay, PayPal will grow ever faster. Among the significant mobile payment service providers, smaller providers are beginning to emerge, but with great growth potential that offer various application programming interfaces (APIs) or standard development kits (SDKs) that can be implemented by developers within mobile applications to provide a fast, easy and secure payment experience for users.

Mobile payments can be divided into 2 main categories: micropayments (worth less than 10 euros, for example small purchases or a ticket for public transport) and macro payments (worth more than 10 euros, for example online purchases). Thus, micropayments can be made directly via SMS sent from the mobile phone; sellers avoid debit / credit card payments because of high commissions. Macropayments are a major challenge for electronic payments providers due to the high security required to prevent fraud (Liebana, et al., 2014).

Mobile payments can also be divided into two categories: daily shopping or bills. For purchases, mobile payments compete with or supplement cash, debit cards, credit cards, or checks, while in the case of invoices, they typically provide access to account-based payment instruments, such as money transfers, Internet Banking or Mobile Banking, direct debit or receiving e-invoices (Dahlberg, et al., 2008).

Looking ahead, a number of factors will continue to positively influence the evolution of mobile payments and the growing decline of traditional payment instruments. Thus, the increase of the number of mobile devices and users worldwide is the most important factor; the generations Z (18-24 years old) and millennials (25-34 years old) will contribute to the growth of the mobile payments industry.

The mobile payments industry will revolutionize the way payments will be made as new technological innovations such as wearables, biometrics or blockchain technology develop. Increasing the number of portable devices such as watches, rings or other accessories equipped with NFC technology to make payments increasingly simple just by bringing objects closer to a POS terminal, even without an internet connection (VUBO Ltd Reading, 2018). One of the recent examples is the 2018 Winter Olympics where VISA offered viewers payment-enabled gloves and prepaid stickers (they have the potential to

turn any object into a payment device). Biometric payments are also an innovative technology that will revolutionize the mobile payments industry. Biometric payment systems analyze the biological characteristics of the individual, such as DNA, facial features or fingerprint. Due to the security and convenience of biometrics, it will replace traditional digital identification systems on a global scale.

## **METHODOLOGY**

This paper carries out a qualitative research based on the study of diversified resources in the field of mobile payments, the opportunities and development possibilities they offer, as well as the interaction of mobile payment systems with other information systems; a series of resources presented at various conferences in the field, articles published in international journals or resources published on various web platforms dedicated to research (ResearchGate.net, Academia.edu, etc.) will be analyzed. It also capitalizes on the practical experience gained in researching mobile payment systems and how they can be integrated into mobile applications.

## **ADVANTAGES OF MOBILE PAYMENTS**

Mobile payments have become increasingly simple and familiar to users; thus, by means of simple swipes, approaches or touches, they can make the payment of the desired products in a short time. Also, the implementation of mobile payment systems is simple for companies of all sizes through POS systems, smartphones or tablets; installation time is minimal and allows for rapid development, and for online merchants, the integration of electronic payment systems has become one of the mandatory requirements in terms of user experience.

According to Information Systems Audit and Control Association (ISACA) (ISACA, 2011), mobile internet development encourages consumers to use smart devices for trading purposes (online commerce, transfers or payments through a banking service or application, contactless payments, e-wallets, etc.). In the source (Report, 2008) is presented the idea that the development of digital payments has influenced the emergence of electronic wallets, the tool capable of storing payment means, loyalty vouchers, coupons and other facilities. Mobile payments also encourage users' consumer-oriented behavior due to their ease of payment and avoidance of lack of cash at the time of purchase. Thus, by implementing mobile payment systems, companies increase their revenues naturally, avoiding situations where lack of cash is a problem. (Lowry, 2016).

In the literature, the advantages of mobile payments are analyzed in various papers. Thus, Chen and Nath (Chen & Nath, 2008) lists among the most important advantages the comfort of the transaction, the compatibility between systems, security and confidentiality. Shin also found in a study on mobile wallets (Shin, 2009) that, in addition to high security, social influence and trust is an advantage for

users, and the study (Yang, et al., 2012) presents as important advantages of mobile payments social influence, low risk, compatibility between systems or high degree of innovation. Phonthanikitithaworn and Fong (Phonthanikitithaworn, et al., 2015) also presents the advantage of low costs as an important factor in the adoption of mobile payments.

From the point of view of companies that implement mobile payment services, they bring them a number of major benefits, including the rapid execution of transactions, the reduction of human error, the increase in cash flows or the reduction of labor costs.

In terms of speed of transactions, it saves time because the payment data of the card or mobile device is read automatically, without human interaction, and they are sent to the payment processor to be processed or to various resources management systems within the company.

The lack of the human element in the trading process reduces the risk of possible errors such as duplicate data entry or incomplete / incorrect entry, and possible subsequent interventions on the data even lead to financial losses for the company to locate and correct errors.

Regardless of the company's level, the cash flow is one of the central elements on which it is based and in the absence of which it cannot honor its obligations to third parties (suppliers, employees, tax institutions, etc.). Thus, through fast transaction processing and further processing in an ERP system, companies become agile and can find out exactly, at any time, the liquidity they have and can make operating decisions based on accurate data so that it works as efficiently as possible.

The integration of mobile payment systems helps to reduce labor costs by automating in-company processes that were previously performed by employees. Also, the possible costs for training the employees who will process the payments are reduced or avoided.

In the source (GPK Retail, 2017), GFK Retail presents important advantages of mobile payments processing speed, increased security and flexibility. It also notes that contactless mobile payment systems can be integrated with any POS device that has mobile connectivity.

In terms of processing speed, it contributes to increasing both customer satisfaction and increasing the processing power of a large number of transactions in the shortest possible time. Payment data security is also one of the challenges to mobile payments so that the risk of security incidents is minimized. Payment engines such as Apple Pay or Android Pay use complex encryption and identification technologies so that payment authorization is performed without exposing customer account details and even in the event of a cyber attack, customer data is secure. Through flexibility, GFK Retail defines the possibility of integration with other sales programs, such as loyalty programs, and allows the distribution of transaction data between systems.

In addition to processing speed and convenience of electronic payments, the source (Kasavana, 2017) mentions as advantages the potential increase in revenues from the sale of products or services,

increased customer satisfaction and the avoidance of fraud compared to traditional payments. Like remote mobile payments, mobile payments via NFC technology have the advantage of increased security because customer account information is not directly exposed, it is encrypted and can only be read in close proximity to the reader.

## FEATURES OF MOBILE PAYMENT SYSTEMS

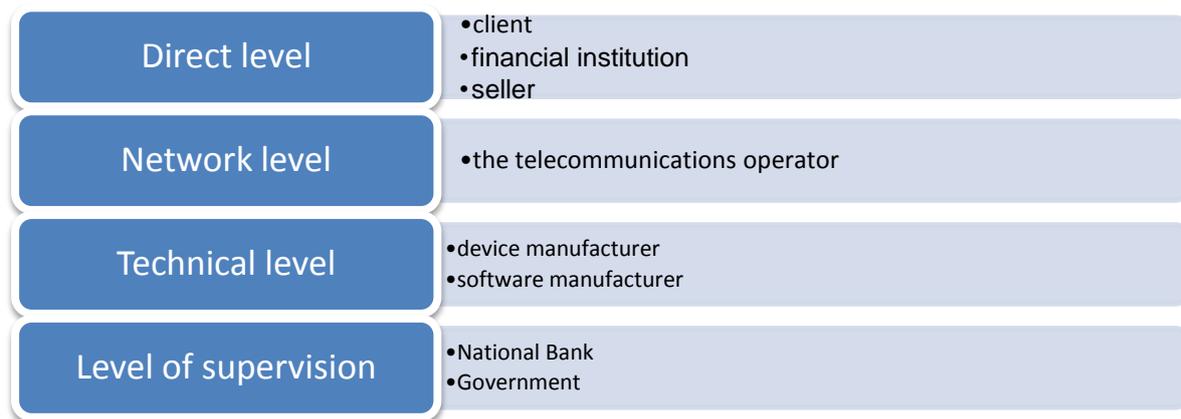

At present, people have the opportunity to choose between different payment methods, either directly through a banking institution, through the mobile network operator or through independent payment systems. Thus, there is a wide range of mobile payment solutions using SMS (Short Message Service), USSD(Unstructured Supplementary Service Data), WAP(Wireless Application Protocol) or NFC (Near Field Communication).

Mobile payment services, in order to be accepted by users and currently used by them, must have a number of essential features. These include: simplicity, usability, universality, security, privacy, low cost and high speed (Carr, 2007).

| Feature                         | Description  |
|---------------------------------|--|
| <b>Simplicity and usability</b> | The application must be user-friendly, intuitive without requiring a period of learning. The user can also customize different functions of the application or save different preferences.   |
| <b>Universality</b>             | The payment service must make the payment either between users (C2C), between a user and a business (B2C) or between businesses (B2B). The payment service must be available to perform both micropayments and macropayments.  |
| <b>Security and privacy</b>     | The service must be able to keep customer information secure. It must also maintain the confidentiality of transactions (payments must remain anonymous, as well as cash transactions) and save their history for future reference. The system must withstand cyber attacks by including various security methods. |
| <b>Costs</b>                    | The cost of payment must not be higher than the cost through other systems.  |
| <b>Speed</b>                    | Payments between the actors involved must be made within an acceptable time frame.   |
| <b>Interoperability</b>         | The payment system must be able to interact with other similar mobile payment systems in the same country or abroad.   |
| <b>Global payments</b>          | The system must be available for cross-border payments.  |

**Table 3. Features mobile payment services**

Within the entire process involving the use of electronic payments, a number of actors (customer, seller, telecom operator, regulatory institutions, etc.) intervenes directly or indirectly; their involvement is more or less obvious in day-to-day transactions. The electronic payment process can be divided into 4 levels, depending on the actors involved (Figure 2).

**Figure 2. Levels of the electronic payment process**

Thus, according to Figure 2, the factors directly involved in the process of making an electronic payment are the customer who wants to make the payment, the intermediary financial institutions, respectively the seller. As technical intermediaries, the telecommunications operator (network level) and the manufacturers of software and smart devices (technical level), respectively the National Bank as supervisor of financial operations intervene.

The purpose of payments is to transfer the monetary value from the payer to the seller (Peiro, et al., 1998). The actors directly involved in the payment are identified at the first level, and the type of payment varies depending on the number of participants involved. Payment models can be defined based on this number.

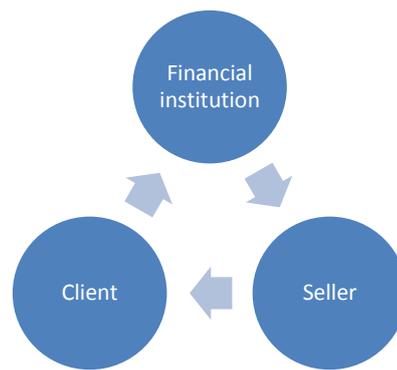

The literature presents a series of payment models depending on the number of actors involved. For this research, 3 of them are relevant: the model with 4 actors involved, the model with 3 actors involved, respectively the model with 2 actors involved.

The model with 4 actors involved (Four-party mobile payment model (Peiro, et al., 1998)) contains 4 actors directly involved, among which we have the payer, the beneficiary, the issuer (representative of the payer), the acquirer (representative of the beneficiary) (Figure 3).

**Figure 3. Four-party mobile payment model**

The model based on 3 actors involved (Three-party mobile payment model (Ham, et al., 2002)) presents the exchange of information related to transactions between 3 actors: client, seller, financial institution (Figure 4).

**Figure 4. Three-party mobile payment model**

From a theoretical point of view, the model involving 3 actors is much more efficient if we analyze the costs. In a model with 4 actors, both the issuer and the acquirer have their own set of commissions. Also, in the model based on 3 actors, the advantage also consists in the fact that they offer a much simplified payment method and are less expensive in the case of international payments.

Model based on 2 actors (Two-party mobile payment model – Figure 5) is the simplest and involves only 2 actors: the client and the financial sector; Mobile Banking or online banking platforms can be concrete examples of implementation.

**Figure 5. Two-party mobile payment model**

The common feature of these 3 models is that the information (payment request, monetary value) is transmitted between 2 parties involved, and the model based on 2 actors can be extended to any other transaction.

Depending on how the payment is made and the technologies used, mobile payment solutions can be based on your bank account, credit card or telecommunications provider's invoice.

Mobile payments based on bank accounts are based on the debit of the user's account at the time of payment and the crediting of the seller's account. The user's bank account is often associated with a telephone number; in this situation, collaboration between financial institutions and telecommunications operators could benefit both parties by increasing the number of transactions and amounts processed.

Credit card transactions have a similar mode of operation to the model based on bank accounts, the amount being credited to the seller's account. The credit card number also corresponds to a phone number. The disadvantage of this model is the level of credit card spread in that area and only those users will be able to use this payment solution.

Transactions based on the telecommunications provider's invoice are based on the use of the mobile phone by the buyers for various payments, and the costs are transmitted by the telecommunications provider. This model can be implemented either by prepayment or by subsequent payment of the invoice.

## CONCLUSIONS

Today, electronic payments are one of the most commonly used services by people. Thus, the average annual increase of 10% in electronic payments demonstrates that it is one of the services that bring real benefits to people and paves the way for new ways of managing money and interacting with financial institutions through alternative technologies. We also find that mobile payments can be integrated into a wide variety of applications, from e-commerce, payments and bank transfers to integration with IoT devices and other emerging technologies.

The way mobile payments have developed and been adopted by people is mainly due to the advantages and innovations they bring, among which we can list ease of use, integration into various complex IT solutions, high security, confidentiality, low transaction costs or social influence. In addition to the advantages presented, mobile payments are the basis for the implementation of electronic wallet products and payments through NFC technology; it is also the basis for payments via IoT devices such as wearables, bracelets, smart home systems, etc.

In order to optimally operate and facilitate the payment process through mobile devices, payments are made through a variety of technologies, including SMS (Short Message Service), USSD (Unstructured Supplementary Service Data), WAP (Wireless Application Protocol) or NFC (Near Field Communication). Mobile payments also involve the interaction of different actors at different levels. Thus, we have as direct participants the client, the beneficiary and the financial institution that mediates the transaction, and in addition to these we also have actors such as telecommunications providers, hardware and software manufacturers or regulatory institutions. Also, a series of models based on 2,3 or 4 actors involved are usually used, each of these models being used in practice depending on the specific context (for example, the model based on 2 actors is used in the use of applications mobile banking or online banking).

Globally, there are a large number of payment service providers (PSPs), or services developed by large companies such as Amazon, Google, Alibaba, but also lesser known services, but with great potential for development (Stripe, Braintree, etc).

Considering all the aspects analyzed and the conclusions formulated, mobile payments are currently one of the services in development, with great potential for growth and innovation.

Continuing this research, I propose to make a prototype application that integrates mobile payment systems. Based on this prototype, I will measure the impact that mobile payment systems have on individual users, as well as how their experience can be improved by adding new features.

*Keywords: payment systems, mobile payments, payment models, mobile payment services*

### INTRODUCTION

Payments have always been one of the main components of trade. Since then, the ways in which payments are made have constantly evolved and taken various forms. Whether we are talking about product-to-product exchanges, metal coins or paper banknotes, bank accounts or electronic wallets, the method of payment has become easier and easier, offering people various possibilities.

The purpose of this paper is to research payments through mobile devices and deepen their implications in the digital economy. Currently, the digitalization of economic activity and its transition to mobile devices offers a lot of research opportunities, both on the technological side and in terms of how these changes impact society and end users.

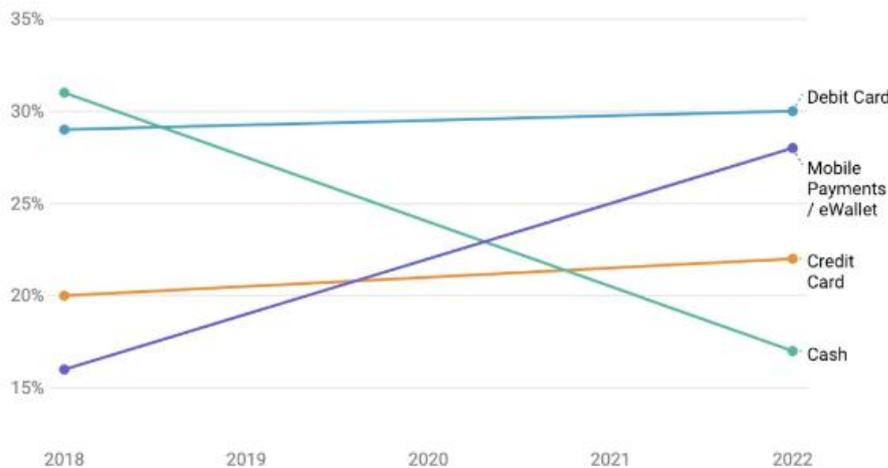

The objective of the paper is to offer a broad perspective on the state of knowledge up to the present moment in the field of mobile payments and to create the necessary context for future research in this field. Thus, it is pursued to present the advantages, characteristics and models of electronic payments, as well as the implications of mobile payments in the digital economy. As we know, mobile payments are a vast field of knowledge, increasingly present in everyday life and requiring in-depth analysis so that it is the starting point for further research on the impact of mobile payments on users and how they can be integrated into fintech applications.

Mobile payments can be defined as "payments for goods, services and invoices with a mobile device using wireless and other communication technologies" (Dahlberg, et al., 2008). A similar definition is provided in (Pousttchi, 2008) and involves "the authorization or completion of payment processes through mobile communication techniques and devices".

In the usual sense, mobile payments represent the use of mobile devices to make the payment of the value of purchased goods and services, either online on the seller's website or through the mobile application or at a POS terminal. There are many ways in which payment can be initiated, among them we can list SMS, mobile application, browser, NFC or QR Code (Medici, 2018).

Over the last decade, payment methods have developed at a fast pace, stimulating trade growth by facilitating payments and offering new payment methods. Thus, from bank accounts and deposits, credit cards and checks, electronic payments have entered a new stage represented by electronic payments through mobile devices. Thus, electronic payments are developing with new providers and payment platforms, and as consumer behavior evolves, the concept of omnicommerce (payment by the same method, regardless of whether the purchase occurs in the store, online or through a mobile device) becomes more and more present, increasing the need for small retailers to adapt to the market by providing fast and secure payment solutions, and accepting mobile payments, helps increase customer satisfaction.

The graph shown in Figure 1 presents the evolution of the utilization rate of various types of payments in the period 2018-2022 worldwide. Thus, we notice that the utilization rate of mobile payments has an increasing trend; at the same time, the cash utilization rate decreases (mobile payments will double in volume over the next 5 years, and the share of cash will be reduced by half). We can also see a steady increase in the use of debit and credit cards, but much smaller than the percentage increase in the use of mobile payments.

**Figure 6. Utilization rate statistics for payment types (VUBO Ltd, 2020)**

The first part of this paper presents electronic payments, the forms they can take, as well as a series of statistics that highlight their importance in society. Next, the advantages of mobile payment systems will be presented; due to these advantages, mobile payment systems have become increasingly popular, becoming widely used and having the potential to grow rapidly.

The third part presents the characteristics of mobile payment systems, as well as the most used models currently on the market. It should be noted that in the process of integrating mobile payment systems into various services, the requirements of market regulators must be considered.

The next chapter is dedicated to the implications of mobile payments in the digital economy. Thus, the implications on the users, the financial environment, at macroeconomic level will be presented. Also, we will present some factors that influence their development.

The last part presents the conclusions of this paper and will create the necessary context for future research in this field of perspective, which is developing rapidly in all geographical areas of the world.

## LITERATURE REVIEW

With an increasing number of users of smart devices and mobile payments, payment engines like Samsung Pay, Android Pay, Apple Pay, PayPal will grow ever faster. Among the significant mobile payment service providers, smaller providers are beginning to emerge, but with great growth potential that offer various application programming interfaces (APIs) or standard development kits (SDKs) that can be implemented by developers within mobile applications to provide a fast, easy and secure payment experience for users.

Mobile payments can be divided into 2 main categories: micropayments (worth less than 10 euros, for example small purchases or a ticket for public transport) and macro payments (worth more than 10

euros, for example online purchases). Thus, micropayments can be made directly via SMS sent from the mobile phone; sellers avoid debit / credit card payments because of high commissions. Macropayments are a major challenge for electronic payments providers due to the high security required to prevent fraud (Liebana, et al., 2014).

Mobile payments can also be divided into two categories: daily shopping or bills. For purchases, mobile payments compete with or supplement cash, debit cards, credit cards, or checks, while in the case of invoices, they typically provide access to account-based payment instruments, such as money transfers, Internet Banking or Mobile Banking, direct debit or receiving e-invoices (Dahlberg, et al., 2008).

Looking ahead, a number of factors will continue to positively influence the evolution of mobile payments and the growing decline of traditional payment instruments. Thus, the increase of the number of mobile devices and users worldwide is the most important factor; the generations Z (18-24 years old) and millennials (25-34 years old) will contribute to the growth of the mobile payments industry.

The study (Karjaluo, et al., 2019) performs an analysis on the adoption and use of contactless mobile payments (CMP). Compared to other previous studies, it analyzes the factors that influence the intention to use mobile banking applications or other mobile payment applications. In this sense, the model is built on the analysis of concepts such as perceived risk, brand involvement, overall satisfaction or continuous use of contactless mobile payments.

The mobile payments industry will revolutionize the way payments will be made as new technological innovations such as wearables, biometrics or blockchain technology develop. Increasing the number of portable devices such as watches, rings or other accessories equipped with NFC technology to make payments increasingly simple just by bringing objects closer to a POS terminal, even without an internet connection (VUBO Ltd Reading, 2018). One of the recent examples is the 2018 Winter Olympics where VISA offered viewers payment-enabled gloves and prepaid stickers (they have the potential to turn any object into a payment device). Biometric payments are also an innovative technology that will revolutionize the mobile payments industry. Biometric payment systems analyze the biological characteristics of the individual, such as DNA, facial features or fingerprint. Due to the security and convenience of biometrics, it will replace traditional digital identification systems on a global scale.

## **METHODOLOGY**

This paper carries out a qualitative research based on the study of diversified resources in the field of mobile payments, the opportunities and development possibilities they offer, as well as the interaction of mobile payment systems with other information systems; a series of resources presented at various conferences in the field, articles published in international journals or resources published on various

web platforms dedicated to research (ResearchGate.net, Academia.edu, etc.) will be analyzed. It also capitalizes on the practical experience gained in researching mobile payment systems and how they can be integrated into mobile applications.

## **ADVANTAGES OF MOBILE PAYMENTS**

Mobile payments have become increasingly simple and familiar to users; thus, by means of simple swipes, approaches or touches, they can make the payment of the desired products in a short time. Also, the implementation of mobile payment systems is simple for companies of all sizes through POS systems, smartphones or tablets; installation time is minimal and allows for rapid development, and for online merchants, the integration of electronic payment systems has become one of the mandatory requirements in terms of user experience.

According to Information Systems Audit and Control Association (ISACA) (ISACA, 2011), mobile internet development encourages consumers to use smart devices for trading purposes (online commerce, transfers or payments through a banking service or application, contactless payments, e-wallets, etc.). In the source (Report, 2008) is presented the idea that the development of digital payments has influenced the emergence of electronic wallets, the tool capable of storing payment means, loyalty vouchers, coupons and other facilities. Mobile payments also encourage users' consumer-oriented behavior due to their ease of payment and avoidance of lack of cash at the time of purchase. Thus, by implementing mobile payment systems, companies increase their revenues naturally, avoiding situations where lack of cash is a problem. (Lowry, 2016).

In the literature, the advantages of mobile payments are analyzed in various papers. Thus, Chen and Nath (Chen & Nath, 2008) lists among the most important advantages the comfort of the transaction, the compatibility between systems, security and confidentiality. Shin also found in a study on mobile wallets (Shin, 2009) that, in addition to high security, social influence and trust is an advantage for users, and the study (Yang, et al., 2012) presents as important advantages of mobile payments social influence, low risk, compatibility between systems or high degree of innovation. Phonthanikitithaworn and Fong (Phonthanikitithaworn, et al., 2015) also presents the advantage of low costs as an important factor in the adoption of mobile payments.

From the point of view of companies that implement mobile payment services, they bring them a number of major benefits, including the rapid execution of transactions, the reduction of human error, the increase in cash flows or the reduction of labor costs.

In terms of speed of transactions, it saves time because the payment data of the card or mobile device is read automatically, without human interaction, and they are sent to the payment processor to be processed or to various resources management systems within the company.

The lack of the human element in the trading process reduces the risk of possible errors such as duplicate data entry or incomplete / incorrect entry, and possible subsequent interventions on the data even lead to financial losses for the company to locate and correct errors.

Regardless of the company's level, the cash flow is one of the central elements on which it is based and in the absence of which it cannot honor its obligations to third parties (suppliers, employees, tax institutions, etc.). Thus, through fast transaction processing and further processing in an ERP system, companies become agile and can find out exactly, at any time, the liquidity they have and can make operating decisions based on accurate data so that it works as efficiently as possible.

The integration of mobile payment systems helps to reduce labor costs by automating in-company processes that were previously performed by employees. Also, the possible costs for training the employees who will process the payments are reduced or avoided.

In the source (GPK Retail, 2017), GFK Retail presents important advantages of mobile payments processing speed, increased security and flexibility. It also notes that contactless mobile payment systems can be integrated with any POS device that has mobile connectivity.

In terms of processing speed, it contributes to increasing both customer satisfaction and increasing the processing power of a large number of transactions in the shortest possible time. Payment data security is also one of the challenges to mobile payments so that the risk of security incidents is minimized. Payment engines such as Apple Pay or Android Pay use complex encryption and identification technologies so that payment authorization is performed without exposing customer account details and even in the event of a cyber attack, customer data is secure. Through flexibility, GFK Retail defines the possibility of integration with other sales programs, such as loyalty programs, and allows the distribution of transaction data between systems.

In addition to processing speed and convenience of electronic payments, the source (Kasavana, 2017) mentions as advantages the potential increase in revenues from the sale of products or services, increased customer satisfaction and the avoidance of fraud compared to traditional payments. Like remote mobile payments, mobile payments via NFC technology have the advantage of increased security because customer account information is not directly exposed, it is encrypted and can only be read in close proximity to the reader.

## **FEATURES OF MOBILE PAYMENT SYSTEMS**

At present, people have the opportunity to choose between different payment methods, either directly through a banking institution, through the mobile network operator or through independent payment systems. Thus, there is a wide range of mobile payment solutions using SMS (Short Message Service),

USSD(Unstructured Supplementary Service Data), WAP(Wireless Application Protocol) or NFC (Near Field Communication).

Mobile payment services, in order to be accepted by users and currently used by them, must have a number of essential features. These include: simplicity, usability, universality, security, privacy, low cost and high speed (Carr, 2007).

| Feature                         | Description  |
|---------------------------------|--|
| <b>Simplicity and usability</b> | The application must be user-friendly, intuitive without requiring a period of learning. The user can also customize different functions of the application or save different preferences.   |
| <b>Universality</b>             | The payment service must make the payment either between users (C2C), between a user and a business (B2C) or between businesses (B2B). The payment service must be available to perform both micropayments and macropayments.  |
| <b>Security and privacy</b>     | The service must be able to keep customer information secure. It must also maintain the confidentiality of transactions (payments must remain anonymous, as well as cash transactions) and save their history for future reference. The system must withstand cyber attacks by including various security methods. |
| <b>Costs</b>                    | The cost of payment must not be higher than the cost through other systems.  |
| <b>Speed</b>                    | Payments between the actors involved must be made within an acceptable time frame.   |
| <b>Interoperability</b>         | The payment system must be able to interact with other similar mobile payment systems in the same country or abroad.   |
| <b>Global payments</b>          | The system must be available for cross-border payments.  |

**Table 4. Features mobile payment services**

Within the entire process involving the use of electronic payments, a number of actors (customer, seller, telecom operator, regulatory institutions, etc.) intervenes directly or indirectly; their involvement is more or less obvious in day-to-day transactions. The electronic payment process can be divided into 4 levels, depending on the actors involved (Figure 2).

**Figure 7. Levels of the electronic payment process**

Thus, according to Figure 2, the factors directly involved in the process of making an electronic payment are the customer who wants to make the payment, the intermediary financial institutions, respectively the seller. As technical intermediaries, the telecommunications operator (network level) and the manufacturers of software and smart devices (technical level), respectively the National Bank as supervisor of financial operations intervene.

The purpose of payments is to transfer the monetary value from the payer to the seller (Peiro, et al., 1998). The actors directly involved in the payment are identified at the first level, and the type of payment varies depending on the number of participants involved. Payment models can be defined based on this number.

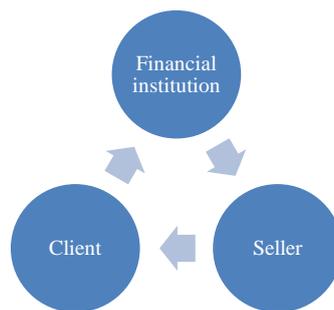

The literature presents a series of payment models depending on the number of actors involved. For this research, 3 of them are relevant: the model with 4 actors involved, the model with 3 actors involved, respectively the model with 2 actors involved.

The model with 4 actors involved (Four-party mobile payment model (Peiro, et al., 1998)) contains 4 actors directly involved, among which we have the payer, the beneficiary, the issuer (representative of the payer), the acquirer (representative of the beneficiary) (Figure 3).

**Figure 8. Four-party mobile payment model**

The model based on 3 actors involved (Three-party mobile payment model (Ham, et al., 2002)) presents the exchange of information related to transactions between 3 actors: client, seller, financial institution (Figure 4).

**Figure 9. Three-party mobile payment model**

From a theoretical point of view, the model involving 3 actors is much more efficient if we analyze the costs. In a model with 4 actors, both the issuer and the acquirer have their own set of commissions. Also, in the model based on 3 actors, the advantage also consists in the fact that they offer a much simplified payment method and are less expensive in the case of international payments.

Model based on 2 actors (Two-party mobile payment model – Figure 5) is the simplest and involves only 2 actors: the client and the financial sector; Mobile Banking or online banking platforms can be concrete examples of implementation.

**Figure 10. Two-party mobile payment model**

The common feature of these 3 models is that the information (payment request, monetary value) is transmitted between 2 parties involved, and the model based on 2 actors can be extended to any other transaction.

Depending on how the payment is made and the technologies used, mobile payment solutions can be based on your bank account, credit card or telecommunications provider's invoice.

Mobile payments based on bank accounts are based on the debit of the user's account at the time of payment and the crediting of the seller's account. The user's bank account is often associated with a telephone number; in this situation, collaboration between financial institutions and telecommunications operators could benefit both parties by increasing the number of transactions and amounts processed.

Credit card transactions have a similar mode of operation to the model based on bank accounts, the amount being credited to the seller's account. The credit card number also corresponds to a phone number. The disadvantage of this model is the level of credit card spread in that area and only those users will be able to use this payment solution.

Transactions based on the telecommunications provider's invoice are based on the use of the mobile phone by the buyers for various payments, and the costs are transmitted by the telecommunications provider. This model can be implemented either by prepayment or by subsequent payment of the invoice.

## **IMPLICATIONS OF MOBILE PAYMENTS**

The continuous development of mobile payments contributes to the process of digitalization of the economy (often called the "digital economy"). The digital economy involves major changes in people's behavior (especially, changing consumption habits), as well as in the economic activity carried out by companies (computerization of economic activity through integrated software applications for managing resources and economic processes).

Among the benefits of the digital economy for individual users, we can list the extension of access to remote financial services - sending and receiving money, access to financial products for saving and credit, mobile applications for tracking stock quotes or IT systems for wealth management. Under these

conditions, the rapid transfer of money and real-time tracking of various indices has changed the way people interact with the financial system; At this moment, technology is becoming more and more important, and the financial sector must adapt by offering customized solutions to customers so as to better meet their needs.

At the level of actors involved in economic activity, the digital economy supports the efficient use of resources by reducing the costs of remittances, reducing branch networks at the regional level and providing alternatives for managing own finances through mobile applications. We can say that mobile payment systems support the increase of the financial intermediation in the economy by redistributing the monetary value from those who have surplus to those who need cheaper loans and obtained in a short time.

At the macroeconomic level, mobile payments stimulate the emergence of new alternative services that contribute through various taxes to state revenues. In this regard, we can note the alternative accommodation services at non-hotel units (Booking, AirBnb, etc.), car sharing services (Uber, Bolt, etc.), digital content delivered directly to mobile devices (Netflix, Spotify, etc.) , delivery services (Glovo, Uber Eats, etc). From a commercial point of view, access to mobile payment systems extends the access of intermediation platforms globally, without being limited to a certain geographical, social or cultural specific.

The digital economy, through mobile payments, supports the efforts of states to discourage various illegal behaviors, such as non-declaration of income and non-payment of related taxes, money laundering, tax evasion, etc. Regarding the transactions made on the Internet or the business carried out in other states, the problem of taxation arises. In this sense, a mechanism obtained by consensus of the states is needed so that they can be tracked and an international taxation can be applied.

As a whole, the digital economy favors the evolution of mobile payment systems and the transition to new technologies that positively influence access to electronic payments, processing time or costs. Thus, a number of factors have the potential to change the current rules by which the financial system works. These include the PSD2 directive by which all electronic payment providers must increase the level of security for online payments (Strong Customer Authentication-SCA) and provide access to affiliates such as fintech companies through secure web services (in this way, the monopoly of financial institutions is diminished by market entry and new companies, with an emphasis on technology). Also, instant payments can change the market by transferring monetary value in real time between those involved in transactions; fintech solutions allow money to be sent directly from e-wallets to other people based on their phone number or user account, without the need for an IBAN code. It is worth analyzing the impact of technologies such as artificial intelligence and the blockchain in electronic payments; Artificial intelligence contributes to the analysis of large volumes of data and the analysis of

user behavior, acquisitions made in the past and forecasting future acquisitions, as well as the detection of possible fraud. In the case of blockchain technology, it can offer various advantages such as improved transparency, increased security, speed in processing), but has a number of ambiguities related to interoperability with current financial systems, the costs of transactions and the multitude of digital currencies and their standardization.

## CONCLUSIONS

Today, electronic payments are one of the most commonly used services by people. Thus, the average annual increase of 10% in electronic payments demonstrates that it is one of the services that bring real benefits to people and paves the way for new ways of managing money and interacting with financial institutions through alternative technologies. We also find that mobile payments can be integrated into a wide variety of applications, from e-commerce, payments and bank transfers to integration with IoT devices and other emerging technologies.

The way mobile payments have developed and been adopted by people is mainly due to the advantages and innovations they bring, among which we can list ease of use, integration into various complex IT solutions, high security, confidentiality, low transaction costs or social influence. In addition to the advantages presented, mobile payments are the basis for the implementation of electronic wallet products and payments through NFC technology; it is also the basis for payments via IoT devices such as wearables, bracelets, smart home systems, etc.

Mobile payments also involve the interaction of different actors at different levels. Thus, we have as direct participants the client, the beneficiary and the financial institution that mediates the transaction, and in addition to these we also have actors such as telecommunications providers, hardware and software manufacturers or regulatory institutions. Also, a series of models based on 2,3 or 4 actors involved are usually used, each of these models being used in practice depending on the specific context (for example, the model based on 2 actors is used in the use of applications mobile banking or online banking).

Globally, there are a large number of payment service providers (PSPs), or services developed by large companies such as Amazon, Google, Alibaba, but also lesser known services, but with great potential for development (Stripe, Braintree, etc).

Considering all the aspects analyzed and the conclusions formulated, mobile payments are currently one of the services in development, with great potential for growth and innovation.

Continuing this research, I propose to make a prototype application that integrates mobile payment systems. Based on this prototype, I will measure the impact that mobile payment systems have on individual users, as well as how their experience can be improved by adding new features.

## BIASES AND HEURISTICS IN CONSUMER BEHAVIOR: COMPARING GENERATION X AND MILLENNIAL CONSUMERS

**Bargoni, Augusto; Bertoldi, Bernardo; Giachino, Chiara; Santoro, Gabriele**

Department of Management, School of Management and Economics, Turin, Italy

### ABSTRACT

Understanding consumers' behavior and unlocking the elements that trigger the decision-making process of consumers is a key element of marketing. Traditional theories of consumer behavior, based on the assumption that consumer choices are fully rational, are proven to be incomplete. Not only they do not take into account cognitive processes such as social comparison, imitation and repetitive behaviour (habits) but they do not explain how the changes in the macro-environment influence the profile of people born in a specific time period, imprinting a specific and common purchasing and consumption behavior. Leveraging the theoretical contribution on consumer biases taxonomies, hence the fallacies in the rational economic behavior, and the generational theories, this paper aims at comparing the response to consumer biases between two generations: Generation X and Generation Y/Millennials. A structured field research on how different generations react to biases and heuristics has not yet been proposed. This paper, through data collection from two focus groups of eight participants each, infers that each generation, due to the imprinting of specific social and macro-environmental externalities has a different response to consumer biases. Understanding how different generations react to biases, that *de facto* create fallacies in the rational decision-making process of consumers, can definitely contribute to define a new perspective on market segmentation and can provide useful frameworks for companies to maximize the return on investment on marketing expenditures.

*Keywords: consumer behavior; behavioral economics; neuromarketing; consumer biases; heuristics; adaptive behavior; decision-making; generation X; millennials; generation differences;*

### INTRODUCTION

In 2019 companies have spent 563 Billion US dollars in advertising with a 4% growth from 2018 (*Statista, 2019*). It is without the shadow of a doubt that targeting the right segment of customers, stimulating potential buyers and fulfilling the needs and desires of the customers is key for companies whose objective is creating customer value and building profitable customer relationships (*Armstrong et al., 2014*). However, due to the expansion of the domestic markets into a global economy and the

increase in cross-border competition, today consumers are bombarded with advertising promoting different products that aim at satisfying the same needs (Bennett, 2017; Coulter et al., 2001; Kresh et al., 2018). This means that consumers are continuously making choices among products, comparing prices or benchmarking quality but they are not fully aware of the consequences of those choices (Dzyabura and Hauser, 2019; Nelson, 1970; Obermiller, 2019). The way in which consumers make choices and take decisions has been the key research question for academics in the marketing field for the last decades (Sprotles and Kendall, 1986; Tsai and Honka, 2018; Xiao and Benbasat, 2018). Traditional theory of consumer behavior has always taken for granted the assumption that consumer choices are fully rational decisions (Jager et al., 2000). The academic studies on neuromarketing first, and the literature on cognitive biases have tried to explain why consumers' behavior is not always rational (Kahneman and Tversky, 1973; Trevisan, 2016; Xinhui and Han, 2016) but, instead, violates the axioms stated by rational predictive models such as the Expected Utility Theory (Navarro-Martinez et al., 2018; Takemura, 2019; Von Neumann and Morgenstern, 1947). Building on the academic research developed in the field of consumer biases, our research question aims at understanding what are the different responses to consumer biases between generations. Recent studies have proven the existence of consumer biases when exposed to advertising (Xiao and Benbasat, 2018), have proven the individualistic response to environmental stimuli in the act of purchasing (Carter et al., 2007). However, literature still hasn't analyzed the different responses to consumer biases between generations.

To deepen the literature on generational theories and consumer biases we conducted two focus groups comparing the reaction of the exposure to consumer biases of two different generations: Generation X and Generation Y/Millennials.

Our research demonstrates that Generation X suffers from a bias called endowment effect that appears to be characteristic of this generation. The adversity to risk taking, the attachment to the well-known brand and the distrust towards the internet leads this generation to sub-optimal decision making. Generation Y, by being technologically savvy, less brand driven and more oriented to deal-making appears to be prone to risk taking to maximize the return on the choices made.

The understanding of the difference in behaviors and the differences in the reaction to biases and heuristics of different Generations, represents an essential condition for designing and implementing successful marketing campaigns. Studying cognitive biases and heuristics highlights the importance of a different perspective in the segmentation models. This research can be particularly appealing to practitioners since it allows a multi-dimensional approach to the identification of the decision-making processes that leads consumers' preferences.

## THEORETICAL BACKGROUND

The traditional theory of consumer behavior is based on the assumption that consumer choices are fully rational decisions (Jager et al., 2000) but, in everyday life, the behaviour of people is typified by multi-dimensional optimization (Ceschi et al., 2014). In fact, people engage in cognitive processes such as social comparison, imitation and repetitive behaviour (habits) so as to efficiently use their cognitive processes. Neuromarketing, a branch of marketing, aims at filling this gap between traditional consumer behavior and cognitive processes trying to foresee consumers' reaction when exposed to an advertisement (Alvino et al., 2018; Bakardjieva and Kimmel, 2017; Hsu, 2017).

Some studies investigated this aspect focusing the attention on biases (Ceschi et al., 2019; Kahneman et al., 1982). It emerged that biases are fallacies in the rational economic behavior due to psychological factors and individual differences (Ceschi et al., 2014). To explain the extent to which individual perception models human behavior, academics have tried to find theoretical taxonomies of biases. Arnott (2006) has proposed a classification of biases related to the computer science domain to establish all the normative violations executed by human beings compared to machines. Carter et al. (2007) have focused on finding taxonomies of biases in managerial decision-making. Such taxonomies however are specific to the field of study of the authors. Our research leverages the taxonomy of biases proposed by Ceschi et al. (2019) that through a three step analysis overcomes the limits of empirical solutions and theoretical taxonomies present in the previous literature.

However, theoretical contribution on biases has been focused on aggregate effects using between-subjects designs in order to demonstrate violations of rationality (Ceschi et al., 2019; Kahneman et al., 1982). Other studies have been designed to demonstrate the relationship between biases to enrich the academic literature of individual differences by integrating intelligent measures with few biases tasks (Bruine de Bruin et al., 2007; Slugoski et al., 1993).

Existing literature has deepened the influence of groups in the decision-making processes and part of the existing literature infers that groups tend to be less biased, or act in a more rational way, resulting in better decision-making than individuals (Kameda and Tindale, 2006; Tindale et al., 2013). However, academic literature still hasn't found a common perspective on the subject (Gigone and Hastie, 1993; Kerr et al., 1996; Kerr and Tindale, 2004; Sunstein, 2004) In their study, de Wild et al. (2018) state that even though groups perform equally as their best member on intellectual tasks that have a demonstrably correct answer and high information load (Laughlin, 1980; Laughlin et al., 1991, 1998), often they appear to be as biased as, or even more biased than, individuals operating alone and independently (Kerr et al., 1996; Kerr and Tindale, 2004).

Academic literature still hasn't analyzed the role of cognitive biases between generations. Our research question aims at understanding what are the different responses to consumer biases between

generations. Understanding how different generations react to biases, that *de facto* create fallacies in the rational decision-making process of consumers, can definitely contribute to define a new perspective on market segmentation driven by a multi-dimensional approach and can provide useful and practical frameworks for companies to maximize the return on investments on marketing expenditures.

Our research builds on the theoretical contribution of generation theorists that assert that changes in the macro-environment influence the profile of people born in a specific time period, imprinting a specific and common purchasing and consumption behavior (Anderson et al., 2018; Giovannini et al., 2015; Howe and Strauss, 2007; Lissitsa and Kol, 2016). Generations are shaped by the context in which they emerged and each cohort has specific traits (Amplitude, 2009; Greenberg, 2011; McKinsey, 2019):

**Generation Baby Boomer (1940-59):** were immersed in the post-World War II context and are best represented by consumption as an expression of ideology;

**Generation X (1960-79):** were born in a political transition phase, where capitalism and meritocracy dominated. They are imprinted with a materialistic, individualistic and competitive behavior, oriented to status expression focusing their aspirational consumer behavior on well-known brands and luxury goods

**Generation Y (1980-94):** were born in economic stability within the globalization era and have witnessed the important emergence of the internet. This generation is characterized by strong self-orientation that is reflected in the consumer habits which are experience oriented and less brand oriented.

**Generation Z (1995-2010):** the main spur to consumption is the search for truth, in both a personal and a communal form. This generation feels comfortable not having only one way to be itself. Its search for authenticity generates greater freedom of expression and greater openness to understanding different kinds of people.

This paper, by leveraging on the classification of measurable consumer behavior biases theorized by (Ceschi et al., 2019) and the studies of generation theorists (Jain and Viswanathan, 2015; Thomas et al., 2014) aims at studying the response to different biases between Generation X and the Millennials/GenY. The study of the correlation between generations and consumer biases represents a contribution to the existing literature as it tries to demonstrate how these biases influence the consumer behaviors of two different generations: one that has seen the emergence of the internet era and has learned to interact with digital and online shopping (i.e. Gen X) and one that has grown up being a “fully digital” generation (Gen Y).

## METHODOLOGY

Our research methodology leverages the focus group technique which is widely spread in the social science research (Wilkinson, 1998). This data collection methodology has been used in a first attempt to deepen the literature on consumer behavior biases and to better understand the phenomenon. As stated by (Beck et al., 1986) “a focus group is an informal discussion among selected individuals about specific topics”. To conduct our focus group we selected, for both Generation X and Millennials, a group of homogeneous individuals, especially in relation to 'prestige' or 'status' to avoid communication conflicts or status inhibition (Carey et al., 1994). Discussions between individuals in the focus groups have been facilitated by a moderator, especially introducing the argument and to put every participant at ease. The small number of participants has been chosen in order to facilitate the discussion between members of the focus group and to have a direct glimpse at the phenomenon to gain valuable information on language or behavior specifics prior to conducting in-depth interviews or large scale surveys (Threlfall, 1999).

Table 1 indicates the composition of each focus group

**Table1**

| Participants     | Generation X | Generation Y |
|------------------|--------------|--------------|
| Number of female | 4            | 5            |
| Number of male   | 4            | 3            |
| Total            | 8            | 8            |

### *Personal elaboration*

Leveraging the classification of consumer biases of Ceschi et al. (Ceschi et al., 2019) the members of the focus groups have undergone to six different test in order to study six different consumer biases:

**Endowment effect:** this test aims at studying the online consumer behavior of the two generations regarding the choice between the same product but sold on two different websites. One, a well-known e-commerce website with a higher selling price, the other an unknown website but with a lower selling price. The groups have been asked to choose and motivate their choice. Then the participants were presented with a rating of both e-commerce websites and they were asked to change or confirm their choice.

**Framing Effect:** the participants were asked to choose between two identical products but represented differently (the image depicted a form of Parmigiano Reggiano, one intact and the other one with a slice already cutted) with the same final price for the consumer. One of the products had an initial higher price but presented a discount of 20% so that final price to consumer was equal to the other product.

**Anchoring heuristic:** to each group two questions have been asked on a geography subject. None of the participants knew the answer. The first question served as anchor for the second one thus for the definitive choice of the sample.

**Reference price:** this bias has been tested by asking the participants to first, choose between two different products with different characteristics and prices, second they were presented with a third product less costly for the consumer but more advantageous for the producer.

**Time discounting:** to test gambler's fallacy, participants to the focus groups were asked to choose between two types of rewards to participate to the focus groups. Both the rewards were Amazon bonus. The first reward consisted on 25 euros on Amazon bonus delivered immediately, the second reward consisted in a 35 euros Amazon bonus delivered in 50 days. The participants who chose the immediate bonus were given specific conditions: to keep the bonus they had to obtaining the head face of a coin after a sequence of 1 toss or they could have kept 15 euros without playing the coin game.

**Representativeness heuristic:** this test consisted in presenting the focus groups with two different individuals. These two different individuals shared the same set of adjectives to describe them but were presented in mixed order to the participants. To demonstrate the representativeness heuristic, we asked the participants to judge the characters presented based on the adjectives read and were asked to pin point the adjectives that best described them.

Each focus group has undergone to the same questions and in the same order, the process by which the facilitator has deployed the questions has been the most similar as possible between the two groups.

For each question of the different set of test we let the participants 10 to 15 minutes to discuss the possible answer.

## FINDINGS

The preliminary analysis of the results emerging from the six tests performed to the Generation X group and the Generation Y group highlights the existence of biases deriving from the belonging to a specific group, hence a specific generation.

Table 2 indicates the results for each bias measured for each focus group

Table 2

| Test performed                      | Generation X   | Generation Y  |
|-------------------------------------|--|---|
| <b>General discussion</b>           | 25% of the respondents were aware that their choices were biased by the images, sounds and captions of both product's characteristics or the environment in which the purchase was made. After an explanation of the biases 100% of the respondents stated that they would have been able to control those biases.   | More than 50% of the respondents were aware that their choices were biased by the images, sounds and captions of both product's characteristics or the environment in which the purchase was made. The group expressed that 90% of the series they watched on Netflix are actually series recommended by Netflix.   |
| <b>Endowment effect</b>             | 88% of the respondents preferred to buy the product on a well-known website rather than an unknown website but with a much lower price. When confronted with the references of the two websites (low references for the well-known website and vice versa), 25% of the respondent changed their mind but the other 75% still preferred to buy on a well-know website even with bad references. | 75% of the respondents preferred to buy the smartphone on the well-known website even if the price was two times higher than the other, less known, website. After showing the references on the products of the websites (low references for the well-known website and vice versa), 100% of the respondents changed their choice.   |
| <b>Framing Effect</b>               | 100% of the respondents, when confronted to the image of two identical products showed no preference between the two products. After showing two different prices with two different discounts but same final price, 88% of the respondents chose the product with the initial higher price stating that the higher price was a reflection of the superior quality of the product.             | 100% of the respondents, when confronted to the image of two identical products showed no preference between the two products. After showing two different prices with two different discounts but same final price, 100% of the respondents chose the product with the initial higher price stating that the higher price was a reflection of the superior quality of the product. |
| <b>Anchoring heuristic</b>          | 100% of the respondents, when asked to answer to two different questions that had no bond between them, leveraged the answer to the first question in order to answer the second question. This proves that all the participants in Generation X cohort were subject to the anchoring effect.  | 100% of the respondents, when asked to answer to two different questions that had no bond between them, leveraged the answer to the first question in order to answer the second question. This proves that all the participants were subject to the anchoring effect.  |
| <b>Reference price</b>              | 100% of the participants made a choice between two products based on their specific needs of the moment. When confronted with a third product with a more convenient price 100% of the respondents did not change their choice stating that price was not a driver of choice.  | 50% of the participants made a choice between two products based on the price and 50% based on their specific needs. When confronted with a third product with a more convenient price 100% of the respondents changed their choice.  |
| <b>Time discounting</b>             | 100% of the participants accepted to have a lower amount of money immediately instead of a greater amount of money in two months. All the respondents showed a loss aversion   | 50% of the respondents affirmed that they would have preferred a larger amount of money in two months and 50% accepted the lower amount offered immediately. Those who accepted to receive the money in two months stated that for larger amounts they would have chosen to receive less but immediately.   |
| <b>Representativeness heuristic</b> | 100% of the respondents used the first adjectives presented for each character in order to express a judgement of the person. 100% of the respondents also used the first two adjectives of the list to describe the two characters.   | 100% of the respondents used the first adjectives presented for each character in order to express a judgement of the person. 100% of the respondents also used the adjective that was in the middle of the list to describe the two characters.  |

### *Personal elaboration*

This research highlights that 70% of the decisions taken by both focus groups suffered from biases and heuristics. The analysis of the answers, gestures and interactions of the participants during the focus groups clearly highlighted a sense of intra-generational unity. This common way of reacting to the test, these common cognitive processes and the explanations given to justify their choices seemed influenced by their common set of values as if the era in which they built their consumer awareness had imprinted the way they consume now and the cognitive processes that underlie to the consumption habits.

We propose a brief discussion of every bias tested in order to highlight the differences in behavior of the two generations in order to highlight also the observational aspect of the research.

**Endowment effect:** this test was conducted to understand the response to online shopping of the two generations and their risk aversion towards unknown ecommerce platforms versus well-known platforms. It clearly appeared that the Millennials were more prone to risk taking than the Generation X. In fact, even when confronted to customers' feedbacks that were highly negative for the well-known platform and highly positive for the unknown platform, Gen X members did not change their choice preferring the well-known platform. Participants of Generation X stated that they were used to buy through that platform and that they would not change, furthermore they stated that they already knew the process to buy on that platform and did not want to learn new processes.

**Framing Effect:** when the participants were asked to choose between two identical products but represented differently, 100% of the respondents from the two groups showed no preference between the two products. After showing the groups the prices of the goods (i.e same final price but with two

different discount options) 88% of the Generation X respondents and 100% of GenY respondents chose the product with the initial higher price stating that the higher price was a reflection of the superior quality. This leads the observers to deduct that both generations give a high value to quality or at least perceived quality and that they apply the price as a benchmarking tool for quality.

**Anchoring heuristic:** to each group two questions were asked on a geography topic. The questions were not related, hence knowing one answer would not facilitate the response to the other question. 100% of the respondents from Generation X and Millennials, leveraged the answer to the first question in order to answer the second question. This proves that all the participants in Generation X and Millennials cohorts were subject to the anchoring effect. Anchoring and is the tendency of subjects to be influenced by a reference point. Anchoring processes relies on the definition of Ecological rationality (i.e., the ability to exploit the structure of the information in natural environments; Gigerenzer et al., 1991) which may involve also some personality dispositions. On the other hand, an effect such as anchoring cannot be explained only by individual differences, but also by other general knowledge (Blankenship et al., 2008), expertise about the topic used to test the bias (Wegener et al., 2001), mood, self-regulation (English and Soder, 2009) and in general by generational characteristics.

**Reference price:** to conduct the test, participants were asked to choose between three popcorn baskets, sized small, medium and large. These three baskets had three different prices and participants were asked to pick the basket that mostly would have satisfied their needs to eat popcorn while watching a movie. 100% of the participants in Generation X focus group made a choice between two products based on their specific needs of the moment asserting that price was not a driver of choice. Instead, 100% of the Millennials participants made a choice between the products based on the economic advantage of the price/quantity ratio. This means that Generation X has a much higher reference point bias, that is a useful concept to explain why people focus on reference points without considering alternatives; reference points and all subsequent thought allow economizing cognitive resources compared to alternative strategies that require more computationally taxing operations (Ceschi et al., 2019).

**Time discounting:** participants to the focus groups were asked to choose between two types of rewards for their participation to the focus groups, 25 euros on Amazon bonus delivered immediately or 35 euros Amazon bonus delivered in 50 days. 100% of the participants in Generation X focus group accepted to have a lower amount of money immediately instead of a greater amount of money in a future time span. Instead, 50% of the Millennials respondents affirmed that they would have preferred a larger amount of money in two months. It appears that Generation X is characterized by an avoidance orientation of losses that leads to more biased decision. The feeling toward wasting is strictly connected

to a sense of guilt regarding the violation of a No-Waste heuristic whilst Millennials seem to be prone to risk taking with an opposite attitude or an overly optimistic view of the world.

**Representativeness heuristic:** this test consisted in presenting the focus groups with two different individuals. These same set of adjectives to describe the individuals was used but was presented in mixed order for each individual. 100% of the Generation X and Millennials respondents used the first adjectives presented for each character in order to express a judgement of the person. These biases appear to be dependent on using information that is recalled easily and relevant for comparative judgments. It appears that these biases affect the two generations in the same way as no difference in the responses was found.

In conclusion, building on the consumer bias theory and the generational theory, our research demonstrates that Generation X, when confronted to online shopping, suffers from an endowment effect that appears to be characteristic of this generation. The adversity to risk taking, the attachment to the well-known brand and the distrust towards the internet leads this generation to sub-optimal decision making. Generation Y, by being technologically savvy, less brand driven and more oriented to deal-making appears to be prone to risk taking to maximize the return on the choices made.

## CONCLUSIONS

This study, by leveraging the extensive literature review on decision-making heuristics (Arnott, 2006; Carter et al., 2007; Ceschi et al., 2019; Gigerenzer and Gaissmaier, 2011; Kahneman et al., 1982) and biases and leveraging the generational theories (Amplitude, 2009; Anderson et al., 2018; Giovannini et al., 2015; Greenberg, 2011; Howe and Strauss, 2007), aims at shedding light on the different impact that heuristics and biases have on Generation X and the Millennials in order to identify a phenotypic structure of decision-making proper to each Generation. Existing literature has focused the research on the study of heuristics and biases in isolation from others, suggesting the stable and reliable individual differences in rational thought (Ceschi et al., 2019). Our research fills the gap identified in the literature by putting into comparison two Generations and aims at demonstrating the existence of intra-generation similarity in performance suggesting a similarity in decision-making skills of each generation.

From our perspective, the understanding of the difference in behaviors and the differences in the reaction to biases and heuristics of different Generations, represents an essential condition for designing and implementing successful marketing campaigns. Studying cognitive biases and heuristics highlights the importance of a different perspective in the segmentation models. This research can be particularly appealing to practitioners since it allows a different point of view on the identification of the target market based on simple test that can be iterated. The study of the impact of heuristics and

biases in decision-making processes can lead to the promotion of programs designed to promote a debiased decision-making helping individuals or practitioners to have a better impact on real-life decisions.

Although these results are promising, we must acknowledge several limitations that could represent the focus of future research. First, to reduce participant burden, the biases and heuristics studied were limited to a small set. This limits our ability to generalize the results to an entire cluster such as the two generations.

Second, present literature indicate that the characteristics and behavior of Millennials might be difficult to distinguish in comparison with older cohorts, because of their young age (Howe and Strauss, 2000), and several studies outline that Millennials should not be considered as a homogeneous group (Foscht et al., 2009). The “Myth” of Millennials homogeneity and distinctiveness (Henderson, 2010) may be determined by the choice of specific groups as populations of study – such as college students (Bakewell and Mitchell, 2003; Beard, 2003; Cowart and Goldsmith, 2007), and by a cohort-level comparison with other generations (Loroz, 2006; Moore and Carpenter, 2008; Pitta and Gurău, 2012)

# CAN SOCIAL RESPONSIBILITY AND CIRCULAR ECONOMY BE CONSIDERED DRIVERS OF CORPORATE SOCIALIZATION?A

## RESEARCH ON ITALIAN SMES

Basile, Gianpaolo<sup>1</sup>; Fortunati, Simona<sup>2</sup>; Morea, Donato<sup>1</sup>

### ABSTRACT

In management studies, social innovation refers to two new foci. The first one considers the firm as a network of social relations and as a community member in which technological and administrative changes are just one part of the innovation picture and, the institutional and social being fulfils equal importance.

The second refers to social and environmental commitments that increasingly reflect a pure marketing strategy to better firm reputation.

The original objective of this paper is to join the two foci by means a literature review and a framework arguing that the social values, the related mission, the Circular Economy (CE) culture and the Corporate Social Responsibility (CSR) models can be useful to achieve social ends without neglecting the marketing strategies.

On these methodological bases, the paper presents a research carried out on desk on nine Italian food industry Small and Medium-sized enterprises (SMEs).

The study findings highlight a limited awareness by corporate of their social role that highlights lacking declared social goals. Moreover, social and circular economy values and Agenda 2030 goals are vaguely claimed in the corporate missions that it is characterized by a strong reference at low production impact on the environment, at workers safeguard and for customer satisfaction.

Finally, although the paper shows some limitations in the research, it contributes to developing the scientific literature overcoming the Elkington triple-bottom-line model and, for managers and practitioners, focusing on the firm social role being regardless profit or no profit.

*Keywords: Social Innovation; Social Entrepreneurship; Corporate Social Responsibility; Circular Economy; Sustainability.*

## INTRODUCTION

Research on social innovation has gained momentum over the last decade, spurred notably by the growing interest in social issues related to management, entrepreneurship, and public management. Nevertheless, the boundaries of social innovation processes have not yet been completely defined, leaving considerable space for contributions to both theory and practice.

A variety of life-spheres and academic disciplines have taken on board the concept of social innovation. Social innovation is becoming a hot topic in management studies where it refers to two new foci. The first one gives more attention to the social character of the firm: the firm as a network of social relations and as a community in which technological and administrative changes are just one part of the innovation picture, the institutional and social being of at least equal importance. The second concern, which is to let firms play a more active social role in society – discursive or real (Murray, 2010; Cajaiba-Santana, 2014; Tarde 2009; Altuna et al., 2015).

The paper tries to join the two foci by means a literature review and a framework arguing that the social values, the related mission, the circular economy culture/processes and the CSR models can be useful to achieve social ends without neglecting the marketing strategies.

In contemporary literature, Schumpeter and Weber are cited regularly by authors seeking to legitimize social transformation in organizational structures, in both business and public administration, where principles of social innovation are actively applied. In this literature building, cannot miss Benjamin Franklin, who perceived social innovation as the solution to specific life problems (Mumford, 2002).

On these bases, social innovation stresses the emergence and implementation of new ideas about how social and economic actors should organize interpersonal activities, or social interactions, to meet one or more common goals. As with other forms of innovation, results produced by social innovation may vary about breadth and impact (Dufays, 2019).

These results could contribute to improving social capital which would allow economic organizations either to function better or to change; this would produce positive effects on a social level in both the profit and non-profit sectors, including economic aspects of human development, as an ethical and stable entrepreneurial culture. Regarding that, the authors will pay attention to the contribution that circular economy culture and processes implementation could give both to the CSR commitment for the business ends reaching by means a better reputation and in reaching of various Agenda 2030 goals as social ends.

Therefore, social innovation has to be seen to be aimed at “the development of what is currently viewed as assets for Sustainable Development Goals (SDGs) of the Agenda 2030 reaching (Dro and Therace, 2011).

The socially responsible behavior shown by CSR tools often reflects a pure marketing and communication strategy in the sense of 'make the firm look more socially responsible to better its reputation and growing revenues' (Howaldt and Schwarz, 2010).

This behavior increasingly stands for a real alternative at the diversity of 'Corporate Social Responsibility' aimed for ecologically and socially sustainable outputs and production models.

Thus, this work presents a research paper to contribute to this still-gaunt topic for a better theoretical and conceptual understanding of the social innovation phenomenon with a focus on relations between circular economy principles, CSR aims and social ends. Moreover, it feeds current debates on social innovation, reviewing the extant literature to clarify its meaning and analyze its connections with CSR increasingly considered as a strategy for creating economic value (Howaldt and Schwarz, 2010; Sila and Cek, 2017)

First, the paper shows a social innovation literature review to argue that it is related to collective actions aiming at a social change. Secondly, it employed literature on the CE and CSR to define social innovation as an engine of change that does not negate competitive challenges to support firm survival but considering them as a means to reach social ends. Thirdly, we discuss the insights from research on desk carried on about nine Italian agri-food firms, offering a framework that interprets relations between values, mission and circular economy process, CSR and social ends. The paper concludes with a summary that can provide ideas for future research (Chatzoglou et al., 2017).

## **RELEVANT LITERATURE IN SOCIAL ENTREPRENEURSHIP**

As regards the scenario just presented, the authors consider worthwhile discussing the "enterprise socialization" matter. Are there any differences between "enterprise socialization" and "social entrepreneurship"? The discussion around this matter is ongoing and, in this paper, the authors will try to give their contribution.

Social entrepreneurship (SE) emerged as an important means by which teams and individuals are meeting the social and environmental needs of society by developing economically viable organizations (Czinkota et al., 2018).

In this way, we can outline an answer at the question arguing that, just as traditional entrepreneurship is essential for economic growth and social survival (Javed et al., 2018) also social entrepreneurship (SE), containing the same genes as of other entrepreneurship, is essential for the economy.

Therefore, one of the important objectives of firms exclusively committed in social initiatives is to achieve organizational sustainability. However, these organizations face the problem of shortage of funds, so they need to shift to commercial activities to generate necessary financial resources (Defourny and Nyssens, 2010). This has resulted in the emergence of social enterprises as independent

entities focusing both on social and economic motives (Chell, 2007; Santoro et al, 2018)). However, to achieve sustainability, these organizations need to move from the concept of “cost recovery” to “more than cost recovery” and to become a self-sustained social organization (Yunus, 2007).

In the case of social enterprises, this can cause mission drift as social enterprises are hybrid organizations with the social and commercial mission at their heart. Thus, for continuously creating social value and social impact, social enterprises need to sustain their organizational existence through economic development (Wu and Si, 2018). Furthermore, in literature, several key factors for social enterprise sustainability are discussed like social innovation (Edgeman and Eskildsen, 2012), networking (Meyskens et al., 2010), commercial growth (Chell, 2007), managerial expertise (Roy and Karna, 2015), human resource (Jenner, 2016), and other organizational resources (Doherty et al., 2014). More recently, to create jobs and fight social issues, governments are also stepping up to support enterprises that add at their economic ends also social interests (see laws that consider “for benefit corporation” in Us and Italy) (Czinkota et al., 2018).

Authors like Murphy and Coombes (2008), and Weerawardena and Mort (2006) argue that the difference between social enterprises and profit-oriented ventures lies in their motives, cultural values and mission.

Entrepreneurial Social values and their related mission make enterprises an agent of change (Barendsen and Gardner, 2004), defining it, in this way, as any innovation in process, product, technology and networking that is essentially focused on meeting social needs.

Regarding networking capabilities, according to Granovetter (1985), economic activities of enterprises are embedded in social networks which make them crucial for organizational survival and growth.

Therefore, in the firm survival process, networking and reputation create an idiosyncratic and non-substitutable social resource (Czinkota et al., 2018). In this view, networks work as a catalyst for the sustainable development of enterprises and their ecosystem composed by social and economic stakeholders. Entrepreneurs are using networks for getting information, resources, help, spotting opportunity, advice, knowledge about markets. On the other hand, social networks also create an ecosystem where network partners can learn from each other hence, contributing to the sustainable development of the organization (Vrontis et al., 2020).

## **CIRCULAR ECONOMY AND CORPORATE SOCIAL RESPONSIBILITY IN A SOCIAL INNOVATION VIEW**

The CE in corporate culture and in its social ends is still prevalently overcome by competitiveness and profits aims. This condition lead to obstacles which prevent the transition to a "circular" logic of the

economic-ethical model linked also to successful strategies that are fundamental for a competitive company (Granovetter, 2018).

Companies contributing to the transition to a CE are considered the future of the economy and ensure a healthier environment. Lack of information on the real CE benefits, very often, generates social tensions in place where the company works, especially for those that deal with waste, reuse, recycle. People involved in these activities are often considered a threat to the territory (making the business to detriment to the environment). This lack of reputation of the CE company creates a major obstacle to the transition from a linear to a circular economy and also a degraded socio-economic environment (Michelini et al., 2017).

Goldring (2015) defines the company's reputation as the fundamental image that the company conveys, both directly and indirectly, to its customers, its stakeholders. CSR practices are not only an economic commitment but a real strategy geared towards the company's reputation improvement including ethical, social and environmental, which requires an adaptation of processes, resources, skills and factors of competition. In the light of these considerations, emerges a framework in which CSR is considered as a construct capable of explaining the connection between circular economy and corporate reputation. CSR practices are necessary to support companies within their local area and as behaviours aimed to optimise their work as an active member in the transition to a circular economy. In the last decades, increasingly companies implemented circular economy behaviours in values and related mission (Ruiz Malbarez and Romero Gonzales, 2011).

Therefore, the relationship between a company mission, committed to reach its profit with positive impacts in terms of Agenda 2030 goals, cannot ignore circular economy values as an alternative to the current linear system, which privileges waste to the detriment of the environment and society.

Therefore, CSR and CE can represent an "economic ethic" that produces different results, from strictly economic individual interests, in which relationships between needs, values, actions and institutions belong to a much broader field (Velenturf et al., 2019).

Regarding that, authors argue that the policy for the transition to a circular economy takes into account economic rather than social aspects and 'that business support should be derived from a broader understanding of the role of business in society. The different motivations and willingness of business leaders to engage in a circular economy should be further examined with results that will feed into broader and more inclusive business support guidelines to accelerate the transition to a circular economy in the future" (Ellen MacArthur Foundation, 2015).

The circular economy model that also takes social aspects into account can benefit from certain advantages such as: "...taking a holistic view by creating environmental quality, social equity and economic prosperity for current and future generations..." (Kirchherr et al., 2017). Regarding to social

equity, while the circular economy places emphasis on process redesign and the materials cycle and can contribute to more sustainable business models, encapsulating tensions and limitations, these models show an absence of the social dimension in sustainable development limiting, in this way, its ethical dimensions and some unintended consequences (Murray et al., 2017).

CE needs to pay more attention to strategies for social and institutional change to make more accessible production process upstream and consumption. Most scholars on CE are interested on the dynamics and strategies of material closure cycles, without considering the slowdown in the production cycle. This scientific trend requires a clear stance to abandon the old consumption and production patterns of the linear economy (Merli et al., 2018).

The model promotes the transition from quantitative to qualitative growth that can lead to the implementation of new innovative business models (Zott and Amit, 2010) by enhancing productive, financial and social capital (Geissdoerfer et al., 2018).

These innovative business models carry on principles of sustainability in every process in order to achieve sustainable and at the same time circular business (Skene and Murray, 2017).

To reach these transition objectives needs of an holistic collaboration of many figures such as: workers, consumers, suppliers, institutions, trade unions, public administrations, so that new professional figures can be created news skills (Deschenes, 2015).

In this view, the present paper considers CSR model as an operative process useful to support companies both to reach social legitimation and grow its reputation aimed to increase competitive capabilities (Friedman, 2007).

Through internal policies with a lower environmental impact, a reduction in internal costs can be achieved with benefits also for the budgets. Implementation of occupational safety systems that exceed the standards required by current legislation can, for example, improve the worker health with positive effects on the working environment and the quality within the company.

Therefore, in the current saturated marketplace there are, increasingly, fewer differentiation factors against the competitors. Companies who do not take account of the increasing importance of their social roles may not survive, in the similar way of the companies that fail innovations.

According to Van Marrewijk (2003) "... in academic debates and business environments hundreds of concepts and definitions have been proposed referring to a more human, more ethical, more transparent way of doing business. This point in time is important if a not critical moment in the development process of new generation business frameworks facilitating sustainable growth...".

The development of the concept of CSR and the need to rethink innovative organizational models combines several aspects useful to contribute to the change of management systems and the improvement of business performance (Popa, 2015).

Regarding that, Barrena-Martinez et al. (2015), define “...the bibliometric analysis conducted by Dahlsrud highlights that all of the definitions set up until this year have three points in common: the importance given to the stakeholders; the voluntary degree of CSR actions by companies and the reference to these actions representing a set of social, economic and environmental obligations, and the association of these commitments with sustainable development...”.

In the last decades, one of the CSR main application is to strengthen corporate reputation and establishing good corporate practices. This behaviour is brought about communication activities leading to a rethink of doing business (Birim, 2016). Therefore, this characteristic made authors analyze companies' CSR behaviors as a tool to support corporate reputation development.

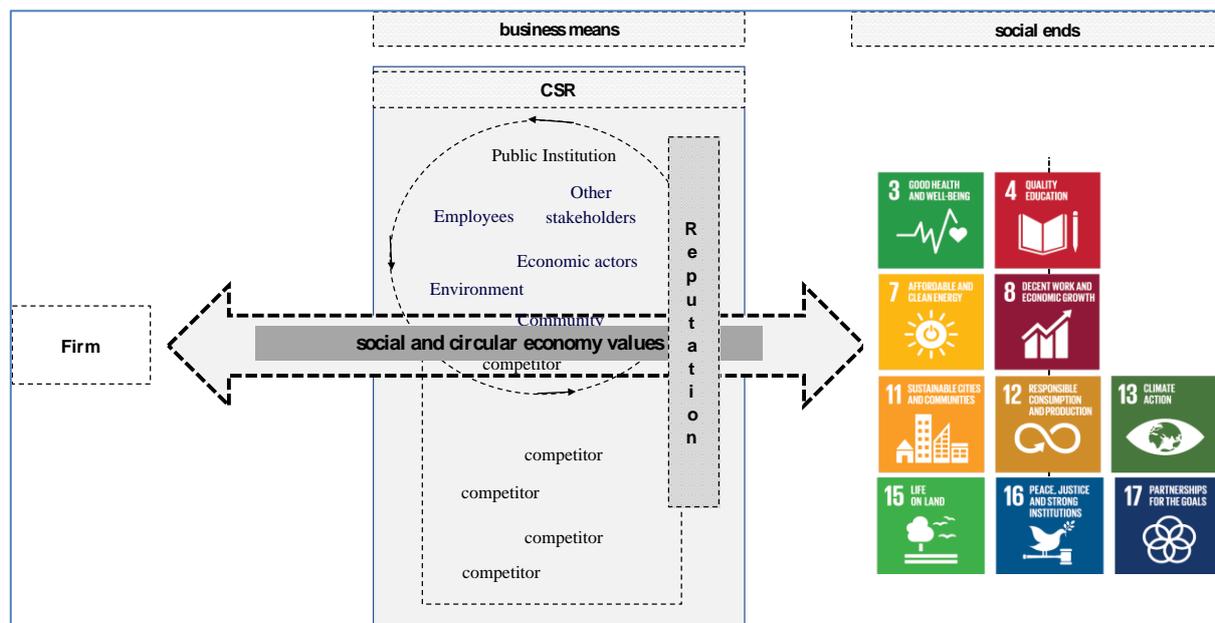

**FRAMEWORK**

The focus on social issues has allowed a paradigm shift from the so-called profit logic based on profit maximization strategies to social ends through business means (Reiter, 2016).

The survival of a company is linked to economic means that support growth, social and sustainable development (Manasakis, 2018).

Regarding that, the authors present a framework in which ultimate goals company are characterized by Agenda 2030 goals and reached by means numerous and heterogeneous marketing activities based, also, on CSR behaviors communication (Czinkota et al., 2019; Idowu and Filho, 2009) (see fig.1).

Figure 1. Relations between entrepreneur social values, mission, business means and social ends.

Source: Authors' elaboration

Regarding the figure above, the OECD defines corporate social responsibility through guidelines for multinational enterprises "as channels of communication and innovation, development and transfer of knowledge in the context of investments in sustainable development" (Fiandrino et al., 2019).

Regarding that, Porter and Kramer (2011) argued that to help companies in this growth, it is necessary that CSR can also lead to the benefits of competitive advantage and shared value creation through guidelines that help companies to increase practices of social responsibility.

In this scenario, the authors introduce a framework to show that a firm with social values and aims has to be supported by competitive behaviours.

In a social innovation context, the adoption of circular economy values and processes could lead to multiple benefits with an improvement in the economic value chain and in social impacts (Arfaoui et al., 2019).

## **METHODOLOGY AND RESEARCH HYPOTHESIS**

The objective of this research is to investigate how social values and related mission, Circular Economy processes and CSR adopted by SMEs represent means to reach final social results without to neglect competitive behaviours.

Therefore, the authors try to verify the existence of the following hypothesis:

*Hp1: Are there relations between mission declared and social ends claimed?*

*Hp2: Is CSR prevalently considered as a communication tool to better corporate positioning in target perception?*

*Hp3: Are there relations between CE principles applied, CSR behaviours and social ends reached?*

To reach these scientific aims, the authors carried out a multiple comparative analysis of nine SMEs in the food sector that have adopted the CSR model in Italy. They examined both the mission claimed and CSR reports to evaluate if SMEs behaviours are based on social values and circular economy principles.

Moreover, they analysed behaviours claimed about governance, workers, community and environment to evaluate if the firms considered in mission definition some ends ascribable to Agenda 2030 goals.

The document adopts a qualitative methodological approach based on the protocol for the study of a descriptive case defined by Yin, 1994, 2009. The documents and information were selected through and related links and the documentation published on company websites and the social reports. Other information was found analysing their activities on social media, official annual reports and Aida Bureau Van Dijk database. The target was selected through company websites research and was taken as a reference for research in the "food" industry.

The companies selected for multiple benchmarking are: Fugar S.p.a., Giacinto Callipo Conserve Alimentari S.p.A., De Matteis Agroalimentare S.p.A, Sabelli S.p.A., Villa degli Olmi San Matteo Tenuta Altavilla S.p.A, Villa Caplet S.r.L., Lattebusche S.c.A., Grandi Molini Italiani S.p.A, Poiatti S.p.A.. The study led to the evaluation of company activities and their implications and limitations for social issues.

## RESULTS AND DISCUSSION

The multiple comparative analysis was carried out on nine Italian SMEs operating in the "food" industry. There were analysed the following variables: mission, governance, workers, community and environment (see Table 1 and 2). Successively, the authors contextualize variables analysis in the research hypothesis to define a "social" company profile.

Table 1. *Enterprises examined*

|   |  |
|---|--|
| Fugar S.p.A.  | It is based in Verucchio (RN) with two other offices in Rimini. The reference sector is the production and sale of semi-finished products for pastry and ice cream. Fugar Commerciale specializes in decorations for pastry, catering and ice cream parlours. The Coronelli brand was founded in 2007 and with it Fugar is aimed at consumers offering high- quality products (spreads and liqueurs). The outlet markets are represented for 70% by the national market and the remaining 30% by the world market.       |
| Giacinto Callipo S.p.A.                             | The company is based in Maierato (VV). It produces and sells gut, roe, freshly processed tuna, yellowfin tuna fillets, mackerel fillets, anchovy fillets. The products are marketed on the national territory 7% of the total turnover is absorbed by the markets such as: Canada, Austria, France, Switzerland, Australia, Slovenia, USA, Lithuania, Great Britain, South Africa.   |
| De Matteis Agroalimentare S.p.A.                    | The company is based in Flumeri (AV). It produces durum wheat flours, conventional dry pasta, egg pasta, and vitaminized pasta. The markets to which it is addressed are mainly foreign suchas: USA, United Kingdom, Europe, Japan, Arab countries where about 60% of the production is exported. The restis marketed in Italy through large-scale retail trade and retail distribution. The brands owned by De Matteis Agroalimentare are: Pasta Armando, Baronia and Donna Vera  |
| Sabelli S.p.A.                                      | The company is based in Ascoli Piceno (AP). It produces and markets milk and dairy products. Its reference markets are central and northern Italy. 1% of its turnover is exported to France and Austria. It has as its customers mass retailers such as Coop, Conad, GS, SMA-Rinascnte, Auchan, Carrefour, PAM etc., wholesalers of dairy products and the Ho.Re. Casector (hotels, restaurants and catering).   |
| Villa degli Olmi San Matteo tenuta Altavilla S.p.A. | The company is based in Creazzo (VI) and sells its products mainly in Italy to the large-scale retail trade. The vineyards are productive since 1996 and converted into organic farming. The new headquarters was built following aesthetically the canons of typical Venetian buildings, enhancing the area with a building of architectural value. The wine-making cellar penetrates deep into the ground to exploit the geothermal characteristics of the subsoil. The wooden barriques are inside underground cells. |

|                      |   |
|----------------------|---|
| Villa Caplet S.r.L.  | The farm is located in Isola Della Scala (VE). It grows vines trying to improve quality with innovative and natural technologies and covers 21 hectares. It won the bronze medal for being the first company in Italy for the creation of braille labels. They are made with a new technology of silicone paint that in addition to functionality greatly attracts the attention of the consumer. As a result of this new creation of labels has achieved an increase in sales of 12% and 8% in customer share. |
| Lattebusche S.c.A.   | The company is based in Busche Cesiomaggiore (BL) and is one of the largest cooperatives operating in the dairy sector in Veneto. The company's policy is oriented towards customer satisfaction and to combine respect for dairy traditions with technological updating of production facilities. The strength of this business vision is translated into the market with products of excellence recognized and appreciated by many Italian and international consumers.                                       |
| Grandi Molini S.p.A. | The company is based in Rovigo. It produces soft and durum wheat flour. It is a leader in all markets where it is present with over 4,000 customers. Grandi Molini Italiani, an Italian milling group that has chosen to expand its range of products from kamut to organic flour, from adjuvants to improvers, from semi-finished products to extra virgin olive oil, from semolina pasta to egg pasta, from gnocchi.  |
| Poiatti S.p.A.       | Poiatti, "inimitable since 1946", produces and markets more than 100 different formats of pasta: durum wheat semolina, whole semolina and now also organic.   |

*Hp1: Are there relations between mission declared and social ends claimed?*

In the community area, some companies declared to be active in promoting social projects to local communities located, also, in disadvantaged areas of the world. Attention to social issues is very low, in that few cases, in mission areas, is declared that social efforts are aimed to safeguard local industry creating specific networks to support the country of origin economic conditions.

Moreover, some companies claim their social commitment through initiatives such as donations, distance adoptions, the granting of scholarships to encourage culture, sports initiatives and the promotion of educational and training courses in local schools. Finally, three of the companies examined, in their mission, declare none social ends focusing their attention only on consumer satisfaction. These last cases confirm that CSR policies were applied as marketing and communication tools to better company reputation against competitors. The other six companies show in their mission and values declared that their behaviours are also aimed at reaching at least an Agenda 2030 goal.

*Hp2: Is CSR prevalently considered as a communication tool to better corporate positioning in target perception?*

The multiple comparative analysis revealed that firms examined pay attention to their customers and suppliers satisfaction, also through the use of questionnaires to verify any critical points in their relationships. Therefore, firms declared to pay particular attention to privacy management, the adoption of ethical and environmental codes and quality policies, transparency and information clarity. In the workers' area, companies' policies are focused on health and safety in the workplace, adaptation and healthiness of the premises, and on employees' professional growth through training courses.

Finally, in the environment area, all companies have shown a strong inclination towards sustainability matters. This is demonstrated by the numerous certifications both in the environmental and agri-food sectors.

*H<sub>p3</sub>: Are there relations between CE principles applied, CSR behaviours and social ends reached?*

Moreover, from a circular economy point of view, there is a trend to practices of recycling of water resources used, to techniques of waste reduction and to measures adoption for reduction of energy and plastic used for packaging during the production process. This trend is communicated in CSR reports but is not considered in social impact terms.

## **CONCLUSIONS, LIMITATIONS AND FUTURE IMPLICATIONS**

The present paper wants to represent an advancement of the scientific trend on company social sustainability and its social roles. Particularly, the paper overcomes Elkington triple-bottom-line model, highlighting that sustainability and responsibility concepts are not sufficient goals to company survival if they are aimed only at the business ends. Therefore, the authors argue that company survival could be lasting if it will be based on its economic aims to reach final social objects.

The comparative analysis presented shows that although they have a predisposition at the level of corporate policy to pay attention to sustainability and to the practices of attitudes of programs to reduce pollution, waste and water resources used, the companies do not fully show social and values commitment.

Therefore, the research insights highlight a prevalent focus on consumer satisfaction, that we could consider as a mere means to reach a better market positioning, and a lacking attention to social ends both in mission claims and in final aims.

Moreover, the paper tries to give a contribution to scientific and practitioner fields showing that companies, both profit and no-profit, are increasingly community members and social actors setting forth this role, reaching the social legitimation, claiming and planning their social ends-commitment.

The present work contributes directly to the body of knowledge on social innovation compared with CSR and circular economy, as possible enabling factors for the development of Agenda 2030 17 goals.

Policy makers and managers in CE development policies and CSR models should transform CE principles in corporate culture values.

This effort should give contribution to create corporates with CE values and, increasingly, social actor committed in Agenda 2030 goals achievement.

The limitations are mainly related to the limited target and sector, for this reason the authors consider the proposed study as a first step to define a comprehensive model.

The future research steps could concern the qualitative analysis to verify the firm social value level in the mission implemented in daily behaviors. Moreover, it could be useful to carry out a SROI (social return on investment) analysis evaluating firm social impacts and noticing future scientific interests.

## ABSTRACT

The household income and expenditures as an important indicator of the sustainability development of any country. The monitoring of the households state allows determining the power of the regional development and the success of achieving the sustainable development goals at the territory. The purpose of the study is to develop a system of indicators for monitoring the state of Ukrainian households, aimed at determining the sustainability level of regional development. The main goals of sustainable development, the success of which can be studied based on the state monitoring of households, are identified in the paper. The modern global trends of the state, size, and finances of households are analyzed. Sustainable development objectives and indicators for monitoring the state households, which are likely to be used to establish the success of these tasks at the regional level, were identified. The classical econometric methods and models were used in the paper to determine the success of achieving the sustainable development goals of household income and expenditure. The theoretical significance of the study is that taking into account the results of monitoring household incomes and their impact on the sustainability of social development will formulate appropriate proposals to reduce the differentiation of household incomes and ensure sustainable development. The practical significance of the study is due to the developed correlation models of household expenditures, developing practical recommendations for cost management and optimization of the ratio of income and expenditure, both by type and in the regional distribution.

*Keywords: sustainable development, household, region, sustainable development goals (SDG), household incomes, household expenditures, differentiation of living standards.*

## INTRODUCTION

The global concept of sustainable development was elaborated in detail in the declarations and reports of various international organizations, in particular, the UN and the Club of Rome. Thus, in June 1992, the need to recognize the principles of sustainable development as the key guidelines for the formation of a new society was declared. One of the advantages of the concept is the ability to align common development guidelines with the specific existing and prospective conditions of countries and regions (social, geopolitical, environmental, economic, historical, etc.).

According to the results of the UN summit, held in the framework of the 70th session of the UN General Assembly in 2015, the Development Agenda 2030 and Seventeen Sustainable Development Goals (SDG) were adopted, which are the main priorities of social development for the near future. The monitoring and analysis of the 17 SDG and 169 targets of the new agenda will be carried out through a set of global indicators. It should be noted that the UN reports on the achievement of the sustainable development goals (published for the period 2014-2016) show that the development of a unified system of indicators continues. The nowadays challenge is not only to set targets but also to develop systems of indicators that will determine the degree of progress in each of the areas. The main indicators of well-being of the nations, as well as social and economic sustainability based on household indicators, esp. state and dynamic of resources and expenditures, ratio between these indicators, structure of resource and expenditures et al.

The purpose of the study is to develop a system of indicators for monitoring and predicting the state and dynamic of Ukrainian households' income & expenditures, aimed at determining the sustainability level of regional development. Also, the structure of the household expenditures has to be explored by levels (first or primary level and second or higher level) and regions aimed on the same task. The results can be used for identifying the impact of regional progress on poverty alleviation and reducing inequalities, improving the health and well-being of the population, ensuring quality education, access to clean water and appropriate sanitation conditions.

The outcomes of the research include economic and social effects. The economic one lies in the fact that the investigated peculiarities form conditions that reduce the level of income differentiation of the population by optimizing the mechanisms of obtaining these revenues which will contribute to the reduction of shadowing in pay, an increase in official income, which together will increase the budget revenue. The social impact will manifest itself in the formation of more sophisticated social norms positively that will transform the society in the direction of common principles of social justice.

## LITERATURE

Valid formation and distribution of household income have traditionally been the basis for the stable development of any country in the course of mankind's evolution. The founders of classical Economics A. Smith and D. Ricardo believed the income distribution to be the basis for the theoretical research in political economy and significant disparities to be the main obstacle for economic development (Smith, 1776; Ricardo, 1891). In the early twentieth century due to the rapid development of the economy, this problem needed a theoretical background and relevant practical solutions. Through this century western economists (Dalton, 1920; Atkinson, 1970; Dayton, 1997 et al.) suggested substantive theoretical constructs. Having learned foreign experience of many countries regarding the dynamics of incomes, the conclusion can be drawn that a slight disparity contributes to the development by stimulating employees to provide real results for the corresponding wages and vice versa, a significant separation between social groups forms a depressive mood, causes social tension. The latter is the situation occurring in Ukraine.

Currently, there is a significant amount of research dealing with the difference of incomes ranging from small analytical and statistical reviews to the fundamental monographs. Complex research was done by foreign scholars (Tanzi, 1999; Schneider, 2005; Chandra & Yadoo, 2018; Bosch, & Kalina, 2016 et al.). Ukrainian scholars (Shubina, Miroshny, 2010; Petkova, Zagorulko, Palamarchuk, 2019) also investigated this problem. However, the studies of foreign and domestic scientists do not discuss all the existing problems that have arisen in Ukraine in the current circumstances, therefore, there is a need for further scientific substantiation of theoretical and practical bases of household income differences.

According to the UN recommendations, a household is a group of persons who have reached certain agreements among themselves to ensure their consumption. McConnell & Bru, 2003, emphasized that "...the household is the supplier of all economic resources and at the same time the consumer of the greater part of the national product". Becker, 1957, emphasizes the importance of the productive function that households perform in modern conditions. In Statistical collection "Households expenditures and resources in Ukraine for 2010-2017" (Households expenditures, 2018) defines a household as a small group of people living in one room and fully or partially combine their income and property, jointly consume certain types of goods and services. Cohabitation and household management provide for common expenditures, that is, household members must have a common budget to meet their needs. According to the All-Ukrainian Population Census: Law of Ukraine dated 19.10.2000 No. 2058-III, a household is a collection of persons who live together in one or a part of a dwelling, provide for themselves with everything necessary for living, maintain a common household, fully or partially combine and spend funds.

Yuri & Kizima, 2008, mentioned that the global indicators are designed to analyze trends towards achieving globally defined GDS by 2030 and to make international comparisons. However, such indicators are not always acceptable in the national context. The indicators for monitoring at the national, regional and local levels should be developed taking into account the capabilities of the national statistical system.

Ukraine is one of the countries that has committed itself to the transition of the economic system to the principles of sustainable development. In particular, in the document "The Strategy of Sustainable Development of Ukraine – 2020" (about "The Strategy of Sustainable Development Ukraine-2020": Decree of the President of Ukraine No. 5/2015 dated January 12, 2015) the concept of the sustainable development is defined as the basic imperative of affirming the ideas of dignity, and freedom. Sustainable Development Goals (SDGs) in Ukraine is the new system of mutually agreed management measures for economic, social and environmental measures aimed at building public relations based on trust, solidarity, equality of generations, and a secure environment. In September 2017, the Government of Ukraine presented the National Report "Sustainable Development Goals: Ukraine", which defines the basic indicators for achieving the goals of sustainable development. The report presents the results of the adaptation of 17 global GDS to the specifics of national development. Taking into account the principle of "leave no one behind" and using a wide range of information, statistical and analytical materials, a national system of GDS was developed (86 development objectives and 172 indicators to monitor their implementation).

The success of the implementation of the fourteen tasks for the achievement of the GDS in the regions of Ukraine (from the above 86) can be verified using 28 quantitative indicators of the condition of the households. The information about the condition, volumes, average values and distribution of household finance provide an opportunity to conclude about the level and sustainability of territorial development. These indicators relate to 6 goals (Goal 1. Overcoming poverty; Goal 2. Overcoming hunger and developing agriculture; Goal 3. Good health and well-being; Goal 4. Quality education; Goal 6. Clean water and adequate sanitation; Goal 10. Reduction of inequality).

## **METHODS**

The classical econometric methods and models, which are a universal tool for the analysis were used in the paper to determine the success of achieving the sustainable development goals of household income and expenditure. The forecast values of the studied indicators are proposed to be obtained using the exponential smoothing method. The latter has been chosen because it belongs to adaptive forecasting models, that is, to data discounting models that can quickly adapt their structure and parameters to changes in external conditions characteristic of household income and expenditure. Along with this, to

summarize the results of the study and determine the importance of indicators, the paper uses multidimensional ranking and the method of expert assessments. The research is carried out based on statistical data of the State Statistics Service of Ukraine, Ministry of Economic Development and Trade of Ukraine, UN reports. The statistical information used for the period from 2010 to 2018 years. The retrospective information is considered both for Ukraine in the whole and in the context of 24 Ukrainian regions and Kyiv city in particular. The model of the integrated indicator of higher level expenditure was built for the paper's aim achieving. The higher level expenditure are the expenditure that don't meet the basic needs of the household, but spend for recreation, health care, education, car purchase, restaurants, hotels and savings. Also the correlation-regression models of the relationship between the total average monthly resources and expenditure of households in Ukraine, as well as between the total expenditure and higher level expenditure were built.

## FINDINGS AND DISCUSSION

The number of households in Ukraine during 2010-2018 decreased by 13.83% - from 17 million units to 14.935 million units, due to the demographic situation in the country (low birth rate, high mortality, significant labor immigration). The average household size in Ukraine during the study period ranged from 2.59 to 2.58 persons, corresponding to the European average (from 2.0 to 2.8 people). This indicator significantly different in continents as well as across countries. According to the UN (The world needs to build 2 billion new homes over the next 80 years), recent trends over the past 50 years have also shown a decline in household sizes. In France, for example, the average household size fell from 3.1 in 1968 to 2.3 in 2011, while the country's birth rate fell from 2.6 to 2.0 births per woman. For example, in Kenya, the average household size decreased from 5.3 persons per household in 1969 to 4.0 in 2014, respectively, reducing the birth rate from 8.1 to 4.4 births per woman.

The state, volumes, average values and distribution of household finances allow to conclude the level of development of the territory and the continuity of this development. So, the success is the achievement of sustainable development goals – poverty reduction – can be assessed using the following indicators: the proportion of the population whose average equivalent total expenditure per person are below the actual (estimated) cost of living; the proportion of people whose daily consumption is below 5.05 US dollars; the proportion of poor who are maintained by the state social support in the total poor population; the ratio of the levels of poverty of households with children and households without children, times; the expenditures on food in total household expenditure, etc. According to recent studies, the world as a whole is getting richer, but the main problem is the uneven distribution of this wealth, which is increasing. According to the Credit Suisse global report (Chart of the day: Which countries have the largest share of global household), during 12 months to mid-2018, the total global

household wealth increased by nearly 14 trillion USD to 317 trillion USD – a growth rate of 4.6%. Meanwhile, the average wealth rose by 3.2 percent to a record of 63.1 thousand USD per person. Now the greatest achievements in this direction are demonstrated by North America and Europe that together hold 60% of the total wealth of households, while only 17% of the world's households are located in their territory.

According to a report by Oxfam (Reward work, not wealth: to end the inequality crisis, we have to build an economy for ordinary people, not the rich and powerful), the poorest half of the world has not seen an increase in wealth since 2010. Conversely, the wealth of billionaires grew by an average of 13% - six times faster than the wages of ordinary workers, which increased by an average annual amount of only 2%.

As for Ukraine, the results of the analysis of the dynamics of the average monthly total resources and household expenditure for 2010-2018, are shown in Figure 1.

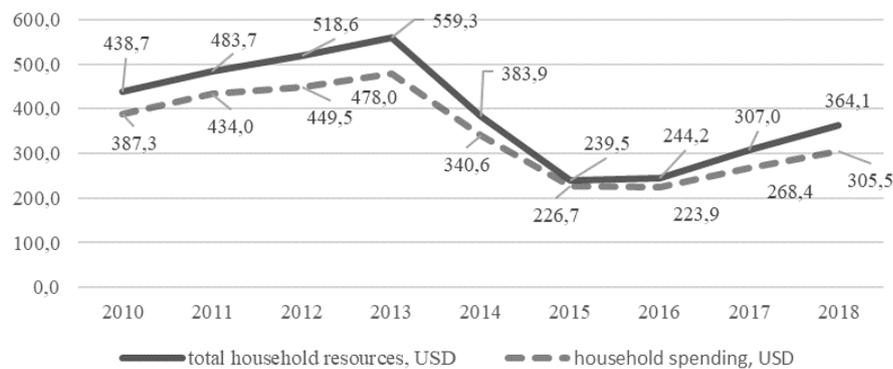

Figure 1. Dynamics of the average monthly total resources and expenditures of households in Ukraine, per household (USD).

Source: The data is from calculations by authors based on the State Statistics Service of Ukraine Statistical collection “Expenditures and resources of households of Ukraine in 2018” (Expenditures and resources, 2018)

Overall, during the period under the review, the average monthly total resources per household exceeded similar average monthly total expenditure by an average of 13.65 percent or 47.24 USD. The largest percentage difference occurred in 2012 and 2013 – 15.38% (69.13 USD) and 17% (81.35 USD) respectively, and in absolute terms - in 2018 (58.66 USD), but relative terms it was 19.2%.

The average growth rate of total household resources for the period from 2010 to 2018 years is 2.3%, with the largest growth occurring in 2017-by 25.33%, and the largest drop-in 2015 by 37.62%. The average growth rate of household spending (expenditures) is 2.92%, while the trend of intensive and slowest growth is similar to the indicators of resources +19.9% in 2017 and 33.45% in 2015. If in general to compare growth rates (falling) of resources and expenditures of households, they are jumpy, so, the income had higher growth rates than expenditures in 2012-2013; 2016-2018, more prompt rates of falling

in 2014-2015, in other periods growth rates of expenditures prevailed. Adjusting the growth rate of household resources and expenditures for the inflation index (within each year) significantly changes the picture – so in 2014 and 2015, real total household resources decreased by 22.45% and 28.65%, respectively, and expenditure – only by 18.74% and 21%, respectively. Since 2016, there has been an increase in indicators – by 6.85% (2016) and 17.18% (2017) of total household resources, adjusted for the inflation index and 3.12% (2016) and 11.11% (2017) of total costs, adjusted for the inflation index. The tendency of growth of indicators with simultaneous excess of rates of growth of resources (in 2.2 times in 2016 and 1.55 times – in 2017) over expenditures prove to have essential progress in the dynamics of indicators.

The correlation and regression analysis was made based on statistical data for 2010-2018 years (Expenditures and resources, 2018) shown on fig. 1. This analysis allowed to determine the relationship between the average monthly total resources (x) and household expenditures (y) for the studied period. As a result, a linear model was constructed:

$$y=20,56+0,83x, \quad (1)$$

This model indicates that with resources growing by 1 USD, the average monthly household expenditure increases by 0.83 USD.

In the course of the analysis with the help of the correlation coefficient, it is proved that between resources and costs there is a rather close relationship, as evidenced by the value  $r_{xy}=0,995$ . The coefficient of determination showed that 99.2% of the total fluctuations in household expenditures are due to the influence of resources on them, and the other 0.8% of fluctuations are due to the influence of other factors not studied in the model.

The economic interpretation of the model is carried out, as a result of which it is determined that an increase in the average monthly resources of households by 1% will raise the costs by 0.94%.

Using the exponential smoothing method for the period under the review, household incomes (monthly average) were projected for 2020. They could be 259.09 USD, which is 28.84 USD less than in 2018. Using the model (1), the projected value of household expenditure could be as high as 234.98 USD, or 10.26% less than resources. However, this pessimistic forecast takes into account only the previous trends in resources and does not take into account the potential change in the economic situation in Ukraine, which may be caused by the COVID-19 coronavirus pandemic.

At the same time, it should be noted that this level is influenced by many factors including political, migratory, demographics, mental, financial, etc, which lags far behind a real income. If to take into account the significant level of shadow economy (according to estimates of different experts - from 35 to 55% of GDP), a low level of social standards (minimum wage (137.86 USD) and the minimum living wage for able-bodied persons is 68.3 USD), which at 52.01 USD (76.35%) is less than the actual

subsistence minimum, the minimum pension is 55.04 USD as of December 1, 2018), fairly significant unemployment rates (in the range of 10% of the working population), the depreciation of UAH during 2014-2016 by more than three times, it becomes apparent that the standard of living of the majority of the population is lower as compared to physiological standards in other European countries.

The analysis was done to clarify the situation regarding income differences of the population the appropriate. Evaluating these figures, the following conclusions can be drawn: the population with the average total income per month is below the current minimum wage which amounted to 20.2 million persons in 2015, or 51.9 %; in 2016, these figures are fixed at the level of the 10.6 million individuals and 26.6% in 2018.

Quintile difference coefficient of the population total income and assets ratio (for total income) in 2018 constituted 2.0 and 3.3 times respectively, which is almost associated with most of Europe, however, it should be taken into account that the survey does not fully consider the current real facts of life, namely, certain problems in obtaining information about the actual state of revenues stimulated in the mentality of the nation, a significant transfer of funds to Ukraine by "migrant workers", the introduction of e-declarations of income in 2016, etc.

According to the study of subjective poverty and social self-identification "Self-assessment of income level by households in Ukraine for 2017" by State Statistics Service of Ukraine (Self-assessment, 2017), Ukrainian households were asked to determine which class they belong to in assessing material well-being. According to the survey (Self-assessment, 2017), 71% of respondents identified themselves as poor (74% in 2016), 29% as nonpoor but not yet middle class (26%), 0.6% as middle class (0.5%) and almost none of the respondents considered themselves wealthy. This response pattern applies to all groups of households, regardless of where they live, whether they have children or not. Households were asked to specify how much money is needed on average for each person per month not to feel poor. Most households reported an income of USD 338.5 – 376.0 USD and more than 376.0 USD (by 22%) (in 2016-16% and 12%, respectively). The next most common estimate was an income of 150.5 – 188.0 USD, which was indicated by 16% of respondents (23%).

So, as can be seen, one of the main goals of sustainable development, namely overcoming poverty, is very relevant for Ukraine. And this is even though according to calculations carried out by the Institute of Demography and Social Research named after M. V. Ptukha of the National Academy of Sciences of Ukraine, the level of relative poverty in 2018 compared to 2017 decreased by 0.3 percentage points and amounted to 24%. The limit of poverty has reached a level of 96.36 USD average per person per month and increased by 16%.

However, analyzing the structure of households expenditures in Ukraine indicates that 70% of expenditures is the purchase of food, soft drinks, utilities, clothing, shoes, household items and

communications, 15% is other consumer and non-consumer expenditure and only 15% is on recreation, health care, education, car purchases, restaurants, hotels and savings, that is, the needs of the higher level.

The dynamics of total household expenditures in Ukraine and the higher level expenditures is shown in Fig. 2.

Figure 2. Dynamics of total household expenditures and the higher level expenditures in Ukraine

Source: Data is from calculations by authors based on SSU Statistical collection "The structure of households overall costs"

Analysis of the data allowed to build a model of the relationship of these costs:

$$y = -18,39 + 0,27x, \quad (2)$$

This model shows that with the increase in total expenditure ( $x$ ) by 1 USD the higher level expenditures ( $y$ ) increases by 0.27 USD. The relationship is strong enough to indicate that 99.8% of the change in higher level household expenditure depends on the change in total spending, and 0.2% is the effect of other factors that are not investigated in the model. Model (2) is adequate and statistically significant.

The deeper analysis argued clarifying current situation with secondary household expenditures in the 24 regions of Ukraine and Kyiv city. It should be noted that generalizing all regional indicators helped to build the construction of an integral indicator of the higher level expenditures (IHLE). The calculation method that was used, described by Berezhna & Snytyuk, 2016. Concerning this case the sequence is following:

1. Formation of a set of indicators and determination of their characteristic values. The higher level expenditure indicators proposed to characterize according to their type: health care ( $x_{1i}$ , USD), recreation and culture ( $x_{2i}$ , USD), education ( $x_{3i}$ , USD), restaurants and hotels ( $x_{4i}$ , USD), purchase of shares, certificates, currency, bank deposits ( $x_{5i}$ , USD), where  $i$  is the region for which the calculation is made ( $i = 1, n$ ).

2. Normalization and standardization of indicators. As it is known, the task of normalization is the transition to this scale of measurement, when the "best" indicator corresponds to the value of 1 and a "bad" value is 0. All proposed indicators are stimulants. Therefore, the standardization of indicators made by comparing them with the average result in Ukraine ( $a_j$ ), according to the formula:

$$z_{ij} = \frac{x_{ij}}{a_j}, \quad (3)$$

where  $i$  is the region for which the calculation is made ( $j=(1,m)$ ).

3. Calculation of the integral index. It is proposed to build an integral indicator of the higher level expenditures (IHLE) according to the following formula

$$I_{HLEij} = \sum_{k=1}^5 d_k z_{kij},$$

that is

$$I_{HLEij} = 0,3z_{1ij} + 0,2z_{2ij} + 0,2z_{3ij} + 0,175z_{4ij} + 0,125z_{5ij}, \quad (4)$$

where  $z_{1ij}, z_{2ij}, z_{3ij}, z_{4ij}$  – normalized and standardized values, respectively, of expenditures for health protection ( $x_1$ ), on recreation and culture ( $x_2$ ), education ( $x_3$ ), restaurants and hotels ( $x_4$ ), the purchase of shares, certificates, currency, deposits in banks ( $x_5$ );  $i$  – the region for which a calculation of ( $i = 1, n$ ) is performed,  $j$  – the index, which is calculated ( $j = 1, m$ ).

It should be noted that the coefficients  $d_k$  ( $k = 1, 5; d_1 = 0,3; d_{2,3} = 0,2; d_4 = 0,175; d_5 = 0,125; \sum_{k=1}^5 d_k = 1$ ) are obtained by the method of expert assessments and indicate the importance of each of the indicators in the integral  $x_{1ij}, x_{2ij}, x_{3ij}, x_{4ij}, x_{5ij}$  indicator  $I_{HLEij}$ . The formula shows that health care costs are the highest. The higher level expenditures integral indicator calculated by the formula  $I_{HLEi} = \frac{1}{5} \sum_{j=1}^5 I_{HLEij}$ .

The data  $I_{HLEi}$  of the State Statistics Committee of Ukraine for 2018 on cash expenditures of households by regions were used for the construction. The obtained results of the integral indicator are summarized in Fig. 4.

The results of the study indicate that 11 regions of Ukraine have generalized indicators of secondary costs above the national average, and 14 regions are below it. The cost of healthcare, recreation, education, transportation, deposits in banks are mainly affordable by the households of Kyiv, Chernivtsi and Zaporizhia regions with values  $I_{HLEi}$  1.845; 1.633 and 1.466, respectively. The residents of Donetsk, Zhytomyr, Kherson, Khmelnytsky and Rivne regions can buy less and have an integral index of less than 0.6. Thus, households in most regions of Ukraine are not satisfied with the opportunities available to ensure an adequate standard of living.

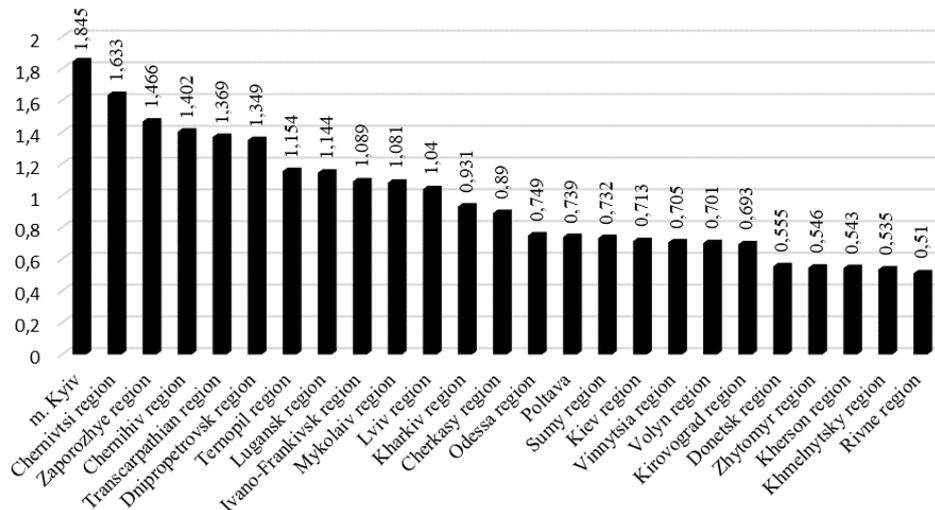

Figure 4. Ranking of regions of Ukraine on the higher level expenditures integral indicator in 2018

Source: Data is from calculations by authors based on SSU Statistical collection "Households money expenditures by region of Ukraine in 2018"

## CONCLUSIONS

The household income is an important socio-economic indicator of the social development of any country and its differentiation leads to stratification on a property principle. The study identified the level difference of this, which, in general, does not reflect domestic facts of life in comparison with the official statistical data.

Monitoring of the condition of the households allows determining the power of the regional development and the success of achieving the sustainable development goals at the territory.

The developed model of connection of total household expenditures and the higher level expenditures in Ukraine proves that with the growth of total expenditures ( $x$ ) by 1 USD the the igher level expenditures ( $y$ ) increases by 0.27 USD. The relationship is strong enough to indicate that 99.8% of the change in the higher level expenditures depends on the change in total expenditure, and 0.2% is the effect of other factors that are not investigated in the model. The model is adequate and statistically significant.

Thus, it can be concluded that a household is more satisfied with life and does not feel poor if it can spend more money on non-urgent needs, namely on: health care; transport; recreation and culture; education; restaurants and hotels; purchase of shares, certificates, currency, deposits in banks.

The results of the study indicate that 11 regions of Ukraine have generalized indicators of secondary costs above the national average, and 14 regions are below it. The cost of healthcare, recreation, education, transportation, deposits in banks are mainly affordable by the households of Kyiv, Chernivtsi and Zaporizhia regions with values  $I_{HLE_i}$  1.845; 1.633 and 1.466, respectively. The residents of Donetsk,

Zhytomyr, Kherson, Khmelnytsky and Rivne regions can buy less and have an integral index of less than 0.6. Thus, households in most regions of Ukraine are not satisfied with the opportunities available to ensure an adequate standard of living.

The theoretical significance of the study is that taking into account the results of monitoring household incomes and their impact on the sustainability of social development will formulate appropriate proposals to reduce the differentiation of household incomes and ensure sustainable development. The practical significance of the study is due to the developed correlation models of household expenditures (by the type of expenditure and by the regional distribution), developing practical recommendations for cost management and optimization of the ratio of income and expenditure, both by type and in the regional distribution.

Taking into account that the income of households in Ukraine, comparable with the volume of GDP, lags far behind, affects the SDG achievement, there is a need to continue research in this area.

## ROLE OF PERSONAL NETWORKS AND SOCIAL CAPITAL ON THE ACQUISITION OF RESOURCES FOR THE SOCIAL ORGANIZATIONS

Bernardino, Susana; Freitas Santos, J.

CEOS.PP, ISCAP, P.PORTO, Porto, Portugal

### ABSTRACT

A major problem for social entrepreneurs that want to manage a social organization on a daily basis is the problem of acquiring external resources (physical, financial, human, etc.) to fulfil its social mission. The literature has suggested that networks can play a critical role in resources acquisition.

This study aims to investigate the role of the social entrepreneur's network and social capital on the acquisition of different kind of external resources to the social organization. The study uses a quantitative method, and the primary data as collected through an online survey of 313 social organizations from Portugal, the results show that the founders' network acts positively in attracting human resources, assuring state support and obtaining information from different stakeholders relevant for the management of the social organization. The founders' social capital seems to be only relevant to the attraction of financial resources to social organizations. The investigation allows enlarging the knowledge about the network approach to social entrepreneurship that is still very under-exploited.

*Keywords: Personal network; Social Capital, Resources; Social entrepreneurship; Portugal.*

### INTRODUCTION

Social entrepreneurs are people who play the role of change agents in the social sector by: i) adopting a mission to create and sustain social value; ii) recognizing and relentlessly pursuing new opportunities to serve that mission; iii) engaging in the process of continuous innovation, adaptation and learning; iv) acting boldly without being limited by resources currently in hand; and v) exhibiting heightened accountability to the constituencies served and for the outcomes created (Dees, 2001; Cho, 2006).

In the context of entrepreneurship, there is a long tradition of studying entrepreneurial networks and their effect on startups' success (Birley, 1985; Aldrich and Zimmer, 1986; Johannisson, 1988; Hoang and Antoncic, 2003; Greve and Salaff, 2003; Witt, 2004). Similarly, the literature on social entrepreneurship has recognized that networks and social capital are critical for social organizations' success (Leadbeater, 1997; Austin et al., 2006; Mair and Martí, 2006; Sharir and Lerner, 2006; Chell, 2007; Bauer et al., 2012). For instance, Chell (2007), states that social entrepreneur's behaviour would not be complete without

the inclusion of the role of networks whether Leadbeater (1997) claims that networks represent one of the main assets of social organizations.

In general, social businesses are founded as a result of motivated entrepreneurs that are capable of attracting external resources to explore opportunities that try to attenuate social problems. From inception, the set of personal networks of the founder and the social capital that are built around the social organization are crucial assets for the social organization struggling to create social value (Bernardino, Freitas Santos and Cadima Ribeiro, 2019). Personal networks and social capital allow social entrepreneurs to enlarge their activities, save time and gain access to resources and opportunities otherwise unavailable. Social networks stimulate the attraction of resources by capturing financial resources, seizing human resources, creating awareness for the social project, and generating organizational knowledge (Bernardino and Freitas Santos, 2019). Social capital provides access to new information, additional resources and knowledge-management capabilities (Hoffman, Hoelscher and Sherif, 2005), and their existence is rooted in the relationships established with other actors (e.g. entrepreneurs, firms) or institutions (e.g. public or private organizations) (Estrin et al., 2013).

However, empirical research on the role of networks and social capital on the mobilization of resources is still somewhat limited (Turkina, 2018; Bernardino and Freitas Santos, 2019). Therefore, the purpose of this paper is to study the role of social entrepreneur's network and social capital on the process of resource acquisition for the functioning and development of social organizations.

The paper proceeds as follows. The first three sections review the prior literature on the social entrepreneur's network and social capital, as well as the benefits for social entrepreneurship. The following section describes the methodology for the development of the empirical work. Then, the results are presented and discussed. The final section concludes.

## **1. PERSONAL NETWORKS**

The concept of networks was derived from social psychology, sociology and inter-organizational theory (Tichy, Tushman and Fombrun, 1979; Granovetter, 1983; 1985) to analyze the nature of exchange that occurs between individuals and the influence of networks on the management of organizations (Dodd, Jack and Anderson, 2006).

Over the past years, the concept has been progressively applied to entrepreneurship (Slotte-Kock and Coviello, 2010; Dodd et al., 2006, among others) and more recently to social entrepreneurship (e.g. Leadbeater, 1997; Bauer et al., 2012; Bernardino, Freitas Santos and Fagundes, 2017).

According to current positions in the literature, economic behaviour is embedded in a network of relationships that connects individuals and firms in a continuous and cumulative process that is developed over time (Slotte-Kock and Coviello, 2010; Granovetter, 1985; Jiang et al., 2018). Thus, to

have a complete picture of entrepreneurship is necessary to take into consideration the role played by networks.

A network consists of single nodes (such as persons or organizations) linked by a set of relationships (e.g. friendship, transfer of funds, overlapping membership), which as a whole form the structure of the network (Hoang and Antoncic, 2003). Thus, individuals belonging to a given network are involved in social interactions and social relationships with the actors that also belong to the same network.

In the context of the entrepreneurial process, networks act both as a support to entrepreneurial activity (by making easy the access to resources), as well as a source of information about improvements in the operational efficiency of the business (technical advice and management of human, physical and financial resources) (Stuart and Sorenson, 2005).

The literature recognizes that there are different types of networks. The structural characteristics of the network refers to configuration and linkage between its members (Aprilia and Wibowo, 2017) that are influenced by the network size (the number of direct links hold), diversity, centrality (the capacity of the individual to "reach" others in their network through intermediaries), formality and proximity to the different members (strong vs weak ties) (Dodd et al., 2006; Hoang and Antoncic, 2003).

Further, networks could be categorized in accordance with the actors interconnected in the nodes' relationship. Personal networks include the set of social relationships that are established by the entrepreneurs with family members, friends, business colleagues and other entrepreneurs (social or economic) (Santos, 1998; Witt, 2004). These informal relations are grounded on shared interests, personal friendship, family ties or other kind of demographic, social or cultural preferences. These sorts of relationships have been recognized as particularly important for entrepreneurship (Dodd et al., 2006).

As mentioned by Huang et al. (2012, p. 316) "expanding individual social network to organizational network will create meaningful ties for the organization to connect mutual networks (or business networks) and bring important resources that used to be non-imitable and inaccessible". Thus, some organizations, mainly medium and small-sized startups, to succeed, have to rely on their founders' ties to increase its capacity to pursue its mission and improve its overall performance.

## **2. SOCIAL CAPITAL**

Social capital is derived from the links established between individuals and/or other entities, and encompasses all the effects these links are able to provide (Bauer et al., 2012). In this sense, social capital is defined by Bauer et al. (2012, p. 438) as "the sum of all the potential and real resources that are accumulated in a person or group of people (institutions, firms, associations, regions or countries) due

to having a lasting network of more or less institutionalized knowledge and mutual-recognition relationships".

Social capital can be seen as the capital that can be derived from belonging to a given network, or as referred by Bowey and Easton (2007) as 'network capital'. Thus, social capital can be understood as the assets or resources embedded in the relationship between individuals or groups, that are linked together through durable networks (Bourdieu, 1986). Therefore, as argued by Bowey and Easton (2007, p. 273), social capital "has been inextricably linked to networks, network formation, or networking activities", since social capital is created and leveraged through the relationships that are established within the different networks to which an individual belong. Therefore, social capital is an intangible asset that derives from the investment made in human relationships and is developed in an iterative process (Bauer et al., 2012; Woolcock and Narayan, 2001) and is empowered through the high level of trust, reciprocity, and behaviour norms, that are shared between the members of a network (Mair and Martí, 2006; Meyskens et al., 2010). This shared resource is created, leveraged and renewed through interpersonal networks and the interaction between citizens that belong to the same network (Ármanndóttir, 2011; Toledano, 2011; Zhengdong, 2011; Tremblay, Gutberlet and Peredo, 2010).

Literature has recognized that different individuals could have different social capital endowments that are able to influence the benefits they can achieve. (Woolcok and Narayan, 2001). The development of an individuals' social capital is a cumulative and contextually contingent process, built over time that is dependent of the relationships he/she has with other individuals or entities, and the structure, contents and shared interests of those relationships (Bowey and Easton, 2007). Thus, the social capital endowments will increase if: (i) the social network of a social entrepreneur is more extensive and diverse; (ii) the members of the network are more connected; and (iii) the quality of relations established between the members of the network, expressed by the level of trust, respect and friendship are higher (Ármanndóttir, 2011; Mair and Martí, 2006; Sharir and Lerner, 2006).

Many authors claim that social capital is a critical asset for social entrepreneurship, and for the success of social ventures (Austin et al., 2006; Leadbeater, 1997; Mair and Martí, 2006; Mourão, Pereira and Moreira, 2017; Sakurai, 2008; Sharir and Lerner, 2006; Liu, Xiao, Jiang and Hu, 2020). From the point of view of the social entrepreneur, this asset concerns the number of contacts (network extent) and the trust that could be derived from them (Leadbeater, 1997). For Bauer et al. (2012), social capital is one of the main bases of the social sector, being considered even more important than in the economic entrepreneurship field.

### 3. PERSONAL NETWORKS, SOCIAL CAPITAL AND RESOURCES ACQUISITION

The network approach to entrepreneurship suggests that entrepreneurs "use their personal network of private and business contacts to acquire resources and information that they would not (or not as cheaply) be able to acquire on markets" (Witt, 2004, p. 392). The network also signals resource availability for entrepreneurs asking for resources (Dodd et al., 2006). Consequently, the nature of the relationships established between different parties will influence the resource exchange among its various members (donors, sponsors, friends and family) (Axelsson and Easton, 1992).

Social capital is able to offer several gains for individuals that are involved in social relationships. For Ge et al. (2009, p. 224) "the network provides a special structure for connecting to the outside to get useful information, resources, and social support that allows the firm to identify and make use of various opportunities". By improving the ability of the entities involved to access resources, social capital also has a very positive contribution on the venture ability to grow and develop itself and to reinforce its competitive position (Bauer et al., 2012). These benefits are derived from the interconnection of different people/entities that belong to the same network, and share such kind of reciprocity, trust and cooperation, leveraging the access to other specific resources that are critical for their activities (Bauer et al., 2012). In fact, social entrepreneurs need to manage a wide range of internal and external resources to pursue its social mission (Leadbeater, 1997; Dees, 1998, 2001; Di Domenico et al., 2010) and the use of networks and social capital could be very important for that purpose.

After a review of the literature on social entrepreneurship and social networks, Dangmei (2016) concludes that social networks are useful vehicles enabling the social entrepreneurs to get access to important resources. Also, the role of networks have been empirically confirmed in several studies (e.g. Jenssen, 2001; Jenssen and Koenig, 2002; Stuart and Sorensen, 2005; Ge et al., 2009).

The relationship between the personal network of entrepreneurs and the influence on the process of resource acquisition has been explicitly recognized by Witt (2004). According to this author "founders can gain access to resources more cheaply by using their network contacts than by using market transactions, and that they can acquire resources from the network that would not be available via market transactions at all" (Witt, 2004, p. 394). Further, the "opportunity to procure resources (...) arises due to friendship or kinship ties to network partners" that "offer the entrepreneur specific resources at no charge or below the market price simply to do them a favour or to return a favour that they received earlier" (Witt, 2004, p. 394).

For Jiang et al. (2018), social entities have an excellent potential to leverage outside resources, that are inherent in their networks, and that will allow the entity to exploit emerging opportunities. Still according to the authors, based on a network approach, by resorting the relationships held within a

network, actors will increase the likelihood of success in resource seeking and acquisition. The potential in terms of social capital generation and utilization could be optimized in accordance with the members motivation-opportunity-ability (Jiang et al., 2018).

Specifically, the improved capacity in accessing resources could be found in different types of resources, such as physical, financial, human or informational (Bauer et al., 2012; Austin et al., 2006; Mair and Noboa, 2006; Sakurai, 2008).

- *Physical resources*

To exploit a social opportunity, social entrepreneurs need a range of assets, which include the physical resources. The ability of acquiring such kind of resources is critical for social entrepreneurship and could be made possible or beneficial through the use of the social entrepreneur network, since the conditions under which the transitions are carried out could be improved and the transactions costs reduced (Bauer et al., 2012).

- *Financial resources*

The personal network could be used to acquire financial resources from family, friends and acquaintances and to access donors and other sponsors. According to the literature, network ties appear to be more effective in increasing the chances of raise capital from friends and family, acquaintances, donors, sponsors than the market methods, such as banks and investors (Zhang et al., 2010). For Stuart and Sorensen (2005), social networks influence the entrepreneurial process and trace the ties through which financial capital flows. Based on a literature review, Zhang et al. (2010) show that social networks have been widely recognized for successful funding, especially strong ties and particularly for initial funding acquisition. Also, the private information transferred through direct ties can help to build up the knowledge-based trust of the donors in the social entrepreneurs and thus facilitate resource acquisition (Shane and Cable, 2002).

- *Human resources*

Social ventures depend on human resources to accomplish their mission. Compared to business firms, social ventures have more disadvantages in their quest for human resources in a dynamic and competitive labour market. Therefore, an entrepreneur's personal network becomes critical in the process of identifying and recruiting workers or volunteers for the social venture (Stuart and Sorensen, 2005), that could be done more effectively and efficiently.

Based on a literature review in the profit sector, Galaskiewicz et al. (2006) show that social networks are useful for recruiting new people, even though they can increase employees' turnover, since individuals could use their ties to find new jobs. In the social entrepreneurship domain, qualitative research reveals

that social networks are critical for the mobilization of resources by social organizations (Bernardino, Freitas Santos and Fagundes, 2017). According to the same research, the use of networks for human resources' acquisition occurs mainly in the provision of specialized employees than other employees and volunteers (Bernardino, Freitas Santos and Fagundes, 2017).

- *Informational resources*

Social capital is also critical for obtaining informational resources, that are critical for improving the organization ability to identify (local) social needs (Shaw, 2004), solve problems and make management decisions more knowledgeable (Bowey and Easton, 2007).

The information shared between the members of a given network also leads to collective learning processes, the development of more innovative solution (Myers and Nelson, 2010; Nga and Shamuganathan, 2010), as well as a more effective discover and exploitation of opportunities (Bauer et al., 2012; Marshall, 2011; Myers and Nelson, 2010; Galaskiewicz et al., 2006). According to Burt (1993), the benefits of social networks on information acquisition can derive from: (i) access to better information quality; (ii) the time the information is provided; and (iii) the number of referrals each individual could have access.

## 4. METHODOLOGY

### *Research context*

The database of organizations that are willing to benefit from a consignment of 0.5% of the personal income tax-supported by taxpayers provides the empirical setting for this research. The database integrates the organizations that Portuguese tax administration considers of public interest, such as institutions of social solidarity and other types of entities (social, cultural, humanitarian). The list for the fiscal year of 2017 was accessed in April 2018 and included 3.777 organizations. The database that only contains the fiscal number and the name of the entities was completed by consulting the website of the organizations, the social media pages, and the website of the Social Chart (includes the institutions that are supervised by the Ministry of Solidarity and Social Security). This operation was performed during the years of 2018 and 2019, leading to a list of email contacts of 3.252 entities.

### *Data collection*

### *Questionnaire design*

Measures of all constructs were developed based on a review of the literature. A preliminary version of the questionnaire was developed and administered to three academics in the field of management and economics. The purpose was to evaluate the content validity of the measures selected. The research

instrument was then modified based on the feedback received. Subsequently, the revised questionnaire was pretested and refined for relevance and clarity, and no significant problems were found.

#### *Survey response*

Each of the 3.252 entities included in the database with the email address was contacted during January and March of 2020. The purification of the database was completed with the removal of 864 email addresses due to absent emails addresses and errors messages. The total number of the sampling frame was 2.388 email contacts.

A formal email describing the objectives and importance of the study was sent to all entities. All respondents were guaranteed anonymity, and a summary of the research findings was promised in exchange for their participation. After two rounds of persistent emails asking for respondents to return the questionnaires, some entities failed to accept the email or were not willing to answer. A total of 337 questionnaires were received although 24 were dropped due to excessive missing data. Thus, we obtained 313 responses, yielding an acceptable response rate of 13.1% (313/2.388).

#### *Sample*

The largest number of the 313 respondents who participated in the survey were from social organizations located in the middle of the country (N = 143), North (N = 112), South (N = 50) and Islands (N = 8). In the sample, 91.1% of the organizations held more than 10 years of existence, 6.1% held between 5 and 10 years, and the remainder (2.9%) held less than 5 years. The geographical area of intervention of the majority of organizations were local (N = 141), regional (N = 92), national (N = 62) and international (N = 18). The size of the social organizations measured by number of employees, volunteers, beneficiaries and annual total amount is as follows: number of employee less than 5 (N = 45), between 5 and 10 (N = 41), between 11 and 30 (N = 98) and more than 30 (N = 129); number of volunteers less than 10 (N = 186), between 10 and 20 (N = 63), between 21 and 50 (N = 25) and more than 50 (N = 39); number of beneficiaries less than 100 (76), between 101 and 200 (N = 78), between 201 and 500 (N = 58) and more than 500 (N = 101); annual amount less than €50.000 (N = 30), between €50.000 and €100.000 (N = 61), between €100.001 and €500.000 (N= 89), and more than €500.000 (N = 133).

#### *Measurement*

Multi-item scales and five/seven-point response formats were used to operationalize all variables. The measurement approach for each theoretical construct is described briefly below and is measured on a five-item Likert scale: 1 for “strongly disagree” and 5 for “strongly agree”.

**Founder's network (FN)** – this five-item construct was operationalized using four statements for measuring founder's perceptions of the potential partners that are beneficial for his/her business, the

common values that founder shares with his business partners, the founder and business partner trust and respect between each other, and exchange of information with honesty between founder and business partner. The items were derived from Huang, Lai and Lo (2012), adapted for social organizations and refined in the pre-testing stage of the questionnaire.

**Founder's social capital (FSC)** – this seven-item construct was operationalized using four statements for measuring founder's and its team perceptions about the consistency of their professional background with the needs of the social organization and the success in obtaining funds for the social organization. The items were derived from Huang, Lai and Lo (2012), adapted for social organizations and refined in the pre-testing of the questionnaire.

### **Resource acquisition capability**

The variables related to resource acquisition capability were operationalized using a five-item Likert scale, according to the scheme below:

CAPYS – defined as the capacity to acquire physical resources (machines, cars, etc.);

CAHUM – defined as the capacity to acquire human resources (volunteers, collaborators);

CAFIN – defined as the capacity to acquire financial resources;

CATFS – defined as the capacity to obtain tax exemptions and financial support;

CAHSO – defined as the capacity to obtain help from other social organizations to deliver the service;

CABSP – defined as the capacity to get better suppliers;

CAINF – defined as the capacity to acquire relevant information to the social organization.

The first six items were derived from Ge, Hisrich and Dong (2009) and the last one from Thornton, Henneberg and Naudé (2015), although all were adapted for social organizations and refined in the pre-testing stage of the questionnaire.

## **5. RESULTS**

Exploratory factor analysis was initially employed to purify the multi-item scale regarding the constructs related to the founders' network and social capital network. The method of principal component analysis was used, and the results are presented in Table 1. The indicators of the robustness of the analysis (Kaiser-Meyer-Olkin Measure of Sampling Adequacy (MSA) = 0.838; Bartlett's test of Sphericity 1983.113,  $p < 0.001$ ), seem adequate for further analysis. The two factors solution corresponds: i) the first factor to the founder network (FN); ii) the second factor to the social capital of the founder (FSC). The Cronbach estimate of internal consistencies for each factor is very good (0.901 and 0.895).

| Items | Factor 1 | Factor 2 |
|-------|----------|----------|
| FN1   | 0.714    |          |
| FN2   | 0.835    |          |
| FN3   | 0.863    |          |
| FN4   | 0.814    |          |

|                     |        |        |
|---------------------|--------|--------|
| FSC1                |        | 0.763  |
| FSC2                |        | 0.785  |
| FSC3                |        | 0.810  |
| FSC4                |        | 0.838  |
| Eigenvalue          | 5.33   | 0.837  |
| Explained Variance  | 38.843 | 38.253 |
| Cumulative Variance | 38.843 | 77.096 |
| Cronbach's Alpha    | 0.901  | 0.895  |

Notes: N = 281; Kaiser-Meyer-Olkin Measure of Sampling Adequacy (MSA) = 0.838; Bartlett's test of Sphericity 1983.113 ( $p < 0.001$ ).

Table 1. Results of the exploratory factorial analysis (principal component)

An analysis of correlations between the two constructs and the other variables that will be used in the study was performed to provide a general picture of their intercorrelations (table 2). The highest correlations (0.675 and 0.661) were between financial and physical resources, and financial and human resources, respectively. There are also several correlations above 0.5 although the estimated magnitudes of the correlation's coefficients do not raise any severe concerns of multicollinearity for the regression analysis.

| Variables | FN    | FSC   | CAPYS | CAHUM | CAFIN | CATFS | CAHSO | CABSP | CAINF |
|-----------|-------|-------|-------|-------|-------|-------|-------|-------|-------|
| FN        | 1     |       |       |       |       |       |       |       |       |
| FSC       | 0.00  | 1     |       |       |       |       |       |       |       |
| CAPYS     | 0.278 | 0.24  | 1     |       |       |       |       |       |       |
| CAHUM     | 0.368 | 0.283 | 0.564 | 1     |       |       |       |       |       |
| CAFIN     | 0.295 | 0.397 | 0.675 | 0.661 | 1     |       |       |       |       |
| CATFS     | 0.325 | 0.176 | 0.553 | 0.446 | 0.606 | 1     |       |       |       |
| CAHSO     | 0.279 | 0.258 | 0.484 | 0.561 | 0.619 | 0.579 | 1     |       |       |
| CABSP     | 0.316 | 0.294 | 0.439 | 0.41  | 0.504 | 0.448 | 0.536 | 1     |       |
| CAINF     | 0.385 | 0.24  | 0.42  | 0.401 | 0.411 | 0.413 | 0.467 | 0.635 | 1     |

Note: All correlations are significant at the 0.01 level (2-tailed).

Table 2. Correlation Matrix

To test for the effects of the founders' network and social capital, we adopted the OLS (Ordinary Least Squares) regression procedure. The dependent variables are two constructs measuring the personal network and the social capital of the founder, respectively. The independent variables consist of the seven variables controlling for different type of resources (physical, human, financial, tax exemptions and financial support, help from other social organizations to deliver the service, suppliers, relevant information).

The empirical results are presented in Table 3. To check the stability of the impacts of the network and social capital dependent variables, our first set of estimates excluded the control variables age of the organization and size measured by the number of employees (FN1 and FSC1). The latter was subsequently added to the analysis (FN2 and FSC2), thus allowing us to determine whether the basic findings on the variables of interest were affected by the inclusion of the control variables.

| Variables | FN       |          | FSC      |          |
|-----------|----------|----------|----------|----------|
|           | 1        | 2        | 1        | 2        |
| Constant  | -1.844** | -1.194** | -1.375** | -1.403** |
| CAPYS     | -0.015   | -0.08    | -0.062   | -0.054   |
| CAHUM     | 0.252**  | 0.234**  | 0.029    | 0.014    |
| CAFIN     | -0.047   | -0.056   | 0.414**  | 0.412**  |
| CATFS     | 0.162*   | 0.155*   | -0.132   | -0.128   |
| CAHSO     | -0.058   | -0.053   | -0.002   | -0.006   |
| CABSP     | 0.053    | 0.068    | 0.121    | 0.128    |
| CAINF     | 0.236**  | 0.233**  | 0.063    | 0.070    |
| Age       |          | -0.064   |          | 0.027    |
| Size      |          | -1.199   |          | -0.065   |
| R2        | 0.218    | 0.227    | 0.185    | 0.189    |
| Adj R2    | 0.20     | 0.205    | 0.166    | 0.165    |
| F         | 12.176** | 9.912**  | 9.882**  | 7.844**  |

Note: N = 313. (\*\*) Significant at the 0.01 level; (\*) Significant at the 0.05 level.

Table 3. *Multiple regression analysis*

The estimates on the partial model, which consists of just the variables of interest for the examination of the founders' network, show that three of the seven variables are statistically significant. Therefore, the founders' network acts positively in attracting human resources, assuring state support and obtain information from different sources relevant to the management of the social organization. The results of FN2 reveal the stability of the signs of the variables and provide further support for the findings. The non-significance of the remaining variables implies that physical and financial resources, other social organizations help, and better suppliers' selection are not attracted by the founders' network.

The results for the founders' social capital show that only financial resources are attracted to social organizations. The remaining variables are not statistically significant, even the control variables, meaning that none of them is influenced by the social capital of the founder.

## CONCLUDING REMARKS

Academic research has consistently advocated the relevance of social networks and social capital to entrepreneurship. In spite of the increased recognition that networks and social capital are critical for the success of social ventures, empirical studies are still scarce. This study contributes to get a more comprehensive understanding of the influence that entrepreneurs' personal network and social capital could exert in the management of social organizations, specifically on the process of resource acquisition for the functioning and development of social organizations.

The empirical study developed within the Portuguese social organizations revealed that the involvement of social entrepreneurs in networks is able to offer some benefits to organizations related to its ability to acquire resources. Specifically, the results revealed that the social entrepreneur's

personal network is able to favor the capacity of acquiring human resources and relevant information. The founders' social capital is also able to enhance the capacity to acquire financial resources. This pattern is found for all social organizations, regardless the control variables, such as age or size. No specific benefits were found with respect to physical resources, capacity to obtain tax exemptions, access to better suppliers or exchanges with other social organizations.

The findings attained are consistent with the network approach to entrepreneurship (Witt, 2004; Dodd et al., 2006; Hoang and Antoncic, 2003) and are aligned with existing evidence that confirms the benefits that networks and social capital are able to provide (e.g. Jenssen, 2001; Jenssen and Koenig, 2020; Bernardino, Freitas Santos and Fagundes, 2017). The results attained allowed to go further in the comprehension of a topic that although relevant and promising is still under-exploited in the context of social entrepreneurship.

The main limitation of the study is to include only Portuguese social organizations. As social networks and social capital are a very contingent dependent phenomenon, this could compromise the ability to generalize the results to other empirical contexts.

In the future, it will be worthy to study the role of other types of networks (such as entrepreneurial or institutional) on the resources acquisition, as well as the way different structural characteristics of the social network are able to shape the benefits attained. It would also be interesting to quantify the effective impact that network produce on the performance that social ventures are able to achieve. In addition, it would be positive to develop a comparative study between entities belonging to social and commercial entrepreneurship.

## A FRAMEWORK TO TRANSFORM SMES IN DEVELOPING COUNTRIES - A CASE STUDY OF INDIA

**Bhatia, Asha<sup>1</sup>; Jain, Prachi<sup>2</sup>**

<sup>1</sup>Dept. of Research, Universal Business School, Mumbai, India

<sup>2</sup>Barclays Global Service Centre Pvt Ltd, Pune, India

### **ABSTRACT**

Businesses around the globe are expanding their horizon and advancing their business activities to other countries. India is also a major shareholder of global trade. All the emerging economies are trying to gain the king's share in the world of International Business.

SMEs play an important role in emerging economies including India. The number of SMEs in India is estimated to be around 42.50 Million, including registered and unregistered companies. They provide employment to 106 million people, which is 40% of the Indian population. SMEs contribute to 40% export in India (Data from MSME/CII Reports, 2017). They have various strengths like the availability of cheap labour, the abundance of resources, and the rise in disposable income of the Indian population, influx in domestic and foreign capital. Indian SMEs can use all these factors and gain further prominence.

There are four broad categories through which SMEs can get involved in International Business, these are exports, contractual agreements, production investment, and strategic alliances. This research will majorly focus on the export processes.

The Research methodology used for the collection of data and analysis comprises of both primary and secondary research.

Secondary research was done through analysing data and information present in a number of research papers, globally published reports, news articles, etc.

Primary research was conducted using the qualitative technique of face to face interviews, where decision makers of SMEs, academicians from the industry, and industry experts were interviewed. The questions explored the major challenges faced by SMEs, the reach of government initiatives tailor made for the SME sector, issues in finding prospective clients/buyers, internal challenges of the organization, etc.

SME sector needs to adapt to the Go Global concept as it is no more a choice but a survival tactic to have steady business growth. Internationalization will open large markets for goods and services, help in mitigating risk, and earning higher profits.

The authors suggest recommendations like starting awareness programs as there is a lack of awareness about the existence of such initiatives. Conducting of City level Internationalization

Training Programs where SMEs should be informed about the process and methods of how to approach it. Making available market development assistance schemes where SMEs can easily create a market for their goods and services can be made easily available.

*Keywords: International Business, SME, Export, Strategic Planning, Government Support, Internal Efficiency, Market Competitiveness*

## 1. INTRODUCTION

The SME sector is a significant contributor to the economic and social growth of the country. According to the CII SME sector contributes 40% of overall exports from India. SME is termed as the driver of growth and exports, and thus there is the utmost importance to promote manufacturing exports which have a high potential for employment generation and revenue growth.

Internationalization is defined as the extent to which a firm is involved in different aspects of international business. It comprises exporting, foreign subsidiaries, the appointment of foreigners in the organizational hierarchy, and share ownership by foreigners. (Chelliah, et al, 2010).

Codotto (2008) has suggested four modes of internationalization: production investment, contractual agreements, exports, and strategic alliance. Kogut and Chang although regard export as the first step of entering the international market as it comes out as a safe strategy because of a lack of resources and finances.

Through this research, various challenges faced by SMEs have been identified. In the whole ecosystem, there are numerous stakeholders such as SMEs and their internal organizational capabilities, government, policy makers, trade associations, etc. The importance of each stakeholder, challenges associated with their current working, and possible solutions were identified through this research.

Indian SMEs still struggle to mark their presence in the International markets. For excelling at International Business there are three important factors: (i) Support from government, (ii) Intrinsic qualities of the organization, and (iii) Demand of the product or the service in the International Markets.

The authors have divided the proposed recommendations that came out through the research into three categories for a clear division of roles and responsibilities. More awareness needs to be created regarding the government schemes and initiatives and the process needs to be simplified and hassle free so as to provide higher benefits to the SMEs. SMEs need to focus more on their internal organizational capabilities by following best practices suitable for the industry at the international level, increasing the strengths and role of trade associations, etc.

## 2. LITERATURE REVIEW

1. Chandra et al (2019) in their study using qualitative research have found that internationalization of SMEs in Fiji depends on management competency and entrepreneurial orientation and is obstructed by the negative institutional environment.
2. Sonia Mukherjee (2018) in her study about challenges to MSMEs analyses the rival firms originate from the neighboring countries in terms of export competitiveness. The main reason attributed to this is the lack of use of updated technology and other notable reasons. She concludes that higher investment in technology and R&D can help in reducing the gap. Other contributing factors are an investment in human resources, improved access to finance, reduced infrastructural gaps, and lesser stringent business regulations.
3. Jyoti Sharma and Guneet Gill (2016) have recognized MSMEs as an integral part of the economy. They have been termed as “engine of the growth” for a country accrediting to various factors such as providing large scale employment, helping in the industrialization of rural and backward areas, bridging the gaps of regional imbalances, providing an equitable distribution of national income and wealth.
4. Cerrato et al (2016) have presented a multi dimensional approach to analyzing the internationalization of firms. Four archetypes like weak internationalizer, investor, networker and marketer were identified by the authors through cluster analysis of data drawn from 63 Italian SMEs.
5. Dr. Vishal Bishnoi (2015) has analyzed the strategic issue, organizational transformation, and performance challenges faced by Indian SMEs while Internationalization. The research suggests that globalization has provided new opportunities to Indian SMEs and the sector has also taken advantage of them. The author expects that internationalization will gain further momentum in the future because the world economy is becoming increasingly integrated due to the continued decline in government imposed barriers and continued advances in technology.
6. Binod Anand, Pooja Jain and Somprabh Dubey (2015) et al have identified major problems in the path of internationalization for Indian SMEs to be the absence of access to the international markets, knowledge management at the firms, banking services and availability of the credit. The study suggests that to enhance the competitiveness of SMEs there is a need for creating the legal, regulatory, and administrative environment, access to finance and capable institutional structures, and human capital.
7. Anis Ali and Firoz Husain (2014) highlight that the MSME sector accounts for 36% export made by India, but the distribution is not uniform across India because of the unavailability of raw material, lack of finances, lack of entrepreneurial skills development and lack of technical support. The unavailability of adequate and timely credit facility, high cost of credit, lack of modern technology, no

research, and innovations, insufficient training and skill development, complex labor laws are the main problems of the MSMEs.

8. Nir Kshetri and Nikhilesh Dholakia (2011) et al have compared India and China's regulative, participative, and supportive roles from the standpoint of entrepreneurship in the two countries. Their study reveals that the Chinese government provides a more favorable environment than the Indian government.

9. Sinha, Paresha et al (2011) have studied motivations for offshore outsourcing encountered by manufacturing SMEs and their suppliers in China. Their study shows that the first rationale is to increase efficiency and reduce labor costs while holding quality constant. The second is flexibility in resource allocation.

10. Rajesh Kumar Singh and S G Deshmukh (2009) have done a comparative study between India and China about the competitiveness of SMEs in a globalized economy. They have examined the role of government policies and strategy development for competitiveness. Their study suggests that an organization should focus on developing human resources and improving quality.

### **3. OBJECTIVE**

The objective of this research paper is:

- i. To understand the level of awareness of government schemes and initiatives and to assess the reach.
- ii. To understand how well aligned are the government schemes and initiatives to the need of SMEs in terms of design and implementation.
- iii. To identify the importance of trade associations and industry associations and the vital role they play as a mediator between the enterprises and the policy makers.
- iv. To analyze the crucial internal strategies and how businesses can harness them for growth.
- v. To develop a framework where important factors for enhancing exports and provide a clear demarcation of roles and responsibilities for collaborative growth.

### **4. RESEARCH METHODOLOGY**

This research project is a pilot project conducted using primary and secondary research methodology. Secondary research was used to gain in-depth knowledge about: (i) Influential factors in international business, (ii) Export scenario in India and comparison with other countries, (iii) Challenges faced by Indian SMEs, (iv) Government schemes and their implementation, (v) Export process and other nitty gritty involved.

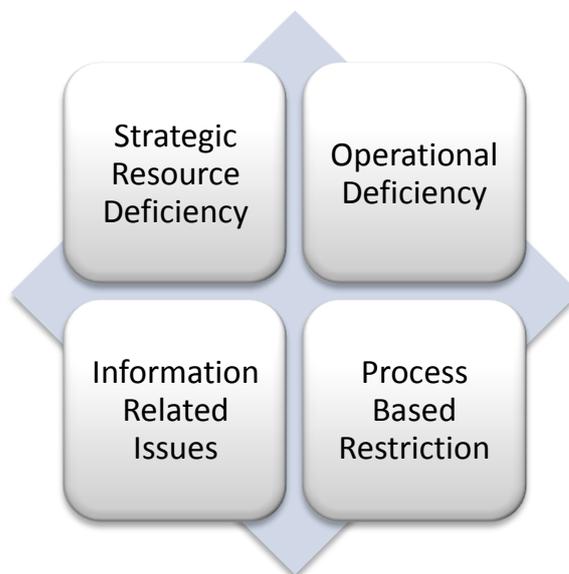

Information for the same was collected through other published research papers, government portals, annual reports of government departments, news articles, journals, etc.

Primary research was done through qualitative techniques by interviewing top management and the decision makers of the SME companies. Interviews were conducted for more than 25 industries belonging to different sectors. These interviews were designed to gain insight into the organization and internal qualities, awareness about government schemes, and major challenges faced by them.

To get a broader understanding of the challenges, feasible solutions, and best practices followed by other countries, academicians and industry experts were also interviewed.

## 5. THEORETICAL BACKGROUND

Bishnoi V (2015) in his study lists four major categories of challenges faced by SMEs: (i) Strategic Resource Deficiency, (ii) Operational Deficiency, (iii) Information Related Issues, and (iv) Process Based Restriction.

For the flourishing of international business in any country, three major contributing factors are support from the government, internal efficiencies of the organization, and market competitiveness.

**Figure 11: Authors' Interpretation, Factors for effective International Business**

## 6. ANALYSIS

### 6.1 Discussions

#### **Discussion 1: Awareness about the government schemes is low thus affecting the reach of these schemes**

When the interviewees were asked to give a number of the schemes they have even heard of even in case they have not used it, most of the companies could identify five or fewer schemes from the list.

Some companies highlighted that there is no proper communication channel from the government bodies to educate businesses about these schemes.

A company highlighted that a lot of hassle is associated while making use of any scheme because of the lack of a platform for understanding the process of implementation. Even the departments are confused regarding the implementation and nitty gritty of the procedures which leads to the amount of getting stuck.

#### **Discussion 2: Government Schemes need restructuring and should be more aligned to the need of the industries**

Flaws and implementation issues were brought out in different schemes. For instance, the RoDTEP scheme suggests that if the raw material is purchased for manufacturing goods only for export purposes and not for domestic consumption then the manufacturer can avail claim on the diesel bill of

the transportation of raw material. But the challenge is identifying that the material was procured for manufacturing export goods only.

Similarly, an issue with the Duty Drawback scheme was drawn out that over a period of time drawback rates have come down significantly. For a small and medium exporter, the final value that comes after exporting is so low that the cost of getting drawback is more than the drawback itself so people let it go. There is so much of hassle, you have to change banking norms and arrangements and documentation that it is totally not worth it.

**Discussion 3: Trade Association need to be fostered and they need to act as a channel for the representation of SMEs**

Companies had suggestions regarding the change of processes and development of markets. The responsibility lies with them of acting as a channel and representing the issues and suggestions of the association to the government.

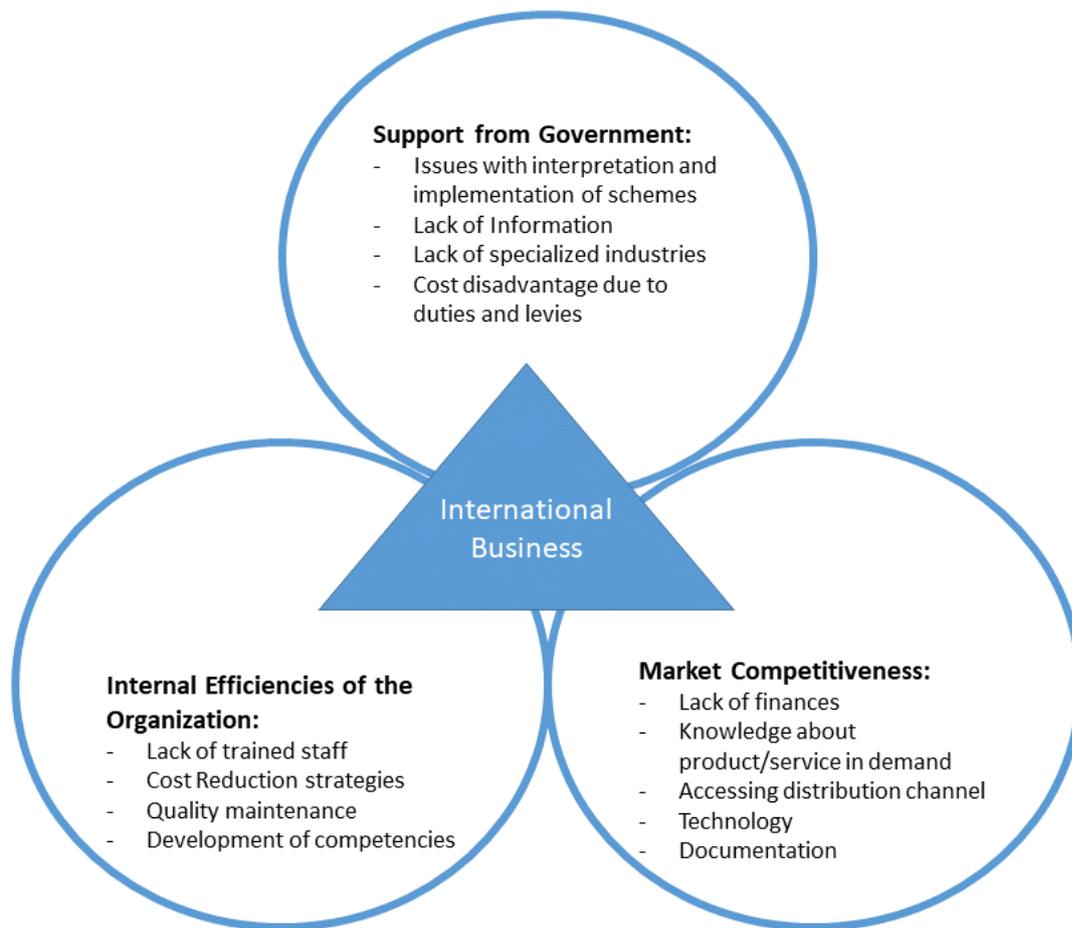

The discussion highlighted that CII and AIAI are extremely active and such associations need the support of companies and government both to act as a bridge between the two.

**Discussion 4: Most important factors to be worked upon internally by the companies are Cost Reduction, Quality Improvement, and Development of Human Resources**

Companies, Industry Experts, and Academicians suggested that the top three qualities that an organization needs to work upon are Cost Reduction, Quality Improvement, and Development of Human Resources.

Cost reduction and quality improvement are of high importance as India is competing in a global market. Where the USA and European countries hold a position for high quality, China has cost differentiating factors associated with its industries. The expectation is India should provide high quality goods at a reasonable price.

Human resource development is of critical importance, there is a lack of resources who understand international business and can help the organization grow its competencies as per the need of the international markets.

**Figure 12: Authors' Interpretation, Challenges to effective International Business**

## **6.2 Internal Efficiencies Of The Organization**

i. **Lack of Trained Staff:** Most of the SMEs lack trained staff who can bring in competency in the firm required for competing at the global level. Companies have to invest a large amount in training them to enhance their skill set as per the requirement.

ii. **Cost Reduction Strategies:** Lack of technology, cost of procuring raw material, costs associated with exports is a strong challenge to cost reduction strategies used by the enterprises. While competing in the International markets Chinese goods pose a tough competition to Indian goods in terms of pricing.

iii. **Quality Maintenance:** Intensive manufacturing countries make use of high end technology and deliver products of high quality. Indian enterprises feel constant pressure to comply with the international standards for successfully running the business in developed countries. It is a huge challenge for SMEs to keep themselves updated with constantly changing requirements.

iv. **Development of Competencies:** Most businesses find it challenging to identify key competencies and align them with the development of business goals. Competency development needs prompt elimination of the inefficient processes and quick adaption to the market condition, thus making it a challenging on-going process for the enterprises.

### 6.3 SUPPORT FROM THE GOVERNMENT

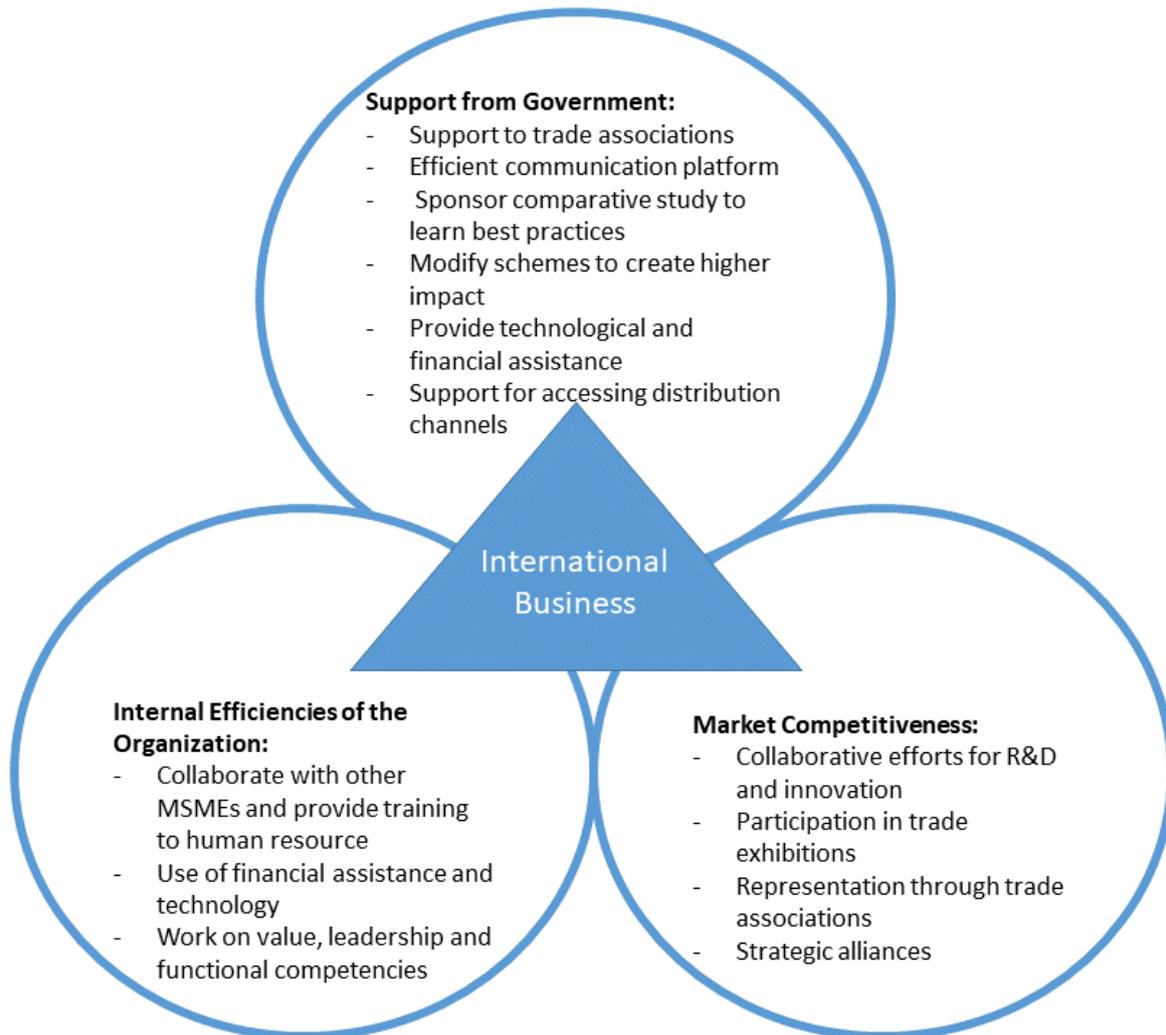

- i. Issues with the interpretation and implementation of the schemes: There is very limited awareness about the government schemes designed to help SMEs boost exports. Enterprises find these schemes time taking and document intensive. There are also major issues with the implementation of these schemes affecting the overall impact.
- ii. Lack of Information: SMEs find a lack of a suitable platform for assimilating information about various procedures, documentation, specifications, rules, regulations, and standards.
- iii. Lack of Specialized Industries: China has set an example by strategic development of its handful SEZs. India is unable to recreate the same magic even after having 28 SEZs and more approved by the commerce ministry.
- iv. Cost Disadvantage Due to Duties and Levies: Industries such as cotton face the issue of cost disadvantage due to duties on import of raw material. A study by CITI (Confederation of Indian Textile Industry) reveals that the export of yarn from India has declined over the years because of uncompetitive cost, and other countries such as Vietnam, Bangladesh, and Pakistan are posing stiff competition.

### 6.4 Market Competitiveness

- i. Lack of Competitiveness: Industry experts and SMEs highlighted that India lacks behind in R&D and innovation and is often adopter rather than the innovator. This takes advantage of entering in the Blue Ocean and generating higher revenue by eliminating first mover advantage. Lack of facilities and investment is the pressing concern leading to a lack of competitiveness.
- ii. Knowledge about Product/Service in Demand: Medium industries fare well at this issue, but small enterprises find it a challenge to know about the product/service in demand and thus are unable to customize their offerings according to the demand.
- iii. Accessing Distribution Channel: Choosing the correct distribution channel comprises of modes of reaching the target audience through different marketing factors. It is vital to any organization because it increases sales volume by providing customer satisfaction with the best quality on time. MSMEs have hurdles identifying such channels thus impacting their profitability and growth.
- iv. Technology: The major issues that make technology and its usage a challenge for SME are: cost, lack of skilled manpower, low awareness of the benefits of technology, security & privacy, and poor infrastructure (Punnet and Davinder, 2014)
- v. Documentation: Documentation is a tedious task that requires trained staff, also it varies from country to country. SMEs agree that documentation is extremely vital for securing the risk and having efficient paperwork but they also admit that they struggle to find human resources who are trained to understand and manage it.

## 7. FINDINGS AND FUTURE SCOPE

### 7.1 Findings

**Figure 13: Authors' Interpretation, Key to the Challenges identified**

#### A. Enhancing the internal efficiencies of the enterprise

The responsibility of increasing internal efficiency lies in the enterprise itself to be strategically ahead of the competition.

For the development of human resources, two major factors are attracting talent and providing training. For attracting talent SMEs need to provide motivation and growth environment along with compensation and incentives according to the industry standards. Industry experts should be included in the decision making team so as to get exposure to industry best practices.

Training can be provided in collaboration with other SMEs from the same industry so as to enhance the learning and flexibility of different processes.

The enterprises need to adapt to the latest technology and keep themselves abreast of rapidly changing scenarios to stay competitive. Technology is the biggest enabler in implementing cost reduction and quality management strategies.

Categorization of value (core), leadership, and functional competencies need to be done and an action plan should be drafted for their development. Core competency is based on the quality, customer satisfaction, and innovativeness of the firm. The need for leadership competency comprises of decision making and problem solving capabilities. The technical and specialized skills account for functional competency.

These competencies should be evaluated individually and worked upon accordingly.

### **B. Increasing the support from the government**

The government has a key role in boosting exports from the MSME sector. The Indian government is constantly upgrading and enhancing its policies to strengthen the sector.

The need of the hour is increasing awareness about schemes & initiatives, and efficient feedback from the enterprises to bring in the flexibility in the policies.

Industry and Trade Associations such as CII, AIAI, FICCI, NASSCOM, etc. should be strengthened to act as a bridge between government and enterprises. They can be an efficient channel for representation and communication and can give effective inputs for the drafting of policies.

Many SMEs refrain from making use of government schemes because of cumbersome procedures and documentation. The assistance should be provided for the use of schemes and they should be upgraded to increase the outcome and reduce the bottlenecks.

In trade fair, country pavilion does not attract much audience. They should be marketed well for crowd pulling. Also, industry specific trade exhibitions should be organized so as to cater to the correct audience.

Lack of credit is a major problem highlighted by SMEs during the research. Policies should be implemented to ensure the availability of credit for exports.

To increase the competency of Indian firms at a global level, technology aid should be provided. Subsidizing the purchase of machinery, I.T Development assistance is required.

### **C. Sustaining in competitive markets**

Innovation and Research & Development are expensive and require specialized technology, skills, and human resources thus making it an expensive affair. To excel at this and compete the stiff competition posed by Chinese industries and other Developed countries, collaborative effort is required.

Enterprises should pool their resources for sharing the cost of innovation and reaping maximum benefits.

International trade exhibitions may seem an expensive affair, but they provide the best platform for networking in the business. Online platforms are indeed a suitable platform for generating leads for the business, but trade exhibitions create a lasting impression, provides direct sales opportunity and most importantly helps in building brand proximity.

The enterprise should associate itself with trade/industry associations and provide a contribution to the goal of strengthening the industry.

Strategic alliances if implemented correctly can generate a high number of benefits such as the addition of competitive skills, entry into new markets, risk reduction, increase in intellectual capital, and leapfrogging the competition.

### **7.2 Significance Of India In International Business**

India can be a major contributor to International Trade by boosting its SME sector. There are many products such as pharmaceutical products, cereals, clothing & accessories, cotton, fish, meat, miscellaneous textile, coffee, tea, spices, mineral fuel including oil, gems, precious metal, machinery including computers, vehicles, organic chemicals, electrical machinery, iron, steel, etc.

India is located between highly populated trading partners like China, Pakistan, and Bangladesh. India shipped goods worth US\$323.1 billion around the world.

India has trained engineers, scientists, and researchers who are coveted globally for their technical knowledge. Also, labor is cheaply available so as to cut the cost of manufacturing.

Different success stories suggest that India's young population, government schemes, developing technology, etc. make India a lucrative location for manufacturing operations.

### **7.3 Limitations**

Considering the sheer difference of scale of operation in small and medium enterprises, the inferences and solutions proposed are generalized, but they may vary as per the individual sector according to the investment made. Thus sector specific approach is required for the elimination of challenges from the root.

For more efficient analysis of the data, the research can be repeated with a larger sample size so as to get a better understanding of the sectorial issues.

### **7.4 Future Scope**

The prime objective was to analyze the major roadblocks in the process of going global for Indian SMEs. In future this study can be extended in different directions to gain better and granular understanding and come up with a specific solution through the following ways:

- Conducting quantitative study by preparing a questionnaire around the postulated issues and analyze their impact and relation to each other. This will also help in gaining deeper insight into how these challenges affect different industries and services differently.

- A comparative study with other emerging economies will help in understanding how other nations are boosting International Business for SMEs. Ideas and learnings can be replicated if suitable to the Indian industrial environment.
- In the future, start-ups can be included for a comparative study for the identification of synergies and scope of collaboration. Through collaboration, SME and Start-ups can achieve the common goal of geographic expansion and higher revenue generation.
- The model in Figure 1, 2 and 3 can be used to conduct a similar study for different countries and analyze how different solution is required for the different country because of the cultural, economic, social and technological situations across the countries.

## 8. CONCLUSION

SME sector is the growth engine of the economy and provides immense growth opportunity to the domestic industry of the country.

International Business is key to expand over the geographical bounds and unleashing the true potential by bringing in more business opportunities.

The research identifies that the reach of government initiatives and the scheme is very low among SMEs and the need for communication platform is identified for the same.

There is a challenge with the design of schemes and ambiguity regarding the implementation part. Also, the processes are cumbersome and time consuming. Through feedback, processes can be smoothened out. The use of digital platforms will help in increasing the speed of the processes. Not only SMEs but the government department should also be trained well about the benefits of the schemes and its implementation.

Trade Associations and Industry Associations are active in India and they are the right channel for the representation of the enterprises. SMEs must associate with them and work in collaboration to modify the existing policies and bring in new policies that can boost the growth of the industry.

Enterprises also need to constantly strive to improve internal strategies to stay competitive at a global level. They should always stick to the learning curve and be adaptive to the new demands and technological changes.

The three required factors for boosting exports from SME sectors are support from the government, working on the internal capabilities of the organization, and staying abreast of the competitiveness of the global markets. Through collaborative efforts of all the stakeholders, Indian SME can expand even better in International Business and contribute more to the growth of the industry and the nation.

N.B. This paper was written pre Covid 19 pandemic. The country's economy suffered due to the implementation of the lockdown. India's finance ministry extended support to save the dwindling

GDP which suffered a downturn The Indian government has been doing its bit to salvage the disrupted supply chains and shipping routes. It has given sops for SMEs which amongst others includes a three month credit extension for exporters and several other reform commitments.

# ENCOURAGING THE RETURN TO MUSEUMS THROUGH THE THROUGH ENRICHING OF THE EXPERIENCE AND THE FEELING OF PRIDE

Blanco, Teresa<sup>1</sup>; Loureiro, Sandra Maria Correia<sup>2</sup>

<sup>1</sup>Instituto Universitário de Lisboa (ISCTE-IUL), Portugal

<sup>2</sup>Instituto Universitário de Lisboa (ISCTE-IUL), Portugal and Business Research Unit (BRU-IUL)

## ABSTRACT

The aim of the current study is to investigate the effect of museum experiences on visitors' willingness to recommend a museum and desire to return, based on the influence of the perception of coolness and the feeling of authentic pride. A sample of 308 usable questionnaires retrieved from four Lisbon (Portugal) museums provide a good understanding of the drivers of revisit and recommend intentions.

Museum Atmospheric Cues contribute to the perception of Museum Coolness and the feeling of Authentic Pride, which, in turn, have an effect on the intentions to Recommend and Revisit a museum. The perception of Museum Coolness has a stronger influence on both intentions to Revisit and Recommend.

*Keywords: Museum Experiences, Atmospheric Cues, Museum Brand Coolness, Authentic Pride, Revisit, Recommend*

## INTRODUCTION

Cultural attractions, such as museums, constitute sources of cultural diversity, personal development, and social cohesion, apart from enhancing employment and income (Brida *et al.*, 2011). In 2018 Portugal received 19,494,106 visitors to museums (INE, 2019), of which 9,287,559 were foreigner visitors. Moreover, regarding statistics of DGPC (2018) about monuments, museums, and palaces entrances, 33.3% of the visits were to museums. This evidences the importance of museum management in Portugal since it attracts both locals and foreigners from all over the world.

Statistics show the relevance of museums in the overall economy of Portugal, but what exactly leads people to enjoy a museum, to desire to come back and to recommend it? Several researchers have studied the impact of atmospheric cues (Loureiro, 2019), of perceived authenticity (Carù *et al.*, 2017; Loureiro, 2019) and of satisfactory museum experiences (Antón *et al.*, 2018) in the willingness of museum visitors to revisit a museum and/or recommend it to others. However, no study has yet

assessed the effect of visitors' perceived museum coolness and the authentic pride they feel after a visit in those revisit and recommendation intentions.

By applying the concept of Brand Coolness to the museum context for the very first time, and using the Authentic Pride construct in an innovative way, the present study aims to answer the following research questions: how can the museum experience enhance visitors' perception of coolness and feeling of authentic pride? Can perceived coolness and authentic pride influence visitors' intention to revisit and recommend the museum?

## **THEORETICAL FRAMEWORK**

### *Museum Atmospheric Cues*

Loureiro (2019) defines four main factors that can help appraisal inside of a museum. The first is design, which relates to characteristics such as facilities, colors, and permanent exhibitions and the second is lighting, this is, the adequacy of the lighting. Then, learning, which regards to the interest of visitors and the meaning that it has for them. Does the exhibition add to the visitor's knowledge? Does it meet their expectations? Finally, the fourth factor is staff, which considers the people working in the museum and how they present themselves and communicate with the visitors.

### *Museum (Brand) Coolness*

Regarding brand coolness, studies have confirmed that the word "cool" has a positive valence and can be used as a synonym to "I like it" (Belk et al., 2010). Additionally, the coolness literature proves that enhancing visitors' perceived coolness leads to higher levels of tourist satisfaction (Chen and Chou, 2018). Consequently, the probability that the visitor will revisit and recommend the destination increases. According to Warren and Campbell (2014), the concept of coolness is socially constructed, because objects and people are only cool if others consider them so. Also, coolness is subjective and dynamic since it depends on personal experiences and it can vary throughout time.

In the museum context, experiences are created through four atmospheric cues: design; lighting; learning, and staff (Loureiro, 2019). The final goal for museum managers is to provide a space where visitors feel comfortable and happy, having the possibility to enhance their knowledge about specific or diverse themes. Both ambient and design aspects provide not only a memorable experience, but also boost visitors' inclination to revisit and recommend some cultural attractions (Bonn et al., 2007).

Taking all of this into consideration, the following can be hypothesized:

**H1: The Museum Atmospheric Cues are positively associated with the perception of Museum Coolness**

### *Authentic Pride*

Researchers in the psychology field have demonstrated that pride is a critical emotion in the psychology context (Tracy and Robins, 2007). Authentic pride is a feeling associated with internal and controllable causes (Loureiro, 2019), success-oriented, related to genuine self-esteem and agreeableness (Kong *et al.*, 2017). This type of pride is connected to hard work, perseverance, and effort (Huang, 2014).

Authentic Pride is linked to perceived authenticity, which is a motivational factor for museum visitors (Knudsen *et al.*, 2016; Loureiro, 2019). If visitors believe that a museum is genuine and trustworthy, they are more prone to feel they have achieved something with the visit, and also more willing to share their experience (Loureiro, 2019). According to the literature, an experience designed by museum managers can be crucial in the perception of authenticity and the materialization of a brand identity in the consumer's mind (Carù *et al.*, 2017).

Therefore, the second hypothesis is as follows:

### **H2: The Museum Atmospheric Cues are positively associated with the feeling of Authentic Pride**

#### *Intention to Recommend*

According to Holbrook and Gardner (1993) and Antón *et al.* (2018), the recommendation of a museum after its visit can be translated into content generation, which refers to visitors sharing their experiences with others in the online world. For this purpose, they can publish reviews and comments on social networks and travel websites, which are seen as reliable by others (Presi, *et al.*, 2013; Antón *et al.*, 2018; Rosado-Pinto and Loureiro, 2020).

When talking about a recommendation, another dominant concept is word-of-mouth (WOM), which is information shared by past consumers with potential consumers, based on their past experiences (Wang *et al.*, 2016). WOM is a powerful tool for purchase decisions because it consists in information communicated by people who are considered trustworthy (Wang *et al.*, 2016; Day, 1971) rather than being communicated from the brand itself. Nowadays, with the Internet, traditional WOM has gained the electronic element which can constitute an influential social interaction and can have very wide dissemination (King *et al.*, 2014).

Antón *et al.* (2018) have concluded that content generation mainly happens when the visitor is satisfied with the visit. On the other hand, engaging in word-of-mouth interactions can occur whether the experience is positive or negative (King *et al.*, 2014). Therefore, the perception of coolness in the museum context is deeply relevant, since the probability of the visitor recommending the cultural attraction increases once the level of perceived coolness is high (Chen and Chou, 2018). Hence, another hypothesis is:

**H3: The perception of Museum Coolness is positively associated with the Intention to Recommend the museum*****Revisit Intention***

Although the perception of coolness is subjective and dynamic, it is agreed upon the literature that something that is cool is seen as positive (Warren and Campbell, 2014; Belk *et al.*, 2010). Additionally, people tend to evaluate a high quality and innovative product as cool (Sundar *et al.*, 2014). This can also be applied to the museum context, where when visitors regard the museum as being different, unique, and valuable, it is suggested they consider it a cool museum.

A growing body of literature has established the importance of creating the perception of coolness in museum visitors. By generating that perception, museum marketers hope to encourage behaviors from visitors that will enlarge their experience. One of those behaviors is intensification, the intention to extend the museum experience by, for instance, participating in the museum's extra activities and buying items from the museum shop (Holbrook and Gardner, 1993; Antón *et al.*, 2018).

The visitor's intention to enhance the museum experience relates to the willingness to revisit it. According to Batra *et al.* (2012), when someone is passionate about a brand, he/she will invest time and money in interactions with it. Loureiro and Ferreira (2018) apply this to museum context, confirming that when visitors identify themselves with the museum and are absorbed in it, the passionate desire to revisit it can emerge.

Moreover, the literature proves that when visitors perceive museums as cool, their link to the museum will increase (Loureiro and Ferreira, 2018) and thus the probability they will return to revisit it also increases (Chen and Chou, 2018; Shahrabani *et al.*, 2019). For all the above reasons, the following hypothesis is:

**H4: The perception of Museum Coolness is positively associated with the Intention to Revisit the museum**

Loureiro (2019) claims that the feeling of authentic pride can be a predictor of word of mouth, as visitors who feel that the museum is trustworthy and genuine will be more encouraged to communicate their experiences and advocate the museum. Similarly, if the visitor considers the visit useful and meaningful, he is more prone to speak about it with others. As stated above, the recommendation by the visitor can be done either through content generation or word-of-mouth.

Literature also suggests that if the visitor has a feeling of authentic pride, he/she will want to participate in further activities of the museum, give advice to the managers and follow the museum's social media pages (Holbrook and Gardner, 1993; Antón *et al.*, 2018). Likewise, this feeling can lead visitors to have a true desire to return to the museum and visit its exhibitions once more (Loureiro and Ferreira, 2018). Thus, having this in consideration, the last two hypotheses are:

**H5: The feeling of Authentic Pride is positively associated with the Intention to Recommend the museum**

**H6: The feeling of Authentic Pride is positively associated with the Intention to Revisit the museum**

## METHODOLOGY

The questionnaire was designed online, but it was mostly distributed offline, near the four selected museums: the National Coach Museum; the Museum of Art, Architecture, and Technology (MAAT); the National Tile Museum, and the Orient Museum. Data was collected for two months, from mid-January to mid-March 2020. The constructs and items used in the questionnaire were based on the literature review and measured with a 7-point Likert-type scale. Museum Atmospheric Cues were measured based on Loureiro (2019), Museum Coolness based on Warren *et al.* (2019) and Authentic Pride based on Loureiro (2019) and Loureiro and Ferreira (2018). Revisit Intention was measured with a scale adapted from Bonn *et al.* (2007) and Kottasz (2006), a scale from Loureiro (2019) and another from Antón *et al.* (2018). Finally, Recommend Intention dimensions were measured with scales from Antón *et al.* (2018), Loureiro and Ferreira (2018) and Loureiro and Kastenholz (2011). A sample of 308 participants was obtained, of which 71.1% are female and 28.9% male. Most of the respondents belong to the 18-24 age group (35.7%), followed by the 25-34 age group (21.8%).

## RESULTS

After obtaining 308 questionnaire responses, data was adapted to fit the chosen statistical program – IBM SPSS Statistics 26. Once the variables were computed appropriately, it was possible to conduct several analyses. First, to ensure the internal consistency of the measurements, the Reliability Analysis was conducted, testing the Cronbach's Alpha coefficients (see Table 1). All of these values were above 0.8, which represents good consistency of the items in each scale (George and Mallery, 2003).

| <b>Construct</b>       | <b>Cronbach's Alpha</b> |
|------------------------|-------------------------|
| Atmospheric Cues       | .910                    |
| Museum Coolness        | .949                    |
| Authentic Pride        | .947                    |
| Revisit Intention      | .849                    |
| Intention to Recommend | .816                    |
| Sum Total              | .876                    |

**Table 5 - Reliability Analysis**

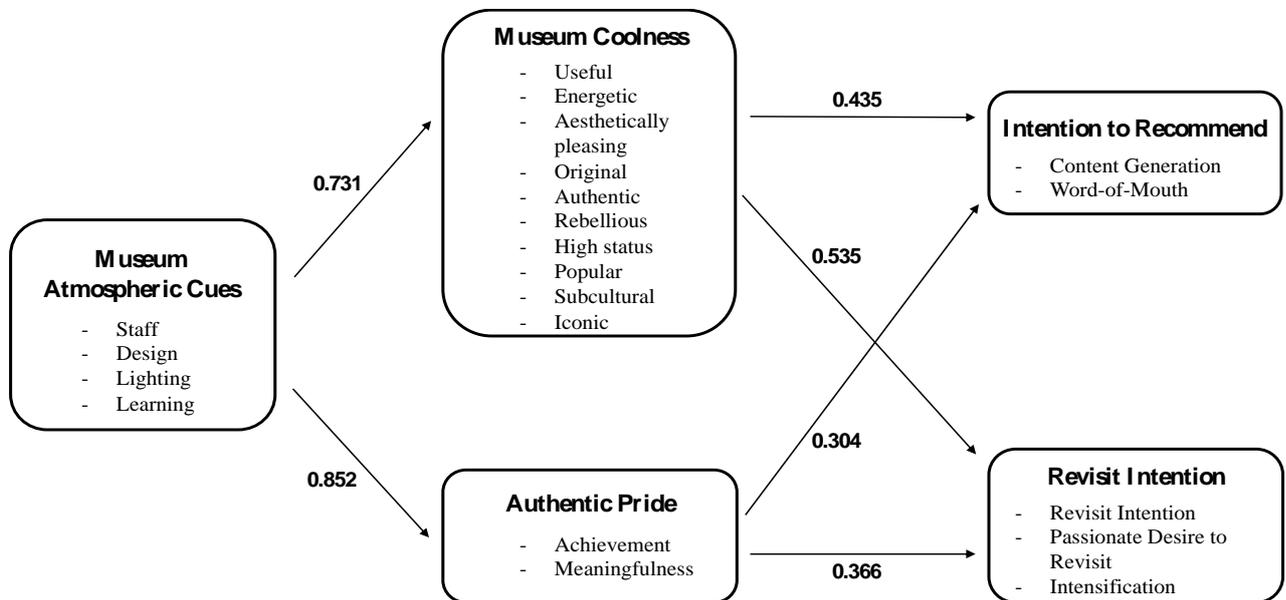

Then, the software was used to execute Frequencies and Descriptive Statistics, as well as Simple and Multiple Linear Regression Analysis. To test the six hypotheses of the model, this is, considering the different independent variables, Multiple Linear Regression was conducted. As observed in Table 2, all hypotheses of the theoretical framework were supported, being possible to highlight the independent variable with higher effect in the dependent variable for each hypothesis.

| Hypotheses                                    | Strongest X Variable | Beta  | P Values |
|---|----------------------|-------|----------|
| H1: Museum Atmospheric Cues > Museum Coolness | Design               | 0.434 | 0.000    |
| H2: Museum Atmospheric Cues > Authentic Pride | Learning             | 0.330 | 0.000    |
| H3: Museum Coolness > Intention to Recommend  | Useful               | 0.327 | 0.000    |
| H4: Museum Coolness > Intention to Revisit    |                      | 0.346 | 0.000    |
| H5: Authentic Pride > Intention to Recommend  | Achievement          | 0.320 | 0.000    |
| H6: Authentic Pride > Intention to Revisit    |                      | 0.460 | 0.000    |

**Table 6 – Hypotheses Testing**

For the last four hypotheses, regarding the constructs as a whole, both Simple and Multiple Linear Regression were used to take conclusions (see Figure 1).

**Figure 14 - Theoretical Framework with Beta values**

**CONCLUSIONS**

From the results there is evidence that Design is the variable from Museum Atmospheric Cues that more highly affects the perception of Museum Coolness. Regarding the feeling of Authentic Pride, this

is specially influenced by the Learning variable of Museum Atmospheric Cues, in concordance with Loureiro (2019). From the several variables that constitute Museum Coolness, Useful is the one that is more highly associated with both intentions to Revisit and Recommend a museum. Finally, considering the Authentic Pride construct, Achievement is the dimension that has a stronger effect on both intentions to return to the museum and to suggest the visit to others.

The final four analyses allow to state that all the constructs are positively related among themselves. Museum Atmospheric Cues have a higher association with the perception of Museum Coolness than with Authentic Pride. Moreover, results show that if museum visitors' perceive a museum as cool and develop a feeling of accomplishment with the visit they become more willing to return to the museum, rather than recommend it. The perception of Museum Coolness influences more strongly both intentions to Recommend and Revisit than Authentic Pride.

Regarding managerial Implications, it was uncovered in this study that museum managers must focus on keeping the décor and display of exhibitions up-to-date and try to renovate, when possible, the display of the permanent exhibition. Furthermore, the museum experience should be enhanced with the use of games and quizzes throughout the visit, as well as on an online platform. Managers would, therefore, respond to the visitors' necessity learning, while building a relationship with them. Moreover, there should be online workshops, Q&A and tours to engage with visitors while they are quarantined or simply cannot go to the museum.

Some limitations were found in this research, as expected, and they should be interpreted as future research opportunities. First, one of the limitations concerns the fact that the sample is mostly characterized for younger people. Similarly, female respondents represent more than half of the sample (71.1%). Furthermore, as the study was conducted in Portugal, the vast majority of the participants were Portuguese (82.8%). Thus, future research could consist in a more culturally diverse sample that is balanced between the different age groups and genders. Additionally, future studies could use the theoretical framework and apply it to different countries and cultural attractions.

For the first time in the tourism literature the concept of Brand Coolness was studied, more specifically in the museum context. Although the constructs of Atmospheric Cues and Authentic Pride are retrieved from previous studies (Loureiro and Ferreira, 2018; Loureiro, 2019), the relationships investigated between them are innovative.

### ABSTRACT

The healthcare system is a knowledge-driven, interdependent set of major domains experiencing fundamental change due to multiple factors such as advances in science and technology, patient expectations, and government funding and oversight. This paper examines the escalating role of technology in healthcare, recent advances in organizational learning and knowledge management, and how healthcare professionals can leverage the knowledge associated with implementing and integrating new technologies to improve patient care and system effectiveness by institutionalizing it in systems, structures, procedures, and strategy. We conclude with a call for research and scholarly inquiry involving experts in knowledge management, organizational change, and healthcare.

*Keywords: Knowledge management, Change management, culture, healthcare, technological change*

### INTRODUCTION

Healthcare is distinguished world-wide by its importance, expensiveness, and rapidly changing technology. New technologies can dramatically improve patient care while escalating the cost, increasing the demand for access to such care to the extent it can become a political issue, and placing new demands for knowledge on the multidisciplinary teams of caregivers called to implement them effectively and efficiently. These advances in care also change the way the system's major domains relate to each other often resulting in structural, economic, strategic, and professional realignments and adjustments. All of this change throughout the system creates the dynamic complexity Senge (1990) hypothesized as the cause of unexpected consequences. Changes in the healthcare system are well-known phenomena because we experience so many of them in our personal lives. Yet, these changes are under-studied by the scholarly community with expertise in knowledge management and organizational change likely due to the fact that healthcare is the domain of healthcare professionals. We therefore begin this article by exploring the history of technological change in healthcare.

Healthcare has experienced decades of improved services, much of it driven by advances in science and technology (Bowden & Smits, 2012). Technologies formerly seen only in science fiction novels or Hollywood blockbusters are now becoming a reality in everyday life and throughout the healthcare system. Such technologies include the use of virtual reality therapy for pain management; virtual assistants to facilitate care management and coordination; drones and smart-phone enabled ride and delivery service to transport time-sensitive medical supplies; 3D printed biological implants; as well as the use of artificial intelligence to mine medical records, to design treatment plans, and to link genetic information to define and deliver personalized care. Healthcare providers, hospitals, payers, and manufacturers are all trying to determine how to best leverage existing technologies and bridge them with new health technologies that drive efficiencies in care delivery and improved patient outcomes and engagement. Meanwhile, with an increasing trend towards consumerism, patients are more actively seeking better experiences and outcomes in a dynamic and interconnected, technology-oriented environment. Healthcare is experiencing, and will continue to experience, a virtual explosion of new technologies resulting in greater complexity, technology dependence, and the need for teamwork for which new knowledge is a critical element.

New health technologies are essential for a functional health care system, as is a paradigmatic culture shift towards a mindset that supports shared learning and creates a “culture of change” in order to spur dissemination across the multiple components and groups within the system itself. As Bowden and Smits (2012) noted, culture is the accumulated results of a defined group’s experience-based learning, develops at multiple levels of organized activity, and can be one of the most potent drivers of change. As Bengoa et al (2009) noted, culture is an important consideration in knowledge transfer. Historically, advances in science and technology have been important drivers of change. Such advances have enabled the delivery of health care services which have steadily increased in dynamic complexity over time (Figure 1). This integration and enablement have been so dramatic that healthcare is now highly dependent on technology to provide even routine services.

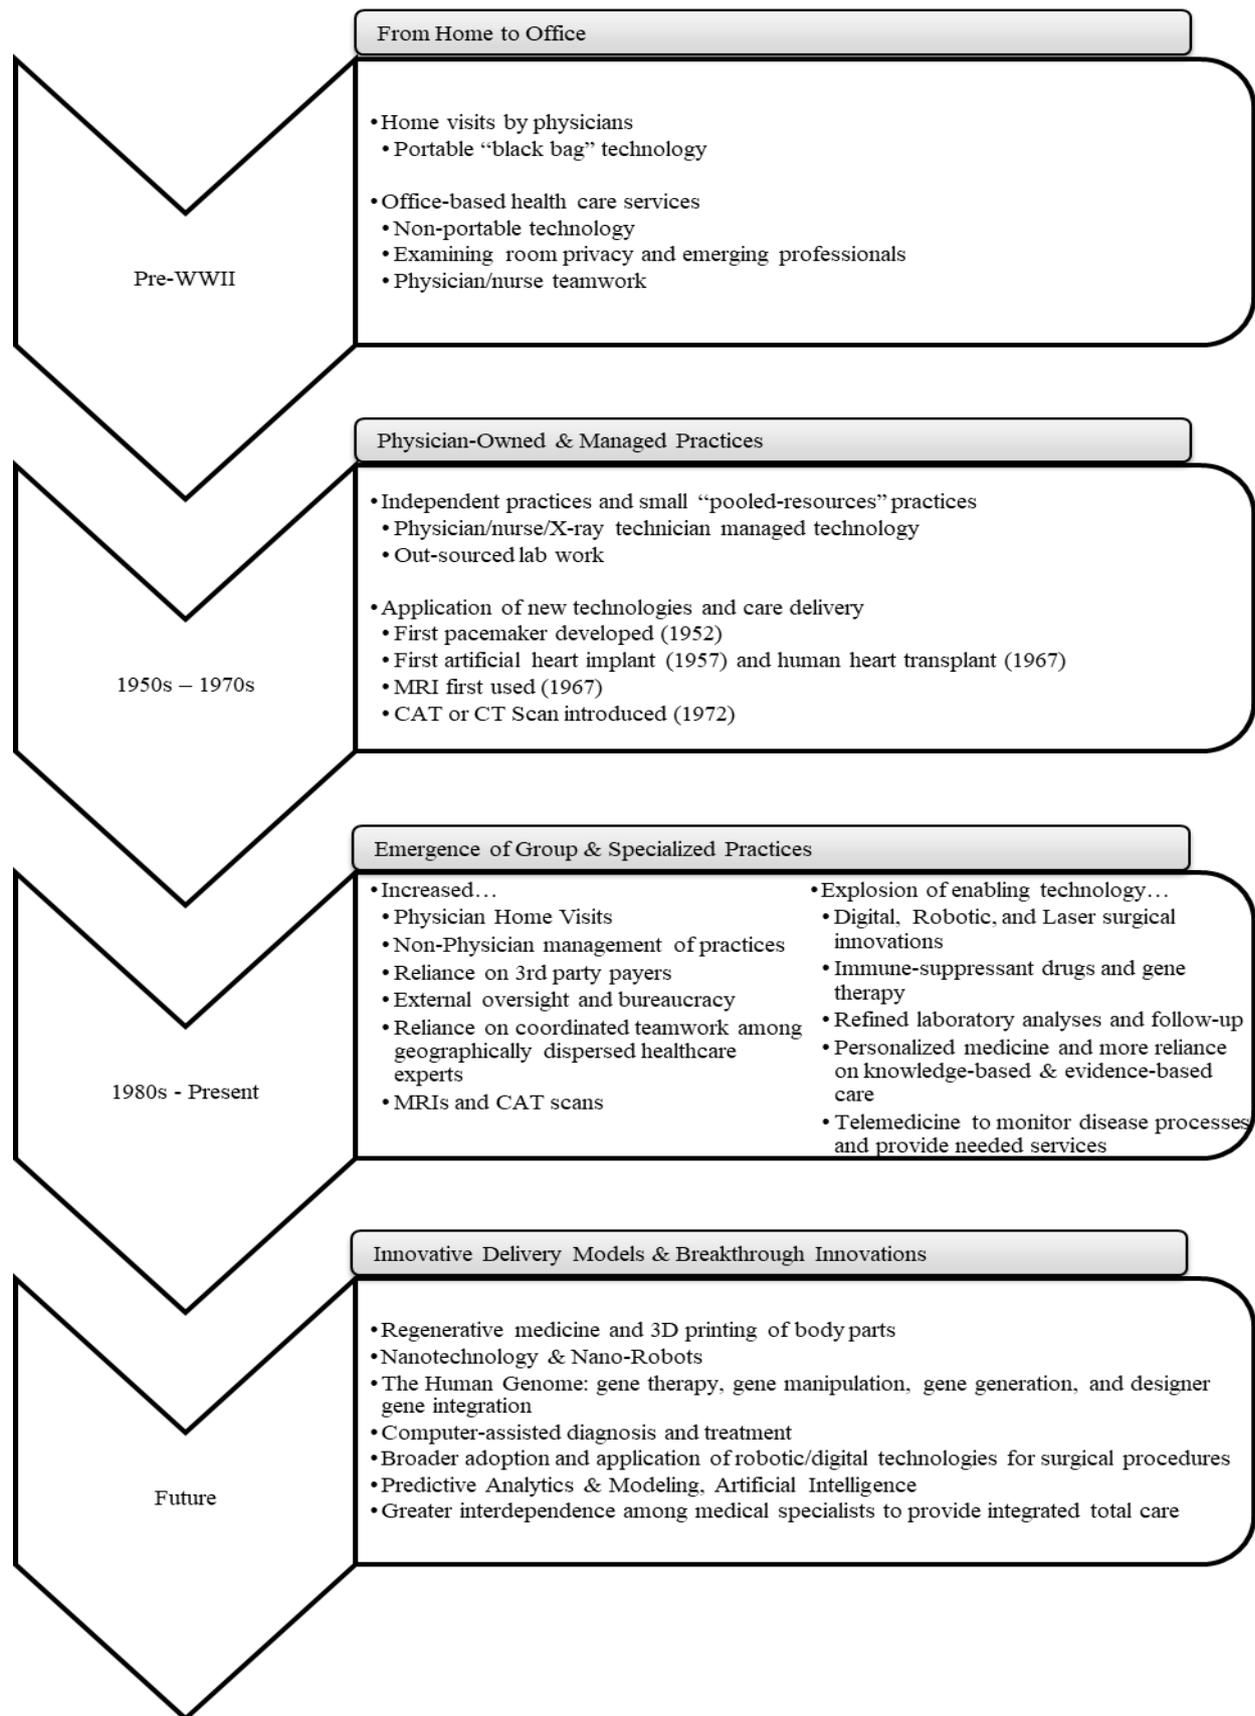

Figure 1. Timeline for select technological advances and health care delivery progression

While improved technology drives change, strong cultures resist it in order to protect the status quo. While we recognize that cultural issues are salient, our focus here is on the challenge of knowledge management within the healthcare system, on its relationship with continuously evolving and developing technology, and on the probable impact on care delivery quality and costs. Specifically, in this paper, we focus on the potential benefits of capturing and applying the knowledge developed by skilled professionals in healthcare through shared experience as they discharge their responsibilities, often in teams, often applying new technologies. Moreover, we describe how such knowledge is developed through experience, how advances in assessing this knowledge can bring it to the level of application, and how this application can evolve into best practices at the organizational level and into standards of practice at the level of the professions involved. Finally, we emphasize the important role leadership can play in promoting learning organizations, assessing experience-based knowledge, and leveraging this knowledge for continuous quality improvements.

## **EVOLVING ORGANIZATIONAL COMPLEXITY AND TECHNOLOGY DEPENDENCE IN HEALTHCARE**

According to Shapin (2007), “just as innovators commonly understand the fundamentals of a technology better than subsequent users, so users can acquire knowledge that would never have occurred to the inventors” (p. 148). The user-derived knowledge referred by Shapin evolves from the tacit knowledge which develops from experience. Such knowledge is the starting point for our discussion of the knowledge management challenges at play as the healthcare system implements new technology and learns to use it in ways that continuously improve the quality and efficiency of patient care. Similar knowledge management challenges exist in other sectors such as supply chain management (Fletcher & Polychronakis, 2007). Experience produces tacit knowledge – which, if captured, refined, and applied – can improve treatment practices. Given the volume of new technologies in healthcare, systematically leveraging lessons from experience in order to improve care requires a planned, strategic approach to knowledge management. We begin our discussion of such an approach by briefly reviewing how tacit knowledge evolves into more explicit forms of institutionalized knowledge-in-practice, and by reviewing the models and tools available to enable communities of practice.

While deeply ingrained tacit knowledge, intuited by individuals via experience, is virtually impossible to capture, tacit knowledge emerges in group settings through dialog with others experiencing the same work-based phenomena. Team members learn from their collective experience and each other (Edmonson, 1999, 2007; Garvin, Edmonson, & Gino, 2008; Smits, Bowden, Falconer, & Strasser, 2014). Teams play a fundamental role in capturing individual tacit knowledge and moving it

to broader organizational use. Edmondson (2002) and Crossan, Lane, and White (1999) contend that intuited tacit knowledge developed by individuals is interpreted and integrated via group-level processes. According to Edmondson (2002), “collective learning is inherently local” (p. 142) because it transpires among members of teams and small groups.

In the early 2000’s, with the increased use of multidisciplinary teams came increased research focused on effectiveness. This research suggested that strong collective identification among team members was linked to greater team effectiveness Van Der Vegt and Bunderson (2005). Moreover, it suggested that teams were more productive when members understood each other’s mental models and engaged in cross-learning (Huber & Lewis, 2010), when the members experienced a deep level of trust and exchanged tacit information (Jones & George, 1998); and when the members were capable of implicit coordination to deal with dynamic complexity and unplanned change (Rico et al., 2008). Similarly, research by Somech and Drach-Zahavy (2011) on well-functioning primary care teams in Israel found that they exchanged information to find new and improved ways to meet patient needs. To sum up, such competent teams operating in healthcare settings, described by Loftin and Straker (2011) as “complex adaptive systems,” engage in greater levels of collaboration to improve patient care.

Individuals and teams are assigned tasks in accordance with the organization’s purpose and strategy, and are given the resources, including technology, the organization has available for task completion. Over time, experience helps individuals and teams make nuanced adjustments that improve the efficiency and effectiveness of the technology for accomplishing the designated outcomes. These nuanced adjustments start as novel insights by users of the technology – intuitive in nature and difficult to articulate and formalize because they are often specific to a given situation (Crossan et al., 1999; Ambrosini & Bowman, 2001; Nonaka, 1994). The experience-based knowledge on which these adjustments/improvements are made is referred to as tacit knowledge. Analyzing the processes by which organizations acquire knowledge (organizational learning) and apply it (knowledge management) involves tracking tacit knowledge from its origin (experience) through its institutionalization in systems, structures, procedures, and strategy (Crossan et al., 1999; Argote, 2005).

Andrews (2017) summarized the work of several scholars stating that “tacit knowledge is difficult to formalize, tends to be personal, is embedded in practice, and is context specific” (p. 39). Raelin (1997) described tacitness in a more collective context describing communities of practice evolving around shared learning and a high degree of synchronization, eventually becoming so tacit (mutually understood and acted upon) that “the work becomes effortless” (p. 570). Rather than promoting unconscious performance, however, Raelin is in fact advocating communities of practice “to develop their mutual expertise” by making mental models explicit through action learning (Raelin, 1997, p.

570). Further, the notion of action learning can be extended to knowing-in-action; according to McIver et al. (2013), “tacit knowledge is a form of knowing that is inseparable from action because it is constituted through doing” (p. 600).

In brief, health care providers, individually or in teams, begin using a new technology and over time learn by doing. This learning is valuable to the individual and the team, but does not lead to institutionalized improvements unless the tacit knowledge is made explicit. That means we need to capture the tacit knowledge and manage it for performance improvement. Ambrosini and Bowman (2001) suggested a method of “causal mapping” to capture tacit knowledge. Their methodology involves conducting semi-structured interviews with key individuals and focus groups to create “causal maps” defined as “a form of cognitive map that incorporates concepts tied together by causality relationships” (p. 817). Their model starts by identifying the key organizational constructs linked to success for the entity under investigation, and then seeks to discover the primary causal factors which enable this success. The mapping process uses causal questions and stories. The causal mapping model from Ambrosini and Bowman (2001) identifies four levels of skills with the most tacit being inaccessible (Level A), and the least tacit being primarily explicit (Level D). Causal mapping focuses on the middle two levels which consist of skills that can be indirectly articulated through storytelling and metaphors (Level B), and skills that can be articulated when a skilled researcher asks the right questions (Level C).

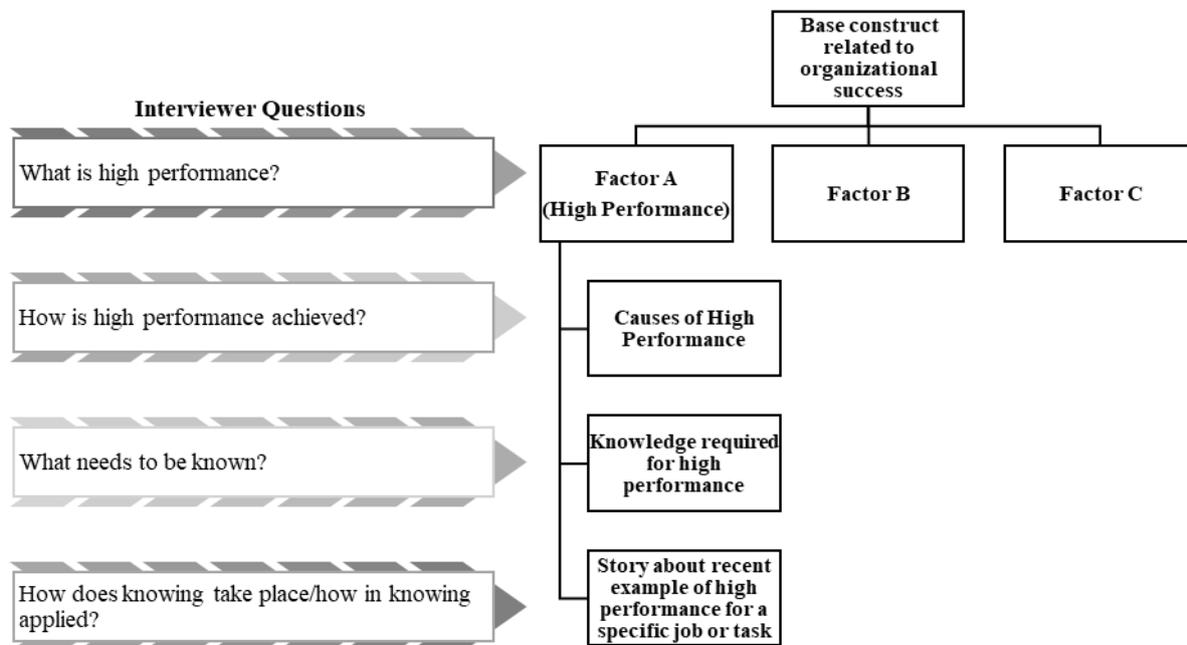

Figure 2. *Integrated diagnostic model: casual mapping and knowledge-in-practice*. Adapted from Ambrosini & Bowman, 2001 and McIver, et al (2013)

Andrews (2017) further refined the causal mapping methodology by using questions from McIver et al.'s (2013, pp. 605-606) Knowledge-In-Practice Model to elicit more work specific responses to the level C tacit knowledge (Figure 2)

Having mapped tacit knowledge and demonstrated how it is used to achieve desired outcomes, the next task is to manage it to improve organizational functioning. Here we turn to the 4I model developed by Crossan et al. (1999) and further operationalized by Lawrence, Mauws, Dyck, and Kleysen (2005), who argued that "organizations are inherently political and consequently so are the processes of organizational learning" (p. 180). The 4I model of organizational learning (Crossan et al., 1999) is a multi-level process that takes knowledge from a tacit level to an explicit, mandated, organizational level:

- *Intuiting* – individuals develop novel insights based upon their experience
- *Interpreting* – explaining the novel insight to oneself and others through dialogue
- *Integrating* – the group-level process of developing shared understanding and taking action
- *Institutionalization* – embedding the learning that has occurred among individuals and groups into the organization through systems, structures, procedures and strategy.

However, Lawrence et al. (2005) contend the 4I process only happens when ideas are pushed forward by engaged individuals using the political processes that promote change within a given organization: "Without that political behavior, new ideas may be generated by individuals, but organizations will never learn" (p. 190).

To summarize at this point, we contend that healthcare professionals given new technology to care for patients will develop valuable tacit knowledge while using it; that tools and models exist to capture and manage such knowledge for improved care; and that there is a professional imperative to accelerate organizational learning and knowledge management systems.

## **PRACTICE IMPLICATIONS**

It is always difficult to direct recommendations at healthcare as a total system because of its diverse components and functions, and the dynamic complexity within and among them (Bowden & Smits (2011). See Figure 3 for the major domains we see as operating with various levels of interdependency.

Granted that healthcare's multiple settings already foster learning and manage existing knowledge to various degrees of sophistication, here we selectively suggest ways that health care managers can improve knowledge management first across the entire system, next in clinical settings, and finally in business units.

All domains within the system would benefit from interventions making them more proficient learning organizations. Thus, we begin our refinement dialogue by suggesting ways leaders in healthcare can improve learning.

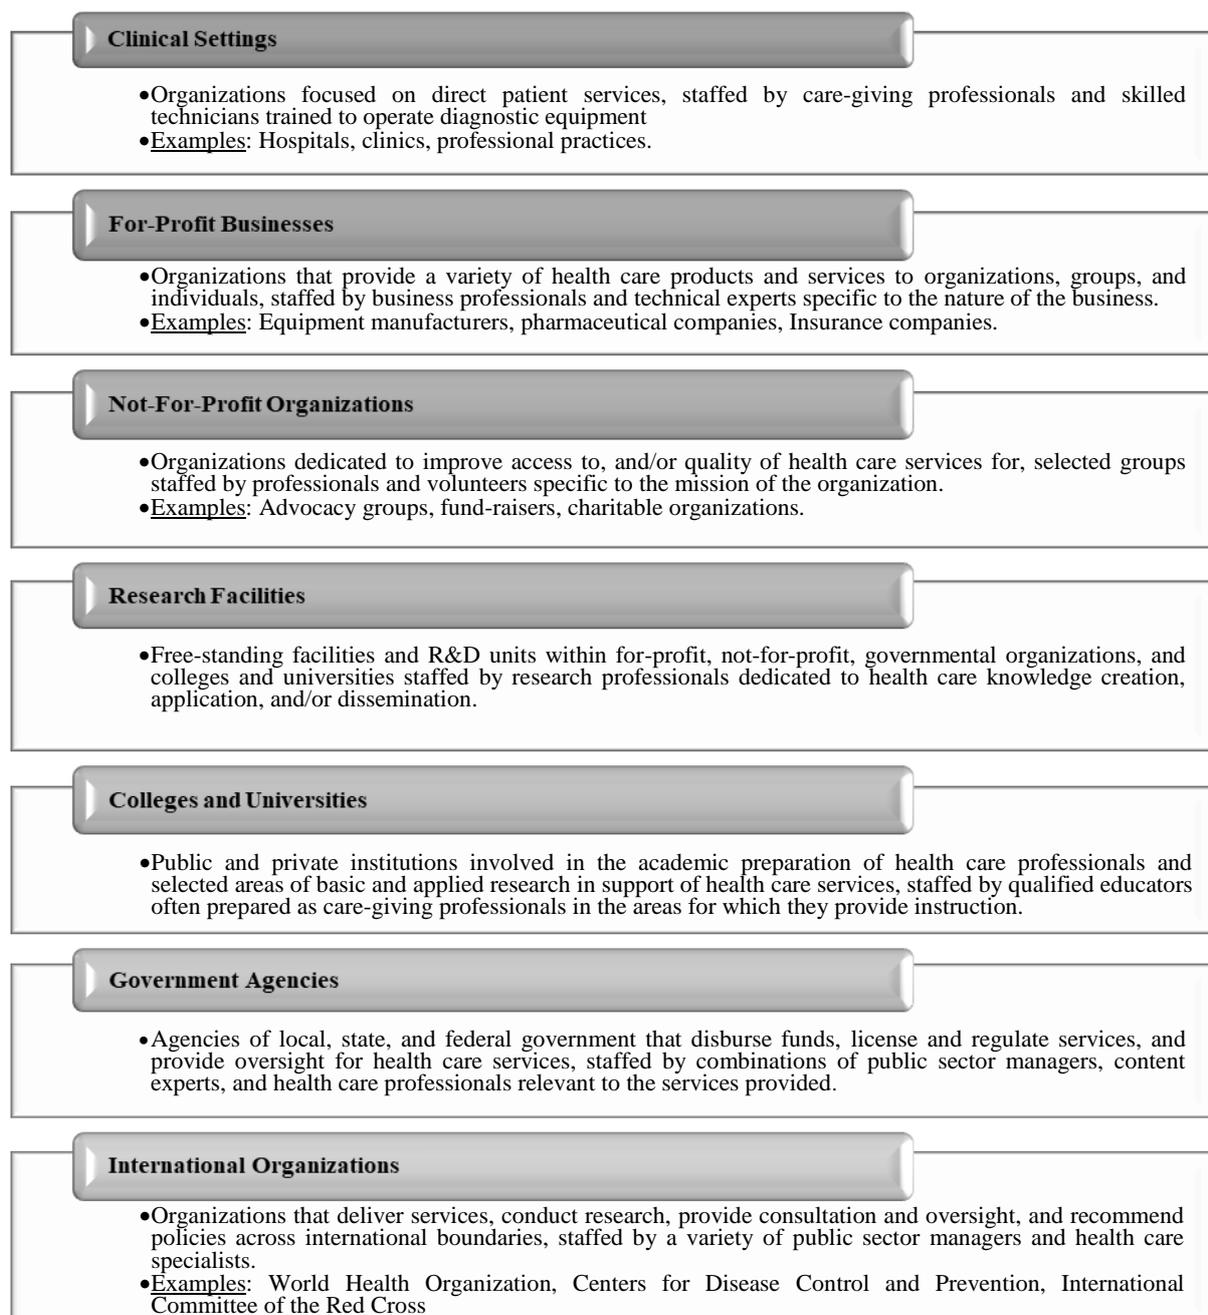

Figure 3: Major Interdependent Domains within the Healthcare System. Source: Smits *et al*, 2016; p. 302

*Building learning organizations*

While learning is a natural byproduct of experience, organizations that rely on knowledge and knowledge workers for successful performance, now pursue the development of what the scholarly literature refers to as the learning organization. Citing Daft and Marcic (1998), Rowden (2001) described such an organization as one “in which everyone is actively engaged in identifying and solving problems, enabling the organization to continuously experiment, change, and improve, thus increasing its capacity to grow, learn, and achieve its purpose” (p. 15). Raelin elaborated on action learning by saying the organization “builds on previous learning ... takes action, reflects and adjusts its course as it goes ” (p. 16). That said, we like Garvin et al.’s (2008) concise description of the learning organization as a place where members “excel at creating, acquiring, and transferring knowledge” (p. 110).

In a manner consistent with Rico et al.’s (2008) focus on teams capable of implicit coordination to cope with unexpected change, Edmondson (2008) stated: “Today’s central managerial challenge is to inspire and enable knowledge workers to solve, day in and day out, problems that cannot be anticipated” (p. 60). Describing learning as a “competitive imperative”, she characterizes today’s knowledge-driven work settings where leaders set direction and articulate the mission while the employees, working in teams, continuously improve work processes by discovering answers to problems via experimentation and knowledge exchanges in the form of feedback. In our terms, Edmondson is describing problem-solving and continuous quality improvement achieved by exchanging tacit knowledge.

Garvin et al. (2008) provided a useful, detailed description of the defining characteristics of the learning organization, including an on-line survey and normative data for organizations that want to assess their present status as a learning organization. The learning organization these scholars describe consists of three essential building blocks that in our judgment require policy, structural, staffing, and resource decisions by organizational leaders. The first building block is a “supportive learning environment” (p. 111) which includes the key ingredients for effective interpersonal relationships within the organization. The environmental components are consistent with the requirements for effective teamwork, whatever the nature of the tasks the teams perform. This first block includes “time for reflection” (p. 111), something individuals and teams in today’s high-stress healthcare settings may find difficult to incorporate unless it is built into the infrastructure described in the second building block. The second block consists of “concrete learning processes and practices” (p. 111). This block describes the infrastructure needed to experiment with new ways of conducting the organization’s ways of working, to collect and analyze the information necessary to objectively manage processes and practices, to improve functioning via education and training, and to share

information with key stakeholders. The infrastructure in this building block is essential to moving tacit knowledge into explicit knowledge for improved organizational functioning. The third building block is “leadership that reinforces learning” (p. 111). This block describes the key managerial activities required to work in challenging environments characterized by dynamic complexity. Managers must seek inputs from others, ask probing questions, listen attentively, encourage multiple points of view, and provide the resources that keep the organization problem-solving, innovating, moving forward strategically, and engaging in action learning as it does so (Garvin et al., 2008).

In summary, we recommend a system-wide development effort to make each healthcare domain a compilation of learning organizations. In all forms of behavior, context matters. For our purposes, new technologies and tacit knowledge are most likely to be utilized productively in healthcare settings that meet the characteristics of the learning organization.

## **DOMAIN-SPECIFIC REFINEMENTS**

We see striving to improve patient care as an ethical imperative that becomes more complex as new technology accelerates change. Flexible approaches to working have shown improvements in efficiency and knowledge sharing. With evidence that feedback from experience can be used for continuous improvements in practice (Brown & Duguid, 1991; Wilson, Goodman, & Cronin, 2007; Yamklin & Igel, 2012), no further explanation is required to support this dimension of importance.

The plethora of new technology impacting the delivery and effectiveness of healthcare described in the introduction to this paper suggests the need to continually review, upgrade, and disseminate professional standards of practice; a significant challenge for professional education programs, professional associations; funding sources; program administrators, and oversight and regulatory bodies. To keep up with advances in technology, sophisticated protocols need to be implemented to collect, analyze, and apply practical knowledge from clinical teams, knowledge that often begins as tacit knowledge.

Businesses mine tacit knowledge to develop the expertise that gives them competitive advantage on a sustained basis. For example, Andrews (2017) argues that competitive advantage in e-commerce companies is not likely to be located only in the company’s products, services, and technologies but also in the organization’s values, processes, and routines, and in how members of the organization engage in technologies. Tacit knowledge is often embedded in these areas. One need only observe the way e-commerce is curtailing commerce in healthcare to understand its current competitiveness. For example, Amazon has been exploring entrance into the prescription drug market, creating joint healthcare ventures to drive down cost of care through more direct purchasing and distribution

models (e.g. J.P. Morgan and Berkshire Hathaway), leveraging Alexa to assist with health and wellness at a consumer level, and selling medical supplies to U.S. hospitals. The processes, supply chain logistics, and underlying technologies that Amazon has deployed in other sectors is challenging the status quo and serving as a platform for disruption in the healthcare industry.

All, or most, health care units manage knowledge to some extent as they make improvements based upon experience. We are recommending formalization of the function by assigning knowledge management responsibilities to designated and empowered persons and structures; and by putting protocols in place to formally monitor feedback from experience to capture tacit knowledge whenever new technologies are introduced. Such formalization, complete with appropriate training for the unit's knowledge management leaders and staff, is consistent with Lawrence, et al.'s (2005) operational improvement of Crosson et al.'s (1999) 4I framework to help organizations learn. Lawrence and his associates (2005) argued convincingly that subtle improvements based upon experience do not become institutionalized practices unless the power and politics in play in the organization support such change. Health care managers can help make improvements happen by assigning and empowering a respected knowledge management leader to implement protocols to capture improvements as the unit learns from experience how to better use its new technology. There needs to be a convergence of technologies along with an active documentation and dissemination of tacit knowledge.

## CONCLUSION

Much research takes place in the healthcare system domains to produce the technological changes discussed in this paper. However, less scholarly effort is expended to study knowledge management and organizational change in many of the system's domains. We see such scholarly inquiry as both an opportunity for improving healthcare and for advancing our understanding of basic theory and research in disciplines concerned with organizational change per se and how knowledge management facilitates and accommodates successful change efforts. In summary, we would like to see more scholarly teamwork between organizational theorists and researchers and experts in the healthcare system.

## UNIVERSITIES AND KNOWLEDGE TRIANGLE MODE: THE EIT HEALTH EXPERIENCE

Capobianco, Nunzia

Department of Economics, Management, Institutions, University of Naples Federico II, Italy

### ABSTRACT

The awareness of Knowledge Triangle as one of the drivers of innovation has been increasing in the past decades. Cooperation between higher education, business and research is at the core of the Knowledge Triangle universities are key players in Europe's research and innovation landscape.

This paper aims to analyze the Knowledge Triangle and the ways in which its principles are applied in university practice. This work analyzes the European Institute of Innovation and Technology (EIT) - specifically on its "Knowledge and Innovation Community" (KIC) focused on the health sector named "EIT Health" - to improve our understanding of the different ways to implement a model in practice. The concept of the Knowledge Triangle is not just a theoretical idea has attracted already considerable interest, however, there is scant evidence on the different forms Knowledge Triangle may actually display. The present study starts to remedy this gap and contributes the management field by providing evidence about the EIT Health experience.

The research methodology applied in this study is case study approach. The phenomenon under investigation is the relationship between Knowledge Triangle and forms of collaboration.

The preliminary empirical results show that policies and strategies focusing upon practice application of the Knowledge Triangle play a key role, also highlights the opportunities that integration of the they dimensions is essential to delivering the added value in terms of fostering innovation.

### INTRODUCTION

The Knowledge Triangle (hereinafter KT), introduced by the Lisbon Agenda early in the 21st century, intertwines research institutions, education and innovation. It replaces the traditional one-way flow of information, from research to education and from educators to students, with systemic and continuous

interaction among the three corners of a triangle that encompasses research, education, and innovation (Council of the European Union, 2009). The KT integration has been in the core of the European Union's action line towards becoming the most competitive and dynamic knowledge-based economy. The KT can be defined as a set of actors and policy spheres that span the space for collaborative activities (Unger and Polt, 2017). There is not an agreed upon definition for the KT model, however all definitions academics, policy-makers and practitioners have offered so far are centered around the interaction among higher education, business and research - the three fundamental factors that contribute to the creation of the knowledge-based society and promote innovation (Markkula, 2011; Goossens and Sjoer, 2012; Gornitzka *et al.* 2007). Still, the KT concept outlines the importance of improving the impact of investments in the three activities by systemic and continuous interaction (Markkula, 2013). How these interactions unfold in the KT is dependent upon the structure of the national or regional innovation ecosystem (Lundvall, 1992; Edquist, 1997; Jackson, 2011).

The cooperation process is influenced by policy maker decisions, governance rules, internal and external resources, university links and networks. The KT dimensions may be institutionally incorporated in internal organization and mission. The cooperation may be supported by external structures and initiatives for knowledge dissemination such as joint programs that integrate research, development, training, and commercialization.

The elements in the KT model are intertwined and enjoy specific relations:

Research and Education: relations reflected in educational training programs, fundamental and applied research as the foundation for research-based teaching, process to improve skill-matching between graduates and companies, etc.

Education and Innovation: relations between actors is evaluated by considering the support for the development of an entrepreneurial culture in the education training programs and the formation of relevant expertise.

Research and Innovation: relations to support and intensify the transfer of knowledge process, public-private partnership models, research and development services contract from universities for the industrial sector, knowledge and technology transfer offices (TTO), university spin-offs and academic start-ups, etc.

The societal role of universities is essential in building a European Union where the impact of intellectual capital can be measured in terms of social and economic progress. The current model of the university, based on education and scientific research, is extended to include several challenges as well as shaping creativity and proactive attitudes open to entrepreneurship among students; cooperation with business, developing knowledge and technological and organizational solutions for the needs of the market; manage intellectual property created at universities; initiating partnership and network

relations with businesses. However, there are other concepts, partly overlapping and blurring, and partly complementary such as the “third mission” (OECD, 2015), the “entrepreneurial university” (Etzkowitz, 1983; Etzkowitz et al, 2008; Foss, Gibson, 2015) and the “triple helix” or even, the “quadruple helix” Etzkowitz, Leydesdorff, 2000; Leydesdorff, 2012; Ranga, Etzkowitz, 2013). Many European universities have recognized the importance of contributing to society through a model centered around science, research and extended education.

The awareness of KT as one of the drivers of innovation has been increasing in the past decades, as more and more universities have been successfully adopting this model. The different kinds of organizations forming the KT may follow a strategy of cooperation for joining some of the programs to benefit from participating in higher European innovation networks. Such a cooperation can be observed in the network and activities carried out by the EIT model.

The EIT model is inspired by open innovation principles (Chesbrough, 2006), and adopts an approach focused on the creation and management of collaborations between different subjects: public and private sector; for-profit and non-profit enterprises; institutions and society. The development of networks that include public-private partnerships or university-industry links is a key element within an open innovation system (Etzkowitz and Leydesdorff, 1997; Leydesdorff and Meyer, 2000; Larédo, 2003; Geuna and Muscio, 2009).

The EIT can be defined as a model aimed at establishing pan-European ecosystems of entrepreneurial innovation. It set up in 2008, is independent community body built to address the Europe's innovation gap and to become a key driver of EU sustainable growth and competitiveness through the stimulation of world-leading innovation. The EIT's concept of an integrated approach to the knowledge triangle is a way for EU scheme to promote innovation and entrepreneurship.

The analysis of literature shows that academics have paid due attention to the EIT foundation, when, in 2008, the first regulation was approved by the European Council and Parliament (Jones, 2008; Jofre *et al*, 2009; Gornitzka and Metz, 2014). Notwithstanding the intense debate which preceded that initial political agreement (Didier, 2010; Tindemans and Soete, 2007; Huisman and de Jong, 2014) there is no substantive research about the EIT. For instance, Rohrbeck and Pirelly (2010) built on a literature review and stakeholder analysis to propose a multi-level framework of key performance indicators for the EIT to steer its operations. Haegeman *et al*. (2012) discussed a foresight process to develop thematic priority areas for a new wave of Knowledge Innovation Communities (KICs). Heger and Boman (2015), in turn, explored the value of an KICs. This paper starts to address this gap by exploring how the European Institute of Innovation and Technology (EIT) integrates all parts and all actors of the KT in a unique way. Specifically, this study focuses on developing joint education and research program and projects within a knowledge triangle.

## AIM

The concept of the Knowledge Triangle has been applied in practice. However, there is scant evidence on the different forms Knowledge Triangle may actually display. Hence, the objective of this work is to fill the above literature gap and explore how this model works in practice.

This paper intends to achieve multiple aims:

First, it analyzes the KT and the ways in which its principles are applied in real-life.

Second, it investigates aspects such as what the KT means in university practice, so it will be examined strategies of EIT Health for implemented the KT model and the universities role.

The analysis of EIT Health improves our understanding of the different ways to implement KT in practice, by developing joint education and research program and projects.

## METHODOLOGY

The research methodology applied in this study is case study approach. The phenomenon under investigation is the relationship between KT and forms of collaboration. The research setting is the EIT Health network, which represents a suitable research context.

Case study is an umbrella term that encompasses different data gathering and analyzing techniques. For the purpose of the current study, primary and secondary data were collected. The access of research setting is characterized by the involvement and the participation into EIT Health activities. Such an involvement offers a unique opportunity to get acquainted with the setting under investigation. Participation observation allows to establish relationships of social interactions with different actors and to get knowledge from the inside of the phenomenon.

Specifically, the author acted as researcher-observer during the implementation of educational programs. This dual role enabled the collection of ethnographic field notes as well as semi-structured individual interviews (Cohen and Crabtree, 2008) with different stakeholders selected European universities where there are on-going EIT Health programs. Secondary data refer to government publications, annual reports, official website, newsletter, etc. Taken together, primary and secondary data enable the analysis of implementation patterns of the KT in the universities involved. By doing so, the study also disentangles the drivers and barriers in implementing a KT.

This study also provides a comparative case analysis of the relevant elements in the relationship between KT and forms of collaboration. The case also provides insights into drivers and barriers in implementing a KT model.

## RESEARCH FINDINGS

In this section we provide an overview of EIT Health. We then present preliminary research findings.

### *EIT Health: An overview*

The EIT was established in 2008 as a response to deep-seated concerns regarding the innovation performance of the EU. The model of the EIT in helping to achieve the objectives in H2020 is stated in its Strategic Innovation Agenda proposed by the Commission: “Through the KICs, the EIT helps to create environments where innovation is more likely to thrive and to generate breakthroughs in the way higher education, research and business collaborate. This approach helps addressing the increasingly complex societal challenges set out in Horizon 2020 in a holistic way, bringing together excellent people from different sectors, backgrounds and disciplines - who otherwise would not necessarily meet - to jointly find solutions to the challenge” (European Commission, 2011). Although the EU plays a leading global role in terms of top-level scientific output, it lags behind in the ability of converting this strength into wealth-generating innovations. It appears to not be less able to translate its research excellence into economic or social value, this phenomenon is widely referred to as “the European innovation paradox”. The EIT was designed to address some of the UE weakness: a fragmented innovation system, lack of integration of European higher education into the innovation chain and a low level of entrepreneurial activity, as depicted in Figure 1.

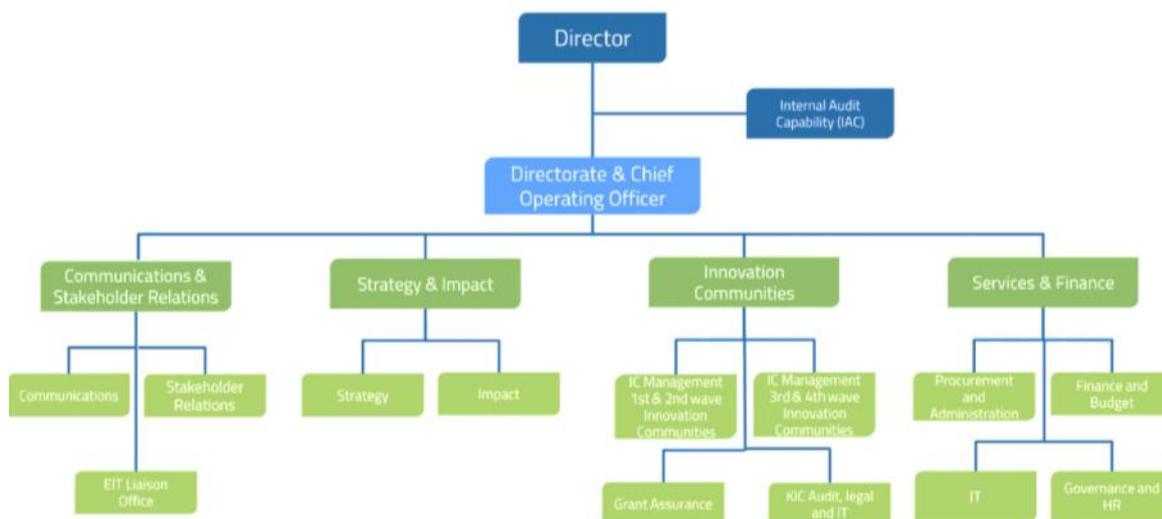

Figure 1. EIT Organization Chart.

Source: EIT (2020)

The EIT aims to bridge the gap between the research-focused universities and market-oriented companies. It is made up of various KICs who focus each on a different sector, or area, of innovation.

The idea behind the EIT KICs is that innovation flourishes best when the right people are brought together to share expertise. The KICs thematic are aligned with the Horizon 2020 societal challenges. At the time of data collection, there were eight KICs: Climate-KIC, Digital, Food, Health, InnoEnergy, Manufacturing, Raw Materials, and Urban Mobility. Each KIC encompasses innovation, entrepreneurship and education. The EIT Innovation Community's mission is to boost innovation and entrepreneurship through the integration of the KT, with two intertwined aims: Creating new jobs and spurring economic growth. KT integration is a coordinated process in which the EIT Community inspires, facilitates and empowers innovators with diverse skills and competences to creatively:

- deliver new products, services and business models;
- equip students with the skills to become entrepreneurs;
- create start-ups and accelerate the scaling up of ventures.

The actual implementation of the KT integration model (see figure 2) requires representatives of the full spectrum of partners to enter a process of strategic thinking, resulting in a set of clear goals and objectives, and pathways to achieve these. In the EIT model the KT concept is replaces the traditional one-way transfer of knowledge (i.e. from higher education institutions towards the industry) by a both ways flow between the corners of the KT, meaning that its sides are more important than its corners (Sjoer *et al.*,2015).

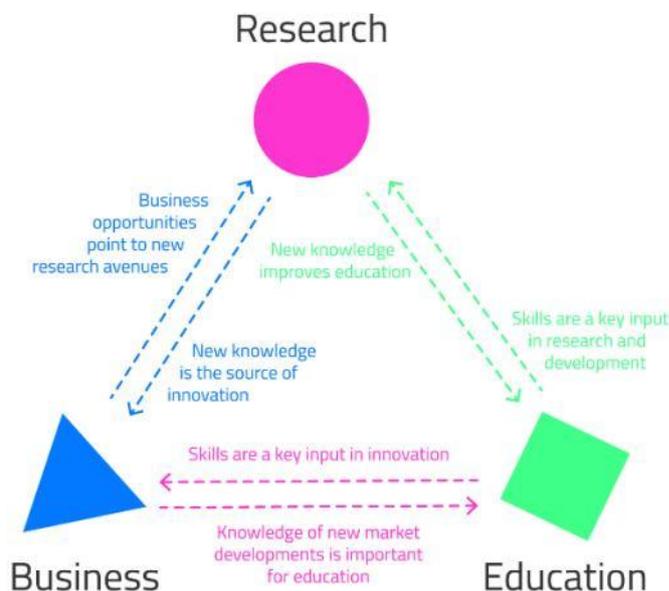

Figure 2. EIT Knowledge Triangle Model.

Source: EIT (2020)

The cooperation among, and the diversity of, partners is a core principle in designing the EIT model as no two companies, universities or research institutes are the same. The people within these companies, universities or research institutions are also unique (in terms of their skills, gender, culture, age, experience, etc.). EIT Health was established in 2015, as a KIC of the EIT. The goal of EIT Health is to contribute to increasing the competitiveness of European industry, improve the quality of life of Europe's citizens and the sustainability of healthcare systems. Partnership is an essential characteristic of an Innovation Community, and a requirement of the EIT's aim to bring together players from across the KT in a balanced and collaborative manner.

#### *Preliminary findings*

The network EIT brings together leading business, education and research organizations to form dynamic cross-border partnerships. The EIT sets the educational, entrepreneurial and innovation strategies for the KICs by outlining activities that contribute to the integration of the KT. These activities are established in an individual Framework Partnership Agreements and Specific Grant Agreements signed with the KICs. The former establishes long-term cooperation and sets out its terms and conditions as well as the general terms and conditions, rights and obligations applicable to the specific grants that may be awarded by the EIT for actions under the Framework Partnership Agreement, which is entered into for a period of seven years.

KICs are legal entities that integrate public and private research organizations, innovative industries, higher education institutions, investors and spin offs. Each KICs uses the central EIT funding as seed money to leverage existing investments and attract investors. Each one holistically builds innovation ecosystems through a portfolio of activities addressing the identified societal challenges and integrates Europe's leading players in education, research and business.

These system of funding have resulted into a new knowledge base of globally networked expertise, students, trainees and professional experts working within a KIC and educated through degree programs and courses on entrepreneurship that are awarded an EIT Health. Training programs have a multidisciplinary approach to engages learners also in the practical knowledge. The EIT Health community, including approximately 150 world-class partner organizations, works across borders to connect the three worlds of KT. Furthermore, the network created task forces for developing a project, preparing networking opportunities and organizing programs on health system in order to bring together students, researchers, educators and innovators, but also learners, business people and other societal stakeholders. The implementation of KT is assessed by studying the development of an entrepreneurial culture within the training programs.

The preliminary empirical results show that policies and strategies focusing upon practice application of the KT play a key role. Many policy instruments like EIT are vital for the actual implementation of

the KT within the universities. In the education programs the interdisciplinary approaches are mainstreamed, cooperation with research institutions and business are facilitated by EIT Health community. In the EIT model all the activities that are carried out involve all the dimensions of the KT, with universities playing an important role. The several activities promote involved partnership with research and business.

The EIT Health framework is used by universities as an external driver for institutional modernization. The policy experimentation space provided by EIT Health has acted as an internal transformation driver. The different activities promote is adapt to local cultural and regulatory contexts.

Results show that for the purposes a practical approach of KT are essential, for creating an innovation ecosystems: foster a shared vision, create a favorable atmosphere for idea generation, encourage a entrepreneurship, collaborative learning and knowledge co-creation, culture of change management and orchestration, motivating users as innovators, commitment on long-term change, accepting a radical innovation, piloting and rapid prototyping, and optimized full-use of digitalization as an all-permeating resource.

## **RESEARCH LIMITATIONS AND IMPLICATIONS**

This research has some inevitable limitations which could generate avenues for future research. The primary limitation of this study is related to the adoption of a qualitative methodology. The case study approach has been often criticized for its extreme subjectivity in interpreting collected data and evaluating the accuracy of the conclusions and lack of generalizability of the results. This study holds potential for future research avenues. A first research avenue is to investigate the transferability of this model to other geographical contexts. The experience refers to a European network within the European Union, which represents a unique institutional context. Whether it is suitable to different contexts is still to verify.

A second line of inquiry is related to the analysis of relationships among partners within KIK, and the mechanisms that help to build trust and avoid deception. To this end a processual and ethnographic analysis is the most suitable approach to understand how these relationships are created and evolve over time.

## **MANAGERIAL IMPLICATIONS**

The KT also offers managerial implications about how to foster an effective relationship among education, research and entrepreneurship. The integration of these three elements, no matter what starting point, is the key to delivering the added value in terms of fostering innovation. A cooperation is key in order to implement relevant governance models that support to develop innovation. The

impact of a good relationship reflects into an entrepreneurial culture, the formation of relevant skills and competences, the support of the transfer of knowledge process and public-private partnership models.

## CONCLUSION

Universities are key players in Europe's research and innovation landscape, partnership and networking are significant elements, which in turn require cooperation and constant dialogue to encourage innovation processes. It is essential to create a culture of networks and co-creation that crosses through the entire university in order to implement a Knowledge Triangle collaboration model. In a KT the cooperation brings with it an increase in the productivity of various entities, by including them in a specific network partnership.

The study offers insights into pros and cons of the EIT model and the opportunities that cooperation and network, through the KIC, can offer to the various actors involved in the innovation ecosystem. The study provides evidence for the approach of the KT is used in practice by entities set up under the EIT, in particular in Health communities.

## THE RECOVERY FUND: THE EU'S NEW QUASI FISCAL CAPACITY AND THE SOCIAL NETWORK PERCEPTION

Cardi, Mavie; Graziano, Elvira Anna

Department for Research, Link Campus University, LCU, Rome, Italy

### ABSTRACT

The objective of this paper is to provide a first overview of the financial and regulatory profiles of the *common debt instruments* contained in the *European Recovery Plan* and, at the same time, to offer an interpretation of the first results, in terms of media and social network reactions.

As a response to the strong economic impact of the pandemic, in May 2020, the European Commission has proposed a new European Emergency Temporary Recovery Instrument, "*Next Generation EU*".

The proposal is based on the extension of the *Budgetary Policy* foreseen in the Union's *Multiannual Financial Framework* (MFF) which, for the period 2021-2027, would be reinforced by resources from the *Recovery Fund* for a total amount of € 750 billion.

By integrating the potential of the European budget through the issuance of debt securities on the financial markets on behalf of the EU, the instrument will make it possible to support the measures deemed necessary and strategic for the recovery of the Member States.

The results of the empirical analysis show several implications with which this paper contributes to enrich the initial literature on the topic. The first is the significant gap that exists between the adoption of an institutional approach that for the first time gives the EU a "*quasi-fiscal capacity*" and the perception, given by the *Social Network Analysis*, far below the expectations that such an innovative institutional regulation would make consequential.

*Keywords: Recovery Fund; Next Generation EU; Pandemic; Emergency Temporary Recovery Instrument; Market Sentiment; Social Network analysis.*

### INTRODUCTION

The aim of this research is to provide a first overview of the financial and regulatory profiles of the *common debt instruments* contained in the *European Recovery Plan* and, at the same time, to offer an interpretation of the first results, in terms of media and social network reactions.

The new European Emergency Recovery Instrument, "*Next Generation EU*" - proposed by the Commission to the European Parliament and the European Council on May 27, 2020 and with some changes, approved by the EU Council in the Special Meeting (July, 2020) - is significant not only in

terms of its quantitative dimension (which will be discussed below), but also in terms of the prospects for the integration of European economic policies linked to the novelty of an approach based on common debt instruments. In fact, by integrating the potential of the European budget through the issuance of debt securities on the financial markets on behalf of the EU, the instrument will make it possible to support the measures deemed necessary and strategic for the recovery of the Member States.

The proposal is based on the extension of the *Budgetary Policy* foreseen in the Union's *Multiannual Financial Framework* (MFF) which, for the period 2021-2027, would be reinforced by resources from the *Recovery fund* for a total amount of € 750 billion.

This toolbox is part of the broader framework of European institutional measures developed in response to the economic impact of the symmetric shock caused by the health crisis; however, the different capacities of Member States to react to the shock have highlighted the need for a coordinated and redistributive approach in favour of countries in greatest difficulties. In this context the following are recalled:

- the *Pandemic Emergency Purchase Programme* (PEPP)<sup>1</sup> through which, as of March 2020, the European Central Bank has confirmed the re-interpretation of its mission in terms of stability and irreversibility of the euro;
- the introduction by the European Commission of margins of flexibility in the application of State aid rules through the modification of the *Temporary framework*<sup>2</sup>;
- the package of measures agreed by the European Council on April 23, 2020 for a total of € 540 billion, containing the establishment of a temporary support instrument that complements national measures to mitigate the risks of unemployment (“SURE”); the activation of a credit line under the *European Stability Mechanism* (ESM) dedicated to expenditure on pandemic crisis management and health systems strengthening (“*ESM Pandemic Crisis Support*”); the creation of a new “*Pan-European Guarantee Fund*” with a budget of € 25 billion to which Member States contribute, in the form of a guarantee, in proportion to their shares in the European Investment Bank (EIB).

The perspective that emerges from the study is that of a wide divergence between the innovative financial instruments developed in response to the economic impact produced by the health crisis, representing an extraordinary quasi fiscal capacity, and the very critical perception widespread at the level of social networks, as shown by the empirical analysis.

---

<sup>1</sup> Decision (EU) 2020/440 of the European Central Bank of 24 March 2020 on a temporary pandemic emergency purchase programme (ECB/2020/17).

<sup>2</sup> The Communication from the Commission of 8 May 2020 “Amendment to the Temporary Framework for State aid measures to support the economy in the current COVID-19 outbreak” (C(2020) 3156 final) sets out the criteria under which Member States may recapitalise or provide subordinated loans to non-financial firms in difficulty, safeguarding the level playing field in the European Union.

The phenomenon of this divergence - albeit outlined within the limits of this analysis - highlights the potential *social network deficit of consensus* profiles of European public policies with the consequent potential problems.

## NEXT GENERATION EU: EMERGING ISSUES

The emergency toolkit contained in the *Next Generation EU* programme provides for the use of the EU budget supplemented on a temporary basis by recovery resources collected from the financial markets. These resources will be allocated to the common strategic priorities already partly outlined in the *Multiannual Financial Framework* prior to the effects of the crisis. In particular, the focus on sustainable development and digital transformation objectives is confirmed, hence the provision of strategic investments in technology and network infrastructure, resilience of the health system and innovation.

On the financial side, the instrument - of an urgent and temporary nature - requires the modification of the own resources ceiling of the European budget so that the Commission can borrow up to €750 billion on behalf of the Union over the period 2021-2024. In line with budgetary discipline, the liabilities linked to the financing of the *Recovery Facility* should be offset by a temporary increase in the own resources ceilings for commitments and payments of 0.6 % of EU Gross National Income (GNI). The increase in expenditure, anchoring the funds to the own resources system, requires the approval of all Member States. Moreover, it is precisely the emergency context in which the instrument is designed that makes it necessary to use financing mechanisms that go beyond the increase in national debt.

The bonds resulting from this specific debt issuance will therefore be repaid through future EU budgets, although the Commission's proposal foresees the possibility of introducing, at a later stage, "additional new own resources" (here the grounds to label the "policy" as "quasi fiscal") to help finance the repayment and interest of the funds raised on the market. These taxes (among others, the *carbon tax*, the *plastic tax* and the *digital tax*) are foreseen directly from the common budget and, according to the proposal, would reduce Member States' national contributions to the *Multiannual financial framework 2021-2027*.

The strategic choice to include more own resources in this emergency context appears to be relevant in terms of the opportunities and prospects that can be achieved in terms of setting up Community investment and supporting Member States, leaving aside in part the issue of national contributions to the Community budget. Moreover, this innovative configuration of *Recovery's* financial instruments could pave the way for further issues of common debt securities, in the absence of mutual guarantees between Member States.

It should also be noted that since the repayment of securities is borne by the European budget, i.e. ultimately by the Member States, any balance of net benefits must also be assessed taking into account

the obligations to repay debts incurred through the European budget. The latter are proportionate to GNI and therefore the net benefits will depend on the margin of divergence between the funds allocated - based on the preference for the countries most affected by the health crisis - and the corresponding GNI shares. Therefore, the distinction between loans and transfers to Member States, discussed below, seems less relevant than perceived in the public debate.

The loan taken out on the financial markets by the European Commission - which, if the contents of the proposal were confirmed, would become the largest supranational issuer in Europe - has certain specific characteristics:

- the issue of the securities will take place on terms reflecting the high credit rating of the Union;
- maturity diversification in order to allow markets to absorb bonds at a lower average cost;
- redemption of the securities from 2027 and by 2058;
- presence of the pro-quota guarantee of the Member States.

Among the considerations that the profiles just recalled solicit, the first one is that they give rise to a scenario whose programmed duration, although temporally defined, **does not seem to be entirely referable to a mere emergency dimension**. The instrumentation is in fact characterized by structural profiles such as to assume, presumably, that the presence of the guarantee and the increase in own resources will represent new aspects of the European budget projected in the long term (up to thirty years).

## THE ALLOCATION OF RESOURCES COLLECTED ON FINANCIAL MARKETS

The resources raised on the financial markets would be allocated under the EU's *Multiannual Financial Framework*, in the form of grants, loans and budget guarantees, giving priority to the countries most affected by the crisis.

More precisely, the channelling of financial resources will take place in three main directions:

- support to Member States;
- support for private and strategic investment;
- support for the establishment of new research and innovation programmes, especially in health and crisis management.

With regard to the first point, the quantitative dimension of the share of funds allocated to support **public investment and reforms** in the Member States is significant. More than 70% of the resources will be dedicated to the main programme of the *Next Generation Eu*, i.e. the *Recovery and Resilience Facility*, with a budget of € 560 billion, of which € 310 billion will be allocated to finance the grant component, with no reimbursement obligation, and the remaining part of the funds mobilised through the Facility (€ 250 billion) to finance loans to Member States. At the strategic level, the *Recovery and Resilience Facility*

aims to support public investment to prevent the effects of the health crisis from undermining convergence between countries, leading to further negative economic, social and political externalities.

The *REACT-EU* programme, which will provide support to the Member States most affected by the pandemic in the form of grants for employment incentives and cross-cutting support to economic sectors most affected by the crisis, is also part of **cohesion policies**.

The *Solvency Support Instrument* and the *Strategic Investment Facility* are a temporary cover mechanism with a budgetary guarantee, aimed at mobilising private capital to support healthy companies affected by the crisis by providing partial guarantees against losses. The EU budget, with a financial envelope of €31 billion from the *Next Generation EU* framework, will provide a guarantee of around €75 billion to the EIB, which is entrusted with the operational implementation of the Facility in order to reduce the risk for private investors investing in eligible companies.

In a similar direction, as a complementary measure, the strengthening of the existing European programme (*InvestEU*) providing **support to businesses in the recovery phase**, with a strong focus on general economic priorities such as the European *Green Deal* and digitisation. Through the additional financial contribution of *Next Generation EU* of €15.3 billion for existing policy areas and €15 billion for the *Strategic Investment Facility*, the total *InvestEU* budget will be €30.3 billion. This will increase the capacity of the EIB and national promotion banks to take risks in support of economic recovery.

Finally, the investment objectives in health security and the EU Civil Protection Mechanism will be pursued through the resources allocated to the *EU4health* and *RescEU* programmes.

Overall, these *instruments* and *facilities* represent a significant opportunity for a common response, proportionate to the effects of the crisis, but whose financial resources come from a common debt contracted by the European Union, which would be the responsibility of all member countries.

From an operational point of view, therefore, the mechanism of access to resources will follow the procedures of the European budget: the Member States will have to agree on the purposes for which the funds will be allocated and present a financial plan highlighting the strategy for the use of the available resources. This opportunity implies at the same time acceptance of the European surveillance of the national economic policies of the beneficiary countries.

In the light of the brief analysis conducted here, it emerges that the European financial *Recovery fund* represents an important step in the process of economic and fiscal policy integration. It is interesting to note that, in exceptional circumstances, the spending capacity of the EU budget can be increased by using debt to intervene when and where necessary. The Recovery Mechanism thus provides a first strong European fiscal response to the Covid-19 crisis and provides the necessary conditions to boost investor confidence that the euro can be reliable during major shocks.

The analysis that follows offers an initial assessment of the possible orientation of investors on this issue, focusing on the results of the dissemination of news through *social networks* - in this case, Twitter - regarding the introduction of the *Recovery instruments*. It emerges that the impact on investor confidence is complex, presumably also due to the general economic vulnerability.

## ANALYSIS METHODOLOGY

### *The Social Network Analysis*

This paper aims, in the following context, to verify some aspects related to the dissemination of news through *social networks* - in this case *Twitter* - concerning the introduction of the *Recovery Fund*.

Based on a mechanism similar to *word of mouth*, Twitter allows the active participation of users, through the possibility to express and disseminate comments. For this reason, over time it has become an interesting field of study on how financial news is circulated. In this perspective, we want to investigate the link between the nature and influence of different sources of information, highlighting the actors that have a central role in the dissemination of news on the theme of the *Recovery Fund*<sup>1</sup>.

The methodology adopted makes it possible to distinguish the types of users who have published on topics identified on the basis of *hashtags* and to detect the set of relationships between different users and the propagation of a message within the social network.

The analysis of the nature of Twitter users allows to distinguish between mass media, blogs and individuals.

The centrality of one actor with respect to another has been measured by *betweenness*. Specifically, it was calculated by averaging the number of times that a node is in a "path" between two other nodes, thus providing a measure of how much an actor has control over the information flowing between the others.

The actor  $i$  *betweenness* is given by the sum of all the partial *betweennesses* calculated for each pair of  $g_{jk}$  vertices:

where  $g_{jk}$  represents the number of geodetic connections, i.e. shorter, between vertices  $j$  and  $k$ , while  $g_{jk}(n_i)$  is the number of times the  $i$ -th actor is involved.

The idea behind this measure is that the impact that a generic actor is able to make is linked to the number of times he is in the shortest path between two other actors. In other words, this measure is an

---

<sup>1</sup> The Social Network Analysis (SNA) methodology is used to study the relationship between nature and influence of information sources (Mitchell, 1969; Wasserman and Faust, 1994; Degenne and Forsé, 2007; Signori and Confente, 2014; Lazzeretti and Capone, 2016).

To analyze the semantic aspects of the tweets on the investigated topics in terms of positive or negative value of the content, the methodology of *Text Analysis* (Stone *et al.*, 1966) is used.

expression of a user's ability to be an informative relational bridge.

The significance of the differences in the categories was then tested through the ANOVA statistical test.

### *The Text Analysis*

The second part of the analysis concerns the evaluation of the semantic aspects of the *tweets* produced and selected according to both *hashtags* according to the *Text Analysis* methodology.

This methodology (Stone *et al.*, 1966) is used through the use of Oxford University's Wordsmith 4 software (Scott, 1999), adopted with the aim of measuring the value of the content (positive or negative) and expository tone (strong or weak) used in the release of users' messages on Twitter.

From an operational point of view, Wordsmith 4 software counts the number of words of each news item that falls into the categories "positive/negative" and "strong/weak" of the vocabularies used.

This study used Loughran and McDonald's (2011) vocabulary, which considers terms that generally have only financial implications. In detail, the category of negative words counts 2,337 records, while the category of positive words includes 353. Similarly, 27 are the words included in the category that identifies a weak expository tone, while the category of words that identify a strong expository tone is composed of 19 records<sup>1</sup>.

## THE SAMPLE

As said, the data are represented by all the tweets (in Italian and English) converging towards the hashtag #recoveryfund, from May 27, 2020 until June 15, 2020.

The period has been selected taking as its starting point the date when the European Commission defined the details of the *Recovery Fund*, structuring the *Next Generation EU* programme.

According to the hashtag #recoveryfund there are 2970 registered users who have produced 4948 tweets and 4275 retweets.

---

<sup>1</sup> In order to establish the value of a content, the most adopted formulation for studies in this field (Barber and Odean, 2008; Carretta *et al.*, 2011) is the following:

$$(P - N)/W$$

where P and N are respectively the number of positive and negative words contained in the analysed text, according to the classification given by the adopted vocabulary; W represents the total number of words contained in the analysed document. The value obtained in this way is between -1 (completely negative tweet) and 1 (completely positive tweet).

To establish the tone adopted in the release of the news in a manner similar to the content, the wording adopted is as follows:

$$(F - D)/W$$

where F and D are respectively the number of strong and weak words contained in the text, according to the classification given by the vocabulary used; W represents the total number of words contained in the document examined. Again, the value obtained in this way is between -1 (completely weak news) and 1 (completely strong news).

The high coverage of the *Recovery Fund* confirms some of the requirements of the news of Galtung and Ruge (1965): the Covid-19 health emergency and its economic and financial implications affect the entire national and global population, which shows a "hunger for news" linked to both the current situation and future developments, making the *Recovery Fund* subject suitable to become news.

A central role in tweet distribution networks is played by general users, including journalists through personal accounts and political figures, followed by traditional media through official social network profiles and blogs.

Considering retweets is important because it is precisely on the basis of these that it is possible to define the networks of interactions between all users.

Tweets and retweets published on the Social Network reach a peak on May 27, 2020 when the measure is announced by the European Commission (Figure 1).

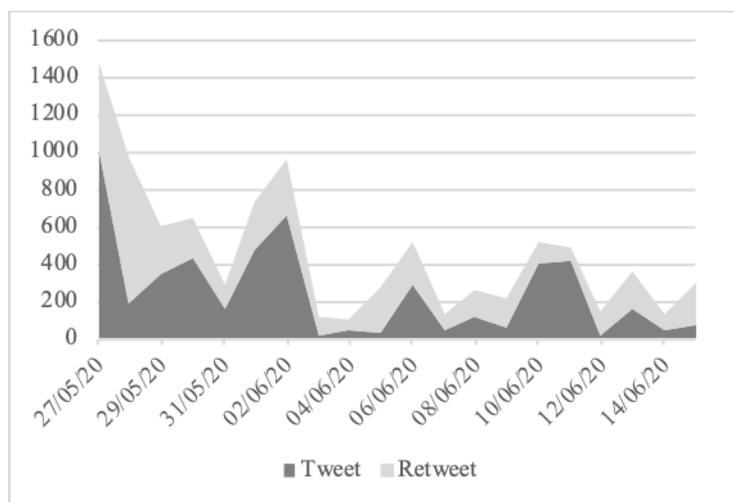

Figure 1. Tweet and retweet distribution with hashtag #recoveryfund published from 27 May 2020 to 15 June 2020. Source: authors' elaboration

In the following days the attention on the Social Network remains always high on the theme of the *Recovery fund*, even if with an appreciable difference in terms of number of tweets produced.

In all cases the retweets are even more numerous than the tweets published on the same day.

This behavior and the link of the theme with the Covid-19 pandemic make the tweets published with the hashtag #recoveryfund reflect most of the fundamentals of the "newsworthiness" of the events according to Galtung and Ruge. The health emergency of the Coronavirus and the resulting economic and financial repercussions affect the entire national and global population, which shows a "hunger for news" both for the current situation and for future developments.

In fact, if we look at the hashtag *clouds* (figure 2) that most frequently recur in tweets and retweets containing the hashtag #recoveryfund, we see that the most recurrent ones concern:

- The Covid-19 hashtag or coronavirus;
- political parties;
- names of public figures, Italian or foreign politicians and journalists;
- TV or newspaper headlines;
- hashtag as #nextgenerationeu or #ESM;
- #European Commission, #European Union, or names of member states or former members of the European Union;
- #taskforce.

Figure 2. Network of recurring hashtags in tweets on #recoveryfund.

Source: authors' processing of Twitter data.

## THE RESULTS OF THE ANALYSIS

### *The results of Social Network Analysis*

Based on the analysis carried out, Figure 3 shows the interaction network between users trained on the retweets produced on tweets containing the hashtag #recoveryfund examined.

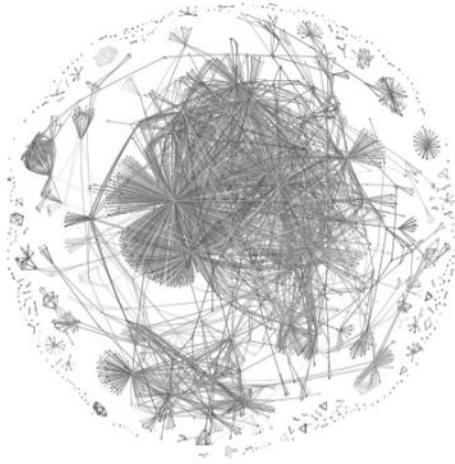

Figure 3. *Tag cloud generated by retweets containing the hashtag #recoveryfund. Source: authors' processing of Twitter data*

The observation of the cloud generated by the selection of retweets based on the hashtag used for the research confirms first of all that *Recovery Fund* is a hot topic for the debate on social networks. The concentration of the *tag cloud* in fact reveals a strong interaction between users that shows how the debate is on and extremely topical.

In order to identify the actors responsible for the dissemination of information and news on Twitter, the *betweenness* analysis (Table 1) was carried out, whose statistical significance of the differences between the groups was tested using the ANOVA test (Table 2).

The analysis of *betweenness* reveals that the actors taking a central position in the network are generic users, with politicians and journalists who tweet about the topic with their personal accounts, followed by traditional generalist information sites and specialized information sites, followed by financial blogs.

|                 | #recoveryfund |                      |        |
|-----------------|---------------|----------------------|--------|
|                 | N             | Betweenness<br>Media | Dev St |
| Mass - Media    | 213           | 0.5527               | 0.4661 |
| Financial Blogs | 393           | 0.2021               | 0.2820 |
| Generic Users   | 2364          | 0.6673               | 0.4830 |

Table 1. *Betweenness analysis on retweets containing the hashtag #recoveryfund*

|               | #recoveryfund  |    |             |        |      |
|---------------|----------------|----|-------------|--------|------|
|               | Sum of Squares | df | Mean Square | F      | Sign |
| Between Group | 535.61         | 2  | 273.784     | 13.630 | .000 |
| Within Group  | 1019.63        | 51 | 20.0141     |        |      |
| Total         | 1555.24        | 53 |             |        |      |

Table 2. *ANOVA test - Significance values in relation to retweets containing the hashtag #recoveryfund*

### Results of the Text Analysis

The semantic interpretation of tweets shows how *Recovery Fund* is mentioned on the Twitter platform. If we consider the tweets by type of users responsible for their publication (Table 3), we can see how the mass-media express themselves on the *Fund* with a substantial neutrality: the values of the content worthiness and of the display tone used are respectively 0.03 and 0.06, outlining a style of messages that seems to be popular. Financial blogs show a very weak positivity both in terms of published content (0.19) and in terms of display strength used (0.15). Individual users, on the other hand, appear to be the most critical, expressing themselves on Twitter very vehemently (0.93 is the value of the display tone) and also critical of *Recovery's* instrumentation (-0.97 is the value of the content).

| #recoveryfund   |                    |              |
|-----------------|--------------------|--------------|
| Type of Users   | Valence of Content | Display Tone |
| Mass – Media    | 0.03               | 0.06         |
| Financial Blogs | 0.19               | 0.15         |
| Generic Users   | -0.97              | 0.93         |
| Total           | -0.89              | 0.81         |

Table 3. *Tweet sentiment containing the hashtag #recoveryfund by user type. Source: authors' processing of Twitter data.*

## IMPLICATIONS

As we have seen, the process launched for the approval of the *Recovery Fund* is an issue to which the media, with particular regard to social networks such as Twitter, have reserved considerable space by virtue of the impact, not only strictly economic-financial, but also political and social, which may result. The issue obviously presents aspects of complexity that concern, in particular, the financial convenience profiles of each country and its novelty with respect to the European sovereign bond market, as a result of the launch of a *common debt issuance* policy.

In fact, in fiscal and financial terms, the issuance of bonds with different maturities between 2027 and 2058 - where confirmed - will define a real yield curve for the euro area.

However, it must be considered that, in order to effectively change the perception of the euro by **institutional investors** of a *genuine euro area yield curve* - through the *Recovery Fund* - (Panetta, 2020), the necessary prerequisite is that of **predictability**: in other words, to transmit to the market the assumption that this type of action is always predictable at times of great economic and social importance.

On the other hand, the empirical analysis of *sentiment* conducted above looking at **generic users** and **financial blogs** sometimes shows negative content and even harsh tones for the tweets of the former and a very slight positivity on the part of the latter, while a substantial neutrality of both the value of the content and the emphasis is assumed by the media.

The media seem to maintain an attitude of disseminating information in relation to the *Recovery Fund* mechanism, limiting themselves to playing the role of information brokers.

The results of the empirical analysis - albeit within the inevitable limits given here - show several implications with which this paper contributes to enrich the initial literature on the topic. The first is the significant gap that exists between the adoption of an institutional approach that for the first time gives the EU a "*quasi-fiscal capacity*" and the perception, given by the *Social Network Analysis*, far below the expectations that such an innovative institutional regulation would make consequential.

Consequently, from the point of view of *Social Network Analysis*, it is essential to understand by whom and in what way the news about the *Recovery Fund* is published on *social networks*, as the central actors in the process of spreading and propagating the news have an impact on the knowledge of other users about the mechanism itself: bad information by the central actors of social networks generates negative externalities and information asymmetries with negative repercussions on financial markets.

## FUTURE RESEARCH PERSPECTIVES

The future prospects of this study will concern the monitoring of the Network, linked to the issue of the *Recovery Fund*, over a longer time horizon and the investigation into the existence of a relationship among the financial instruments adopted, the circulation of news and the degree of attention/awareness of individuals.

The perspective to which the further development of this line of research, which combines the regulatory-financial approach with that of behavioural finance, may tend to lead is that of outlining a path that analyzes the causes and information distortions that give rise to the gap resulting from the empirical analysis. Moreover, prospectively the extension of the analysis could devise paths of reconciliation between the regulatory logic and the sentiment resulting from Social Networks.

# THE IMPACT OF THE CORONAVIRUS ON THE TOURISM INDUSTRY IN THE EPICENTERS – BRIEF CHRONOLOGY

Chemli, Samiha<sup>1</sup>; Toanoglou, Michail<sup>2</sup>

<sup>1</sup>Deusto University, PDI Doctor Encargado, Bilbao, Spain

<sup>2</sup>SIHOM. Sol International School, Woosong University, Head of Department, Daejeon, South Korea

## ABSTRACT

The world is facing the new epidemic of the Coronavirus. The latter has had a profound impact on the tourism industry around the globe, with more than 80.000 infections and 3000 deaths by the time of the investigation. The spread of the virus has started from a unique country in the Asian continent “China” to 59 countries in the different continents in less than a month, and the negative expansion is continuing.

This paper presents a brief of the coronavirus chronology during the prodromal and the crisis phases, along with the impacts on the world tourism industry with a stress on the epicenters, declared by the time of study, namely “China”, “South Korea”, and “Italy”.

Several scenarios of cancellations are presented, from both, the side of tourists as well as the one of the suppliers of the tourism industry. The main reasons behind are the lack of knowledge in terms of potential development of the crisis, lack of visions, the unawareness and the ignorance in managing such situations, as well as the noted responses of Governments to specific circumstances while infections appear in tourism premises.

This paper gives a projection of the future directions to be considered, related to the impacts of the Covid-19, as well as the crisis management evaluation compared to previously experience similar epidemics.

*Keywords: Covid-19, crisis management, crisis denial, tourism flows, cancelations*

## 1. INTRODUCTION

The Covid-19 crisis began in December 2019, in the province of Hubei in China, and led to the containment of affected cities. This negative event was mainly based on the growing numbers of infected patients in China, leading to a pandemic spread (WHO 2019) (Figure 3). More than fourth of the world’s countries have been infected in a very short period of time. The situation has reached the mentioned level, principally because of the denial response strategy (Coombs, 2007) adopted by the first epicenter.

This paper is a first step of more profound work, it presents a brief chronology of the situation, the responses, and the consequences of the Covid-19, on the tourism and the hospitality industry. The main sources of data collected are observation and ethnography, in a day to day basis during the primary month of the spread of the epidemic disease from the 28<sup>th</sup> of January 2020 to the 29<sup>th</sup> of February of the same year.

The paper discusses the impact of the 2019 Coronavirus in terms of international tourists' flows and repatriation, potential job losses, sudden quarantines applied to hospitality premises, and cancellation of delivery of tourism services and products. Another issue to be discussed is the responses of the countries considered as the main epicentres of the epidemic crisis, during both the prodromal and the emergency phases.

In addition, this actual paper aims principally to study the scales of the crisis in China, South Korea and in the world as well as the link of the latter to the impacts and responses. In the final part, there will be a presentation of the potential future evolution of the work, as it is planned by the authors, during the emergency and the post crisis phases.

## **2. CRISIS RESPONSES BASED ON THE PREVIOUS EXPERIENCES**

Many previous studies are trying to approach the different ways by means of which crises can be managed. In some cases, formal frameworks are proposed with specific functional structures and with constructed information flows (Bénaben, 2016). A few of the proposed crisis management frameworks are quite general (Faulkner, 2001) and other are focused towards knowledge management systems (Jia, Shi, Jia, & Li, 2012).

More specifically, for health-related crises there are numerous researchers contributing the last few decades. Epidemic diseases like Ebola (Novelli, Burgess, Jones, & Ritchie, 2018), Avian Flu (Kuo, Chen, Tseng, Ju, & Huang, 2008), SARS (Kuo, Chen, Tseng, Ju, & Huang, 2008), Swine Flu and MERS were quite critical for humanity in various ways. Several data sets from these periods were analyzed in a way to create meaningful outcomes.

Specific case studies from affected destinations were examined and studied providing interesting conclusions. Destinations like Hong Kong (Chien & Law, 2003), Singapore (Henderson & Ng, 2004) and Korea (Kim, Chun, & Lee, 2005) during SARS, but also Brunei during Swine Flu (Haque, 2017) were studied and important evidences have resulted to specific conclusions about the impacts on tourism and the overall economy.

Additionally, academicians looking towards connections between such research studies and strategic decision making, have presented important integrative frameworks (Bundy, Pfarrer, Short, and Coombs, 2017).

Such management frameworks, especially for the hospitality and tourism industry, were proposed directly from expert responses during opinion mining (Paraskevas, Altinay, McLean, & Cooper, 2013). Finally, broader thematic approaches, including previous research and identified gaps, examine the various research methodologies and suggest future research approaches to have significant progress in this field (Ritchie & Jiang, 2019).

Health crisis is not the only form of crisis threatening global tourism. Examples of other forms of crises like major terrorism attacks as the case of 9/11 have been studied in a similar way to contribute to the crisis management theories (Evans & Elphick, 2005). Although impacts are in many cases similar, the latter crises have different impacts on tourists' behavior and flows in the world.

### 3. METHODOLOGY

The data is gathered through the main accurate sources of information used worldwide by the time of the crisis, and from the beginning of the emergency stage, more precisely, the main news media as well as local and international official data sources, specifically created for the Covid-19, as follow:

- Tv channels France 24, Euronews and BBC news: to collect the data about the different decisions, and the crisis management's resolutions of the infected countries;

- Coronavirus maps: are updated at least twice per day during all the period of the study.

- o South Korea – <http://coronamap.site>; and

- o Worldwide

- o <https://gisanddata.maps.arcgis.com/apps/opsdashboard/index.html#/bda7594740fd40299423467b48e9ecf6>.

- Ethnographic observations: simplified by the geographical locations of both authors by the time of the study - one of the authors is in South Korea by, and the second in Europe;

- Facts have been constantly collected from connections in the epicentres, mainly China, as well as in the hospitality premises affected by the crisis, such as the Diamond Princess.

Besides, this paper is resumed to a brief chronology of facts and figures, negative impacts on the tourism and hospitality industry, as well as countries' main strategies adopted by the prodromal and the emergency phases. In fact, it represents a first stage of a wider ongoing research, going through the coming periods in a similar fashion, but in more developed ways of analysis.

**The selection of the destinations, as stated at an earlier part, is based on the following criteria:**

- Declared epicentres: The first infected country (China, accounting nearly 80.000 infected patients by the 01-March 2020), the second and the third most infected countries in Asia and Europe (South Korea – with 4220 cases and Italy – with more than 1700 cases);

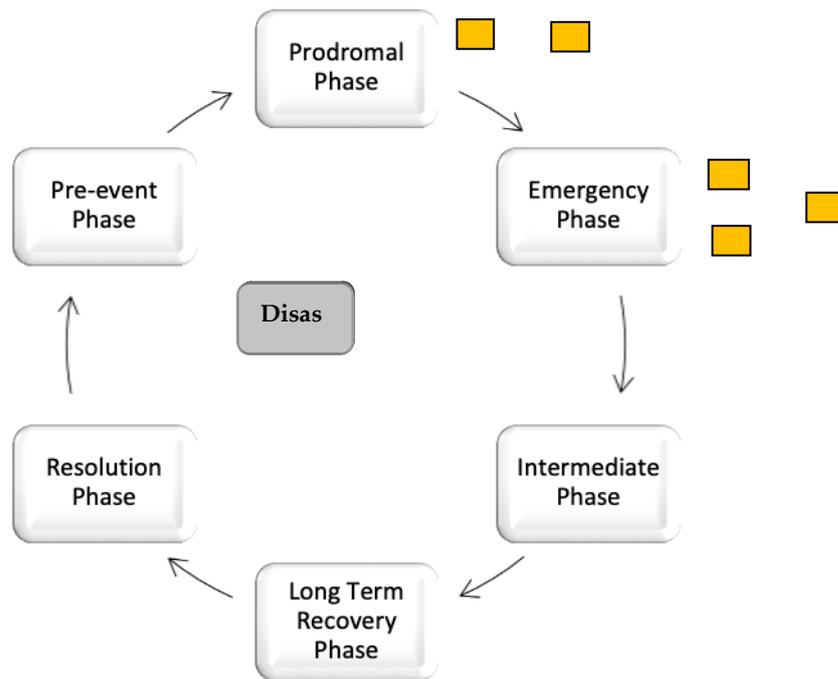

- The very rapid growth rate of the illness – what have been considered as exponential;

- The nature and the phase of the crisis: very short prodromal phase and unpredictable emergency or disaster phase (Faulkner, 2011);

#### 4. THE COVID-2019 AND THE TOURISM INDUSTRY

Faulkner’s (2001) model is used to point at scenarios and place accordingly to their phases and their duration over time.

Figure 2. Disaster Management Framework – Scenarios of Covid-19

Source: Faulkner (2001)

Table 1. Covid-19 and territories of epicenters’ responses

| Countries   | Period  |    | Scenarios’ explanation – Strategies and responses  |
|-------------|---|----|--|
| China       | From the end of December 2019 to the mid-January 2020 | S1 | - Prodromal phase in China aligned with the denial strategy applied to the crisis;<br>- Lack of transparency during this period: led to a bigger spread of the virus;<br>- No impact on the tourism industry at this stage;  |
|             | 28- Jan 2020 to 01 – March 2020                       | S2 | - Complete transparency and containment of the cities infected;<br>- Many restrictions have been applied blocking the flows of tourists from and to china, with inbound severely impacted;<br>- Flights cancellations have exceeded 200.000;   |
| South Korea | 28-Jan to 19-Feb                                      | S3 | - In the prodromal phase South Korea applied containment, due to the lessons learned from the spread in China;<br>- Closure was targeting China mainly but no other countries;<br>- No restrictions on gatherings, events and travelling until the 12th of February, which as stamped by the highest number of Infections in China, and the start of the raise in South Korea; |
|             | 20-Feb to 01-March 2020                               | S2 | - Critical situation with many restrictions to South Korea from different countries;   |

Source: Authors (2020)

The biggest problem resides on the fact that during the prodromal phase and the beginning of the emergency phase, the selected countries initiated their crisis management with a denial strategy. The latter has led to a more spread of the epidemic. The strategic responses of containment, quarantines and restrictions to and from certain territories, were in most cases, decided and announced after the epidemic was spread. Most of the secondary infected countries are, by the time of the study, following the same steps as the first epicenters.

Although differences in terms of starting dates, there are several similarities in the speed of the virus spreading in China and in South Korea. During the two first weeks of the emergency phase in China the growth rate (GR)<sup>1</sup> accounted for 20.41% on average daily and the peak of the growth was registered on the 12<sup>th</sup> of February 2020, with more than 15150 new infections, equivalent to 34.97% of DG. However,<sup>1</sup> although numbers are growing, the growth rate slow down and starting from the 13<sup>th</sup> of February 2020, the average DG did not exceed 4.15% and even dropped to less than 1%, in the last few days of the month of February 2020.

In South Korea, the growth rate in the emergency phase has been quite high with peaks, in daily basis between 32 and 112 %. The highest level of the growth was registered in the 21<sup>st</sup> of February 2020.

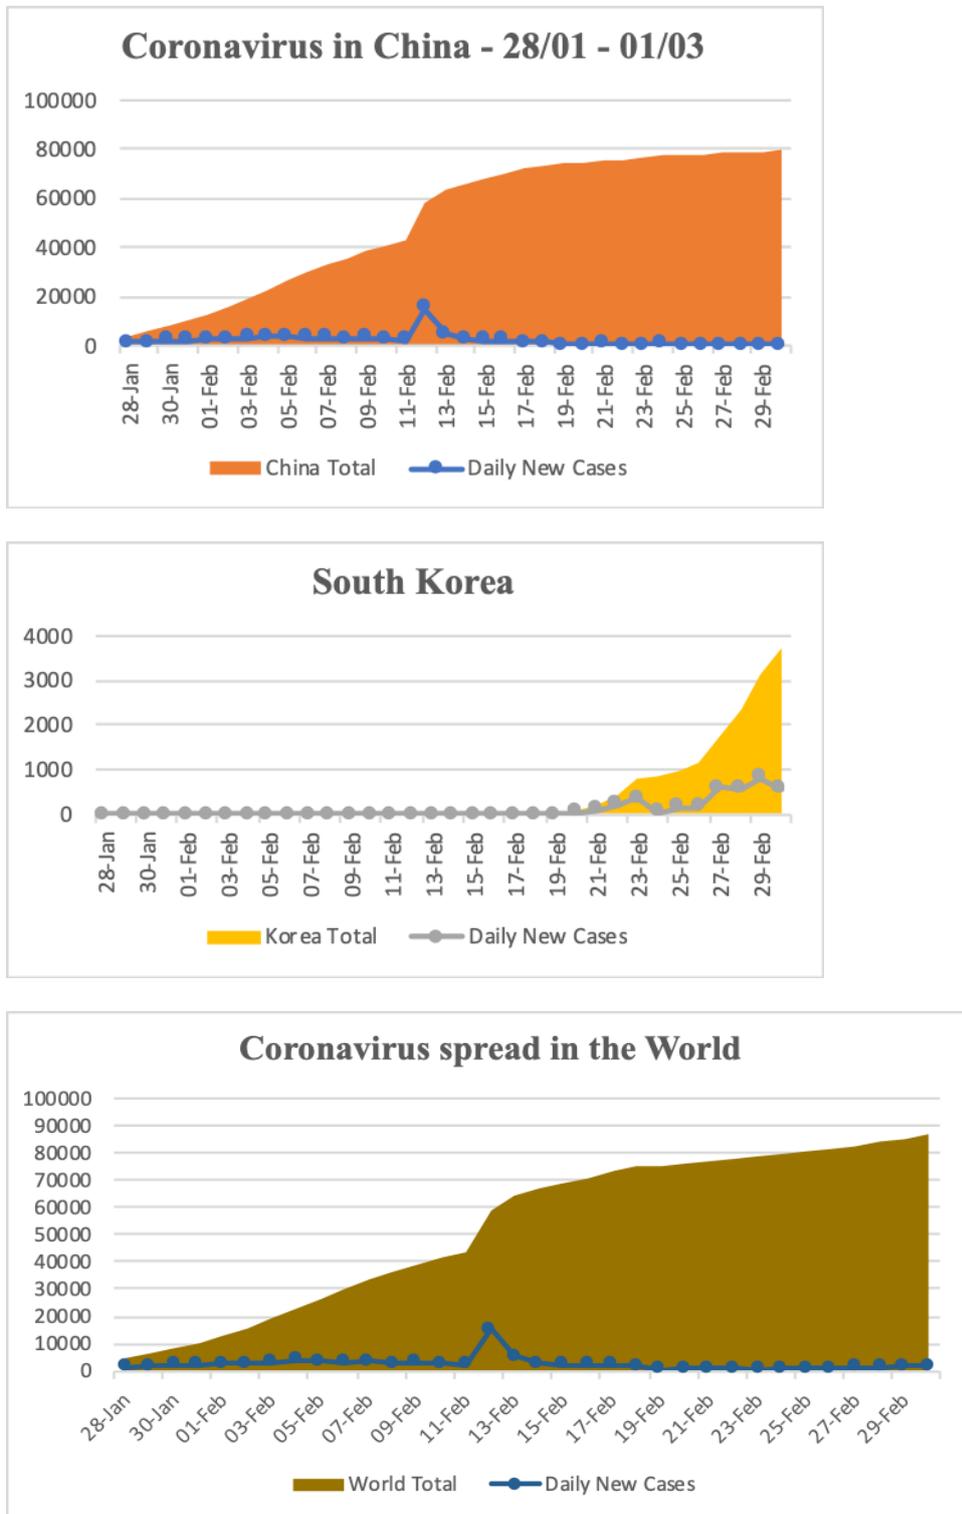

Meanwhile, aligned with the previously mentioned figures, response to crisis are registered, especially at the peak periods. The latter have impacts on countries, locals, and more severely on the tourism industry. Usually, locals, have no other choices than undergo the crisis, tourists would consider safety first. Thus, several direct impacts have reached airlines, then cruise lines, and hotels. The tourism loop is easily interrupted, as this is justified by several previous research studies (Chien & Law, 2003; Kuo et al, 2008; Paraskevas et al, 2013; Novelli et al, 2018)

### **The current facts and the unknown elements of the crisis**

<sup>1</sup> (GR) Growth Rate: The equation takes into account the time of intervals in our data.  
 $GR = (\text{present/past})^{1/n-1}$ . N=number of time periods.

As we are going through the Covid-19 outbreak, and while the number of incidents, infected individuals and related deaths, are growing (JHWSE, 2020) we experience various reactions and impacts on a national, regional and global scale. The development of the cases shows significant growth and curb variations between different countries and regions (Figure.2).

Figure 2 Coronavirus – China, South Korea and the World

Source: Authors (2020)

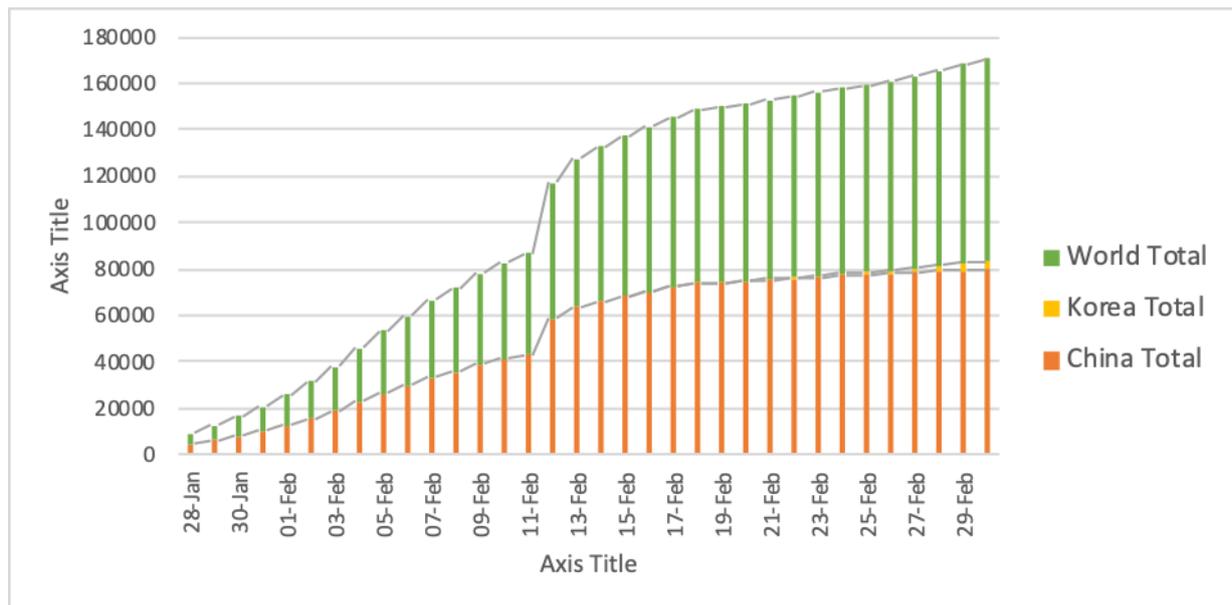

Development and volume of cases in Korea (Korea CDC, 2020) has a significant time delay with China (JHWSE, 2020) but we identify similarities on the curve (refer to figure 3).

As Covid-19 started to spread globally from China to the rest of the world, in APAC region, North America and Europe, the human suffering is not only related with health. In fact, the virus may be as contagious economically as it is medically. The global media are continuously reporting the situation on national or regional level. Such information channels include reliable networks from Europe (BBC News, Euronews, and France24, 2020) and specialized international organizations (WHO, 2020). As the medical data changes hourly the list of the ten largest economies is almost identical, with the ten nations hit hardest by COVID-19 (Baldwin & Weder, 2020).

China is by far the hardest hit, but we lately see exponential growth of cases in the G7 economies. Discussing just for US, China, Japan, Germany, UK, France and Italy, they account for 60% of world supply and demand, 65% of world manufacturing and 41% of world manufacturing exports (OECD, 2020). Supply chain contagion may also occur as countries like China, Korea, Japan and US are considered of fundamental importance of global value chains.

As travel restrictions are raised in order to minimize the outbreak effects, and also to support containment, tourism industry is potentially in a direction of a serious hit. Major events are canceled globally, and the overall population uncertainty result to a dramatic drop of travel demand and hotel occupancies. Estimations under current situation result to a scenario of a \$28bn loss of passenger revenues in Asia-Pacific airlines (IATA Economics, 2020). In addition, hotel occupancies are dropping from 50-90% depending on the country and on the number of registered infections. Recent reports in major tourism markets like US, Europe and China are showing occupancies around 10-20% in all major branded properties (STR, 2020). Besides, the cruise industry faces also tough time as extensive infection incidents among passengers occurred and this results to tremendous drop of demand for cruise trips (CLIA, 2020).

Figure 3. Coronavirus – comparison of the epicenters

Source: Authors (2020)

More facts of the impact of the disease by the 29<sup>th</sup> of February 2020:

- More than 200.000 flights cancelled worldwide;
- France as a Number 1 country in terms of number of arrivals, has 30 to 40% of drop so far, mainly of Chinese, who are considered as high spenders;
- Loss of more than \$90M in the tourism industry with a forecast of a potential coming loss of \$560M;
- Tourists fear travelling and flying - this is worsened by the sudden spread, following the denial of crisis, and the different scenarios of confining tourists inside premises, such as the Diamond Princess cruise ship, quarantined in Japan for more than 2 weeks, as well as the hotel in Tenerife. Easy management decisions, however, impacting negatively on tourists' perceived risk and their willingness to travel.
- Chinese tourists, South Korean tourists and very soon, Italian tourists are and are going to be the unwelcomed;

## 5. CONCLUSION AND THE COMING RESEARCH PROJECT

This paper has been created as a brief chronology of the Covid-19, only for a month, in order to see the span of the crisis and mainly, the effect of the latter on the industry of tourism. Every single day of a crisis has a tremendous negative result on the sector, the medium and small companies, the big ones, the economy and therefore on destinations. Countries have responded differently implementing almost the same strategy of denial, followed by containment. However, the timing given to each of the

previously stated responses made the difference in terms of impacts on tourists perceived risk and the perception of destinations as trouble spots.

The different scenarios presented at earlier stages of this work, aligned with the multiple facts worldwide, make of the Covid-19 a very important focus in the coming months.

The tourism industry is suffering, and the approaching possible directions are very tempting to be reviewed and studied. Therefore, as future step ahead, would be the study of the optimal strategies to implement in order to counter the crisis, which would be applied by governments and responsible bodies of the tourism industry.

## 6. LIMITS OF THE STUDY

This work is simply deductive and descriptive, based on facts and observations. Therefore, some of the data may be considered as subjective in nature.

# INTELLECTUAL CAPITAL AS SOCIAL CAPITAL IN NON-PROFIT ORGANIZATIONS: A SYSTEMATIC LITERATURE REVIEW

Civitillo, Renato<sup>1</sup>; Festa, Giuseppe<sup>2</sup>; Nardo, Maria Teresa<sup>3</sup>; Chouaibi, Salim<sup>4</sup>

## ABSTRACT

Despite recent trends to re-evaluate the potential contribution of intangible assets in economic and social organizations, the Non-Profit Sector (NPS) is still characterized by some reticence to consider the relevance of these resources from a managerial, financial, and organizational perspective. This is even truer for Intellectual Capital (IC), which nowadays among the intangibles has been widely recognized as key success factor for the value creation of any socio-economic organization. This research, deploying a systematic literature review (SLR), aims to ascertain whether and how relevant studies about Non-Profit Organizations (NPOs) have explored the potential beneficial effects that could be generated by efficient governance and management of their IC, with specific regard to the influence that IC may exert as SC. The results emerging from the analysis have showed that so far, from a quantitative point of view, the interest about this specific issue has not been constant and systematic, while, from a qualitative point of view, three themes seem to be mostly investigated (institutional scope, human resources, and operational functioning).

*Keywords: Intellectual Capital; Social Capital; Non-Profit sector; Non-Profit Organizations; NPO; NPOs; Systematic literature review; Relational capital; Reputation; Intangible asset management.*

## 1. INTRODUCTION.

The importance and relevance that in the past have been attributed to intangible assets in economic and social organizations have emerged along the years with different emphasis. Scarce consideration was initially given to enhancing these elements both for profit-oriented organizations (Guthrie, 2001; Möller and Gamerschlag, 2009) and for public administrations, and perhaps even less for Non-Profit Organizations (NPOs). However, if at least in the for-profit sector some scholars have tried over the years to recognize the importance of knowledge and other intangibles (Penrose, 1959; Bell, 1973; Drucker, 1993), the same considerations cannot be repeated for public administrations and NPOs,

whose functioning and most of all purposes show completely different features as concerns capitalization, even when regarding intangible assets.

In truth, some typologies of these operators seem to be characterized by enormous potential when considered as critical value drivers. In this respect, peculiar attention should be paid to Intellectual Capital (IC), and maybe particularly in its potential component of Social Capital (SC) (Bueno et al., 2004); in fact, relevant research has identified IC and SC as key success factors to be used in the strategic and operational plans for the value creation of any socio-economic organization (Augier and Teece, 2005; Marr, 2005; Porter and Kramer, 2011).

Nonetheless, in the specific context of NPOs, some reticence to adequately consider the value of intangibles continues to persist: most probably, the absence of a strong profit orientation for NPOs may lead to an ambiguous assessment of their performance (Civitillo, 2016; Civitillo et al., 2018). In fact, NPOs are mainly governed on the basis of socio-economic interests and values that are vast, heterogeneous, and complex to express (Speckbacher, 2003): consequently, these organizations appear to be ideally constructed only on their mission and their related value system (Porter and Kramer, 1999), but this essence would not mean that intangibles assets cannot have specific relevance also in this specific field.

In this respect, this paper has been engineered as follows. With the objective of delineating a general scenario about the progress of the research on IC and SC particularly for NPOs (thus providing the investigation with an explorative engagement), after a narrative literature review a systematic literature review (SLR) has been conducted on the theme, arriving at highlighting results both from a quantitative and qualitative point of view; subsequently, results discussion, scientific and managerial implications, and research limitations and future directions have been developed.

## **2. LITERATURE REVIEW ABOUT IC IN NPOS.**

Economic organizations put in place a production process in which numerous (from a quantitative point of view) and different (from a qualitative point of view) resources, as inputs, are continuously worked for the generation of other resources as outputs, according to the well-known input-output model (Smyczek et al., 2020). In the past the more consistent contribution to value creation seemed to derive most of all from tangible assets, while today intangible assets, and above all IC, are believed to be most likely the main creators of value (Augier and Teece, 2005).

One of the main problems related to IC concerns its internal composition, which in truth depends on the different perspective or discipline that is involved in the discussion, and its consequent disclosure (Castelo Branco et al., 2010; Ousama and Fatima, 2012; Nardo and Vietri, 2014): although traditionally distinguished into human, structural, and relational capital (Roos et al., 1997; Bontis, 1998; Kong and

Prior, 2008; Kong, 2007; Kong and Thomson, 2006; Festa et al., 2016), with provision also about SC (Reed et al., 2006; Swart, 2006; Hashim et al., 2015), a globally accepted definition is still to be generated. The same issue seems also to concern the potential differences regarding the public sector, the for-profit sector, and, for what most interests in the current research, the NPOs (Marr, 2005).

It is very difficult to assign an orthodox evaluation to intangibles, most probably because they rarely have 'common' exchange value; in this respect, Hall (1992 and 1993) introduced an interesting conceptual approach that interprets intangible resources upon the distinction, on the one hand, as 'assets' and, on the other hand, as 'competences'. As assets, intangibles include reputation and intellectual property rights about patents, trademarks, copyrights, registered designs, contracts, industrial secrets, and databases; as competences, intangibles includes the know-how of the employees (considering also suppliers, consultants, and distributors) and the collective attributes that can be added-up to the organizational culture.

Unfortunately, this fascinating and somehow 'question-resolving' distinction presents an essential limit. While intangibles interpretable as 'assets' may be subjected to an assessment that, although complex, could be technically possible, intangibles conceivable as 'competences' are quite impossible to assess, because they are fundamentally 'linked' to the organizational structure in which where they work, and thus they could have not the same value in another organizational context.

That is why, according to other studies, the IC "... held by a firm can be thought of as a form of "unaccounted capital" within the traditional accounting system. This "unaccounted capital" can be described as the knowledge-based equity that supports the knowledge-based assets of a firm" (Abeysekera, 2006, p. 61). In this respect, there is evident consideration that, in the current and most of all future business scenarios, the power of IC is direct expression of the ever-major influence of the knowledge base and its knowledge management (KM): in a knowledge economy, knowledge-based resources – i.e., intangibles – become source of differential capability, sustainable competitive advantages, and successful strategic thinking (Hall, 1993).

Nevertheless, it is important to underline that "... extracting value from intangible capital is a much more complicated and risky process than extracting value from tangible (physical) capital. Intellectual property, standing alone, generates little or no value to the final consumer" (Augier and Teece, 2005, p. 18). Thus, after identifying intangibles as relevant if not strategic levers, the most critical part of the consequent problem concerns how to extract value from these resources.

It is to highlight that undoubtedly, the greatest part of the studies so far conducted on methodologies, techniques, and tools for extracting value from IC – or similarly, on how to govern and manage IC – has considered almost only for-profit organizations, sometimes analyzing even more specifically the influence of the ownership structure and the related profit expectations (Chouaibi and Kouaib, 2016).

Whereas scarce attention has been reserved to the public sector and to the Non-Profit Sector (NPS), with the latter representing the focus of the current study.

In truth, in recent years the importance of NPOs has considerably increased in both developed and developing countries (Salamon and Sokolowski, 1999): in fact, they have been representing one of the main actors in the supply of specific categories of goods and services, as well as one of the main employers of workers (Salamon and Anheier, 1996; Kong, 2010). This situation is mainly due to their 'civic engagement' that from a social perspective has been gaining ever more favor on behalf of communities and institutions but that from an economic point of view still shows several complexities, mainly with reference to governance and management (and related activities/operations), and most of all their correct reporting, being ever more required the assurance of the value that they are able to generate.

In general, the absence of a clear for-profit aim and at the same time, the presence of a clear social aim, but inevitably forced to respect economic conditions, hugely influence the lack of specific financial parameters to measure the organization's performance, sometimes leading to ambiguous assessment of their value (Civitillo, 2016; Civitillo et al., 2018). Therefore, their organizational, managerial, and financial functioning is under the global influence of their specific value creation system (Najam, 1996; Porter and Kramer, 1999; Putnam, 2001; Speckbacher, 2003; Toepler and Anheier, 2004): politics, religion, voluntarism, philanthropy, or compassion are only some examples of these complex circumstances.

The core matter, however, is that nowadays also NPOs act in a highly competitive environment, characterized, on the one hand, by a growing demand for services from the community and on the other one, by increasing competition from the public sector and the for-profit sector (Ramia and Carney, 2003). This evolution has generated the need also for NPOs of specific managerial concepts, principles, and techniques (Salamon and Sokolowski, 1999; Stone et al., 1999; Salavou and Manolopoulos, 2019).

In this respect, NPOs have an extreme need both to extract the most efficient value from existing resources (*exploitation*) and to generate additional value from innovative resources (*exploration*), then adopting an ambidextrous approach to the economic environment. This advanced orientation implies major and better use of knowledge, thus presenting, as aforementioned, new fundamental issues concerning IC governance and management also for NPOs.

Basically, the conceptualization of IC as a fundamental lever for the strategic management of NPOs is direct consequence of what has been formerly reasoned about For-Profit Organizations (FPOs). In fact, it is to be carefully considered that almost initially the development of the research on NPOs' governance and management had focused on the assumption that these organizations had to be

technically compared to FPOs, with the mainstream literature that highlighted the need for NPOs to be more 'business-like' oriented: thus, although without declining the specific characteristics of the non-profit orientation, many studies (Weisbrod, 1991; Austin, 2000; Brinckerhoff, 2000; Frumkin and Andre-Clark, 2000; Moore, 2000; Dart, 2004) have asked for the adoption of for-profit strategies and operations to gain success in the NPS (Kearns, 2000), with consequent influence also on the evaluation about performance and capital, even when intangible and/or intellectual (Festa et al., 2020).

However, in scientific research about FPOs, profit orientation mostly serves as simple common language for governing, managing, measuring, and communicating the organization's performance (Sawhill and Williamson, 2001; Speckbacher, 2003). Whereas NPOs, at least in normal conditions, have no financial aims, but financial objectives at most, in any case to be used as means for evaluating the organization's efficiency and not the organizations' efficacy (Speckbacher, 2003), otherwise the use of for-profit managerial techniques would translate most probably into a real vulnerability for NPOs (Kong, 2007).

Nonetheless, if the issues about IC in FPOs are complex, as above cited, it is reasonable that understanding how IC can be governed and managed in NPOs, because of their 'normal diversity', is even more difficult, although these resources could be physiologically appropriate most of all for non-profit contexts. In fact, the IC concept is essentially meant to valorize intangible assets, often adopting qualitative and non-financial indicators that most probably are indispensable in modern business evaluation (Krishnan and Ramasamy, 2011), thus representing a sort of strategic framework that could be potentially able to coordinate the organization's performance with the peculiar socio-economic environment that embraces the NPS.

More particularly, IC seems to contribute to NPOs' strategic positioning by offering a more qualified understanding of the allocation of the organizational resources, allowing at the same time to improve the performance evaluation by providing meaningful information to the variegated set of stakeholders (Kong, 2007). IC can be crucial for NPOs, becoming a useful tool to favor changes in functioning behaviors and value perceptions: in this respect, Roos argues that the "... deeper purpose of an IC approach is to change people's behaviour, not least through changing the corporate language. The concept of IC brings with it a whole set of new values about what is good and what is bad management" (1998, p. 151).

Finally, the importance of IC for NPOs has emerged also with reference to one of the most relevant characteristics for this kind of economic sector, i.e. the solidarity, that has value not only for the potential beneficiaries of the organization's activity, but also with regard to NPOs collaboration/cooperation/cooperation (for example, the software re-use in open-source projects). From this point of view, the economic value of the organizations' knowledge does not depend only on its

contextual utility, but also on its potential transfer and replication (Augier and Teece, 2005), with SC playing a relevant role in knowledge alliances (Ferreira and Franco, 2019), thus providing further perspectives of application for IC governance and management in NPOs'.

### 3. RESEARCH QUESTIONS AND METHODOLOGY.

Based on all the above considerations, this study aims at providing evidence for potential responses to the following research question, according to the explorative nature to the study:

*“How have IC and more specifically SC been considered in the scientific literature about NPOs?”.*

As investigation method, a SLR approach has been adopted, considering that it should represent the most adequate examination tool in relation to the nature of the research question. In fact, “... a review of the literature to provide the best evidence for informing policy and practice in any discipline, is a key research objective for the respective academic and practitioner communities” (Tranfield et al., 2003: 207).

The application of a systematic investigation approach to the literature review requires first of all the identification of the objects to be analyzed: in this respect, the current research has examined the two databases of publications that are commonly considered the most reliable as concerns their scientific indexing, impact, and reputation, i.e. Web of Science (WOS) and Scopus (Walters, 2016). These two databases have been investigated using the following query syntaxis:

*“intellectual capital” OR “social capital” AND “No\* Profit”*

obtaining the following results (cf. Table 1).

| Scientific database  | Results from the query |
|----------------------|------------------------|
| Web of Science (WOS) | 095                    |
| Scopus               | 155                    |

*Table 1 – Results from the query on WOS and Scopus (Authors' calculation).*

Taking into careful consideration the differences about the two scientific databases (Archambault et al., 2009; Abrizah et al., 2013; Chadegani et al., 2013; Bartol et al., 2014; Sánchez et al., 2017), and to avoid that these differences could affect the results of the investigation, both of them have been considered only about the common documents that they have generated through the filtering. Specifically, the total number of scientific documents under common 'coverage', and that finally has been examined, is equal to 66 items, whose characteristics are illustrated in Figure 1, representing the set of elements to be analyzed in the SLR.

| Description                          | Results     |
|--------------------------------------|-------------|
| Documents                            | 66          |
| Sources (Journals, Books, etc.)      | 61          |
| Keywords Plus (ID)                   | 214         |

**Figure 1. Characteristics of the items, common to WOS and Scopus, under analysis (Authors' elaboration).**

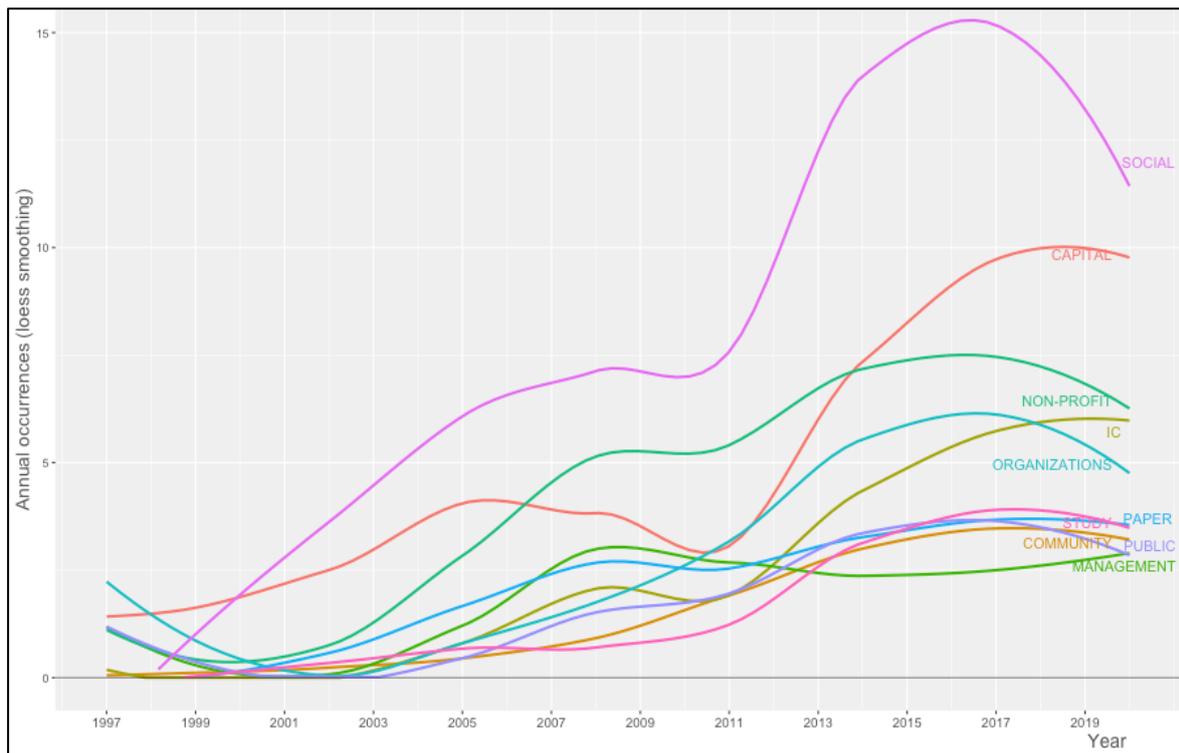

The SLR has been conducted using a specific open-source software, 'Bibliometrix' (bibliometrix.org). This package "... provides a set of tools for quantitative research in bibliometrics and scientometrics. It is written in the R language, which is an open-source environment and ecosystem" (Aria and Cuccurullo, 2017: 963).

#### **4. RESULTS FROM THE SLR.**

As summarized in Figure 1, the scientific documents related to research about IC or SC issues in the NPS have been published since 1997, and consist of 66 elements, relating to 61 bibliographic sources. From a qualitative point of view, most of these elements are scientific articles (55), while 11 are proceedings.

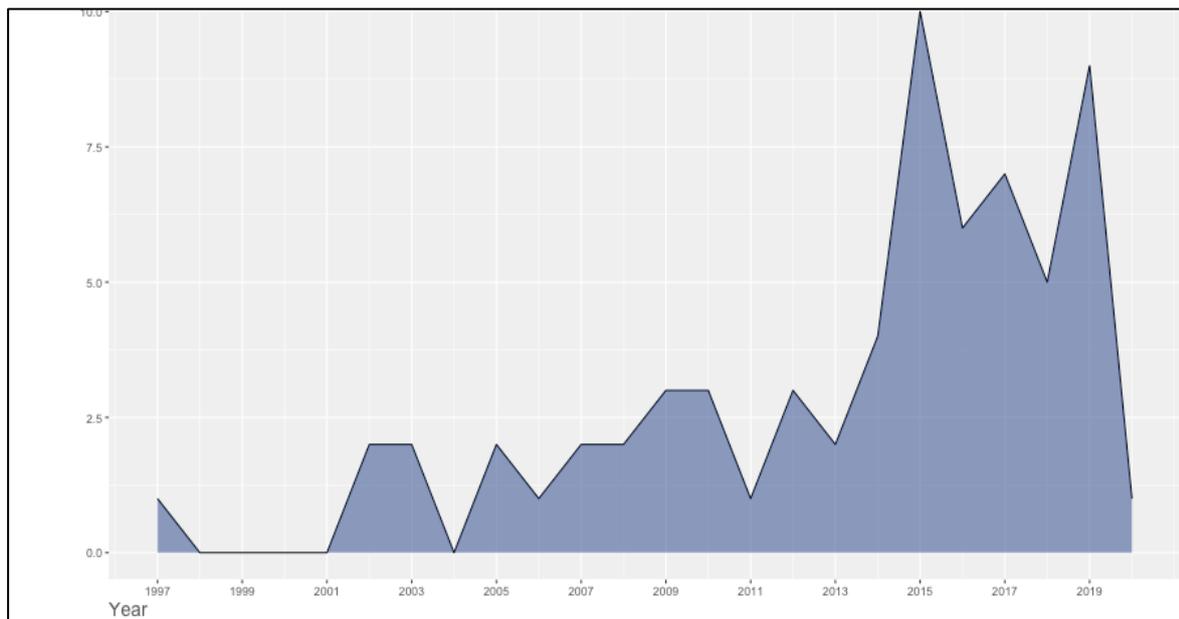

The bibliometric analysis has highlighted that there have been 121 authors involved in the field: 21 of them are single-authored documents' authors, while the other 100 are multi-authored documents' authors. This circumstance means that this kind of research represents a theme that greatly stimulates collaboration among different authors: in fact, the number of documents per author is equal to 0.545 and the number of authors for each document is equal to 1.83, with a collaboration index equal to 2.33.

**Figure 3. Words dynamics analysis (authors' elaboration).**

The above cited words, considering the research context, allow most probably to highlight some peculiar aspects of the issues under investigation. In fact, the multidisciplinary nature of the theme, the ever more increasing role of KM, the constant interference with the human relation sphere, and the fiduciary component are all dimensions with great relevance in this field.

**Figure 4. Annual scientific production (authors' elaboration).**

With regard to the evolution through the years of the research, the bibliometric analysis (cf. Figure 4) has showed that the IC and SC issues in the NPS have known the periods of the greatest scientific

productivity in 2015 (10 documents in the year) and in 2019 (9 documents in the year). More in general, this peculiar theme has experienced a significant increase in the interest of scholars since 2014, and at the same time it seems nowadays constantly attractive for the academic community, but frankly with continuous ups-and-downs.

The Conceptual Structure Map in Figure 5 reports the graphical representation of the results emerging from Multiple Correspondence Analysis (MCA) and Cluster Analysis (CA): "... as words are more similar in distribution, the closer they are represented in the map" (Aria and Cuccurullo, 2017: 969). Thus, this elaboration provides evidence about the potential proximity of some concepts ('words') used in the analyzed documents and therefore, highlights further possible interpretation of the aspects underlying this research.

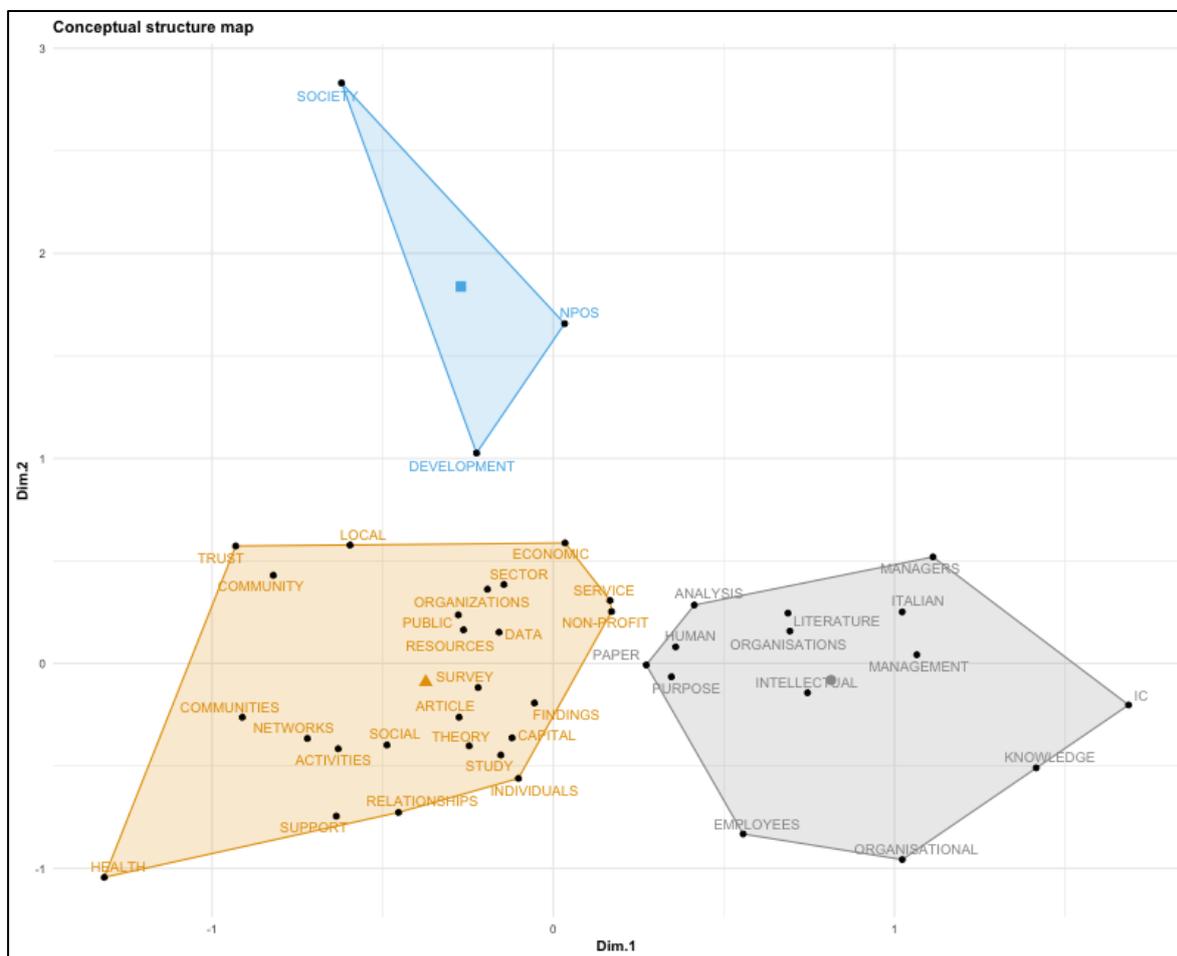

Figure 5. Conceptual structure map (authors' elaboration).

In this specific situation, three main groups/areas seem to emerge from the analysis. A first terminological and conceptual group is represented by a sort of narrow triangle, whose vertices are 'NPOs', 'Society' and 'Development': this area would seem to express that, from the evidence of the context under investigation, NPOs are profoundly interconnected with the development of the

society, thus indirectly confirming this result the reliability of the research. This group/area of words (and then, related research) seems mostly oriented to the institutional scope of the NPOs.

A second, vaster terminological and conceptual group consists of a sort of irregular hexagon, whose vertices are the words 'Organizational', 'IC', 'Managers', 'Analyses', 'Paper', and 'Employees'; whereas inside the hexagon find place (among the others) concepts like 'Knowledge', 'Intellectual', 'Management', 'Purpose', and 'Human'. This combination seems to highlight the correspondence that IC and KM have with the most important purpose of the organizations under investigation, i.e. the human dimension, confirming explicitly the relevance of these issues also in the NPS. This group/area of words (and then, related research) seems mostly oriented to the role/contribution of the human resources.

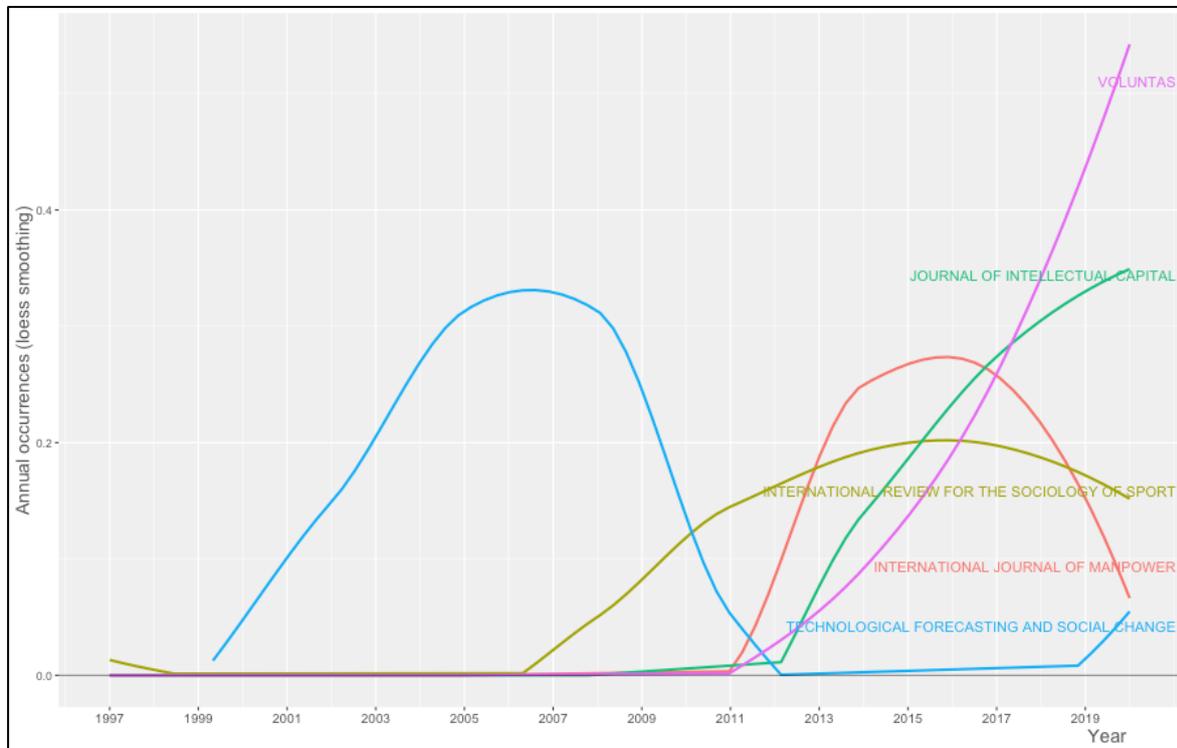

The third terminological and conceptual group, the vastest in the graphical representation, is constituted by an irregular pentagon, whose vertices are the words "Individuals", 'Non-profit / Service', 'Economic', 'Trust', and 'Health'; whereas inside the polygon find place (among the others) concepts like 'Support', 'Relationships', 'Networks', 'Community', 'Local', 'Social', 'Public', and 'Capital'. This appears to be a set of concepts that express the main values of the NPS, which traditionally represents the environment for the protection of aspects that normally are not at the center of the attention of the private business, but in many cases, neither of the public one. This group/area of words (and then, related research) seems mostly oriented to the operational functioning of the NPOs.

Finally, the analysis that has been represented in Figure 6 provides evidence about the trend over the years of the frequency of IC and SC issues in the NPS in some relevant international journals. The journals that have been reported in the following representation are those for which it has been possible to count at least two publications annually.

For some of them (Technological Forecasting and Social Change, International Journal of Manpower, and International Review for the Sociology of Sport), a sort of Gaussian distribution of the annual occurrences seems to arise, with different peaks (Technological Forecasting and Social Change around 2006, International Journal of Manpower around 2016, and International Review for the Sociology of Sport around 2016).

Instead, for the others (Journal of Intellectual Capital and Voluntas) the current trend is characterized by a continuous increase about the scientific production in the field, even though, or maybe just because, it seems that they have started to publish research on this specific issue after the journals of the first, abovementioned group. Considering a comparison, it could be even possible that in the near future a Gaussian curve will occur also for these two journals, on the basis of a sort of 'swing' of these topics in the context of the international scientific debate.

Thus, basing our considerations on the above analyzed observations, with the intention to provide global response to the fundamental research question (“How have IC and more specifically SC been considered in the scientific literature about NPOs?”), there seems to exist evidence for at least two considerations, one more quantitative and the other one more qualitative.

**Figure 6. Word source dynamics (authors' elaboration).**

From a quantitative point of view, so far IC and SC in the NPS have not shown constant and systematic presence in the scientific literature, highlighting almost 'sinusoidal' trends over time that therefore are not able to guarantee a reliable prediction about the progressive expansion and consolidation of the knowledge in the field: however, the considerable increase that has been detected for two journals specifically, could be a very encouraging evidence to imagine further development for this kind of research.

From a qualitative point of view, three seem to be the most relevant areas of scientific interest in the field: institutional scope, human resources, and operational functioning. These aspects are naturally connected from a systemic point of view, but from the SLR results interpretation their boundaries in terms of methodological development appear to be rather separated.

## 5. SCIENTIFIC AND MANAGERIAL IMPLICATIONS.

From a theoretical point of view, it seems evident that major effort is required on behalf of the scientific community about the research on IC and SC for NPOs, because of the growing importance

that the NPS has been assuming and will assume ever more in the future, most of all if considering that methodologies, techniques, and tools of the management for FPOs have been already taken into careful consideration for their contextual application to the NPOs' world. Most probably, the real effort that needs to be generated will concern the contextual characteristics of IC in this sector, with the aim of investigating not only the performance margins or ratios that could be generated by intangible assets, but also and above all, the specific value margins and ratios, with peculiar regard to the human and social aspects of this value.

From a managerial point of view, the three most important themes emerging from the SLR about IC and SC for NPOS regard institutional scope, human resources, and operational functioning, and thus to improve the performance of these organizations it could be desirable to focus most of all on these aspects, being this evidence at least a symptom of major concern. Triangulating from a conceptual point of view these three elements, a specific attention seem necessary for the human resource management, not only (but also) from the point of view of the operational functioning, but also (and not only) from the point of view of the institutional scope, thus highlighting the double contribution that the 'service encounters' can provide also in the NPS, as human capital (stock that can be accumulated on a knowledge basis) and SC (stock that can be accumulated on a reputational basis, also by virtue of workers that at all levels are efficient, transparent, and oriented to human and social utility).

## **6. RESEARCH LIMITATIONS AND FUTURE DIRECTIONS.**

The most relevant constraints of the investigation concern naturally the criteria of the SLR. Consequently, further avenues of the research could be considered as attempts to overcome these restrictions.

First, the study has been conducted only on two scientific databases (Web-Of-Science and Scopus), which, although being the most authoritative, could be limited in the quantity of items to process, and thus other sources could be considered (Google Scholar, for example, with all its specific limits). Second, the investigation has adopted a specific syntaxis ("intellectual capital" OR "social capital" AND "No\* Profit"), and thus other specific keywords and/or other specific syntaxis would naturally provide different results, maybe taking suggestions from the keywords that have emerged in the three groups/areas regarding institutional scope, human resources, and operational functioning.

Third, the documents under investigation are only the ones that are common to Web-Of-Science and Scopus, while extending the research also to the other documents from these two sources that respond to the used query would automatically enlarge the perimeter of analysis. Fourth, the investigation have considered only the abstracts, to enlarge the range of the words under analysis (although only

the first 100 words have been considered), but at the same time excluding other meta-data and clearly more in general the content analysis of the whole text of the papers; thus, further research could loosen these criteria, generating bigger data to process.

Fifth, the period under analysis ranges from 1997 to 2020, and another temporal interval could be designed for the analysis, although the one that has been considered seems quite solid, just because it considers only common documents; most probably, careful attention from a temporal point of view must be paid particularly to the two journals with an increasing publication trend in the field, i.e. *Journal of Intellectual Capital* and *Voluntas*. Sixth and finally, the software that has been used is very specific: this is certainly a strength, considering also the scientific references that support it, but at the same time it is clearly understandable that other application packages, with different internal rules, would provide different outcomes, most of all as concerns the qualitative interpretation of the results.

## 7. CONCLUSION.

This research has investigated the existing academic literature regarding IC and SC particularly in the context of NPOs. Even though the nature of the study is clearly explorative, the results of the SLR have provided sufficient evidence about the limited interest of the international scientific literature for this topic, both considering the number of publications over the years under examination and detecting the different journals that show peculiar trends about the number of publications over the years.

In truth, the evolutions that have been characterizing the society, the economy, and the service market have forced NPOs to deal with the issue concerning IC in general, and thus some development in the field should be quite natural. Nevertheless, the investigation has demonstrated that, at least so far, reticence to adequate investigation continues to persist.

Reasons for this lack of consideration can be multiple. A possible explanation could regard the intrinsic characteristic of the NPOs, i.e. the absence of the profit orientation, which could have influenced some concern about their scarce – or even absent – ability to create value. In other words, the ‘non-profit’ dimension of these organizations could have determined the marginality in the research about IC – and in this context even SC – because of the misleading conviction that where there is no profit, there is also no capital, but only patrimony.

In this respect, it is to highlight firmly that the natural non-profit orientation of the NPOs does not imply absence of value, since these organizations could be more correctly defined as ‘non-profit-distributing’ rather than ‘non-profit-making’ entities (Anheier, 2014). This means that all incoming monetary flows are destined to the management of their institutional activities and therefore, to their mission (Civitillo, 2020), and that NPOs are able to generate indisputable advantages in terms of social

value production (Porter & Kramer, 1999; Wondolleck & Yaffee, 2000; Smith, 2008), also thanks to the efficient governance and management of IC and SC.

## EXPLORING THE SHARING ECONOMY AND RELATED CONCEPTS

Correia, Fábio; Meneses, Raquel

School of Economics and Management, FEP, Oporto, Portugal.

### ABSTRACT

Sharing is an act that has accompanied us since the dawn of humanity, however, with the technological explosion and its constant evolution, new terms based on sharing have appeared, namely the Sharing Economy. However, the literature shows us that this term is mostly used in the wrong way, being generalized for each and every act of sharing. With its growing notoriety, the Sharing Economy has been largely exploited by the scientific community, especially regarding the reasons that lead individuals to share. However, there is a lack of research that differentiates all terms associated with the Sharing Economy, whether they are Collaborative Consumption, Access-Based Consumption, among others. The present essay aims to make this differentiation, thus contributing to the correct use of terms and avoiding the generalization of the Sharing Economy for all acts. For this, a literature review was carried out in which the various terms used as Sharing Economy were compared between the various authors, as well as between companies that practice or contribute to the sharing of goods and services.

*Keywords: Access-based Consumption; Collaborative Consumption; Sharing; Sharing Economy;*

### INTRODUCTION

Technology and globalization are two drivers for the industry development. This constant evolution and simplicity of IT means supports the expansion and the appearance of new businesses. Proof of this is the exponential growth of the Sharing Economy in the last decade (Teubner & Flath, 2019). The PricewaterhouseCoopers even estimates that business revenue related to Sharing Economy will reach 335 billion in 2025, while in 2015 the revenue has been 15 billion (PWC, 2015). These figures support the idea of several authors that the Sharing Economy is a fast-growing phenomenon (Belk, 2014a; Bocker & Meelen, 2017; Bradley & Pargman, 2017; Gobble, 2017). Despite this reality, sharing it is not a new phenomenon, it has been with us since the dawn of humanity. Long before the birth of networks and any computer, sharing was already practiced, especially among people close to individuals (Belk, 2010). The internet only brought new opportunities for this practice (Möhlmann, 2015), opening new horizons for sharing, supported by globalization. Uber and Airbnb are two of the most cited companies when looking for information about the

Sharing Economy (Martin, 2016), despite the essence of Uber being contrary to this business model. In addition to these two companies, many others are cataloged as Sharing companies and every day new ideas and models appear that focus on the sharing of goods, to the detriment of their sale (Belk, 2014b). This consumer paradigm shift, which leads consumers to prefer sharing over purchase, has captured the attention of both the scientific community and organizations. The latter realized that they had to rethink business models and innovate to respond to this consumer demand, remaining competitive in the current market. An example of this is Volkswagen, a German vehicle manufacturer that launched “We Share”, a car-sharing service in Berlin with electric cars. Regarding the scientific community, this attention is related to the reason that leads to this paradigm shift (Baumeister, Scherer & Wangenheim, 2015). However, even under this media coverage, the literature on the various concepts of Sharing is still scarce and not rigorous. In addition, the Sharing Economy concept is not infrequently used.

In this way, this paper aims to fill this gap in the literature. Thus, our purpose is to contribute to a clarification in the use of the various concepts associated with the Sharing Economy, highlighting the differences and the similarities between them.

The following section discusses and compares the different concepts.

## **THEORETICAL BACKGROUND**

Technology and globalization make it possible to create new business models based on sharing at the expense of property (Daunoriene et. al., 2015), however, this verified increase results from a mentality shift of individuals. According to Botsman and Rogers (2011), the 2007-2008 financial crisis was a catalyst for this change in mentality, leaving people more predisposed to new ways to access products or services given their economic benefits (Belk, 2014b; Hamari et al., 2016; Mohlmann, 2015; Pizam, 2014). The concern with environmental is another major factor that favors sharing (Bardhi & Eckhardt, 2012; Belk, 2014b; Hamari et al., 2016; Heinrichs, 2013; Mohlmann, 2015). Convenience, given that the time and effort in acquiring a product is greater (Seiders, et al., 2007), and the new provided experiences (Babin, et al., 1994), are other factors that lead individuals to choose the world of sharing.

Nevertheless, sharing, a generous and altruistic word, has become from a non-profit act to a business model. It is important to mention, as we have seen, this type of business model has numerous associated advantages. Furthermore, based on overcapacity (Jing & Sun, 2018) it enhances population, consumerist, financial and knowledge decentralization (Ravenelle, 2017). Likewise, this type of business model makes it possible to bring underdeveloped countries closer to development and to all associated benefits, namely with regard to humanitarian crises.

In fact, these new business models based on sharing are being associated with terms incorrectly, as seen in the literature. In a first phase, it seems that the term Sharing Economy fits any new business model where something is shared. However, this does not represent the truth. Juliet Schor (2016) goes so far as to state that a solid definition of the Sharing Economy that reflects common use is practically impossible. Belk (2014a), on the other hand, argues that there is no consensus on the meaning of Sharing Economy or what defines sharing and not sharing due to the different use of concepts by different people and organizations. In the same order of thought, Belk (2014a), uses the “umbrella concept” to represent the use of the term Sharing Economy in society.

There are several authors who claim that there is no definition of Sharing Economy and that the term is used to describe another type of sharing (Schor, 2016).

Added to the sharing, there are innumerable concepts usually used: Sharing Economy

(Möhlmann, 2015); Collaborative Economy (Botsman and Rogers, 2009); Collaborative Consumption (Herbert and Collin Lachaud, 2017); Peer-to-peer Economy (Bellotti et al., 2015, p. 1); Access-based Consumption (Bardhi and Eckhardt, 2012); Connected Consumption (Schor and Fitzmaurice, 2015); Peer-to-peer Rental (Hawlitschek et al., 2016); Peer-to-peer Markets (Perren and Kozinets, 2018); Commercial Sharing Systems

(Lamberton & Rose, 2012); Access-based Services (Botsman, & Rogers, 2010); “The Mesh” (Gansky, 2010); Peer-to-peer Sharing Economy (Wirtz, et. Al., 2019); Ondemand Economy (Selloni, 2017); Time Banking (Pais and Provasi, 2015). Gigeconomy (Schlagwein et. al., 2020). Among so many concepts, it is understandable the reason for so much divergence when trying to approach sharing. Qiao et al. (2018) support this idea by stating that the literature has not converged to a common nomenclature. Among all the terms there are logically correlations, however, there are clear differences between them. Most researchers believe that Collaborative Consumption is the same as Sharing Economy (Parguel et al., 2017), on the other hand, several others consider the concepts different (Belk, 2014b; Frenken, 2017; Hamari et al., 2016). The Access-based Service and Peer-to-peer Sharing Economy platforms are usually called Sharing Economy (Wirtz et. al., 2019). Bardhi and Eckhardt (2012) use the term Sharing Economy and Collaborative Consumption in their concept of Access-based Consumption (ABC). Botsman and Rogers (2010) argue that Access-based Services operate under different terms, such as Collaborative Consumption, Sharing Offerings and Commercial Sharing Systems. These are just a few examples that support the idea that in this way it is impossible to define Sharing Economy and aggregate terms. In one aspect, all the authors converge and, supported by the literature, we can say that: in any of the terms related to Sharing there must be interested parties with or without intermediaries, there must be a product or service, there must be an exchange, be it permanent or temporary, market-mediated or not, there may or

may not be monetary compensation, the ultimate goal may be to generate profit, or not. In almost all, technology, namely the internet, are central connecting different players. Having seen this and comparing exhaustively the way the terms are used by the scientific community and organizations, it is possible to differentiate the various concepts, as well as to contribute to possible definitions. Therefore, in order to simplify the understanding, the terms are distributed and identified considering these same characteristics.

With regard to the most popular theme, Sharing Economy, most authors refer to the fact that it is mostly a Peer-to-peer model and focused on temporary access to goods (Botsman and Rogers, 2011), however, exchanges they can be professional, rented or free (Palgan et al., 2017). Thus, we can say that Sharing Economy is a model mostly based on Peer-to-peer, and it can also be Business-to-peer or Business-to-consumer, performed mainly through platforms, without a mediator, that facilitate the match between the supply and demand for a service or product, enabling sharing, without definitive transfer of ownership, with or without profitable objective and mediated by social mechanisms. Example of Sharing Economy platforms: Peer-to-peer non-profit – Time Bank; For-profit Peer-to-peer - Airbnb; Non-profit Business-to-peer – Meal Connect; Business-to-peer for profit - Zipcar. It is important to note that for-profit business-to-peer is often referred to as Rental Economy (Pais and Provasi, 2015) given the operability through rental systems managed by companies without the existence of transfer of ownership. Through the literature review it was also possible to conclude that platforms like Uber are not part of the Sharing Economy since they are mediated by the market and not by social mechanisms. Thus, this type of platform fits into concepts such as "On-demand Economy" or "Gig-economy" (Meelen and Frenken, 2015). These concepts are characterized by being platforms that, in addition to being mediated by the market, serve as intermediaries for personal services being operated by professionals and non-professionals (Pais and Provasi, 2015).

Another theme often confused with Sharing Economy is Collaborative Consumption (Hatzopoulos and Roma, 2017). Botsman and Rogers, in 2011, defended Collaborative Consumption as a new term for traditional sharing, exchange, and rent, facilitated by new technologies. Belk (2014b), three years later, considered that Collaborative Consumption was situated between the sharing of something and the traditional market transaction as we know it. However, in 1978, the internet was still being considered and the term was already used by Felson and Speath (Belk, 2014b). However, over the years, dozens of contradictory definitions about Collaborative Consumption have been adopted, thus contributing to a complete confusion regarding the literature on the subject. Seen this and analyzing the various points of view, it was agreed that a single definition should start from concepts such as access, ownership, sharing and mediation. Thus, after analyzing the various

definitions, it can be said that Collaborative Consumption is a term derived from the Sharing Economy (Hamari, 2016), but less comprehensive, which is based on a Peer-to-peer model where they are lent, rented, shared goods or services, including spaces and solutions, operated through platforms and mediated by the market, in which there is no definitive transfer of ownership and requires monetary compensation.

Another concept, less covered than the previous two but in equal divergence in terms of definitions, is Access-based Consumption. According to Bardhi and Eckhardt (2012), Sharing Economy is a broader concept that also includes free exchanges, while Collaborative Consumption and Access-based Consumption requires monetary compensation and there is no definitive transfer. The similarity between Access-based Consumption and Collaborative Consumption is evident, however, crossing the various definitions existing in the literature it was possible to arrive at a differentiating definition. Therefore, according to Frenken and Schor (2019), Hamari et al. (2016), Bardhi and Eckhardt (2012), Botsman and Rogers (2010), it is possible to define Access-based Consumption as a model mediated by the market, where there is no transfer of ownership, requires financial compensation, taking place through platforms, through rental, lending, loan, dues paid to clubs and organizations, aiming at sharing spaces, services and products belonging to companies, through redistribution markets. During the present research, the term Access-based Consumption was often referred to as Access-based Service. Having not identified any differentiation between the terms, it can be concluded that they are synonyms since an individual consumes not only products but also services. In fact, in this situation individual consumes experiences.

|                           | Actors             | Platform     | Sharing Type                       | Property transfer | Mediation        | Compensation           | Profitable goal |
|---------------------------|--------------------|--------------|------------------------------------|-------------------|------------------|------------------------|-----------------|
| Sharing Economy           | Peerto-peer        | Yes (mostly) | Product; Service                   | No                | Social mechanism | Monetary; non-monetary | Yes; no         |
| Collaborative Consumption | (Mostly); B2C; B2B |              |                                    |                   | s                |                        |                 |
| Accessbased Consumption   | Peerto-peer        | Yes          | Product; Service; Space; Solutions | No                | Market           | Monetary               | Yes             |

|  |      |     |           |    |        |                |     |
|--|------|-----|-----------|----|--------|----------------|-----|
|  | B2C; | Yes | Product;  | No | Market | Monetary       | Yes |
|  | B2B  |     | Service;  |    |        | (may being per |     |
|  |      |     | Space;    |    |        | fee)           |     |
|  |      |     | Solutions |    |        |                |     |

*Table 1 - Concepts of "new" modes of exchange*

As noted, so far throughout the present Essay and according to table 1, the world around the Sharing Economy is far more complex than it first appears. We concluded that not all types of exchanges are part of the Sharing Economy, despite this being the most popular term. Associated with this popular business model, we find dozens of other terms that do not refer specifically to qualifying the action as the previous three. Again, several definitions were compared in order to find the best definition for each one. This is the case of Connected Consumption (Schor and Fitzmaurice, 2015) and Collaborative Economy, which represent themselves as an economy of networks of individuals that has changed the way we used to consume (Botsman and Rogers, 2009). Another term that has been gaining popularity is "The mesh", initially adopted by Gansky in his book "The Mesh: why the future of business is sharing" (2010). This term refers to the possibility of the individual to connect with others from a platform, based on the central strategy of "selling" the same product, talent or service several times. In this way profits and contacts are multiplied, thus offering greater visibility and enhancing additional sales.

Inevitably associated with sharing (Pais and Provasi, 2015), especially Sharing Economy and Collaborative Economy, we have the term Peer-to-peer Economy, Peer-to-peer Market or Peer-to-peer Market exchange. This term, as the name implies, is the economy among consumers, excluding organizations, where the holders of products or services produce value directly for other individuals in the same way and not for the market. Bauwens (2006) stated that in Peer-to-peer Economy it is necessary to give something to have access to everything and that it is the only model capable of facing the problems that the world faces, namely sustainability. When the concept Peer-to-peer Sharing Economy is used, the exclusion of Consumer-to-peer is understood. Peer-to-peer Rental, on the other hand, is nothing more than a simple rental, in its traditional form, between individuals (Hawlitshchek et al., 2016). Also, in this line are terms such as Time Banking and Local Exchange Trading Systems. These concepts are directly related to On-demand Economy however there are no cash transactions. Alternatively, the product or service is usually paid for with another service (Pais and Provasi, 2015).

As noted, the terms directly or indirectly associated with the Sharing Economy are numerous. Here (table 2), the main, most important and most used by the general population were mentioned and defined. It should be noted that in addition to these, there are other less used concepts and expressions, such as the Commercial Sharing System (Lamberton and Rose, 2012) which, as the name implies, is nothing more than everything we have been talking about. However, referring to all concepts, including used only by one author, would become an almost impossible job.

---

**Access-based Service** is synonymous with Access-based Consumption and refers to the act itself.

**Connected Consumption and Collaborative Economy** – Represent an networks economy of individuals that has changed the way we used to consume.

**The mesh** – It refers to the possibility of the individual to connect with others through a platform, on a basis of making the product, service, talent yield several times.

**Peer-to-peer Economy, Peer-to-peer Market or Peer-to-peer Market exchange** – Market between individuals excluding companies, where value is not generated for the market, but directly for the individual, unlike P2C and C2C which represent interactions with and between companies.

**Peer-to-peer Rental** - Rental between individuals in their traditional way.

**Time Banking and Local Exchange Trading Systems** - Directly related to **On-demand Economy** however there are no cash transactions. Payment can be made with another product or service.

---

*Table 2 - Sharing economy derived terms*

## CONCLUSION

The advantages of the Sharing Economy justify its popularity. Sharing economy presents a disruptive potential, challenging incumbents and presenting new opportunities (Kraus et al., 2020). Such a business model allows consumers to access products and services for the time strictly intended and for a price that would otherwise be impossible to beat (Bardhi and Eckhardt, 2012). Likewise, the environmental effect is preserved, reducing excessive consumption (Mont, 2002). Given all the advantages and considering the increased demand for the Sharing Economy, companies, to be competitive, need to change the way they approach the market. This need drives innovation and creativity in companies (Botsman and Rogers, 2010) and, thus, provides an

opportunity for entrepreneurs to contribute to the fight against humanitarian problems (Hamari et. Al., 2016). However, not all companies that grow under the Sharing Economy label really are. Uber is the perfect example, it is referred as belonging to Sharing Economy; however, it belongs to the On-demand or Gig Economy family (Meelen and Frenken, 2015). Wrong associations like this contribute to a stampede of biased definitions. Considering this reality, an exhaustive analysis of the literature was made, and concrete conclusions and definitions of the various terms associated with the Sharing Economy were reached, conceptualizing them. Among the various definitions, common and contradictory points were found, and these points were also compared with the terms usually used by companies. Thus, in addition to several other definitions, it was possible to define Sharing Economy as a model mostly based on Peer-to-peer, however it can also be Business-to-peer or Business-to-consumer, performed mainly through platforms, without a mediator, that facilitate the match between the supply and demand for a service or product, enabling sharing, without definitive transfer of ownership, with or without profitable objective and mediated by social mechanisms. Thus, this essay contributes to fill a gap in the literature that required maximum urgency, considering the growing confusion. As this business model evolves, new concepts emerge and, therefore, it is necessary that future investigations accompany them and contribute to their clear and concrete definition. It is important to note that different business models present diverse advantages and challenges, moreover not all contribute in the same level for a green consumer and a sustainable development.

### ABSTRACT

In this research, we aim to answer how organizational absorptive capacity (ACAP) component elements are embedded in the strategic management processes of digital technology-based small and medium organizations (SMEs). Following virtual consensus on knowledge as a strategic resource, the organizational capacity to absorb valuable knowledge, leveraging innovation and fostering performance, has become an important topic in strategic management. The basic assumption here is that organizational ACAP may be an important source of competitive advantage for digital technology-based SMEs. This paper contributes to the ACAP field by linking its component elements obtained from relevant published articles to strategic management imperatives for SMEs. Such imperatives were retrieved through a systematic literature review and the proposed links with ACAP component elements examined through case studies in the field. There are also benefits to practitioners, since the implementation of processes related to the proposed links might support management and operations in these specific SMEs.

*Keywords: absorptive capacity; strategic management; digital technology-based SMEs; small and medium organizations; SMEs*

### INTRODUCTION

Developing competitive advantages and generating above-average returns in an industry are at the heart of the strategy in many organizations (Grant, 1991; Porter, 1985). In pursuing above-average returns as a strategic endeavor, it is common sense that management of organizational knowledge assets is of the essence (Alavi and Leidner, 2001; Nonaka and Takeuchi, 1995), particularly when it relates to the ability to innovate and foster performance (Carrillo and Gaimon, 2004; Nickerson and Zenger, 2004). Following this argument, it becomes vital to develop one's absorptive capacity (ACAP) i.e., recognize the value of external knowledge, assimilate it at organizational level and apply it for commercial ends to leverage innovation and, ultimately, performance (Cohen and Levinthal, 1990).

ACAP is a vibrant construct among scholars and has appeared as a constant theme in innovation and strategic management research (Fabrizio, 2009; Rothaermel and Alexandre, 2009). In this study, supported by literature reviews, we proposed an integrative framework connecting the imperatives of ACAP and strategic management. We then tested this framework in the field for validation.

Overall, being able to develop and sustain competitive advantage, following the technology dynamics of the global environment, remains a major challenge for managers and organizational strategists. Digital technology-based small and medium enterprises (digital SMEs), operating with technological or scientific knowledge to supply market value through digital products and services, are specifically impacted by these dynamics (Giones and Brem, 2017). Despite several other challenges and resource constraints compared to larger companies (Tolstoy, 2009), knowledge is recognized as a key resource for these SMEs in achieving competitive advantages (Bojica and Fuentes, 2012). In this article, we focus our field of study on digital SMEs. We aim to shed light on the integrated processes and mechanisms of ACAP and strategic management to achieve superior performance to thrive in dynamic markets.

Although SMEs are more dependent on external knowledge when compared to larger companies in the same sector (Tolstoy, 2009; Zahra et al., 2003), research on knowledge management usually focuses on large companies with overall results not always applicable to SMEs (Cerchione et al., 2016). The generally limited capacity of SMEs to access specific resources poses an additional challenge to structuring their processes and mechanisms of external knowledge absorption through a comprehensive configuration (Langley and Traux, 1994; Liao et al., 2003). Despite the importance of knowledge absorption for SMEs, there are still few studies dealing with ACAP in the context of these companies (Flatten et al., 2011; Kim et al., 2014; Zahra et al., 2009). Concurrently, the general focus of empirical studies on strategic management is on leading companies in their sectors, or even public traded companies, with few such studies specifically targeting SMEs (Cerchione et al., 2016; Katila et al., 2012). Considering the above, we aim to answer the following research question in this study: “How are organizational absorptive capacity (ACAP) component elements embedded in strategic management processes of digital SMEs?”

In addition to the introduction, the structure of this paper comprises a theoretical background on ACAP and SME strategic management. We then connect these processes through an integrative theoretical framework. Next, we present the methodological procedures used to assess organizations in the field. Results and discussion sessions followed by implications and conclusions complete the article.

## **ABSORPTIVE CAPACITIES**

Although the term "absorptive capacity" had been used previously (Volberda et al., 2010), the contribution of Cohen and Levinthal (1990) is widely accepted as a seminal work on the subject. These authors define ACAP as the organizational ability to recognize the value of new external information, assimilate and exploit it for commercial purposes. They emphasize the importance of prior knowledge and prior investments in research and development (R&D) as essential background to ACAPs. Evaluation and utilization of outside knowledge is largely a function of prior knowledge. The authors also reinforce the relevance of individual absorptive capacity to forming ACAP at organizational level. In a complementary study, Zahra and George (2002) define ACAP as an organizational dynamic capability (Teece et al., 1997) and propose four dimensions as in the explicit phases of their model. For these authors, ACAP is a set of organizational routines and strategic processes, through which organizations acquire, assimilate, transform and exploit knowledge to produce organizational dynamic capability. Todorova and Durisin (2007) suggest a new definition and model with some important changes to Zahra and George's (2002) proposal. The authors redirect attention to the first skill proposed by Cohen and Levinthal (1990), which is the recognition of external information value for the organization. They also complement their understanding of the transformation phase, proposing this step as an alternative rather than subsequent to the assimilation phase.

In addition to the dimensions or sub-capacities already mentioned, ACAP component elements also include multi-level organizational antecedents (Jansen et al., 2005). Internal and external social linkages, knowledge coordination through cross-functional interfaces and participation in decision-making processes, as well as such specific routines as job rotation, are examples of other ACAP component elements (Gebauer et al., 2012; Van Den Bosch et al., 1999).

**ACAP has been used in conjunction with various fields of knowledge, leveraging its current widespread diffusion among scholars. Whatever differences there are among the main authors as to the precise and clear definitions of the construct and its dimensions or sub-capacities, such multidisciplinary applications of ACAP premises endorse the construct's resilience and reinforces its importance, both in academy and management.**

Considering knowledge management literature usually targets large companies with low applicability of the outcomes to SMEs (Cerchione et al., 2016), a literature review on strategic management in the context of SMEs, highlighting knowledge absorption practices and routines, is presented next.

## LITERATURE REVIEW: STRATEGIC MANAGEMENT AND ACAP IN SMES

Data were extracted from Clarivate Analytics Web of Science™ database in June, 2019, using the Boolean logic TS = ("strategic management" AND SME OR "small business" OR "medium business") to retrieve all documents presenting these specified expressions in title, abstract, author keywords and keyword plus™. With this procedure, we retrieved 187 documents in the first extraction. After an initial review of all titles and abstracts, focusing only on documents based on general themes related to strategic management (e.g.: knowledge, innovation, business model), we selected 52 documents as a first filter. After applying a second filter for business management documents published in journals with impact factor or SCOPUS *citescore* index greater than 1, we selected the final 15 articles in line with the objectives of this review.

After a comprehensive content review of the articles retrieved, we propose the following linking blocks between ACAP and strategic management for SMEs.

### *Knowledge absorption from inter-organizational partnerships*

SMEs benefit considerably from inter-organizational partnerships and more specifically from alliances, when expanding to international markets (Colombo et al., 2009). Among other benefits, these partnerships allow parties to share organizational knowledge and overcome resource constraints in terms of human capital (Ferreira and Franco, 2019). Nakos et al. (2014) build on strategic alliance and entrepreneurship literature to evaluate the impact of alliances with competitors and non-competitors on international SME performance. Engagement in foreign market alliances facilitates knowledge transfer and absorption between partners, since alliance participants share a common previous language and understanding of the business context and its critical resources (Ritala et al., 2008). This is in line with ACAP literature on previous related knowledge as an important antecedent to facilitate new knowledge absorption (Gebauer et al., 2012; Lane and Lubatkin, 1998). Benefits are multiple, including gaining knowledge of the specific foreign market helping the SME with institutional network contacts abroad (Sefiani et al., 2018). In summary, alliances are recognized as a relevant initiative to foster knowledge absorption and strategic benefits.

### *Innovation through customer relationships*

Building on extensive literature on strategic management underpinned by the resource-based theory (Grant, 1991; Peteraf, 1993), Rangone (1999) developed empirical research based on 14 case studies of SMEs in different industries, aiming to propose an approach to strategy analysis based on such a theory. Results obtained from case studies reveal three critical capabilities upon which SMEs base their strategic approach: innovation, production and market management capabilities. The framework proposed by the author on practices linked to innovation capability highlights customer relationship as having high strategic value for SMEs. This practice is especially important as a new knowledge source alone or as a trigger to search for valuable knowledge applied to new product development (Fletcher and Polychronakis, 2007; Rangone, 1999).

### *Dynamic capabilities nurturing learning*

Dynamic capabilities (DC) are currently widely discussed in strategic management and may be defined as an organization's ability to integrate, build and reconfigure internal and external resources (Teece et al., 1997). SME development of dynamic capabilities is the overall objective of Tallott and Hilliard's (2016) study. The authors undertook a qualitative study with longitudinal data collection to understand the development processes of DC in a specific organization. The implementation of practices and routines of a learning organization (Senge, 1990) is at the core of initiatives to build DC in the specific case study. Since ACAP is a dynamic capability (Zahra and George, 2002) linked with organizational learning (Cohen and Levinthal, 1990; Sun and Anderson, 2010), these initiatives may be

important elements in integrating ACAP dimensions in the context of SME strategic management processes.

*Social capital as a knowledge absorption enabler*

Social capital may be defined as the value embedded in the social relationships of individuals or groups (Gedajlovic et al., 2013). Social and relational capacities of SME top decision makers are required to manage and nurture external relationships over time, leveraging valuable external knowledge absorption (Santoro et al., 2019). Hernández-Carrión et al. (2017) evaluated the impact of social capital on SME economic performance. Authors group entrepreneurial relationship networks into four categories: personal, professional, associative and institutional. These four networks are sources of valuable knowledge to support the development of financial, technological, commercial and other relevant capabilities for SMEs. Social integration mechanisms for leveraging knowledge absorption in organizations is a common topic in ACAP literature (Gebauer et al., 2012; Todorova and Durisin, 2007; Yli-Renko et al., 2001; Zahra and George, 2002). Combining these references, social capital may be an important enabler for strategic valuable external knowledge absorption.

*Internal social networks fostering knowledge absorption*

Campbell and Park (2017) considered another perspective of social capital as a critical resource for SMEs. Key dimensions in their study include trust, homophily, reciprocity and shared vision as the main attributes for consideration to understand internal social capital impacts on SME performance. In their analysis, Tsai and Ghosal (1998) suggested that the creation of internal social capital eventually generates value in SMEs with each of the four dimensions, reinforcing the creation and development of the other dimensions. Social capital underpinned by quality of internal social interactions fosters an organization's knowledge absorption capabilities (Kusunoki et al., 1998). Against conventional beliefs regarding motivation factors as the primary enabler or restrictor of proper internal knowledge flow, Szulanski's (1996) findings show that relationship difficulties between the source and the recipient of the information is one of the major barriers to internal knowledge transfer and assimilation. This reinforces the need to investigate practices and routines associated with internal social network integration as a relevant component element of ACAP to leverage strategic value for SMEs.

*Leveraging previous knowledge to seize new opportunities*

Drawing on the knowledge-based theory (Grant, 1991), Kallmuenzer and Scholl-Grissemann (2017) developed a framework of antecedents aiming to evaluate the internalization of external knowledge through seizing technological opportunities and inter-organizational collaboration. Their findings showed previous internalized knowledge as having a positive impact on seizing external technological opportunities, confirming their argument that existing knowledge within organizations ultimately impacts SME financial performance. The importance of previous knowledge as an antecedent for effective knowledge absorption is at the core of seminal publications on ACAP (Lane and Lubatkin, 1998; Todorova and Durisin, 2007). Practices and routines associated with previous knowledge related to external technological opportunities and inter-organizational collaboration may be important elements integrating ACAP and strategic management for SMEs.

*Entrepreneurial orientation for external knowledge acquisition*

Entrepreneurial orientation (Covin and Lumpkin, 2011) as an antecedent for SME performance is included in 7 of the 15 articles retrieved for this review. Either as an independent or mediator variable, entrepreneurial orientation (EO) appears to be an important element for SMEs to support their strategic planning. Mediated by experiential learning and networking capability, Karami and Tang (2019) suggest that EO combined practices and routines of experimentation, risk-taking, interaction with context and collaborative decision making, among others, lead to international SME performance. Similarly, Rua et al. (2018) suggest that combined EO behavior and knowledge absorption capabilities may lead to export performance for SMEs. Jin et al. (2017) also examined the independent roles of each EO dimension – proactiveness, innovativeness and risk-taking – in international performance. As SME owners or top management deal relentlessly with business in

scarce resource contexts, recognition of threats and opportunities of new knowledge resulting from EO behavior seems to yield a relevant bond between SME ACAP practices and strategic management initiatives.

## INTEGRATIVE FRAMEWORK

For the purpose of this research, ACAP component elements encompass all aspects related to ACAP dynamics in an organization. Integration of these component elements with relevant strategic management imperatives for SMEs is the base of our proposed integrative framework to investigate results in the field.

Figure 1 summarizes this literature review, highlighting relevant links of SME strategic management elements to absorptive capacity literature.

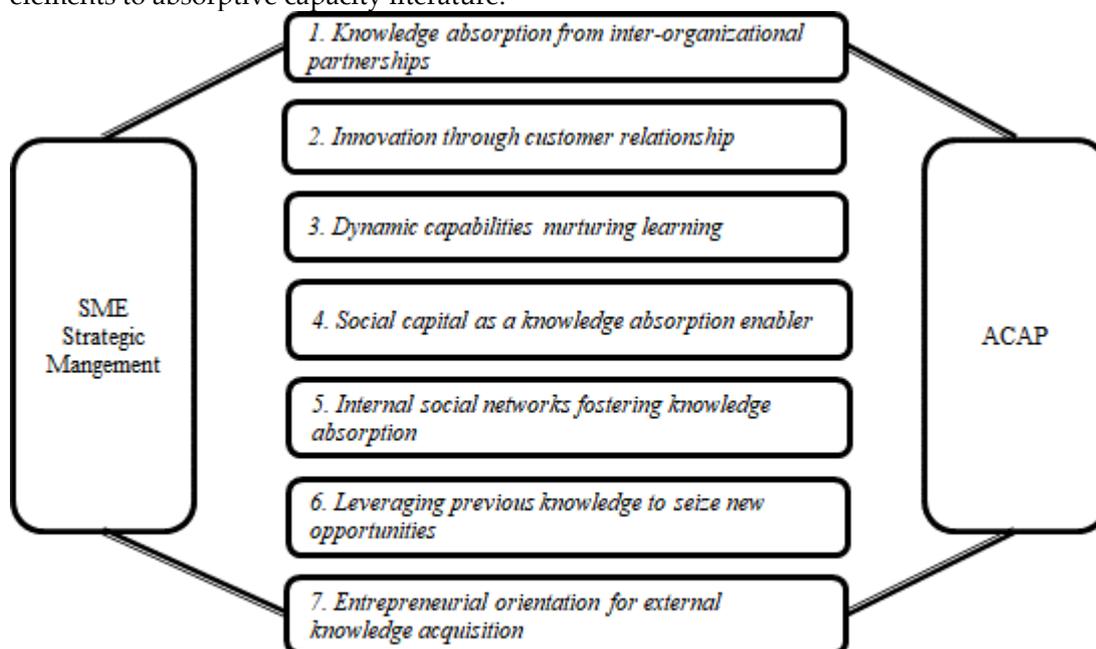

Figure 1. Relevant links between SMEs strategic management and ACAP

## METHODOLOGICAL PROCEDURES

ACAPs are complex and dependent upon the context in which they are observed. They are firm specific and potential sources of sustainable competitive advantage (Argyres and Zenger, 2012). To achieve research objectives, we chose a qualitative, exploratory methodology as an appropriate approach when the boundaries between the phenomenon (ACAP) and the context are not well defined (Yin, 2003).

We conducted 2 exploratory studies to evaluate the proposed model. The following criteria

were used to define and select these two cases: one small and one medium organization; their value proposition includes digital products, services or solutions.

#### *Case descriptions*

Company A is a medium-sized technology solutions organization, in operation for over 25 years. The company portfolio includes high-tech products, services and solutions for aerospace and defense, targeting worldwide markets. Gross revenue is above US\$15M (fifteen million dollars) per year, with about 250 employees, including shop-floor industrial workers.

Company B is a small-sized technology products organization, in operation for over 20 years. The company portfolio includes digital broadcasting equipment with proprietary software embedded. Gross revenue is below US\$400K (four hundred thousand dollars) per year with about 70 employees, including shop-floor industrial workers.

See table 1 for individual interviewee job roles.

| Company A |  | Company B |   |
|-----------|--|-----------|---|
| Reference | Job role   | Reference | Job role                                      |
| A1        | Executive VP of Operations                       | B1        | Owner and Managing Partner                    |
| A2        | Director of Research, Development and Innovation | B2        | Sales Manager                                 |
| A3        | Executive VP of Sales                            | B3        | Finance and Administration Manager            |
| A4        | Technical Leader of Research and Development     | B4        | Engineering, Development and Research Manager |
|           |  | B5        | Production Manager                            |
|           |  | B6        | Customer Services Manager                     |

Table 1. *Interviewees list*

## RESULTS ANALYSIS AND DISCUSSION

In this section we present the research results. We also examine how interviewee responses may answer our research question for each of the proposed integration blocks between the ACAP and strategic management imperatives of SMEs.

#### *Knowledge absorption from inter-organizational partnerships*

Company A's value proposition is to provide excellence as a technology integrator. According to respondent A1, technology dynamics mean that project requirements and resource allocation are not stable. This means experimentation and inter-organizational partnerships for risk and knowledge sharing are top priorities. As an integrator of multidisciplinary projects, knowledge sharing between partners is crucial to deliver project results. According to respondent A2, inter-organizational networks are embedded in their business model. This includes alliances with other companies in the

aerospace sector, with a larger company at the center of the network. Scarce resources make it difficult for SMEs to innovate alone in a dynamic environment. Respondent A2 went further by mentioning that even large companies are failing to do so. Respondent A2 also mentioned a recursive cycle of knowledge absorption originating in these network activities. Each individual recursive cycle feeds other partner cycles in a healthy, productive symbiosis. Such inter-organizational networks seem to be at the core of knowledge absorption practices and routines embedded in company A's strategic initiatives.

Two main initiatives are at the core of Company B's strategic knowledge absorption initiatives. One is through co-development of a product with a university to fulfill a specific market demand. The other is an important initiative with an international competitor. Despite the risk of partner opportunism, product complementarity supported company B's product portfolio update in a typical co-competition (Ritala, 2012) type of partnership.

*Innovation through customer relationships*

Customer engagement is deeply embedded in company A's management process, including local, regional and international formal and informal contacts. The business development team is formally assigned to continuously assess new customer needs in the aerospace and defense sectors. According to respondent A3, those professionals must raise such opportunities in formal internal meetings, start a project related to such opportunity and be accountable for follow-up knowledge assimilation and potential exploitation.

Respondent B2, a sales manager, mentioned that the company's ultimate focus is on market demand opportunities and quick responses to these demands. Such responses include hardware and software solutions, mostly developed internally, according to respondent B4. Respondent B2 mentioned daily contacts with market influencers who have direct contacts with final customers as the source of valuable knowledge recognition for company B.

*Dynamic capabilities nurturing learning*

Company A's concept of value, according to respondent A1, is switching from products and services to customer experiences. This is one of the triggers for continuous initiative changes in the company. Company A employees recognize their lack of capacity to influence the dynamics of technological challenges nowadays. Uncertainty is the new pattern, and according to respondent A1,

they must keep looking for business opportunities and new valuable knowledge, even if they do not know exactly what they are searching for.

Classic strategic planning approaches rarely apply to the reality of company A. There is no control of markets or knowledge. An internal dynamic approach to seize such opportunities and reconfigure resources to exploit them lies at the core of their strategic management process. According to respondent A1, their job is to identify technology trends, assess internal knowledge gaps, acquire and assimilate lacking resources and, more importantly, change quickly. In order to operationalize this, company A has gatekeepers responsible for screening worldwide markets, looking for new valuable knowledge and technology trends. The competences of these professionals are not limited to high technical expertise but also include market orientation. Additionally, they are capable of matching potential new external knowledge with current organizational knowledge.

Due to low product innovation in company B, and fierce competition, respondent B2 mentioned a daily routine they perform to learn directly from their competitors. Since most broadcasting product specifications are well known, competitor websites are an excellent source of information. Although such imitation practices reveal their continuous intent to keep updated regarding market demand requirements, there are no strong indications of dynamic capabilities pervading company B. Nonetheless, these practices release learning processes that eventually trigger the transformation of available resources to help generate innovation.

*Social capital as a knowledge absorption enabler*

According to respondent A1, instead of managing projects using traditional supplier-customer logic, a project team includes all project stakeholders, from partners to final customers. Serial step-by-step project management no longer applies to Company A. This means social relationship attributes are at the core of proper knowledge transfer practice. There are incentive initiatives for participants to talk and interact as a paramount condition for project success.

Respondent B2 mentioned the relevance of influencers with direct contacts with final customers. These professionals are experts in broadcast equipment and solutions for the customer they provide with services. The closer and more open the relationship with these influencers is, the more opportunities there are to absorb valuable knowledge and the quicker and more effective the response of company B to market demands is.

*Internal social networks fostering knowledge absorption*

According to respondent A1, management continuously pursue the formation of internal innovation networks. Attaining an environment open to valuable new ideas is the main objective of such networks. In addition to the already mentioned gatekeeper role, company A also has the so-called knowledge acquisition and development group network. According to respondent A2, this network also includes external members from suppliers and local universities. Altogether, they belong to the formal research, development and innovation area.

The main cultural aspect observed in company B was a common sense of trust in the company owners, which minimizes conflicts, enhances the organizational climate and generates an environment open to new ideas and innovation. Despite the lack of formal internal networks or specific practices associated with team building, such cultural aspects seem sufficient for a common orientation of company personal. According to most respondents, this sense of trust plays an important role in Company B's employee interaction at work.

*Leveraging previous knowledge to seize new opportunities*

Company A was established with deep engineering and aerospace market knowledge. From this point on, the company path has always been related to this initial knowledge. Since the company business model implies delivery of customer solutions as a package instead of an engineering hourly rate, knowledge absorption and retention is imperative. This company's practice is to develop newly graduated engineers instead of recruiting experienced ones. New engineers are usually allocated to multi-organizational innovation groups to speed up their individual learning and assimilate company innovation practices.

Company B's owners are electronic engineers who started operations immediately after graduating. All ensuing development was based on this initial knowledge. Despite operating for more than 20 years, the owners still participate actively in product design. Respondent B1 states they are proud to call themselves "bench engineers". Employee retention is critical for company B. They therefore base their knowledge update practices on hiring recently graduated engineers and training them on the job.

*Entrepreneurial orientation for external knowledge acquisition*

Since its foundation, company A has targeted local and foreign markets for new opportunities and orientation for research and development initiatives. Adaptability was at the core of company initiatives from the very beginning of operations, due to a crisis period. Based on engineering projects, the organization's initial 10 years of operations comprised several examples of entrepreneurial adaptability. As a matter of survival, and to maintain the initial founding vision, apart from targeting aerospace and defense markets, they entered non-related markets with such diverse projects as improving bicycles, washing machines, pressure cookers and women's tampons.

Despite not considering themselves pioneers, respondent B1 was clear about their risk-taking approach to new opportunities. Proactive behavior may be observed in such specific daily practices as watching market movements assiduously. All in all, EO elements seem to be evident in company B as well, but more as a survival need than a support for initiatives. No matter what the reason for adopting such behavior is, overall EO behavior is an important indicator to support the design and implementation of specific practices and routines in their daily battle for knowledge acquisition, leveraging the efforts to add value to their products.

## IMPLICATIONS AND CONCLUSIONS

The main focus of this paper lies in the relevance of valuable knowledge absorption for strategic management processes in digital SMEs. Our intent is to comprehend how absorptive capacities are embedded in the strategic formulation of these digital SMEs. The literature review shows potential strategic initiatives where knowledge absorption capacities are integrated. Field results reveal relevant evidence for each linking block of the proposed framework.

These findings provide some theoretical and managerial implications. Firstly, the study adds to the literature on ACAP by tackling digital technology-based small and medium organizations. Although digital SMEs have overall limited capacity to access specific resources and greater difficulties to set the flows involving ACAP (Tzokas et al., 2015), there are still few studies dealing with ACAP for these specific organizations (Flatten et al., 2011). Secondly, the study contributes to the broad field of strategic management by focusing specifically on SMEs. Even though relevance for employment levels and complementarity of the value chain are acknowledged, there is still a lack of comprehensive studies on strategic management related to SMEs (Cerchione et al., 2016). Since knowledge absorption capacities are paramount for achieving competitive advantages and above average results (Cohen and Levinthal, 1990), the third implication relies on our proposed framework with linking blocks combining strategic management imperatives and ACAP component elements. This last implication has important managerial contributions, as it may serve as a potential orientation for digital SMEs in

their strategic endeavor to survive and thrive in dynamic markets.

This research is an on-going work and has some limitations. Although both companies are digital technology-based SMEs, company A is a medium company operating worldwide, while company B is a small company operating locally in a highly regulated environment. Based on our results, we acknowledge some minor adjustments might be effective in the framework. As an example, in the EO section, rather than reflecting on the behavior itself, the questions might focus on practices and on routines for validation purposes. Learning through the inter-organizational network partnership section should also be better explored, by adding straight questions on knowledge absorption from all kinds of network engagement. Blocks related to social capital could be combined in just one group for further examination. Although these points might pose limitations to this study, they also provide some valuable avenues for deeper investigation.

As digital technology-based SMEs struggle to survive and thrive in a global dynamic world, the more we investigate strategic management processes applied to their reality, the better we will be able to comprehend their importance to value chain complementarity. We chose ACAP embedded in strategic management processes. However, many fields of study may also support such debate. Entrepreneurship, open innovation, organizational learning, among others, might underpin the foundations for further, desirable investigation.

# DIGITAL TRANSFORMATION IN SMES: A SYSTEMATIC REVIEW AND FUTURE DIRECTIONS

De Bernardi, Paola<sup>1</sup>; Forliano, Canio<sup>2</sup>; Bertello, Alberto<sup>1</sup>

<sup>1</sup>Department of Management, University of Turin, Turin, Italy

<sup>2</sup>Department of Political Science and International Relations, University of Palermo, Palermo, Italy

## ABSTRACT

In the nowadays global economy, digital transformation is leading companies of all sizes to rethink their products, processes, and business models to meet changing society requirements. In this regard, research on digital transformation has gained great research interest from both scholars and practitioners.

However, to date, most of the research has been focused on studying such changes within the boundaries of large companies or high-tech start-ups. Thus, this paper is motivated by the necessity of providing a more profound understanding of the interplays existing between digital transformation processes in the context of small and medium-sized enterprises (SMEs).

To do so, a two-step structured literature review was conducted with the aim of systematizing and synthesizing current research on the topic and provide an avenue to drive future research. To do so, articles indexed in the timespan 2010-2019 on Scopus were submitted to bibliometric analysis, allowing us to synthesize and systematize current knowledge on the topic. Then, the articles published in journals ranked 2 or higher in the AJG2018 were selected for a content analysis. Interestingly, three major research streams emerged: (1) innovation, (2) information and knowledge management systems, and (3) decision making. Moreover, avenues for orienting future research agenda could be identified. These results highlighted the partial conceptualization of the phenomenon and were used as useful baseline to provide some insights about future research needs.

*Keywords: digitalization, small and medium-sized enterprises, SMEs, structured literature review, bibliometric analysis, innovation, information systems, knowledge management, decision making*

## INTRODUCTION

Digital transformation is nowadays influencing every type of business. Technologies such as internet of things (IoT), blockchain, and artificial intelligence (AI) are radically changing the rules of the game by requiring firms to face great challenges but also great opportunities (Bresciani *et al.*, 2018; De Bernardi *et al.*, 2019; Ferraris *et al.*, 2019; Scuotto *et al.*, 2016; Serravalle *et al.*, 2019). At first, the digital revolution

seemed to be the prerogative of large companies and start-ups from high-tech sectors. However, the increasing uncertainty and dynamism of business environments (Thrassou *et al.*, 2020), further triggered by the COVID-19 crisis, is also calling small- and medium-sized enterprises (SMEs) to advance their technological competencies (OECD, 2020). The development of ever more sophisticated and advanced information and communication technologies (ICTs) can, in fact, offer SMEs the opportunity to rethink product, processes, business models, and customer experiences to meet changing society requirements (Müller *et al.*, 2018; Santoro *et al.*, 2018a; Scuotto *et al.*, 2017a; Scuotto *et al.*, 2017b). Digital transformation, also recently known under the label “Fourth Industrial Revolution” (Fakhar Manesh *et al.*, 2020), has become a topic of interest in many research areas, such as computer science, engineering, and material science. However, the pervasiveness of new technologies within our businesses and our society in its entirety is also attracting the attention of managerial studies. Indeed, digital transformation is raising 360-degree reflections on the possible organizational and managerial implications that derive from technological progress in SMEs. In fact, it is not technologies that create value in themselves (Chesbrough, 2007) but their integration within a clear corporate strategic vision (Saebi and Foss, 2015), where the term transformation refers to the organization and to its structure, culture, and capabilities.

Despite the variety of digital technologies, their pervasiveness, and the various fields in which digitalization can be leveraged in SMEs, no comprehensive studies have addressed the impact of digitalization in SMEs. In this vein, the aim of this study is to systematize the scientific literature published to date on this topic, shedding more light on what we know, what we don't know, and what we need to know about digitalization in the context of SMEs. With this purpose, we developed a structured literature review (SLR) that followed a three-phase design research. As a first step, studies indexed on Scopus were submitted to a bibliometric analysis for capturing trends and performances of scientific publications. Our findings show that research investigating the interplays existing between digitalization and SMEs is emerging as a globally relevant topic, involving both emerging and advanced countries, but is still fragmented and undertheorized, requiring more systematization studies. As a second step, we developed a content analysis to individuate the main classes of clusters in the leading academic literature on digitalization in SMEs. In this way, three main thematic clusters were identified as follows: (i) innovation; (ii) information and knowledge management systems; and (iii) decision-making. Furthermore, the results enabled us to individuate the topics which can drive future research agenda.

The remainder of this paper is structured as follows. In the second section we describe the structured review methodology and data collection process. In the third section we provide a descriptive analysis

of the findings. In the fourth section we present the findings of our content analysis. In the last section we provide avenues for future research and both theoretical and practical implications.

## METHODOLOGY

In this article, a SLR was performed for investigating relevant publications related to digitalization and SMEs. To do so, both quantitative and qualitative analyses were performed. So, in the first phase, a bibliometric analysis was conducted for evaluating scientific publications' trends and relevance through statistical techniques. Articles, journals, and authors represented the main unit of analysis of this phase (Thelwall, 2008; Massaro *et al.*, 2016). This kind of analysis represents a well-established method for studying science and evaluating scientific publications published in a specific research area and period of time (e.g., Cuccurullo *et al.*, 2016; Diem and Wolter 2013). In this study, the bibliometric analysis was performed using the Bibliometrix package (Aria and Cuccurullo, 2017), developed to run into RStudio (RStudio Team, 2016), which is one of the most used software by researchers and analytical practitioners to conduct statistical analysis. Secondly, papers were qualitatively analyzed for identifying primary research areas that have been investigated by scholars to date. In this way, also the gaps existing in the literature were identified and possible future research lines provided.

### *Research questions formulation*

According to Nguyen *et al.*, (2018), a successful SLR starts posing a clear research question. Following Vrontis and Christofi (2019), in this study, the research questions were settled through dialogue between authors and by taking the opinions of academic and industry experts. Since the aim of this study is to analyze the interplay existing between small and medium enterprises and digitalization, the research questions were posed as follows:

RQ1. "How is the business and management literature investigating the digital transformation of SMEs developing?"

RQ2. "How does the business and management literature address the dramatic changes occurring in reason of the digital transformation?"

RQ3. "What could be possible emerging topics in the future?"

### *Data search*

The first step of a SLR is to collect the publications that will be processed for obtaining the necessary metadata (Carvalho *et al.*, 2013). Consistently with other studies addressing digitalization in social sciences (Galati and Bigliardi, 2019; Mariani and Borghi, 2019), in this paper the research was conducted using one database: Elsevier's Scopus. This choice is suggested for avoiding homogenization issues that would emerge extracting data from different databases (Waltman, 2016). Together with

Clarivate Analytics' Web of Science (WoS), Scopus is considered one of the most reliable and comprehensive scientific databases in social sciences (Mongeon and Paul-Hus, 2016), with more than 20,000 active titles (i.e., peer-reviewed journals, books, and conference proceedings) and around 69 million records. However, to corroborate the choice of using only Scopus, the same set of keywords was also used to search into WoS, resulting in a consistently lower list of publications.

To collect data from Scopus, the literature related to the investigated topic was analyzed for selecting relevant keywords. Following Scopus' syntax, the initial search string was set for searching into the title, abstract, keyword fields of publications as follows:

*TITLE-ABS-KEY ("Cloud computing" OR "Machine learning" OR "Augmented reality" OR "Virtual reality" OR "Artificial intelligence" OR "Internet of things" OR "Fourth Industrial Revolution\*" OR "Big data" OR "Cybersecurity" OR "Blockchain" OR "Digitalis\*" OR "Digitaliz\*") AND TITLE-ABS-KEY (SME\* OR "Small and medium-sized enterpris\*" OR "Small and medium sized enterpris\*" OR "small compan\*" OR "small manufactur\*" OR "small firm\*" OR "medium firm\*" OR "medium compan\*" OR "small enterpr\*" OR "Medium enterpr\*")*

Thus, Boolean operator "OR" was used to combine keywords related to the same group (i.e., digitalization and SMEs) and the Boolean operator "AND" for combining the two search strings. Moreover, wildcards were set to capture different combinations of keywords.

#### *Data collection*

The search was conducted in February 2020 and included all documents published between 2010 and 2019, resulting in 2,693 results. The restriction in the timespan of publications was posed for investigating the last ten years of studies addressing the digitalization phenomenon and excluding publications released in 2020. This is a common practice in bibliometric studies to limit comparability biases during the performance evaluation of publications that could not benefit from an adequate time to be read and cited by other scholars (Massaro *et al.*, 2016).

Secondly, the sample was restricted to consider only: (i) English-written documents due to limitations of researchers (Vrontis and Christofi, 2019); (ii) peer-reviewed articles for ensuring a higher quality of data; and (iii) papers published within the business and management domains for answering the research questions of this study and excluding issues in comparing the metrics of scholars or journals of different research fields. A final record of 197 results was submitted to bibliometric analysis.

Finally, studies in peer-reviewed journals ranked two or higher in the AJG 2018 published by the Chartered Association of Business Schools were considered for content analysis. Fully aware that this could have excluded some relevant articles, the authors posed this restriction to consider only top-tier academic journals and peer-reviewed articles. This ensured a higher quality of retrieved data and the

identification of relevant research trends, as can be retrieved in other studies published in top-ranked business journals (e.g., Gaviria-Marin *et al.*, 2019; Vrontis and Christofi, 2019; Franco-Santos and Otley, 2018). This resulted in 56 documents, as shown in Figure 1.

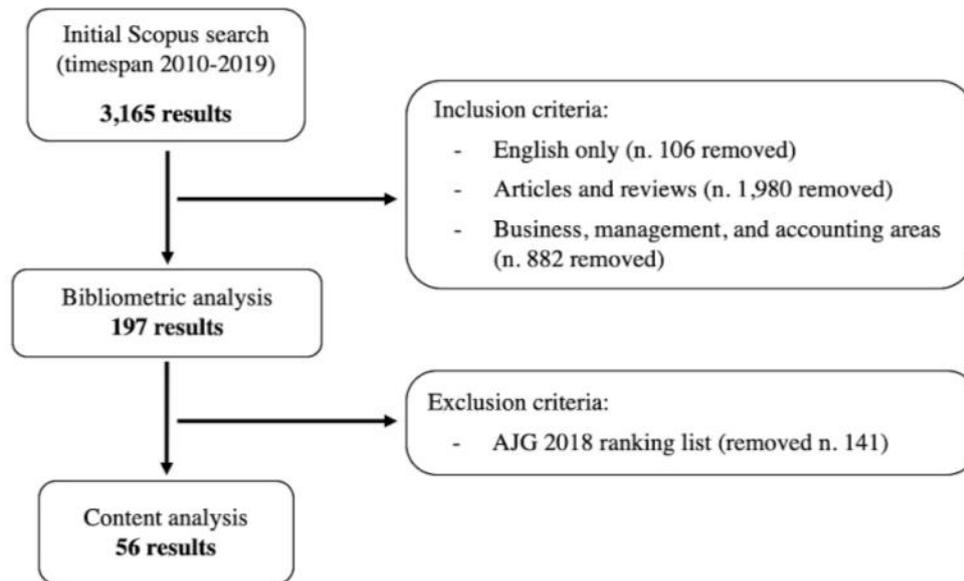

Figure 1. *The data collection and analysis process.*

## BIBLIOMETRIC ANALYSIS

This section explores the performance analysis of publications, countries, Journals, and authors leveraging both productivity (e.g., total publications, geographic distribution) and impact (e.g., total citations, h-index) measures. A comprehensive picture of the trends characterizing the scientific publications on digitalization and SMEs from 2010 to 2019 is offered for answering RQ1 of this study.

### *Articles' evolution and geographic distribution*

Articles on digitalization and SMEs have been published since the early '90s, but publications started to increase from 2010, the cutting point set for data extraction (Figure 2). This trend was exacerbated by the introduction of the "Industrie 4.0" program in Germany in 2011, followed by other European countries in the next years, and confirms that the topic is relatively recent (Tirabeni *et al.*, 2019). It can be noted how the annual growth rate is around 55%, demonstrating an increasing interest of scholars on the subject.

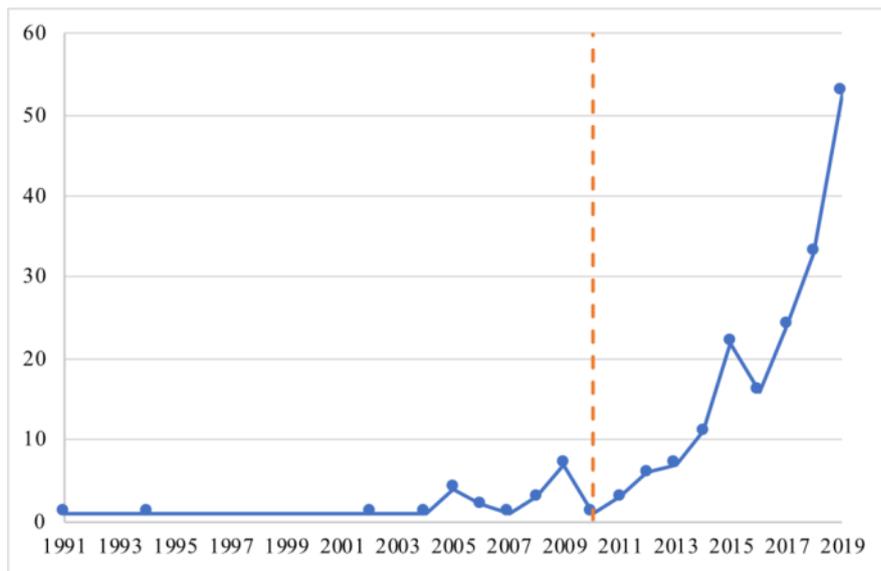

Figure 2. *Publications trend in the timeframe 2010-2019.*

For what regards the geographic distribution of articles, Figure X reveals that India is the country with the highest number of articles (49 results). India launched its Industry 4.0 program, “Make in India”, in 2015 together with a governmental plan, called “Digital India”, to transform the country into a digitally empowered economy. Moreover, SMEs represent the backbone of its economy in terms of productivity, trade, and employment (Government of India, 2020). respectively. Although the resulting documents in some countries are low, Figure 3 also allows assuming that the topic is globally relevant, involving both advanced and developing countries.

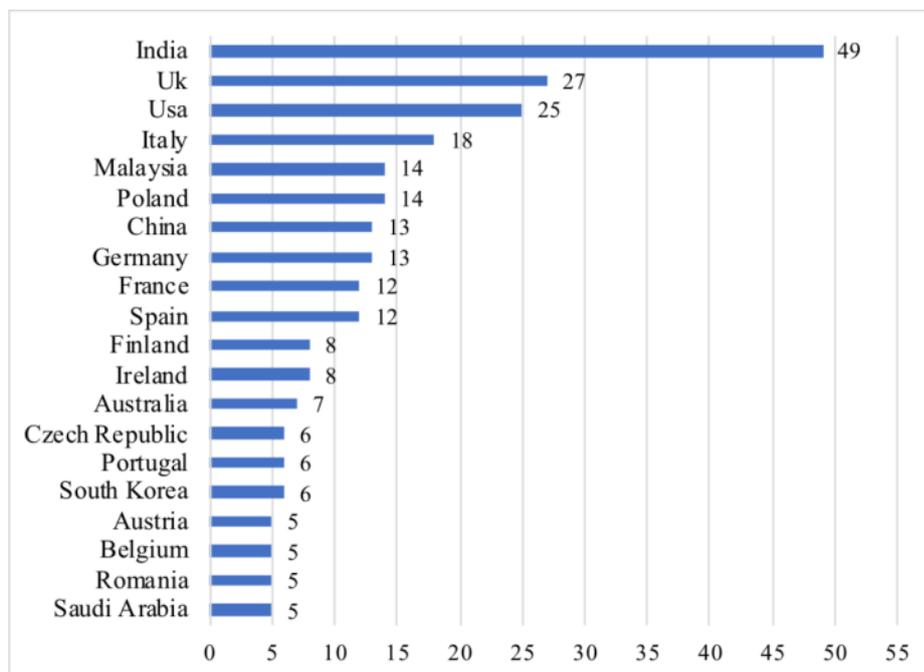

Figure 3. *Number of articles per country.*

Considering the citation trend of different countries (Figure 4), it could be easily noticed that countries rank very differently compared to productivity. So, the UK goes up from second place to first place, distancing other countries, while India goes down to sixth place. In this regard, together with China and the USA, European countries show a higher impact than emerging countries.

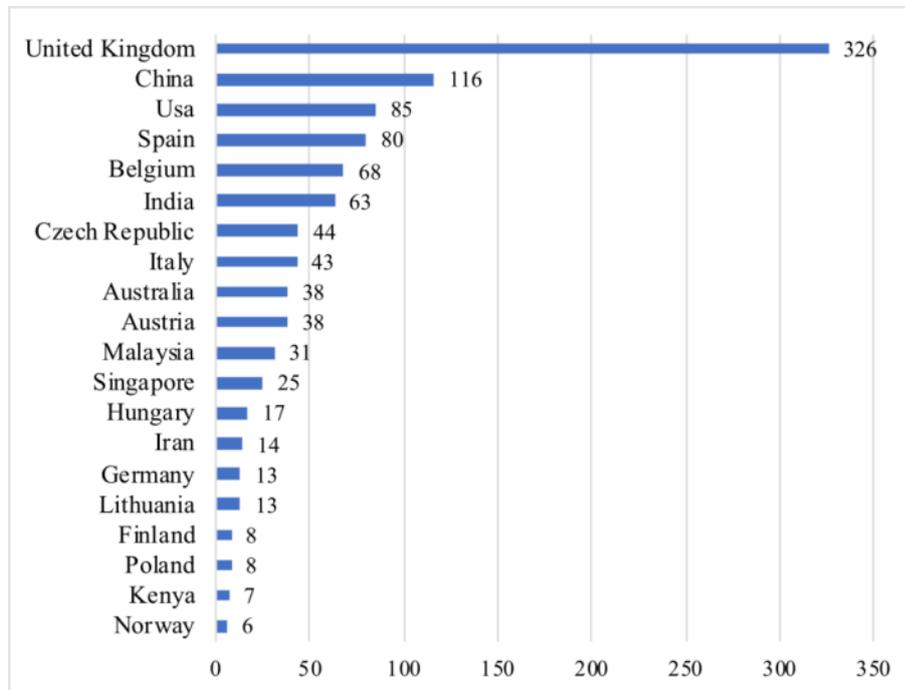

Figure 4. Number of citations per country.

#### *Journals*

Regarding the journals, the top 10 in terms of the number of published articles are presented in Table 1. Journals that publish about internationalization are the most productive in terms of digital transformation and SMEs, ranking among the top three journals. Interestingly, other journals among the most productive on the topic are focused journals, publishing about innovation, information management, decision making and decision systems. However, it is worth highlighting that only 37 journals out of 118 have published more than one article related to the theme. The rest of the journals published only one article, which in some cases was highly cited (e.g., Journal of Industrial Engineering and Management with 96 citations, Electronic Markets with 64 citations, Information Systems Research with 47 citations). This can be easily noticed from Table 2, in which the top 10 journals in terms of the number of citations are presented. These results are also useful to determine the most relevant authors and papers and confirm the lack of maturity and high fragmentation of this research field, as well as the need for systematization works.

| #  | Journal  | N. of articles | Total cit. |
|----|--|----------------|------------|
| 1  | International Journal of Business Information Systems      | 11             | 68         |

Table 2. Top 10 journals per number of total citations.

### Authors

For identifying the most influential authors that have studied digital transformation and SMEs, their most cited publications in the dataset were considered in this study. Indeed, total citations are considered a proper indicator for synthesizing the impact of a publication within the scientific community (Merigó *et al.*, 2015). Table 3 depicts the top ten articles for total citations, whilst Table 4 shows the top ten on the basis of citations received per year (TCpY), considering publication date. It can

be noted that the article from Alshamaila *et al.*, (2013) is the most cited, with 271 citations. The article shows how cloud computing can boost technological, organizational, and environmental aspects and how SMEs' strategies can be modeled to adopt such technologies. Following Alshamaila and colleagues, two literature reviews from Moeuf *et al.*, (2018) and from Sommer (2015) for analyzing the implications of Industry 4.0 on SMEs can be found, respectively, accounting 129 and 96 total citations. Then, there is a quantitative analysis from Scuotto *et al.*, (2017a), investigating the role of ICTs and big data in intra- and inter-organizational ties and the consequent effects on SMEs' innovation performance (73 citations). Then, a qualitative analysis from Trigueros-Preciado *et al.*, (2013), investigating which barriers hinder the adoption of cloud computing technologies in SMEs (with 64 citations), can be found.

Table 4. Top 10 articles per number of total citations per year (TCpY).

## CONTENT ANALYSIS

In this section the results of the content analysis are discussed, providing an answer to RQ2 of this study. The analysis was conducted on the 56 publications, resulting from having considered only articles published in journals ranked 2 or higher in the AJG2018. In this way, the most relevant research trends could be identified and clustered. Three clusters emerged as follows:

- Research Area 1: innovation
- Research Area 2: information and knowledge management systems
- Research Area 3: decision making

### *Innovation*

Innovation is not only driven by technology. To successfully turn technologies into innovation, SMEs need to screen their market, have a clear idea of their business model, and adapt the organizational culture and structure. Digital technologies, if well managed, can lead to different innovation outcomes such as product innovation, process innovation, service innovation, marketing innovation, organizational innovation, strategic innovation, and so forth (Gupta *et al.*, 2007). In our sample, most of the papers highlight how digitalization can enable collaboration, both with customers (Goduscheit and Faullant, 2018; Shamsuzzoha *et al.*, 2016) and other organizations (Del Vecchio *et al.*, 2018; Scuotto *et al.*, 2017a). More specifically, digitalization can allow SMEs to be part of an ecosystem when taking advantage of collaboration with other companies, universities, government, and customers (Bogers *et al.*, 2018; Enkel *et al.*, 2020; Radziwon and Bogers, 2019; De Bernardi *et al.*, 2020). In this regard, according to Del Vecchio *et al.*, (2018), SMEs can tackle more effectively some challenges by leveraging big data for open innovation strategies. For instance, they could overcome their vulnerability when trading conditions change and the economy takes a turn for the worse. More specifically, Del Vecchio *et al.*, (2018) individuate three ways of creating new opportunities to sustain an open innovation strategy: the creation of a new open business model, the spin-out asset and the secondary markets, and a process of organizational change. The potential of big data was also recognized by Goduscheit and Faullant (2018). In this case, they point that big data generated internally within the focal company in combination can enhance the innovativeness of the service offered to the customers. However, they also recognize that digitalization must be combined with an efficient mobilization of internal resources and external resources in collaboration with other organizations. Shamsuzzoha *et al.*, (2016), instead, argue that web technologies and the IoT can enable collaboration among SMEs for customizing products and improving product innovation. In a similar vein, Scuotto *et al.*, (2017a) highlight how advances in information and communication technology lead SMEs to achieve better performance in terms of exploiting both internal and external knowledge to improve innovation processes in generating new products and/or services. However, some studies also reveal that SMEs have more difficulties than large companies in leveraging technological innovation. For instance, Clohessy and Acton (2019), adopting an innovation theory perspective, point out that top management support and organizational readiness enable blockchain adoption, and large companies are more likely to adopt blockchain than SMEs.

### *Information and knowledge management systems*

SMEs tend to be less structured than large companies. They often do not need advanced information systems (ISs) and knowledge management systems (KMSs) to turn information in knowledge and manage their activities. However, the increasing uncertainty and dynamism of competitive landscapes

are pushing companies to accelerate their innovation paths and to process a greater amount of data (Santoro *et al.*, 2019). This is not always easy to be managed since the increase of unstructured and simultaneous data and information may reflect negatively in organizations by congesting the information systems (Fakhar Manesh *et al.*, 2020). For this reason, in order to benefit effectively from digital transformation, organizations should improve their KMSs so as to scan and detect meaningful pieces of information and develop sophisticated and valuable uses of new knowledge (O'Connor and Kelly, 2017). In our sample, we have individuated two main streams of research addressing the topic of IS and KMSs in the digital transformation domain. A first body of literature focuses on analyzing the relationship between ISs and KMSs triggered by digital transformation and their impact on SME performance. Most of these studies are quantitative in nature. According to Ferraris *et al.*, (2019), for instance, SMEs developing more big data analytics capabilities than others are likely to increase their performance, and this relationship is positively amplified by KM orientation. A second stream of research tries to investigate deeper through both qualitative and quantitative studies what are the difficulties SMEs face when adopting dealing with a large amount of data and information and complex ISs and KMSs. Tvrdíková (2016), for instance, highlights how important are ICTs to process a huge amount of data. She points out that SMEs often use only personal IT and communication tools. Moreover, SMEs still suffer from lack of resources for investing in IT development, as well as a lack of awareness of the possibilities to buy quality IT at a lower cost. Among the technologies that are more relevant in our sample to develop successful ISs and KMSs, we have individuated machine learning (Delen *et al.*, 2013), big data analytics (Ferraris *et al.*, 2019), and cloud computing (Kumar *et al.*, 2017).

#### *Decision making*

The hyper-connected, dynamic, and complex context in which organizations operate nowadays requires them to limit as much as possible delays in decision-making processes. However, generally speaking, decision-making processes are unformalized in SMEs due to flat hierarchies (Salles, 2006). So, it happens that decision-makers have responsibilities at different levels and with different implications, dealing with both strategical and operational tasks in the absence of codified (Lect and Ogarcă, 2010). These characteristics result in large companies acting more driven by rational processes in comparison to SMEs, where inspirational decisions usually overwhelm rational ones. This implies that SMEs are a perfect setting in which investigating decision-making issues (Hauser *et al.*, 2019). Some studies concentrated on the internal environment in which decision-making processes occur, analyzing to what extent humans (Subramania and Khare, 2011), ISs (Borade and Sweeney 2015; Masclé and Gosse, 2014), or KMSs (Li *et al.*, 2016) should be involved and/or leveraged in these activities for enhancing SMEs' performances. Differently, other studies considered more the external environment. In this vein, Niu *et al.*, (2012 investigated which attributes must be taken into account

when selecting a partner to collaborate with, concluding that time, cost, quality, reputation, and risk are the most relevant. In the context of collaborative network, instead, Lin *et al.*, (2012) provided a conceptual model for supporting efficient conducts of SMEs' decision makers. In this way, they demonstrated how to leverage full benefits from participating in the network while attaining its strategic goals. Similarly, Renna (2013) proposed an interesting model for supporting rational decisions and simulations in the context of dynamic collaborative networks. So, he proposed a practical tool for helping SMEs' decision makers in deciding when the participation in such networks can be beneficial (or not) for the company.

Finally, a more recent study, investigated the role that decision support systems can have into empowering environmental management ISs to support for sustainability decisions and a cleaner production (Renatus and Geldermann, 2016). Indeed, SMEs often suffer from underemployment nor have the financial or organizational resources to deal with environmental matters, which are set aside to focus on more compelling affairs.

## CONCLUSION

### *Implications and future avenues for research*

SMEs are different from large companies (Bianchi *et al.*, 2018; Santoro *et al.*, 2018b), and this is also reflected in their digital transformation paths. Therefore, there is a need to develop comprehensive studies that can analyze the phenomenon. The main results of our study revealed that the adoption of new technologies had encouraged innovative paths to achieve product, process, and service innovation (Goduscheit and Faillant, 2018; Scuotto *et al.*, 2017a; Shamsuzzoha *et al.*, 2016). Few studies, instead, have focused on how digital transformation can influence the business models of a company (Rachinger *et al.*, 2019) and how it can stimulate innovations with social and environmental impact (De Bernardi *et al.*, 2020; Tirabeni *et al.*, 2019). The content analysis also revealed how digitalization can stimulate SMEs to undertake innovation paths based on inter-organizational collaboration with multiple stakeholders (Del Vecchio, 2018; Scuotto *et al.*, 2017a; Yaghmaie and Vanhaverbeke, 2019). From a practitioner perspective, our paper is useful as it offers an overview of the learnings on the interplays existing between digitalization and SMEs, providing some useful insights for what regards the three discussed research area, namely (i) innovation, (ii) information and knowledge management systems, and (iii) decision-making.

Furthermore, several theoretical implications can be derived. In this regard, answering RQ3, we have identified some research questions that can guide future studies on digital transformation and SMEs:

- How can the digital transformation contribute to the development of sustainable business models in SMEs?
- How do SMEs align their business model with technological advancements?
- Are SMEs able to take advantage from collaborative forms of innovation as well as large companies?

This work also highlights how important it is that SMEs be able to develop ISs and KMSs to process ever-increasing amounts of unstructured data. As argued by Ferraris *et al.*, (2019), for instance, KMSs can be seen as a moderator between big data analytics capabilities and organizational performance.

More effective management of information and related knowledge also have an impact on organizational decision-making processes, especially when dealing with collaborative networks (Renna, 2013; Scuotto *et al.*, 2017a; Forliano *et al.*, 2020) or sustainability driven shifts (Papadopoulos *et al.*, 2014; Renatus and Geldermann, 2016; Franceschelli *et al.*, 2018). Future avenues of research in the domain of ISs and KMSs are:

- How do SMEs integrate digital-based ISs and KMSs in their organizations after having traditionally relied on informal ways of processing and transferring information across the organization?
- Are complex ISs and KMSs always the right solution in SMEs?
- How are decision making processes affected by the introduction of formal and digital-based ISs and KMSs in SMEs?

The studies from our sample have highlighted how digitalization in SMEs can have a positive impact on various outcomes. However, undertaking digital transformation also requires certain resources, structures, and skills that SMEs do not always possess. Despite this awareness, few studies have developed in-depth analyses starting from these reflections. Based on these insights, we have developed some further future possible research questions:

- Which resource configurations SMEs need for effectively creating and capturing value from their technological development?
- What capabilities do SMEs need to develop to deal with digital transformation?
- What are the human skills required to cope effectively with technological development in SMEs?
- Finally, there is still paucity of studies addressing sustainability-related practices, especially regarding social sustainability, as well as the relationship existing between firm economical and non-economical performances and greenwashing practices (Bartolacci *et al.*, 2020). This leaves an opportunity to explore these issues from other management disciplines such as strategic, organizational, human resource perspectives.

*Limitations and further developments*

This research is not free from limitations, which pave the way for some interesting future studies. A first limitation can be identified in the choice to investigate only one database for conducting the data collection process. Scholars usually suggest to avoid consulting more than one database in conducting bibliometric analysis, due to homogenization issues. Second, in conducting the performance analysis of articles and authors, and journals, the most influential were considered in relation to the total amount of citations received or their h-index. So, younger scholars or more recent publications could have been penalized in this sense. However, the qualitative nature of the content analysis enabled to mitigate this bias, even if it was conducted considering only top-tier academic journals. This choice was made for capturing the debate of most relevant journals and scholars, but we are fully aware that some relevant articles could have unintentionally not been considered in this study. Finally, only articles considered in the timespan 2010-2019. However, due to the increasing trend of publications related to the topic, this would encourage observing the phenomenon over the years and dedicating future efforts of systematization.,

**DIGITAL MARKETING AGENCIES' INTERNATIONALIZATION  
PATHWAYS: A VIEW OF AN INTERMEDIARY ON THE PROCESS AND  
INTERNATIONALIZATION BARRIERS**

**ABSTRACT**

Business internationalization is usually time-consuming process that requires a significant amount of resources. Traditional theories describe internationalization as a process where companies slowly expand their operations to the "closest" markets, gradually increasing their internationalization commitment over time. With the deployment of new business models, usually backed by development and implementation of various Internet based technologies, a new type of rapid internationalization pathway emerges. Labeled as "born globals", companies following this pathway seek internationalization opportunities since their inception. During the internationalization process, companies face various barriers. While the research studies provide certain insight into the internationalization barriers that affect larger enterprises, the context of born globals is not that much investigated. The purpose of this study is to shed some light on the internationalization barriers among born globals. As the selected research method, two in-depth interviews with industry professionals in order to investigate common internationalization barriers among digital agencies. Some of them are external and mostly related to the lack of market information. Internal barriers are usually related to the productive capacity, available funds, manager's uncertainty and low level of risk accepting. Therefore, digital agencies follow different internationalization pathways. Although they base their business on the Internet, they are not necessarily highly internationalized and, in some cases, follow gradual approach with lower market commitment. Agencies with more resources and good ties on international markets tend to internationalize their business at higher pace. While being exploratory, this paper provides guidelines for further research of the rapid internationalization phenomenon among digital marketing agencies.

*Keywords: internationalization, Uppsala model, stage model, born global, internationalization barriers, digital marketing, advertising agency.*

## INTRODUCTION

The purpose of this paper is to provide certain insights into the internationalization process among digital marketing agencies. Specifically, this paper has two main objectives. First of all, common internationalization patterns among digital marketing agencies are investigated in order to be compared with the specifics of the two opposing internationalization theories. While the preliminary study (Draskovic, Markovic and Hruskar, 2017) indicates rapid internationalization pathways quite common among digital marketing agencies, there are also cases with more conservative approach towards internationalization. Finally, this paper focuses on the detection of internationalization barriers among digital marketing agencies.

Due to the nature of digital marketing agencies, Internet can be considered as the main catalyst for agencies' internationalization. Since its commercialization in mid 1990s, the Internet has been considered as a crucial force shaping modern business landscape and providing both entrepreneurs and managers with vast opportunities for the development of new and innovative business models. The newly formed internet economy received big support of financial markets leading to an enormous financial bubble that resulted with a market crash in 2000 and massive bankruptcies among the so-called dot-com companies (Berlin, 2008). Since then, a lot of things changed. Internet technology penetrated even further into economy and also our private lives, especially in its mobile form. In the late 2000s, social media became the "new internet" and new companies and business models emerged on the wave of digital transformation. Additionally, the Internet erased boundaries between countries and provided additional opportunities for internationalization for both existing businesses and start-ups. The internet brought a plethora of business opportunities for companies on a global scale. Traditionally, internationalization is being considered as an incremental and slow process that requires a lot of time and significant amount of resources (Johnson and Wahlne 1977; Bilkey and Tesar, 1977; Reid, 1981). Therefore, it was mostly attributed to the large-scale enterprises (LSEs), usually originating from economically developed western countries. On the other hand, the Internet acted as an equalizer of business opportunities removing geographical, economic and cultural barriers supporting small and medium-sized companies (SMEs) in their internationalization efforts, especially in the context of non-western countries with the lower level of economic development.

Theoreticians (e.g. Oviatt and McDougall, 1994; Gabrielsson and Kirpalani, 2004) noted existence of companies that do not follow traditional stages pattern of internationalization. Instead, their internationalization is rapid from inception and the Internet, usually, plays very important role in companies marketing efforts and daily operations. Additionally, the whole process has to be supported by the managers' global mindset, which has positive impact on the internationalization efforts and performance (Miocevic and Crnjak-Karanovic, 2012).

Utilizing exploratory research methodology, this study mainly focuses on internationalization motives and barriers. Additionally, the study investigates digital marketing agencies' internationalization modes comparing them with the two main theoretical approaches – Stage Model and Born Global.

## INTERNATIONALIZATION THEORIES

Internationalization in general can be understood as “the process of increasing involvement in international operations” (Welch and Luostarinen, 1988, p. 84). Internationalization has been studied by scholars for decades and the wealth of research findings, with theories and models built on them, mark the evolutionary peculiarities of different times and conditions that existed, out of which many persist to date. Analyzing the literature, it is visible that theories of internationalization of firms can be generally divided into two main streams: stage models of gradual internationalization of firm and models of rapid internationalization that neither follows gradual approach in models of foreign market entries modes neither the gradual distance mode from domestic market (Caputo *et al.*, 2016).

### *Stage Model of Internationalization of Firms*

Early models and theories emerged from the efforts to systematically explain internationalization pathways of various firms through the 1970s. Among them, the Uppsala model or the Stage model (Johanson and Wiedersheim-Paul, 1975; Johanson and Vahlne, 1977; Johanson and Vahlne, 1990) attempted to explain internationalization pathways of Swedish firms particularly focusing on the choice of country to enter and choice of mode of entry. As the (Stage) model suggested, firms initially opt for entering the countries that are the “closest” to their home market (neighboring countries) and with the modes of entry that are the “simplest” ones (exporting). This approach minimizes the risk of failure by targeting countries that are “close” to home country across numerous variables. Most commonly researched variable that serve as distance indicators were geographical, institutional and cultural distance from the home country (Brewer, P. A. 2007). Stage model also suggests that firm will expand internationally at a different pace primarily depending on the size of their domestic market and the size of the company (Peng, 2013). Firms that grow faster will accumulate more resources to counter the liability of foreignness in an easier way, relying on abounded resources available. Evidence points to the fact that there is a positive relationship between company growth ambition and exporting (British Business Bank, ERC and Goldman Sachs, 2015). Also, firms that saturate their domestic market early on will tend to internationalize sooner as this presents their only way of growing within the industry they compete in. This reasoning adds additional layer of understanding within the Stage model of internationalization.

Internationalization decision is intertwined with the choice of entry mode. Companies choices among main types of entry modes have been explored extensively (Johanson and Wiedersheim-Paul, 1975; Johanson and Vahlne, 1977; Johanson and Vahlne, 1990; Hollensen, 2017). In essence we can differentiate between export modes, intermediate modes and establishment of foreign wholly owned subsidiary. Export modes require lowest financial and organizational commitment and bare relatively low risk. Therefore, it is usually the first step in the internationalization process, especially among SMEs. In case of export mode, companies can choose between two options: (1) export directly to foreign customers or (2) to export through an intermediary (Peng and York, 2001; Hollensen, 2017). In case of direct exporting, a company has sole responsibility for finding customers abroad and to organize deliveries. The role of intermediaries is to support exporting companies with relevant market information that can reduce uncertainties and related risks, and to perform whole or partial exporting function (Acs and Terjesen, 2013). However, this mode of entry might be adequate for the early stages of internationalization but it also has disadvantages that might negatively impact companies' growth (Chintakananda *et al.* 2009). Intermediary is incentivized not to share all the information available and relevant to exporter with the exporter since this will most likely reduce his bargaining power in negotiation with exporter. Intermediate modes signal strategic success for the company and mark positive strategic development. Company commits larger resources to their international market(s) and often times expands geographical reach. Establishing wholly owned subsidiary in an essence marks the end point of internationalization as the difference between resource commitment between domestic and foreign markets essentially subside.

Although Stage model received substantial empirical support and extensions, i.e. Makino and Tsang (2011) have expanded the traditional variables used to measure distance by discovering the link between historical ties between countries and FDI flows, limitations of the model were also pointed to. Hernández *et al.* (2018) pointed that family firms might have an opposite choice patterns vs. non-family firms regarding the international location choice when taking institutional distance into consideration.

#### *The Born Globals Theory*

While reporting on the fast internationalization phenomenon among Australian export firms, McKinsey study come up with the term "born globals" in order to emphasizes the speed of the process that traditionally requires quite significant amount of time (Rennie, 1993). The study made distinction between traditional domestic-based companies focused on domestic sales and born global, companies with most of their sales resulting from exports, among the higher-value-added manufacturing firms in Australia. As the study suggested, these small to medium-sized companies successfully competed against bigger, well-established companies. Oviatt and McDougall (1994) also described same phenomenon but they labelled it as an International New Venture (INV). According to them, INV is "a

business organization that, from inception, seeks to derive significant competitive advantage from the use of resources and the sale of outputs in multiple countries". Knight and Cavusgil (1996) described born globals (or INVs) as often small and medium-sized enterprises (SMEs) with strong focus on information technology and with the global market vision. Crick (2009) distinguishes born globals and INVs, considering former as firms with global presence and commitment, while later are considered as internationalized firms with regional focus. To summarize, the aforementioned definitions emphasize the phenomenon of small and relatively small companies being active on global market, contrary to the more traditional views and theories describing only the LSEs as being capable of serving global markets

In contrast to the traditional internationalization theories suggesting slow and gradual internationalization, such as the Uppsala model (Johanson and Wiedersheim-Paul, 1975; Johanson and Vahlne, 1977; Johanson and Vahlne, 1990), born globals usually skip lower commitment entry modes, while giving advantage to more advanced modes with higher commitment levels (Ferencikova and Hluskova, 2015). In addition, what distinguishes born globals from other start-ups is very rapid internationalization since their inception or soon afterwards (Moen and Servais, 2002; Chetty and Campell-Hunt, 2004). Furthermore, they are prone to quickly adopt internet-based sales channels (Gabrielsson and Gabrielsson, 2011), but also different types of hybrid distribution channels combining traditional means of distribution and internet (Hollensen, 2017).

To be labeled as born globals, companies going through rapid internationalization also have to satisfy certain export ratio criteria. However, there is a lack of consensus among scholars about the portion of exporting activities that qualifies companies as born globals. According to one approach (Knight and Cavusgil, 1996; Knight, Madsen and Servais, 2004; Servais, Zucchella and Palamara, 2007) suggest their exporting activity should reach at least 25% of their revenues within three years since the firm's inception. Other studies consider 25% being too low in the context of small economies (Madsen, 2013; Sleuwaegen and Onkelinx, 2014). Apparently, niche markets tend to be too small in such environments, rapidly pushing companies to search for similar market segments or niches within the global market, which significantly reduces their home market focus. Furthermore, companies residing within countries with small domestic markets are more prone to become born globals than companies with large domestic markets (Madsen and Servais, 1997). In a recent study by Choquette *et al.* (2017), analyzing a sample of 23,201 firms, average revenues from international activities were as low as 22%.

There are also further inconsistencies among researchers when it comes to the number of markets a born global company has to serve. Crick (2009) describes born globals as firms with presence "in at least the world's triad regions". Traditionally, Japan, Western Europe and North America were considered as triad regions due to their high economic development and dominance in the world

economy until the late 1990s (Colinson, Narula and Rugman, 2017). However, with the rise of BRICS, Eastern Europe and Next eleven (N-11), the economic weight of triad regions declined making Crick's definition obsolete. Other authors consider at least five markets as a threshold for a born global firm (Kuivalainen *et al.*, 2012; Sleuwaegen and Onkelinx, 2014). Madsen (2013) and Sleuwaegen and Onkelinx (2014) imposed certain limitations to this approach adding additional criteria of being present in at least two regions, where one should be outside the EU (in case of EU firms).

## **INTERNATIONALIZATION BARRIERS AND BORN GLOBALS**

The marketing literature recognizes various barriers that prevent companies to initiate the internationalization process. Some of the critical barriers are insufficient finances, lack of market information and connections, not sufficient productive capacity to cover international sales, and management focus on domestic markets (Hollensen, 2017). Furthermore, company related specifics such as home versus host region-orientation and the company's industry, especially in the context of LSEs, has significant impact on the internationalization process and company's performance (Ferraris, Bresciani and Del Giudice, 2016). The Uppsala model is basically built on an assumption that companies due to lack of market information follow the pathways of slow, gradual internationalization (Johanson and Vahlne, 1990; Hollensen, 2017). While the aforementioned internationalization barriers are commonly associated with LSEs, specifics of the born global internationalization pathway are determined by their business strategies and rapid internationalization (Luostarinen and Gabrielsson, 2006). However, empirical research focused on specific internationalization barriers that interfere with born globals is rather limited (Danik and Kowalik, 2015). Or, the main actors of the rapid internationalization are seldomly aware of barriers, so there is not much to be investigated?

Persons acting as founders of born globals and INVs are often characterized as overconfident persons with unreasonable optimism (Liesh, Welch and Buckley, 2011). Their behavior can be described as a mix of innovation, proactivity and risk or opportunity seeking (McDougall and Oviatt, 2000; Oviatt and McDougall, 2005). However, a study by Keupp and Gassmann (2009) reported a significant number of born globals that are not conscious or constrained by lack of knowledge about international markets or lack of experience. But it does not necessarily mean that born globals are more prone to risk. While a business activity may appear risky to a more established firm, an entrepreneur may perceive same activity as less risky (Simon *et al.*, 2005; Janney and Dess, 2006). Furthermore, firms being in the preparation phase for internationalization, but still without any current international activities, may underestimate some barriers and overestimate others (Internationalisation of European SMEs, 2010).

While studying entrepreneurial new ventures in New Zealand, Shaw and Darroch (2004) detected finance and cost-related factors as the main internationalization barriers among exporters and likely

exporters. On the other hand, non-exporters perceive firm size, lack of market knowledge and lack of experience as main barriers. A study by Luostrianen and Gabrielsson (2006) detected following categories of the so-called entrepreneurial challenges or barriers among born globals: 1) managerial challenges - mainly related to the limited experience of managers, their limited marketing and managerial knowledge, lack of focus and workable business and marketing plan, together with insufficient revenue; 2) R&D challenges - related to the high cost and long duration of R&D process; 3) sales and marketing challenges, caused by low investment and low focus on marketing and sale functions, together with delayed planning and implementation of marketing tasks; 4) financial challenges – caused by lack of money, high price of money, weak revenues due to low sales levels and penetration pricing.

According to a study commissioned by European Commission (Internationalisation of European SMEs, 2010), there are various internal and external internationalization barriers in the context of SMEs. Among internal barriers, respondents perceived price of firm's products/services, high cost of internationalization, and product specification and quality as the most important. As external barriers, European SMEs consider lack of capital, lack of adequate public support and, of adequate information, and high transport cost or difficult transport related paperwork. In overall, respondents perceive higher importance and impact of external barriers in the context of non EU-EEA markets than in case of EU-EEA markets.

## **RESEARCH DESIGN**

As the literature review revealed, the number of research studies dealing with the rapid internationalization of digital agencies is limited. While there are some studies approaching this topic from the SMEs perspectives and certain analogies can be drawn, born globals have their own specifics and require further investigation. This study aims to make an initial effort in revealing typical barriers born globals face while they internationally expand their activities. The study focuses on the specifics of the digital marketing agencies internationalization pathways.

Due to the exploratory nature of this study, a qualitative research methodology has been selected as the most appropriate. As Golic and Davis (2012) suggest, a qualitative study provides deeper understanding of the researched phenomenon by providing more detailed information. The research method applied in the context of primary research is an in-depth interview. A total of two in-depth interviews were conducted during the second half of 2019. The interviewees were founders and managers of an online platform that performs intermediary services for both digital agencies and their potential clients. Although founded in Croatia in 2016 and having an additional office in Ireland, this platform is a global phenomenon providing services to over 6,000 agencies from 123 countries. While

helping digital agencies to internationalize their respective businesses, the platform itself went through a rapid internationalization qualifying itself as a born global. The interviewees can be considered as industry experts since they conducted a comprehensive market research of the digital marketing industry in order to develop their online platform. They also gained additional experience and market expertise in the past few years while they were promoting their platform on various online and offline events across the globe.

## RESEARCH FINDINGS

As the interviewees reported, the impact of barriers on the digital marketing agencies internationalization efforts actually sparked the idea to form a start-up that will act as an intermediary, connecting agencies with their potential clients on the global market. As they noted, clients tend to search for agencies in their close neighborhood, in order to simplify and speed up the selection process. However, there are also some other reason why clients act like this: "Digital marketing industry is, actually, quite a local one. When searching for service providers, clients are usually searching for an agency within their geographic region. For example, a company in Los Angeles will always look for an agency in Los Angeles area. The clients usually don't bother looking for agencies abroad. First of all, they have no information about good and reliable agencies from other countries. In addition, they probably have certain level of experience with some local agencies, although it sometimes means they also charge relatively high fees." [Interviewee 1]; "I am sure some clients are aware that certain services cost less in some emerging countries, but they have no idea about the existence of, for example, some great digital agency in Bulgaria. Additionally, setting-up business relationship with a new service provider requires significant travelling abroad...which also generates extra costs." [Interviewee 2].

When it comes to the internationalization pathways, interviewees noted existence of few different approaches. Some digital agencies tend to expand regionally by targeting neighboring countries and they try to find long-term international clients. These agencies are mostly motivated to internationalize due to domestic market saturation and relative productive overcapacity. Their internationalization is usually gradual, with just one or a few targeted markets. Limited internal resources, including manager's lack of knowledge about foreign markets. The other group of agencies, especially those from emerging and formerly emerging markets, target clients in western countries, especially in the US, UK and Germany. Although it sometimes means bridging significant geographical distances, the market potential of a distant country is mostly sufficient to employ the excess capacity, so there is no need to expand on additional markets.

Agencies with occasional overcapacity tend to follow certain part-time internationalization model. Due to limited resources, they internationalize their business in times of excess capacity. When the local

clients provide them with sufficient number of projects, they refocus on domestic market and neglect international markets. On the other hand, some agencies dedicate most or even all of their capacity to serve international markets. This is quite common if an agency offers very specific type of digital marketing services where there is no local demand.

Digital agencies from various countries face similar internationalization barriers. They have difficulties detecting and targeting clients abroad because of lack of reliable market information and no international ties. Sometimes, even language barriers can prevent them to target clients from specific countries. Furthermore, agencies are faced with certain internal obstacles: "To internationalize, an agency would definitely need dedicated staff and some marketing budget to search for foreign market opportunities. Google and LinkedIn can help. But, at the end of day, it is a time-consuming process and potential clients sometimes have a negative attitude towards unsolicited offerings they receive through digital channels." [Interviewee 2]; "Sometimes, agency managers are not feeling confident to internationalize beyond their region, which comprises few countries within the EU, usually with the same or similar language. Since internationalization on a larger scale require more internal resources and more money to be spend while targeting potential clients, some managers are cannot accept the related risk." [Interviewee 1].

When it comes to the potential obstacles in the relationship between an agency and a client, both being from different countries, there is also some general commercial risks, such as on-time payment for provided digital marketing services and on-time delivery by an agency. In some cases, both sides can be quite cautious about each other due to high perceived risk: "People, sometimes, tend to stereotype certain countries and regions of the world. Especially, if they have no previous experience or they have some bad experience from, form example, their holydays." [Interviewee 2]; "Developing business connections on the global level takes time and there is always a certain amount of risk. An agency has to be sure to collect its money after delivering the service." [Interviewee 1].

## DISCUSSION AND CONCLUSION

Although this study has certain methodological limitations, it managed to detect diverse internationalization pathways among digital agencies. Despite the advantages of modern technologies and various internet platforms, some agencies follow traditional pathways with gradual international expansion and lower market commitment. However, they do not necessarily follow nor transition through stages as described by the Uppsala theory (Johanson and Wiedersheim-Paul, 1975; Johanson and Vahlne, 1977; Johanson and Vahlne, 1990). Due to the lack of resources and perceived internationalization barriers, their internationalization efforts are somewhat limited.

On the other side, there are agencies dedicating most of their resources to the international clients. Their internationalization usually starts at their inception, since there is very limited demand for their specific services on the domestic market. Therefore, these digital marketing agencies can be considered as real born globals fulfilling all the relevant criteria outlined in the related studies, such as speed of internationalization, high commitment, export ratio and utilization of the Internet based technologies (Moen and Servais, 2002; Chetty and Campell-Hunt, 2004; Gabrielsson and Gabrielsson, 2011; Ferencikova and Hluskova, 2015). Additionally, some agencies internationalize occasionally, when faced with excess capacity. Although this type of part-time internationalization can be characterized as a low commitment approach typical for the Uppsala theory's early stages of internationalization, the process itself can be quite rapid and include several foreign markets. Therefore, this hybrid approach also contains elements of the born globals theory and we can consider these agencies as part-time born globals.

The research showed that there is a strong mindset about the market for digital marketing agencies being very localized, which represents one of the biggest internationalization barriers. This is probably legacy thinking from before internet era when geographical distance, as one of the forms of distance discussed earlier in the paper, served as a strong predictor of choices of particular digital agency. Furthermore, this could be also attributed to the lack of information about export markets, which is in line with some previous studies (Shaw and Darroch, 2004; Internationalisation of European SMEs, 2010).

As the noted successes of born global digital marketing agencies becomes more prominent the awareness of importance of expanding search distance when selecting digital marketing agency is most likely to grow as well. This will lead to reducing localization and increasing internationalization and globalization of the market for digital marketing agencies.

Taking into consideration research limitations and implications, further research should explore the born globals phenomenon in order to provide additional insights from the perspectives of digital marketing agencies, especially about the perceived internationalization barriers and internationalization best practices. While there is a significant number of studies focused on rapid internationalization and born globals, the number of studies that cover internationalization specifics of digital marketing agencies is quite limited. Furthermore, future studies should also address some of the methodological shortcomings of this study. Considering the sample size, it can be hardly said that results here present robust findings. Future studies need to expand the sample size, not just in quantity of digital marketing agencies surveyed but also in terms of their expanded geographical scope. Also, one important avenue of research is to compare the observations discovered and presented in this study across other areas of business, not just across digital marketing field. There are for sure valuable

discoveries to be made and learning opportunities to be explored by looking at globalizations patterns of born global start-up companies from other areas of business.

### ABSTRACT

In the information technology revolution there are several issues that concern Accountants and Tax Professionals. One of them is the application of electronic bookkeeping, which refers to a new dynamic application, which is expected to modernize the traditional format of accounting. The following paper deals with the issue of electronic bookkeeping and its effects in facilitation and sustainability of the accounting profession. The survey was conducted all over Greece by random sampling of 280 accountants. A multinational and multicultural environment is a challenge and requires proper management of international issues, including technological demands. The objective of this research is to examine the level of professional promptitude and technology awareness of Greek professional accountants. Furthermore the paper is concerned with the ability of using accounting information systems, but also the fears and issues digital-bookkeeping manifests on accounting professionals.

*Keywords: accounting information systems, accounting, digital accounting, cloud accounting, digital economy*

### 1. INTRODUCTION

In the information technology revolution there are several issues that concern Accountants and Tax Professionals. One of them is the application of electronic bookkeeping, which refers to a new dynamic application, which is expected to modernize the traditional format of accounting.

It is a fact that in the coming years with the development of technology and the modernization of the accounting profession it will be necessary for all Accountants to be well versed not only in the accounting software they use for their daily operations but also in various electronic applications that will improve communication and data exchange. The qualification and training of

professional Accountants - Taxation Professionals is necessary to enable them to make effective use of technology.

There is an urgent need to develop multi-role skills at the undergraduate level. In addition, what aggravates the problem and the need for technological training in academic institutions is the fact that there is a lack of knowledge in both communication and information technologies and information systems that are in line with the modern requirements of the profession (Ahmed, 2003).

Interviews for new hires in the accounting industry are based on multiple criteria, not just academic qualifications and knowledge. Technology with the tools available gives everyone the opportunity, even as a self-taught person, to greatly cultivate these skills (Gordon, 2018).

The new model that may be created in the coming years through the electronic bookkeeping application can bring extensive changes to both the accounting information systems used and the accounting profession as we know it today. The business plan should investigate whether the implementation of an electronic application in a dynamic environment is in line with the needs of the business environment.

The bibliographic overview led to further research through interviews and questionnaires to a representative sample of Professional Accountants - Tax Engineers in the Greek territory.

The purpose of the research was to study the technological maturity of the professional Accountants - Tax Engineers and to analyze the concerns that electronic book keeping and the prospect of the accounting profession have in the future.

## 2. LITERATURE REVIEW

Today, the need to upgrade accounting to a level that is in line with new technology drives professional accountants to continuously improve their consulting services. Every professional Accountant - Tax Technician should take the time to get to know the technological tools and accounting software he / she is using to the full (The Institute of Certified Bookkeepers, 2018).

However, technological development has created some issues which can turn into threats if not given due attention. Cloud technologies, for example depending on their reliability and functionality, can create operational problems such as:

- Online exposure of data to off-premises servers
- Possibility of remote access to unauthorized users
- Lack of connectivity in each area with the server and data
- The likelihood of data being intercepted and tampered with

The biggest weakness of the above is the exposure of sensitive and personal data online which may be due to the lack of appropriate security measures (lack of encryption, unverified credentials).

This results in unauthorized access to the data by third parties. Consequently, the role of Accountants becomes sensitive in ensuring data protection. The risk of data loss in the event of a breach should also be noted (Rîndașu, 2017).

Running a business in a multinational and multicultural environment is a challenge and requires proper management of international rules. Accountants should ensure that their clients fulfill their legal and tax obligations with the countries that are trading (Praxity - Global alliance of independant firms, 2014).

According to Radu (2008) it has been found that cloud accounting will have some weaknesses in its launch but also some negative effects that can be summarized below:

1. Reduction of jobs due to automation of several jobs
2. Increased investment cost in software and computers
3. Increased costs for redesigning internal processes
4. Increased costs in external staff training seminars
5. Increased costs for increased software protection measures

Rao et al. (2017) also mention:

1. An internet connection is a prerequisite for operation
2. Data control and dependence on impersonal managers not directly controlled by the business
3. Lack of customization capabilities in the measures of each business

Finally Ionescu et al. (2013) add the following issues:

1. Licensing of cloud technology programs does not belong to the business but the business usually leases the royalties
2. Storage of personal and business data on non-local servers away from its headquarters
3. The legal status of data storage and management may be different from the domestic status if the host is in another country (Ionescu et al. 2013)

An inevitable effect of digital accounting is the increased pressure on professional accountants, because in order to become competitive and keep up with the times they need continuous improvement and training in automation. After research, it has been shown that almost 7 out of 10 professional Accountants need to learn more about the types of automation they can use and still feel half-way, while about 3 in 10 respond that there is insufficient training even though they pay enough. striving to improve on a daily basis both in their workplace and by attending specialized seminars (Anderson, 2017).

In recent years, accounting information systems has automated or minimized the trading activity associated with accounting records. This in itself indicates that some jobs, mainly at the

Accounting Assistant level, are likely to be eliminated as it appears that a number of accounting tasks, such as data entry, will now be carried out by automated systems and applications.

Each system however is not meant to operate completely autonomously, so users should have the basic knowledge to intervene if needed. Frequent intervention in the systems will, however, be difficult and will require many jobs, especially at the level of assistant accountant, at risk of being eliminated in the coming years (Muldowney, 2018).

Legislative books should be kept in accordance with the Accounting Standards of the country in which they are opened. However, the electronic application must be harmonized with tax legislation and accounting standards. This way simplification will mainly control the tax, statistical and financial framework but not the accuracy of accounting standards and records (Koulogiannis, 2018).

On the other hand, digital accounting through an online book keeping application will be a great innovation. There is always the risk that handwritten files can be destroyed, lost, stolen, and definitely their archiving is something that requires more time and cost.

New information systems are expected to operate online by storing records in local or cloud databases, where accounting records will be readable, secure, properly classified, and easily searchable otherwise there will be difficulty in operating this system. As a result, each record will be able to be linked to the bank account entry and registration software so that electronic transactions are automatically recorded in the record books.

Also, in previous years and even today, manuscript invoices tend to be issued but tend to be slowly replaced by the new e-invoicing expected to be introduced. Plus, this will be your preferred method of pricing through a single platform or accounting software (1800Accountant, 2018).

Another advantage is the fact that electronic books can be accessed remotely. In such accounting applications, the books may even be automatically updated. The concept of digital accounting will be easily accessible to users with a reduced risk of error in primary data (1800Accountant, 2018). This way the necessary information is easily shared between businesses, clients and colleagues. In addition, filing data such as documents is a time consuming process that commits resources to each business (Gordon, 2018).

According to various studies, it has been found that the positive features of using cloud accounting can be distinguished from those related to the impact on the turnover of a business and on its expenditure circuit. For example saving paper for printing and archiving documents (Radu, 2008) and direct access to primary data once it has been registered (Rao et al, 2017).

Related studies have shown that new information systems in combination with emerging technologies create a framework for coordinating work with real-time reporting and forecasting models even remotely online for any business (Rîndașu, 2017).

So the time saved could be reinvested in entrepreneurship, which was estimated to bring about a 34% increase in employee earnings. Concerning the level of preparedness of professional accountants, only 23% responded that they were ready for the upcoming changes. In fact, almost 2 in 3 (64%) responded that they know someone who works with traditional to "primitive" methods. Many of them generally agree that the transition will be quite a painful process, but agree that it will benefit all involved in the long run (Anderson, 2017).

Estimates have shown that the profit margin per month could increase by up to about 5% due to cost savings from using "cloud" technology. In fact, as users in the cloud computing system grow, the associated operating costs decrease and the rate of return on equity increases, resulting in increased profit margins of up to 8% per month (Ionescu et al. 2013).

We observe in the market the transition from the concept of 'Accountant' to 'financial analyst' and ultimately to 'business partner' (Muldowney, 2018). Employees mainly in large accounting firms gaining experience over the years have the option to change departments or directions with increased earnings and career prospects (Gordon, 2018).

In a new digital world, deep knowledge of accounting in the sense of credit will be of little importance, and understanding of audit procedures (I.T) in information systems and their accessibility will be crucial. Already, traditional forms of sampling that require thought and judgment tend to be eliminated and replaced by data analytics and artificial intelligence tools (Muldowney, 2018).

### **3. THEORETICAL FRAMEWORK**

Although most are familiar with new technologies they do not make the most of them for their professional benefit (Rîndașu, 2017). In addition, for an Integrated Accountant, he or she should perform the role of chief executive officer in the information system and also be able to perform at least one of the other roles of the designer-administrator or evaluator (Richardson et al, 2017).

#### **3.1 Technologically Abbreviated Activities**

The unwritten rule of 80/20 in this case proves to us that 80% of the work we complete comes from 20% of the energy we devote. Therefore, prioritizing the most important work we ensure that we complete the remaining 20% of our work, utilizing our energy at 100% and often completing our work faster (Owens, 2018). Artificial intelligence infiltrates accounting software by creating automations

that replace recurring routine tasks that employ professional Accountants, thus saving valuable time for essential and complex activities such as data analysis and business consulting (Rîndaşu, 2017).

In general, as technology progresses, the amount of time required to perform accounting tasks at an early stage is reduced. Consequently, there is more productive time left to engage with their clients in order to provide businesses with information that is essential to entrepreneurship (The Institute of Certified Bookkeepers, 2018).

The saving time can be exploited in various ways in various aspects of each professional responses indicative given after surveys were as follows at the Anderson (2017):

1. Better work-life balance (42%)
2. Providing more meaningful reports and advice to their clients (21%)
3. Search for new business and investment opportunities (17%)

### **3.2 Advanced Professional Technology**

Technology will play a major role in the future design of digital operating models, reports and forecasts and should become a cornerstone of strategic importance (Victor, 2018).

The tendency to implement smart software will be reinforced. Many networking platforms once they handle big data will be able to export more data and potential investors will in turn be able to detect opportunities (Islam, 2017).

Knowledge of digital technologies will be a competitive advantage, while at the same time Accountants having the ability to extract comprehensive reports that will display quantitative data and interpret qualitative characteristics of businesses. So far few academic institutions have developed a curriculum related to these future needs of the profession (Islam, 2017). Some of Wolf's (2015) dominant technologies that affect the accounting industry are the following:

1. Mobility applications,
2. Cloud application technology,
3. Social collaboration,
4. Digital service delivery using specialized programming languages
5. Big data
6. Electronic payment systems
7. cyber security,
8. Robotics (automation in repetitive routine work)
9. Augmented and virtual reality,
10. Artificial intelligence,

In any case, decision makers should use their analytical skills and skills to decide which of the above tools may be appropriate for their business purposes (Chua, 2013).

Cloud accounting information systems give the prospect of a flexible and competitive service among their users. This perspective is undoubtedly due to the widespread adoption of high-speed Internet connectivity worldwide (Praxity - Global alliance of independent firms, 2014).

### **3.3 Transaction Supervision Capacity**

Technology has already transformed entrepreneurship, there is an increase in online shopping, e-commerce and all kinds of information that is now being digitally distributed among consumers, businesses and banks. According to surveys, 83% of Accountants think they need to be proficient in technology as well as accounting, while 48% of business executives worry about being left behind, a double that of last year. Even the UK tax and customs information system has been upgraded to a new system whereby all business transactions will be automatically registered in an online tax account and along the way these accounts will be submitted quarterly for tax clearance (Anderson, 2017).

In its operation, England's HMRC information system was capable of supervising and cross-checking transactions with tax data, thereby eliminating the tax gap arising from manual cross-checking of incorrect or unregistered transactions. However, the initial accountability of accountants in the transition to the electronic system appeared to be negative as it replaced much of the way the procedures were conducted (Stuart, 2017).

Electronic bookkeeping as a development of digital accounting is gaining ground, but it is not yet fully implemented. Over 3 out of 4 accountants working in companies quite often use simple spreadsheets, with almost 18% keeping handwritten records. 94% of businesses, however, want their Accountants to use state-of-the-art tools. Consequently, professional Accountants now rather than spend unnecessarily on records to conduct quality audits once the human error factor is eliminated in the primary data (Anderson, 2017).

### **3.4 Automated Accounting Degradation**

Technological changes can create business opportunities for the accounting industry in the country, as many businesses that send reports once a year to authorities find it difficult to send quarterly and outsource bookkeeping. But there is also the opposite view that pressure on Accountants by multiple deadlines and reports will be more intense throughout the year. In any case, however, it should be clarified exactly how the filing and clearing system will work if new and specialized software is required by the Accountants which will increase their operating costs and if they really need new software to know it as early as possible. to prepare properly (Stuart, 2017). Some attributes such as confidentiality, honesty, interpersonal relationships, critical ability, reasoning and

creativity are strong links between Accountants and clients and therefore cannot be replaced by any information systems at present (Anderson, 2017).

An information system that will operate remotely from anywhere, securely and be updated in real time will give another dimension to the communication between Accountants and their clients. If all the data is more directly recorded in the information system, then the Accountant will also be able to provide more direct tax advice so that customer relationships can be strengthened (openaccessgovernment.org, 2018).

Several Assistant Accountant positions are expected to disappear. On the contrary, there will still be a need for professional judgment and specialized accounting knowledge to interpret the results of automated processes. The problem, however, is how to develop the advanced judgment and specialization of Accountants if in the future several positions at the primary level are missing. Judgment and specialization are skills acquired through years of experience at a prime level (Muldowney, 2018).

Computerization in recent years has largely replaced routine tasks based on clear rules and programming languages. However, in the digital age of the evolution of big data processing algorithms, many tasks that are not routine but require thinking and judgment to be automated due to the evolution of robotic and artificial intelligence are observed. Consequently, in the coming decades accounting professions with increased critical thinking requirements will face the risk of being eliminated. In the USA. About 47% of the occupations currently available are in danger of being eliminated due to galloping technology and automation. It has been found that basic accounting processes (payroll, book keeping, auditing, taxation) are very close to the possibility of full automation (Frey and Osborne, 2013).

#### **4. METHODOLOGY**

During this study we adopted the mixed method approach, which includes both qualitative and quantitative methods. The theoretical model incorporates factors based on information from relevant literature and articles as well as from interviews with accounting experts. The theoretical areas that have emerged from the literature relate to 1) technological training and familiarity with accounting applications, 2) the disadvantages and risks inherent in the accounting profession from new applications such as electronic bookkeeping, 3) active forces and perspective opportunities created for the accounting profession by the application of electronic bookkeeping.

The above theoretical fields in combination with the interviews and the literature review highlighted the basics of the questionnaire. The interviews took 3 weeks to complete. Thematic analysis was used to analyze the information obtained from the interviews. The experts'

recommendations led to some minor changes in the formulation of the questions and minor verbal changes, while 2 questions were added by the experts and considered interesting for further investigation. It consists of 38 individual questions on a Likert gradient scale. The target population of the research consists of 400 Accountants and therefore a sample size of 208 can be considered representative of the population at 95% confidence level.

## 5. RESEARCH RESULTS

The following section presents frequencies and percentages for the personal and demographic data of the respondents. We observe that the sample is approximately sexed with males but comparatively larger. Regarding the age range of the respondents, we observe that the majority (56.7%) is 31-45 years old.

The age groups 18-30, 46-60 and 61 or more have comparatively lower rates of 15.9%, 26% and 1.4% respectively. Regarding the variable "work experience" we observe that the majority of respondents, about 2 in 3 professionals, have work experience of up to 20 years mainly, while the relatively more experienced with over 20 years are only 1 in 3.

We observe that the majority (69.7%) are external accountants or have an accounting office with responsibility for their clients. There is an increased majority of those working in small businesses of 1-5 people (73.1%).

|  |   | Percent | Frequency |
|--|---|---------|-----------|
| Gender   | Male  | 58,2    | 121       |
|  | Female  | 41,8    | 87        |
| Age  | 18 – 30 years of age                                  | 15,9    | 33        |
|  | 31 - 45 years of age                                  | 56,7    | 118       |
|  | 46 - 60 years of age                                  | 26,0    | 54        |
|  | 61 or more years of age                               | 1,4     | 3         |
| Work Experience                                      | 0 – 10 years  | 36,1    | 75        |
|  | 11 – 20 years   | 30,3    | 63        |
|  | 21 – 30 years   | 21,6    | 45        |
|  | 31 or more years                                      | 12,0    | 25        |
| Work Description                                     | Employee Accountant with position of responsibility   | 11,1    | 23        |
|  | Employee Assistant Accountant                         | 2,4     | 5         |
|  | Outsourced Accountant with position of responsibility | 16,8    | 35        |
|  | Outsourced Assistant Accountant                       | 69,7    | 145       |
| Corporation/Organization Size                        | 1 - 5 employees                                       | 73,1    | 152       |
|  | 6 - 20 employees                                      | 15,9    | 33        |
|  | More than 20 employees                                | 11,1    | 23        |
| Skills in Information and Communication Technologies | Novice  | 0       | 0         |
|  | Moderate  | 10,1    | 21        |
|  | Good  | 44,7    | 93        |
|  | Skilled   | 45,2    | 94        |

|                    |                                     |      |    |
|--------------------|-------------------------------------|------|----|
| Level of Education | Middle School of High School        | 1,9  | 4  |
|                    | Vocational Institution              | 7,2  | 15 |
|                    | Technological Education Institution | 32,7 | 68 |
|                    | University                          | 30,3 | 63 |
|                    | Master's Degree                     | 26,9 | 56 |

None of the respondents self-rated as a novice user, which means that the level of knowledge of information and communication technologies for the accounting industry is virtually indispensable to everyone, with almost half reporting good users (44.7%) .

Almost one third of the sample (32.7%) are graduates of Higher Technological Institutes. A percentage (30.3%) of the graduates are followed by AEI graduates, followed by a very high 26.9% with postgraduate diploma holders.

## 6. DISCUSSION

It is confirmed that technology creates automation that replaces repetitive routine work (Rîndaşu, 2017) and that knowledge of digital technologies will in future be a benchmark and a competitive advantage for professional accountants (Islam, 2017). Emerging technologies (big data, data analytics, cloud computing) will play a particular role in the accounting profession in the coming years (Rîndaşu, 2017). Much of the accounting work is carried out by automated systems and applications, and several audit and tax procedures have been automated.

However, business transactions are not yet fully automated. At the same time, information systems do not seem to have the capacity to supervise and cross-check tax transactions. Therefore, manual cross-checking of incorrect or unregistered transactions has not been desirably avoided, while issues of data entry time, loss of documents and mathematical errors remain.

There is a growing concern in the industry about the specific risks of technological automation that are adversely affecting the accounting profession. Concerns are also raised about electronic book keeping if and to what extent this affects the viability of the industry. It is clear that in the future much of the accounting work will now be carried out by automated systems and applications, as well as several audit and tax procedures.

There is currently no risk of job losses in Greece in the coming years as accounting systems have not been largely developed to automate accounting related business activity, nor are new applications such as electronic book keeping a threat. on the relationship between client business and Accountant.

It is estimated that changes in the organizational structure of accounting firms for electronic bookkeeping are likely to be needed, but there is no clear picture of the extent and nature of the changes that will occur.

## 7. CONCLUSIONS

The accounting profession has promising prospects in Greece as it is undergoing regeneration, redefinition and technological upgrading. It is an opportunity for the entire accounting community, entities, from the first user involved to the tax administration, to converge on tax transparency, electronic standardization, and the emphasis on entrepreneurship and the prospect of accounting.

The success of the online bookkeeping venture may take time, but taking into account the opinion of the Accountants - Tax Engineers will create prospects and facilitate the industry as well as the economy in general. The time savings resulting from the extensive operation of electronic bookkeeping can be exploited in a variety of ways for a variety of professional Accountants. It is therefore considered that there is a risk of eliminating the profession if accountants are left behind in the implementation of electronic bookkeeping.

Proposed measures and improvements that could potentially bring significant results to the practice of accounting include the gradual adoption of electronic book keeping starting with the larger entities and resulting in smaller and better educational orientation in new information and communication technologies. Of course, it is necessary to simplify and converge the Accounting Standards with the tax and labor legislation of each country.

## JAPANESE HUMAN RESOURCES MANAGEMENT: IS WESTERN-STYLE PERFORMANCE MANAGEMENT WORKING?

Drummond, Damon<sup>1</sup>; Hempel, Paul<sup>2</sup>

<sup>1</sup>College of International Management, Ritsumeikan Asia Pacific University, Beppu, Japan

<sup>2</sup>Department of Management, City University of Hong Kong, Hong Kong, PRC

### ABSTRACT

In Japan, the labour force is shrinking and there is high competition for available recruits and their employment expectations are rising. Further foreign owned businesses, foreign investment, foreign customers and suppliers are giving exposure to Japanese traditional firms and employees to Western practices. However, there is inconsistent evidence as to how much Japan has shifted from its traditional performance management practices towards Western styles. Existing research has focused on formal policy rather than actual practices experienced by employees. Japan's aging workforce, compounded by shrinking numbers of youth, is leading to a greater reliance upon women and non-Japanese workers who represent new challenges for Japanese firms. In this paper a total of 89 cases from interviews were collated from across multiple organizations and organizational layers to explore both policy and actual practice. We found evidence for an emerging dual-track system, with traditional Japanese practice for permanent generalist employees, and Western performance management practices for contract specialist employees. We also categorized companies into four types, which differed in the proportions of generalists and specialists used. These types are the traditional Japanese with generalists, the Western type with specialists, and international hybrid and new economy Japanese firms using variable mixtures of generalists and specialists. Models are explained with illustrations.

*Keywords: Japanese HRM practice, performance management, multinationals, international exposure, recruitment competition, shrinking talent pool.*

### INTRODUCTION

Enterprises succeed and grow when they have good internal fit with their external environment, society and stakeholders (DeNisi, 2000; den Hartog, Boselie, & Paauwe, 2004; DeNisi & Murphy, 2017). Fundamentally at the core of this synergy is the contribution and motivation of the firm's internal employees. How they perform impacts the firm. It also connects the enterprise's attractiveness to the external labour talent market. It is fact there is a labour shortage in Japan that is creating strong

competition amongst firms searching for the best recruits. An essential part of what makes a company attractive is the way the company handles its human resources (HR) performance management and compensation schemes. These are critical to enhance the firm's growth and fit with its external environment. In Japan, there has been much discussion about the state of performance management systems, however uncertainty remains as to how, and if, it is progressing to add synergy to the firm. Despite longstanding claims about the demise of lifetime employment (Kato, 2001), there remains an apparent remarkable resilience of both lifetime employment and the Japanese HRM system (Powell, 2016). Given the limited English language research into recent evolution of HR and performance management in Japan, a closer examination is warranted. In order to determine how performance management might be changing in Japan, we conducted intensive interviews involving a total of 89 cases throughout organizational levels as well as across different types of industries.

## PERFORMANCE MANAGEMENT IN JAPAN

Research exploring current trends in Japanese performance management is limited, so a first step is to describe what is a normative baseline for the Japanese approach to managing HR. The three pillars (Abegglen, 1958) of post-war Japanese HRM employment are: 1) lifetime employment; 2) seniority-based pay and promotions and, 3) company or enterprise trade unions. Some key characteristics of this typical traditional Japanese HRM and performance management system (Debroux, 2003; Sano, 1993; Whitehill, 1991) are discussed below.

**Lifetime employment (*Shūshin koyō*).** The most widely known aspect of Japanese HRM is probably the practice of lifetime employment. Employees remain with the firm for the entire period of their working life, and job hopping was most uncharacteristic. This helped protect the company's training investment in employees and developed long-term internal and external trust (*Shinrai*) relationships.

**Seniority pay and promotion system (*Nenkō-joretsu*).** Another stereotypically defining characteristic of Japanese HRM is the reliance upon seniority for promotions and pay increases. This seniority system appears incompatible with achieving high employee performance levels, as it isn't possible to promote and reward good performers. Exceptional performers must wait until they have accrued sufficient seniority to be considered for their next promotion, while employees who are not promoted during that window find their career stalled at their current position.

**Generalists and job rotation.** Japanese college graduates spend the first 5-7 years of their careers rotating jobs broadly throughout the organization, when they become eligible for their first promotion. One reason for this pattern of job rotation is a belief that it is important for managers to become familiar with the overall business. Further, because the company has made a commitment for long-term employment, there is a need to determine how best to utilize each employee, and this period can have a

profound effect on an employee's future. Japanese companies are as a result staffed primarily by generalists rather than specialists. Whereas, employees within Western companies tend to have their careers advance within functional tracks, Japanese employees tend to move across multiple functional postings.

**Pay and Bonuses.** Pay typically has three components: basic pay for career position, seniority increment for years of service, and a company-wide bonus. These bonuses are a part of union agreements and are mostly guaranteed and fixed. This is in contrast to the West where pay varies across functions and depends primarily upon performance.

The broad baseline differences between the two approaches is illustrated in Figure 1. Japan with employees continually rotating throughout the organization, with guaranteed bonus and pay driven by the seniority system. By contrast, the West emphasizes functional specialization, extensive external hiring at all job levels, and a strong emphasis upon individual performance in determining pay.

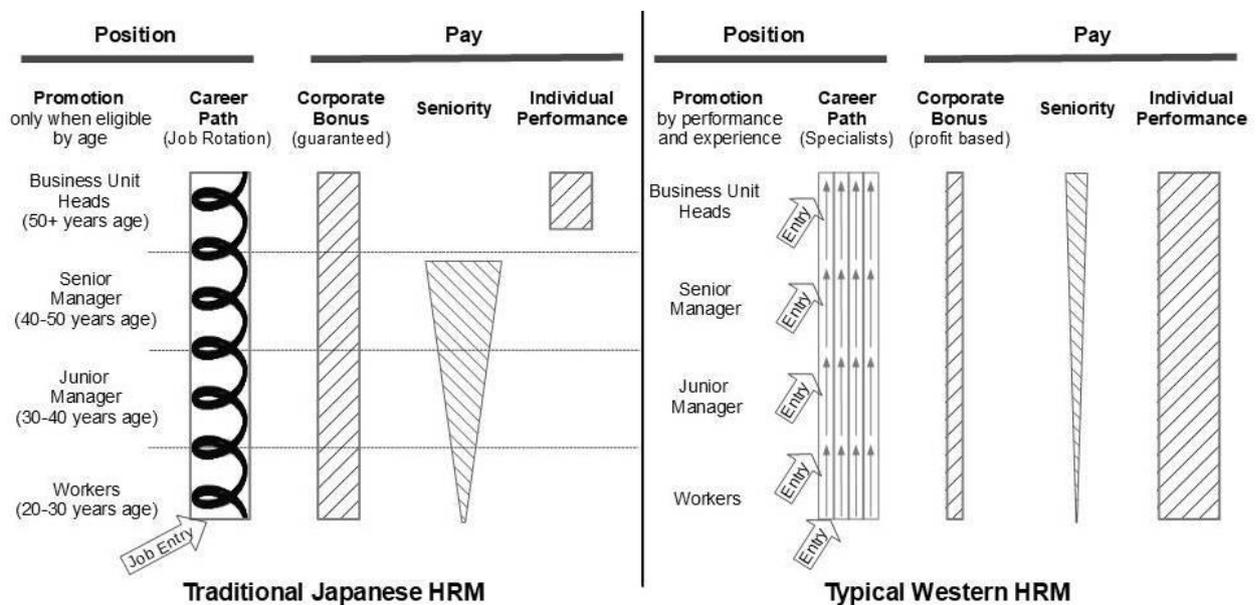

Figure 1: Comparison of Japanese and Western Performance Systems

**The challenge of a rapidly aging Japanese workforce.** Japan is rapidly becoming a super-aged society, with 28.1% of the population aged 65 or older in 2018 (Fukuyama, 2018), with the workforce projected to decline by 20% in the next two decades (Harding, 2019). The declining birthrate also means the number of labor market entrants is declining, with annual entrants now 17% lower than in 2004 (Ministry of Education, Science and Technology, 2019). In response, both the Japanese Ministry of Health, Labor and Welfare (Nikkei Asian Review, 2019), and the OECD (OECD, 2019) have proposed a similar set of remedies: Increased employment of women, the elderly and increasing the number of foreign workers. As a result there is increased competition amongst companies to attract recruits in the shrinking labor market.

*Uncertainties about performance management in Japan*

Much of what is known about the changes in HRM and performance management comes from studies focusing upon systems and policies (Nakamura, 2006; Morishima, 2008), so relatively little is known about how employees are experiencing enacted practices so in our study we took an exploratory approach to the experiences of employees.

*Research objective 1: To determine the current state of performance management in Japan, particularly as experienced by employees.*

**METHOD AND SAMPLE**

To explore the situation in performance management we adopted a grounded theory approach by conducting and analyzing a large number of interviews.

Prior research into the evolution of Japanese HRM has focused upon formal changes in policy as reported by HR executives (e.g., Morishima, 2008; Sano, 1993), rather than examining the experiences of managers and employees. Thus, this study interviewed 89 cases from multiple organizational levels: HR executives and managers, mid-level and line managers, and entry level professionals. We drew upon a diverse sample of participants, interviewing male and female, as well as Japanese and non-Japanese individuals. We also were careful to identify participants from an assorted set of organizations. In terms of industry, we examined a diverse set of industries, including traditional manufacturing companies, service companies, and high-tech/internet companies. Further, we examined Japanese companies, foreign companies, joint ventures, and Japanese companies acquired by foreign companies. Further information about our sample is contained in Table 1.

| Company Types Represented* |    | Job Level of Respondents |    |
|----------------------------|----|--------------------------|----|
| Academic                   | 5  | Academic                 | 5  |
| Traditional Japanese       | 42 | Entry-level Professional | 27 |
| New Economy Japanese       | 13 | Mid-career Professional  | 18 |
| Hybrid                     | 16 | Top-level Professional   | 4  |
| Foreign                    | 13 | Mid-level HR             | 6  |
| Total firms                | 89 | Senior HR                | 6  |
|                            |    | Mid-level Manager        | 6  |
|                            |    | Senior Manager           | 7  |
| Respondent Nationality     |    | Respondent Sex           |    |
| Japanese                   | 38 | Male                     | 51 |
| Asia (non-Japan)           | 27 | Female                   | 28 |
| Non-Asian                  | 14 |                          |    |
| Total respondents          | 79 |                          |    |

Note: The number of company types is not equal to the number of respondents. We interviewed multiple respondents at the larger companies in our sample, and some job-hopping respondents described their relevant experiences across multiple firms.

Table 1: Interview sample

Interviews began by asking the participant how closely their company's human resource practices conformed to the popular image of Japanese HR. Follow-up questions then focused upon mapping out areas where the company HR practices have diverged from the traditional Japanese baseline.

Two interviewers took notes independently and then a meeting was held to create a combined final set of interview notes. Once the interview notes were compiled, the notes were read and reread independently by two researchers, to recognize recurring themes (Cassell & Symon, 1994; Creswell, 1994) across interviews, as well as to identify patterns and relationships for themes. These were then compared and the two separate analyses were then combined.

## **THE CURRENT STATE OF PERFORMANCE MANAGEMENT IN JAPAN**

Four different approaches to performance management in Japan were identified: traditional, new economy Japanese, hybrid, and foreign. Each of these approaches has a specific set of organizational practices associated with it, and these details will be discussed below. Before delving into the details, we first broadly outline these four approaches.

The traditional approach has divergences from the historical baseline being more in appearance than in substance. As an example, a company might say that promotions are based upon merit rather than seniority, yet managers would not in practice promote anybody "before their time." What these companies had in common, other than organizational age, is a focus upon domestic markets or markets subject to considerable regulatory oversight (such as banking or pharmaceuticals).

At the other end of the spectrum were foreign owned companies, particularly those recently established in Japan, with performance management practices largely conforming to the Western baseline. Examples of such non-traditional practices include a genuine focus upon individual contribution, or a much greater acceptance of mid-career hiring.

The final two approaches, the new economy Japanese and the hybrid, are similar in having significant movements towards the Western baseline. However, some retained substantial traditional Japanese elements. For example, individual contributions are rewarded, but bonus payments remain guaranteed (often by union contract). What differs is the pathway and motivations through which the companies arrive at this mix of Japanese and Western practices. Figure 2 provides a simple diagram to help illustrate the relationship between these four different types.

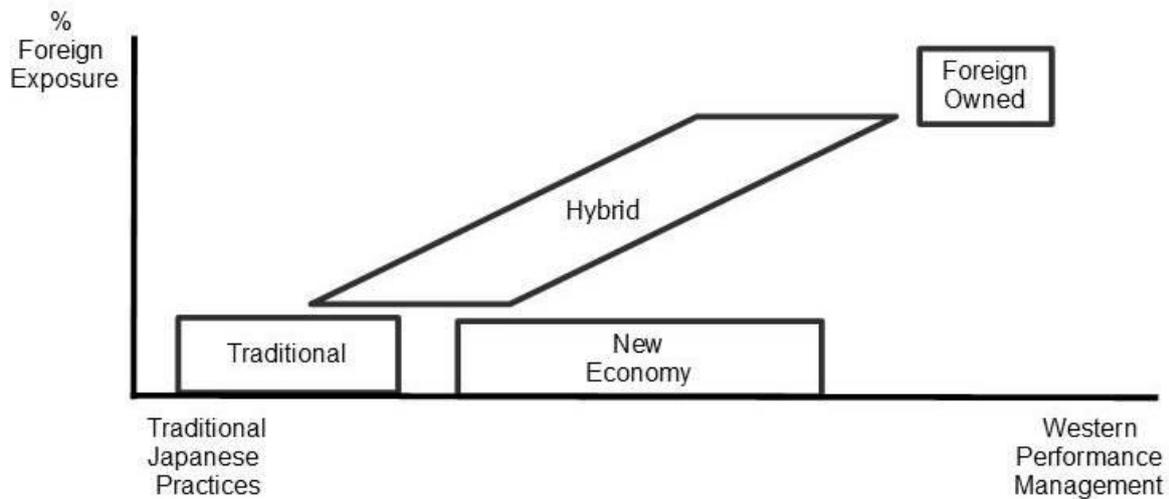

Figure 2: Performance Management Approaches in Japan

The new economy Japanese companies are typically new start-up, IT oriented or with strong or growing international presence, and responding to the desires of a younger workforce. Companies started by older founders, typically adopt HRM systems matching the traditional systems they were accustomed to. By contrast, younger founders, or founders with significant international exposure, tended to adopt systems modeled upon Western practices. Further, these respondents point out that labor market competition for specialists leads and recruits in general led to a greater emphasis upon individual performance management.

The hybrid companies are established Japanese companies with a history of using traditional Japanese management systems that have moved to a mix of Japanese and Western practices. The history and existence of established systems within these firms makes change from the traditional HR practices difficult. One type of hybrid arises when a Japanese company is acquired or heavily invested in by foreign firms, with significant infusion of senior foreign management needed before real changes in performance management practices occur. A second type of hybrid occurs when a traditional company has significant global business, or has a substantial number of non-Japanese employees. The international-oriented employees are typically specialist contract employees rather than generalist permanent employees. The generalist permanent employees are managed in the traditional manner, while the specialist contract employees are more likely to be paid a higher salary but with limited corporate or individual performance bonus.

**Structural adaptations.** In the traditional Japanese companies we examined there was limited fundamental change in performance management practices.

We found another way to get the benefits of Western performance management without implementing it throughout the organization is through investing in speculative startups. These startups typically fall into the new economy Japanese model, adopting a primarily individual outcomes model of

performance management. However, when the investing company assigns staff to the startup, these staff remain under their parent company's performance management system and control.

Ownership and management structure influence the extent to which the hybrid firms shifted from traditional Japanese practices to Western performance management practices. Across our sample, it was clear that the factor most responsible for effective implementation of Western performance management was the number of non-Japanese executives and managers. One of the companies we examined had initially only installed a foreign CEO for an acquired firm, with over a decade passing without substantial changes. It was only after that CEO retired, and the replacement foreign CEO replaced all the directors and appointed a non-Japanese HR director did changes finally begin.

Overall, Western firms tended to operate closest to the Western performance management baseline, while new economy Japanese firms, particularly those with younger founders, also adopted a substantial number of Western performance management practices. By contrast, established Japanese companies still largely conform to the Japanese HR model, with changes largely restricted to separate international divisions when possible. When such a firm is acquired by a Western firm, changes in the performance management system tend to be minimal unless a significant number of non-Japanese managers are brought in to enact change.

*Increasing job-hopping and mid-career hiring.* Due to lifetime employment, mid-career moves by employees to another firm have traditionally been limited. However, mid-career hiring is increasing, although traditional Japanese firms still rely upon entry-level hiring and internal staff movements. Mid-career job hoppers are almost exclusively specialists, as generalist employees rarely have a skill set desired by other companies, and many traditional firms experience a net outward movement of mid-career staff. One junior HR manager at a traditional firm reported that senior leaders are experiencing stress as a result of this, as they are not accustomed to the challenge of managing talent retention.

Respondents identified three factors driving the rise in job-hopping: hiring by foreign and new economy Japanese firms, recruiting agencies, and changed expectations of young employees. New economy Japanese firms are open to mid-career hiring, and one reason put forward by respondents was that companies were explicitly modeling themselves after Silicon Valley firms. Another reason brought up by respondents was a need to hire staff with specific specialized skills sets, and a third reason was that younger firm founders and employees were less invested in traditional Japanese careers.

One of the fastest growing sectors of the Japanese economy is recruitment agencies, with growth between 5-9% annually (Ministry of Health, Labour and Welfare, 2018). One of our respondents, president of a leading foreign recruitment agency, reported company growth between 10% and 15% every year for the last 10 years. This exploding growth and greater shared information this has fostered

mid-career job-hopping, with employees job-hopping repeatedly. Almost universally, young professionals we interviewed commented on being frequently contacted by multiple job agencies. Among job-hopping employees, whether young or mid-career, the clear common characteristic was a universal desire for a specialist career.

**Pay and Bonuses.** Traditional firms employ generalists and pay wage rates plus a corporate bonus with little or no individual component, with specialists present in limited quantities. Within the new economy Japanese, hybrid and foreign firms, things are very different, with substantial mid-career hiring and young talent and specialists both viewed as essential. These recruits all demand higher salaries and greater individual recognition of contributions, due in part to the risks of not being long-term career employees. This has led to pay systems offering specialists positions with higher pay, and a performance management system with links to individual bonuses.

**Generalists and job rotation.** Upon being hired in a traditional Japanese company, young employees begin with up to a year of training, starting with extensive training in Japanese business etiquette. They are then assigned to their first job assignment, typically lasting two to three years. Over half of the young job-hoppers we interviewed said after this first assignment was when they left the traditional firm, either to avoid an unwanted job posting, or mainly to remain within the same functional specialty.

Foreign companies, as well as the new economy Japanese firms, have largely abandoned the practice of job rotation and generalist managers. The hybrid companies are moving away from generalists and towards specialists, but report difficulties with the generalists' ability to adapt. Three respondents, all managers with experience in multiple Japanese companies, reported the same problems associated with an over-reliance upon generalist managers. These generalists fixated on minutiae, called for excessive and unnecessary analysis of data, and lacked the deep functional expertise necessary to determine what was important. Specialists not only improve efficiency through eliminating wasted effort, but also focus on critical rather than minor issues.

**Labor market segmentation.** Young Japanese appear to be self-partitioning into two groups, one that values opportunities for rapid career growth, and the other that values security and stability. Those who value security and stability seek employment in traditional Japanese companies, where there is limited performance pressure. One manager at a traditional Japanese manufacturer stated that "most staff don't want to get promoted", estimating that fewer than 20% of staff wanted to get ahead, while employees "just want to be left alone."

**Performance-based rewards.** Performance-based rewards and promotions lie at the heart of the standard approach to performance management. Across our sample, the Western organizations all made use of individual performance rewards, with both managers and employees in agreement that

individual performance influenced pay and promotions. Within the traditional Japanese companies, the senior HR managers of a few firms stated that individual performance was being rewarded, yet mid-level managers and employees all agreed that individual performance has no influence upon pay, and an unknown influence upon promotions. One of the key reasons the hybrid firms hired large numbers of non-Japanese executives and managers was to effectively implement individual rewards, since the Japanese managers made only token attempts to appraise individual performance.

## DISCUSSION

The evidence from the interviews reported in this paper indicates that there are broader structural changes in the Japanese labor market which are not only influencing performance management practices in Japan but, are also having a wide-ranging impact on the overall approach to HR practices.

### *Performance Management in Japan is Slow to Evolve*

Our interviews indicate that companies and executives are aware of the need to move towards Western-style performance management. Progress in successful implementation remains elusive for traditional firms, and we have found that success in implementing these performance management practices is tightly intertwined with three changes in the labor market: increased job-hopping, growing job specialization, and the strengthening influence of new economy and non-Japanese companies and workers. All three of these changes act to reinforce the gradual introduction of individual rewards based upon explicit performance measures.

Japanese executives have realized the need for reform in Japanese HRM and performance management practices. However, experience has shown that these changes are rejected by the majority of Japanese managers and employees, so companies appear reluctant to implement wholesale changes to their HR systems. Instead, what is emerging is a dual-track HR system, as shown in Figure 3.

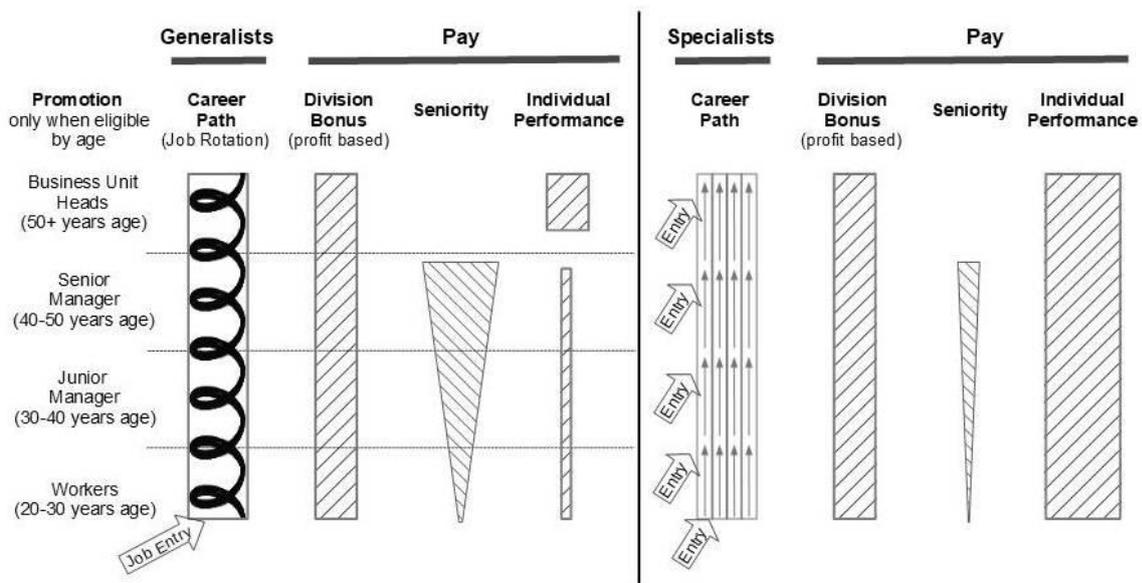

Figure 3: The New Dual-Track Japanese HRM System

One track is the traditional Japanese system of generalist permanent employees, with two primary changes. First, the company bonus is being redistributed into a division or department bonus, which varies with division or department performance and company profits. Second, there is a gradual broadening of the strict age windows for promotion, as well as relaxation of the small individual variable seniority pay increases. The other track is a more Western-style system for functional specialist contract employees who are often paid more than the generalists, and for whom individual performance bonuses can outweigh the divisional bonus received by all employees.

The four organizational types we identified (traditional, Western, hybrid, and new) can be differentiated by the relative importance of these two tracks. Western companies are typically comprised almost entirely of specialists, while traditional Japanese companies have only modest numbers of specialists. The hybrid companies are the ones shifting towards a greater emphasis upon specialists, and with an increasing proportion of the workforce under the specialist system. Finally, the new economy Japanese companies are young companies intentionally designed around functional specialists, and focused upon attracting ambitious young talents. The HR system of both hybrid and new companies show a variable mix of generalist and specialist tracks.

## CONCLUSION

The prevailing desire of Japanese workers for employment security over advancement, strong labor law protections, labor unions, and limited managerial talent in performance management are formidable factors to overcome, regardless of the recognition by executives of the need for reform. Traditional firms are likely to continue pursuing a two-track system, where international divisions and

employees, as well as functional specialists, are managed using individual performance based systems, with rewards and promotions tied to individual performance goal attainment. Foreign firms and new economy Japanese firms, particularly those with younger leadership, will continue to attract the ambitious young specialists who are less concerned about stability through their use of individual performance rewards.

Performance management practices in Japan are gradually becoming aligned with international practice, with foreign companies and new economy Japanese companies having a much easier time implementing individual focused performance management systems. The adoption of individual focused performance management systems appears largely driven by domestic labor market competition, particularly for functional specialists who are in great demand to improve operational effectiveness and efficiency. While a growing element of the Japanese workforce desires the rewards and opportunities provided by the individual-based performance management system, the majority of the Japanese workers still value security and stability, representing a significant obstacle.

Often executives at traditional Japanese companies understand the need for change, but experience resistance from labor unions, middle-management, and a majority of workers. Many traditional companies have made good progress at setting individual performance goals, but largely fail to act upon either goal attainment or shortfalls. In addition to a general resistance to these changes, a lack of professional managerial skills appears largely responsible for this lack of implementation success. We argue that the problem arises from the more fundamental issue of the generalist rather than specialist approach to professional and managerial jobs and careers.

## UNDERSTANDING THE DECISION MAKING PROCESS UNDER UNCERTAINTY USING ARTIFICIAL INTELLIGENCE

Eckart, Li; Enke, Margit

Chair of Marketing and International Trade, Faculty of Business Administration, TU Bergakademie Freiberg, Freiberg, Germany

### ABSTRACT

To understand the decision making process is one of the main research topics for marketing practitioners and scholars. In this work, the authors use one of the artificial intelligent methods, the artificial neural network (ANN) to investigate the decision making process under uncertainty.

*Keywords: artificial neural network, uncertainty, nonparametric approach*

### INTRODUCTION

To understand the decision making process is one of the main research topics for marketing practitioners and scholars. The bulk of such studies investigates the relationship between the determinants and the outcome of the decision making process by asking the question what drives consumers to make such decisions? The conventional framework of cognitive evaluation process suggests that the utilization concept can be considered to understand the decision making process. Based on the cognitive comparison of alternatives, the utility will be ascribed a numerical value. Based on the numerical values of the alternatives, consumers make the final decision (Fishburn and Kochenberger 1979, Gonzalez and Wu 1999, Kahneman and Tversky 1972, Tversky and Kahneman 1992, Von-Neumann and Morgenstern 1944, Wu and Gonzalez 1996). In the framework of the expected utility theory and prospect theory, scholars try to define the curvature and the shape of the mathematical functions in utilization process to give more insights into decision making criteria and consumer references. The further development of the expected utility theory, i.e. the prospect theory, pointed out that the information referring to the decision making process, like the monetary value and probability of occurrence, will be distorted during the information processing. It indicates that the decision makers don't treat those factors linearly and they tend to overestimate some of them and on the other side underestimate the other (Gonzalez and Wu 1999, Wu and Gonzalez 1996).

However, the classical utilization approaches have some limitations. First, the decision making process is often oversimplified and it doesn't provide a valid and comprehensive description of the process (Hastie 2001). Second, the previous studies investigated such information distortion by

examining the impact of the independent variables separately. The interplay of the independent variables is unobserved in the previous research (Burke et al. 2018, Gonzalez and Wu 1999, Hertwig et al. 2004).

To fill this gap in the literature, this study addresses the question: can we use the artificial intelligent method to provide more insights into the distortion of the perception considering the interplay of the decision-relevant inputs? In this work, we apply one of the artificial intelligent methods, the artificial neural networks (ANNs), to review the previous study of Wu and Gonzalez, which also addresses the question of perception distortion in decision making process but without consideration of the interplay of the decision making factors.

The roots of ANNs can be found in computer science, engineering, mathematics, physics and astronomy, neuroscience and medicine (Hinton and Salakhutdinov 2006, Hochreiter and Schmidhuber 1997, Jones 1999, LeCun et al. 2015, Milo et al. 2002, Nielsen et al. 1997, Olden and Jackson 2002, Rubinov and Sporns 2010, Tu 1996). Yet, to the best of our knowledge, no prior research has shed light on the perception distortion using ANN model.

The content of this paper is organized as follows. After referring to literature on conventional utilization concept to investigate the perception distortion, i.e. expected utility theory and prospect theory, ANN model and its implementation in MATLAB will be introduced. Finally, we conclude the work by summarizing the findings, highlighting contribution of current research and providing directions for future work.

## **THEORETICAL AND METHODOLOGICAL BACKGROUND**

The term “utility” is used in normative and descriptive choice models to investigate the decision behavior (Inman et al. 1997). “Utility” is first introduced by Bentham. He defined utility as “the property of something whereby it tends to produce benefit, advantage, pleasure, good, or happiness (all equivalent in the present case) or (this being the same thing) to prevent the happening of mischief, pain, evil, or unhappiness to the party whose interest is considered.” (Bentham 1789) Marshall suggested that utility can be concerned with price which an individual is willing to pay to fulfill or satisfy his desire. Even though desire cannot be measured directly, we can observe indirectly the outcomes to which desire gives rise. The total utility can be described as the total pleasure or benefit that something yields an individual (1890). In the field of judgment and decision making, they are two main utility-oriented approaches that investigate the behavioral and cognitive process of information processing, i.e. expected utility theory and prospect theory.

Expected utility theory is used as the dominant normative and descriptive model to determine the decision making behavior under uncertainty (Inman et al. 1997, Schoemaker 1982). This approach

enables the integration of attributes and uncertainty. Within the framework of Von-Neumann and Morgenstern, they argued in favor of a cardinal view of utility. They assumed that individuals are rational and their preferences are well-defined. Each decision is related to a consequence of alternatives  $i$ , ( $i=1,,n$ ) with value  $x_i$ ,  $i=1,,n$ . The probability of the occurrence of the alternative  $i$  is  $p_i$ . The sum of the probability of the occurrence of all alternatives equals one,  $\sum_{i=1}^{i=n} p_i=1$ . The individual preference of the choice can be viewed as the utility of the bundle of alternatives  $x_i$ ,  $i=1,,n$  with the probability  $p_i$ ,  $i=1,,n$  can be written as:  $\sum_{i=1}^{i=n} u(x_i)p_i$ ,  $i=1,,n$ . The theoretical support for this multiattribute modeling can be found in the literature of Fishbein (Fishbein and Ajzen 1975).

However, several empirical surveys challenged the basic tenets with various paradoxes which are not correspondent to the findings of expected utility theory (Allais 1953, Kahneman and Tversky 1979). Kahneman and Tversky introduced prospect theory and its key tenets: (1) a utility function (in deterministic setting, the utility function also called value function (Smeulders et al. 2019)) is concave for gains and convex for losses. It implies that  $u''(x_i)\leq 0$  for  $x_i\geq 0$ ,  $u''(x_i)\geq 0$  for  $x_i\leq 0$  and  $u'(x_i)<u'(-x_i)$  for  $x_i\geq 0$ . (2) The observation should entail decision weights, which can be interpreted as the distortion of probability. People tend to overweight small probabilities and underweight moderate and high probabilities. Moreover, a decision weighting function should fulfill the principle of diminishing sensitivity, which implies that individuals are decreasingly sensitive to changes further away from the reference point. Thus, a decision weighting function should be concave near 0 and convex near 1. (3) Losses and gains can be treated as a magnitude of change (negative or positive) from a reference point, which can alter. The final utility should be defined on gains and losses rather than on the final results (Kahneman and Tversky 1979). This approach is applied for empirical predictions in various domains in the context of uncertainty (Benartzi and Thaler 1995, Goette et al. 2004, Jullien and Salanié 2000). In the literature, different utility functions are proposed to investigate utility-oriented decision process (Cobb and Douglas 1928; Pratt 1964; Varian 1992).

The distortion of the possibility of the occurrence of an alternative ( $p_i$ ) is expressed by the inverse-S-shaped probability weighting functions  $q(p_i)$ . The estimated utility of an alternative can considering the information distortion be written as  $\sum_{i=1}^{i=n} u(x_i)q(p_i)$ ,  $i=1,,n$ .

However, those conventional utilization concepts assume a certain form of utility function in advance without justification. This is not in agreement with the proposition that the decision making process under uncertainty is indeed a black box model and a previous assumption of functional forms is not appropriate.

Therefore, we choose ANNs to investigate this decision making problem instead of the conventional approach. ANN method is an established method to investigate black box models in neuroscience,

engineering, physics ect. (Hochreiter and Schmidhuber 1997, Jones 1999, LeCun et al. 2015, Rubinov and Sporns 2010).

## **ARTIFICIAL NEURAL NETWORK (ANN)**

In 1934, McCulloch and Pitts introduced neurological network model and showed in their paper even simple networks could be employed to calculate any logic or arithmetic function (McCulloch and Pitts 1943). This can be seen as the beginning of neural network in the scientific community. ANNs enable us to scale the real-world tasks and to find solutions to explain behavioral patterns and performances. ANNs simplify the biological neural network and is one of the data-driven modeling techniques. More precisely, ANNs can be trained to investigate the relationship between the inputs and outputs based on given data sets without any previous mathematical or distributional assumption.

ANNs are viewed as a system of connected artificial neurons. In ANNs, the process of biological neural network will be reproduced with connected artificial neurons (components of network layers). Mathematical functions (propagation function and activation function) represent the strengths of neural connections and activation level of neurons.

The procedure of signal transformation in ANNs begins with an input or stimuli. It will be transferred to neurons in the input layer of ANNs. Like the biological neurons, the strengths of connections between artificial neurons are different. The connecting weights will be stored in the propagation function. The received signal will be transformed into network input using the activation function, also called transfer function. The network signals will pass through hidden layers and then arrive the output layers.

ANNs are considered universal approximators (Kolmogorov, 1957). Based on this theorem, it was proven that regardless of the activation function and the dimension of the input space, a neural network with one hidden layer can approximate any continuous function arbitrarily well (Hornik et al. 1989). ANNs with bias, a nonlinear and a linear output layer are capable of approximating any function with a finite number of discontinuities. This approach enables us to investigate black box models without any previous justification.

Given input and output (in MATLAB: target) data, ANNs can be trained in a so-called supervised learning process. In each learning step, the weights in propagation function will be adapted to minimize the learning errors. The adaptive changes of weights follow the learning rule determined by learning algorithms (e.g. Levenberg-Marquardt backpropagation algorithm in next section). Mean squared error (MSE) can be applied to measure the ANN model fit.

Among different architectures of ANNs, a multilayer feed-forward neural network (MFNN) consisting of three layers (input, hidden and output layer) is proposed in this paper. An ANN with  $n$

$(x_i, i=1, n)$  inputs is considered.  $w_{i,j}$  implies the weights of the connections between inputs and the input layer, which consists of  $m$  neurons ( $j=1, m$ ). The absolute value of  $w_{i,j}$  indicates the strengths of the connections and those connections can be excitatory (positive  $w_{i,j}$ ) or inhibitory (negative  $w_{i,j}$ ).  $b_j$  is bias, which influences the network signal  $net_j$ , but is not a part of input. It can be seen as a linear shift of  $\sum_{i=1}^{i=n} x_i w_{i,j}$ . The network signal  $net_j$  is represented by the propagation function in terms of inputs, weights and bias,  $net_j = \sum_{i=1}^{i=n} (x_i w_{i,j} + b_j)$ . Depending on the activation level of neurons, the network signal is transmitted related to the activation function  $a_j = f(net_j) = f(\sum_{i=1}^{i=n} (x_i w_{i,j} + b_j))$ .  $a_j$  is then passed to neurons in the output layer, expressed as an output function  $o_j = g(a_j)$ . Generally, the output function is defined as the identity function,  $g(a_j) = a_j$ .

The training of ANNs is based on the input-target data in supervised learning process. Thence, the training data should cover a wide range of possible conditions of the observed black box models. Weights and bias are adaptable in the whole training process. Once ANN is trained, the knowledge of the ANN is stored in weights and bias and can be used for further prediction.

## REALIZATION IN MATLAB

MATLAB (MATrix LABoratory) is a programming platform with matrix-based programming language. This language allows the most natural expression of computational mathematics. MATLAB enables scientists to analyze data, develop algorithms, create models and applications. Among a huge range of applications, MATLAB can provide multiple approaches to explore machine learning and deep learning.

The default activation functions in artificial neural networks in MATLAB include Hard-Limit transfer function, linear transfer function, log-sigmoid transfer function and hyperbolic tangent sigmoid transfer function. The last three are differentiable and strictly monotone. Furthermore, Hard-Limit, log-sigmoid and hyperbolic tangent sigmoid transfer functions are bounded. Additionally, the value of hyperbolic tangent sigmoid transfer function ( $f(x) = \frac{2}{1+e^{-2x}} - 1$ ) ranges from negative to positive domain. Based on those features of hyperbolic tangent sigmoid transfer function, it is applied in the further discussion and data analysis in this work.

The differentiability of the activation function indicates that a small change in output  $o_j$  from a neuron can be represented by a small change in weights  $\Delta w_{i,j}$  and in bias  $\Delta b_j$ . It implies:

$$\Delta o_j \approx \sum_{i=1}^{j=m} \Delta w_{i,j} \frac{\partial o_j}{\partial w_{i,j}} + \sum_{j=1}^{j=m} \Delta b_j \frac{\partial o_j}{\partial b_j} .$$

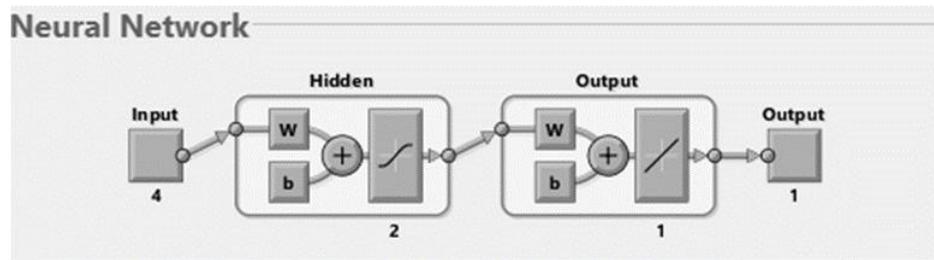

On the strength of quickness and stable convergence, Levenberg-Marquardt algorithm is selected to train the ANN in the next section. Levenberg-Marquardt algorithm, bayesian regularization and scaled conjugate gradient are considered to belong to the family of backpropagation algorithms. Those

learning algorithms consist of two different parts: feed-forward and backward pass. The signals are passed feed-forward and the output errors are propagated backward to adjust the weights and bias of ANNs. They are employed to minimize nonlinear functions. For training small- and medium-sized problems, Levenberg-Marquardt algorithm is more convenient than the other two (Hagan et al. 1996, p. 437–439). In this algorithm,  $w_{ij}$  and  $b_j$  will be adapted ( $\Delta w_{ij}$   $\Delta b_j$ ) after every learning epoch. The output error can be traced back to learning process in ANNs, in other words, the aggregate output error is splitted up into partial errors related to the weights of the connections.

To implement the decision making process using ANNs in MATLAB, we use the data set from the work of Gonzalez and Wu (Gonzalez and Wu 1999) due to following considerations: 1) their work focuses on the perception distortion in decision making under uncertainty through the probability weighting function and the value function with respect to the nonparametric estimation. 2) the empirical test is conducted with simplified stimuli including merely the occurrence probability and the monetary value of lottery alternatives. 3) this nonparametric approach does not assume any functional forms. It makes this approach comparable with ANNs. 4) their work addresses also the question, whether the perception distortions in decision making process under uncertainty exist at the aggregate level. 5) the generality of the finding is not the focus, but the description of the distortion phenomenon in the decision making process.

The experiment design in their study includes 15 two-outcome lotteries crossed with 11 different probabilities associated with the outcomes. All lotteries offer nonnegative outcomes. After the presentation of each lottery alternative, participants should choose a certainty equivalent for this lottery. The certainty equivalent is viewed as the perceived value of the lottery based on its probability and monetary outcomes. Consistent with Wu and Gonzalez, we implement the probability (high and low) and monetary outcomes (high and low) as input matrix. For instance, a lottery offering a 25% chance to win 100\$ and a 75% chance to win 0\$ will be implemented as the input vector (100, 0, 0.75, 0.25). The output data of our ANN model consists of the perceived value, i.e. the certainty equivalent, which is asked at the end of the experiment.

There are no general rules about the determination of the numbers of neurons and layers. Basically, the more complex the system, the more layers and neurons will be involved. We follow the recommendation in the previous literature (Møller 1993) and employ a two-layer ANN with 2 neurons on the first layer and 1 neuron on the second layer to analyze the data set, see Figure 1. In this study, the ANN model consists of an input matrix  $4 \times 154$  and an output matrix  $1 \times 154$ .

**Figure 1. ANN structure**

In Figure 1,  $w$  symbolizes weights and  $b$  bias in the ANN model. Hyperbolic tangent sigmoid function is chosen as the transfer function for the first layer and the pure linear function ( $f(x)=x$ ) for the second layer. The available data set is divided randomly into training, test and validation data set. In our case, 70% of the data set (108 samples) are set to be training data, 15% (23 samples) test data and 15% (23 samples) validating data.

Figure 2 shows the regression plot of the ANN model. Regression  $R$  values measure the correlation between outputs and target. An  $R$  value of 1 means a close relationship, 0 a random relationship. The result of model fit of the ANN after 69 iterations is represented in Table 1.

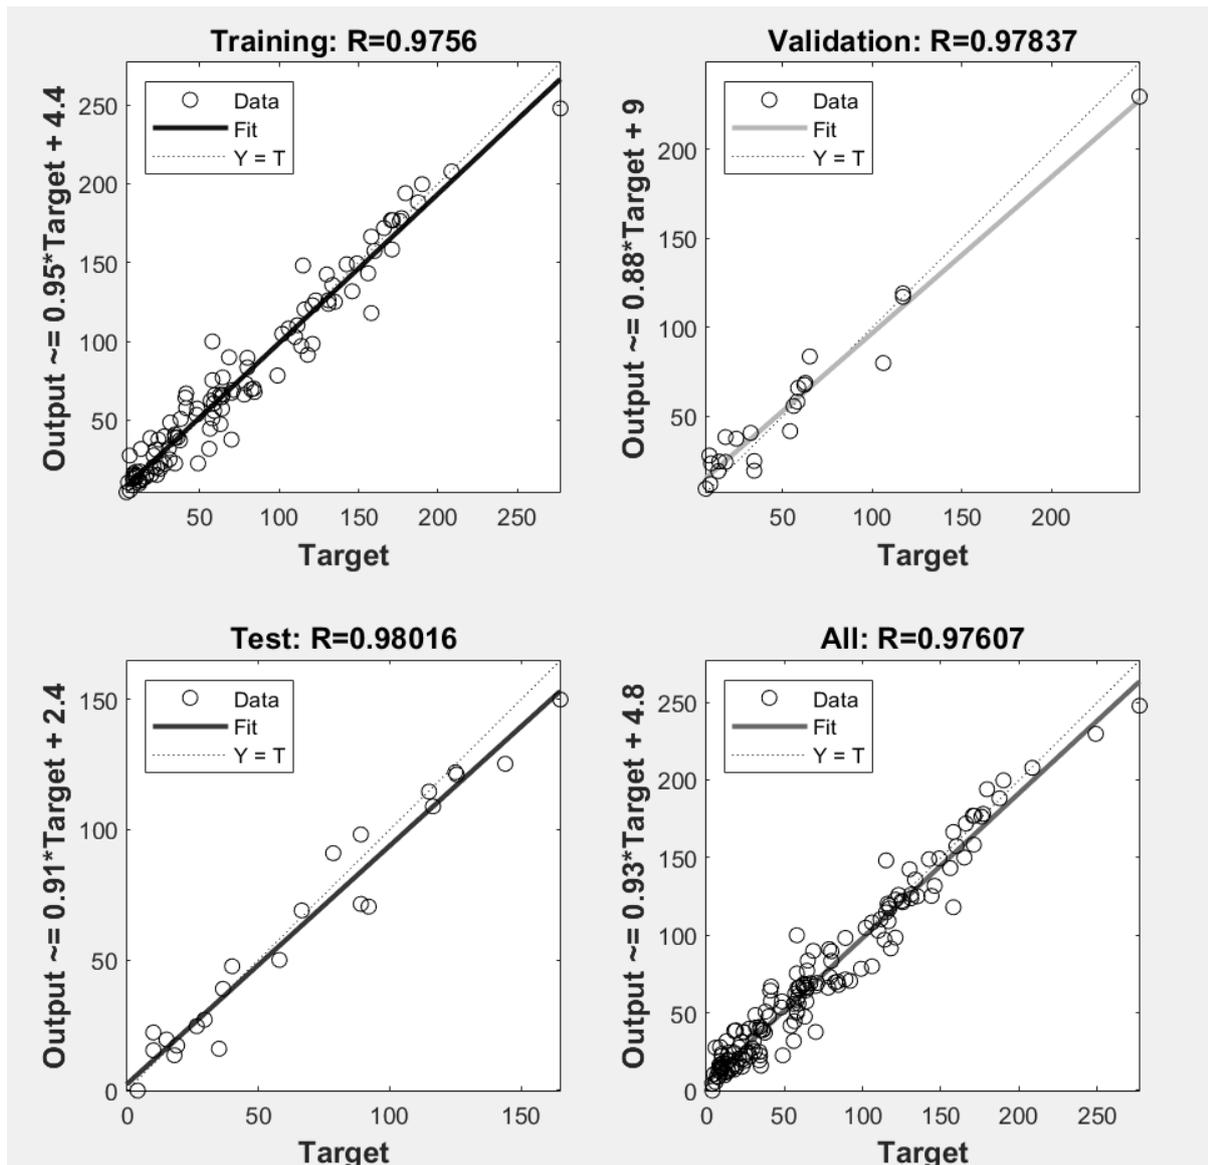

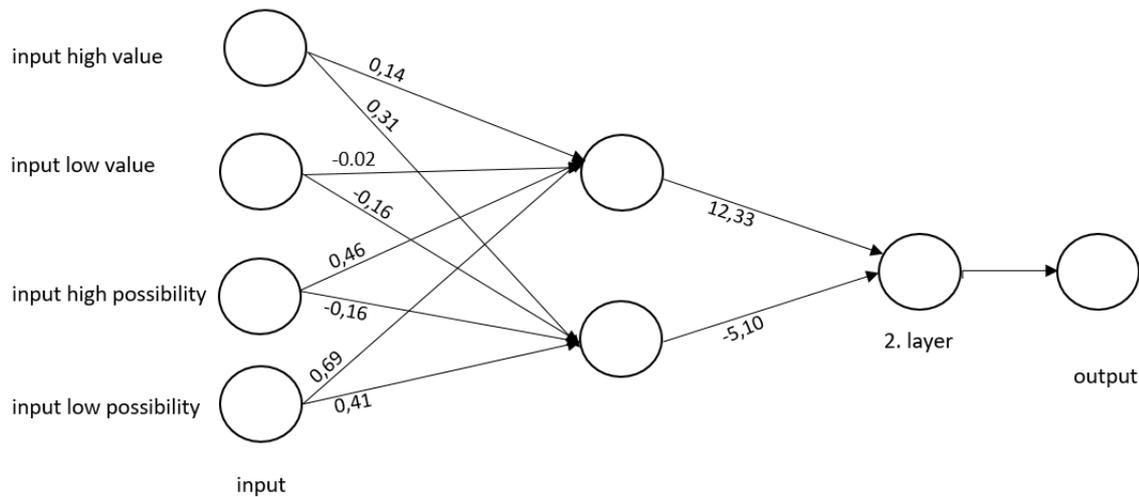

Figure 2. MATLAB Regression Plot

| Set        | Samples | MES       | R        |
|------------|---------|-----------|----------|
| Training   | 108     | 165.29934 | 0.9756   |
| Validation | 23      | 145.78205 | 0.978366 |
| Testing    | 23      | 105.09137 | 0.980155 |

Mean squared error (MSE): the average squared difference between outputs and targets

Table 1: Model fit

The following figure shows the result of the connection weights in ANN model. Both excitatory and inhibitory connections can be identified in our ANN model.

**Figure 3. ANN result**

The connections between the input low value and the artificial neurons in the first layer are both inhibitory, which gives evidence of the underestimation of the input low value. On the other side, between the input high value and the artificial neurons in the first layer exist excitatory connections, which implies the input high value will be overestimated in the decision making process. This finding is not in agreement with the result of Wu and Gonzalez (Gonzalez and Wu 1999), since they proposed the concave shape of the value function. Furthermore, they argued that the low value is always overestimated and oppositely, the high value always underestimated.

The input high possibility is connected with the artificial neurons in both inhibitory and excitatory way. However, the magnitude of the positive connection weight is larger than the negative one. Moreover, the connection weights of the input high possibility are smaller than those of the input low possibility. It means that the overestimation degree of the low possibility is larger than that of the high possibility. In the decision making process under uncertainty, people tend to overestimate the low possibility much more than the high possibility. It is consistent with the finding of Wu and Gonzalez (Gonzalez and Wu 1999).

Since the interplay of the perception of the possibility and the monetary value is also included here, this could explain the finding differences between the previous study and our study. We encourage the scholars to examine this in the future study.

## SUMMARY

Modeling individual choice preferences, considering the effect of uncertainty on multiattribute preference model, improvement for the implementation of the dynamic choice model.

In this work, we presented the approach to model the decision making process under uncertainty in the framework of ANNs. The result shows that ANNs can reveal more behavior patterns with respect to the information perception based on both the independent variables and the interplay of them. It fills the gap in the previous research, which deals with the independent variables separately.

After the review of the body of research on classical utilization concepts, this research shows that an ANN is a powerful approach to investigate a black box model descriptively.

There are several remarkable advantages of ANNs. First, it takes the biological neural network as a role model. It simplifies, but doesn't oversimplify, our decision making process. Second, it doesn't require the assumption of any functional form in advance. The unobservable part of a black box model is reproduced by the connected neurons and mathematical functions. This enables ANNs to explore a black box model in an appropriate way. Moreover, the weights and bias information can be stored as knowledge in ANNs and this provides a simulation basis for further prediction. Marketers can benefit from applying trained ANNs sustainably.

This work represents the first insights in modeling the decision making process under uncertainty in ANNs. However, several limitations of this work should be pointed out. Our finding cannot be generalized yet, without consideration of over-fitting and under-fitting of the ANN model. The over-fitting occurs if the statistical variance between the actual output and the target output is high. On the other side, a high level of the statistical bias implies the under-fitting situation (Turkson et al. 2016). We encourage scholars to investigate the generality of the ANN model taking the over-fitting and under-fitting into account.

Additionally, there are no decision rules about the number of layers and neurons involved in ANNs. The increasing numbers of layers and neurons enhance the network complexity and calculation time, but it can provide a more accurate prediction compared with networks with low numbers of layers and neurons. However, the choice of the required number of neurons should be considered carefully in terms of over-fitting and under-fitting effects. An over-fitted ANN has weak capability of generalization, which indicates that it can provide precise predictions of given learning data sets and the generalization in other context will yield large errors. The question for the further research is how to find the balance between the numbers of computational neurons and system accuracy?

## THE ACCOUNTING REGULATION OF PPPS UNDER IFRIC 12: STATE OF THE ART

Esposito, Paolo; Colangelo, Federica

Department of Law, Economics, Management and Quantitative Methods-DEMM, Sannio University, Italy

### ABSTRACT

IFRIC 12 has been approved by the European Commission with EC regulation no. 254/2009 on March 25, 2009; it has profoundly changed the accounting of concessions, especially in the event that the grantor has control over the infrastructure used by the concessionaire for the provision of public utility services. This accounting change assumes particular importance in the Italian economic reality in which many public utility services, also through privatizations carried out during the nineties, have been entrusted to private-law companies through concession contracts. IFRIC 12 applies to service concession arrangements between a public sector entity (grantor) and a private sector entity (concessionaire) if the following conditions are met:

- a) the grantor controls or regulates which services the concessionaire must provide with the infrastructure, to whom it must provide them and at what price;
- b) the grantor controls - through ownership or otherwise - any residual interest in the infrastructure upon expiry of the agreement.

The objective of this contribution IFRIC 12 is to provide clarifications on the accounting model to be adopted in the dealer's financial statements to detect and evaluate the obligations and rights connected with the agreements for concession services. The European Commission under IFRIC 12 adoption, clarifying that the PPPs consist of forms of cooperation between public and private entities that aim to guarantee the financing, construction, management of a restructuring or maintenance of an infrastructure or the provision of a service. The main advantage that derives from the involvement of the private sector in the management of a public service is that the public body must not use its own resources in financing the operation of a public service.

## 1. THE PROJECT-FINANCING SYSTEM

The project financing system is included in the construction and management concession, that is, the construction of public works without financial charges for the public administration; it is configured first of all as a complex economic-financial operation aimed at a specific investment for the construction of a work and / or the management of a service, on the initiative of private or public promoters. It is therefore a structured financing method also used for some PPP operations (Vacca, Solustri, 2003).

Project financing was introduced for the first time in Italy in the regulation of the public works contract by Law 415/1998, the so-called Merloni-ter law, with the inclusion of articles 37-bis to 37-nonies in Law 109/1994, so-called framework law on public works. This standard had the merit of having defined the procedure to be followed for the financing of public works by private individuals, transforming the PF from an instrument reserved for the construction of large infrastructure works to a normal technique of public action, also in its territorial expressions multiple peripherals (Lepore, 2010).

A definition of this method is that given by NEVITT in 1998, according to which PF means the "financing of a specific economic unit, usually the so-called project company, through an operation in which the lender considers the flow of cash and profits from project management as collateral for debt repayment and economic unit assets as collateral ". The PF, therefore, is a multi-disciplinary approach to financing particularly complex investments, characterized by the possibility of resorting to a high involvement of loans from the banking sector and in which the revenue flows deriving from the management of an infrastructure are sufficient for coverage of management costs, repayment of the loan and return on invested capital; in addition to the relevance that the private individual has regarding the financing and management of a public infrastructure (Cori, 2007).

Project financing therefore consists of financing a project suitable to generate, in the management phase, sufficient cash flows to repay the debt contracted for its realization as well as to remunerate the risk capital. The operation is normally developed through the use of a newly created company, the project company, which has the task of carrying out and managing the project. The advantage of establishing a new company is represented for the private individual by the fact that, since it is a subject legally distinct from the promoter, the capital invested remains separate from the other activities of its members and therefore with a precise delimitation of the risk for the company. project (Sambri, 2012).

Project financing integrates a financing technique characterized by private contributions. A project financing operation can be divided into three phases (Falini, 2008):

- Design and construction (in this phase the financial resources are guaranteed by the financing institutions in favor of the project);
- Start-up (checks whether the project is suitable for generating cash flows through the verification tests);
- Operational management (the project begins to generate cash flows).

The works that can be subject to project financing can be distinguished as follows (Ricciardi, 2014):

- Hot works: Initiatives in which revenues allow the private individual to fully recover investment costs over the life of the concession. Involvement of the public sector limited to identify the necessary conditions to allow the realization of the project;
- Lukewarm works: Initiatives whose user revenues are in themselves insufficient to generate adequate economic returns, but whose realization generates significant positive externalities in terms of social benefits induced by the infrastructure. These externalities justify the provision of a public contribution component;
- Cold works: Initiatives - prisons, hospitals, schools - for which the private entity that realizes and manages them derives its remuneration exclusively (or mainly) from payments made by the public administration.

The PF has undergone many changes; in the Official Gazette no. 231/2008 the legislative decree n. 152/2008, legislative intervention which continues the gradual revision of the Procurement Code and aims to pursue (Grementieri, 2009):

- conditions of competition between economic operators;
- enhancement of the appropriate tools to ensure the transparency of the procedures, with the possibility of verifying the legitimacy of the work of the contracting stations and of the other parties involved;
- streamlining of procedures, for the benefit of transparency and market opening.

Among the main changes made, particular attention is paid to project finance. The regulatory definition of project financing is contained in Article 153 of the Code: realization of public works or public utilities through concession contracts, with resources totally or partially borne by the promoters themselves. The third corrective reintroduces the right of first refusal limited to some hypotheses, which can be activated on the initiative of the Administration or private individuals. According to the new text, "contracting authorities may, as an alternative to awarding a concession pursuant to Article 143, award a concession by placing a feasibility study as the basis for the tender, by publishing a notice for the presentation of tenders which contemplate the use of resources totally or partially at the expense of the proposing parties "(Grementieri, 2009).

In our country, the expression project financing (or in Italian "project finance") has been frequently used to define a particular form of PPP, at the base of which a concession contract for the construction and management of a public work is placed. or of public utility. Project financing in Italy has taken hold mainly in public utility works. In this sense, the promoters are called upon to submit a proposal to the public administration to finance, execute and manage a particular public work that has already been approved or will be approved within a short time. However, there are differences between project finance in Italy and what it represents in its more classic definition. In particular, while project financing provides for an equitable distribution of risk between the promoter and the banks, in Italy the risk is assumed almost exclusively by the promoter (Gennari, Monosilio, Coloparti, Tempesta, 2012).

## 2. THE CONCESSIONS

The public works concession contract represents the most widely used form of contractual PPP.

The term "concession" has been used in many meanings and indicates various figures of measures. The "common nature of these measures is the effect of conferring on one or more persons outside the administration new capacities or new powers and rights, from which their legal sphere remains expanded" (Rizzo, 2012). The concessions are affirmed in our system in meeting the need of the private company to derive profit from the exclusive management of assets held in the hands of the public and the need of the State to obtain, on the one hand, the direct results measurable in terms of works and services intended for the public and on the other the indirect result of the decrease in unemployment thresholds and the increase in overall national production (Napolitano, 2008).

Ranelletti, in his work "General theory of authorizations and administrative concessions", published in the late 1800s, was the first attempt to systematically construct the matter. The author studied the institution of administrative concessions and authorizations: "with authorizations, an obstacle is removed that prevents the exercise of rights that the private owner already has; with concessions new rights are granted to the private individual. The distinction is simple and clear, but it is not entirely satisfactory, because it is not always true that the private individual, before asking for authorization, and in order to ask for it, is (already) the holder of a subjective right, and because the concession does not always creates new rights; but it determines the purchase of different utilities. Ranelletti reconstructed all the concessions in terms of unilateral acts, put in place "by the sole activity of the authority that issues them", following the private request.

The private individual, with his own declaration of "availing himself of the concession" or with the

participation in the public deed or with "giving the security", accepts the concession with the consequent obligation to "respect all conditions", but does not change the legal nature of the institution (Rizzo, 2012).

### **3. THE CONCESSION IS THEREFORE A FORM OF FUNCTIONAL PRIVATIZATION**

The expression "functional privatization", in fact, really wants to highlight the propensity of the PA to create public services, changing the tools and management logic of private companies (Gianfelici, 2008). The ways in which functional privatization is carried out is precisely that of granting (licensing) or outsourcing certain contracted tasks (contracting-out). These procedures do not transfer ownership of the assets to the private sector, but only management, i.e. the opportunity to act in certain contexts for a certain period of time. To achieve the objectives of functional privatization (minimizing the costs of the services offered by the private operator to the public one) it is necessary to correctly manage the tender to avoid that a private monopoly replaces the public monopoly. With the concessions there is a temporary assignment of the monopoly for the production, or distribution of a good or service to a specific economic entity which, by completing a tender, was the most suitable to guarantee the best quality-price combination. The contract represents the assignment in management to public or private operators of activities financed with public funds (Fazioli, 2013). What causes problems is the legal nature of concessions. The doctrine was divided into two: on the one hand the supporters of the publicity approach (concession as a unilateral administrative act - administrative measure) and on the other the supporters of the private approach (concession as a contract) (Raganelli, 2017).

Halfway between the two approaches is the concession-contract theory. This case arises from the confluence of a unilateral act (the concession) and an agreement supplementing the content of this having a private nature, that is, a bilateral contractual relationship which is the source of obligations and mutual rights of the granting entity and the private concessionaire. The concession holders exercise special rights on goods and activities not available to private individuals and reserved for public authorities (De Giorgi Cezzi, 2011).

### **4. THE CONCESSIONS IN THE LEGAL SYSTEM**

The law 24 June 1929, n. 1137 , distinguished two types of concession: the construction-only concession and the construction and management concession. The first consists in the administrative act with which a PA entrusts a subject with the task of building a public work within a certain term and for consideration; the second instead, is the administrative act with which the PA entrusts a subject with the task of building a public work and managing it for a specific period of time, at the end

of which, the work becomes the property of the administration . In particular, the law of 8 August 1977, n. 584 equated the construction-only concession to the contract and subjected it to the same procedural and legal regime (Raganelli, 2017).

In Italy, the process of reforming the discipline of public works begins with the framework law on public works, no. 109/1994 (Merloni) ; it sets out uniform guidelines and principles which inspire the administrative activity in the procurement sector and defines a new discipline of the matter, extended to the entire cycle of construction of public works, from programming, to planning, to awarding, to execution some jobs. The law also tends to act as a general source and, in order to prevent subsequent regulations from compromising, through derogations or implicit changes, the certainty of the legislative framework, provides that any "derogations, changes or repeals" of the rules contained therein may only be arranged "for an express statement with specific reference to individual provisions" of the same law. it continues with the law 18 November 1998 n. 415 , (Merloni-ter) , with the law of 2002 (Merloni-quater) ; the of the Code public contracts in 2006 and the 2016 Procurement Code (Bonacci, 1995).

Taking a step back, as far as the concession of public works is concerned, this took place with the EU directives 93/37 / EC on public works contracts, and subsequently with the directives 17 and 18/2004 / EC in which it is regulated by the inside the contract (Di Giovanni, 2012).

Article 1, paragraph 3, of the unified directive 2004/18 / EC (on procurement), indicates the definition of concession of works as a contract with characteristics similar to the contract, except for the fact that the consideration consists only in the right to manage the work, accompanied by a price (Raganelli, 2017). As regards the concession of services, however, the evolution of the institution passes between the Commission's interpretative communication on services (OJEC 29 April 2000, C. 121 ) and the jurisprudence of the Court of Justice (7 December 2000 C-324 / 1998) , on the basis of which, service concessions are subject to the general principles of Community law on the freedom to provide services, such as transparency, competition, equal treatment, impartiality, proportionality and advertising (Di Giovanni, 2012).

In Italy, the regulations in force regarding concessions are contained in the 2016 Procurement Code, Legislative Decree no. 18 April 2016, no. 50 , implementation of directives 2014/23 / EU, 2014/24 / EU and 2014/25 / EU on the award of concession contracts (Raganelli, 2017). Before examining the new legislation introduced by Legislative Decree No. 50/2016, it is advisable to know the discipline dictated by Legislative Decree 163 of 2006 . This code of public contracts deals with distinguishing the concession of "works" from that of "services", placing the definitions in two distinct paragraphs of article 3:

- (paragraph 11) "public works concessions" means "a contract for consideration entered into in writing pursuant to which one or more contracting authorities entrust the execution of works or the executive design and execution, or the final design , the executive planning and the execution of works to one or more economic operators, recognizing as a consideration only the right to manage the works covered by the contract or this right accompanied by a price, with assumption by the concessionaire of the operational risk linked to the works management ».

- (paragraph 12) "service concession" means: "a contract for consideration entered into in writing pursuant to which one or more contracting authorities entrust one or more economic operators with the supply and management of services other than the execution of works referred to in letter II), by way of consideration, only the right to manage the services covered by the contract or this right accompanied by a price, with assumption of the operational risk linked to the management of the services by the concessionaire ".

Pursuant to the provisions of art. 143, paragraph 9 of the Code, fully include the notion of "public works concession" both the hypotheses where the concessionaire assumes, in addition to the construction risk, the "demand risk" (highway model), as well as the concessions in which the risk of availability is added to the construction risk (model hospitals, prisons, etc.).

The internal legislator also, with the rule of art. 30 of Legislative Decree no. 163/2006 , established that the only pre-established rules governing the granting of services were those contained in the same art. 30 , pending the declared inapplicability, to this type of negotiation, of the other provisions of the Code (Lucca, 2015). The Code of Contracts has been replaced by the 2016 Procurement Code, issued with the d.gls. April 18 2016, n. 50 ; it provides for a transitory regulation, in the transition from the old to the new Code, to give certainty of reference to the contracting stations and the subjects involved.

The Government therefore transposes the public procurement and concessions directives into a single decree and reorganizes the regulations in force regarding public contracts relating to works, services and supplies and concession contracts.

The procedural rules for each type of contract are governed: contract, concessions, other types such as in-house, general contractor, public-private partnership instruments, including in the latter project financing, horizontal subsidiarity tools, administrative barter. For the first time the new Code addresses the institution of the concession in an organic way; a uniform regulation is provided for the concessions of works, services and supplies, clarifying that the concessions are contracts of duration, characterized by the operational risk for the concessionaire in case of non-economic return on the investment made (Interlandi, 2016).

Legislative Decree 18 April 2016, n. 50 has undergone the latest changes with the law 58/2019 ; it regulates the procurement and concession contracts of contracting authorities and contracting entities concerning the acquisition of services, supplies, works and works, as well as public design competitions (Furcolo, 2019). EU Delegated Regulations nos. 1827, 1828, 1829 and 1830 , published by the Commission in the Official Journal of the European Union on 10/31/2019 , modify the European thresholds for public procurement and concessions.

The new thresholds apply, as specified in the regulations, from January 1, 2020. The regulations modify the thresholds of European relevance in relation to procedures for the award of public contracts and concessions.

In particular, Regulation 2019/1827 amends Directive 2014/23 / EU on concessions.

Regulation 2019/1828 amends Directive 2014/24 / EU on procurement in ordinary sectors. Regulation 2019/1829 amends Directive 2014/25 / EU on procurement in special sectors. Lastly, Regulation 2019/1830 amends Directive 2009/81 / EC on procurement in the defense and security sectors (Facondini, 2019).

## **5. PPP FAILURE: SOME CASE STUDIES**

The use of PPP by municipalities assumes an increasingly significant importance over time, reaching 67% of the value of public works notices of municipal administrations in 2016.

However, the potential of this market is hampered by some critical elements. First, the long time between the publication of the notice and the award time during the game , but although the technical and design quality deficiencies on the part of contracting authorities can determine the failure of the initiative.

In fact, compared to about 33,164 PPP procedures detected and archived by the National PPP Observatory, between 2002 and 2016, the "interrupted proceedings" concern 4,429 procedures, equal to 13%, with peaks of over 30% in the case of calls with a unit value over 15 million euros (Giorgio, Marinuzzi, Tortorella, 2018).

**Table 1: PPP market: interrupted proceedings, by amount class, 2002-2016**

| Classe di importo dei bandi PPP | Numero                      |                           |              | Importo (mln euro)          |                           |              |
|---------------------------------|-----------------------------|---------------------------|--------------|-----------------------------|---------------------------|--------------|

### 5.1 Motorway concessions and "Ponte Morandi"

The Polcevera Viaduct, also known as Ponte Morandi, was designed by the engineer Morandi in 1960 and later built by the Italian Society for Water Pipelines in Genoa, on the Polcevera Valley. The bridge was granted in concession to Autostrade per l'Italia, as it was positioned on the route belonging to the Italian A10 motorway. It is a strategic viaduct as it is the main link in Genoa, easy to access to the Voltri-Prà container port and to the Cristoforo Colombo airport. The engineer devised a prestressing system called "Morandi M5" which he used for some of its structures; but the most peculiar note was represented by the structure with balanced trestles that was applied by the same to the General Rafael Urdaneta bridge in Venezuela. This bridge, inaugurated in 1962, collapsed in 1964 due to an accident caused by an oil tanker which hit the batteries designed for the naval passage; but such an event had not been foreseen. The Morandi bridge was nicknamed the Brooklyn bridge because, twenty years after the inauguration, metal cables (stays) were added to avoid the collapse of the structure (Laino, 2018) .

"(ANSA) - Rome, 14 August 2018 - Bridge collapses on the highway in Genoa: both roadways have fallen, there are fears of means involved" (ANSA, 2018 , 1).

The collapse of the bridge was immediately interpreted as enormous damage to the economy and tourism of Liguria. The listing on the stock exchange of Atlantia, a group owned by Autostrade,

immediately fell by 4.5%. The stock market crash, however, was not the only consequence of the crash; in fact, the Italian government immediately expressed its intention to revoke the concession to Autostrade per l'Italia. However, Atlantia immediately ruled on this which saw the probable revocation unjustified, as the causes of the tragedy had not yet been defined. The government's decision regarding highway concessions not only frightened the responsible group, but the entire highway sector, which on the same day closed its quotations on the stock exchange in red (ANSA, 2018, 2).

## 5.2 Motorway concessions towards revocation

The Milleproroghe decree, in art. 35 provides for a new procedure in case of revocation of the motorway concession: " In the event of revocation, revocation or termination of road or motorway concessions, including those subject to toll, pending the tender procedures for the assignment of a new concessionaire, for the time strictly necessary for its identification , ANAS Spa, in implementation of art. 36, paragraph 3, of the law decree 6 July 2011, n. 98, converted, with modifications, by the law 15 July 2011, n. 111 , can take over the management of the same, as well as carry out ordinary and extraordinary maintenance and investment activities aimed at their requalification or adaptation. Any conventional provisions that exclude the recognition of indemnities in the event of early termination of the concession relationship are reserved, and the possibility is made for ANAS Spa, for the purposes of carrying out the activities referred to in the first period, to purchase any projects developed by the concession upon payment of a consideration determined having regard only to the design costs and to the intellectual property rights referred to in art. 2578 of the civil code. With the decree adopted by the Minister of Infrastructure and Transport, in agreement with the Minister of Economy and Finance, the object and methods of carrying out the provisional management assigned to ANAS Spa are governed if the extinction of the concession derives from non-fulfillment of the concessionaire, art. 176, paragraph 4, letter a) of Legislative Decree no . April 18, 2016, no. 50 , even in replacement of any conventional clauses, substantive and procedural, dissimilar, even if approved by law, to be understood as void within the meaning of 'art. 1419 , second paragraph, of the civil code, without being able to operate, as a result of this provision, any termination of law. The effectiveness of the revocation, revocation or termination of the concession is not subject to the condition of payment by the granting administration of the sums envisaged by the aforementioned art. 176, paragraph 4, letter a)" (Official Gazette, 2019).

Following the aforementioned law decree, all the companies holding motorway concessions have requested the opening of a negotiation with the government. L ' Aiscat , the association chaired by Fabrizio Palenzona , which represents 20 dealerships with almost 13 thousand employees who run 6000 km of highway network, believes that it is urgent to bring certainty and stability in the sector. In

the last week (late December 2019 and early January 2020), the Atlantia group (collapsed by the Benetton) has lost almost 4% on the stock exchange, Aspi claims that in the event of revocation of the concession with compensation reduced the bankruptcy of the company it would be inevitable. The unknown-tunnels, is an important variable that weighs on the takeover of Anas in case of revocation of motorway concessions foreseen by the thousand extensions but introduced for the case of Autostrade per l'Italia (Aspi). Italy risks an EU infringement procedure as a large part of the structures are not in compliance with the fire requirements (Corriere della Sera, 2020).

A possible alternative to the revocation appears to be the maxi-fine against Autostrade per l'Italia. According to reports from government sources, this would be one of the ways being studied to close the dossier on granting Aspi opened after the collapse of the bridge Morandi in Genoa. Hanging on the government's decision on whether or not to withdraw the concession, Autostrade per l'Italia is also preparing to implement the new industrial plan to give a signal of change and discontinuity with the past. The Minister of Infrastructure and Transport, Paola De Micheli, in an interview of January 9, 2020 with Repubblica, said that: "To avoid the breaking of the concession, Aspi has made several proposals also to the previous government. We considered them insufficient for the fallout for the benefit of citizens. 700 million for the reduction of tolls? We would have expected a significant reduction in toll charges, without changing the plan for greater investments in the network and for maintenance. The proposal is insufficient. "Autostrade includes the 600 million of the rebuilding of the Morandi Bridge in the compensation it offers to the State? This is money already provided for by law. If the discussion begins like this it is not only insufficient, it is also inadmissible." De Micheli underlines how the adoption of any revocation of hills on two bases: legal and economic. For the minister, "beyond Aspi, the culture of the relationship between the private and the public must be reviewed. The public has a prevailing interest and if it does not have the strength to assert it, an imbalance is created which is also damage to the private individual because it lowers quality. Unfortunately, the tragedy of Genoa is a lesson, "he says." Even the state cannot limit itself to pointing the finger, it must take on greater control capacity "(Rai News, 2020).

### **5.3 Revocation of motorway concessions: possible consequences**

The Milleproroghe decree, approved by the government "unless otherwise understood", risks shaking the majority of the government, unleashing new tensions. The reason for the dispute are some provisions, on all those relating to motorway concessions and which seem to anticipate the revocation of the Atlantia group, which was so much desired by the 5 Star Movement after the collapse of the Morandi Bridge in Genoa. In the Milleproroghe, in fact, there is a rule that provides that in the event of revocation, forfeiture or termination of road or motorway concessions, pending the tender

procedures to find a new concessionaire, management will pass to Anas, which will carry out ordinary and extraordinary maintenance and investment activities for the redevelopment or adaptation of the network.

The outgoing concessionaire will be responsible for the value of the works carried out, the penalties and other costs to be incurred for the termination of the relationship, unless the termination of the concession is due to its non-fulfillment. In this case, according to the decree, the concessionaire will be paid the "value of the works completed plus ancillary charges net of depreciation", but from this amount will be "deducted what the concessionaire is required to pay for compensation for damages deriving from its non-performance".

The Milleproroghe provides that this legislation will apply in place of any unconventional conventional clauses, even if approved by law, which in this case must be considered null. The new rules, in fact, must be considered as included in law in motorway contracts and concessions, even in those already in progress. These provisions have raised tensions in the government, with the representatives of Italia Viva who have not voted for the Milleproroghe rules on motorway concessions and have had their dissent recorded in the minutes. They are, however, those affected to express strong opposition. In the first place, Aiscat (Association of motorway and tunnel concessionaires) has manifested strong bewilderment for the provisions of Milleproroghe on motorways, calling them unconstitutional and speaking of "serious injury to the rule of law". These rules, Aiscat stressed, risk causing serious damage to companies and an entire production sector.

Last December 2019, Autostrade per l'Italia also intervened on the issue, the company of the Atlantia group which belongs to the Benetton family and which manages a large part of the Italian motorway network. According to the company, the Milleproroghe decree presents "significant profiles of unconstitutionality and opposition to European standards". Autostrade per l'Italia has announced that "it is evaluating every initiative aimed at protecting its rights in terms of constitutional and community legitimacy of the regulatory provisions on the principles of entrustment, freedom of establishment and competition, proportionality and reasonableness".

It is clear that the regulation on the possible compensation for default of the concessionaire refers to the case of the collapse of the Morandi Bridge in Genoa, for which the 5 Star Movement has long been asking for the revocation of the concession to Autostrade per l'Italia and for compensation for damages (QuiFinanza, 2019).

If the concessions are revoked, the Democratic Party will yield to the populist blackmail of the 5 Star Movement. The question is in fact twofold: on the one hand, the state controls, which in these twenty years have been almost completely lacking; on the other, compliance with dealers' contracts. The regulatory framework governing concessions is old, because in the meantime the terms of the

contracts have changed, and this anomaly cannot be passed on to citizens and businesses. The state was supposed to carry out the controls, but the concession contracts were secreted. The extent of the dealers' record profitability was known only after the collapse of Morandi. The State therefore also has its responsibilities, as it should have protected the general interest. The revocation of the motorway concession would then lead to a dispute whose onerous effects would fall on citizens, as well as fueling an anti-industrial climate and sentiment that would have the sole purpose of removing potential investors from our country. If the PD, should yield to the proceeds of the Five Star Movement, it would write a new phase in the relationship that regulates the public and private sector in our country. There have been errors and it is right that the investigations ascertain the responsibilities of the private and public (Cianciotta, 2020).

Subsequently, the Fitch cut came to Atlantia, with repercussions still to be established but for now the rating cut on Autostrade per l'Italia from "BBB +" to "BB +" and that on the parent company from "BBB" to "BB" has a somewhat immediate effect; that of allowing Cdp and Bei to request early repayment of the loans granted. As communicated by Atlantia, Fitch's decision "could determine the request by EIB and the CDP for the early repayment of loans granted to Autostrade per l'Italia for an amount of approximately 2.1 billion euros, of which approximately 1,8 billion guaranteed by Atlantia, with the consequent absorption of credit lines from Atlantia and Autostrade per l'Italia" (Il Sole 24 Ore, 2020).

#### **5.4 The government and the revocation of the concession to Autostrade**

The Prime Minister, Giuseppe Conte, seems to have decided, supported by Luigi Di Maio, on the revocation of the concession to Autostrade per l'Italia.

"On Autostrade the government's decision will come soon and will be based on a solid technical-legal basis. It is now clear that serious defaults in the management of motorway infrastructures have emerged. We won't discount anyone"; this is what the Premier said some time ago on twitter.

Luigi Di Maio, too, had already launched an appeal in which he asked to "resist" on the desire to revoke the concession to Autostrade and that they are also working very well with Minister De Micheli. "If a dealer has not done the right maintenance, he no longer has to make profits on our highways, risking the lives of many Italians"; this is what Di Maio said recently. Also the Deputy Minister of Infrastructure and Transport, Giancarlo Cancellieri, he had anticipated: "With President Conte we will take stock in the next few days." And he had thrown himself against the possibility of a maxi-fine, announcing: "We will not retreat".

But, in the majority, the agreement, however, is not total. The first to cast doubts on the possibility of the revocation was Matteo Renzi, who warned: "Concessions can only be revoked if legally the thing stands, otherwise our children and grandchildren will pay the damages for generations".

The leader of Italia Viva has specified that he does not want to defend Autostrade, but "legal certainty. If the company is in default, I revoke the contract: but who decides? The rules and laws are serious things". It withdraws yes, but only if it has legal bases, because "if it turns out that Autostrade is not to blame, 23 billion will have to be paid back. I am ashamed that tomorrow the state will have to pay 23 billion for today's populism" ( Bernasconi, 2020).

In mid-January 2020, Autostrade per l'Italia tries to save its concession, recovering the collapsed trust together with the Morandi bridge, promising tripled investments and a new reinforced maintenance plan, which includes real-time monitoring of the state of health of bridges and viaducts, while providing for around a thousand hires. The Board of Directors of the Atlantia Group , managed by the Benetton family, has set the guidelines for the 2020-2023 period stating in a note that it is ready to put 7.5 billion euros on the table.

In the meantime, the group is attempting to pacify the government, which has not yet made a decision on the revocation of the concession. "Without the concessions and the compensation provided for by the Milleproroghe decree, the company will default - he says - concern for the future of the company's seven thousand employees who work with dedication and for the possibility of being a resource for this country. And despite all the efforts we are making, it will not be easy to recover the financial downgrades ", says Tomasi in an interview (Fanpage.it, 2020).

Prime Minister Giuseppe Conte and Minister of Infrastructures Paola De Micheli are looking for a solution that avoids revocation , but they make it clear that they are ready for revocation if there are no strong openings by Aspi in the sense of a revision of the agreement, the reduction of tariffs and the strengthening of investments in maintenance. Pending a relaunch by Aspi, which had proposed a compensation of 700 million considered insufficient within the government, the hypothesis of the revocation will however be destined to grow. Gianfranco Cancelleri , the Undersecretary for Infrastructures of the Five Stars, had reiterated that "the revocation of the concessions to Autostrade remains the only solution" . In reality, Cancelleri took it with a maxi-fine hypothesis also denied by De Micheli. "A maxi-fine does not do justice to the 43 victims of the collapse of the Morandi bridge. A maxi-fine is an unacceptable compromise after the endless collapses and inconveniences due to the neglect of the motorway works granted to Autostrade " ; this is what affirmed by Cancelleri (Il Sole 24 Ore, 2020).

On the political table, however, the question is: whether or not to withdraw the concession after Ponte Morandi? The initiation of the revocation procedure should be placed at the forefront of possible government decisions. The second technical possibility which has also been mentioned, is that of a breach of the convention, decided by the government outside the procedure established by the convention. The third way for the government is that of the negotiation with Aspi to arrive at a heavy

revision of the agreement in progress with a reduction of the tariffs, an increase in the maintenance of the investments and an increased compensation for the events in Genoa.

The revocation , even if it were supported by heavy documentation on Aspi's responsibilities in the collapse of Ponte Morandi and in the subsequent episodes of bad maintenance, would still be heavy in terms of concrete effects.

Aspi has tried to open a window to the hypothesis of the negotiation and has made a proposal for compensation of 700 million which the government considers insufficient. Aspi also plans to approve a new industrial plan that will speed up investments, digitize controls in tunnels, improve service quality. The minister, however, insists that a revision of the convention is needed; no one off (Il Sole 24 Ore, 2020).

The Atlantia Shares in the last week of January 2020 are up sharply in Milan and this also thanks to the resignation of Luigi Di Maio from driving the M5S. The advances of the Atlantia shares today were supported by the statements of Giuseppe Conte, who confirmed that he has not yet reached a definitive solution on the revocation of the motorway concessions to Aspi (Money.it, 2020) .

According to Carlo Bertazzo , the new CEO of the parent company Atlantia , to evoke the concession to Autostrade per l'Italia would mean compromising a company and putting at risk a world-leading group in its sector, and therefore important for the country. The manager says that the collapse of the Morandi bridge was "something very serious, which should not have happened and which represents a watershed for the company". The manager asks "apologies to the families of the victims and to all the Italians". For the tragic event and for the wiretapping that showed the presence within the group of "people so distant from corporate ethics and our way of seeing and operating". The manager announces changes within Atlantia and in the subsidiaries.

On the lack of maintenance by Aspi and on the fact that everything happened without the knowledge of the parent company, Bertazzo replies that "the board of Atlantia takes care of the strategic guidelines of the subsidiaries. Maintenance programs and their modalities are not among the things we have ever discussed. Safety and reputation have always been absolute goals dictated by the board. It is clear that something did not work or that Autostrade per l'Italia did not do enough. Everyone will have to take on their own responsibilities. Let the judiciary run its course. Autostrade will have difficulty accessing the market, certainly not under the previous conditions. In the event of a revocation, without revenues and with reduced and deferred indemnities over time, it should immediately repay the debts and therefore could hardly avoid a default. It would be a very serious thing for the country. For Atlantia , however, it would be a question of guaranteeing a portion of Aspi's debt. We have lines of credit, but with the revocation we should start making reflections" (HuffPost , 2020).

In the end, the solution could be that of a spin-off of Aspi from Atlantia with the entry into Autostrade per l'Italia of Cassa Depositi e prestiti ( Cdp ) or of Italian Funds for Infrastructures (F2i). It also appears that the Benetton are looking for investors for the dealership, thereby saving the holding company Atlantia as well.

This hypothesis is liked to the market, to the point that 24 January 2020 on the Ftse Mib, Atlantia has been the second best of the day title. But, in addition to the market and investors, that of an exit of Atlantia from Aspi would also be a welcome solution to politics, in particular to the five stars who, from 14 August 2018, the date of the collapse of the Morandi bridge , do not want to hear about alternative solutions to the revocation of the concession (AGI, 2020).

Recently, the Minister of Infrastructure Paola De Micheli confirmed that a decision on the revocation of motorway concessions has not yet been taken. At the same time, however, Prime Minister Giuseppe Conte spoke of upcoming news: "We have not yet collected the latest opinions but we are there ."

Separate statements, Atlantia shares benefited from the outcome of the regional elections in Emilia Romagna and Calabria. From the consultation, the 5 Star Movement has come out downsized . Somehow, investors breathed a sigh of relief despite Conte's willingness to move forward.

From the beginning of the year to today, the stock has recorded positive performances in Milan. 2020 opened around € 20.16 for the Benetton holding, which then gained ground up to breakthrough € 20.5 . At the moment (January 28, 2020), Atlantia shares are gaining more than 2% and are changing around € 21.43 (Money.it, 2020).

### **5.5 Concessions and maintenance activities**

In 2018, the amount of accumulated expenditure for planned investments was 10.6 billion euros. By the expiry of the concession (2038), the concessionaire should have spent a total of 22.8 billion. From 1997 to today, Aspi has therefore completed 46.5% of the investments decided in consultation with the Government, against 51.2% of the time of the concession that has now passed. It would seem that Autostrade has slowed down on the progress of the works. However, the Benetton company has always justified itself by indicating as real causes of delay the "regulatory uncertainties, the abnormal approval times of the projects, as well as the deadlock relating to the approval of the update of the economic and financial plans" (note Aiscat 23 / 09/19), reasons partly shared also by the Ministry of Infrastructure and Transport (MIT) itself. Yet, with regard to ordinary and extraordinary maintenance costs, Autostrade continues to consider its concessionary work to be unexceptionable: according to the company's calculations, between 2000 and 2018 the costs for maintenance works would have amounted to 5.43 billion, against a planned outlay together with Anas of 5.23 billion (Econopoly, 2020).

In the last period, in the spotlight, the political debate appears on the concession of Autostrade per l'Italia (Aspi), including revocation, revision and sanctions. Behind the scenes there is the reform of the system of checks, adjustments and maintenance. It starts from the tunnels that have the most delicate situation, testing not only Aspi, but also all the other road managers, as well as the Ministry of Infrastructure itself (MIT). Carpet inspections have started with three external companies: Lombardi, Sws and Rocksoil. An operation decided after the collapse of two tons of materials from the vault of the Berté tunnel on the A26, on 30 December 2019. 70 million for the surveillance and first intervention activities entrusted to the Lombardi Group, Sws Engineering and Rocksoil.

The rest of the resources, those for the renovations that will be necessary based on their checks, will be taken from the 400 million posted for 2020-2023 in the last maintenance plan. However, it will be necessary first to have the maintenance plan approved by the MIT, as provided for by all the concession agreements, but to do this, the MIT must incorporate the methodologies of these inspections, as part of the work of a commission commissioned by Minister Paola De Micheli, to recover the situation in tunnels that had gone out of control in the last decade. The commission will elaborate parameters to which all motorway concessionaires will have to comply if they want to have the maintenance plans approved. It will also be necessary to see if the methodology possibly shared between Aspi and Mit will also be good for the other dealers, also subject to the approval of the Mit. At the moment, a collective comparison has not been initiated.

With regard to firefighting adaptation, transitory risk mitigation measures must be put in place, including traffic restrictions and controls. So far on the first transitional mitigation measures, there have been various problems and failures by MIT on the toll motorways, subject to its supervision. In Liguria, there have also been reports of non-compliance drawn up by the Fire Brigade. After several failures, Aspi completed the first interventions on the A16, on the Ligurian network it is activating voluntary presidia entrusted to an external company, to guarantee interventions in case of emergency.

From January 2020, to the first week of February 2020, preliminary checks were carried out on 135 of the 587 Aspi tunnels. The tour is expected to finish by mid-March 2020 but the oldest galleries, built until 1979, will be checked first. (Il Sole 24 Ore, 2020).

## **6. IFRIC 12: AGREEMENTS FOR SERVICES UNDER CONCESSION**

IFRIC 12 has been approved by the European Commission with EC regulation no. 254/2009 on March 25, 2009; it has profoundly changed the accounting of concessions, especially in the event that the grantor has control over the infrastructure used by the concessionaire for the provision of public

utility services. This accounting change assumes particular importance in the Italian economic reality in which many public utility services, also through privatizations carried out during the nineties, have been entrusted to private-law companies through concession contracts. IFRIC 12 applies to service concession arrangements between a public sector entity (grantor) and a private sector entity (concessionaire) if the following conditions are met:

- a) the grantor controls or regulates which services the concessionaire must provide with the infrastructure, to whom it must provide them and at what price;
- b) the grantor controls - through ownership or otherwise - any residual interest in the infrastructure upon expiry of the agreement.

If both of the above conditions are met, the concessionaire builds and manages the infrastructure on behalf of the grantor; consequently, it has no title to enter it in its financial statements as a tangible asset. Control of the grantor over any significant residual interest should both restrict the concessionaire's practical ability to sell or commit the infrastructure, and give the grantor an ongoing right of use throughout the term of the agreement. That said, the grantor can check the residual interest in the infrastructure in several ways:

- the grantor retains ownership of the assets under concession and grants the concessionaire a right of access necessary to provide public services only for the duration of the concession;
- the concessionaire builds (or purchases from third parties) the infrastructure, but is obliged, at the end of the concession, to return or sell the infrastructure itself to the grantor or to a third party (designated by the grantor);
- the grantor has the right to exercise an option that allows him to purchase the infrastructure at the end of the concession;
- the grantor remains in control even if the concessionaire, while being able to use the infrastructure during the concession, is required to donate it or sell it at the end of the concession agreement on the basis of a free faculty existing in the grantor.

IFRIC 12 provides that agreements that fall within the scope of application generally involve two subjects:

- a private sector entity (concessionaire) that builds, purchases or improves the infrastructure used to provide the public service and that manages it for a specific period of time, receiving a fee for the services offered;
- a public sector entity (grantor), which through concession agreements involves the participation of the private sector in the development, financing, management and maintenance of this infrastructure.

IFRIC 12 does not define precisely what is meant by private sector companies and public sector companies: the provisions are limited to stating that the grantor is identified by a public sector entity,

including a governmental body, or an entity of the private sector to which responsibility for the service has been delegated. This suggests that the grantor, in addition to an entity directly attributable to the government, can be represented by a peripheral structure of the public administration, as - purely by way of example - a local authority.

The objective of IFRIC 12 is to provide clarifications on the accounting model to be adopted in the dealer's financial statements to detect and evaluate the obligations and rights connected with the agreements for concession services. In view of the interpretation, the concessionaire acts as a service provider (ie construction of the work) and therefore must recognize the revenues for construction and improvement services in accordance with IAS 11 Contract work and the revenues relating to the management of the infrastructure in accordance with IAS 18 Revenues. By virtue of the general principle, envisaged by IAS 18 Revenues, the concessionaire should evaluate the revenues at fair value of the consideration received or due. In some cases, the consideration that the concessionaire receives for the construction activity is not the right to receive "cash", but the right (ie license) to economically exploit the infrastructure. In the latter case, the concessionaire must apply the provisions of paragraph 12 of IAS 18 and therefore if the fair value of the services received (ie the right to use the infrastructure) cannot be determined reliably, the revenue is calculated on the basis of the fair value of the services provided (ie fair value of the construction services provided). IFRIC has observed that the fair value of construction services may, in practice, be the most appropriate method for determining the fair value of the consideration due to the concessionaire for these services and therefore for initially measuring the asset (intangible or financial) that the dealer enters the balance sheet. The IFRIC specified that when the concessionaire receives a right (ie license) in exchange for its construction services, the concessionaire's total revenues do not correspond to the total incoming cash flows. The reason for this is that there are two kinds of cash flows. In the first case, construction services are exchanged with the license in an exchange transaction with the grantor. In the second species, the license (or "intangible asset") received by the grantor is used to generate cash flows that come from users of the public service. This result is obtained whenever an entity provides goods or services in exchange for another non-similar asset which is subsequently used to generate monetary revenues.

If the concessionaire builds or improves an infrastructure of which he has no control, the construction and improvement services carried out by the concessionaire on behalf of the grantor configure real works to order (OIC, 2010).

## 7. THE NETWORK OF MOTORWAY CONCESSIONS IN ITALY

Italy has historically managed the motorway network through the use of concessions, often without recourse to any public tender, justified only by the need to make new investments. Most of these concessions were entered into at the end of the 1990s. Motorway concessions represent the legal instrument on which the entire sector rests: currently, in fact, as much as 87% of the network is managed by private concessionaires and not by the State (through the ANAS its subsidiary) (D'Arienzo, 2018).

After the first dealership experiences of the 1920s and 1930s, which had allowed the construction of the country's first motorway sections, in the post-war period the desire to reconstruct public works and infrastructures can only involve the road sector. The construction of the motorway network in Italy after the war started on the basis of Legislative Decree 547/1948 and Law 463/1955 which, in addition to assigning the tasks of construction and management of new highways to ANAS, establish some characteristics of the nature of the conventional relationship between ANAS and the concession companies. Based on the rules contained in these legal provisions and in Law 59/1961, the construction and management of the Italian motorway network was carried out in part directly by ANAS and in part entrusted to other entities. However, most of the construction and operation of motorways was carried out through the use of the concession instrument.

A significant portion of concessions, ( starting from that for the construction and management of the Milan - Naples motorway in 1956), was entrusted to Autostrade SpA, belonging to the IRI group until the end of the 90s and therefore privatized in 1999 (Iozzi, 2002).

The IRI therefore decides to privatize a series of assets , including the motorway company and it passes from public to private, that is to say that the ownership of the network remains the state but the management and maintenance, remunerated by the tariffs, pass to private companies; this is the moment when a nucleus of private shareholders takes over with 30%, gathered in the Schemaventotto Spa Company which belongs to the Benetton family and which still represents the strong partner of the group. The remaining 70% is on the market. During 2003, due to a new organizational structure , the activities under concession are separated from non-motorway activities and Autostrade per l'Italia is born, 100% controlled by Autostrade SpA, what is now called Atlantia, a holding company listed on the stock Exchange from Milan.

Then the highways abroad will arrive, diversification in the airport sector and the tormented dossier of the wedding with the Spanish group Abertis . But more than corporate history, it is the history of concessions that has fueled the debate between those who point the finger at too generous rules for years. To regulate the system of the concession that entrusts the management of the network to Autostrade is the 1997 Convention (IV Additional Act) between the company and Anas which

considerably lengthens the time by providing for the extension of the concession from 2018 to 2038 (Capozzi, 2018).

The general scheme of the concessions was reformed by D. lgs . October 3, 2006 n. 262 , converted with modifications by L . November 24, 2006, no. 286, which introduced the institution of the "Single Convention". This, to be stipulated between the grantor (then Anas SpA, the Ministry of Infrastructure and Transport since 2012) and each concessionaire within one year from the first update of the financial plan, or the first revision of the agreement, must specify the risk allocation, the return on the capital invested and the methods of adjusting the tariff (Sestito, 2015).

The Italian motorway network is entrusted under concession to companies with various licensors (D'Arienza, 2018):

- MIT, to which most of the network under concession belongs. The toll motorway network granted by MIT is managed by 24 companies. The concession relationships are governed by specific conventional deeds entered into between MIT and the concession companies;
- Anas SpA, a public company subject to the supervision of MIT, which manages some sections directly, while for others it plays the role of indirect grantor, participating in 50% of the share capital in regional companies;
- some regional companies that play the role of grantor of infrastructures placed exclusively in the territory of the region to which they refer.

The last chapter, which ended in April 2018, concerns the 4-year extension of the concession to Autostrade per l'Italia; then to 2042.

### **7.1 The Italian motorway system and the European context**

The Italian motorway network is entrusted under concession to companies with various licensors. The first grantor is the Ministry of Infrastructure and Transport, which took over from Anas SpA in this role from 1 October 2012.

There is therefore, Anas SpA, a public company subject to the supervision of the Ministry of Infrastructure, which manages some sections directly, while for others it plays the role of indirect grantor, participating in 50% of the share capital in regional companies. Then there are the regional companies that play the role of grantor of infrastructures located exclusively in the territory of the region to which they refer. The toll motorway network, granted under concession by the Ministry of Infrastructure, is managed by 24 companies with 25 concession relationships (Ministry of Infrastructure and Transport, 2016).

**Figure 2: Concessionaire companies with the relative km of competence**

Source: Ministry of Infrastructure and Transport in "Directorate General for the Supervision of Motorway Concessions, Activity Report 2016" (2016)

From a comparison with the European network of highways and toll roads, the fragmentation of the Italian network is noted, but another peculiarity is also given by the presence of only one concessionaire, that is, Autostrade per l'Italia SpA, which manages beyond the half of the entire

network. The second concessionaire by extension of the section managed, on the other hand, appears to be the Brenner motorway, while the smaller is the Naples ring road. In Europe, on the other hand, there are fewer operators with a greater development of the sections operated under concession (Ministry of Infrastructure and Transport, 2016).

## CONCESSIONS AND SERVICE CONCESSION ARRANGEMENTS: A LITERATURE REVIEW

Esposito, Paolo; Colangelo, Federica

Department of Law, Economics, Management and Quantitative Methods-DEMM, Sannio University, Italy

### ABSTRACT

The concession is therefore a form of functional privatization; the latter represents a derivative form of privatization, through which the state or public bodies entrust the supply of goods or services under a concession to a private company; it is therefore the passage of ownership and control of enterprises, from a public economic entity to a private economic entity. The expression "functional privatization", in fact, really wants to highlight the propensity of the PA to create public services, changing the tools and management logic of private companies (Gianfelici, 2008). The ways in which functional privatization is carried out is precisely that of granting (licensing) or outsourcing certain contracted tasks (contracting-out). These procedures do not transfer ownership of the assets to the private sector, but only management, i.e. the opportunity to act in certain contexts for a certain period of time. To achieve the objectives of functional privatization (minimizing the costs of the services offered by the private operator to the public one) it is necessary to correctly manage the tender to avoid that a private monopoly replaces the public monopoly. With the concessions there is a temporary assignment of the monopoly for the production, or distribution of a good or service to a specific economic entity which, by completing a tender, was the most suitable to guarantee the best quality-price combination. The contract represents the assignment in management to public or private operators of activities financed with public funds

*Keywords: Public Private Partnerships (PPPs), Accounting, auditing, accountability, Service Concession Arrangements.*

### 1. PPP AND SERVICE CONCESSION ARRANGEMENTS

The collaboration between the public and private sector has been the subject of attention at Community level since Directive 93/37 / EEC of the European Council of 14 June 1993 regarding the coordination of the procedures for the award of public works contracts for the specific themes of the realization of the infrastructure and subsequently, the management of public services with a gradual evolution. The notion of PPP involves a complex scheme of relationships between public authorities

and private companies aimed at realizing infrastructure projects and providing public services (Antoniazzi, 2017).

The source of the key principles of the PPP discipline are contained in the Green Paper on public private partnerships and public law of contracts and concessions of the European Commission of 30 April 2004 (Paradisi, 2017).

The European Commission has clarified that the PPP consists of forms of cooperation between public and private entities that aim to guarantee the financing, construction, management of a restructuring or maintenance of an infrastructure or the provision of a service. The main advantage that derives from the involvement of the private sector in the management of a public service is that the public body must not use its own resources in financing the operation of a public service (Antoniazzi, 2017).

## **2. THE USE OF PPP METHODS**

The use of PPP methods to carry out a project can alternatively allow (Gallia, 2008):

- generate income through user revenues: in this way, the expected revenues from the realization of the projects allow the private sector to recover the investment costs for the duration of the concession;
- request a public contribution: when it comes to initiatives where commercial user revenues are insufficient to generate sufficient economic returns;
- request the direct supply of services to the private entity: in this case, the latter derives their remuneration only from payments made by the PA on a commercial basis.

The 2004 Green Book identifies the distinctive elements of PPP contracts, especially the basic characteristics (Cori, 2007):

- the relatively long duration of the collaboration between the public partner and the private partner on the various aspects of a project to be carried out;
- the method of financing the project, guaranteed by the private sector;
- the main role of the economic operator, who participates in the various phases of the project. The public partner focuses above all on the definition of the objectives to be achieved in terms of public interest, the quality of the services offered, the pricing policy, and guarantees the control of compliance with these objectives;
- the sharing of risks between the public partner and the private partner, which is carried out on a case-by-case basis, according to the ability of the parties to assess, control and manage them.

## **3. PPP OPERATIONS**

PPP operations can bring benefits to all categories of parties involved. They allow (Crivelli, 2011):

- the administration, to perform its function in compliance with the principles of efficiency, efficacy and economy;
- the private sector, to pursue its profit purpose;
- the end user, to obtain more efficient public services that are able to raise the quality of life in the country;
- the entire economic system, local and national, to benefit (in terms of earnings) from efficiency and competitiveness.

The Green Book of 2004 identifies two main forms of PPP (Paradisi, 2017):

1. the contractual PPP, in which the relationship between public and private subjects is based on exclusively contractual / conventional links;
2. the institutionalized PPP, in which the cooperation between public and private subjects takes place within a separate entity with its own legal personality. As part of this form of PPP, the public partner can maintain a fairly high level of control over the structure created, compatible with company law rules.

In light of this, it is useful to note that the institutions mainly involved in the notion of Partnership are (Mastragostino, 2011):

1. the concession (of construction and management; of services); assignment to the general contractor; project financing; global service; financial leasing;
2. the mixed company for the performance of public services (both as a newly constructed object and as an objective of progressive construction); participation foundations that pursue the same purpose.

#### **4.PUBLIC, PRIVATE AND MIXED COMPANIES**

The normative references for public, private and mixed companies are contained in the articles. 101-106 TFEU with specific rules for the protection of competition, the prohibitions for Member States to maintain privileged situations, the regulation on state aid (articles 107 ss. TFEU) and that on public procurement, the rules on special rights and exclusives and the regime for bodies governed by public law (Legislative Decree no. 50/2016).

In addition to examining the institutionalized partnership (PPPI), the Green Paper also identifies two different manifestations of PPPI which consist of:

- in the "creation of an entity held jointly by the public sector and the private sector";

Or

- in the "transfer to private control of an already existing public company".

This cooperation (between public and private) allows the public partner to maintain a level of control over the conduct of operations through the shareholding and participation in decision-making bodies.

The PPPI also includes the transfer of capital of a public company to the private sector. The decision to change the shareholding and the general choice to privatize public services or certain sectors also fall within the economic policy of each individual Member State (Antoniazzi, 2017).

The areas where the forms of collaboration typical of the PPP are carried out with regard to the construction and management of works and / or services, are various (Paradisi, 2017):

- Transportation;
- Power;
- Environment;
- Sports facilities;
- Structures with a cultural value;
- Other public works.

The previous classification (between contractual and institutionalized PPP), is also accepted by the state legislature, which, in art. 3, paragraph 15-ter, Legislative Decree 163/2006 (modified by Legislative Decree no. 152/2008), defines the "PPP contracts", such as "contracts having as their object one or more services such as planning , the construction, management or maintenance of a public or public utility work, or the provision of a service, including total or partial financing for private individuals, even in different forms, such services, with risk allocation in accordance with the provisions and current Community guidelines ". In this perspective, the provision mentions just that. "PPP contracts include the concession of works, the concession of services, the financial lease, the assignment of works through project finance, mixed companies". PPP operations may also include "the assignment to general contractor where the consideration for the construction of the work is postponed in whole or in part and linked to the availability of the work for the client or third parties" (Mastragostino, 2011).

## **5.PPPS IN ITALIAN CODE**

The Public Contracts Code (Legislative Decree 163/06, and subsequent amendments) constitutes the reference regulatory provision also in terms of programming. The Code only regulates the planning of public works, referring to the implementation regulation the programming discipline for public contracts relating to services and supplies. Article. 283 provides the right, for each contracting authority, to approve each year an annual program for the acquisition of goods and services relating to the following year (Gallia, 2008).

The Public Contracts Code provides for two different forms of assignment (Crivelli, 2011):

- public initiative procedure: the PA publishes the call for tenders for those works, which can be financed in whole or in part with private capital, which are included in the relative annual list (art.128);

- private initiative procedure: the PA does not publish the tender notice within six months of the approval of the annual list. The private individual then proposes a project of his own initiative. At that point, the administration is required to publish the notice.

In both procedures, two different selection methods can be applied: "single race" and "double race".

- In the single tender procedure, the contracting authority publishes a tender notice, with the basis of a feasibility study, that is, a document that identifies the functional, managerial, economic-financial and technical characteristics of the necessary intervention. Subsequently, it examines the offers received within the deadline; draws up a ranking according to the criterion of the most advantageous offer and appoints promoter the one who presented the best offer. If the project does not require modifications, the contract is directly signed; if, on the other hand, the Grantor believes that it must be modified, the promoter may proceed with the review or waive its right of first refusal. In this second case, the contracting authority will ask the next candidate in the ranking to be prepared to enter into the contract;

- in the double tender procedure, the award is divided into two phases: the first tender is aimed at identifying the "promoter", while the second is aimed at awarding the concession.

The use of PPPs undoubtedly constitutes an important stimulus for economic recovery. In the Communication of the European Commission of 19 November 2009 (COM 2009 615), issued about five years after the adoption of the Green Paper on PPPs, positive and negative aspects linked to this particular method of carrying out public works are highlighted. As for the positives, we find (Sambri, 2012):

- improvement of project implementation;

- the reduction of infrastructure costs, thanks to the distribution of the cost of financing for the entire duration of the work;

- the improvement of risk sharing between the public and private sectors;

- promoting sustainability, innovation, research and development;

- recognition of the central role of the private sector in the development and implementation of long-term strategies for industrial, commercial and infrastructure programs.

The Commission report concludes that "the development of the PPP as a tool becomes crucial when the economic and financial crisis hampers the ability of public funds to make adequate funding available for specific projects and identifies five action plans to facilitate the spread of PPPs" .

In Europe there is no regulatory framework for PPPs, as there are no special rules of European law applicable to the choice of the private partner or to the implementation phase. The general principles of the EC Treaty as well as the directives in force on public contracts are valid for the choice of the private partner. According to the provisions of the Treaty, all contracts through which a public structure awards a contract must respect the principles of freedom of establishment and the provision of services pursuant to Articles 43-49 of the same Treaty; therefore these contracts must conform to the principles of transparency, equal treatment, proportionality and mutual recognition (Cori, 2007).

Article 3 paragraph 1, lett. eee) of Legislative Decree April 18, 2016 (Public Contracts Code), similarly to the previous Public Contracts Code (Legislative Decree 163/2006) defines the PPP contract as a contract for consideration, stipulated in writing, with which one or more stations contractors grant one or more economic operators for a period determined according to the duration of the amortization of the investment or the financing methods established, a complex of activities consisting in the construction, transformation, maintenance and operational management of a work in exchange for the its availability, or its economic exploitation, or the provision of a service related to the use of the work itself, with risk taking by the operator according to the methods identified in the contract (Massari, 2016).

The article specifies that the operating revenues of the economic operator can come not only from the fee recognized by the granting body but also from any other form of economic compensation, such as, for example, the direct income from the management of the service to external users .

In this way, the PPP stands out for the realization of the so-called "Cold works" (works that do not have an entrepreneurial significance such as to produce direct returns or in any case in which the social function is predominant so as not to allow the application of tariffs) and "hot works" (works that have an entrepreneurial relevance, since likely, in the short to medium term, to produce future profitability and whose investment costs can tend to be amortized with the cash flows deriving from the economic management of the infrastructure) (Polizzi, 2017).

In the legislative decree 18 April 2016, n. 50 (amended with supplementary and corrective provisions by Legislative Decree no. 56 of 19 April 2017) it is possible to find some direct references to the PPP in articles 180 ss. ("Public private partnership"), scheme whose application implies the call for a tender for the selection of economic operators; in the third part on concession contracts (articles 164 ff.) which best express the collaborative model of the public-private partnership according to modern logic and in the articles. 180-184 which expressly refer to the PPP and the application of competition rules. Article. 171 regulates the contract notice, procedures and procedures of the contract and art. 165 delves into the constituent elements of the concession (among the general definitions pursuant to art.3, paragraph 1, uu) and vv) and, in particular, the operating revenues of which the majority must derive

from the sale of the services rendered to the market and the transfer of operational risk (art. 3, paragraph 1, zz) which refers to "the possibility that, under normal operating conditions, the changes relating to the costs and revenues subject to the concession affect the balance of the economic and financial plan (Antoniazzi, 2017).

Among the main reasons for the growing interest in Italy for forms of collaboration between public and private, the particular infrastructure deficit that characterizes our country is highlighted. In fact, it is characterized by a significant gap with respect to the main industrialized countries, which contributes to limiting economic growth and international competitiveness. Hence the need for greater involvement of the private sector (Raganelli, 2013).

Until 2011, the United Kingdom was the leading European country among the countries that undertake PPP contracts with around 800 contracts executed since the mid-1990s and around 100 billion euros in total, mainly in the construction sector. England began in 1980 with the privatization of public enterprises and with the introduction of mandatory tenders (CCT). Subsequently, in the 1990s, the government introduced a mixed market policy for the provision of fundamental public services with the aim of proving their efficiency by exposing them to competition from external suppliers. At the end of 1992, the British Conservative Government launched the Private Finance Initiative (PFI), an institutional program conducive to the involvement of private individuals in the realization of public investments through the provision of construction and management concessions in the presence of conditions of economic convenience for the private sector and cost optimization for the public sector. The PFI's goal was precisely to bring greater discipline in public infrastructure contracts.

A PFI has the purpose of transferring part of the risk associated with the project to private companies and allows the Government to define the performance levels in the contract and to apply financial penalties in the event of non-compliance; the goal is precisely the most efficient delivery of the work. The transfer of risk and the ability of the public administration to sanction the poor performance can only work if the private partner is compliant, given that the risk of bankruptcy can also be added (Antoniazzi, 2017).

In the PFI, the public client selects a private contractor in charge of carrying out the work and taking care of its maintenance. The latter is remunerated (through periodic payments) by the administration itself, by the subjects who use the infrastructure, or by a combination of both solutions. To encourage the use of PFI and spread a culture of collaboration between public and private, the British government has preferred to focus on non-binding legal acts, such as guides, practical notes, recommendations, leaving administrations the choice of whether or not to comply with them. Among the most important PFI guides are those developed by the Ministry of the Treasury, concerning the

standardization of PFI contracts and the identification and evaluation of the various options available to the administration for the construction of the work (Raganelli, 2013).

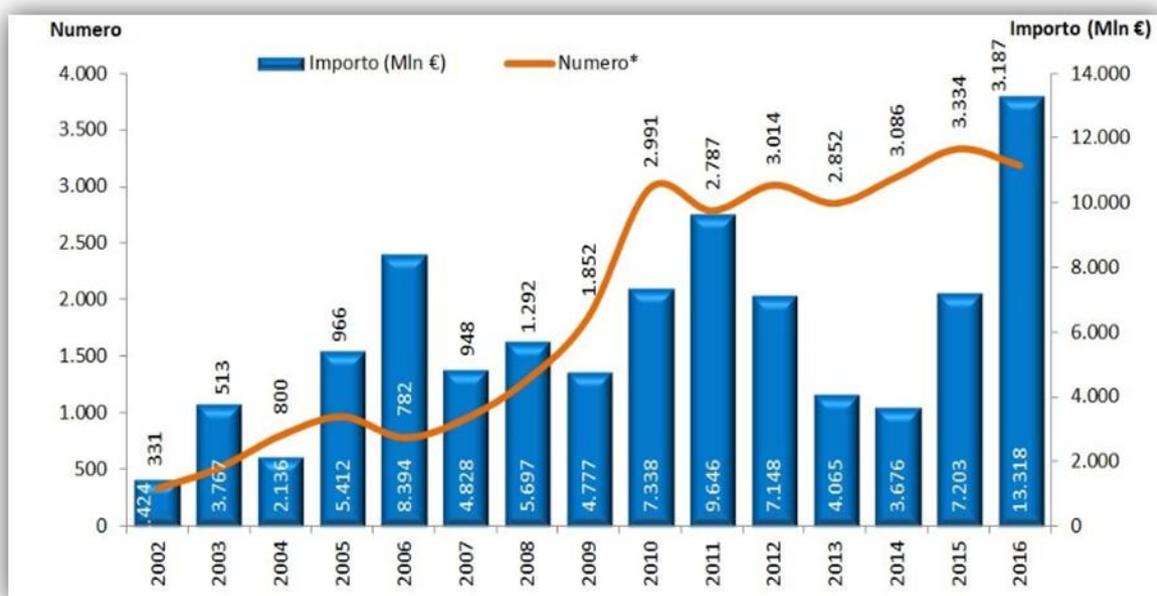

In German law, however, the law on public-private partnership dates back to 2005, after the transposition of directives no. 17 and n. 18 of 2004 on public contracts.

With the federal law of 2005 (Öffentlich-Private Partnerschaft (ÖPP)), the development of the partnership was later than in the United Kingdom. This law defines a very general scheme as long-term cooperation between the public sector and the private economy for purposes of public interest with advantages for both sectors, but it does not propose a legal definition or an organic discipline. The federal law then resulted in the laws of the various Länder with the consequence that currently fourteen disciplines are in force and in recent years the implementation of interventions through PPP has increased, especially in a period of financial and economic crisis; but despite this, it certainly has not reached the level of the United Kingdom (Antoniazzi, 2017).

## 6.DATA

The data provided by the National PPP Observatory for the years from 2002 to 2016, allow us to affirm that the PPP has become an important market for our country over time, with approximately 29,000 "proceedings in progress", ie tenders awarded and tenders in progress, for a total amount of approximately € 90 billion. It passes from 331 initiatives in 2002, to the annual average of over 3,000 initiatives in the period 2012-2016, with the peak of 3,334 in 2015, and with a 2016, despite the entry into force of the new Public Contracts Code, attested at 3,187 ongoing initiatives (Tascedda, 2017).

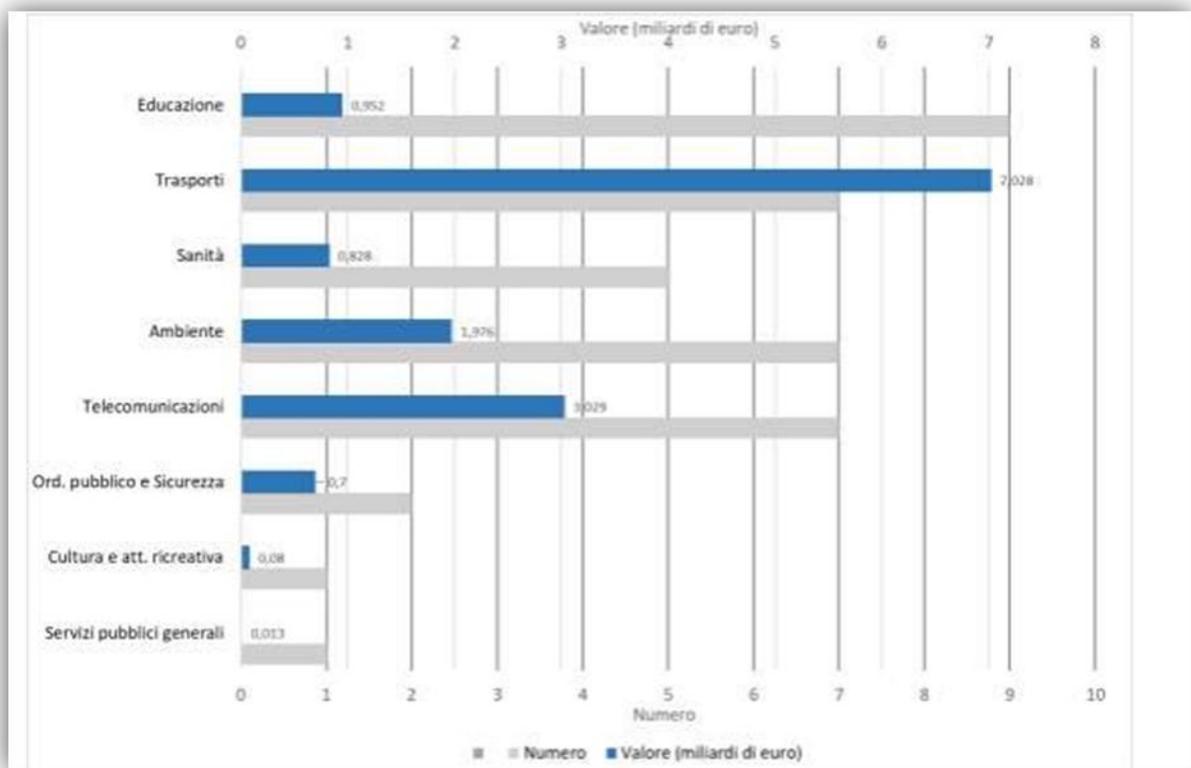

**Graph 3: PPP calls - 2002-2016**

Source: Cresme Europa Servizi on data from the PPP National Observatory (infoppp.it) promoted by DIPE, IFEL, CNAPPC and managed by Cresme Europa Servizi in "2017 Report on the Private Public Partnership Market in Italy" (2017)

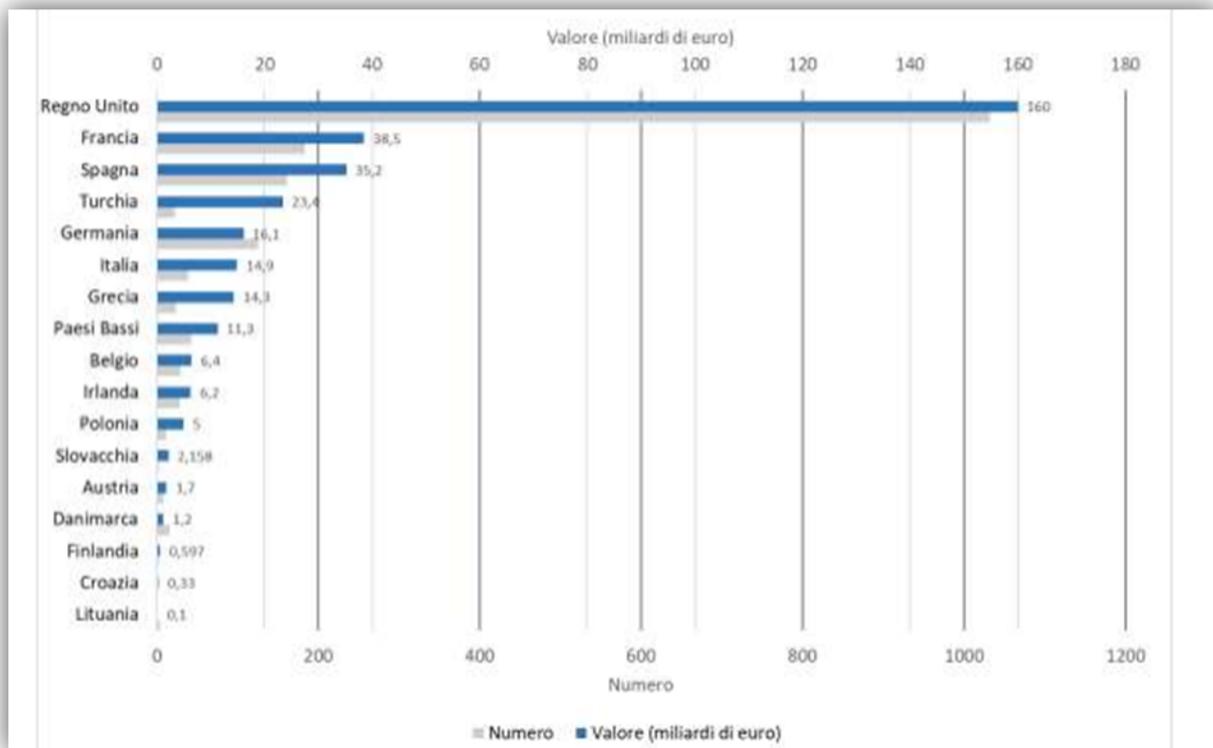

In the last 10 years (2009-2018) the public private partnership market in Europe has shown a decreasing trend. The country that dominated the European PPP market in 2018 is Turkey, which with 5.1 billion euros total (6 billion euros in 2017) recorded the highest value of European transactions. The French market with 15 contracts in 2018 (9 contracts in 2017) dominates the ranking in terms of the number of contracts; ranking that in 2017 was dominated by the British market with 12 contracts followed by the French and Turkish market with 7 contracts each (Pasquini, 2019).

**Graph 4: European PPP market 2018 - Value and number of closed contracts by sector**

Fonte: Elaborazioni DIPE su dati EPEC in "Partenariato Pubblico Privato e Finanza di progetto – Relazione sull'attività svolta dal DIPE negli anni 2017-2018" (2019)

As for the sectors, the transport sector recorded the highest value of financing contracts with 7 billion euros but the number of projects closed in this area (7 in 2018 and 10 in 2017) is the lowest in the last 20 years . If you extend the analysis to the last 10 years (2009-2018), you can see that the United Kingdom has led the European PPP market both in terms of the number of closed contracts (1,032) and in value (160 billion euros), followed by France and Spain. Italy ranks sixth with 39 closed contracts and 14.9 billion euros in value, preceded by Germany and followed by Greece (Pasquini, 2019).

**Graph 5: European PPP market 2009-2018 - Value and number of contracts closed by country**

Source: DIPE processing on EPEC data in "Public Private Partnership and Project Finance - Report on the activities carried out by the DIPE in the years 2017-2018" (2019)

Of the 39 transactions that reached the loan agreement in 2018, 21 saw the participation of institutional investors in several countries (5 in 2017 and 6 in 2016): France, Germany, Ireland, the Netherlands, Serbia, Turkey and the United Kingdom.

In 2018 the sectors that showed the most dynamism are: energy and telecommunications, transport, ports and logistics, health and cemeteries. With regard to the contractual typologies, the one most used by the PAs for PPP initiatives is the concession of services (72%), while in terms of value of the initiatives, 56% refers to the works concessions (Pasquini, 2019).

Finally, it is possible to affirm that, the PPP must not be considered only as an alternative financing model, but in particular as a tool that allows the PA to involve private entities and their skills to find innovative solutions as regards the provision of services. public (Borgonovi, Fattore, Longo, 2015).

In our country, the expression project financing (or in Italian "project finance") has been frequently used to define a particular form of PPP, at the base of which a concession contract for the construction and management of a public work is placed. or of public utility. Project financing in Italy has taken hold mainly in public utility works. In this sense, the promoters are called upon to submit a proposal to the public administration to finance, execute and manage a particular public work that has already been approved or will be approved within a short time. However, there are differences between

project finance in Italy and what it represents in its more classic definition. In particular, while project financing provides for an equitable distribution of risk between the promoter and the banks, in Italy the risk is assumed almost exclusively by the promoter (Gennari, Monosilio, Coloparti, Tempesta, 2012).

# **PUBLIC PRIVATE PARTNERSHIPS: BUSINESS THEORY AND PRACTICE**

**Esposito, Paolo; Colangelo, Federica**

Department of Law, Economics, Management and Quantitative Methods-DEMM, Sannio University, Italy

## **ABSTRACT**

The decrease in public investment in recent decades, partly due to the lack of public spending needs, has generated growing interest in alternative financing models for public works and in forms of Public-Private Partnership (PPP) (Raganelli, 2017).

The PPP represents one of the most important resources available to the PA for the financing, construction and management of infrastructures and / or the provision of services of public interest. It consists of a series of forms of cooperation between the public and private sectors, through which both parties have the opportunity to achieve the objectives they have set themselves, also guaranteeing - based on the analysis of the results achieved ex post - a better quality of services provided. The most common type of PPP is the concession of public works, that is a contract for the design, construction and management of a public or public utility work that can be entrusted through traditional procedures (open and / or restricted) or through the innovative administrative procedure of Project Finance (Taronna, 2014).

*Keywords: Public Private Partnerships (PPPs), Accounting, auditing, accountability.*

## **1. THE PUBLIC-PRIVATE PARTNERSHIP**

The decrease in public investment in recent decades, partly due to the lack of public spending needs, has generated growing interest in alternative financing models for public works and in forms of Public-Private Partnership (PPP) (Raganelli, 2017).

## **2. BUSINESS MODEL**

The PPP represents one of the most important resources available to the PA for the financing, construction and management of infrastructures and / or the provision of services of public interest. It consists of a series of forms of cooperation between the public and private sectors, through which both parties have the opportunity to achieve the objectives they have set themselves, also guaranteeing - based on the analysis of the results achieved ex post - a better quality of services provided. The most common type of PPP is the concession of public works, that is a contract for the design, construction

and management of a public or public utility work that can be entrusted through traditional procedures (open and / or restricted) or through the innovative administrative procedure of Project Finance (Taronna, 2014).

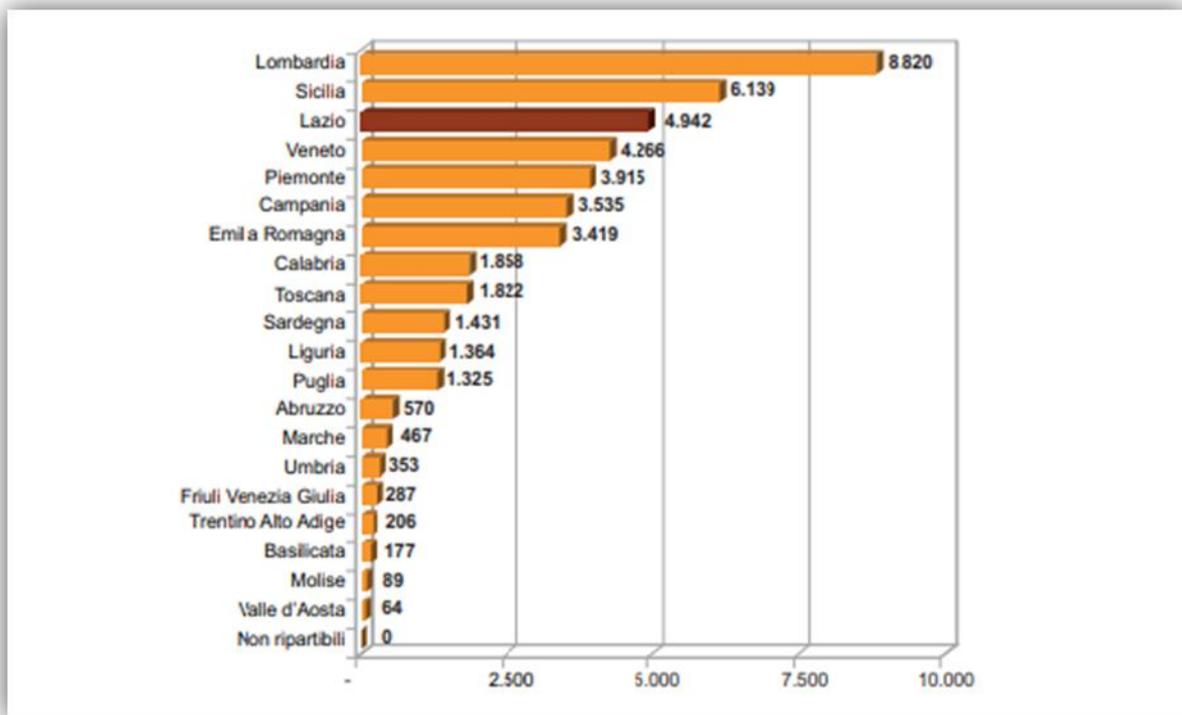

According to the Eurostat definition (Crivelli, 2011):

- the Public Administration must be the main purchaser of the services that the work provides, whether this is done directly or whether it is done on behalf of third parties;
- the contract must provide for the construction of a new infrastructure or the renovation of an existing one.

The second point represents the main difference between a PPP concession and a privatization.

Privatizations concern the "sale" of an existing business from the public sector to the private sector, which should reorganize or improve it. The public sector, after the sale, loses control of the asset. In the context of PPPs, however, the business is created, financed and managed by the private sector but controlled by the public sector.

**Graph 1: Territorial comparisons: amount of PPP tenders surveyed in the period 2002-2009**

Source: SIOP, Annual Report 2009 in "The financial instrument of the Public Private Partnership: state of the art in Italy" (2011)

The collaboration between the public and private sector can be considered as an "old novelty", as the doctrine began to study the private law activity of the PA already in the first half of the twentieth century (Fioritto, 2017).

In Italy the first project finance operations were carried out following the liberalization of the electricity production market, outlined in the early nineties by law 9/91 and law 10/91. The trend of the operations activated in PPP was positive from 2002 to 2005, the year in which 25% of the overall value of public works was reached. In 2006 this trend reversed to 20 and then 15.4% in the first half of 2007 (Crivelli, 2011).

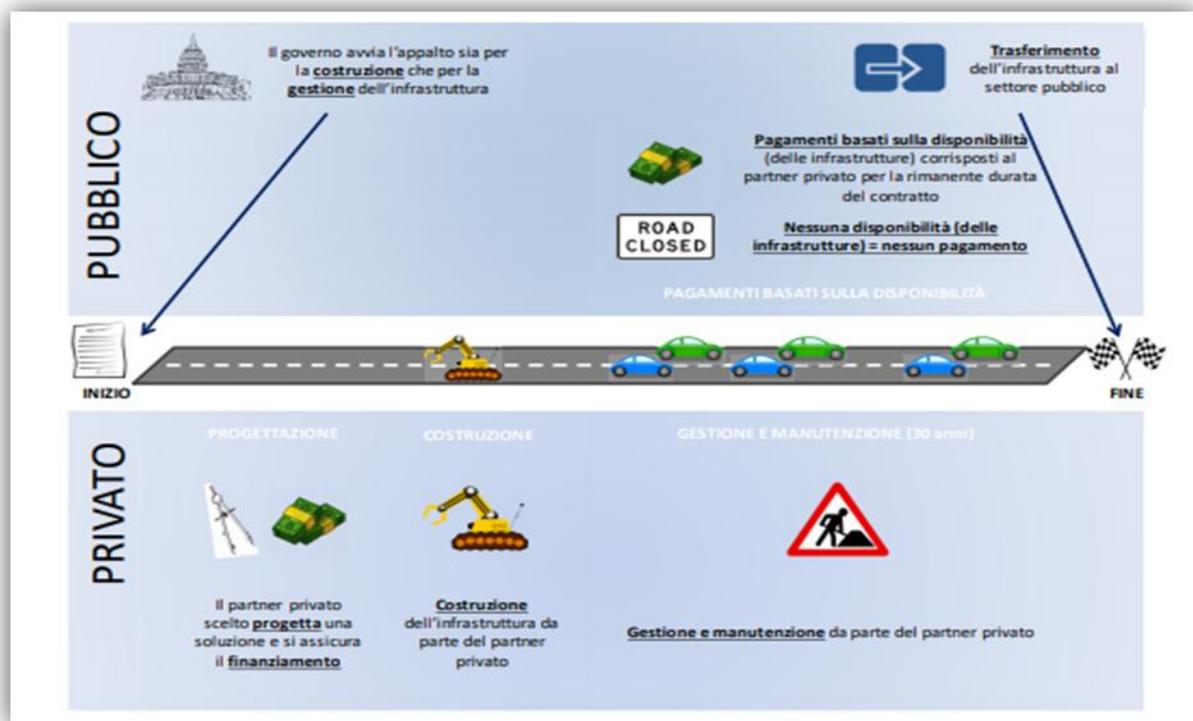

Graph 1 shows the size of the PPP market from 2002 to 2009 at regional level based on data from the 2009 Annual Report of the Information System on the Opportunities of the Public Private Partnership (Crivelli, 2011).

### 3. ITALIAN PPPS EXPERIENCES

According to the European PPP Consultancy Center (EPEC), between 1749 and 2016, 1,749 (PPP) projects reached a financial closure on the EU PPP market, for a total value of 336 billion euros. Before the financial and economic crisis of 2008, the PPP market was in a phase of strong expansion in terms of volume; from 2008 onwards, however, the number of new PPP projects has decreased (European Court of Auditors, 2018).

The PPP is able to reconcile the protection of economic interests with the satisfaction of social needs. This feature makes PPP very useful in times of crisis. In fact, following the 2008 financial crisis, the PPP was conceived as "one of the antidotes to overcome market failures", as it can be used for "the construction of infrastructures and works of particular social utility, such as in the sectors of health and education ". The scope of operation of the PPP goes beyond social services; according to the data of the National Observatory on PPP, between 2002 and 2014, the transport sector is the one in which there was the greatest impact of PPP in economic terms; followed by the energy networks, environment and health sector. Furthermore, even if in Italy, Lombardy is the region that contributes most to the formation of GDP and the one in which there is the greatest number of partnership operations, however there is no one-to-one correspondence between the wealth of the territory considered and the frequency of use of PPP. In fact, the statistical data show that one of the Italian regions in which the latter is most widespread is Campania. For this reason, the PPP could build a lever to be activated to try to reduce the gap that separates North and South in Italy in terms of growth and development (Fioritto, 2017). The most common manifestation of PPP is the contract "project-construction-financing-maintenance-management" (DBFMO, Design-Build-Finance-Maintain-Operate). In this case, the individual is entrusted with all the phases of the project, from design to construction, to operational management and maintenance of the infrastructure, including fundraising.

Graph 2: Scheme of a typical DBFMO PPP based on availability

Source: European Court of Auditors in "Public-private partnerships in the EU: widespread shortcomings and limited benefits" (2018)

Graph 2 contains a representation of the different phases of a DBFMO PPP, where the respective responsibilities of the public and private partners are indicated. After the completion of the construction phase, the public partner begins to pay the private part for the use of the service. The amount of the installments usually varies based on the availability of the infrastructure or the level of use of the infrastructure, to ensure that the required quality standards are met throughout the life of the project (European Court of Auditors, 2018).

#### 4. CONCLUSIONS

In Italy the PPP has not spread as in other countries and the main problems that have hindered this diffusion are different (Crivelli, 2011):

- the low competition in the private finance sector;
- the non-bankability of the Concessions;
- the incompleteness of the Contracts which implies a vague and uncertain allocation of risks;
- the possibility for the private sector to renegotiate: often the PEF is revised to the detriment of the public who has no experience with PPP.

The results therefore lead to:

- long times: both from the publication of the tender notice to the award of the Concession and from this to the financing;

- high mortality rate for projects.

The collaboration between the public and private sector has been the subject of attention at Community level since Directive 93/37 / EEC of the European Council of 14 June 1993 regarding the coordination of the procedures for the award of public works contracts for the specific themes of the realization of the infrastructure and subsequently, the management of public services with a gradual evolution. The notion of PPP involves a complex scheme of relationships between public authorities and private companies aimed at realizing infrastructure projects and providing public services (Antoniazzi, 2017).

The source of the key principles of the PPP discipline are contained in the Green Paper on public private partnerships and public law of contracts and concessions of the European Commission of 30 April 2004 (Paradisi, 2017).

The European Commission has clarified that the PPP consists of forms of cooperation between public and private entities that aim to guarantee the financing, construction, management of a restructuring or maintenance of an infrastructure or the provision of a service. The main advantage that derives from the involvement of the private sector in the management of a public service is that the public body must not use its own resources in financing the operation of a public service (Antoniazzi, 2017).

The use of PPP methods to carry out a project can alternatively allow (Gallia, 2008):

- generate income through user revenues: in this way, the expected revenues from the realization of the projects allow the private sector to recover the investment costs for the duration of the concession;

- request a public contribution: when it comes to initiatives where commercial user revenues are insufficient to generate sufficient economic returns;

- request the direct supply of services to the private entity: in this case, the latter derives their remuneration only from payments made by the PA on a commercial basis.

The 2004 Green Book identifies the distinctive elements of PPP contracts, especially the basic characteristics (Cori, 2007):

- the relatively long duration of the collaboration between the public partner and the private partner on the various aspects of a project to be carried out;

- the method of financing the project, guaranteed by the private sector;

- the main role of the economic operator, who participates in the various phases of the project. The public partner focuses above all on the definition of the objectives to be achieved in terms of public

interest, the quality of the services offered, the pricing policy, and guarantees the control of compliance with these objectives;

- the sharing of risks between the public partner and the private partner, which is carried out on a case-by-case basis, according to the ability of the parties to assess, control and manage them.

PPP operations can bring benefits to all categories of parties involved. They allow (Crivelli, 2011):

- the administration, to perform its function in compliance with the principles of efficiency, efficacy and economy;

- the private sector, to pursue its profit purpose;

- the end user, to obtain more efficient public services that are able to raise the quality of life in the country;

- the entire economic system, local and national, to benefit (in terms of earnings) from efficiency and competitiveness.

## USAGE OF MACHINE LEARNING IN INTERNATIONAL ENTREPRENEURSHIP

Falco, Briam Daniel<sup>1</sup>; Neubert, Michael<sup>2</sup>; van der Krogt, Augustinus<sup>1</sup>

<sup>1</sup>Department of Business Administration, Universidad Paraguayo Alemana, San Lorenzo, Paraguay

<sup>2</sup>ISM International School of Management, Paris, France

### ABSTRACT

The purpose of this study is to explore the perceptions of chief technology officers (CTO) of software development firms (SDF) about how and why machine learning (ML) methodologies might be used to support foreign market evaluation decisions. The research design is a qualitative multiple case study with six interviews with CTOs of SDFs and corporate documents about ML applications from the case study firms as sources of evidence. The results of this multiple case study suggest the following four findings: 1) The usage of ML to support foreign market evaluation and selection decisions has the potential to improve quality and efficiency, 2) data availability is a key factor of ML to support foreign market evaluation decisions, 3) “easy to use” and “easy to interpret” ML supervised methods are the most suitable to support foreign market evaluation and selection decisions, and 4) existing ML development methodologies can be applied to support market evaluation and selection decisions. These findings have a limited generalizability due to the research methodology and are valid only for these case study firms. The results of this study may be relevant for researchers who are interested in a further digitalization of decision-making processes. The results may also be relevant for practitioners to better understand the use of ML methodologies in complex important decision-making processes like the evaluation of foreign markets. This work integrated fundamental theories of internationalization (Uppsala Model) with the concepts and methodologies of machine learning, whose relationship is yet not covered by the academic discourse.

*Keywords: machine learning, internationalization, Uppsala Internationalization Process Model, decision-making, developing country.*

### INTRODUCTION

The world is following a trend that is damaging longtime set trade rules and that adds unpredictability to how markets will behave (The World Trade Organization, 2019). Nevertheless, the recently announced EU-MERCOSUR Trade Agreement is set to strengthen commerce and add some

predictability that member states of the two blocks can take advantage of, while other countries behave erratically. Small and medium sized companies (SMEs) from the EU and MERCOSUR can benefit from this trade agreement, and machine-learning methodologies can help to better understand internationalization processes. This work aims to integrate fundamental theories of internationalization based on the works of Johanson and Vahlne (2017) about the Uppsala Internationalization Process Model (UIPM) and Neubert and van der Krogt (2019) about market evaluation and market selection with the concepts and methodologies of machine learning, and inspired by the machine learning applications in entrepreneurship research (Coad & Srhoj, 2019) and for decision-making purposes (Dvouletý, Srhoj, & Pantea, 2020) public interventions for internationalization and foreign market penetration (Srhoj & Walde 2020).

This work is based on the statement of Coviello, Kano, and Liesch (2017) that states about the UIPM and the digital context: "Although Vahlne and Johanson conclude their arguments by recognizing how information technology is radically transforming international business, they do not explicitly address the impact of this transformation." This work addresses the calls for research of Coviello, Kano & Liesch, (2017) and Neubert and Van Der Krogt (2018) for digitalization in the context of the UIPM.

The purpose of this study is to explore the perceptions, views, and opinions of subject matter experts about how and why machine learning methodologies might be used to support foreign market evaluation and selection decisions using a multiple case study research design with six semi-structured, in depth interviews with chief technology officers as subject matter experts and corporate documents about machine learning applications from their case study respective software firms as sources of evidence.

This paper is structured as follows: After this introduction, the literature review covers the most recent papers about the UIPM and machine learning methodology, and the conceptual framework used in this study. The second chapter explains the methodology used. The results are discussed in the third chapter. Finally, this paper concludes summarizing findings and proposing further research topics.

## **LITERATURE REVIEW AND CONCEPTUAL FRAMEWORK**

This work relies on the foundation set by the UIPM. The UIPM has been a subject of great discussion in the academic discourse and it is particularly relevant to Paraguay and Europe, regions where Neubert and Van Der Krogt (2017, 2018) have proven that different types of companies' internationalization efforts can be described with the UIPM. For the machine learning literature, a

model proposed by Awad and Khana (2015) was selected as the conceptual base for machine learning methodology, as it proves to be validated by a number of authors cited in the literature review.

#### *The Uppsala Internationalization Process Model (UIPM)*

Conceived in 1977 by Johanson and Vahlne, the UIPM is one of the most widely cited models in international business and contributed the first general model of the internationalization process of large firms (Gulanowski, Papadopoulos, & Plante, 2018). At its core, the model focuses on the gradual acquisition, integration and use of knowledge about foreign markets and operations, and on the incrementally increasing commitments to foreign markets (Johanson & Vahlne, 1977). The model describes internationalization as a gradual cyclical process that consists of “state” and “change” aspects, and suggests that the firm commits resources based on the extent of knowledge it has about a given market. (Gulanowski et al., 2018).

Its latest version from the year 2017 preserves the concepts of “state” and “change” aspects, with big changes and additions in their variables compared with the original model of 1977, which are the result of incremental changes of the model over the years. The change variables propose two starting points for change: commitment processes and knowledge development processes. The first variable is defined as “intermittent decision processes related to committing – or not committing – resources”, and the second as “continuous knowledge development processes through learning, creating, and trust-building” (Vahlne & Johanson, 2017).

State variables are the result of (and affect) the change variables and consists of capability variables and commitment/performance variables. The first type of variable “reflects the ability to use resources for a particular purpose” (Vahlne & Johanson, 2017). And the commitment/performance variable is defined with “commitment” as the distribution of resources of the firm to its “functions, its product lines, the countries where it is active, and the relationships in which it has invested” (Vahlne & Johanson, 2017). Whereas “performance” refers to what has been achieved already.

#### *Market Evaluation and Selection*

Based in the concepts of the UIPM, Neubert (2017, 2013) developed a procedural process, “which shows the degree of structured and disciplined approach that is necessary to manage a global sales organization successfully” (Neubert, 2017). In this process four steps are identified as the steps that businesses follow in order to achieve their international business development goals.

In the first step “Market Evaluation and Selection” and the second step “Market Preparation”, the most attractive markets are selected and a business model for them developed. The ability to learn about foreign markets and to create networks is the key driver of these two steps. During step one and step two, the firm needs to understand whether their firm-specific advantages according to the UIPM can be transferred to new foreign markets or if other competences might be considered or used as

firm-specific advantages to compensate for the liability of foreignness and outsidership. Step three “Market Entry” and step four “Market Development and Growth” can be compared to the market commitment establishment chain of the UIPM. With growing market success, the firm is dedicating or investing additional resources in a new foreign market.

This work will limit itself to the first step of this international market internationalization process and market evaluation and selection, which includes some smaller tasks that could be of interest for the use of machine-learning methods. The first task is named “Selecting Appropriate Foreign Markets” and it recommends to first consider the exclusion criteria within a checklist approach before considering more specific variables. After the initial filtering, the second task comes into place: “Calculating Market Attractiveness”. This task includes calculating market attractiveness, in which numerical values are assigned four fields to be analyzed: framework conditions and country risks, industry specific market potential, intensity of competition, and own competitive position. The company assigns variables to each field and the result is a ranking of markets where internationalization is recommended. The subsequent tasks involve more time and resource consumption and can be summarized as the creation of a business plan for the top markets. After selecting the best business plan, a strategy is drawn.

#### *Machine Learning (ML)*

ML is a part of the field of artificial intelligence (Awad & Khana, 2015), and over the years different sources have defined it in different ways. As a field of study, machine learning sits at the crossroads of computer science, statistics and a variety of other disciplines concerned with automatic improvement over time, and inference and decision-making under uncertainty (Jordan & Mitchell, 2015).

ML development practices are not yet standardized. As Watanabe et. al (2019) demonstrated after a search query of 2358 papers, there is still little research on the topic and they stated that that “these practices depend on individual developers or organizations.” Still, this work identified the methodology proposed by Awad and Khana (2015) and found it compatible with other methodologies such as the one proposed by De Souza Nascimento et al. (2019), which conducted a descriptive research in Brazil in the field of ML development practices. Additionally, it was found that the proposed methodology is in accordance to the findings of the Microsoft Research team (Amershi et al., 2019). The often limited access to high quality data in foreign markets limits the use of ML for international decision-making purposes (Coad & Srhoj, 2019; Chung, Kim, & Ryu, 2017). The speed of learning (here: collecting data) has a high impact on the efficiency of decision-making processes and the speed of internationalization (Neubert, 2018). Johanson & Vahlne (1977) describe this limited access to market knowledge and contacts as the liability of foreignness and outsidership.

## RESEARCH METHODOLOGY

Based on the purpose of this study, a multiple case study research design (Yin, 2018) was selected to answer the research question of this study: What are the perceptions, views, and opinions of subject matter experts about how and why machine learning might be used to support foreign market evaluation and selection decisions?

This study uses a purposive and snowball sampling method (Yin, 2018). After conducting six semi-structured, in depth, online interviews, saturation was reached (Guest, Bunce, & Johnson, 2006). The case study firms are software development firms located in Paraguay and Brazil. They are involved in the development and the consultation of companies in the use of artificial intelligence to support decision-making processes. The subject-matter experts are chief technology officers (CTO) of these firms, having both an academic (= university degrees in computer science) background and practical experience (more than eight years) in the application of ML in decision-making processes.

Data was collected through six semi-structured, in depth, online interviews with CTOs as subject matter experts and corporate documents about machine learning applications from their case study respective software firms as sources of evidence. Saturation was reached after six interviews. The semi-structured, in depth, online interviews were conducted in October and November 2019 and lasted in average 47 minutes. The interview protocols were transcribed and member checking was used to guarantee credibility.

The data was analyzed manually using a thematic analysis and critical event analysis approach (Yin, 2018). Data analysis revealed four themes to answer the research question (Halkias & Neubert, 2020).

## FINDINGS

The following four themes emerged through the conducted thematic and critical-event analysis to answer the research question about the perceptions, views, and opinions of subject matter experts about how and why machine learning might be used to support foreign market evaluation and selection decisions.

Theme 1: The usage of ML to support market evaluation and selection decisions has the potential to improve quality and efficiency of decision-making processes of international managers. After a careful explanation of the concepts of market evaluation and market selection (Neubert, 2013), the subject-matter experts agreed that it is possible to develop a machine-learning algorithm that supports market evaluation and selection decisions, assuming that they have a significant amount of data related to the topic. The majority of the subject-matter experts stated that the quality of the market evaluation and selection decisions can be improved when the data for the training of the algorithm consists of multiple variables and foreign markets, because the possible combinations of variables to predict market attractiveness grows exponentially as more relevant variables are added. One subject-matter expert added that combinations of variables can be missed if the task is performed by humans, who also would take considerable amounts of time in analysing datasets with multidimensionality.

The efficiency of foreign market evaluation and selection might also be influenced according to the subject-matter experts. The subject-matter experts mentioned several factors, which might influence efficiency: on-demand availability of data, results, and regular updates to verify or to update prior decisions, time savings to prepare decisions, coverage of a higher number of variables and foreign markets. Thus, the findings suggest that the usage of ML to support market evaluation and selection has the potential to improve quality and efficiency of decision-making processes.

Theme 2: Data availability is a key factor of ML to support market evaluation and selection decisions. All subject-matter experts stated that they would recommend small and medium-sized enterprises to use machine learning to support market evaluation and selection decisions. Two of the participants said that they would not consider company size as a relevant factor to implement ML. They all stressed the importance of data availability. ML algorithms tend to increase in their accuracy with more data. Nevertheless, one participant stated that thanks to technological tools data collection

can also be automated and another one mentioned that there are methods to increase ML performance with relatively low amounts of data.

Theme 3: “Easy to use” and “easy to interpret” machine learning supervised methods are the most suitable to support market evaluation and selection decisions. Considering the unexplored nature of the usage of ML to support market evaluation and selection decisions, the subject-matter experts considered that “easy to use” and “easy to interpret” methods are the most suitable for this purpose. They recommended supervised algorithms to avoid the “black-box” effect and – as two subject-matter experts added – to increase the trust of decision-makers in the recommendations of ML algorithms. One subject-matter expert clearly expressed that unsupervised algorithms will be “insufficient” to address the issue due to transparency issues. The supervised algorithms that were mentioned as the most suitable algorithms are based on logistic regression and decision trees according to the recommendations of five subject-matter experts. They argued that the results of these algorithms are easier to interpret by decision-makers in small and medium-sized enterprises in contrast to more complex algorithms based on neural networks and support vector machines.

Theme 4: Existing ML development methodology can be applied to support market evaluation and selection decisions. Before explaining to the subject-matter experts the definitions and concepts of foreign market evaluation and selection, they were asked how they would describe the process of applying ML methodologies for decision-making purposes in their case study firms. Then, after discussing how and why ML can support market evaluation and selection decisions, the subject-matter experts were asked again to describe their preferred ML development process to support market evaluation and selection decisions and if it would be different from the process that they described before. Although the ML development processes to support market evaluation and selection decisions described by each subject-matter expert were slightly different especially in the details of each step described and in the terms used, they all agreed that they would use the existing ML development methodologies as described before they were explained the definitions and concepts of market evaluation and selection.

Based on the data analysis, the following process was synthesized using the steps described by the participants and their recommendations about how the UIPM might be integrated and how the state variables consisting of capability variables and commitment/performance variables trigger the need for selecting appropriate markets and calculating their attractiveness (fig. 2). This need is then captured by an ML development process that consists of six steps: 1) collect the data, 2) preprocess the data, 3) transform the data, 4) train/test the algorithm, 5) tune parameters, and 6) execute (fig. 2). The results of the executed machine-learning algorithm form part of the change variables in the UIPM as

decisions are made based on the predictions of the algorithm and then the change variables trigger additional changes in the state variables.

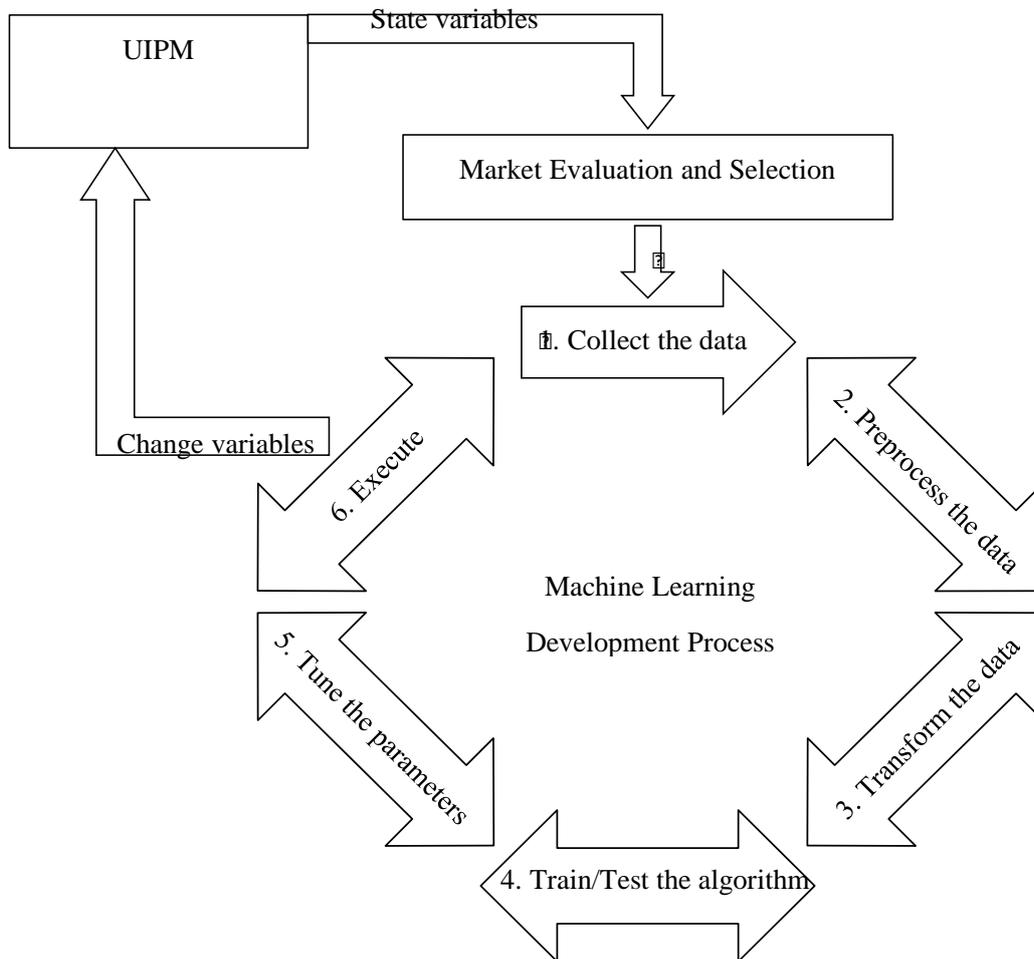

Fig. 2. Integrated Machine Learning Development Process for Internationalization. Source: authors.

## CONCLUSION

Using a multiple-case study research design, we were able to answer the research question of this work, that asked: What are the perceptions, views, and opinions of subject matter experts about how and why machine learning might be used to support foreign market evaluation and selection decisions?.

The results of this multiple case study suggest the following four findings: 1) The usage of ML to support foreign market evaluation and selection decisions has the potential improve quality and efficiency, 2) data availability is a key factor of ML to support foreign market evaluation and selection decisions, 3) “easy to use” and “easy to interpret” machine learning supervised methods are the most suitable to support foreign market evaluation and selection decisions, and 4) existing ML development methodologies can be applied to support market evaluation and selection decisions.

Based on the data analysis, a ML development process is proposed, which integrates the UIPM and includes the following steps: 1) collect the data, 2) preprocess the data, 3) transform the data, 4) train/test the algorithm, 5) tune parameters and 6) execute.

These findings have a limited generalizability due to the chosen research methodology and are valid only for these case study firms. The results of this study might be relevant for researchers who are interested in a further digitalization of decision-making processes. The results might also be relevant for practitioners to better understand the use of ML methodologies in complex and financially important decision-making processes like the evaluation and selection of foreign markets.

A multiple case study research design has several limitations in size and scope that offer new ideas for future research. There is a need to understand in more detail how ML development processes can be optimized and integrated in international decision-making processes. This includes practical experimentation and research about the identified ML development process for internationalization. Future research may also address behavioral aspects of decision-makers using qualitative research methodologies. Future scholarly work might also include quantitative assessments of subject-matter expert perceptions, views, and opinions, and that with qualitative data to provide greater clarification of the statistical significance of the variables of this study or to replicate it with other case study firms from different industries and markets.

### ABSTRACT

Appropriateness is one of the most important issues in today's medicine, from a clinical and more in general multidisciplinary point of view. Thus, a contextual and multifaceted perspective of research and management is indispensable for handling it, also as concerns the Laboratory Medicine (LM), which is ever more characterized as a technology-based science. The case study under investigation, i.e. an accredited private hospital in Italy, has permitted to highlight how an adequate quality management system can provide concrete contribution to handle with appropriateness some test batteries for hospitalized patients waiting for Computerized Tomography (CT) or Magnetic Resonance Imaging (MRI). Direct result of the observed technological innovation (glomerular filtration rate instead of Bence - Jones and immune-fixation tests) is the increase of the economic appropriateness for a new LM procedure that is first of all appropriate from a clinical point of view.

*Keywords: Laboratory medicine; Clinical appropriateness; Economic appropriateness; Quality management; Continuous improvement.*

### 1. INTRODUCTION.

Appropriateness in medicine is nowadays one of the cornerstones of good healthcare management, especially for public expenditures (Bauer et al., 2019), as concerns both clinical and economic dimensions, and especially for diagnostic medicine (Cappelletti, 2016). In this respect, one of the medical specialties that are most interested by the scourge of inappropriateness is Laboratory Medicine (LM), either for more usable instrumental hypertrophy, either for defensive diagnostic medicine, either for real need to explore more possibilities of knowledge of specific clinical cases (Cadamuro et al., 2018; Aita et al., 2019; Plebani et al., 2019). With this regard, an adequate quality management system, properly supported by coherent Evidence-Based Medicine (EBM), can be very profitable, leading to significant enhancement in the process and in the service, when they are really inspired to continuous improvement (Price, 2012).

In the current research, concerning a private hospital in Italy as case study, proof of methodological innovation that has enabled an increase of efficiency for a specific LM process has emerged. The results arising from this innovation have showed high significance from different points of view, and in particular, have generated clear evidence of continuous improvement in the enterprise healthcare system, giving further contribution to the concept of appropriateness based on a multidisciplinary approach (Brescia et al., 2019) in LM, but only, at least as can be observed in the case study, in the presence of an adequate quality management system (Lega et al., 2018; Lippi and Plebani, 2019).

The structure of the paper is as follows: after a literature review about medical appropriateness, with a specific focus on LM, a theoretical/practical framework of investigation about appropriateness in LM is object of analysis for the case study development, with further discussion about implications, limitations, and progresses.

## 2. LITERATURE REVIEW.

The essential goal of every healthcare system is to offer efficient services notwithstanding ever more limited funds and growing demand for high quality care. In this scenario, appropriateness about allocation of resources becomes a priority, as it represents a fundamental key to guarantee the potential sustainability of the overall health system.

Several definitions of appropriateness have arisen from the scientific literature, considering both positive effects (Van Leersum et al., 2019) and negative effects (Squires et al., 2019) for patients. This topic is vital in current and future medicine, combining synthetically concepts like efficacy, efficiency, safety, and quality (Price et al., 2016): in fact, different meanings are possible from the different points of view of the various players operating in a healthcare system, and consequently several are the potential dimensions for the investigation, among which two are most probably the most analyzed: clinical appropriateness and economic appropriateness (Lombardi et al., 2016), in the latter case considering also organizational, managerial, and administrative profiles.

More in general, a diagnostic, therapeutic, or rehabilitative intervention is 'appropriate' if it can optimize benefits while minimizing risks. In particular, according to some researchers of the RAND Corporation ([www.rand.com](http://www.rand.com)), appropriateness occurs when «... the expected benefit (for example an increase in life expectancy, relief from pain, reduction of anxiety, improvement in functional capacity) exceeds any negative consequences (eg mortality, morbidity, anxiety, pain, lost working time) with a sufficient margin for which the procedure is worth practicing» (Fitch et al., 2001).

An explorative analysis of the scientific literature provides evidence that a large part of the healthcare services that are usually object of medical provision appears to be inappropriate; in this respect, several studies have highlighted the deleterious effects that inappropriate clinical practice can have on

patients directly – such as negative experiences (Bourne et al., 2010) or even deterioration of health status (Hall et al., 2015) – and indirectly (inefficient use of resources).

When considering causes for inappropriateness, several scholars have tried to determine possible reasons why it could happen. According to Cadamuro et al. (2018), inappropriateness can be effect of:

- excessive use of required, but not necessary, activities (Korenstein et al., 2012);
- underuse of activities that are not required, but appear to be fundamental (Bossuyt, 2012); or
- improper use of required activities whose incorrect interpretation provokes not to obtain fully the expected benefits (Zhi et al., 2013).

For example, in a study conducted in the United States by Sarkar et al. (2017), it was discovered that for 200 patients with hemorrhagic problems inappropriate tests were performed in 78% of cases, thus causing over 200,000 USD of avoidable costs. Another example concerns redundant or repeated laboratory tests, which according to Rogg et al. (2013) occur on average once for each patient transferred from the emergency room, with huge waste of resources.

Nonetheless, consequences of inappropriateness are harmful also because they put patients' health at risk (Makary et al., 2016), and not only because they are wrong from a financial point of view. More in general, in fact, the inappropriateness due to lack of information and/or communication, or due to failure to request and then to implement necessary examinations, is very dangerous as it is potentially in combination with concrete risk of a missed or delayed diagnosis, which can lead to an aggravation of the pathology, an increase in the costs to be incurred, or an extension of the days of hospitalization, as well as a series of adverse events (Giavarina, 2015).

The demand for excessive performance and unnecessary diagnostic tests provokes unacceptable waste of resources, and altogether exposes patients to risks concerning avoidable invasive procedures (Bindraban et al., 2018). The reasons that generate a demand for performances that exceed necessary medical needs are different: among these, for example, the lack of a correct relationship between patients and healthcare operators (Matysiewicz and Smyczek, 2013), but honestly one of the most insidious is the (unfortunately) widespread practice of active defensive medicine, which pushes doctors to prescribe many diagnostic tests, certainly more than those that should be opportune, for the fear of potential medical-legal disputes (Montagnana et al., 2016).

After a general overview about medical inappropriateness, it is possible to highlight from the scientific literature that a central perimeter of investigation within the boundaries of this topic concerns LM, a discipline in which most probably medical knowledge is transformed into technological innovation with a higher rate than in any other clinical field (Gion et al., 2017), as has emerged also in recent times with the Covid-19 pandemic. In fact, the technological progress has increasingly transformed medicine, and LM in particular, from an art, based most of all on the

doctor's personal ability, into a technological science, in which the human component is always indispensable, but in which, honestly speaking, ever more accurate, personalized, and complex laboratory tests and examinations are prevailing.

Therefore, nowadays clinical decisions are extremely influenced by the information deriving from laboratory analyses, although their costs, according to some estimations, represent for example only 2% of overall health expenditure in Italy, coherently to the rest of Europe (Rohr et al., 2016). The nowadays success of LM is fundamentally due to various factors, including the possibility of having real-time responses, identifying risk factors in asymptomatic subjects, making early diagnoses, or controlling the disease progression (Lippi et al., 2017).

From these premises, it is evident that LM appropriateness is essential to ensure «... the right test, using the right method, at the right time, to the right patient, with the right costs and to produce the right result» (Plebani et al., 2019). Thus, laboratory information becomes essential only if it is able to generate value for the patient: appropriateness in LM is not limited to the examinations prescription, and therefore to the pre-analytical phase, but it is also capable to influence all the clinical decision-making process. If not adequately governed, managed, and controlled, inappropriateness in LM can provoke not only waste of financial resources, but could also act on patients' safety, and therefore, on the final outcome (Sciacovelli et al., 2017), and that is why to focus on this specific topic is fundamental for the overall healthcare system.

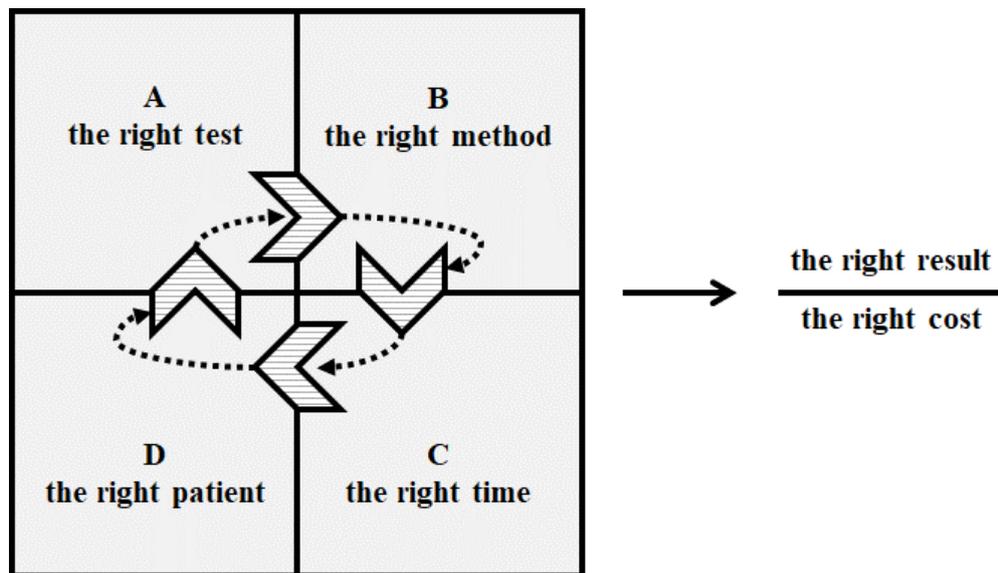

### **3. A POSSIBLE PERSPECTIVE OF INVESTIGATION ABOUT APPROPRIATENESS IN LM.**

As emerged from the literature review, appropriateness, together with its opposite concept of 'inappropriateness', is a commonsense idea, even though quite difficult to determine exactly without assuming a contextual and multidisciplinary point of view. This is even truer for LM, where appropriateness cannot be object of unique definition using absolute and general terms, but depends on the situation, time exigencies, and modalities according to which the diagnostic tests are required.

Thus, most probably, appropriateness cannot be achieved by adopting a unique procedure: instead, it should be considered as an orientation that inspires an underlying complex process, through the mindful application of opportune tools and methods. That is why, for example, concrete appropriateness, most of all when prescriptive, finds an essential antecedent in adequate training not only for clinicians and clinical pathologists, but also for information technology experts (Aggelidis and Chatzoglou, 2008), considering the above mentioned vision of LM as technological science. In this respect, it is fundamental to adopt the most appropriate and updated diagnostic guidelines coming from accredited scientific institutions, naturally also as regards the field of health informatics.

From the point of view of the medical practitioners, however, a very acceptable definition of appropriateness for LM is that one provided by Plebani et al. (2019), above mentioned in the literature review. According to this description, a theoretical/practical framework for the governance of medical appropriateness in LM should consider at least four dimensions of investigation, all oriented to generate an acceptable “right result right cost ratio” (cf. Figure 1):

- 1) the right test
- 2) the right method
- 3) the right time
- 4) the right patient (those who need).

*Figure 1. A possible model for appropriateness in LM. Authors' elaboration from Plebani et al. (2019).*

*Taking the right test* means choosing the examinations that are capable to change the diagnostic / clinical / therapeutic conduct of the physician. In fulfilling this commitment, communication, sharing, and consulting among clinical physicians (prescribing), laboratory technicians (executing), and laboratory physicians (analyzing) are decisive. Thus, a laboratory exam must be prescribed to answer a specific clinical question, clearly indicated in the request by the doctor applicant.

*Taking the test* involves the selection of the most adequate analytical practices, procedures, and systems that are available at the state of the art, favoring specificity, accuracy, minimization of the degree of uncertainty, reliability, sensitivity, promptness, productivity, and so forth; these competences, together with the use of medical statistics techniques, are part of the indispensable background that a LM organization needs for reaching high quality performances. In this respect, continuous adoption of the up-to-date standards required by EBLM (Evidence-Based Laboratory Medicine) is crucial.

*Taking the test with the right method at the right time* implies the application of two fundamental concepts. First, the most suitable ‘diagnostic window’, intended as the most opportune choice about

the time when the exam results can be correlated with the physio-pathological evolution; and second, the TAT (Turn Around Time), intended as the time that elapses between the collection of the biological sample and the communication of the exam response, in order to make the examination 'clinically useful'.

*Taking the test with the right method at the right time to the right patient (those who need)* concerns both efficacy and efficiency. The medical tests should be carried out taking into account two essential attributes at least, i.e. 1) the purpose and / or plausibility and 2) the optimal use of resources; unnecessary examinations, if performed to those who do not need, can generate excessive expositions for those who do not need and divert resources from those who actually have need.

As result from this global analysis from a practical point of view, a medical exam can be considered appropriate, according to a 'positive' perspective, if it fits the four abovementioned dimensions; instead, a medical exam can be considered inappropriate, according to a 'negative' perspective, if it does not fit the four abovementioned dimensions. More in general, however, any medical exam can be potentially inappropriate according to a negative perspective if it is not essential to define or confirm a diagnosis or modify the clinical outcome: that is why appropriateness can be considered only from a contextual point of view (what is right in a setting, can be not right in another setting: Lavis and Anderson, 1996), and thus case management is the most opportune technique of investigation, always involving clinical physicians (prescribing), laboratory technicians (executing), and laboratory physicians (analyzing).

In this respect, classification of the LM exams, which in the past was based on the use of extensive test profiles with respect to the suspected diagnosis or the ongoing pathology, has been reduced hugely by the most recent criteria about appropriateness. The use of 'a priori' protocols has often involved execution of redundant or useless exams, with consequent risk for patients and waste of resources. The 'new' diagnostic profiles must contain a minimum / indispensable number of examinations pertaining to the question ('case'), thus requiring a global and consequently managerial approach (Fletcher and Polychronakis, 2007) to be adopted by all the operators in the supply chain of the LM.

#### **4. RESEARCH OBJECTIVES AND METHODOLOGY.**

Having in mind the above deliberations, the current study aims at responding to the following research question:

*"Is the application of the right-test-right-method-right-time-right-patient framework capable of detecting not only clinical, but also economic appropriateness?"*

Considering the previous issues, the most adequate approach for this kind of investigation should be the case study methodology. The healthcare organization that has been selected for the analysis is the

'Casa di Cura Tortorella S.p.A.', an Italian private hospital that is located in Salerno, in the Campania region, in the South of Italy; the specific motivations for the choice of this enterprise will arise together with its following description.

## **5. THE FIELD RESEARCH: THE 'CASA DI CURA TORTORELLA S.P.A.' CASE STUDY.**

Italy is nowadays one of the most developed economies in the world, being part of the G20 and above all of the G7, being able to count on a Gross Domestic Product (GDP) estimated for 2019 around 2.442 trillion USD, even though, considering the GDP per capita, compared to a population of about 60 million inhabitants, the Italian nation ranks only at the 28th place in the world (International Monetary Fund statistics at October 2019). Understandably, for 2020 these figures will be interested by huge changes due to the Covid-19 pandemic.

In this economic scenario, in which the impact of the great modern transformations from digitalization to globalization is clearly visible, since 1978 the Law No. 833 is active, which has introduced, inspired by the British model, a national health service that is universal and (almost) free, in the sense of having separated the price of the service from the cost of the service, which is instead financed for the most part by the general taxation.

To guarantee economic sustainability for this operation, since 1992 the Legislative Decree No. 502 is active, which has introduced two fundamental novelties: regionalization and corporatization (Lega et al., 2018). With the second pillar, i.e. corporatization, specific criteria for the management of public healthcare have been introduced, formally and substantially inspired by the functioning of corporations in general and private corporations in particular as concerns effectiveness, efficiency, and affordability, naturally with observance of the public dimension of the public healthcare context. In this respect, accredited private healthcare organizations are equivalent to public healthcare organizations: they have been recognized by the institutions in charge, i.e. the Regions by virtue of the aforementioned regionalization, as deserving to be 'employed' as subsidiaries for national / regional health services, with identical operating criteria.

Thus, in the current research, an Italian accredited private hospital has been investigated as case study, because it can be considered as a common case, being its functioning formally similar to other organizations working for the Italian National Health Service; but also as an extreme case, because the substantial commitment about the 'right' functioning of the enterprise is inevitably higher for accredited private healthcare organizations, in which – unfortunately – the entrepreneurial and managerial sentiment is much more urgent than in the public context (for common cases: Yin, 1994; for extreme cases: Eisenhardt, 1989). The following case study is even more peculiar, because it

concerns the Campania Region, which in 2020 is still managing the debt rescheduling plan with the National Ministry of Health, due to the high level of financial debt that has been gathered in the last decades, even though at the beginning of 2020 the Regional Health Service is no more under governmental administration.

The Casa di Cura Tortorella S.p.A., founded in 1954, has the following structural features (source: [www.tortorellaspa.com](http://www.tortorellaspa.com)).

- No. 150 hospital beds (number of patients' seats under national / regional health service).
- No. 4 operating rooms (one of which angiographic).
- No. 1 post-surgical sub-intensive therapy room.
- No. 8 hospitalization functional units.
- No. 1 policlinic unit equipped with 9 examination rooms.
- No. 1 medically assisted procreation center.
- No. 1 diagnostic imaging unit (executing Computerized Tomography - CT and Magnetic Resonance Imaging - MRI).
- No. 240 employees/consultants.

In the enterprise perimeter there exists also an ambulatory / laboratory center ('Centro Polidiagnostico Morgagni'). From a global point of view, therefore, the case study under analysis is evidently well structured, and then adequate, to go under investigation, and in truth it reveals proof of methodological innovation that has enabled an increased efficiency for a specific LM process.

In fact, moving from the most recent scientific evidence (SIRM - Italian Society of Medical Radiology and SIBIOC - Italian Society of Clinical Biochemistry) about the prescriptive appropriateness of the biochemical tests to permit the assessment of the risk of contrast-induced nephropathy for hospitalized patients waiting for CT or MRI to be executed with contrast agents, the Bence - Jones protein urine test (searching kappa and lambda light chains) has been excluded from the set of preparatory laboratory tests, and replaced by the calculation of the glomerular filter. The results arising from this process innovation have showed high significance from different points of view.

Previously, in fact, the search for the kappa and lambda light chains was performed on all received samples and subsequently, immune-fixation was only performed on samples that had been resulted as positive for the chains (approximately 11% in 2017 and approximately 17% in 2018 of the total numbers of chain research for the current case study). The global analytical examination of a (positive) sample therefore consisted of two types of tests, with its organizational burden in terms of number of operations, consumption of resources, and overall clinical risk.

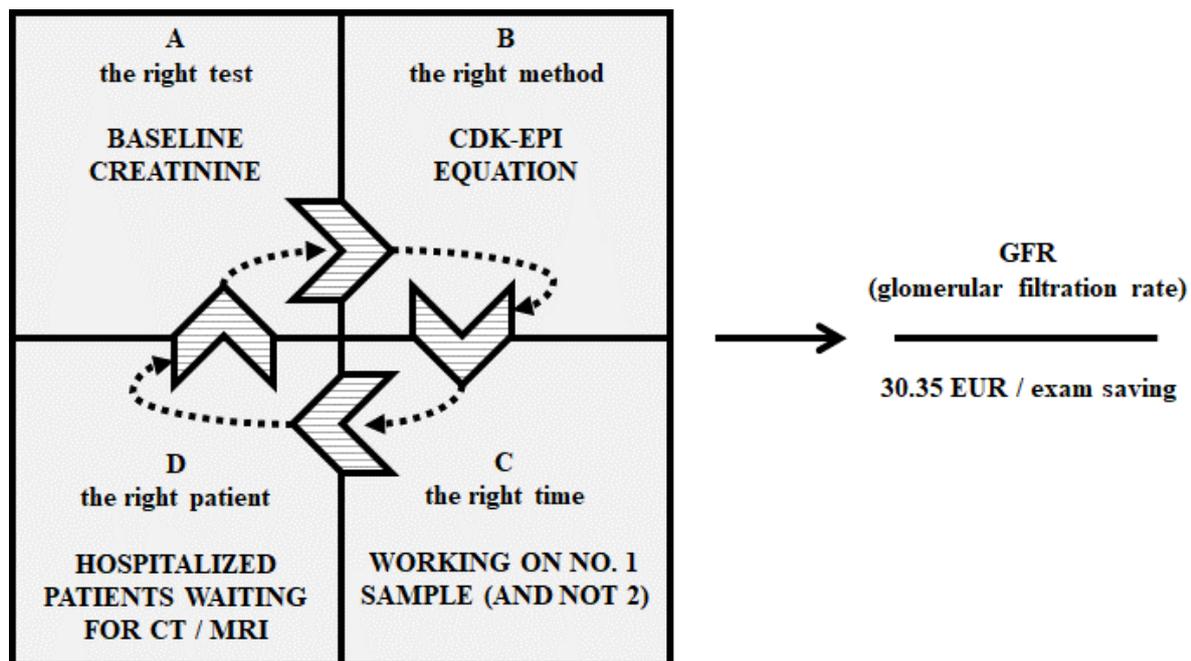

With the application of the calculation of the glomerular filtration rate, using the equation of CDK-EPI (Chronic Kidney Disease Epidemiology Collaboration) applied to the value of the baseline creatinine,

a saving around 30.35 EUR per exam has arisen, only implementing the elimination of the Bence - Jones protein urine test, but naturally in compliance with prescriptive appropriateness in LM, based on the best available scientific evidence (cf. Box 1). A simple proportion between the number of tests of the case study enterprise and other organizations, public or accredited-private, working for the national / regional health service in Italy, would provide reason of the potential saving to be reached.

|   |   |           |
|---|---|-----------|
| Previous exams: Bence - Jones test (10.60 EUR) + immune-fixation test (20.88 EUR) | = | 31.48 EUR |
| Current exams: application of CDK-EPI equation to baseline creatinine             | = | 1.13 EUR  |
| Saving: cost of previous exams (31.48 EUR) – cost of current exams (1.13 EUR)     | = | 30.35 EUR |

*Box 1 - Calculation about saving (values from the 2019 price list of the regional health service in Campania).*

In Figure 2 the conceptual definition by Plebani et al. (2019) about appropriateness has been practically applied to the case study under investigation adopting the theoretical/practical framework that has been developed in Figure 1. Consequently, it is possible to provide positive response (“Yes”) to the research question under analysis (“Is the application of the right-test-right-method-right-time-right-patient framework capable of detecting not only clinical, but also economic appropriateness?”).

*Figure 2 – A possible application of the model for appropriateness in LM (about GFR).*

The application in question represents clear evidence of the valuable impact that continuous improvement in healthcare can provide, giving further tangible substance to the concept of multidisciplinary appropriateness (Brescia et al., 2019) in LM, but only, as above mentioned, in the presence of an adequate quality management system (Lega et al., 2018; Lippi and Plebani, 2019).

## **6. SCIENTIFIC AND MANAGERIAL IMPLICATIONS.**

Main theoretical contribution of this research is the confirmation of the previous scientific literature, even in a case study approach, that medical appropriateness is a very complex concept, which can be object of investigation and management only from a multidisciplinary point of view. Main managerial contribution of the current research is the development of a theoretical/practical framework that could be used for evaluating, organizing, and managing the multidisciplinary concept of appropriateness in LM, but only if supported by continuous references to scientific guidelines in the field.

## **7. RESEARCH LIMITATIONS AND FUTURE DIRECTIONS.**

Fundamental constraint of the research is the case study methodology, even though the unit under investigation seems reliable, both from a common and from an extreme point of view. However, further investigation involving other case studies would constitute most probably the natural development of the current research (quantitative limitation). Nonetheless, other perimeters of investigation, not limited only to the Campania region, would certainly increase the global reliability of the research, also because in Italy almost every Region has its own regional health service (qualitative limitation).

Another possible future line of research, beyond the abovementioned ones that could permit to overcome the abovementioned limitations, could involve the approach, rule, or procedure that the clinical management of a healthcare organization should follow in deciding when considering or not to protocol an exam in a test battery. International and national guidelines are essential sources about, but institutional laws, regulations, and instructions in question are the mandatory point of reference: a possible circumstance to investigate could be that one concerning the situation in which guidelines suggest for something different with respect to the laws, regulations, and instructions, situation that is very frequent in the continuously progressing technology-based medicine, above all when LM.

## **8. CONCLUSION.**

One of the most daring profiles for health services governance in modern societies and economies is appropriateness, not only from a medical, but also and above all from a multidisciplinary point of view. In fact, the rising negative impact of defensive medicine has caused a large amount of medical services, from diagnosis to therapy to rehabilitation, to be prescribed not because useful, but only because 'usual', most of all in LM.

Naturally, invention, evolution, and progress can offer continuous changes to the medical environment, but a reasonable advancement can derive only from a balanced combination of

technological innovation and multidisciplinary feasibility, with careful reference most of all to institutional prescriptions: when this blend is possible, as happened in the case study under investigation, risk for patients decreases and saving for the overall system increases, in a win-win combination. Also for LM, therefore, appropriateness emerges as a multidisciplinary concept, object of potential governance when applying the theoretical/practical framework that has been developed in the current research, but most of all when considering it in a global process of quality management and continuous improvement.

## METAPROFIT OF ORGANIZATIONS: AN APPROACH FOR OVERCOMING THE FOR-PROFIT/NONPROFIT DICHOTOMY

Fifka, Matthias S.<sup>1</sup>; Loza Adauí, Cristian R.<sup>1</sup>; Mion, Giorgio<sup>2</sup>

<sup>2</sup>Department of Business Administration, University of Verona, Verona, Italy

### ABSTRACT

Driven by changing institutional environments and concepts such as social entrepreneurship, we have recently seen a development of organizations that defy the classical dichotomy between a nonprofit and for-profit orientation. The hybrid nature of these organizations does not only pose challenges for taxation and management issues, but also for academic research. It puts into question the handed down distinction between nonprofit and for-profit organizations used to describe organizational entities, and in particular, the central role given to the notion of profit in determining the ontology of organizations. A more refined understanding of the hybrid nature of recent organizational forms presents an opportunity to rethink the notion of firm, the centrality of organizational purpose, and the usefulness of previously established categories. This article explores why organizations shift their attention from profit towards elements that are beyond profit, without neglecting the economic objectives that contribute to their sustainability, which we refer to as “metaprofit”. It contributes to the literature by critically examining the appropriateness of the frequently used categorical and often too simple distinction between for-profit and nonprofit organizations, by providing alternatives to overcome this critical dichotomy, and, in this context, elaborating on the notion of metaprofit.

*Keywords: nonprofit organizations, metaprofit, hybrid organizations, category cognition, dichotomy, organizational purpose*

### INTRODUCTION

During the last few decades, the emergence of several organizations that cannot be categorized as a for-profit or nonprofit organization has challenged long-established classifications and understandings. The exclusive distinction between the for-profit sector, which generally includes all types of organizations selling products or offering services with the dominant purpose of generating financial revenues, and the nonprofit sector—including any type of organization oriented towards addressing social or public purposes without being institutionally related to the government and without any obligation to redistribute profits to its owners or directors (Salamon and Anheier, 1997)—thus has become outdated. While it proved to be useful in the past to solve specific matters, e.g., to create legal

frameworks for organizations, it is currently struggling with new organizational entities that cannot exactly be categorized as merely belonging to either the for-profit or the nonprofit sector.

These preliminary thoughts demonstrate the existing dichotomy applied to the understanding of organizations and the resulting limitations of the available categories to encompass a growing organizational diversity. This dichotomous approach fails to appropriately describe organizations created by persons that use entrepreneurial principles to organize, create, and manage ventures oriented towards achieving a desired social change, without sacrificing economic goals (Defourny, 2001). Overcoming this dichotomy requires solving diverse problems. On an epistemological level, it requires rethinking how organizational entities are understood and evaluating the suitability of the categories that are used to describe organizational reality. On a legal level, it becomes necessary to develop a framework that treats organizations that do not fit into the existing organizational forms appropriately. On a managerial level, management practice, education, and research must be redesigned to better suit increasing organizational diversity and embrace its complexity. Finally, from a business ethics perspective, the role of profit in organizations has to be further discussed enlarging previous research (e.g. Vranceanu, 2014), because it has become one ontological determinant of organizations.

The objective of this article thus is threefold. It first seeks to review the existing literature concerning the juxtaposition of nonprofit versus for-profit organizations. Second, approaches for overcoming the deficits resulting from this dichotomy are examined. This serves as a basis for developing the concept of metaprofit as a new possible alternative to explain the complex phenomenology that unites for-profit and nonprofit characteristics of organizations and thus takes into account their hybrid nature. Accordingly, we initially present the for-profit/nonprofit dichotomy, before we go on to discuss definitions and concepts that have attempted to grasp organizational diversity. Finally, we present the idea of metaprofit as a fruitful alternative to overcome the conceptual and practical weaknesses resulting from the assumed dichotomy. We explain how metaprofit can enrich and improve management, but also elaborate on the managerial and cognitive implications it entails.

## **THE FOR-PROFIT/NONPROFIT DICHOTOMY**

The practical need for a kind of taxonomy of organizations emerged from the necessity to find a legal framework applicable to a variety of organizations and their activities in society, primarily for reasons of taxation (Hall, 2006; Weisbrod, 1988). This process aimed at granting certain benefits to organizations with a social purpose. There was a ubiquitous need to find a criterion to differentiate between organizations with different purposes, and the easiest and foremost criterion used to this end during

the last fifty years has been the profit-seeking goal of an organization (Salamon and Anheier, 1997). Doing so clearly determined whether certain organizations served as part of the market economy by selling their products or services, or whether they were oriented towards the production of welfare in a broader sense. An alternative to the profit-seeking goal as an instrument to deal with organizational diversity has been to create a “complex of institutions” that belongs to different sectors such as the private and the public sectors, and as a residual alternative, the third sector that includes nonprofit-seeking organizations (Salamon and Anheier, 1992b). While the idea of the existence of a nonprofit sector has consolidated over time (Anheier and Salamon, 2006; Salamon and Anheier, 1992b), the difficulties in defining the limits of such a heterogeneous group of organizations continue to remain unresolved and constitute a recurrent topic of research (Morris, 2000; Salamon and Anheier, 1992a).

The criteria that have been useful in differentiating organizational types during the last fifty years—particularly in the case of some unconventional organizations—are increasingly facing serious limitations. The distinction between for-profit and nonprofit organizations has never been as unclear as it is today (Ben Ner, 2002; Bromley and Meyer, 2017; Dees and Battle Anderson, 2003; Laasch, 2018). For several reasons, the (non-)existence of a profit-seeking goal seems to be outdated in explaining the nature of contemporary organizations of a hybrid nature, such as social enterprises (Defourny and Nyssens, 2017; Young and Lecy, 2014). This has become increasingly evident as managers and leaders of such organizations are facing difficulties in finding adequate legal frameworks, or a cognitive environment that allows collaborators, customers, and stakeholders to understand organizational novelty. This scenario is not always helpful for management development owing to several reasons, one of them being the for-profit/nonprofit dichotomy.

While this divide has partly worked well towards juridical ends, it does not work towards embracing the complexity of organizational isomorphism (Dart, 2004; Maier *et al.*, 2016; Nicholls, 2010). Essentially, a logical analysis of this distinction reveals the existence of an assumption that is widely accepted, but a fallacy, since it rests on the false assumption that organizations are either for-profit or nonprofit (Loza Adauí and Mion, 2016).

Such a false dichotomy is a particular kind of fallacy, i.e., an argument that is logically flawed, but is “usually persuasive and often upon the first examination appears to be sound in form and content” (Engel, 1982, p. 76). Dichotomies are informal fallacies, informal “because, although formally valid, their persuasiveness rests on ‘material’ (as opposed to ‘formal’) factors, such as ambiguity, the use of slanted language, and prejudice. The error in these arguments (...) lies in their content, and not in their form or structure” (Engel, 1982, p. 76).

A false dichotomy offers an unsound argument because it consists of unfounded or unproven assumptions. This argument “presumes that a distinction or classification is exclusive and exhaustive

when other alternatives exist.” (Engel, 1982, p. 135) Presented in terms of set theories, a dichotomy is any splitting of a whole into exactly two non-overlapping parts, which are jointly exhaustive, i.e., everything must belong to one party or the other, and is mutually exclusive, i.e., nothing can belong simultaneously to both parts. Figure 1 graphically presents the differences between true and false dichotomies.

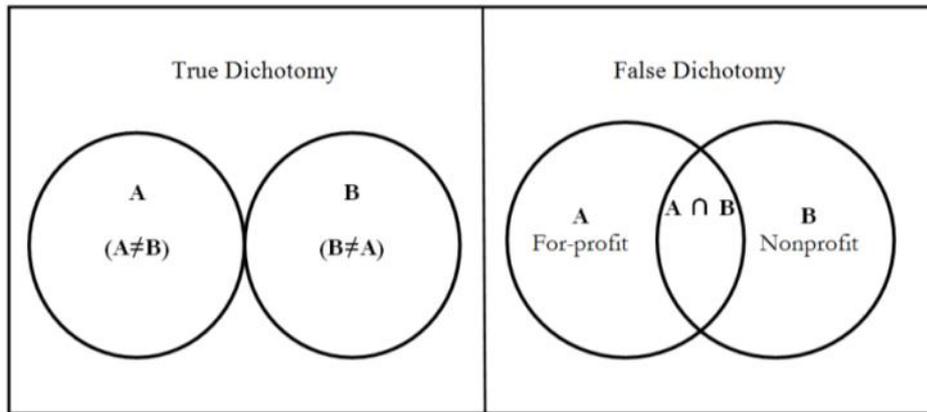

Figure 1. False and True Dichotomies

Dichotomies are usually expressed using the formulation “either X or Y is true” or “either X, Y, or Z is true” (Govie, 2010, p. 196) – depending on the number of options named – and the argument usually takes on the following form:

|               | Disjunctive syllogism     | Example  |
|---------------|---------------------------|--|
| Major premise | either A or B is true.    | Organizations are either for-profit or nonprofit |
| Minor premise | A is true.                | The organization X is for profit                 |
| Conclusion    | Therefore, not B is true. | Therefore, the organization X is not nonprofit.  |

Table 1. False Dichotomy on a Syllogism

As presented in the example, the argument itself is valid because it has a proper form and the conclusion is derived from the premises; however, we observe a false dichotomy here because the major premise is false (Rainbolt and Dwyer, 2012, p. 163). It would be necessary to find only one organization that cannot be exclusively categorized as for-profit or nonprofit (Popper, [1935]1962), and indeed, not only one but several organizations can be categorized in terms of both the aforementioned options concurrently. Therefore, using the profit-seeking goal of an organization as an ontological determinant is insufficient; for example, in the case of a hybrid organization, for which the profit-seeking goal is only one of the multiple organizational goals, and its purpose and main ontological determinant transcend this goal.

## IF NOT FOR PROFIT, FOR WHAT? DEFINITIONAL ATTEMPTS TO OVERCOME THE DICHOTOMY DEFICIT

Some of the main difficulties that this new type of organization faces emerge on adopting a juridical

form to operate in a particular country (Battilana *et al.*, 2012). Another problem arises from establishing suitable governance and accountability systems that permit the integration of multiple organizational objectives (Anheier and Krlev, 2015; Ebrahim *et al.*, 2014; Mair *et al.*, 2015; Makadok and Coff, 2009). There are also difficulties in the process of finding resources to surpass successfully the start-up phase and the early stages of organizational existence (Renko, 2013). During the recruitment process, identifying employees with a non-dichotomous approach towards organizations (biased by their education and/or prior working experience) is difficult (Brewster and Cerdin, 2018; King, 2017). Moreover, trying to find adequate financial instruments to guarantee operation and growth is challenging (Battilana *et al.*, 2012; Battilana *et al.*, 2015). The for-profit/nonprofit dichotomy in the mindset of the respective actors contributes to these difficulties. In fact, over the last few decades, not only has managerial praxis struggled with this dichotomous rigidity, but researchers and managerial scholars have tried to overcome it by assaying several ways to view these kinds of organizations (hybrid organizations, mission-driven organizations, value-driven organizations, blended value organizations, low-profit limited liability company (L3C), benefit corporations, four-sector enterprises, social enterprises, and non-market entrepreneurship) from a different perspective. For definitional and conceptual clarity, we first offer an overview of the definitions behind these categorizations. We elaborate on the more important and commonly used categories such as hybrid organizations, mission-driven organizations, values-driven organizations, L3C, blended value, and benefit corporations.

#### *Hybrid organizations*

A hybrid organization is a frequently used label (e.g. Battilana and Dorado, 2010; Battilana *et al.*, 2012; Billis, 2010; Boyd *et al.*, 2009; Grassl, 2011; Haigh and Hoffman, 2012; Hoffman, 2009; Hoffman *et al.*, 2012; Jäger and Schröer, 2014). Authors referring to a “hybrid” in the organizational context do so analogically. It is a term taken from biological taxonomy as discussed by McMullen (2018). According to the Encyclopedia Britannica, hybrid refers to the “offspring of parents that differ because of genetically determined traits,” for example, as a result of the interbreeding of animals or plants from different species, genera, or family.

One of the oldest definitions of hybrid organizations refers to them as “market-oriented, common-good mission-centered organizations that operate in the blurred space between traditional for-profit and nonprofit enterprises” (Boyd *et al.*, 2009, p. 9). This definition emphasizes the hybridity between the for-profit and the nonprofit realm and is re-elaborated by Hoffman *et al.* (2012, p. 133) as follows: “Hybrid organizations call for mission-centered business models that employ market tactics to address social and environmental issues.” The emphasis changes towards the complementarity of purposes and tactic strategies adopted by these organizations.

| Author  | Definition  |
|---|---|
| Boyd et al., 2009, p. 9   | market oriented, common-good mission-centered organizations that operate in the blurred space between traditional for-profit and nonprofit enterprises  |
| Hoffman et al., 2012, p. 133  | hybrid organizations call for mission-centered business models that employ market tactics to address social and environmental issues  |
| Grassl, 2011, p. 110  | Hybrid business models are meant for the market (i.e. the for-profit sector), but they add the 'logic of gift' (CV 34, 36) both to 'commercial logic' (CV 36) and to the 'logic of the State' (CV 39)   |
| Minkof, 2002, p. 382  | organizational hybrids (...) are combinations of disparate elements – structural or institutional – that represent modes of more or less formal adaptation to environmental uncertainty.  |
| Brandsen, et al., 2005, p. 750 and Brandsen and Karré, 2011, p. 828 | heterogeneous arrangements, characterized by mixtures of pure and incongruous origins, (ideal) types, cultures, coordination mechanisms, rationalities, or action logics.   |
| Battilana, et al., 2012, p. 52                                      | this hypothetical organization [the hybrid ideal] is fully integrated – everything it does produces both social value and commercial revenue (...). Managers do not have a choice between mission and profit, because these aims are integrated in the same strategy. More importantly, the integration of social and commercial value creation enables a virtuous cycle of profit and reinvestment in the social mission that builds large-scale solutions to social problems. |

Table 2. Definitions of Hybrid Organizations

There is an additional group of researchers that define hybrid organizations as belonging to the intersection between state, private, and civil society sectors (Brandsen and Karré, 2011; Karré, 2011) or an evolution of non-profit organizations that adopt a commercial orientation (Litrico and Besharov, 2018), thereby making it clear that hybridity can include other elements (Brandsen *et al.*, 2005). Hybridity, however, does not refer to an entirely new entity. According to Grassl (2012, p. 39), it is relevant to clarify that in social sciences, hybridity has usually been understood as “a simple mixture of characteristics on a continuum between two opposite poles,” and therefore, it is indirectly based on the for-profit/nonprofit dichotomy. Moreover, Grassl (2012, p. 39) emphasize that this “hybrid nature [...] is not a contingent and empirical fact [...], but an analytical truth” that can be applied to bridge diverse divides, according to a particular criterion of classification. The question that remains unanswered regarding hybrid organizations refers to the assumption of dichotomous thinking and the right criteria of classification to adopt. The “hybrid” denomination, however, cannot fully explain that organizations aimed to multiple objectives are not a rare or pathological phenomenon, but a new organizational expression.

#### *Mission-driven and values-driven organizations*

When organizations are called mission-driven (Brewster and Cerdin, 2018; Cetindamar and Ozkazanc-Pan, 2017; George and van de Ven, 2001; Russo, 2010; Wang, 2009) or values-driven (Barrett, 2006; 2017; Cohen and Warwick, 2006), the emphasis relies in the levels of axiological or teleological integrity within an organization. The level of coherency and alignment of an organization and its management with a particular purpose is at the center of attention. For example, for Russo (2010, p. 5), “a mission-driven company refers to a for-profit enterprise that seeks to simultaneously meet profit goals and

social and environmental goals that reflect the values of its owners." For Cohen and Warwick (2006, p. 9-10), a values-driven organization gathers productive and motivated employees "working for something they believe in", loyal and forgiving customers, and sustainable and humane business. Barrett (2006) emphasizes the internal coherence between values and the organization. In his words, "the values of the organization should be pervasive. They should drive all aspects of decision-making and be reflected in every system and process. They should underpin and be reflected in the individual behaviors of the leaders, managers, and staff; and the collective behaviors of the organization. They should become part of the organization's cultural DNA" (Barrett, 2006, p. 6-7).

Research on this category of organizations has attributed the term "mission" to the management philosophy adopted in a firm and the comprehensive processes it can initiate (Wang, 2010), or has been used to refer to organizations based on a particular spirituality or religion. Bruni and Smerilli (2009) demonstrate the relevance of certain elements related to these types of organizations. According to them, the identity and the activities carried out by values-based organizations are essentially interlinked; this identity is intensely linked to a core group of members that essentially embody the values of the organization and that are intrinsically motivated (Bruni and Smerilli, 2014; 2009).

#### *Blended value, benefit corporations, and L3C*

Another way of understanding these organizations is to focus on the way they treat financial revenue or the way they are legally constructed. Emerson (2003, p. 38) demonstrates that "the core nature of investment and return is not a trade-off between social and financial interests, but rather the pursuit of an embedded value proposition composed of both." This approach is commonly assumed and is a symptom of a dichotomous approach towards the value that has been already questioned (Castellas *et al.*, 2018; van der Linden and Freeman, 2017; Porter and Kramer, 2010).

In response to the rigidity of legal frameworks in the last few years, some countries have developed possibilities for these new organizations in the form of institutional benefits. One such benefit is the L3C, which enables an organization to access private funding along with funding in the form of grants or program-related investments usually from privately held foundations, under the condition that these funds are used for charitable purposes, and not primarily for making profits (Marcum and Blair, 2011). Another more diffused legal alternative, are benefit corporations (B-Corps), a juridical form already adopted by the legislation of 34 states in the US, and since 2015 in Italy and Puerto Rico. According to André (2012, p. 133), these new types of organizations appear "to enhance corporate social responsibility by providing legal protection to management that wants to both maximize shareholder income and pursue a social or environmental agenda."

While the attention received by B-Corps has increased over the last few years (Hiller, 2013; Rawhouser *et al.*, 2015), it is clear that more than a new legal framework is needed to facilitate organizational

activities. This is evident from, for instance, the lack of ad hoc accounting practices capable of representing value creation in a manner that includes financial and social factors (Sabeti, 2011).

This intent to answer to dichotomous thinking enables classifications based on legal definitions to be dependent on the law and therefore relative to the country, the society, and the political milieu that legitimizes laws. While, on the one hand, the recognition of the contingent nature of law is needed for the development of new legal frameworks, on the other hand, the process of law creation is slow and not always capable of responding promptly to the needs of organizational diversity in the same way across different countries and cultures.

### *Social enterprise*

A social enterprise, and likewise social business, is another commonly used label to identify organizations that do not fit into traditional categorizations. Since the seminal work of Dees (1998), academia has worked intensively on a definition of social entrepreneurship and social enterprise. While the social orientation of entrepreneurship can be recognized in several for-profit and nonprofit organizations—although in different measures and forms—, the term “social enterprise” wants to identify organizations specifically dedicated to a double objective, economic and social. The EMES Research Network has made significant contributions in Europe by defining social enterprise, trying to gather consensus in academia, and inspire legislation in different countries (Borzaga, 2013, p. 318; Borzaga and Defourny, 2001; Defourny, 2009; Defourny and Nyssens, 2010). They define social enterprise in a structured manner, and they have included three dimensions and several criteria to be fulfilled by an organization for it to be called a social enterprise. Table 3 presents the structured definition of the EMES Network:

| Dimensions               | Criteria   |
|--------------------------|--|
| Economic-entrepreneurial | <ol style="list-style-type: none"> <li>1. Continuous activity producing goods or providing services.</li> <li>2. At least the partial use of costly production factors (e.g., paid work).</li> <li>3. A high degree of autonomy and, hence, a significant level of economic risk.</li> </ol>   |
| Social                   | <ol style="list-style-type: none"> <li>1. An explicit social aim of serving the community or a specific group of people.</li> <li>2. The production of goods/services that are characterized by a general-interest of meritorial nature.</li> </ol>  |
| Ownership-governance     | <ol style="list-style-type: none"> <li>1. Collective dynamics involving people belonging to a community or to a group that shares a certain need or aim.</li> <li>2. A decision-making process that is not based on capital ownership.</li> <li>3. Representation and participation of customers, stakeholder orientation, and a democratic management style.</li> <li>4. A total non-distribution constraint or a partial non-distribution constraint such that the organization distributes profits only to a limited extent, thus avoiding profit-maximizing behavior.</li> </ol> |

Table 3. *Social Enterprise Definition of EMES Network* [Adapted from Borzaga (2013)]

Research on social enterprises and social entrepreneurship has experienced overwhelming growth in the last few years and is gaining popularity in academia (Hota *et al.*, 2019; Mongelli *et al.*, 2018). However, some critical voices state that the adjective "social" is associated with normative or moralistic content (Lautermann, 2013) because the need to put the adjective "social" before the enterprise indirectly assumes that the traditional enterprise is less social or not social at all. Recent research on the internal dynamics of social enterprises demonstrates the existence of several tensions—such as the risk of mission-drift (Wolf and Mair, 2019) or the influence of external stakeholder (Ramus *et al.*, 2018)—that these organizations face as a consequence of "their commitments to both social missions and business ventures" (Doherty *et al.*, 2014; Siegner *et al.*, 2018; Smith *et al.*, 2013; Yang and Wu, 2016). While the necessity to use the word "social" is another expression of dichotomous thinking, the existence of internal tensions is partially a symptom of deeper cognitive problems occasioned by the for-profit/nonprofit dichotomy.

This demonstrates a need to expand the framework of understanding of organizational and institutional forms, and that narrow approaches used until now rely on assumptions that have to be redefined. While definitions based on legal frameworks remain limited to making laws and shaping policies, referring to these organizations as hybrids are helpful as this focuses on their operational novelty and avoids misinterpretations that may eventually emerge when referring to them as social enterprises.

The undeniable appearance of new forms of organizations that cannot be classified suggests that the purpose of organizations is not uninominal, but rather a mix of multiple goals that could also include social, economic, and environmental objectives. Even if under certain circumstances, the reconciliation of all these objectives within the context of a unitary organization and a clear management strategy proves to be difficult and causes extreme tension, the existence of this new type of organization represents an opportunity to question the lack of concrete formal juridical structures or institutional forms adapted to the needs of contemporary times, and perhaps more important, their existence compels us to expand our cognitive framework and understanding of organizations.

## **METAPROFIT: OVERCOMING THE FOR-PROFIT/NONPROFIT DICHOTOMY**

The analysis of the for-profit/nonprofit dichotomy and the alternative approaches developed to describe organizations that defy this dichotomy to demonstrate the need to rethink how organizational nature and management is conceived. One of the major problems behind the current categories used to understand organizational diversity is the difficulty in breaking away from the shackles of old paradigms. We believe that to reach an original understanding of new organizational realities, we also

need to think "outside the box," and propose the notion of metaprofit as a way to overcome the dichotomy in question.

The etymological origin of the neologism metaprofit is based on the polysemy of the Greek prefix meta (μετά) and in particular, two of its meanings, a causal one and an instrumental one: Meta (μετά) on the one side has a causal meaning and refers to "something beyond" or to a "cause of major relevance." In the case of the latter, metaprofit refers to the existence of a cause of major relevance situated beyond the profit-seeking goal of organizations. On the other side, it has an instrumental meaning, because it refers to an indispensable medium to reach those causes of major relevance. The notion of metaprofit considers profit (i.e., the creation of financial revenue) as an indispensable means to reach ulterior ends. In this sense, metaprofit makes it clear that "using profit" other ends of major relevance are pursued. It is beyond the discussion about the production or distribution of profit.

The complete meaning of metaprofit refers to those causes that organizations pursue beyond profit, but at the same time, do so by making use of profit. This notion overcomes the for-profit/nonprofit dichotomy by refraining from using a mix of two different species (hybrid), relying on legislative innovations (legal forms), using an appealing adjective (social), or merely focusing on the mission or the values of organizations (mission-driven, values-driven). We believe that the respective organizations can comprehend that driving forces behind their success include clarity of purpose and a set of values that are beyond profit, but at the same time, recognize that these can be achieved using profit and economic inputs.

Once the meaning of the notion of metaprofit is presented, questions regarding its content arise. The notion of metaprofit allows a broad and rich view of organizations. It becomes evident that going beyond operational, legal, and managerial limits demands a holistic and deeper understanding of organizations, which in turn permits understanding the richness of human organizational capacity.

The notion of metaprofit becomes clearer if it is analyzed according to the impact it has at different levels: individual, organizational and societal.

#### *At an individual level*

The core of the notion of metaprofit is its humanistic approach. Its emphasis on purposes beyond profit opens up possibilities that extend beyond a mere functional definition of organizations. It helps organizations to be perceived as communities of persons with deeper and humanistic purposes and helps transcend a "black box" approach towards these organizations.

The anthropological orientation of metaprofit, for example, takes advantage of the recent research on motivation. While, traditionally, extrinsic motivations have been at the core of managerial systems, the notion of metaprofit takes advantage of research that considers human motivations in more complex ways, including intrinsic motivations. Some research has been done at this level, and the relevance of

intrinsic motivations for traditional and new kinds of organizations has been increasingly evidenced (Bruni and Smerilli, 2014; Frey, 1994; Miller *et al.*, 2012; Ryan and Deci, 2000, Smerilli, 2013).

The role of intrinsic motivations for organizations is crucial. As Bruni and Smerilli (2009) documented, a core group of intrinsically motivated persons is needed to run for example a values-based organization; the survival of the organization and, in particular, its maintenance depends on a critical mass of intrinsically motivated persons inside the organization. Once the critical mass of intrinsically motivated persons diminishes, the risk of mission drift increases, and the survival of the organization in the long term is questionable.

#### *At an organizational level*

At an organizational level, the notion of metaprofit introduces a teleological shift into the relationship between profit and organization. While it still considers making profit as a relevant objective, metaprofit proposes a shift in attention from profit as the main goal, towards the purposes that organizations pursue using profit. It is important to clarify here that the metaprofit approach does not consider organizational purposes as univocal, as it is usually proposed; moreover, a realistic approach towards organizations clarifies that the main organizational purpose is the result of multiple ends, and therefore, the methodological reduction of the aim of an organization towards a profit-seeking goal can work as a hypothetical assumption, but not necessarily as a real one. As Ghoshal (2005) remarked, social sciences theories can also finally influence how we understand and consider reality, and in some cases, the for-profit/nonprofit dichotomy results in shaping a distorted understanding of the organizational realm.

The concept of metaprofit, therefore, allows a broad and composite view of the ontology of organizations as a complex relational system of goals. This dichotomy is superseded by repositioning profit within the ambit of a broad and varied system of interrelated ends. It participates in the creation of an organizational system and satisfies the needs of its stakeholders. In other words, if the goal of organizations is considered beyond profit, responsible and sustainable management could not be considered as a managerial constraint any longer, but as a part of the normal management practice.

#### *At a societal level*

At a societal level, the notion of metaprofit suggests that while legal frameworks depend on regional, national, and country legislation, the need to rethink organizational frameworks of understanding and legislating organizations is a global one. Several problems that affect our world today remain unsolved because they have a global dimension, and the traditional entities oriented to solve these problems are not sufficient. The notion of metaprofit refers to a phenomenon that transcends a reduced group of organizations; moreover, it emphasizes the need to rethink capitalism. In recent years, academia has

already embraced the discussion of viewing capitalism differently has seen "capitalism in question" (Adler, 2014). In the United States, calls for a "conscious capitalism" were made, (Mackey and Sisodia, 2013), while in Europea "civil economy" was proposed (Bruni and Zamagni, 2007).

The notion of metaprofit offers a better framework to understand the mediating role of profits in organizations; for example, in the case of family firms, empirical evidence shows that that socioemotional wealth creation and preservation explains family businesses' behavior better than the profit maximization paradigm (Berrone *et al.*, 2012; Cennamo *et al.*, 2012; Stockmans *et al.*, 2010). Similarly occurs with organizations typically considered as nonprofit, where the economic revenue is a condition sine qua non for the operation and survival (Brozek, 2009; Dart, 2004; King, 2016, Maier *et al.*, 2016) but not the main organizational purpose. In the case of hybrids, and other new organizational forms, however, much remains to be done to capture their uniqueness and to demonstrate that economic goals play an instrumental role.

In the following sections, we will present from a theoretical perspective some of the implications that the notion of metaprofit places on management and leadership inside organizations.

## **MANAGERIAL IMPLICATIONS OF METAPROFIT**

Viewing organizations through a different perspective has some implications for management. On a strategic level, the notion of metaprofit demands a holistic approach to strategy development. It can help to clarify the purpose of the organization because it frees strategic thinking from profitability as an ontological determinant. From organizational governance, metaprofit goes beyond the shareholder value maximization dogma (Collins and Porras, 1994; Stout, 2013), but at the same time, can enrich the stakeholder approach because it offers a larger view of organizational purpose, and arguably of value creation (Freeman *et al.*, 2004; Van der Linden and Freeman, 2017). Apart from considering different stakeholder interests in an instrumental manner, reflecting on metaprofit gives a sense of legitimate interactions with stakeholders.

The notion of metaprofit can help managers to better understand the drivers of different agents' behavior in organizations. It makes clear to the people within an organization that economic and financial performance is presented as a means and not as the end. Moreover, it embraces the complexity of human motivations by considering extrinsic as well as intrinsic motivations and the meta-preferences of employees. Finally, it can enable managers to decouple employees' performance from economic incentives.

Organizational complexity becomes clearer, thanks to the notion of metaprofit, which can be considered as an instrument for the alignment of the values of an organization around a central

purpose that includes multiples goals, with economic, social, and environmental content. Thus, the organization is considered for its capacity to contribute to sustainable development.

The notion of metaprofit offers a framework for understanding the necessity of more complex or adapted instruments of accountability offering information on financial and non-financial performance, including social and environmental aspects and intangible elements. It can do so by using, for example, integrated reporting, a multichannel approach, and multiple stakeholder communications. Thus, metaprofit goes beyond standard solutions for accountability and makes clear the need for tailored accountable approaches to suit every organization.

In terms of cognition, the notion of metaprofit not only expands our understanding of the nature of organizations, but it also challenges contemporary managerial praxis to understand the need for the license to operate and the risks of categorical rigidity. While the research on cognition in management relates categorical membership to success (Durand and Paoella, 2013; Negro *et al.*, 2010), the metaprofit approach permits a better understanding of the legitimacy of organizations in society because it relativizes categorical membership and introduces a new horizon of comprehension of organizational phenomena.

#### *Limitations for managerial applications from the legal point of view*

The emergence of new organizational forms creates a need to redefine legal frameworks that pay tribute to the specific characteristics of the organizations described above. A clear and appropriate legal framework specifies taxes and subsidies and thus is dependent on a respective policy. Currently, the role that for example, hybrid organizations play for fiscal policy continues to remain ambiguous. Legal limitations are clearly beyond the control of a single manager. However, laws and policies can influence the development of society and the economy only if they go hand in hand with changes in the society. Otherwise, they run the risk of becoming outdated and obstructing development, instead of promoting it. As explained in previous sections of this article, the benefit corporation movement is trying to offer a solution to this problem through in countries around the world (André, 2012; Esposito, 2013; Hiller, 2013; Rawhouser, 2015). This is a promising development; however, legislation can be better supported with a cognitive framework that allows a better understanding of the organizational realm as we propose here with the notion of metaprofit.

## CONCLUSIONS

This article has described the notion of metaprofit and its utility to better understand new forms of organizations and their management: first, the metaprofit approach suggests that the for-

profit/nonprofit dichotomy obstructs the full comprehension of managerial reality, and therefore, the notion of metaprofit plays an important cognitive role in developing managerial debate.

Further, while "profit" could be considered as a useful instrument to reach human goals, it cannot be considered as the unique end of an organization. By analyzing organizations based on the metaprofit approach, it is possible to obtain a better understanding of the strategic leverage of such organizations (strategic management, managing people, etc.). Nevertheless, a metaprofit approach emphasizes the necessity to rethink our cognitive approach towards organizations and how organizational ontology is defined.

The notion of metaprofit challenges both managerial sciences and practice, however at the moment it still is a purely theoretical concept that yet has to stand its test in real-life organizations. We thus encourage the operationalization and subsequent testing of the notion of metaprofit among representatives of different kinds of organizations to see its applicability and reception. This will provide valuable information to develop the concept further.

Likewise, we encourage further academic discussion and input from scholars from different disciplines. We consider our elaboration on the concept of metaprofit as a starting point for overcoming the outdated dichotomy between profit and nonprofit organizations. Only if we manage to develop a clear conceptual framework for the increasing number of organizations that fall somewhere in between, we will be able to provide much-needed recommendations for the practical realm, e.g., concerning tax issues, accounting principles, and managerial as well as value systems.

## WILLINGNESS TO PAY FOR INDUSTRY 4.0 TECHNOLOGIES IN AUGMENTED MAINTENANCE

**Fiorini, Niccolò; Casprini, Elena; Zanni, Lorenzo**

Department of Business and Law, University of Siena, Siena, Italy

### ABSTRACT

*Purpose* - The aim of this research is to investigate the willingness to pay (WTP) to acquire the desired technologies according to some specific features included in the app. It deals with Industry 4.0 (I4.0) technologies from a pure maintenance services' perspective.

*Design/method/approach* - Our conceptual model was tested on a sample of 100 Italian installer and maintenances' services companies and data were collected through a structured survey submitted via phone interviews.

*Findings* - The analysis shows a positive impact of some relational and technological features on the WTP. The results show a significant role played by the Augmented Reality (AR) feature.

*Research Limitations/Implications* - We believe that a limitation of this research is given by the small sample size, for which only Italian firms were interviewed. It would be extremely interesting to extend the survey to other countries including more companies.

*Practical implications* - This paper contributes both to the academic and the non-academic literature thanks to its consulting-based criteria.

*Originality* - It represents, to the best of our knowledge, the first paper on WTP for I4.0 technologies and (augmented) maintenance services, contributing in developing the current report-based knowledge with an empirical study based on an experts' survey.

*Keywords:* *Willingness to pay, Maintenance, Augmented Maintenance, Augmented Reality, app, Industry 4.0.*

### INTRODUCTION

Willingness to pay (WTP) refers to the attitude of person or a company to pay certain amounts for some products/services (Braidert *et al.*, 2006; Horowitz and McConnell, 2000; Louviere and Islam, 2008). Many studies have examined the WTP in relation to consumers' behaviour, especially with respect to low tech products such as fashion (Pucci *et al.* 2017a), food (Kehagia *et al.* 2007) and wine (Pucci *et al.*, 2017b), showing how specific product- or service-related characteristics have a higher influence on consumers' purchasing behaviour. Indeed, understanding which of those features are making

customers more inclined to pay more for products or service represents a key question for both B2B and B2C companies.

Some scholars have noticed that when customers are able to specify their preferences with respect to products, they have higher WTP and clearer purchase-related attitudes (Franke et al., 2009). This represents an important aspect for firms that could benefit from a clearer identification of those product- or service-related features that meet customers' desiderata. However, it is not easy to identify *a priori* what customers value more, especially when the product and service characteristics are still at their embryonic stage. This is the case for Industry 4.0 technologies that are increasingly adopted by firms, but whose value is not fully understood (e.g. Müller et al., 2018).

In order to provide preliminary evidence about which features influence industrial customers' WTP, this study focuses on one specific Industry 4.0 technology: Augmented Reality (AR). Given the significant economic impact in the manufacturing sector of the so-called simple combinations of "manu-services" (Sissons, 2011, Leoni, 2019), we decided to look at an innovative app developed by a service provider for post-purchase maintenance services distinguishing between relational and technological features, i.e. those characteristics that enable interactions among the customer and the supplier and those that are mainly technology4.0-related, respectively. Thereof, our research question is: *which are the app's features influencing an industrial customer's willingness to pay?*

The article is organized as follows: Section 2 discusses the theoretical framework, the conceptual model, and the research hypothesis; Section 3 outlines the empirical methodology; Sections 4 presents and discusses findings; Section 5 draws some conclusions and discusses possible limitations and further research topics.

## **THEORETICAL BACKGROUND AND CONCEPTUAL MODEL**

Scholars are increasingly discussing Industry 4.0 (I4.0) technologies such as advanced manufacturing solutions, additive manufacturing, augmented reality, simulation, horizontal/vertical integration, industrial internet, cloud, cyber-security, blockchain, big data and analytics (Fantoni *et al.*, 2017; Khaqqi *et al.*, 2018; Maslarić *et al.*, 2016; Sahay and Ranjan, 2008; Witkowski, 2017). especially looking at their influence on production processes or postproduction. For example, many researchers have dealt with maintenance services and I4.0, investigating the use of data in order to optimise and predict when and why it would be needed a maintenance service (Macchi *et al.*, 2016; Suzuki *et al.*, 2014).

However, little is known about which are the features of I4.0 technologies on industrial customers' WTP. WTP is a concept that is often used in consumer behaviour studies (Pucci et al., 2017a, 2017b), even if it has been considered in many other fields (see, among others, Bergmo and Wangberg, 2007).

Additionally, as far as we know, there is scant attention about industrial customers' WTP, especially when considering I4.0 technologies. Which are the features that industrial customers value more?

To the extent of this research, due to the high heterogeneity of I4.0 technologies, we focused on AR. More precisely we looked at augmented maintenance services (Oztemel and Gursev, 2020; Frank *et al.*, 2019; Fernández-Caramés and Fraga-Lamas, 2019; van Lopik *et al.*, 2020). We analysed an app designed by a software start-up company to help maintainers during their maintenance services thanks to several features. We distinguished between two types of features: *relational and technological features*. *Relational features* are those able to create human interactions during the maintenance service between the maintainer and the not-in-site expert. These features, similarly to what investigated by Andronikidis (2009), are based on "old" technology which can be easily found in any smartphone without the need to install special maintenance apps. *Technological features* are those strictly linked with I4.0 technologies and derive from AR, cloud, big data and analytics and blockchain, thus significantly help maintainers during their operations (Gomes *et al.*, 2017). We disentangle the value of these two features, arguing that each of them influences the industrial customers' WTP. Hence, we test the following two hypotheses:

Hp1: An industrial customer's willingness to pay for an Industry 4.0 technology is influenced by its relational features

Hp2: An industrial customer's willingness to pay for an Industry 4.0 technology is influenced by its technological features

Figure 1 graphically represents our conceptual model.

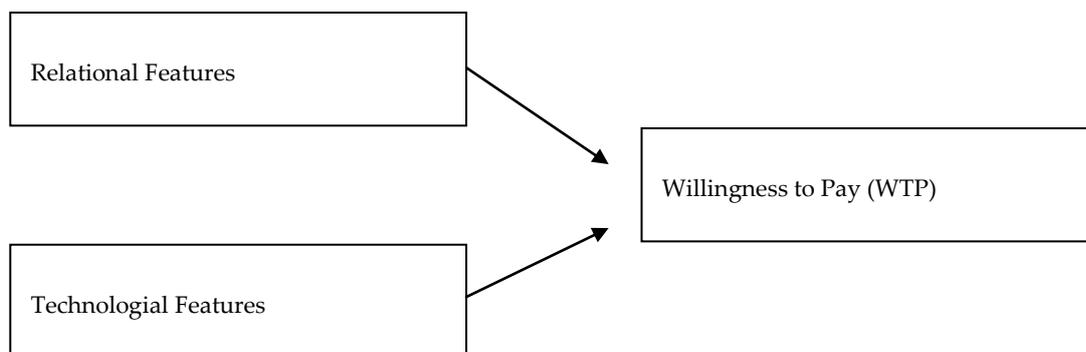

Figure 15. *Conceptual model (source: Authors)*

## METHODOLOGY

### *Data Collection*

Data collection (from February to April 2019) was performed through a structured survey on 100 Italian installer and maintenances' services SMEs. The survey was performed through direct call to the

companies, while general info (e.g. year of constitution) was gathered through secondary sources, namely the Chamber of Commerce. We also collected data about the age of the respondents, to have a well distributed panel (Table 1).

| Age                  | Numerousness | Share |
|----------------------|--------------|-------|
| Less than 30 yo      | 10           | 10%   |
| Between 31 and 45 yo | 42           | 42%   |
| Between 46 and 60 yo | 37           | 37%   |
| Older than 61        | 11           | 11%   |

Table 7. Age of interviewed (source: Authors)

### Measures

*Dependent Variable.* Willingness to Pay (WTP) comes from a direct question asked to the interviewed owners/managers/employees. The question concerned their WTP in case the proposed app would have included all the features individuated as relevant. The options went from none (i.e. I will only use the app if free, I am not WTP for such app) to high (I would pay a significant amount for using such app).

*Independent Variables.* The *Relational feature* comprises: (1) *Social network appearance*, operationalised asking firms if they considered relevant an appearance similar to instant message or other social network apps; and (2) *interaction text*, based on the importance of sending and receiving text messages. The *Technological feature* comprises: (1) *expert contact*, operationalised asking firms if they wanted the app to implement a function allowing them to get in touch with an expert from remote; (2) *previous operations*, hence the value assigned to the possibility to use big data and cloud to access information from similar interventions already made; (3) *augmented reality*, operationalised asking firms if they wanted the app to have an AR option to visualise directly in the smartphone screen all the information needed pinned to each part of the machine/instrument for which the maintenance is needed, simply using the smartphone camera.

Furthermore, we control for the size of the company using its natural logarithm.

## FINDINGS

To investigate the WTP for technology adoption of an augmented maintenance service, we employed a linear regression analysis. Table 2 show the results.

|   | WTP      |
|---|----------|
| Social network appearance   | -0.0510  |
|   | (0.118)  |
| Interaction text  | 0.238*   |
|   | (0.139)  |
| Expert contact  | 0.0713   |
|   | (0.146)  |
| Previous operations   | 0.326**  |
|   | (0.150)  |
| Augmented reality   | 0.373*** |
|   | (0.133)  |
| size(ln)  | -0.136   |
|   | (0.120)  |
| Constant  | -1.365** |
|   | (0.566)  |
| Observations  | 99       |
| R-squared   | 0.355    |
| Note: Robust standard errors in parentheses; *** p<0.01, ** p<0.05, * p<0.1 |          |

Table 8. *Linear Regression Results*

For what concerns our hypotheses, the results show a positive and significant effect of Interaction text, Previous operations and Augmented reality on WTP for implementing augmented maintenance. Hence, our hypotheses are partially supported.

## DISCUSSION AND CONCLUSIONS

This research points out the WTP for implementing an augmented maintenance service through the use of a specific app combining both relational and technological features. Among the relational features, only the possibility to send and receive text messages augment the willingness to pay for obtaining it. If we consider them in term of user-friendliness, this result is in line with other studies about WTP and technologies (Bergmo and Wangberg, 2007). Our results are consistent with the findings pointed out by Sadik-Rozsnyai and Bertrandias (2019), but also Carpenter et al. (1994), Walters and Lancaster (1999), and Zeithaml (1988) who underline that the perceived value, and therefore the WTP, is increased by new attributes. On the other hand, two technological features are significant and play a relevant role in augmenting the WTP of installer and maintenance services' companies. Smart data, i.e. information coming from previous operations, are considered relevant and therefore they justify a higher WTP. As pointed out also in Gomes *et al.* (2017), AR is the I4.0 technology considered most relevant when dealing with the WTP of potential customers.

## IMPLICATIONS AND LIMITATIONS

This study represents one of the first papers on the industrial customers' WTP for I4.0 technologies. This paper contributes both to academics and practitioners providing a first empirical example on WTP for I4.0 technologies – in particular augmented maintenance services. We think that it also contributes in developing the current report-based knowledge with an empirical study based on an experts' survey. Nonetheless, it would be extremely fruitful to extend the survey in terms of both surveyed industrial customers (at both national and international levels) and even more nuanced relational and technological features.

## THE WILL TO ACCOUNTABILITY IN THE VOLKSWAGEN DIESELGATE

Florio, Cristina; Sproviero, Alice Francesca

Department of Business Administration, University of Verona, Verona, Italy

### ABSTRACT

Upon dieselgate eruption, Volkswagen underwent severe consequences in terms of stakeholders' trust. Extant literature underlines media reactions to the emissions scandal, however it neglects to consider Volkswagen's disclosure behaviour in its aftermath. This study fills this gap by investigating how Volkswagen discharged accountability in the first Letter to Shareholders (LS) issued after the fact. It relies on an accountability frame and adopts critical discourse analysis as a methodology to identify Volkswagen's discourses around the "diesel scandal". The findings show that Volkswagen chose the LS as a preferential document to discharge accountability through discourses of apologies, trust and hope, which convey an ongoing corporate effort to overcome the diesel scandal. Further, the analysis demonstrates that the German automaker represents the scandal by employing several expressions and different verb tenses, by evoking internal and external actors and by referring to both local and global spaces. It also highlights the use of metaphors and value assumptions to tie discourses on the diesel scandal and on future corporate initiatives together. This study contributes to extant accounting literature by offering new insights on the role of the LS as a locus for accountability. It also extends the emerging literature on the Volkswagen's diesel scandal by focusing on its disclosure behaviour. Finally, the study produces two major implications for research and practice: it reveals the potential of critical discourse analysis to explore issues under an accountability frame and advises share/stakeholders on the potential use of the LS in the aftermath of scandals entailing sustainability disasters.

*Keywords: Accountability, Letter to shareholders, Sustainability, Case study, Volkswagen, Critical discourse analysis, Disaster.*

### INTRODUCTION

In September 2015 Volkswagen became protagonist of the well-known dieselgate, a scandal that entailed various dimensions of sustainability and undermined its credibility to its stakeholders. This study investigates the disclosure behaviour adopted by Volkswagen shortly after the dieselgate, under the expectation that the company leveraged on voluntary reporting to provide information that goes

beyond traditional financial disclosures. Among the forms of voluntary reporting, the Letter to Shareholders (LS) is '*arguably the most powerful and influential*' (Mäkelä and Laine, 2011, 218). It may especially repair the relationship with share/stakeholders and fulfil their informational needs. These purposes are intrinsic to the idea of accountability proposed by Gray et al. (1996, 38), which refers to the sense of duty to provide an explanation (*account*) of those actions that fall under his/her responsibility. This idea implies a relationship between who gives an account and who demands an account of corporate conduct. In virtue of such relationship, the accountor is called to discharge accountability to the accountee by explaining and taking responsibility of his/her conduct.

Following these premises, this study focuses on the first LS issued by Volkswagen in the aftermath of the scandal (i.e. in the 2015 annual report), when the need to recover the share/stakeholders' trust was particularly urgent (Sims, 2009). To achieve its purpose, the study adopts critical discourse analysis (Fairclough, 2003) as a methodology to examine how discourses around the diesel scandal are conveyed to the corporate audience and how this sustainability disaster is represented. The analysis demonstrates that Volkswagen – on behalf of its Chief Executive Officer (CEO) – employs the LS as an official, preferential document to discharge accountability. It shows that the Volkswagen's will to accountability entails discourses on apologies, trust and hope, which underline the ongoing Volkswagen's effort to overcome the sustainability scandal and reassure its share/stakeholders, by elucidating initiatives undertaken and future sustainability challenges. This study contributes to prior literature in different ways. First, it contributes to extant literature on corporate accountability by elucidating corporate disclosure behaviour in case of scandals entailing sustainability disasters (Chatzoglou et al., 2017; Florio and Sproviero, 2017), and specifically highlighting those discourses through which companies pursue accountability in case of corporate scandals (Amernic and Craig, 2000; 2013). Second, it demonstrates the potential of the critical discourse analysis as a methodology to explore discourses according to an accountability frame (Higgins and Coffey, 2016; Busco et al., 2018). Finally, it provides new insights on the role of the LS as a locus for accountability, as opposed to a locus for impression management (Merkl-Davies and Koller, 2012).

## **ACCOUNTABILITY AND THE LETTER TO SHAREHOLDERS**

Accountability is a chameleonic concept that changes with the context and is subjectively constructed. Generally defined as giving or demanding the reasons for conduct, accountability implies a relationship between two parties, i.e. the accountor and the accountee. Leading scholars have further conceptualised accountability by focusing on the accountor's or the accountee's viewpoint. Focused on the accountor's viewpoint, Gray et al. (1996, 38) define accountability as '*the duty to provide an account (by no means necessarily a financial account) or reckoning of those actions for which one is held responsible*'.

Similarly, Boland and Schultze (1996, 62) maintain that accountability entails *'the capacity and willingness to give explanations for conduct, stating how one has discharged one's responsibilities'*. As emerged in the definitions above, accountability requires the accountant to explain and take responsibility for his/her actions by disclosing information to the accountee; in parallel, it also recognizes to the accountee the right to obtain information by the accountant (Roberts and Scapens, 1985; Roberts, 1991; Boland and Schultze, 1996; Gray et al., 1996). Roberts and Scapens (1985) and Roberts (1991) suggest that obligations entailed in being accountable encompass two forms of accountability that are in ongoing tension and interdependence within corporate contexts: hierarchical accountability, which results into individualising effects produced by formal relationships, and socialising accountability, which creates informal relationships that allow the individual to overcome his/her isolated character. Boland and Schultze (1996) argue that hierarchical and socialising forms of accountability stem from *'the interplay of two different modes of cognition'* (Boland and Schultze, 1996, 65) proposed by Bruner (1986; 1990): the calculative mode and the narrative mode. While the former represents events through abstract, theoretical concepts that allow the individual engaging in calculation, the latter represents events through a story-telling that involves individuals with their motivations and ideas.

Even though Boland and Schultze (1996, 62) dichotomise the faces of accountability according to these modes of cognition, they suggest that *'[p]roducing accountability requires both narration and calculation'*. Accordingly, accountability entails both a recounting of events in a story form (i.e. the narrative face of accountability) and a calculation of net balances of (also moral) obligations in a transaction form (i.e. the calculative face of accountability). These two faces are interrelated, intertwined and inseparable in both informal and formal corporate relationships and are necessarily used together in discharging accountability. Similarly, Gray et al. (1996, 32) maintain that the discharge of accountability covers the disclosure of information about financial as well as nonfinancial aspects. They also indicate the accountability framework as *'the most useful one for analysing accounting information transmission in general'*.

The LS provides *'an overview of the company and its performance rather than pure financial data'* (Bartlett and Chandler, 1997, 254). Previous literature underlines the LS is the most read part of the annual report to which it is included or attached; it may include a range of issues that are not disclosed in other parts of the report (or in other reports); it may reveal about the company's priorities and how it wishes to be seen, especially given that it is made available directly on the company's website (Epstein and Pava, 1993; Bartlett and Chandler, 1997; Fanelli and Grasselli, 2005). Further, the LS allows directors/executives addressing a message to share/stakeholders that adds information to sustain their decisions (Clatworthy and Jones, 2003). In a longitudinal study, Mäkelä and Laine (2011) find significant differences between the CEO's letters issued in annual reports and those issued in

sustainability reports. Moreover, while the economic discourse of growth and profitability is prominent in CEO's letters in annual reports, the "well-being" discourse supports the LS opening sustainability reports.

Prior research extensively analyses the LS from an impression management perspective. For instance, Clatworthy and Jones (2003, 183) stress how '*[f]or declining performers, these narratives downplay bad news*'. Moreover, Merkl-Davies and Koller (2012, 179) argue that impression management '*constitutes an integral feature of corporate narrative reporting*' and is aimed at persuading corporate audiences under controversial circumstances, e.g. corporate scandals. Few studies have approached the LS from *the other side of the coin* (Frink and Ferris, 1998), i.e. an accountability perspective. More precisely, Amernic and Craig (2000; 2013) are pioneers in exploring the letter as an accountability, narrative and discourse document. Their analyses investigate discourses in the Walt Disney's 1940 letter to stockholders (Amernic and Craig, 2000), when "Uncle Walt" needed to issue shares because of the company's debt. The authors also examine the News Corporation's 2010 letter (Amernic and Craig, 2013, 388), in which the CEO defines the "killer app" (i.e. the phone-hacking technology) as an essential part of the company's '*armoury in the war to achieve circulation sales and profit in a highly competitive business environment*'. Both papers show how the CEO's letters help appreciate corporate values and (un)ethical behaviours, by using metaphors and rhetoric.

This study rests on an accountability perspective to investigate the Volkswagen's LS. This document is regarded as a suitable locus for an accountable explanation of relevant events occurred during the financial year. From a theoretical stance, the study relies on Gray et al. (1996) definition of accountability, combined with the arguments by Boland and Schultze (1996) to clarify how the Volkswagen's LS reveals a particular explanation of the diesel scandal in its aftermath. In detail, Gray et al. (1996) definition of accountability elucidates how Volkswagen (the accountant, in the person of its CEO) establishes a one-way communication with its share/stakeholders (the accountees) by means of the 2015 LS and how this document supports the company in discharging its duty to account for the sustainability disaster. Moreover, the arguments raised by Boland and Schultze (1996) help highlight on which faces of accountability Volkswagen mainly leverages when it "tells about" the diesel scandal.

## **VOLKSWAGEN DIESELGATE**

This study refers to the well-known Volkswagen's dieselgate, a scandal erupted in September 2015 when Volkswagen, one of the world's largest car manufacturers, was blamed by the US Environmental Protection Agency (EPA) to violate the Clean Air Act (Neate, 2015; Schiermeier, 2015). In the days following the scandal, Volkswagen's stock crashed by more than 20% on the Frankfurt Stock Exchange and the Volkswagen's CEO, Mr. Martin Winterkorn, resigned. A new CEO was appointed, Mr.

Matthias Müller, who immediately launched an internal inquiry. The Volkswagen dieselgate has drawn the attention of scholars in several fields of research, e.g. management, corporate governance, and communication strategies. Scholars particularly focused on identifying the reasons behind the scandal and the reactions of social media to the latter. Extant literature particularly points the finger at corporate governance issues as the root causes behind the diesel scandal (Elson et al., 2015; Crête, 2016; Li et al., 2018). At the time of the scandal, Volkswagen had a two-tier board structure with the supervisory board equally split between shareholders and employee representatives. This pushed into *'an alliance between the shareholder-controller, management, and labor'* (Elson et al., 2015, 42), which led to shortcomings in the monitoring and control mechanisms, and eventually *'in the compliance system established by the company to ensure that legal requirements were respected'* (Crête, 2016, 26). Moreover, generous bonus schemes granted by Volkswagen to senior executives were identified as a main determinant of the wrongdoing concealment, given their structure as individual bonus, company performance bonus, and rewards for team performance (Li et al., 2018).

Moving the attention to media reactions to the Volkswagen's diesel issue, Valentini and Kruckeberg (2018, 529) observe that Volkswagen was not fulfilling *'its promise to be a socially responsible and sustainable'*. They find that, according to international newspapers, Volkswagen's behaviour affected major stakeholders, such as customers, shareholders and other investors, US EPA, European and German institutions, and the *'society-at-large'*. Focusing the analysis on German newspapers in the week immediately after the scandal eruption, Clemente and Gabbioneta (2017) show that the media identified the employment of a special software to manipulate the evaluation of pollutant emissions as the nature of the scandal, while referring also to environmental and health implications. Newspapers focus on both reputational and financial costs resulted from the scandal, the former referring to image deterioration and loss of stakeholders' trust and the latter referring to monetary sanctions, costs of product recalls, the fall in stock prices, the interruption of US sales, and the issuance of a profit warning. Newspapers identified also potential spill overs on the automotive industry or the overall German economy, especially exports. Finally, newspapers discussed about the means through which Volkswagen could recover its reputation, by suggesting the step down and/or the removal of the CEO and involved executives, as well as a cooperation with authorities (Clemente and Gabbioneta, 2017, 295). In the wake of extant literature, this study investigates whether and how, after the outbreak of the scandal, Volkswagen relied on the LS as a voluntary document to discharge the duty of accountability to share/stakeholders.

## RESEARCH DESIGN

### *Case-study and documents analysed*

To meet the main objective of this study, official reports published with reference to year 2015 were searched: only the annual report resulted available on the Volkswagen's website. While reading through the 2015 annual report, it became evident that the locus chosen by Volkswagen to deal with the diesel issue was the LS issued by the newly appointed CEO, Mr. Matthias Müller. Lacking a timely sustainability report, the choice of the LS is not surprising, provided that it is the most read part of the annual report and may affect investors' decision making by helping predict future performance (Epstein and Pava, 1993; Bartlett and Chandler, 1997; Clatworthy and Jones, 2003). On the preparer's side (i.e. Volkswagen), the LS represents not only the sole document dealing with this sustainability issue, but also the first chance for the CEO to address an official, written speech to the company's share/stakeholders. Therefore, this document is particularly pertinent for performing a critical discourse analysis aimed at revealing how Volkswagen discharges accountability at the time of the diesel scandal.

### *Critical discourse analysis*

The study applies critical discourse analysis (CDA) as proposed by Fairclough (2003). According to Fairclough (2003), CDA is not merely an analysis of the text, even though textual analysis is an essential part of it. Under such thought, Fairclough (2003, 3) conceives texts as '*transcripts of (spoken) conversations*' (i.e. language) that entail discourses, which in turn are intended as '*signals [...] of language in use*'.

Accounting scholars have drawn on Fairclough (2003)'s approach to CDA to examine corporate reporting narratives (e.g. Merkl-Davies and Koller, 2012; Higgins and Coffey, 2016) and inspect the constitutive role of discourses in an organisational realm (Busco et al., 2018).

To the purpose of this study, the analytical scheme originally proposed by Fairclough (2003) has been adapted to explore discourses around the diesel issue and how such event is re-presented in the LS. The analysis performed is summarized in Table 1.

CDA distinguishes discourses into two analytical categories: discourses and representation of event. Discourses deal with themes addressed, features of discourses (linguistic elements like metaphors, collocations, and assumptions), and interdiscursivity. The latter concerns the way in which discourses are drawn upon and articulated together in texts as it stems from the import of elements of some discourses from other (heterogeneous) discourses. In turn, the representation of the event deals with ways of re-contextualising in a written form: the event itself (i.e. generalising or concretizing the event

and including or excluding processes, relations and actions undertaken), actors involved in such event, as well as spatial and temporal circumstances surrounding it.

| Analytical categories   | Elements under analysis   |
|-------------------------|---|
| Discourses              | Themes: Main topics addressed in the document and on which discourses are developed.  |
|                         | Features of discourses: Expressions that characterise the account of the dieselgate, like metaphors (words that extend a part of the world to another - lexical metaphor - or represent processes as things - grammatical metaphor), collocations (how words are most frequently preceded/followed by other words), and/or assumptions (presuppositions about what exists - existential assumptions -, what is or can be or will be the case - propositional assumptions -, and what is good or desirable - value assumptions). |
|                         | Interdiscursivity: How different discourses are entangled in the text.  |
| Representation of event | Representation of the event itself: The generalization or concreteness through which the dieselgate is conveyed, and the inclusion or exclusion of processes, relations, and actions undertaken.  |
|                         | Representation of actors: The inclusion or exclusion of subjects who participate to the dieselgate actively or passively, personally or impersonally.   |
|                         | Representation of space and time: Circumstances that help re-contextualize the diesel issue and, in turn, incorporate the event at the time of writing.   |

Table 1. *Analytical scheme applied for CDA*

## FINDINGS

### *Discourses*

Titled '*Letter to our Shareholders*', the Volkswagen's letter is structured into two pages with eight paragraphs, four for each page. This structure helps Volkswagen deal with six different topics pertaining to *corporate scandal*, *responsibilities*, *actions & change*, *corporate qualities & values*, *financial performance*, and *future & strategy*. *Corporate scandal* is the only topic treated in every paragraph of the letter; it is intertwined with other topics throughout the document, thus allowing to both address the diesel issue from different perspectives and texture heterogeneous discourses within the LS.

In the first paragraph, the letter mentions the *corporate scandal*, assuming *responsibilities* and recalling *corporate qualities & values*. More specifically, it links the discourse on the diesel scandal to discourses on the company's history and apologies for the occurrence. The second paragraph presents high interdiscursivity: it mixes discourses around the sustainability disaster by adding information about *actions & change* undertaken by Volkswagen to overcome the scandal and avoid similar situations in the future. The third and the fourth paragraphs are focused on how the *corporate scandal* has affected the Volkswagen's *financial performance*. In this vein, the diesel scandal is represented with reference to its financial impact on the 2015 corporate results as well as on shareholders' remuneration. Turning the page, the letter leaves financial discourses to project *corporate scandal* and *corporate qualities & values* towards the future. The fifth paragraph particularly introduces the topic of *future & strategy*, which is

then widely developed in the sixth and seventh paragraphs. More specifically, the fifth paragraph entangles the discourse on *corporate scandal* with a few attributes on which Volkswagen intends to leverage to resolve the diesel issue and continue its activities. The following two paragraphs relate the topics of *corporate scandal*, *future & strategy*, and *corporate qualities & values* to the one of *actions & change*. These paragraphs tell about the initiatives already promoted to overcome the diesel issue, by intertwining them with information on *future & strategy*. The mix of discourses is similar with the one of the second paragraph, with only one difference: the discourse related to the awareness about the difficult situation and commitment aimed at clarifying how the scandal happened (*responsibilities*) is replaced with the discourse developed on prospects and long-term programs on which Volkswagen builds its strategy (*future & strategy*). The last paragraph addresses all the topics recurring in the letter, with the only exception of *financial performance*. The Volkswagen's letter concludes by condensing and retracing the discourses encompassing the document with the aim to call for shareholders' support.

Metaphors and value assumptions are the two features of discourse included in the Volkswagen's LS, while there are no evident collocations patterns nor existential and propositional assumptions. A metaphorical representation of the company is proposed throughout the document and helps transmit that the company struggles to return on *the right track*, rebuild the broken trust and seize the opportunities (*opened doors*) provided by this scandal. Further, grammatical metaphors appear in the specific form of nominalization, which emerges in objectifying processes and attributes. Accordingly, verbs like "to trust", "to cooperate", "to achieve", "to dedicate", and "to found" are turned into nouns. Finally, value assumptions are features of discourses employed in the Volkswagen's LS to create links between the diesel scandal and the future course of action. These assumptions indicate some desirable expectations from a successful resolution of the scandal and a responsive control of its consequences.

#### *Representation of event*

The Volkswagen's letter refers to the *corporate scandal* through several expressions. In the first paragraph, it is indicated both directly as *irregularities relating to diesel engines* and indirectly by using the expression *in more auspicious circumstances*, implicitly referring to circumstances that - due to the scandal - were lacking at the time of writing. The diesel issue is further denoted as *probably the greatest challenge* in the Volkswagen's history. In the second paragraph, it is pointed out as *what happened*, *past mistakes*, and *something like this*. It is also indicated as *this crisis*, which however remains undefined in nature. *The present crisis* introduces the part of the LS dealing with the company's *financial performance* (third and fourth paragraphs). Consistently with the technical terms employed to report financial results and figures, the diesel scandal is here referred as *negative special items* and *high exceptional charges*. In the third paragraph, the *corporate scandal* is further represented as *difficult phase* and *diesel issue*. In the remainder of the letter, it is denoted as *this crisis* (again) and *the difficult situation*. In the last

line of the document, the diesel issue is represented underlining *the present pressures* it puts on the company.

Actors included in the representation of the diesel scandal are depicted through nouns and pronouns. Through nouns, the letter evokes group categories of actors that are involved in, and affected by, the event. In the first part of the document, these group categories relate *the (Volkswagen) Group* (also represented as *the Company*) to governance and management actors, specifically *shareholders, Chairman of the Board of Management, the Board of Management, the Supervisory Board* and *the Annual General Meeting*. Volkswagen is also described in relation with two external subjects, i.e. *customers* and *authorities*. The second part of the letter represents categories of actors belonging to stakeholders' groups with which Volkswagen interacts and by which it draws human and relational resources. In particular, the document mentions *customers, shareholders, team, employees, partners, and society*. The letter includes both personal and possessive pronouns. First, pronouns are used to underline a personal CEO's commitment (*I, me*) and a shared (*we, us, our(s)*) engagement of all Volkswagen's members in solving the diesel issue. Further, the first plural person reflexive pronoun *ourselves* recurs in two parts of the LS to emphasise the difficult situation the company is called to face and overcome, whereas second plural pronouns are employed to directly refer to the owners of Volkswagen's shares (*you*) and emphasise that the diesel scandal increases the company's needs of their patience and support (*yours*). Finally, the indefinite pronoun *everyone* is used to stress that every single member at Volkswagen works with the scope to build again the corporate reputation.

The LS represents space through two extremes that oppose a local place (*the Annual General Meeting of Volkswagen Aktiengesellschaft*) to a global place (*Volkswagen's global presence, all over the world, automotive world*). It also offers examples of space-time relation that emerge in the representations of duration and distance in time. Referring to the past, the LS includes expressions such as *in the history, for the last fiscal year, in the previous year, over the past years, in recent weeks*, while referring to the future it mentions *over the next ten years, a year of transition, a year when we lay the foundations for the future, into the future*. Space-time relation is also introduced through movements among different verb tenses and use of adverbs (*rightly, usually*). More specifically, the representation of time draws on several tenses throughout the LS. Present tense is employed in both the non-progressive form and the progressive form. The latter is widely used with multiple purposes: to underline the corporate commitment in overcoming the diesel scandal (e.g. *we are doing everything, everyone at Volkswagen is working*); to highlight the corporate value drivers (*our portfolio of twelve strong brands, unique in our industry, is carrying us even through this difficult phase*); to portray the business landscape (*automotive world that is facing epoch-making change*); and to describe the actions undertaken (*we are realigning our structures, we are also renewing our targets, we are evolving the strategy, we are now putting in place, we are working on that*). The present continuous tense also

closes the LS, with the CEO's expression *I am asking*. In its turn, future tense marks those portions of the document referred to the dividend proposal (*the Board of Management and the Supervisory Board will propose a dividend of*), the 10-year strategic plan (*[t]he presentation of our Strategy 2025 mid-year will be an important milestone*), the expectation for the current year (*2016 will clearly be a year of transition*), and the resolution in successfully overcome the diesel issue (*we will be able to say: no matter how grave the crisis was, it also opened doors for us, we will succeed in making Volkswagen a better company*). Conditional sentences are placed only in the first paragraph to introduce the CEO's apologies for the wrongdoing (*I would have preferred, I would like to apologize*) and in the part presenting the financial performance (*the operating result would have slightly exceeded, we would once again have been able to talk about a successful year overall*). Finally, the representation of time draws also on the modal verbs "must" and "can". "Must" is used to communicate that Volkswagen hearty wants to learn from the diesel scandal and pay its debt to the society (*we must above all learn from past mistakes and draw the right consequences*). "Must" also points out how the company plans to address the big future issues (*the Volkswagen Group must become faster and more efficient, more flexible and courageous, more technically progressive and sustainable in all relevant aspects*). At the end of the LS, it is used to state the central importance of regaining trust (*trust must be earned*). Finally, the modal verb "can" helps convey the corporate commitment in removing everything is related to the diesel scandal (*everything we can, something like this can never happen*), as well as the possibility to leverage on distinctive resources for continuing operations (*qualities on which we can also build for the future*).

## DISCUSSION AND CONCLUSIONS

The findings show that, in the aftermath of the sustainability disaster, Volkswagen chose the LS as the locus for discharging its duty of accountability towards share/stakeholders (Gray et al., 1996). Written by the CEO on behalf of the company (i.e. the accountant), the LS contains an official, preferential message on the sustainability issue resulting in the diesel scandal. While the LS is addressed to shareholders, it also delivers a subtler message to stakeholders (i.e. the accountees). The findings reveal an urgency to tell about the diesel scandal, which is mentioned since the third line of the LS. This urgency highlights a sense of responsibility hanging over the company to account for its legal and ethical negligence (Gray et al., 1996; Dillard and Vinnari, 2019).

In the Volkswagen's 2015 LS, accountability emerges in both narrative and calculative faces and draws on different discourses (Boland and Schultze, 1996). More specifically, narrative accountability stems from discourses surrounding initiatives undertaken, stakeholders' involvement and future sustainability challenges, which construct a story-telling on how the company was acting to solve the sustainability disaster (Higgins and Coffey, 2016). In turn, calculative accountability arises from

discourses surrounding financial performance and shareholders' remuneration, which provide an evaluation of the impacts of the diesel scandal on the company's business. While discourses surrounding initiatives undertaken, stakeholders' involvement and future sustainability challenges are sparse throughout the letter, discourses surrounding financial performance and shareholders' remuneration are concentrated in a specific part of the LS. Furthermore, both the narrative and calculative faces of accountability emerge in discourses of apologies, trust and hope through which Volkswagen conveys an ongoing effort to overcome the sustainability disaster. In providing an account of its disaster, Volkswagen relies on financial and nonfinancial information to offer an all-encompassing representation of the scandal. It refers to past, present and future situations, as well as to the private location of the annual shareholders meeting and the worldwide presence of the corporate business.

The findings show the pervasiveness of the discourse around the scandal, which trespasses all the LS and is related to several internal (e.g. the Group, the Board of Management, employees) and external (e.g. responsible authorities, customers, partners) actors. The evidence further reveals that metaphors and value assumptions make the representation of the sustainability disaster general and abstract, however without obscuring the Volkswagen's responsibilities for the diesel scandal.

The study highlights the Volkswagen's will to accountability for the sustainability disaster. It confirms that a financial discourse is present in the LS that opens the annual report (Mäkelä and Laine, 2011), yet it also underlines that this discourse is not prominent in case of a letter issued in the aftermath of a sustainability disaster. More precisely, the financial discourse is restricted to a small part of the letter, while discourses on apologies, commitment, and prospects recur in the remainder part of the letter. In line with Amernic and Craig (2000; 2013), the analysis reveals that metaphors and value assumptions support an accountable representation of the sustainability disaster and the (future) corporate initiatives, by proposing a fictional representation of the event.

Furthermore, the analysis reveals the Volkswagen's will to communicate to the major stakeholders affected by the scandal. It particularly adds to Valentini and Kruckeberg (2018) by demonstrating that the Volkswagen's LS and news media have common recipients, who may rely on both sources to fulfil their informational demands. The Volkswagen's 2015 LS also emphasises how a document issued in the aftermath of a sustainability disaster helps in reassuring share/stakeholders as well as in recovering their trust (Sims, 2009).

This analysis offers four main contributions to extant literature. It extends prior literature on corporate accountability, by shedding light on discourses through which companies pursue accountability in time of sustainability disasters (Amernic and Craig, 2000; 2013(Florio and Sproviero, 2017)). It also adds evidences to the potential of critical discourse analysis as an approach to inspect corporate reporting

document under an accountability frame (Higgins and Coffey, 2016; Busco et al., 2018). Finally, it offers new insights on the role the LS plays in discharging accountability, instead of being a locus for impression management (Merkl-Davies and Koller, 2012). With its findings, the research may produce practical implications, in that it advises corporate audience on the role the LS may have as an official, public, written document in which companies explain and take responsibility of scandals entailing sustainability disaster.

To conclude, this study is not free from limitations, which pave the way to further research. It focuses on the LS referred to year 2015, thus it neglects the discourses contained in LSs issued before and after the sustainability disaster, or in other forms of corporate disclosure. Future research may inspect whether and how Volkswagen's discourses change in the letters preceding and following the diesel scandal, or in other voluntary documents, to understand the company's disclosure behaviour according to the sustainability achievements/shortcomings/failures. The study limits the analysis to a Volkswagen's written document. Future studies may enrich the investigation with interviews to corporate members and triangulate the results. The analysis restricts on the Volkswagen's case, even though other car manufactures (e.g. Renault-Nissan, and Fiat Chrysler Automobiles) faced sustainability disasters. Further research may enlarge the scope of research to a comparative analysis of discourses formulated by other companies in the LSs issued immediately after the scandal.

### ABSTRACT

Tourism industry encompasses the organization of art festivals which can act as drivers of local development and bring social benefits which improve the quality of life of local communities. However, efficient festival management requires the understanding of visitors' satisfaction with the experience they gained while attending a festival or event. The case study presented in this paper is the international short film festival of Drama, a rural city in northern Greece, which attracts many visitors every year. The aim of this paper is to group visitors into typologies and to identify important correlations between their satisfaction and overall assessment with their demographic and other characteristics. Using categorical principal components analysis, categorical regression and cluster analysis, significant insights were gained. In particular, although the festival has gained its position as a brand name in the local market, the provided tourism services should be improved to meet visitors' expectations. Overall, it seems that the Regional Unit of Drama has managed to convince the visitors that it is a value for money destination, while strategic planning should remain a priority in the development plans of the broader area.

*Keywords: Drama short film festival, local development, visitors' satisfaction, value for money, cultural tourism, categorical principal components analysis, categorical regression, cluster analysis.*

### INTRODUCTION

Tourism has the ability to transform the local social and economic structure (Loukissas, 1982) and, in rural remote areas, it can benefit the local economy through the creation of new jobs while offsetting job losses due to the decline of sectors, such as agriculture. The impact of tourism on the economic, social and cultural development of rural areas has been widely acknowledged. In economic terms, tourism can provide the inflow of foreign exchange and, at the same time, consists a key driver of local economy through the jobs it creates and the improvement in local infrastructures and services (Andereck and Nyaupane, 2011; Guaita Martinez et al., 2019). As Varvaresos and Sotiriadis (2002)

observed, tourism is able to offer jobs to that part of the population that faces the greatest difficulty finding work such as young unskilled individuals, long-term unemployed people and women. The same authors also noticed that unemployed individuals who find work in the tourism industry are often trained in occupations which are totally irrelevant to tourism. Therefore, tourism can absorb a significant proportion of unemployed individuals since it is not a highly demanding sector and does not require specialized technical knowledge. As for culture, tourism brings together people of different cultures and origins (Mowforth and Munt, 2003; Almeida et al., 2016).

Festivals and events consist part of tourism and, in the recent decades, they have flourished while the research interest in understanding their significance has increased. The evolution of festivals has confirmed their impact on rural development and local economic development, while their marketing functionality has also been acknowledged in social and cultural proliferation (Pavluković et al., 2019). Therefore, it is of great importance to develop visitors' typology as part of an integrated effort to increase the success of cultural festivals. In addition, it should be noted that tourism industry and specifically festivals are now oriented towards the derived social benefits, which create not only strong ties with the local community but also form a special identity for the destination (Mair and Duffy, 2015).

To that end, Skoultzos et al., (2020) placed particular emphasis on the festivals' value using the argument that the small communities which consist of the festival assemblers provide the sense of community (SOC). In specific, the SOC provides the members of the festival community with a sense of belonging, while it creates positive feelings of safety and social cohesiveness.

There is robust reasoning supporting the development of festivals in rural development planning. Most importantly, festivals offer an exceptional opportunity for promoting the particular character of local culture and history. Indicatively, Yozukmaz et al. (2020) argued that art, crafts, performances, recreation and entertainment are the vehicles for attracting visitors' attention. Additionally, festivals can serve as brand name promotion tools because they can give added value to destinations and, at the same time, they may promote alternative forms of tourism. It might, nonetheless, be questioned why the potential of festivals remains untapped. Interestingly, Georgoula and Terkenli (2017) stressed the need to investigate case studies in rural medium-sized cities which host international festivals in order to make progress in tourism planning. In specific, if decision makers attain a deeper knowledge about visitors' views, they could organize a more successful international festival. This means that policy makers will be able to utilize and promote the existing cultural assets and traditions. In addition, the development of tourism could promote the sustainable exploitation of natural resources (Karasmanaki and Tsantopoulos, 2019). Therefore, if the above steps are taken, rural decline and outmigration of young people from rural to urban areas could be reduced (Kwiatkowski et al., 2020).

The aim of the present study is to examine the views and satisfaction of visitors of the Drama international short film festival (DSFF) which is held every year in the Regional Unit of Drama (RUD), in Greece. Based on visitors' responses, the typologies of the festival visitors will be developed. These typologies could be particularly important and be used to plan more efficiently the international art festival in the rural area of Drama. Hence, insights into visitors' satisfaction and into critical correlations may enable policymakers to detect the strengths and weaknesses in RUD but also point to ways to exploit the marketing potential of the DSFF.

## STUDY AREA

### *Regional unit of Drama*

The study area was the Regional Unit of Drama which administratively belongs to the Region of Eastern Macedonia and Thrace in the northern part of Greece. In particular, the Regional Unit of Drama is located in the northernmost part of Macedonia and in the westernmost part of the Region of Eastern Macedonia and Thrace. It covers an area of 3.468 km<sup>2</sup> and the population is estimated at 98,287 inhabitants (Hellenic Statistical Authority, 2019). The city of Drama is the seat of the Municipality of Drama and the wider area is characterized by a unique natural environment including an impressive mountainous area and unspoiled landscapes such as the nature reserve Frakto - Virgin Forest.

The landmark of the mountainous area of Drama is Mount Falakro which belongs to the crystalline mass of Rodopi, with a significant geological substrate of marble (Tsiftsis et al., 2006). Today, the exploitation of marble is the major driver for local economic growth and large marble processing plants with great export activity have been operating in the area. At the same time, the broader area of Drama is isolated due to its geographical position and its predominantly mountainous type. As a result, it is located in a long distance from metropolitan while there is a lack of modern road networks. Indicatively, visitors have to drive more than 50km to reach the highway of Egnatia, which connects the west to the north part of Greece (Figure 1). With the policy currently being implemented, tourism makes a minor contribution to local development and accounts for as little as 6% of the gross domestic product in the region of Eastern Macedonia and Thrace. Other economic drivers supporting local development in Drama involve the primary sector and the exploitation of mining resources (Karamanidis, 2006).

Figure 1. *The study area: The location and map of the regional unit of Drama (source: Google Maps)*

Nonetheless, the regional administrative authority declared 2017 as the year of tourism, thereby recognizing the great potential for tourism development in the region. One of the landmarks for setting the ground of tourism development in Drama could be the annual event of Drama International Short Film Festival (DISFF) which has been held Drama for the last 43 years. The festival, except for its cultural and artistic context, is also oriented towards the promotion of local cultural and natural assets as well as local products. It should be noted that the film festival attracts numerous visitors from Greece and abroad.

#### *Drama International Short Film Festival*

The international short film festival of Drama was launched in 1978 on the initiative of the Drama Film Club and, in mid 1980s, it was placed under the auspices of the Municipality of Drama. The event is held every September and aims at the promotion and dissemination of cinema through Greek and internationally produced short films (DISFF, 2020).

It is worth noting that according to Georgoula (2018) the festival hosts about 10,000 visitors from 40 countries every year. Indisputably, the city of Drama has benefited greatly from the festival especially in terms of infrastructural improvement which in turn provides a satisfactory experience to visitors.

The festival was widely acknowledged by the public in mid 1980s, when it was established as a cultural institution. In August 1996, the Ministry of Culture recognizing the importance of the festival along with its growing international prestige included the festival in the Network of National Cultural Cities. The inclusion resulted in the participation of the festival in a cultural network of Panhellenic scope as well as the regular funding from the Ministry of Culture and the Municipality of Drama. Moreover,

due to the high level of the artistic works presented in the festival, the European Film Academy (EFA) has recognized the short film festival as one of the most important festivals in Europe. In addition, both Fipresci (International Federation of Film Critics) and the Hellenic Parliament have been awarding the international department of the festival with special prizes of honor. During the period 2014-2018, there was an increase in the participation of both Greek and international films while the total number of visitors increased by 12.5%.

Today, the short film festival of Drama stands as a major attraction for various visitors who comprise the Greek and international cinema world. According to Sakkas (2017), the organization already supports and intrinsically promotes the local assets and tourism. The latter highlights the festival as a significant brand name, able to enhance tourism in the area. However, this potential should be regarded as strength if certain preconditions are met. Namely, there is a need for the festival to increase its extroversion in the market and to interact with the various elements of the existing cultural assets. To this end, it is of great importance to exploit financial tools and pursue fruitful collaborations at various levels.

On the other hand, the weaknesses of the festival can be found in the lack of infrastructures such as efficient building stock, the limited resources available for the operational and organizational procedures and the absence of an integrated plan for promotional activities able to increase the popularity of the festival.

Taking all the above into consideration, it could be argued that the short film festival of Drama is an event which is highly recommended for visitors, while the variety of natural and cultural features in the broader area offer an added value to the tourism product of Drama. In addition, if festival attendees are able to combine their visit to the festival with activities related to alternative tourism, then the region may follow an integrated development plan.

## **MATERIALS AND METHODS**

The results presented in this paper are part of a broader study that was conducted in the Regional Unit of Drama in Greece during November 2016 - September 2017. A structured questionnaire was used as the research tool for the data collection. The population under investigation included the visitors of the short film festival of Drama and, in total, 500 visitors completed the questionnaire. The method of personal interviews was used in order to ensure higher response rates and, in this way, it was also ensured that all respondents would comprehend the questions.

The present study analyzes specific variables related to the visitors' demographic characteristics, respondents' view on whether the Regional Unit of Drama is a value for money holiday destination and a destination of major cultural interest, the overall expectations fulfilment, the general evaluation

of the existing tourist services, the possibility of recommending the Regional Unit of Drama to other potential visitors, the importance of maintaining the particular cultural character of the region, and the visitors' intention to buy agricultural and livestock products. In terms of statistical analysis, the collected data were analyzed with the Statistical Package for the Social Sciences (SPSS). More specifically, descriptive statistics, Categorical Principal Components Analysis, Principal Components Analysis, Categorical regression and Cluster analysis were applied for the data processing.

## RESULTS

### *The visitors' demographic profile*

In terms of gender, 59.2% of respondents were men and 40.8% were women. The majority belonged to the age classes of 18-30 (49%) and 31-40 (28.8%), followed by respondents older than 60 (by 10.8%), and aged between 51-60 (by 7.2%). As few as 4.2% of respondents were aged between 41-50.

As for their educational level, a significant number of respondents were high school graduates (27.6%) and university or technical institution graduates (26.8%). Furthermore, 16.4% were graduates of technical schools, 14.8% were high school graduates and 14.4% had only attended primary school education.

The marital status of the respondents was also investigated. Thus, almost four out of ten of the visitors were married (40.7%), followed by widowed and divorced (31.1%) and unmarried (28.2%) visitors. Regarding the number of children, the category "two children" is prevailing with a percentage of 37.4% respondents, followed by the categories "one child" with 37.4% visitors. In addition, 26.8% stated not having any children. Therefore, the average number of the visitors' children is estimated as 1.28 (SD 0.945, s.e. 0.043).

In addition, visitors' occupation was analyzed. According to the findings, an appreciable share of visitors were private Employees (30.9%), followed by undergraduate students (16.4%), pensioners (15.7%) and crop and livestock farmers (12.5%), respectively. Lower percentages were recorded for freelancers (9.3%), civil servants (8.8%), and housewives (5.1%). Conversely, respondents who were unemployed accounted for only 1.2% of the DSFF visitors. Regarding the origin of the visitors, the vast majority came from places that are away from RUD (56.6%), 22.4% of respondents were "locals" while 21% stated they "were married to someone from the area".

### *The visitors' experience evaluation*

The visitors were asked whether Drama is a value for money destination and, interestingly, more than half visitors (54.9%) considered that it is. Yet, approximately six out of ten perceived that it is not a destination with special cultural interest. In addition, three in four respondents felt that the destination

has not met their expectations. Concerning visitors' overall assessment of tourism services, 81.2% of respondents considered that tourist services are at an average level. Moreover, almost one in two visitors (by 48.4%) would not recommend visiting the Regional Unit of Drama or would recommend it only to few people as tourism destination. In addition, it should be noted that the maintenance of the particular cultural character of the region was considered by respondents as less important (46%) to attract tourists. Interestingly, most visitors (67.0%) expressed a strong intention to buy agricultural and livestock local products.

#### *DSFF Visitors typology*

Respondents' views were examined in order to determine the types of visitors attending the festival with similar characteristics. For the purposes of the study, Categorical Principal Components Analysis (CATPCA) was used. The variables used in this analysis were:

- The RUD is a value for money tourism destination
- The RUD is a destination of major cultural interest
- Fulfillment of expectations
- Evaluation of tourism services
- Recommending the RUD to other potential visitors
- The importance of maintaining the particular cultural character
- Intention to buy agricultural and livestock products

The solution of two dimensions provided values of characteristic root  $\lambda_1= 2.932$  and  $\lambda_2= 1.626$ , while the Cronbach's reliability coefficient alpha was estimated as being 0.911. The variable loadings of the principal components are presented in Table 1. In order to meet the general criterion for convergence 0.00001, 54 iterations were conducted. The first Dimension accounts for 40.07% of variance, while the second Dimension accounts for 25.04%.

| Variable  | Dimension 1 | Dimension 2 |
|---|-------------|-------------|
| The RUD is a value for money tourism destination                | 0.823       | 0.060       |
| The RUD is a destination of major cultural interest             | -0.746      | -0.332      |
| Fulfillment of expectations                                     | -0.697      | 0.039       |
| Evaluation of tourism services                                  | -0.362      | -0.010      |
| Recommending the RUD to other potential visitors                | 0.303       | 0.891       |
| The importance of maintaining the particular cultural character | -0.175      | 0.919       |
| Intention to buy agricultural and livestock products            | 0.913       | 0.005       |

Table 1. *The loadings of the principal components*

The variables "Intention to buy agricultural and livestock products" and "The RUD is a value for money tourism destination" had the highest positive loadings in terms of the first dimension. On the other hand, the highest negative loadings appeared for the variables "Fulfillment of expectations" and "The RUD is a destination of major cultural interest".

As for the second Dimension, the variables "The importance of maintaining the particular cultural character" and "Recommending the RUD to other potential visitors" had high positive loadings. Moreover, based on the quantified values of observations, the diagram of the scattering of the variable categories was created (Figure 1).

The high loadings in the two dimensions enable their identification and interpretation. The first Dimension involves the variables related to the satisfaction of the visitors with their experience as tourists and the recommendation of the Regional Unit of Drama to other potential visitors. Therefore, it could be termed "RUD visitors' satisfaction". The second Dimension could be titled "Particular cultural character of RUD" as it is formed by variables related to the cultural identity and the local agricultural and livestock products.

Concerning the factors that affect the abovementioned dimensions which represent the visitors of the film festival, factors' possible correlations with various independent variables were then investigated. The factorial degrees given by Categorical Principal Components Analysis, which was conducted previously, were used as measures for the estimation of the dependent variables.

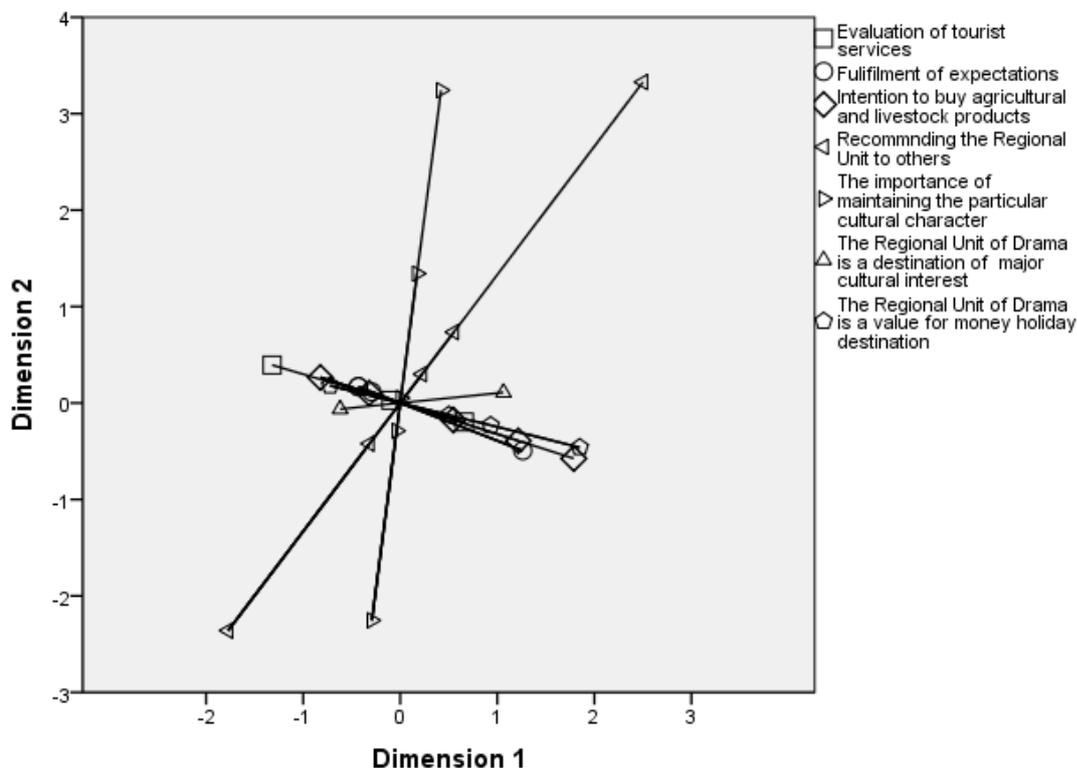

Figure 2. Scattering of the variable categories

Next, the simultaneous combined correlation between visitors' type (CATPCA scores) with their demographic characteristics was examined. To that end, Categorical regression was conducted (Tables 2 and 3).

For the first Dimension (Table 2), it was indicated that there is a correlation among the visitors' type and a) educational level, b) family status, c) number of children and e) main occupation. However, no significant statistical difference among the visitors' type and the other examined variables was observed. According to Pratt's index of relative importance, it was indicated that the most important variables, in terms of weight in the sub-sample, are the main occupation, the family status and the educational level. In other words, visitors' satisfaction with their visit in the Regional Unit of Drama depends mainly on the main occupation, the family status and the educational level. The higher the values of these variables, the higher the satisfaction of the visitors.

| Variable  | Beta   | SE    | p     | Pratt Index |
|---|--------|-------|-------|-------------|
| Gender  | 0.043  | 0.022 | 0.053 | 0.005       |
| Age   | -0.093 | 0.089 | 0.297 | 0.071       |
| Educational level   | 0.154  | 0.040 | 0.000 | 0.053       |
| Family status   | 0.123  | 0.034 | 0.000 | 0.077       |
| Number of children  | -0.182 | 0.032 | 0.000 | 0.002       |
| Main occupation   | 0.791  | 0.056 | 0.000 | 0.793       |
| R <sup>2</sup> =0.936, Beta: Regression coefficient, SE: Standard error |        |       |       |             |

Table 2. Results of Categorical Regression regarding the demographic characteristic which affect visitors' satisfaction

As regards the second Dimension (Table 3), it was indicated that it correlates with a) gender, b) age, c) family status, d) marital status and e) main occupation. Based on Pratt's index of relative importance, it was indicated that the variables with the greater weights in the subsample were (in a declining order) main occupation, age, number of children, and family status. The special cultural character of the Regional Unit of Drama is highly dependent on respondents' main occupation, age, number of children and family status. The higher the values of these variables, the greater the satisfaction of the visitors.

| Variable           | Beta   | SE    | p     | Pratt Index |
|--------------------|--------|-------|-------|-------------|
| Gender             | 0.319  | 0.061 | 0.000 | -0.070      |
| Age                | -0.417 | 0.199 | 0.013 | 0.102       |
| Educational level  | -0.238 | 0.180 | 0.187 | 0.011       |
| Family status      | 0.404  | 0.126 | 0.000 | 0.031       |
| Number of children | 0.229  | 0.082 | 0.006 | 0.042       |
| Main occupation    | 0.903  | 0.058 | 0.000 | 0.885       |

R<sup>2</sup>=0.733, Beta: Regression coefficient, SE: Standard error

Table 3. Results of Categorical Regression regarding visitors' demographic characteristics which affect the special cultural character of the region

In the next stage of the analysis, and in order to identify the types of visitors who attend the festival, Cluster Analysis was carried out. Again, the factorial degrees that resulted from the Categorical Principal Components Analysis, which was previously conducted, were used as dependent variables. The analysis gave four types of visitors: Festival 1, Festival 2 Festival 3 and Festival 4 (Figure 3).

|                    | Type of festival visitors in Drama |       |       |       |
|--------------------|------------------------------------|-------|-------|-------|
|                    | 1                                  | 2     | 3     | 4     |
| Dimension 1        | 0.47                               | -0.62 | 1.14  | -1.13 |

Table 4. Cluster centers for each type of festival visitors

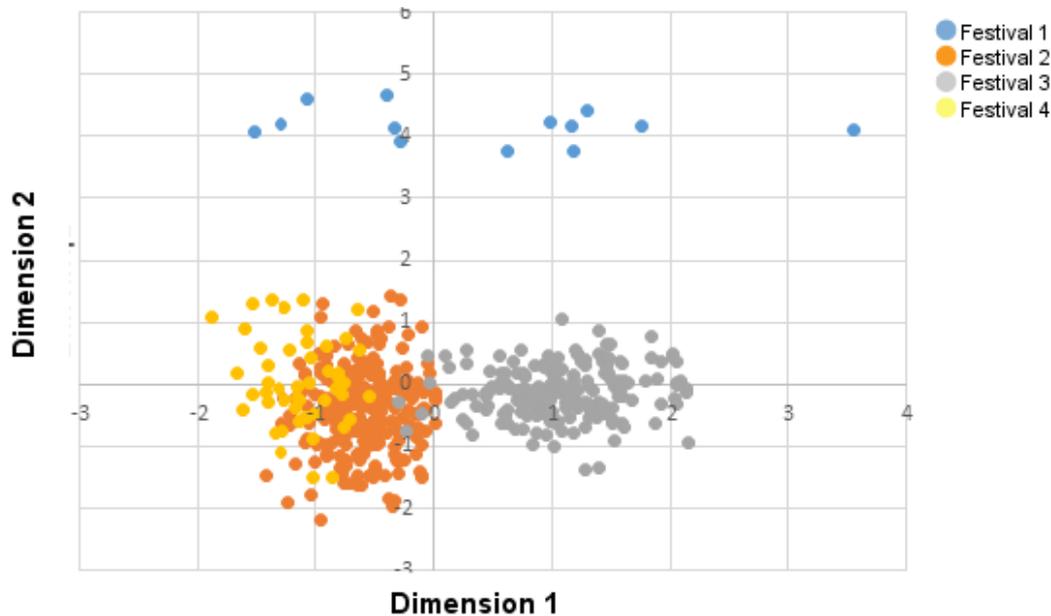

Figure 3. Identification of the types of festival visitors in the two-dimensional space

The identification of types reveals a significant differentiation among the four visitor types:

- Festival 1: This visitor type consists mainly of visitors aged between 41-50 years, who hold a technical school degree, have one child and are mainly occupied as freelancers. These visitors expressed a moderate satisfaction with visiting Drama but acknowledged to a high extent the particular cultural character of the region.
- Festival 2: This visitor type involves mainly male visitors, who are married and aged between 18-30 years. In terms of their educational level, most are high school or university graduates, and, as for their occupation, they are employed in the private sector or are pensioners. These visitors were dissatisfied with the visit in the RUD but evaluated moderately the cultural character of the area.
- Festival 3: Type 3 consists mostly of women aged between 18-30 whose education level ranges up to secondary school. In terms of their family status, most of these visitors are divorced or

widowed with two children. This type of visitor expressed the highest satisfaction level with the Regional Unit of Drama. However, these visitors are only moderately convinced that the Regional Unit of Drama possesses a particular cultural character.

- Festival 4: In this visitor type there are mainly men aged between 31-40, who are high school or university graduates. In terms of their family and occupation status, they are mostly married and private employees. This type of visitors is the least satisfied with their visit in the Regional Unit of Drama, however, these respondents evaluated positively the cultural character of the region.

## CONCLUSIONS

The aim of this study has been to identify the types of visitors attending the short film festival of Drama based on their satisfaction with the visit in Drama. The identification of visitor types is considered critically important in guiding efforts to design effective measures which will improve the provided services and products. The aim of the study was met as the visitor types and the characteristics of each type have been identified.

Important correlations among certain characteristics of the festival and visitors' overall satisfaction led to the identification of four tourist types. These findings could serve as the basis for further analysis in order to enable the managers of the festival and policymakers in Drama to formulate a more efficient communication policy. This effort, however, presupposes strategic planning which will ensure that the festival meets all the necessary standards to enhance tourism growth in the region. Therefore, such changes can be considered important especially because the majority of visitors expressed their intention to visit again Drama in the future. In addition, the Regional Unit of Drama has a special cultural importance for most festival visitors, who expressed a pronounced intention to support the local market through the purchase of local agricultural and livestock products. In view of this intention, priority should be given to the provision of affordable high-quality local products of the primary production sector.

This study has also revealed that visitors regarded the Regional Unit of Drama as a value-for-money destination, although the provided tourism services received a poor evaluation, which in turn led to visitors' low satisfaction with the overall experience in the area. An explanation might be the low satisfaction levels with the festival itself; that is, it is possible that the visitors who were dissatisfied with the content or the quality of the festival production have expressed negative views on their evaluation.

Furthermore, the recognition of visitor types using cluster analysis can lead to interesting conclusions as positive correlations have been identified with certain variables. In specific, satisfaction with visiting

the Regional Unit of Drama and the acknowledgment of its special cultural identity are closely related to visitors' main occupation and family status. However, there were rather negative correlations including average satisfaction for female visitors up to 30 years old and male visitors between the ages of 41-50, who hold a low educational degree. This type of visitors regards also as average the cultural character of Drama.

The findings have also pointed to the need for introducing strategic planning in order to achieve greater tourism development in Drama. At the same time, there should be more integrated efforts towards the improvement of the tourism product of Drama. In other words, certain advances in the provided tourism services and existing infrastructures are required, as these are the primary features comprising the tourism product of RUD.

Moreover, the contribution of the short film festival should be acknowledged as a vital part of the development route in the Regional Unit of Drama. In fact, the festival is already considered by many film experts a milestone for Greek cultural events. Meanwhile, official data confirm the popularity of the festival as a tourism attraction while the number of festival visitors is maintained at a fixed level. However, it should be noted that an important number of festival visitors are local residents who make use of free invitations which are offered by the organizers to the citizens of Drama every year in order to ensure the success of the event. The increased number of the local visitors due to this initiative, however, does not reduce either the artistic prestige of the festival nor the need for its better promotion. The positive effect of local people on the festival can be confirmed by Yozukmaz et al., (2020) who stated that interactions between local people and visitors in festivals play an important role in tourism experience. Moreover, an increased number of visitors is recorded in activities carried out in the context of the festival such as "the festival which travels" which involves the screening of films in other cities or countries. Hence, it should be investigated whether this additional screening is accompanied by a corresponding increase in the number of visitors from other areas. Moreover, in order to shed more light on the efficient promotion of the festival, future research should examine the interaction between the festival trips and performances in other destinations as well as the corresponding rise in tourists in these destinations.

It is also highly recommended to further elaborate and examine all the above findings and prioritize the promotion of the festival as a strength for local development through the enhancement of alternative tourism. Unfortunately, Sakkas (2017) concluded that efforts to improve the region have been abandoned. Meanwhile, the findings of this research have shown that there is still substantial room for improvement. An example of improvement could be the design and introduction of innovative and case-based marketing strategies aiming to efficiently promote this unique international film festival. It

is critical though, to engage all the local, regional and national authorities, as well as the relative agencies, and organizations into decision making and cooperation on a multi-level scale.

## ABSTRACT

The aim of this paper is to investigate the satisfaction of visitors attending the Christmas event “Oneiroupoli” (Dreamland) which is held every Christmas in the city of Drama, in Greece. In specific, this study examined visitors’ satisfaction with the provided services and infrastructures in the area as well as their revisit intentions. In addition, it was explored whether visitors would recommend visiting Drama to their friends and whether they would be interested in participating in other activities during their visit to Oneiroupoli. To achieve the aims of the study, 503 questionnaires were completed by visitors attending “Oneiroupoli” and to analyze the collected data, descriptive statistics, the non-parametric Friedman test and categorical regression analysis were performed. Results showed that most visitors had visited the area again in the past and were satisfied more with services than infrastructures. However, the results have clearly indicated that the services for parents with four children and for unmarried visitors ought to be improved. In terms of infrastructure, visitors’ responses have shown that the road network needs to be improved. In addition, most respondents would be interested in participating in activities like mountaineering, cycling and skiing while attending Oneiroupoli. At the same time, they would recommend this destination to their friends so they can also enjoy the local natural wealth, cultural activities and Oneiroupoli. The results of this study could be particularly useful to policymakers and relevant stakeholders in order to exploit natural resources and to enhance the services provided to visitors.

*Keywords: Perception, visitors, local development, Christmas events, satisfaction, service quality, infrastructure quality, Oneiroupoli.*

## INTRODUCTION

In Greece, the intensive urbanization that occurred after the second world war led to a massive internal and external migration. Urbanization and the changes in the dispersion of residents in the Greek territory resulted in an uneven development and expanded the differences between areas (Chatzitheodoridis et al., 2016). The exploitation of local resources consists not only a basic condition for achieving and maintaining local development but also for ensuring capital inflow which can form the basis for multi-level development. Local development, however, is a continuous and complex process that interacts with multiple factors, which can in some cases be obvious but in others be less obvious (Gavalas et al., 2014).

Tourism dynamics consist a major factor in changing the local social and economic structure (Loukissas, 1982). At the regional level, tourism assumes an even greater importance because it creates new jobs while offsetting the loss of jobs in sectors which lose their competitive advantage over time, such as agriculture. The contribution of tourism to the prosperity of an area, in economic, social and cultural terms, is both proven and desirable. In particular, tourism can ensure the inflow of foreign exchange while it consists a key driver of local economy through the jobs arising from tourism and the fulfilment of needs at the level of infrastructure and services (Andereck and Nyaupane, 2011; Guaita Martinez et al., 2019). According to Varvaresos and Sotiriadis (2002), tourism can provide jobs to that part of the workforce that often consists the hard core of unemployment and includes young individuals, women and unskilled staff. The same research team indicated that unemployed individuals who are absorbed in tourism are mostly trained in occupations which are unrelated to tourism. Hence, tourism has the ability to create jobs for unemployed individuals as the tourism sector is not overly demanding in terms of specialized technical knowledge. In relation to culture, tourism is a first-class opportunity for bringing together people of different cultures (Mowforth and Munt, 2003; Almeida et al., 2016). Tourism can, however, have negative effects on the natural and anthropogenic environment especially when it takes the form of mass tourism (Urdang and Howey, 2001; Guaita Martinez et al., 2019).

In the regional unit of Drama, various events aiming at promoting the unique character of the area and the local products are held every year. Most of these events are quite successful and attract visitors from the entire country and abroad. Such events include the Drama International Short Film Festival, "Draminognosia" and "Oneiroupoli" with the latter being by far the most known event held in Drama. In particular, since 2003 and every year for a whole month during the holiday season of Christmas (from the beginning of December to the beginning of January), the Municipal Garden and the Eleftheria Square in the city of Drama are transformed into a Christmas village. In the context of the event, numerous, free of charge activities are addressed mainly to children while many forms of recreation

such as concerts with famous artists and other recreational activities are offered to older visitors. Therefore, it is no surprise that during the Christmas period the city of Drama is flooded by visitors with more than seven million visitors having visited Oneiroupoli since 2003 (Regional Unit of Drama, 2019).

Service quality and customer satisfaction are broadly recognized as critical factors in creating competitive advantage and maintaining existing customers. The overall satisfaction with the experience as visitor is a function of satisfactions which result from the individual characteristics of all products and services which consist the experience, such as accommodation, climate, natural environment, social environment and so forth (Pizam and Ellis, 1999).

Hence, the aim of this study is to investigate Oneiroupoli visitors' satisfaction with infrastructures and services as well as their intention to revisit and the possibility that they will recommend Drama to their friends as a destination. The results of the present study can be used not only to improve the quality of the provided services and infrastructures but also to promote local development in a region which possesses significant natural wealth.

## **THEORETICAL BACKGROUND**

The greatest difficulty, which tourist businesses face, is perhaps to find and maintain valuable customers especially in a time that intense international competition prevails. According to Hayes and Miller (2011), for businesses it is far more important to create customer devotion than to maximize revenues in the short-term. That is because customers, who are devoted to a specific product or service because it meets a certain need, do not feel the need to look for other products or services (Kristensen et al., 2000; Westlund et al., 2001). It can be said that loyal customers are those who can lead a business to success over time. Reichheld (1996) found that customers remain loyal to a business because of the value they receive from it. Maintaining loyal customers requires, of course, constant efforts on the part of the business while communication with customers is an important tool to earn their loyalty.

There is a general consensus that customer satisfaction is often reliant on the quality of the product or service (Levesque and McDougall, 1996). Moreover, Parasuraman et al. (1985) pointed out that when the perceived quality of services is high, it can increase customer satisfaction.

From this perspective, it becomes quite relevant to detect what affects customer satisfaction. Saad Andaleeb and Conway (2006) identified the factors affecting customer satisfaction in the food service industry. The results of their study indicated that customer satisfaction is mostly influenced by business employees' feedback and service followed by price and finally the quality of products and services. Conversely, the design as well as the image of the food business had little effect on customer satisfaction.

The relationship between hotel guest satisfaction and the level of provided services is a point that has been consistently examined. Most of these studies have concluded that satisfaction is primarily dependent on the quality of the provided services (Hayes, 2008; Reisig and Chandek, 2001) and secondarily on other factors like hospitality (Poon and Low, 2005) and atmosphere in the hotel (Carey, 2008). Moreover, Dominici and Guzzo (2010) observed that the success of a hotel business is not limited to attracting new guests but extends to maintaining the existing guests and establishing effective policies which will create satisfied customers.

The investigation and understanding of customer satisfaction have today become a wide research field and a subject to many theoretical approaches. Greek researchers have also focused on customer satisfaction. Indicatively, Arabatzis and Grigoroudis (2010) used the MUSA methodology (Multicriteria Satisfaction Analysis) in order to explore the satisfaction levels among the visitors of the Dadia-Lefkimi-Soufli Forest National Park in Northern Greece. In addition, Velissariou and Gogou (2009) sought to measure the satisfaction of guests in ten hotels in the city of Larisa and found that the guests were overall satisfied but pointed to the need to upgrade the provided services in hotels. In this case, hotel managements need to consider these study results and improve their provided services by providing enhanced services and, at the same time, upgrading their facilities (Velissariou and Gogou, 2009).

## **STUDY AREA**

### *Regional unit of Drama*

The area of study was the regional unit of Drama which is part of the Region of Eastern Macedonia and Thrace in Greece. The regional unit of Drama is located in the northernmost part of Macedonia and in the westernmost part in the administrative region of Eastern Macedonia and Thrace. It covers an area of 3,468 km<sup>2</sup> and has a population of 98,287 inhabitants (Hellenic Statistical Authority, 2019). The regional unit of Drama is abundant in natural resources and is known for the Falakro Mountain, which is one of the highest mountains in the country. Today, marble exploitation consists the key element in the development of the region and the existing marble processing facilities are not only considered as the greatest and most modern in the country, but also present a remarkable export activity.

The prefecture of Drama is mainly mountainous and located away from the country's largest urban centers and main road axes. It should be noted that a significant part of the local population emigrated abroad during the 1960s and other Greek regions in the 1970s. In particular, during the five-year period from 1959 to 1964 a total number of 16,359 inhabitants migrated from the prefecture of Drama, which back in 1961 had a population of 121,000 inhabitants. Moreover, the population in the prefecture corresponded to 1.44% of the total Greek population, while the people who migrated from the Drama

prefecture accounted for 3.89% of the overall number of immigrants during 1959-1964 (Mandatzis, 2019).

The region suffered further decline with the almost entire abandonment of the once prosperous tobacco cultivations. On top of that, in late 1980s the region was hard hit when most readymade garment businesses closed. The first business of this type started to operate in 1974 and employment followed an upward trend reaching 5,640 job positions in 1989 while mostly women (by 94%) were employed in these businesses (Papamichail, 1996). The negative effects of this situation together with the need to comply with the new agricultural policy were particularly felt in the mountainous, disadvantaged areas (as they have been characterized according to the Directive 75/268/EEC) in the prefecture of Drama (Drama Development Company S.A., 2019).

However, the region has an exceptional tourism potential, and, thanks to the diversity of the local landscape, visitors can get acquainted with every form of natural environment. For instance, from November to April, ski enthusiasts can enjoy snow during their accommodation at the Falakro ski resort. The area, nevertheless, is not attractive only in winter. In spring, a great part of the land is covered in wildflowers and, in autumn, the color changes before the leaves fall off the trees in the forest of Elatia and the Virgin Forest of Frakto can provide a unique experience to visitors. Visitors can also wander in the spruce forests, go mountain hiking, enjoy mountaineering and climbing but also bask in cultural activities such as visiting post-Byzantine churches, archaeological sites, local museums as well as attending folklore events and local fairs. In addition, agritourism enthusiasts have the opportunity to experience life in the countryside and enjoy the hospitality of local people as well as observe all kinds of agricultural activities.

Despite the tourism potential in the area, tourism consisted and still consists only a minor percentage (6%) of the regional gross domestic product and, consequently, it does not have a notable impact on local economy which is based mainly on other sectors such as the primary sector and mineral wealth exploitation (Karamanidis, 2006). Nevertheless, the Region of Eastern Macedonia and Thrace declared 2017 as the “Year of Tourism” in recognition of the great contribution to local economy that tourism can make (Region of East Macedonia and Thrace, 2017).

Even though tourism does not contribute significantly to local economy, the various events which are held every year aim at promoting the local character and the products of the area while they are able to attract a lot of visitors from the wider area, the entire country and other countries.

### *Oneiroupoli*

According to the official site of the event (Oneiroupoli, 2019), “Oneiroupoli” which means “Dream city”, is an event which is held every year in the center of the city of Drama and lasts almost a month. In the context of the event, concerts, theatre and dance performances, sport activities, games as well as

other educational and recreational activities are carried out. It should be noted that visitors can attend all these activities and events for free. The event begins in early December and lasts a month while it was first held in 2003. The Municipality of Drama is responsible for the organization and dozens of volunteers support the event every year. Beside attending activities and concerts, the visitors of Oneiroupoli can also taste traditional local delicacies and purchase souvenirs from the stalls which are placed in the site of the event.

In 2018, "Oneiroupoli" covered an area of 12,000 sq.m. with thematic open and sheltered spaces. According to the Municipality of Drama, visitors have exceeded the seven million mark since 2003. It is also interesting to pay attention to some data. That is, from 2012 to 2016 the number of visitors rose from 200,000 to 400,000 while the number of events increased from 215 to 300 with concerts being held once to twice a week. One of the objectives set by the Municipality of Drama was to increase the number of visitors from the neighboring countries. To that end, in 2015 there were many targeted actions including the advertisement and promotion of the event in Balkan countries, contacts with foreign tourist agents and participations in tourism exhibitions in Bulgaria and Turkey. In addition, for the first time there is evidence on the promotion of the event on the Internet as well as on social media (Facebook, YouTube, Instagram, Flickr). The main aim of the organizers is to render Oneiroupoli a self-funded event in the next years, an objective that seems to be already met.

## **MATERIALS AND METHODS**

The research instrument was the questionnaire and in total 503 visitors participated in the study. To achieve higher response rates and to ensure that all participants would comprehend the questions, the questionnaires were completed through personal interviews. Hence, the questionnaires were collected during the conduct of Oneiroupoli in December 2016 and were completed through personal interviews with the visitors.

The results presented in this paper consist part of a wider study which investigated tourism development in the regional unit of Drama. In this study, the variables related to visitors' socioeconomic characteristics, their satisfaction with the services and infrastructures, the activities in which they would like to participate, reasons for not revisiting and the possibility to recommend Drama to their friends were analyzed. In terms of data analysis, the collected data were analyzed with the Statistical Package for the Social Sciences (SPSS) and the data were processed using the SPSS statistical program. In specific, descriptive statistics, the non-parametric Friedman test and categorical regression were conducted. Descriptive statistics is used to describe all variables and the non-parametric Friedman test is used to rank the sub-topics. In addition, categorical regression is used to

predict the values of the dependent variable for every possible combination of independent variables once the quantified data of categorical variables have been quantified.

## RESULTS

### *Demographic characteristics*

Respondents' gender, age, education level, family status, occupation and some information concerning their visit to Drama were recorded. In terms of gender, there were slightly more male (51.7%) than female respondents (48.3%). It was observed that most visitors (77.7%) were under the age of 51 and, in specific, large proportions of respondents fell into the age categories of 18-30 (by 29.6%), 31-40 (by 28.6%) and 41-50 (by 19.5%). On the contrary, only 11.3% and 10.9% of visitors were aged between 51-60 and were over 60, respectively. As for their education level, most respondents were high school graduates (by 37%) and university or technological institution graduates (by 28.4%). In addition, 15.5% of respondents had attended a technical school, 10.5% were primary school graduates and 8.5% were secondary school graduates. In terms of their marital status, about half respondents (by 47.5%) were unmarried while a large share of visitors was married (42.5%) and only 9.9% were widowed or divorced. Moreover, slightly over half respondents (50.1%) had no children and considerable shares had two children (21.7%) and one child (14.9%). As for their occupation, appreciable shares of respondents were private employees (20.7%) and crop/livestock farmers (20.3%). Unemployed respondents accounted for 11.9%, workers accounted for 10.7% and public servants accounted for 10.3%. However, significantly lower shares of visitors were university students (8.5%), pensioners (7%) and freelancers (5.8%). In addition, only 4.8% were not engaged in paid work but were merely involved in household chores. Respondents' place of residence was also reported and, interestingly, most visitors (by 78.8%) were not residents of the Drama prefecture, whereas as few as 4.8% of visitors were local residents and 16.3% were married to someone from the area. More analytically, the majority (39.4%) resided in the Greek province of Macedonia, and considerable shares resided in Thrace (27.4%) and in other areas of Greece (20.3%). It is also worthwhile to note that only 9.5% of visitors were residents in the city of Drama and only 3.4% of visitors lived abroad. Further information on respondents' visit to Drama was recorded. In specific, the visitors in their majority (by 65%) had visited Drama twice, 35.2% visited Drama for the first time, 37.8% for the second time and 27% many times. In addition, a substantial share of respondents (27%) reported they have visited Drama many times. The manner in which respondents organized their visit to Drama was also investigated and, it was indicated that the strong majority (78.7%) organized it on their own whereas 22.3% of visitors used travel agencies. Over half visitors (54.5%) travelled to Drama with their family and 24.1% were travelling with their friends. Moreover, only one in ten visitors (11.1%) travelled alone while 7.8%

travelled with their partners and only 2.6% travelled in a tour group. What is more, for many visitors (63.4%) the visit to Drama and the event of Oneiroupoli was part of a wider visit to Macedonia whereas fewer visitors visited Drama during a trip to Thrace (13.5%) and Greece in general (10.1%). In addition, 9.3% of visitors were travelling to Bulgaria. Finally, around half respondents (49.3%) would stay one day, 42.5% would stay two days and 8.2% would spend only a few hours in Drama.

#### *Visitors' satisfaction with services*

The satisfaction of Oneiroupoli visitors with the provided services is particularly important as it can point to weaknesses and areas that need to be improved. Respondents were thus asked to evaluate the provided services and their responses were analyzed with the non-parametric Friedman test. According to the results, visitors were mostly satisfied with volunteers' services, music and dance performances, game safety as well as the activities addressed to children. Conversely, they were less satisfied with the quality and prices of local traditional products ( $N= 503$  Chi-Square= 234.91  $df = 8$   $p<0.001$ ). Visitors also stated the degree to which services should be improved. In particular, they perceived that there should be substantial improvement in information signs in archaeological sites, signposting at local attractions, travel maps and guide brochures while a tourist information center should be created.

Visitors' intention to buy agricultural and livestock products from local farmer associations was also examined and, interestingly, the majority of respondents (by 67%) expressed their intention to buy. This finding is exceptionally important and can be used to establish a potential "partnership" between tourism and farmer associations with the aim of providing an improved and more complete experience to tourists.

In order to investigate the factors affecting visitors' satisfaction with services, categorical regression was carried out. Overall satisfaction with services was used as the dependent variable and the independent variables used in the analysis can be seen in Table 1. The statistical coefficient of multiple determination ( $R^2$  value) equaled to 0.917 while  $F$  scored 198.1 ( $p<0.001$ ) which is statistically important. The standardized regression coefficients of the independent variables indicated that visitors' satisfaction with services was mostly affected by the variables: number of children, occupation, and family status. The  $F$  values of each independent variable showed that the deletion of variables with high  $F$  values renders the sub-sample weak, whereas the deletion of the variable "family status" has a negligible effect on the predictability of the sub-sample. Moreover, the measurements of relative importance of the independent variables showed that the variables number of children (45.3%) followed by occupation (24.2%) and education level (17.8%) made the greatest contribution to the dependent variable.

| Independent variables | beta   | F       | p     | Pratt's relative importance index |
|-----------------------|--------|---------|-------|-----------------------------------|
| Gender                | 0.361  | 80.401  | 0.000 | 0.113                             |
| Age                   | -0.037 | 0.027   | 0.870 | -0.004                            |
| Education level       | -0.455 | 112.684 | 0.000 | 0.178                             |
| Family status         | 0.446  | 10.181  | 0.000 | 0.018                             |
| Number of children    | -0.691 | 98.053  | 0.000 | 0.453                             |
| Occupation            | 0.498  | 51.364  | 0.000 | 0.242                             |

Table1. Factors affecting visitors' satisfaction with services

Taking into consideration the transformation diagrams (which are not presented in this paper due to space constraints) and the signs of the standardized coefficients, it can be inferred that parents with four children were dissatisfied with the services whereas parents with up to three children were more satisfied. In terms of visitors' occupation, freelancers, private employees, pensioners were the least satisfied visitors while public servants and those involved in household work were the most satisfied visitors. As for visitors' education level, primary school graduates were the most satisfied group of respondents and satisfaction levels decreased in higher education levels. In terms of family status, married visitors expressed higher satisfaction levels than their unmarried counterparts and finally, in terms of gender, female visitors were more satisfied with services than male visitors.

#### *Visitors' satisfaction with infrastructure*

The visitors of Oneiroupoli were also asked to evaluate the existing tourist infrastructures in the regional unit of Drama. After conducting the non-parametric Friedman test, hotel accommodation and dining spaces received the highest rankings. These were followed by transport, road network, entertainment spaces and museums-ancient monuments ( $N=503$  Chi-Square= 259.285  $df=5$   $p<0.001$ ).

In order to examine the factors affecting visitors' satisfaction with infrastructures, categorical regression was carried out. Visitors' overall satisfaction with infrastructures was used as the dependent variable and the independent variables used in the analysis can be seen in Table 2. The statistical coefficient of multiple determination ( $R^2$  value) equaled to 0.794 and F scored 75.063 ( $p<0.001$ ) which is statistically important. The standardized regression coefficients of the independent variables revealed that satisfaction with infrastructures was mostly affected by the variables: age, education level, occupation and number of children. In addition, the F values showed that the deletion of the variable "number of children" has a negligible effect on the predictability of the sub-sample. Moreover, the measurements of relative importance of the independent variables showed that occupation (47.3%), number of children (28.4%) and education level (20.5%) made the greatest contribution to the dependent variable.

| Independent variables | beta   | F      | P     | Pratt's relative importance index |
|-----------------------|--------|--------|-------|-----------------------------------|
| Gender                | 0.187  | 11.567 | 0.001 | 0.035                             |
| Age                   | -0.829 | 37.721 | 0.000 | -0.067                            |
| Education level       | -0.783 | 17.608 | 0.000 | 0.205                             |
| Family status         | 0.391  | 31.763 | 0.000 | 0.065                             |
| Number of children    | 0.672  | 10.088 | 0.000 | 0.289                             |
| Occupation            | 0.724  | 82.574 | 0.000 | 0.473                             |

Table 2. Factors affecting visitors' satisfaction with infrastructures

Taking into consideration the transformation diagrams (which are not included in this paper due to space constraints) and the signs of the standardized coefficients, it can be concluded that, in terms of visitors' occupation, freelancers expressed the highest satisfaction whereas private employees expressed the lowest satisfaction with infrastructures. In relation to visitors' number of children, the more children the visitors have, the more satisfied they are with infrastructures. Finally, in terms of education, primary school graduates were more satisfied with infrastructures compared with the other more educated visitor categories.

#### Visitors' revisit intention – Recommending Drama to other potential visitors

The reasons for not revisiting were also examined and, as it can be seen in Table 3, the respondents have stated different reasons for not visiting again Drama in the future (Chi-Square = 195.630, df= 3,  $p < 0.0001$ ). In specific, lack of time (44.5%) and kilometric distance (36.7%) were the most important reasons. Other reasons but less important were the lack of interest (12.3%) and travel cost (6.5%).

|                     | Frequency | Percent | Valid Percent |
|---------------------|-----------|---------|---------------|
| Lack of time        | 213       | 42.3    | 44.5          |
| Kilometric distance | 176       | 35.0    | 36.7          |
| Travel cost         | 31        | 6.2     | 6.5           |
| Lack of interest    | 59        | 11.7    | 12.3          |
| Total               | 479       | 95.2    | 100.0         |
| Missing System      | 24        | 4.8     |               |
| Total               | 503       | 100.0   |               |

Table 3. Reasons for not revisiting

Individuals are more likely to visit a destination if this destination is recommended to them by friends who have themselves visited the destination. For this reason, visitors were asked to assess a set of events, activities and characteristics based on whether these could be reasons for recommending their friends to visit Drama (Table 4). According to visitors' responses, natural wealth and climate, local traditional products, cultural activities and the event of Oneiroupoli were the most important reasons for recommending Drama to their friends. Moreover, the respondents evaluated Drama positively in terms of affordability, wineries, and film festival. Conversely, service quality and alternative activities received the lowest rankings.

| Reasons                               | Mean Rank |
|---------------------------------------|-----------|
| Natural wealth and climate            | 7.02      |
| Local traditional products            | 5.13      |
| Cultural activities                   | 5.12      |
| Oneiroupoli                           | 5.12      |
| Affordable destination                | 4.87      |
| Film festival                         | 4.78      |
| Wineries                              | 4.62      |
| Service quality                       | 4.39      |
| Alternative activities                | 3.96      |
| N=503 Chi-Square=634.266 df=8 p<0.001 |           |

Table 4. The application of the Friedman test for ranking reasons for recommending visiting Drama

*Visitors' desire for participating in complementary activities while visiting Oneiroupoli*

Visitors were asked to state whether they would like to participate in complementary activities during their visit in Drama. As it can be seen in Table 5, visitors were mostly interested in participating in activities related to physical activity in nature and, more specifically, mountaineering, cycling, skiing, other sport activities and nature walks following well-organized systems of trails. In contrast to these activities, visitors were less interested in taking part in gastronomy seminars and educational activities.

| Activity  | Mean Rank |
|---|-----------|
| Mountaineering  | 6.77      |
| Cycling   | 5.82      |
| Skiing  | 5.79      |
| Other sport activities                                  | 5.71      |
| Nature walks following well-organized systems of trails | 5.64      |
| Guided tours  | 5.48      |
| Visits to local wineries                                | 5.33      |
| Horse-riding  | 5.26      |
| Gastronomy seminars                                     | 4.80      |
| Educational activities                                  | 4.39      |
| N=503 Chi-Square=243.299 df=8 p<0.001                   |           |

Table 5. The application of the Friedman test for ranking visitors' preferences for complementary activities

## CONCLUSIONS

It was somewhat to be expected that the majority of visitors in Oneiroupoli would be quite young, namely between the ages of 18 and 40, because Oneiroupoli offers a significant number of activities which are addressed to younger children and concerts which attract the interest of relatively young individuals. In addition, most visitors stated that it was their second time visiting Drama, and many were residents in the wider region of Macedonia and Thrace. For many respondents, the visit in Drama would last two days and was part of a trip to other areas in Macedonia.

The investigation of visitors' satisfaction with services revealed that they were mostly satisfied with the services provided by volunteers as well as the events and activities carried out in the context of

Oneiroupoli. Interestingly, most visitors were willing to buy local traditional products but were dissatisfied with the price and quality of these products. Beside the need to improve local products, visitors pointed to the need for improving signposting at tourist sites and installing information signs in order to facilitate visitors. Admittedly, signposting is relatively easy and requires low cost but can substantially facilitate tourists and improve their experience. Hence, special attention should be given to visitors' satisfaction because high service quality creates not only satisfied but also loyal customers (Levesque and McDougall, 1996; Kumar et al., 2009). In this study, the least satisfied visitors were parents with four children, unmarried individuals and freelancers. These visitor groups could be considered more demanding and, thus, the organizers should take steps to improve the services provided to them.

Responsible bodies should also seek to improve infrastructures since visitors perceived that there are major deficiencies especially in terms of road networks. However, improvements in infrastructure are quite expensive and the unfavorable economic situation of the country poses great difficulty in making such improvements. In addition, it was interesting that private employees and parents with up to three children were the most dissatisfied visitors with infrastructures.

On a general note, it could be stated that visitors were satisfied with their experience in Drama as they would not visit this destination again due to lack of time rather than lack of interest in Oneiroupoli. Visitors' satisfaction was also confirmed by their intention to recommend visiting Drama to their friends so that they can also enjoy the event and the natural wealth in the area.

In order to improve visitors' satisfaction and, at the same time, exploit the natural wealth in the area, it would be useful to provide visitors with the opportunity to participate in other activities during their visit. As shown in this study, visitors were highly interested in taking part in various activities and were very keen on activities carried out in nature such as mountaineering, cycling and skiing. This finding resonates with other studies which have concluded that the natural environment remains a constant point of reference and a driver of local development (Sinclair, 1998; Garay and Canoves, 2010). In conclusion, it could be said that any communication policy is doomed to fail unless it consists part of a wider strategy on the future development of an area. For this reason, businesses, members of the productive sectors and local residents need to cooperate. If wider cooperation is ensured, strategic communication ought to be targeted as well as set clear and feasible objectives. At the same time, the outcomes related to the objectives should be evaluated annually in order to highlight areas that need improvement and to point to the appropriate steps that should be taken.

## A MULTI-LEVEL FRAMEWORK ON DRIVERS OF COOPETITION

Garraffo, Francesco<sup>1</sup>; Siregar, Suzanna<sup>2</sup>;

<sup>1</sup>Department of Business Economics & Management, University of Catania, Catania, Italy

<sup>2</sup>Laboratorium LePMA, Gunadarma University, Depok, Indonesia

### ABSTRACT

*A review of the literature on coopetition reveals that the majority of studies focus either on the nature of the phenomenon or on its outcomes. Less attention has been directed on drivers explaining why cooperative agreements rise in an industry. By using an event history analysis, we developed a multi-level framework showing how the likelihood of entering a cooperative agreement is influenced by firm-, inter-firm, and industry-level factors, including the number of previous firm's agreement, the competitors' cultural distance, the number of partners involved, the pace of cooperative agreement, and the total number of cooperative agreement. Implications for research and practice are drawn from results.*

*Keywords: coopetition, joint ventures, proliferation of coopetition, event history analysis, car industry, telecommunication industry, air transportation industry, bank industry, computer programming services industry.*

### INTRODUCTION

A growing number of theoretical and empirical investigations in the literature of management focus on agreements among competitors (Brandenburger & Nalebuff, 1996; Lado et al., 1997; Bengtsson & Kock, 2000; Garraffo, 2002; Gnyawali & Madhavan, 2006; Chen, 2008; Le Roy et al., 2010; Galvagno & Garraffo 2010a). This is not surprising, as the development of competition in national and international markets calls for conceptual contributions and empirical observations on the effects of emerging approaches in cooperative and competitive strategies, in different cultures and industries (Gnyawali & Park, 2011).

A substantial bunch of the literature regards cooperative strategies at different levels (firm, inter-firm, industry-level): *strategic alliances* (Ancarani & Shankar, 2003; Dussauge, et al., 2000; Khanna, et al., 1998), *collective strategies* (Yami & Roy, 2007), *competitive strategies* (Fosfuri & Giarratana, 2009; Lado, et al., 1997), *co-marketing agreements* (Sengupta, 1995), *supply chain relations* (Cachon & Zipkin, 1999; Kotzab & Teller, 2003), *network relations* (Bengtsson & Kock, 2000; Garraffo, 2002; Ritala et al., 2008; Tidström, 2008), and *cooperative R&D projects* (Miotti & Sachwald, 2003; Weck & Blomqvist, 2004).

The concept of coopetition came in the literature of management by two streams of research (Le Roy et

al., 2010; Rusko, 2011). One, based on the idea of cooptition as a game, where different players increase the business “pie” by cooperating with competitors and then competing to divide it up (Brandenburger & Nalebuff, 1996). Another one, related to the alliances literature where, within an alliance, competitive tensions persist among partners (Gomes-Casseres, 1994; Harbison & Pekar, 1998). The first stream of research relies on the idea that one of the most important reasons to cooperate among competitors is to gain a better position in the market and thus achieving a strategic advantage (Hamel et al., 1989). The second stream of research is based on the idea that cooperation and competition are two opposed forces entangled inside each alliance relationship (Park & Ungson, 2001). The majority of these studies analyze the outcomes of cooptition (Afuah, 2000; Baldwin & Bengtsson, 2004; Barbee & Rubel, 1997; Bengtsson & Kock, 2000; Gnyawali & Madhavan, 2006; Hamel et al., 1989; Hokura, 2007; Luo, 2007; Luo et al., 2007; Ritala et al., 2008; Oliver, 2004; Quintana-Garcia & Benavides-Velasco, 2004), while others define the nature and the conceptual boundaries of this phenomenon (Bengtsson & Kock, 2000; Lado et al., 1997; Luo, 2007; Rusko, 2011).

Less attention has been focused on drivers explaining the occurrence of cooptitive agreements among firms that increase the proliferation of cooptition in different industries and markets.

Some contributions already discussed the drivers of cooptitive agreements among competitors (Gnyawali & Park, 2008), but from the perspective of costs and benefits for players. Our paper tries to continue to fill this research area by studying drivers, at firm, inter-firm and industry-level that affect the proliferation of cooptition in different industries. By carrying out an event history analysis in five global industries (air transportation, banks & financial services, computer programming services, motor vehicles, telecommunications) along 10 years, we aim to give a more in depth comprehension of why cooptition has been rising in several industries and what drivers at firm-, inter-firm and industry-level have been influencing its proliferation.

### **Theoretical Background and Hypotheses Development**

To develop drivers that affect the proliferation of cooptition, we chose two key concepts from: a) the transaction costs economics (TCE) (Hennart 1988; Teece, 1986; Williamson 1981) and, b) the competitive dynamics (Baum and Korn, 1996; Chen, 1996; Gatignon et al., 1989; Gnyawali & Ravindranath, 2001; Ketchen et al. 2004; Lambkin, 1988; Smith et al, 1989).

From the TCE we took the concept of “opportunistic behaviors” that are always entangled in cooptition, despite partners agree to carry out together projects that will affect their strategy, market positioning and technological innovation. From the competitive dynamics, we took the “imitative behaviors” that always occur during the competition among firms within an industry but can occur during the cooptition among firms working together, as well.

These concepts are particularly relevant in explaining the proliferation of cooptitive agreements and,

in our framework they complement each other (Kogut, 1988).

Accordingly, the drivers of cooperative agreements that we take into account are: a) at the firm level: the competitors' experience into inter-firm collaborative agreements, and the competitors' cultural distance, b) at the inter-firm level: the number of competitors involved in the agreement, and c) at the industry level: the lag between two consecutive cooperative agreements in the industry, and the total number of inter-competitor agreements in the industry (see Fig. 1) (Galvagno & Garraffo, 2010b).

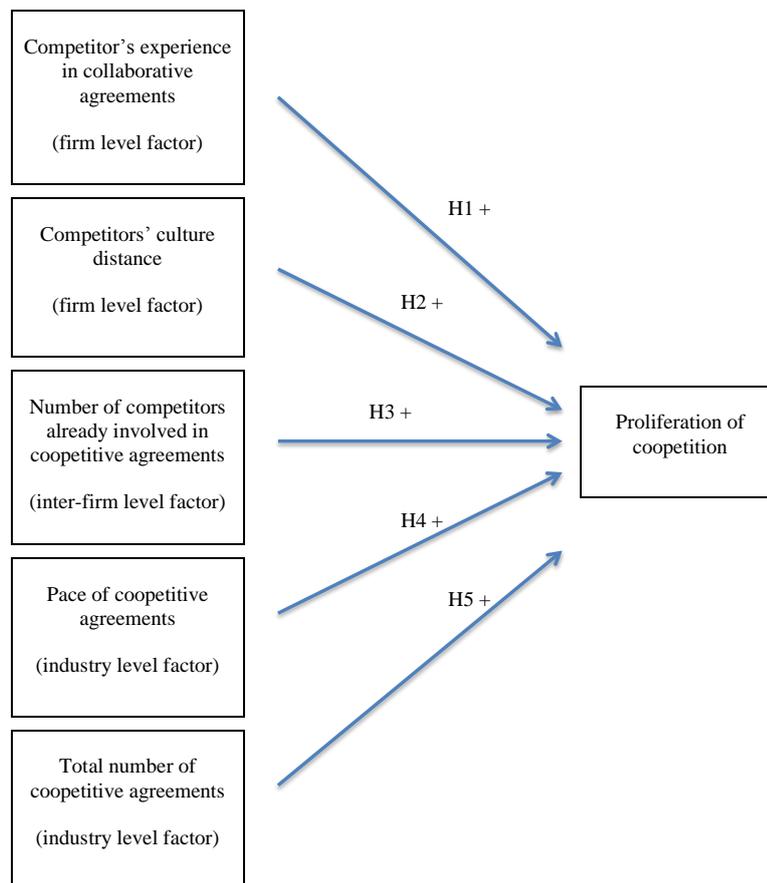

Figure 1. *The proliferation of cooperation: a multi-level framework*

The competitors' experience in cooperation allows arguing that the likelihood of cooperative agreements is higher when we observe a growing number of collaborative competitors in an industry (Bouncken et al. 2020). A firm with previous or on-going programs of cooperation has a track record to be considered trustworthy. Because it is almost impossible, and certainly un-efficient, to foresee every circumstance affecting an agreement and contractually regulate it (Williamson, 1985), a trustworthy competitor is a desirable partner even for another competitor (Kogut, 1991). Therefore:

H1: the greater the competitor's experience in collaborative agreements, the higher the chance to enter a cooperative agreement.

The second explanatory variable at the firm-level, the competitors' cultural distance, is taken into consideration to measure the cultural effect on the proliferation of inbound or outbound agreements among competitors (Contractor & Lorange, 1988, Park & Ungson, 1997; Talay & Cavusgil, 2009). Park

and Ungson (2001) agree with the argument that cultural compatibility between partners is the most important factor in the survival of a global alliance, because the defects in alliances often stemmed from the unobtrusive influence of national culture on behavior and management systems, which may lead to competitive behaviors (Baum and Korn, 1996). Cultural distance, in our perspective, can make the same effect because, within a cooperative agreement, differences in national cultures can create unsolvable conflicts. Partners from different cultures tend to experience a lack of fit in norms and meanings, making coordination more difficult. Therefore:

H2: cooperative agreements are more likely to occur when the partners are from culturally similar countries.

At the inter-firm-level, the chance of a firm to enter a cooperative agreement is affected by the total number of direct competitors already involved in cooperative partnerships (Garraffo, 2002). Accordingly to the literature on competitive dynamics the number of competitors that will execute a course of action is positively affected by the number of firms that already took it (Knickerbocker, 1974; Gimeno, 2004).

Although the costs of coordinating and managing a new agreement increase, as a consequence of the lower number of trustworthy potential partners still available (Williamson, 1985), the remaining competitors belonging the industry facing cooperative agreements focused on specific tasks (technological innovations, product or process innovations, new market opportunities, etc.) will respond by joining a new agreement. Therefore:

H3: the greater the number of direct competitors already involved in prior cooperative agreements, the higher the chance of a firm to enter a cooperative agreement.

At the industry-level, we first argue that the pace of competition in an industry affects the chance of a firm to enter a cooperative agreement. The period of time that separates two consecutive agreements permits to measure the time lag effect of competition in an industry. According to the literature that highlights the role of timing in competition (Chung, 1999; D'Aveni, 1994; Wiggins & Ruefli, 2005), the timing of a firm's action is affected by the pace of competitors' course of actions. In our perspective, the pace of competition will increase if a growing number of other competitors enter cooperative agreements. Therefore:

H4: the higher the pace of cooperative agreements in the industry, the higher the chance of a firm to enter a cooperative agreement.

Moreover, the total number of cooperative agreements in the industry affects the chance of a firm to enter a cooperative agreement. As we already said, a firm's course of action is affected by its competitors' course of action (Chen, 1996; Gimeno, 2004). As a result, a snow ball effect of cooperative

agreements in the industry is predictable as a consequence of the similar cumulative courses of action take by firm competing in the industry. Therefore:

H5: the greater the number of cooperative agreements in the industry, the higher the chance of a firm to enter a cooperative agreements.

## DATA AND METHOD

To test our hypotheses, we decided to focus on all the joint ventures (JVs) between competitors launched from 2010 to 2019 in five large global industries all over the world: car makers (Gwynne, 2009), banks, telecommunications, air transportation (Chiambaretto & Fernandez, 2016), and computer software.

The reasons why we decided to analyse JVs in five different large global industries all over the world are the followings: (a) increasing the ability of the data-set to seize the proliferation of cooperation in industries that differ in terms of: number of firms, competitive scenario, consumer behaviour, alliance activity, product and process innovation, and, (b) testing our hypotheses of drivers leading to cooperative agreements with cases of JVs occurring in different, but in our topic comparable, industries (Galvagno & Garraffo, 2010b; Garraffo & Siregar, 2017).

To create the dataset of JVs we used the Zephyr database by Bureau van Dijk ([www.zephyr.bvdep.com](http://www.zephyr.bvdep.com)). To be included in the study, a JV should meet three criteria: (1) it had to be a 50-50 venture (in term of equity arrangement); (2) it had occurred in the period between January 1<sup>st</sup>, 2010 and December 31<sup>st</sup>, 2019; (3) firms involved in any JV had to be direct competitors that share exactly the same four digits of USSIC codes.

The USSIC codes we took into account in testing the hypotheses are the following: (1) USSIC 3711 – Motor vehicles and passenger car bodies; (2) USSIC 4512 – Air transportation, scheduled; (3) USSIC 4813 – Telephone communications, except radiotelephone; (4) USSIC 6021 – National commercial banks; (5) USSIC 7371 – Computer programming services.

Zephyr database records 49.095 JV occurred in the period of January 1, 2010 to December 31, 2019, within the five industries selected, with 1288 firms involved, 155 of which are censored cases and 1.133 are uncensored ones. The censored cases are firms that have not been involved in any cooperative JV during the observation period, while the uncensored cases represent the firms that have experienced at least one cooperative JV during the period of analysis. Table 1 resumes number of cases employed in the analysis.

| USSIC | USSIC description                                    | censored case | uncensored case | total n. of firm | n. of country |
|-------|--|---------------|-----------------|------------------|---------------|
| 1     | 3711 Motor vehicles and passenger car bodies         | 59            | 192             | 251              | 41            |
| 2     | 4512 Air transportation, scheduled                   | 44            | 235             | 279              | 46            |
| 3     | 4813 Telephone communications, except radiotelephone | 21            | 168             | 189              | 25            |
| 4     | 6021 National commercial banks                       | 17            | 145             | 162              | 28            |
| 5     | 7371 Computer programming services                   | 14            | 393             | 407              | 33            |
| Total |  | 155           | 1.133           | 1.288            | 81            |

Table 1. *Number of cases*

The dependent variable is the likelihood of a firm to establish a cooperative JV during the observation period. Dependent variable is also referred as censoring variable which denotes the event in the Event History Analysis. Event in this research is a condition in which a firm is not involved in any cooperative JV during the observation period. Event is denoted by the value of zero (0) of the censoring variable (cooperation = 0). The occurrence of a cooperative JV is represented by the value of one (1) of the dependent variable (cooperation = 1).

This research employs the duration variable as the time variable (duration). Time variable is defined as the time from the beginning date of the observation period (January 1<sup>st</sup>, 2010) to the date the first cooperative JV occurred for each case (firm). The value of duration is denoted in days. For all the censored cases, January 1<sup>st</sup>, 2010 is assigned as the replacement of the date of the first cooperation. This value is not only needed in completing the value of time variable but also required in computing one of the covariates (time\_lag).

At the firm-level, covariates are: (1) the number of collaborative agreement occurred prior to the first cooperative JV (ncbpre) and (2) cultural distance between acquirer or parent firms (cd\_p). The first covariate (ncbpre) represents the firm's experience in having collaborative agreements before establishing a cooperative JV. This variable designates the number of JVs established by a firm with other firm(s) operating in different industries before that the firm establishes its first cooperative JV.

For measuring the cultural distance of parent firms (cd\_p), we employ a composite index based on the deviation of the four cultural dimensions (i.e. power distance, uncertainty avoidance, masculinity/femininity, and individualism) of each parent firm involved in cooperation (Hofstede, 1983). This measure is a modification of those that first formulated by Kogut and Singh (1988) which then followed by most studies of correlation between cultural distances and joint ventures (Meschi

and Riccio, 2008; Park and Ungson, 1997; Pothukuchi, *et al.*, 2002). In this research, the  $CD_j$  index represents the cultural distance between each parent firm's country of origin involved in each cooperative agreement.

The deviations are corrected for differences in the variances of each dimension and then arithmetically averaged. The index is calculated following the below equation:

$$CD_j = \sum_{i=1}^4 \left\{ \frac{(I_{ik} - I_{im})^2}{V_i} \right\} / 4$$

where  $CD_j$  stands for cultural distance between parent firms in the  $j^{\text{th}}$  cooperative joint venture,  $I_{ij}$  stands for the index for the  $i^{\text{th}}$  cultural dimension of the  $k^{\text{th}}$  and  $m^{\text{th}}$  country in a cooperative joint venture,  $V_i$  is the variance of the index of the  $i^{\text{th}}$  cultural dimension. Though the scaling method imposes weights based on index variance, any resultant measurement error cannot be expected to be correlated theoretically with the other independent variables and should reduce the significance of the statistical relationships (Kogut and Singh, 1988). In this study the  $CD_j$  is operationalized as the variable of  $cd\_p$ .

For the analysis at the inter-firm level, we solely used the variable of number of competitors involved in cooperative agreement ( $nfc$ ). This variable denotes the number of direct competitors (number of firms) of every referent firm involved in competition during the observation period.

Analysis at the industry level includes two industry specific drivers: the number of firms involved in cooperative agreements in a specific industry ( $ncoind$ ) and the time-lag between any two consecutive cooperative agreements ( $time\_lag$ ) within a specific industry. The variable  $time\_lag$  is denoted in days. The first time lag is the lag between the date of the first cooperative agreement, occurred in the industry, to the date of the beginning of the observation period (January 1<sup>st</sup>, 2010), the second time lag is between the date of the second cooperative agreement happened in the industry to the first's, and so on.

The number of cooperative agreements in the industry ( $ncoind$ ) is a counter-like variable. The first cooperative agreement happened in the industry in the observation period does not have a predecessor, the second cooperative agreement has only one cooperative agreements occurred prior to it, and so on (since the analysis at the industry-level includes five industries, the analysis deals with five series of datasets of  $ncoind$  variable and  $time\_lag$  variable).

Our model examines the effects of firm-, inter-firm and industry-level drivers on the likelihood to enter a cooperative agreement. The analyses derived from Cox proportional hazards regressions models (Cox, 1972) of the following form:

$$h_i(t) = h_0(t) \times \exp\left(\sum \beta_k \times [X_i(t)]\right),$$

where  $h_0(t)$  is the baseline hazard function and  $X_{ik}(t)$  is the value of the  $i^{th}$  covariate (independent variable) where  $i = 1, 2, 3, 4,$  and  $5$  consecutively referred to variable of `ncbpre`, `cd_p`, `nfco`, `ncoind`, and `time_lag` and  $\beta_i$  is the exponential regression coefficient for the  $i^{th}$  covariate. A key benefit of the Cox model is that no assumptions are made as to the distribution of the baseline hazard function. For examples of management research using the Cox approach, see Katila and Shane (2006) and Yu & Cannella (2007).

In our data set, the failure event (in event history terminology) was the occurrence of the first cooperative agreement for a firm. Starting on the date of January 1<sup>st</sup>, 2010 we noted the number of days that elapsed until the first cooperative agreement (in each industry) was entered by a firm. If the observation period ended before the first cooperative agreement occurred, the observation was right-censored at December 31<sup>st</sup>, 2019. We used STATA 10.0 to estimate our model.

## RESULTS

Table 2 resumes the descriptive statistics of research variables. Since the analyses at all levels examine the relationship between the dependent variable (cooperation) and the covariates using univariate models, we do not test the correlations neither perform the multi-collinearity between variables.

| variable and covariates           | mean    | standard deviation |
|-----------------------------------|---------|--------------------|
| Dependent variable: cooperation   | 0.88    | 0.01               |
| Time variable: duration           | 2190.25 | 31.49              |
| Firm-level                        |         |                    |
| Covariate : <code>ncbpre</code>   | 0.02    | 0.00               |
| Covariate : <code>cd_p</code>     | 0.28    | 0.02               |
| Inter-Firm Level                  |         |                    |
| Covariate : <code>nfco</code>     | -4.11   | 0.05               |
| Industry-Level                    |         |                    |
| Covariate : <code>time_lag</code> |         |                    |
| Car Industry                      | 35.35a  | 3.62               |
| Airline Industry                  | 36.05a  | 3.44               |
| Telephone Industry                | 55.27b  | 4.18               |
| Banking Industry                  | 57.62b  | 4.51               |
| Software Industry                 | 24.96a  | 2.85               |
| Covariate: <code>ncoind</code>    |         |                    |
| Car Industry                      | 105.62a | 7.35               |
| Airline Industry                  | 138.42b | 6.98               |
| Telephone Industry                | 102.96a | 8.47               |
| Banking Industry                  | 88.00a  | 9.15               |
| Software Industry                 | 263.26c | 5.78               |

Table 2. Descriptive Statistics

Means sharing a letter in the group label are not significantly different at the 5% level. For industry covariates, the descriptions are chained with Duncan's homogenous subsets that represent the comparison of the values of `time_lag` and `ncoind`. The homogeneity tests of `time_lag` lead to two

ranks of values. Software, airlines and car industry share the same value of mean of time\_lag and in the shortest time\_lag value group, while, telephone and banking are proven to be a group with the longer time lag, For the variable of ncoind, the order of the value from the lowest to the highest is: (1) banking, (2) telephone, (3) car, (4) airlines, and (5) software industry. In term of the mean of ncoind, banking, telephone and car industry are in the same group with the lowest ncoind, where airlines in the middle group and software in the highest mean group.

#### *Survival and Hazard Functions at the Firm Level*

Through survival function, the probability of objects to survive over the observation period is delineated. In this research, objects that survive longer than the observation period represent the JV that could not be considered as cooperative JV. Kaplan-Meier survival functions including all industries (Figure 1) has a downward slope. This tendency prevails that the number of JV that are not regarded as cooperative decreases over time during the observation period.

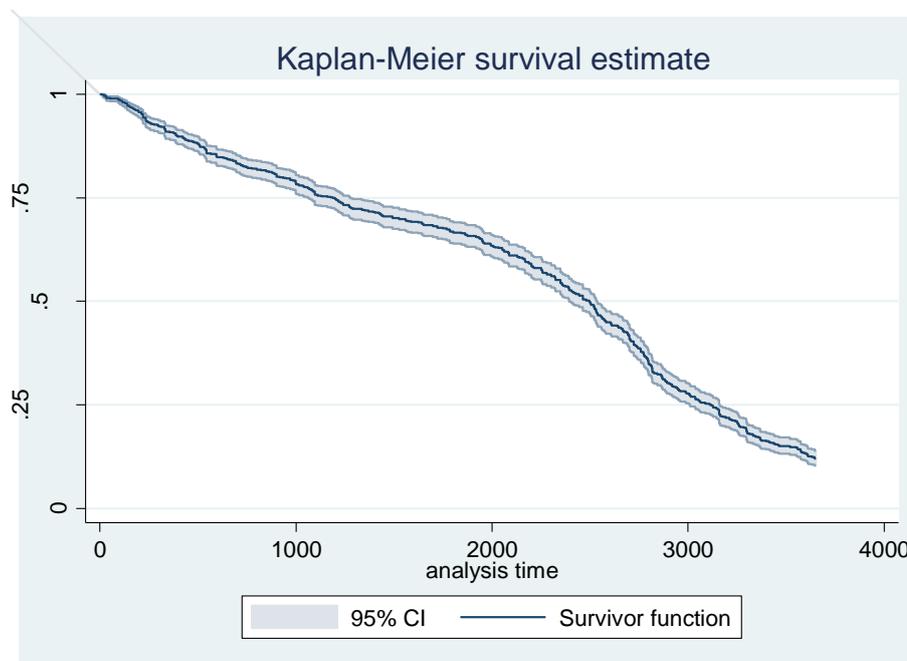

Figure 1. *Kaplan-Meier survival function, all industries, January 1<sup>st</sup>, 2010 – December 31<sup>st</sup>, 2019*

Hazard function is the derivative of the survivor function over time and does not display density or a probability. However, it can be regarded as the probability of failure in an infinitely small time period between  $t$  and  $t + \Delta t$  given that the subject has survived up till time  $t$ . In this sense, the hazard is a measure of risk: the greater the hazard between times  $t_1$  and  $t_2$ , the greater the risk of failure in this time interval. Figure 2 and Figure 3 show hazard function for all industries. Respectively, Figure 2 and Figure 3 displays the Kaplan-Meier hazard function and Nelson -Aalen cumulative hazard function. Both functions have upward slope, showing that the hazard, i.e. the cooperation increases over time during the observation period.

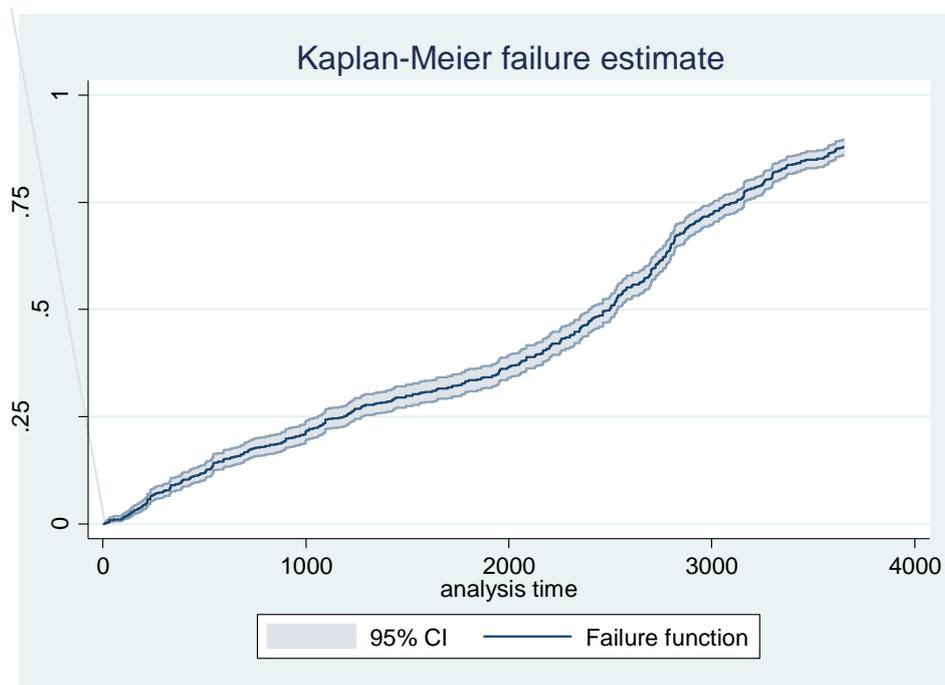

Figure 2. Kaplan-Meier hazard function, all industries, January 1<sup>st</sup>, 2010 – December 31<sup>st</sup>, 2019

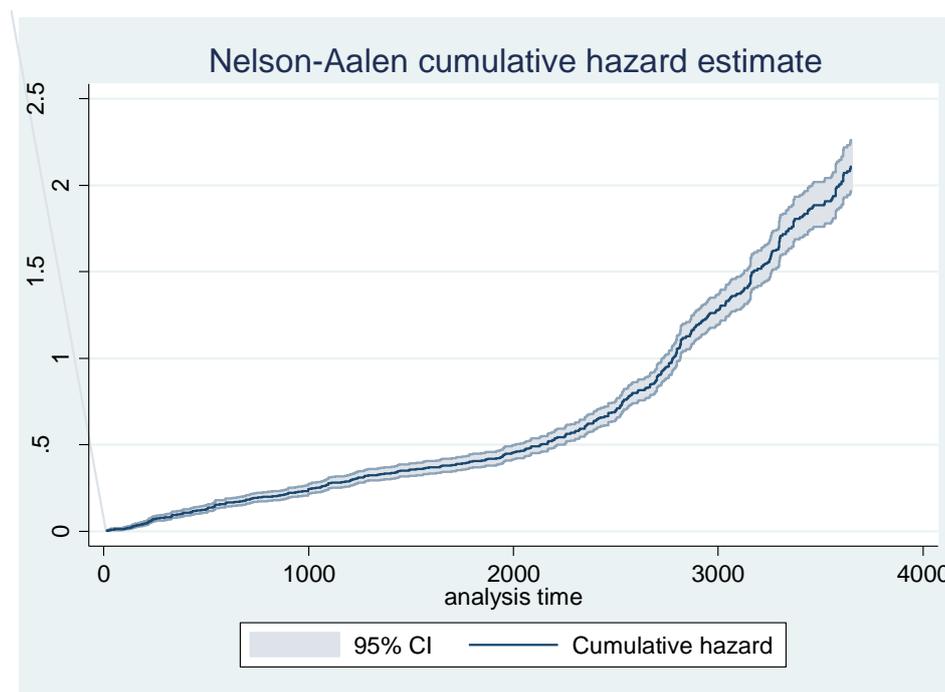

Figure 3. Nelson -Aalen cumulative hazard function, all industries, January 1<sup>st</sup>, 2010 – December 31<sup>st</sup>, 2019

*Survival and Hazard Functions at the Industry Level*

The slope direction of the survival and cumulative hazard functions of each industry involved shares the similarity with those of the overall survival and cumulative hazard functions. Figure 4 displays the baseline survival function for each industry included in the analysis. The downward slope of the survival function of each industry indicates that during the observation period, number of agreements

that could not be categorized as cooperative in each industry decreases overtime. Figure 5 displays the baseline hazard function in the five industries.

The direction of the functions' slope shows the hazard function as the inversion of survival functions. As the cumulative hazard functions for overall industries, the hazard functions of each industry also possess the upward slopes, which indicate that the occurrence of competition increases over time.

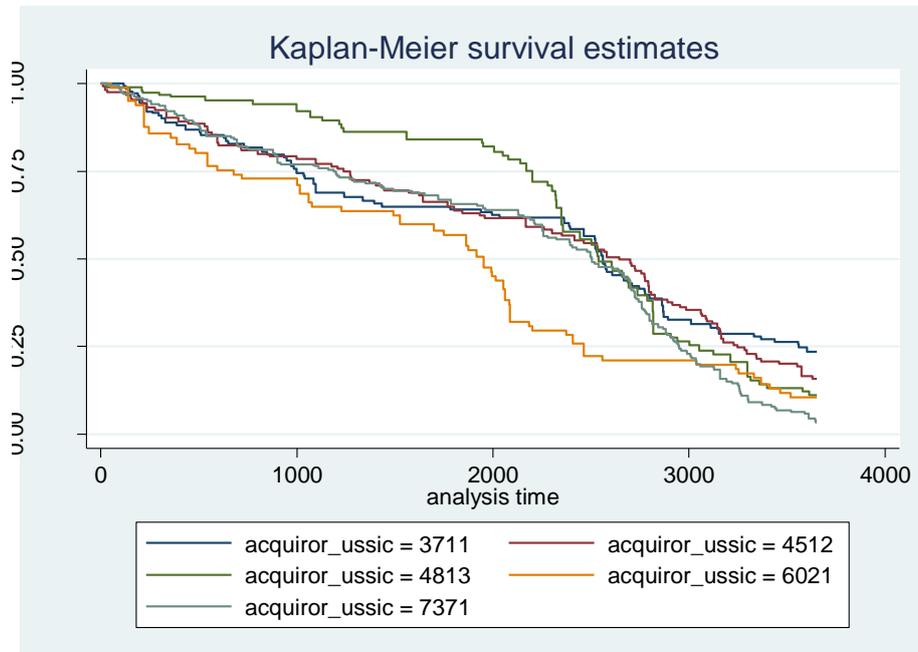

Figure 4. *Kaplan-Meier survival function, the five industries, January 1<sup>st</sup>, 2010 – December 31<sup>st</sup>, 2019*

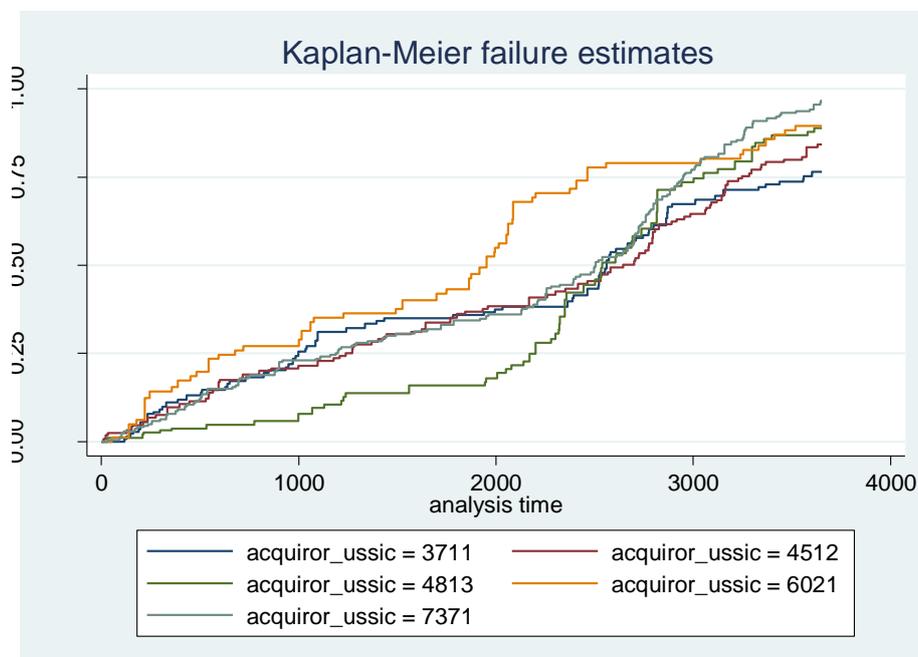

Figure 5. *Kaplan-Meier hazard function, the five industries, January 1<sup>st</sup>, 2010 – December 31<sup>st</sup>, 2019*

Log-rank test (Table 3) followed by paired equality tests (Table 4) are used to justify whether the differences of the survival/hazard functions between industries are significantly different. The null

hypothesis for the equality of survivor functions ( $H_0$ ) is all functions are significantly the same, while the alternative hypothesis ( $H_1$ ) is at least one function is not significantly the same. The  $P > \chi^2 = 0.000$  of the result (Table 3) leads to rejection of  $H_0$  and accept the  $H_1$ , at least one industry has a significant different survival function compare to the others at the 5% level of significance.

| USSIC              | Events observed | Events expected |
|--------------------|-----------------|-----------------|
| 1 3711 (car)       | 192             | 244.33          |
| 2 4512 (airlines)  | 235             | 268.98          |
| 3 4813 (telephone) | 168             | 180.38          |
| 4 6021 (banking)   | 145             | 106.54          |
| 5 7371 (software)  | 393             | 332.77          |
| Total              | 1133            | 1133            |
|                    | chi2            | 41.82           |
|                    | P> chi2         | 0.0000          |

Table 3. *Log-rank test for equality of survivor functions*

The results of paired equality tests (Table 4) indicate that the survival functions of car, airlines and telephone industry are significantly equal, while banking and software industry share the equality of their survival functions.

| USSIC   | chi2  | P>chi2 | Note      |
|---|-------|--------|-----------|
| 3711 (car) × 4512(airlines)                     | 1.04  | 0.3077 | equal     |
| 3711 (car) × 4813 (telephone)                   | 2.18  | 0.1400 | equal     |
| 3711 (car) × 6021 (banking)                     | 20.38 | 0.0000 | not equal |
| 3711( car) × 7371 (software)                    | 22.97 | 0.0000 | not equal |
| 3711 (car) × 4512 (airlines) × 4813 (telephone) | 2.37  | 0.3051 | equal     |
| 6021 (banking) × 7371 (software)                | 1.21  | 0.2705 | equal     |

Table 4. *Summary of paired equality test of survivor functions between Industries*

#### *Hypothesis Testing*

Examinations on the models report that mostly the relationships between the occurrence of cooperative agreement (cooperation proliferation) and the covariates are significant (Table 5) at 5% of significance level. The significance of the relationships is proven by the value of  $P$  (or Probability)  $> \chi^2$  (less than 0.05) which comes in conjunction with LR  $\chi^2$ . Even though these relationships are significant, the values of their  $R^2$  are relatively low. Most research omits the  $R^2$  and only utilize the LR  $\chi^2$  to test the significance of the relationships in the model.

| Covariates        | Log likelihood | LR chi2 | P> chi2 | Hazard Ratio | Std Err | Coo. Likelihood | R2 (%) | z     | P > z  | Notes           |
|-------------------|----------------|---------|---------|--------------|---------|-----------------|--------|-------|--------|-----------------|
| <b>Firm</b>       |                |         |         |              |         |                 |        |       |        |                 |

Table 5. *Hypothesis Testing*

At the firm level analysis, the relationships between the occurrence of coopetition and the number of prior collaborative agreements (ncbpre) (H1) and between the cultural distance of parent firms (cd\_p) (H2) are significant. The strength of variable of number of prior collaborative agreement (ncbpre) to explain the likelihood of the occurrence of coopetition is only 0.36%. Cultural distance of parent firms (cd\_p) only puts influence at 0.22% on the likelihood of the occurrence of coopetition. In terms of cultural distance of parent firms (cd\_p), Chinese firms are the most determined to choose Chinese partners in coopetitive agreements (Table 6). Out of 673 Chinese firms, 643 establish coopetition with their fellow Chinese firms (indicated by the cd\_p = 0). The mean and std deviation for cd\_p respectively are 0.28 and 0.61. Default value for the variable is 0, meaning no difference in cultural distance.

| Country               | censored |        |       | uncensored |        |       |
|-----------------------|----------|--------|-------|------------|--------|-------|
|                       | cd_p=0   | cd_p>0 | total | cd_p=0     | cd_p>0 | total |
| China                 | 18       | 9      | 27    | 643        | 30     | 673   |
| Japan                 | 4        | 5      | 9     | 39         | 34     | 73    |
| US                    | 4        | 5      | 9     | 13         | 20     | 33    |
| Others (78 countries) | 66       | 44     | 110   | 240        | 114    | 354   |
|                       | total    |        | 155   | total      |        | 1133  |

Table 6. *Cultural Distance*

The value of hazard ratio in the relationships of  $ncbpre \times cooperation$  is 1.6561 and the direction of the relationship is positive which also justified by the positive values of  $z$ . The result denotes that a unit increase in number of collaborative agreement prior to the first cooperation is significantly associated with a 65.61% increase of the possibility of the occurrence of cooperation. This result supports H1: the greater a competitor's experience in collaborative agreements, the higher the chance to enter a cooperative agreement.

As for the relation between cultural difference  $cd\_p$  and the existence of cooperation, the hazard ratio value is 0.9029. This value signifies the negative direction in the relationship. A unit increase in  $cd\_p$  may lead to a 9.71% increase of the likelihood of the occurrence of cooperation. Cooperation is more likely to occur when the partners come from culturally similar countries (H2).

Analysis at inter-firm level in which the variable of number of competitors involved in cooperation ( $nfco$ ) is examined lead to the acceptance of Hypothesis 3. The relationships of  $nfco \times cooperation$  is proven significant, with  $R^2 = 0.61\%$  and Hazard Ratio = 1.0536. That is, a unit increase in number of competitors involved in cooperation leads only to 5.36% increase of the likelihood of the occurrence of cooperation.

At the industry level, the relationships between the occurrence of cooperative agreements and the time lag between two consecutive agreements in all industries (H4) are indicated significant. The direction of  $time\_lag \times cooperation$  association in all industries is uniformly detected significant and negative. The significant relationships are in accordance with moderate values of  $R^2$ . Consecutively, the degree of  $time\_lag$  variable in explaining the proliferation of cooperation in car, airlines, telephone, banking and software industries are 63.70%, 48.79%, 22.17%, 37.06%, and 16.10%. All the values of the hazard ratio in all relationships are negative. A day increase of  $time\_lag$  covariates may affect a 0.14 to 0.21% decrease of the likelihood of the occurrence of cooperation.

Finally, concerning the relationships between the proliferation of cooperation and the total number of cooperative agreements in the industry (H5), only in the car and software industries the  $ncoid$  covariate is proven to have significant influence. In the other industries,  $ncoid$  does not affect the occurrence of cooperation. In the significant relationships, the direction of the relationships is proven to be positive. The hazard ratios both in the significant and non-significant relationships are slightly above or under 1. The values of  $R^2$  in the models in which the number of total cooperative agreements in the industry is associated with the occurrence of cooperation are less than 0.5% except in software with  $R^2 = 13.19\%$ .

## DISCUSSION

Our study examined the effect of specific antecedents, at firm-, inter-firm, and industry-level, on the

occurrence and proliferation of cooptation. By testing some hypothesis, derived from a multi-level framework, through an Event History Analysis, our study contributed to the literature on cooptation by identifying some drivers, at firm, inter-firm and industry-level, that explain the proliferation of cooptation. The drivers of cooptative agreements that we taken into account are: a) at the firm level: the competitors' experience into collaborative agreements, and the competitors' cultural distance; b) at the inter-firm level: the number of competitors already involved in cooptative agreements; c) at the industry level: the lag between two consecutive cooptative agreements in the industry, and the total number of inter-competitor agreements in the industry.

The results suggest that firms' experience in cooperation (H1) and the cultural similarity among competitors (H2), predict whether a firm will enter a cooptative agreement. Moreover, the total number of competitors already involved in cooptative agreements (H3) has a low positive effect on the chance of a firm to cooptate.

Finally, the speed of agreements among competitors (H4) and the total number of cooptative agreements in the industry (H5) (only in the car and software industries) are positively related to the chance of a firm to enter a cooptative agreement itself.

In general, these results support the idea that cooptation, at firm-level, is a consequence of the availability of trustworthy competitors (Kogut, 1991) belonging to similar cultural contexts, while at the inter-firm and industry-level, is an outcome of competitive and cooperative moves undertaken by competitors in a logic of competitive or hyper-competitive dynamics (D'Aveni, 1994; Chen, 1996; Chung, 1999; Gimeno, 2004; Wiggins & Ruefli, 2005).

The theoretical contributions of this research are manifold. First, we contribute to cooptation literature by studying some drivers that have been so far underestimated in the literature. The knowledge of factors that explain why cooptation occurs and proliferates in an industry is helpful for a more in depth theoretical development and a more detailed empirical progress of the literature. Moreover, we make a contribution to the literature on inter-firm rivalry, by introducing cooptative behaviours within the range of strategic option for rivals' actions and reactions.

In addition to theoretical, also empirical implications for practitioners emerge from our study. It clarifies the relationship between the logic of competitive dynamics with the one concerning cooptation. While managers take into account strategic moves against competitors, according to our investigation, it is valuable to consider cooptative actions, especially when other competitors are involved in cooptation. Moreover, the knowledge of drivers at the firm-, inter-firm, and industry-level affecting cooptation is helpful to identify the weak or strong signals that show the rise and proliferation of cooptation in the industry.

## LIMITATIONS AND FUTURE DIRECTIONS

The main objective of this study was to uncover several drivers of co-competition at different level of analysis. The results provide support to all hypothesis proposed, suggesting the significant impact of firm, inter-firm and industry level drivers on the proliferation of co-competition. However, the study has some limitations. First, we identified and tested specific drivers of co-competition as a result of our literature review and data accessibility. For this reason, the results may have omitted some drivers able to further explaining the proliferation of co-competition. Second, our findings are based on five industries over a specific ten-year period. Consequently, the results may reflect some factors specific to those industries or period under study. A new study could analyse other different industries and/or a different time period. Third, we used a sample of cooperative JV but co-competition can occur also through other forms of collaborative agreements, which could be related to others drivers.

To conclude, this study, built on TCE and competitive dynamics perspectives, examined drivers of co-competition and linked them to firms' actions and strategic behaviours. Because other studies have shown that actions and reactions matter to performance (Chen & Hambrick, 1995; Chen, 1996), our results are a first step in the process of linking co-competition to firm performance.

# ORGANIZATIONAL SOCIAL MEDIA IN PRACTICE - INVESTIGATING THE EMERGENCE OF NEW WORK PRACTICES AND ORGANIZATIONAL STRUCTURES

Högberg, Karin

Department of Business Administration, University West, Trollhättan, Sweden

## ABSTRACT

In this paper, the general use of multiple social media in organizations is investigated. As social media are increasingly adopted by organizations, there is a demand to understand how they are being incorporated in organizational settings. In the past decade a broad stream of research has studied how organizations use specific social media platforms. There is a lack of research, however, that focuses on more general, multiple use of organizational social media over time that includes social media use for both internal and external purposes, and what implications that use has on work practices and organizational structures. Hence, the aim of this paper is to study the organizational use of multiple social media in terms of what new work practices and organizational structures emerge and change over time. For this purpose, Orlikowski's "practice lens" has been used to analyze the introduction and ongoing use of social media in a hotel chain over a period of seven years. The main contribution of the paper is providing a means to explain the new work practices and organizational structures related to organizational work that arise due to the use of multiple organizational social media

*Keywords: organizational social media, multiple social media, work practice, organizational structure, routines, case study*

## INTRODUCTION

The use of social media has in many ways transformed organizations (Aral, 2013) and their business activities and become a part of many workplace activities (Leonardi and Vaast, 2017). Compared to other information technologies (IT) used in organizations, social media are flexible in use, ranging for example from internal communication to external communication and marketing. Social media do not serve an obvious purpose in workplaces (Kruse and Baumöl, 2016) either, compared with CRM systems or other administrative IT systems that are designed to make work practices more effective (Huang et al., 2015; Kapoor et al., 2018). The usefulness and organizational value of social media depend on how the user makes sense of it, or interprets its usefulness. Recent research suggests that

the use of social media in organizations calls for major changes in work routines and organizational structures (Forsgren and Byström, 2018). Furthermore, social media is suggested to “represent one of the most transformative impacts of information technology on business, both within and outside firm boundaries” (Aral et al., 2013, p. 3). Previous research on social media in organizations reveals that early studies often focused on the introduction of individual tools within an organization such as a blog or social network like Facebook. Furthermore, these studies focused on novel technical features and their usage and therefore little attention was given to their development and long-term usage in a work context (Leonardi et al., 2013; Leonardi and Vaast, 2017). In agreement, Van Osch and Coursaris (2013) point out that research in the area of social media has “largely ignored the more general use of social media by and within organizations” (p. 703). Consequently, there is need for research that focuses on a more general use of multiple organizational social media with a wider ecological approach to social media use both for internal and external purposes and its implications on organizational practices (cf. Van Osch and Coursaris, 2013; Schlagwein and Hu, 2018; Nicoli and Papadopoulou, 2017). In the present study, the definition of organizational social media suggested by Van Osch and Coursaris (2013, p 54) is used. They define organizational social media (OSM) as “technology artefacts, both material and virtual, that support various intra- and extra-organizational actors—including management, employees and external stakeholders.” Organizational social media are expected to bring both strategic and economic benefits for organizations (cf. Benthous et al., 2016; Kane, 2015; Leonardi et al., 2013). However, there is little research focusing on how multiple organizational social media are integrated and used in work practices over time (Forsgren and Byström, 2018; Kapoor et al., 2018). Earlier studies tend to approach social media from a fragmented, instrumental perspective, overlooking the impact on organizing and understanding of the work practices. Researchers (cf. Aral et al., 2013; Schlagwein and Hu, 2018) have been critical towards this fragmented perspective, focusing solely on the individual social media perspective. Arguably, there is a need for more theoretical and empirical understanding on how organizational social media will disturb work practices and the structure of the organization. Hence it is motivated to further develop both our empirical and theoretical understanding of how multiple organizational social media are integrated into work practices and what consequences this has on organizational processes, structures and routines (cf. Leonardi and Vaast, 2017). The present paper aims to address the above described research gap and provide empirical understanding by studying the organizational use of social media in terms of what new work practices and organizational structures emerge and change over time. Orlikowski’s “practice lens” (2000) will be used to analyze an international hotel chain’s introduction and ongoing use of social media during seven years, as it “allows us to see what, when, where, how, and why different groups enact different structures (technologies-in-practice) through their recurrent

interaction with a particular set of technological properties in similar and different contexts at the same time and over time" (p. 420). The theory also seems suitable since it focuses the users and their work practices, rather than on the technology and its attributes. Hence, the paper seeks an answer to the following question: *How are organizational work practices and organizational structures challenged by the use of multiple organizational social media use over time?* In order to achieve the aim and research question, the present paper is based on a longitudinal qualitative case study of an international hotel chain that uses organizational social media. The hotel chain was chosen because it was a late adopter of organizational social media, not introducing it until 2013, and because there was an opportunity to follow the use over time (2013-2020). The paper contributes theoretically by analyzing and explaining the new work practices and organizational structures related to organizational work that emerge over time due to the use of multiple organizational social media. The remainder of the paper begins by presenting earlier research related to organizational social media. This is followed by a description of the theoretical framework, i.e., the practice lens. In the next section, the research methods are explained. Thereafter findings and analysis of the organizational social media are presented, followed by conclusions.

## RELATED RESEARCH

The term "social media" refers to technology artefacts that support various actors in a multiplicity of communication activities for producing user-generated content, developing and maintaining connections and social relationships, or enabling other computer-mediated interactions and collaborations (Kaplan and Haenlein, 2010). Research uses multiple terms when referring to social media used in organizations, including public social media, enterprise social media, enterprise social software, and corporate social software (Leonardi and Vaast, 2017). Public social media such as Facebook and Twitter are often used by organizations for marketing purposes and to create relationships with customers while enterprise social media are used for internal communications or internal knowledge exchange (Leonardi, et al, 2013). Initially, research on social media in organizational contexts concentrated on external social media use (often referred to as public social media), that is, social media used to communicate with e.g. customers or stakeholders outside the organization (Mangold and Faulds, 2009). Furthermore, a broad stream of research has focused on social media marketing (SMM), i.e., marketing activities conducted by organizations through social media platforms (Minazzi, 2015). Studies focusing on organizational use of social media for external purposes are less common in the Information Systems (IS) research field (Van Osch and Coursaris, 2013; Högberg, 2018). Some studies have focused on social media use for stakeholder engagement (e.g. Lu et al., 2015; Zhang et al., 2016). Another broad stream of research has focused on user-generated

content (UGC) and word of mouth enabled by social media and how it can be used by customers to share information about organizations and their products and services (e.g. Benthaus et al., 2016). There has been a shift in focus towards social media used for internal communication and knowledge sharing, often referred to as enterprise social media (ESM) (Leonardi and Treem, 2013). Agerdal-Hjermind (2014) stressed the multifaceted nature of enterprise blogging within a government office. Oostervink et al. (2016) studied how the features of social media caused uncertainty in how to use them as communication systems. Their study illustrates that employees were torn between the logic of the organization and the logic of the profession. The research described above focuses on specific social media use, that is, a single type of technology within one organization. However, more recent research has focused more on multiple social media use. This research has highlighted social media's role e.g. in changing communication patterns or potential conflicts. Benthaus et al. (2016) argue that digitalized word of mouth and user-generated content (UGC) have resulted in extensive sharing of information among consumers about firms' products and services. Dong and Wu's (2013) study is on how firms can use social media technologies for open innovation by crowdsourcing ideas about new products and services.

## **THEORETICAL FRAMEWORK: TECHNOLOGY AND PRACTICE**

In the present study, the "technology-in-practice" perspective (Orlikowski, 2000) or "practice lens" is used to study technology use in organizations. It focuses on "emergent technology structures enacted in practice rather than embodied structures fixed in technologies" (p. 408). Orlikowski (2000) suggests that by seeing the usage of technology as a process of enactment, one can develop a deeper understanding of "the constitutive role of social practices in the ongoing use and change of technology in the workplace" (p. 404). That is, by studying how structures develop through the lens of "technology-in-use" it is possible to see how structures are avoided or reconstructed, and how new structures arise in the context in which the technology is used. The practice lens was proposed by Orlikowski (2000) to both complement and challenge previous structuration models of technology use (e.g., Orlikowski, 1992) by viewing technology as not stable but constantly re-negotiated by its user. According to Orlikowski, the use of technology is what individuals do with a technological artefact in their repeated, situated practices such as work practices. Hence, the use of technology includes "a repeatedly experienced, personally ordered and edited version of the technological artefact, being experienced differently by different individuals and differently by the same individuals depending on the time or circumstance. In this aspect, it may be termed a *technology-in-practice*, to refer to the specific structure routinely enacted as we use the specific machine, technique, appliance, device, or gadget in recurrent ways in our everyday situated activities" (pp. 408–9). Orlikowski's practice lens also

separates the use of technology and the features of the technology. Practices are people's everyday activities, which are shaped by structures and likewise shape the structures (Feldman and Orlikowski, 2011). Using a practice lens does not need to restrict the analysis to a macro or a micro level, or to a merger of the two. Instead it "directs attention to how institutional phenomena are constituted in everyday activities, and how those everyday activities, in turn, are shaped by institutional influences and entailments" (Orlikowski and Scott, 2015, p. 6). Hence, using a practice lens means the attention is pointed towards repeated situated activities (Cetina et al., 2005), and by understanding everyday practices of organizational social media creates a possibility to understand how organizational structures, routines and practices are affected. This notion is especially interesting when studying social media since, as noted above, these were not originally designed to be used in an organizational setting and consist of constantly developing and changeable algorithms to which the user must adapt.

## RESEARCH METHOD

To observe and understand how the hotel chain used organizational social media over time, an in-depth case study research design was used (Yin, 2003). Given the interest in the relationship between changes in work practices and organizational structure due to organizational social media use, the case of the international hotel chain was chosen since it reflected the introduction and ongoing use of organizational social media. The studied hotels all belong to the same hotel chain and are located in eight European countries. An interpretive research approach was followed, which is particularly appropriate for understanding human practice in organizational contexts (Klein and Myers, 1999). Furthermore, this approach allowed an examination of the relationship between work practices, organizational structures and the use of multiple organizational social media in an organizational context (Walsham, 1995). The case study is longitudinal as data was collected over a period of seven years (2013-2020) within the international hotel chain. There are several ways of studying organizational practices qualitatively. In the present paper, a combination of multiple qualitative data collection methods has been used, with empirical data obtained through interviews, field visits, observation and organizational documents. Hence, the data collection resulted in rich and multifaceted data, and this paper and its analysis focuses mainly on data from semi-structured interviews (cf. Walsham, 1995) concerned with the practical use of organizational social media. The respondents were all employed at the hotel chain and had positions and responsibilities in different positions such as social media managers, e-commerce managers and marketing managers at the different hotels within the chain. They were all involved in the social media use. Interviews were mainly conducted face-to-face at different hotels and the head office, with one exception of using videoconferencing on five occasions. In total, 41 semi-structured interviews were conducted with 58

employees from 15 hotel organizations. The interviews lasted about 60 minutes and all interviews were recorded and transcribed verbatim. The initial interviews were conducted during 2013-2014 about the respondents' practical use of social media at each hotel, and how social media related to other work tasks, organizational structures and routines. The interviews were semi-structured and the respondents were asked open-ended questions that involved themes such as the ways they worked with and used organizational social media technology, and their work practices. Questions like "Can you describe how you use social media?" and "How has the use of social media changed your work routines?" were asked. Furthermore, the respondents were asked to reflect upon how the social media strategies and use have changed the organizational structure. In order to understand the ecology of the organizational use, questions concerned what specific social media platforms were used, and how their use affected the organization and work tasks. These questions were asked in order to understand how social media was actually used in the studied organizations, which is technology-in-use (Orlikowski, 2000). Furthermore, the interviews remained open for interesting topics that emerged during the interviews from additional dialogue with the interviewees. Also, notes were taken based on indirect participant observations and interactions that took place during the study. During the following years (2015-2019), 16 follow-up interviews were conducted as well as interviews with new organizational members in new positions such as social media content manager and regional social media manager. The follow-up interviews focused on questions like: "Can you describe how you work with social media today and what changes you have made?"

By regularly conducting interviews and making observations at the studied hotels, important insights were made, e.g. how the hotel chain changed its management of social media and organizational structure and what implications this had for the hotel organizations. Used in combination with interviews, the observations made it possible to capture not only what the respondents were saying, but also how they actually used social media in practice in the studied context. Similarly, data was collected from "netnography" observation (Kozinetz, 2010) of the hotels' activities in social media platforms, e.g. Facebook, Instagram and Twitter. These online observations offered further insights into the practice of social media and provided insights on what type of content was published and how the hotels interacted with customers. Therefore, the perspective of organizational social media (Van Osch and Coursaris, 2013) was used when doing the online observations, that is, observations were made both in platforms managed by the hotels themselves, e.g. Facebook, but also in third-party platforms such as TripAdvisor. Furthermore, written documents such as social media guidelines and policies were a source of empirical data. By using multiple data sources selected during a longitudinal period for studying the same phenomenon (Yin, 2003) the validity of the study was improved.

## ANALYSIS

The analysis followed an iterative procedure, that is, by going back and forth in the data, patterns and explanations related to the practices of organizational social media could be identified (Miles and Huberman, 1994). Based on the research aim and theoretical framework (practice lens), a basic set of initial codes was used. The empirical data analysis was guided by a set of concepts from Orlikowski's (2000) "practice lens." Concepts such as "facilities," "norms" and "interpretive schemes" were used (see Table 1). The first step in the analysis was to read the transcripts to develop an understanding of the actual use (technology-in-use) of social media at the hotels. In order to understand the emergence of new organizational structures and changes over time, a timeline was made. The development of new organizational structures, norms, hierarchies and new organizational roles such as regional social media managers could thus be identified and tracked in time. By going back and forth through the data, an understanding of the data was created, using open coding processes (Cole and Avison, 2007). Throughout the process of analyzing the empirical data, the emergence of new work practices and organizational structures was found, which was summarized in three categories: 1) Flexible new work practices; 2) contradictions and incongruencies; and 3) emergence of new organizational structures and hierarchies, which will be further developed in the following section.

| Theoretical Concepts   | Empirical data – technology-in-practice   | Data sources   |
|------------------------|---|--|
| "facilities"           | Social media platforms used, supportive IT, e.g. Google analytics and software  | Interviews, workplace observations, online observations, written documents |
| "norms"                | Descriptions of social media use, e.g. organizational routines, and descriptions of "dos and don'ts" in policies and strategies | Interviews, workplace observations, online observations, written documents |
| "interpretive schemes" | Assumptions, expectations and feelings  | Interviews   |

Table 1 – Overview of theoretical concepts and data

## FINDINGS AND ANALYSIS

### *Flexible New Work Practices*

When the hotel chain management took the decision to start using organizational social media, this included using social media at both a brand level and at individual hotels within the hotel chain. On a hotel chain level a social media manager was implemented to be in charge of policies and strategies and communicate with local hotels. The social media manager was in charge of social media activities on a brand level, but also in charge of the implementation and training at the local hotels within the chain. Furthermore, an e-commerce manager was implemented offering training in social media

activities and connecting these with the hotels' online sales activities. The local hotels had the mandate to choose one employee to be responsible for social media use. In most cases, the marketing or sales manager was chosen. Hence, new work practices related to social media use emerged from the very start of the implementation process. Furthermore, new organizational structures developed as new managers with new responsibilities were implemented. The interview with the employees at each hotel reveals that a number of work tasks emerged from the decision to start using social media that were related to return on investment, data analytics, advertising and customer relationship management. The employees in charge of social media at each hotel were involved with various activities related to social media ranging from online booking to posting pictures and answering online reviews. Hence the implementation of social media platforms affected the new functions of the categories "social" as in interaction with customers and service encounters, but also "content," as in pictures and messages produced to be published on the social media platforms. Both of these categories of work tasks created new work roles. Both categories also created a heavy work load for the employees in charge of social media. They describe that it was hard to "come up with" new ideas for what to publish and what audience to approach. Furthermore, use of multiple forms of organizational social media (Van Osch and Coursaris, 2013), such as Twitter, Instagram and Facebook, created the need to be present and interactive in the social media platforms, which quickly became a burden for the employees. However, the employees describe that it was the social media content coming from stakeholders and guests that created the heaviest workload for them. The massive amount of online reviews from guests needed to be managed and answered quickly. However, the work tasks that emerged from the guests' use of social media caused a need for new knowledge and expertise, that is, how to respond to guests and handle complaints online. Similarly, guests used social media platforms for service encounters creating a new digital service arena, which created a need for flexible digital presence. One of the employees, Emma, a marketing manager says about the workload:

It is a never-ending story, I mean you are never on top of it and the comments and reviews keep coming. And I want to give good service to our guests but I haven't got more time to do this and that's why I sometimes just don't prioritize it, and that is not good of course.

In order to control and manage the many work tasks that emerged from the use of social media new facilities were introduced into the organizations (Orlikowski, 2000). The hotel chain implemented an app referred to as "Circus" that was used to manage social media practices, for example to plan when to post pictures or advertising. The tool also gave alerts when the hotels got an online review that needed to be answered. The employees described that the app was useful, but also stressful since it constantly gave them alerts about new online reviews. The facility exemplifies the heavy work load

that emerged from using multiple organizational social media and the need to manage the new work tasks that appeared.

### **Contradictions and Incongruencies**

During the seven years of the study, the individual employees and the hotel chain management developed different ways of making sense of social media. That is, their interpretative schemes became incongruent (Orlikowski, 2000) which resulted in contradictions in their interpretations of how to use social media in practice. The local hotels for example had different ways of using social media in practice depending on who was in charge of it in the specific organization. Furthermore, the local hotels did not want to use the hotel chain's policies or strategies concerning social media since it contradicted how they interpreted the best way of using social media and what they wanted to gain from it. In practice this meant that the local hotels did not post the pictures suggested by the hotel chain, nor did they want to market the whole hotel chain. Instead they wanted to create relationships with customers relevant to their hotel and their surroundings. However, the main conflict, according to the hotel chain, was that the local hotels did not have enough digital presence to manage the social media platforms properly. The hotels were encouraged to use multiple social media platforms or facilities (Orlikowski, 2000), often more than five, e.g. Facebook, Twitter, Instagram and LinkedIn, which obviously caused the need for being reactive. However, the different platforms were often chosen depending on the employee's private use of social media and what platform they were most familiar or comfortable with. That is, if an employee used Instagram in their private life, they often chose to focus on that platform in their work tasks. Similarly, if they were not familiar with Twitter, they did not bother to use it at work. This is an example of how interpretative schemes caused direct effects on work tasks related to social media (Orlikowski, 2000). Marie exemplifies this:

Why should we use Twitter? I don't really like it, I don't use it and I don't read stuff on it. And by the way, we are a hotel that mostly have business guests. I mean these men do not use Twitter, they don't have the time for social media! And to be honest, how many are actually using Twitter, really?

The employees expressed that they were aware of the benefits that social media could bring when interacting with customers, but also expressed negative attitudes towards the obligatory use of social media and the lack of time and resources. The different interpretative schemes (Orlikowski, 2000) resulted in formal policies, i.e., organizational norms, being ignored, and the employees used social media in ways that suited their current work situation.

### **New Structures and Routines**

From 2013-2017 the practical use of social media had a decentralized organizational structure and was primarily managed by the local hotels themselves. Due to the fact that employees had ignored the

formal strategies and policies for years, social media use sprawled. This was a great concern for the hotel chain, which was afraid of losing control over the hotel brand. Hence, the contradictions and incongruencies in the interpretative schemes of the usefulness of social media affected the practical use of it (Orlikowski, 2000). As a result, the hotel chain took a decision in 2017 to radically change how social media was managed. Hence, new organizational structures (Orlikowski, 2000) were created in order to create control over the social media use in practice. These structural changes emerged as a direct result of the discrepancy in interpretative schemes (Orlikowski, 2000) between the hotel chain management and individual employees and individual employees' technology-in-use (Orlikowski, 2000). During 2017-2020 the social media management was structured in five levels: the social media manager (hotel chain head office), regional social media manager (e.g. northern Europe), social media content manager (e.g. smaller parts of northern Europe), regional social media managers (e.g. hotels within a specific country) and social media champions at the individual hotels (see Figure 1).

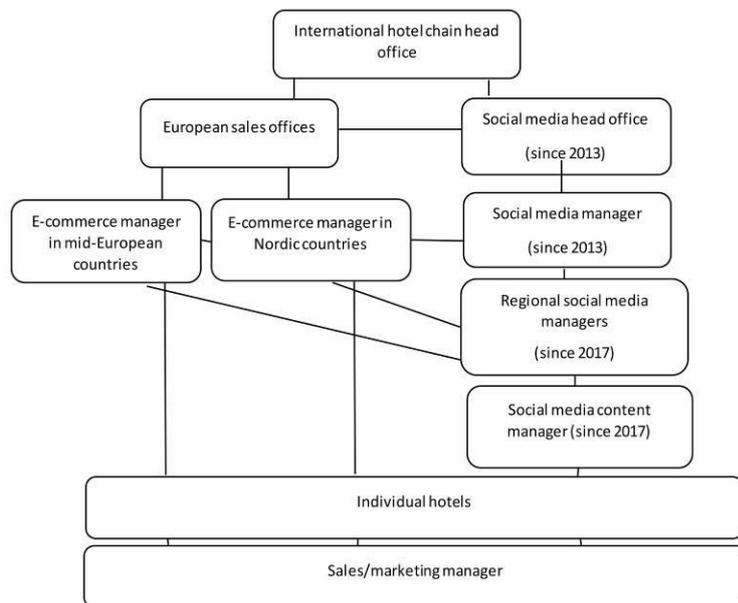

Figure 1 – Overview of organizational structure 2017-2020

By re-structuring the organizational structure, and creating a more top-down approach inspired by a bureaucratic organizational structure with clear responsibilities related to different positions within the organization, the management gained more control over what was published and said in social media related to the hotel brand. As a result, the individual hotels and their employees were no longer allowed to be in charge of their social media channels, hence the “technology-in-use” (Orlikowski, 2000) was controlled. In order to create this control and new structure, all social media channels besides Facebook were shut down and the publishing and content production were managed centrally, from the social media management offices. Wilma, one of the regional social media managers, explains:

The hotel chain was not satisfied with how the hotels used social media. They felt that they were losing control and that the quality of the posts and the pictures were poor. Therefore, they decided to take control over it [social media use]. I don't really like it, but I understand why they did it.

The use of multiple social media during the seven years illustrates how the strong effect of individual employees' (both on a chain and local hotel level) interpretative schemes of social media had consequences for the technology in practice (Orlikowski, 2000), resulting in a need for organizational restructuring. Major importance was put on creating organizational policies and clearer strategies on how to use social media, but also explaining why to use social media in a specific way (Orlikowski, 2000). Hence this is arguably one of the most important instruments that enabled and influenced the structuring of social media use. Both the policies and the strategies can of course be related to organizational culture and their values of how to conduct things in the specific organization (Orlikowski, 2000). Interestingly, the case illustrates that the lack of consistent culture and understanding of the common strategy became transparent due to the incongruity in social media use. That is, using social media differently and interpreting its value in different ways shed light on organizational conflicts. The empirical data also illustrates that individuals with higher rank in the organizational hierarchy were highly influential when affecting the hotel chain social media management, which exemplifies that the technology-in-use (Orlikowski, 2000) greatly affected how the organizational hierarchies and structures developed over time.

### **Concluding Discussion**

The main purpose of this paper was to understand organizational use of multiple social media in terms of what new work practices and organizational structures emerge and change over time. In order to do so, an empirical analysis of these organizational practices was conducted in 14 hotels in eight European countries within an international hotel chain over seven years. By using Orlikowski's (2000) "practice lens" as an analytical tool, the study shed light on how people create structures that shape their actual use of technology over time. Hence, the study also emphasizes that technology use in a work context is not "static" but an ongoing social negotiation that is reproduced over time. This analysis resulted in illustrations of enacted structures, or technologies-in-practice, that exemplify the work tasks related to multiple use of social media use in an organizational context and consequences of the use on hierarchies and structures. Each of these structures represents different ways by which employees use multiple social media for different purposes and have or develop different interpretative schemes over time and how these affected organizational structures and hierarchies (Orlikowski, 2000). The use of social media in practice is enacted in existing routines performed by the individual employees, hence their use is constantly (re)negotiated among the users. That is, as employees use multiple organizational social media, they continue to endorse various tools to

structure and organize their use practices in order to manage the work load or make sense of the new technology use. It could be argued that the general understanding of organizational social media as a new category of technologies (Kapoor et al., 2015) makes employees more aware and anxious about the purpose of using these technologies and how the new technologies re-arrange their existing work practices, hierarchies, responsibilities and routines. Arguably, organizational social media have the possibility of creating new capacities in organizations (cf. Kapoor et al., 2015; Leonardi, 2013; Aral et al., 2013). However, the present study illustrates that realizing these capacities depends heavily on how individual employees structure and enact their social media use. Furthermore, this obviously also has a massive influence on the management of organizations, hence the need for creating more organizational control. The findings also illustrate that persistent use of organizational social media creates new work practices by creating the need for social activities (e.g. service encounters and interaction with customers) (Kapoor et al., 2015). The need for content to post on social media also created new knowledge and hence new organizational roles such as social media managers. Together, both the need for social media and the production of content created new organizational structures, hierarchies, and norms (see Figure 2) (Orlikowski, 2000; Leonardi, 2013).

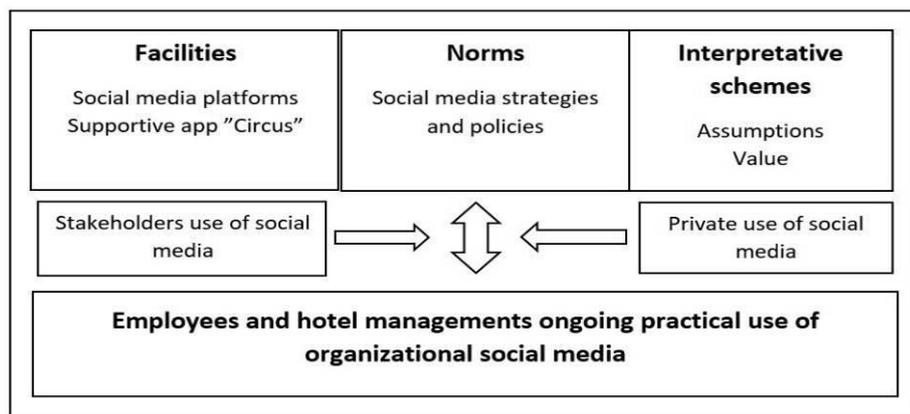

Figure 2 – Practices of organizational social media – adapted from Orlikowski (2000)

The study illustrates how the facilities (Orlikowski, 2000), the different social media technologies and their use, create new work practices both on a hotel chain management level and in the individual hotels. That is, both the micro and macro levels of the hotel chain's organizational structure are affected by individual employees' interaction with social media. Due to individual interpretations (Orlikowski, 2000), the social media policies and norms were ignored and informal norms and routines were created at the individual hotels. This created a discrepancy between the hotel chain management's social media strategy and the technology-in-use at each hotel. Hence, the present paper addresses the calls for more research on multiple organizational social media (Van Osch and Coursaris, 2013), and on how organizations are transformed due to multiple social media use (Aral et al., 2013). Therefore, the study gives a theoretical contribution by explaining how the use of social

media occurs in practice in organizations. Furthermore, the paper contributes to the literature on more general social media use in organizations by illustrating how the technology-in-practice constantly evolved over the seven years that the organizations were studied. The changes in work tasks and structures were both subtle and sometimes radical and continued to change, creating an unstable, very flexible management of social media practices.. Consequently, the present study will extend practice-based studies of technology and organizations (Schultze and Orlikowski, 2004). The present study also contributes practically by illustrating the organizational media use in a large, international hotel chain and its social media management over time and the organizational changes that emerged from it. The study has several limitations. First of all, it is a case study of one hotel chain and 14 hotels, which makes it difficult to generalize the results. Second, the theoretical framework of Orlikowski's (2000) practice lens has offered one way to study the use of social media in organizations. Therefore, it is recommended that further studies examine the use of multiple organizational social media and its consequences in other organizational contexts. Also, other theoretical frameworks can move beyond the focus of understanding technology use and focus on the social media artefact.

## THE IMPLICATIONS OF FISCAL MANAGEMENT IN THE BEHAVIOR OF ROMANIAN ENTREPRENEURIAL MANAGEMENT

Hudelcu, Daniela

Doctoral School of the Law Faculty, University of Bucharest, Romania

### ABSTRACT

The paper aims to explore some of the perspectives of emphasizing the role “fiscal manager” within each entrepreneurial organization based on theoretical-descriptive research. It is known that, the fiscal management is a function of every entrepreneur’s approach, which is at the heart of his concerns, by establishing appropriate managerial measures, both from the perspective of fulfilling the fiscal obligations due to the state budget, as well as from the perspective of income realization, we consider useful the presentation of some ideas of the phenomenon of regulation of this managerial function. This managerial activity represents a real challenge with a significant impact, from the economic-fiscal plan of entrepreneurship in Romania, as well as in terms of legal aspects regulated by the normative acts in force. The importance of the role of “fiscal manager” results from the multitude of fiscal obligations and from the experience of factual situations in the entrepreneurial environment, which according to the financial effects and the impact on the organization and on the state budget could create financial imbalances with unpleasant consequences. The study emphasizes the efficiency, equity and opportunity of implicit evidence of several characteristics of managerial behavior to ensure a balance between the financial benefits obtained and the fulfillment of fiscal obligations due to the state budget.

*Keywords: entrepreneur, fiscal law, fiscal manager, fiscal management, fiscal obligation, fiscal strategy.*

### INTRODUCTION

#### **The context of the study**

Starting from the primary role of the entrepreneur, which consists in the diligence of undertaking a successful business, from the establishment of the business to its efforts to maintain the business, with exceeding all periods of existence of the business on the market, it needs to have the appropriate techniques and tools to fulfill its role.

This paper analyzes and aims to carry out of theoretical research and development, fundamental and conceptual role of fiscal management by direct observation of reality, based on the existing legislative

regulations in Romania, in order to know the direct and indirect connections and effects on the development of personal business.

In the administration of those shown, was performed theoretical analyzes on the Romanian legislation and the norms of their implementation, to build awareness of the role and importance of efficient, sustainable and equitable fiscal management.

In this regard, the paper does not want to draw attention, managerial theories of the entrepreneur from the perspective of his functions, principles and modalities, rather, this theoretical research aspires to carefully examine the implications and incorporation of a distinctive fiscal function and revealing a perspective a importance of having the ability to be a business manager, on the fiscal side of its activity, having a significant impact in fulfilling its obligation to the state budget. This paper also aims to emphasize the importance of managerial responsibility, by implementing the legal regulations in the fiscal field. Careful research leads us to an easy understanding of the existence of a fiscal managerial function in a balanced way from within each organization.

The examined topic approaches a conceptual research, theoretical-descriptive from all points of view of the provisions of the Romanian normative acts with an impact on the organization management activity, as well as the way in which the management of the fiscal activity can be regulated, in own opinion.

Overall, we consider it opportune to create productive connections and with efficiency for the materialization of the fiscal managerial activity, such us, the subject brings benefits and becomes adequate within the functions adjacent to the position of general manager.

In conclusion, the attention given to this topic may constitute an implementation initiative, specifically, fiscal management for all types of organizations and businesses, significant for all types of economic relations better management of their own business on the one hand and on the other hand of the consolidated general budget of the state.

## **SCOPE OF STUDY**

The purpose of the proposed paper is to the emphasize the importance of managerial responsibility by implementing the legal regulations in the fiscal field and through subtle involvement, under the auspices of self-inspiration and flexibility in the capacity of "fiscal manager" for small organizations and the creation of the function of "fiscal manager" or at least of a person in charge with attributions in this sense, for medium and large organizations.

The vision of my perspective consists in interpretations adopted on the basis of the legal regulations in effect, as well as the knowledge acquired from the generally know entrepreneurial activity. We recognize that, given the public (and not private) legal nature of fiscal obligations whose source is the

law, supplementing with legal provisions in the field of private law, which have a rule, all the elements which thorough the medium by the internal decisions of the managers of the organizations, must not contravene the principles of public law, whereas tax law is part of the branch of public law, which is based on law.

## **OBJECTIVE OF STUDY**

The ultimate objective of theoretical research is to identify the implications of fiscal attributions from a managerial perspective and to find out whether it is important to institute and foundation the position “fiscal manager” or the attributions delegated to that sense, as well as the importance of organizing and training “formal and fund comportment” (Dimov, 2011) of entrepreneurs on the procedure for administering fiscal obligations due to the state budget and how to apply this procedure, part of fiscal management.

Therefore, within these objectives the specificity of the researched topic is given by:

- Fiscal conformation of all taxpayers;
- The right to a balance between one’s own economic budget and due and/or overdue fiscal obligations as a consequence fiscal legal relationship between the taxpayer and the state, respectively of the public authority designated with the collection and administration of fiscal receivables;
- A consequent and advantageousness of the organization in relation to the requirements of legislative norms and regulations.

## **SCIENTIFIC RESEARCH METHODOLOGY**

The research topic to research theoretical-descriptive analysis is based on the study of public written documents, as well as the vision in the specialty literature in order to highlight the characteristic of the general context in which the researched phenomenon is included and establishing a report of interdependence between fiscal management, as an eminently and indissoluble component, essential part of entrepreneurial management.

It is proposed by conducting this study a harmonious combination of interpretation between the general management objectives of a business and the subsequent relationship of the general fiscal objectives of the same business, not claiming that, the topic is exhausted, on the contrary, one can insist on the possibility of choosing with predilection and other research methods to get to the same conclusion.

## REVISED LITERATURE

### *Applicable normative regulations*

Bringing to the forefront of the theoretical research, the provision of Article 45 of the Romanian Constitution, republished, by which it is mentioned that free access to an economic activity, free initiative of any person, and the pursuit of such activities in a market economy is guaranteed by the State, we can say that any entrepreneurial activity is the most important segment of a national economy (Petreski, 2006) and is carried out under the auspices of the full trust of the state, and by legislating those normative instruments, for the realization of the state guarantee. Also, by the fundamental law, in Article 56, the obligation of all citizens to contribute through taxes and fees to the public expenditure of the state is established, being ensured a legal system of taxes, by the fair placement of the fiscal burdens for all taxpayers/payers located on the Romanian territory.

In that regard, from the point of view of the interpretation and application of the fiscal provisions with extraneous elements, any provision of fiscal law that is contrary to a provision of the Treaty to which Romania is a party, that provision of the international treaty shall apply. This applicability has its finds its way origin in Article 20 of the fundamental law, in the sense that, when certain inconsistencies between pacts and treaties on fundamental human rights are found, to which Romania is a party, and domestic laws, have priority international regulations, making those cases in which the Romanian Constitution or domestic laws, contain more favorable provisions for physical and legal persons located in Romania.

What should also be noted is that, in case of non-compliance with the obligations to pay to the state budget all fiscal obligations, are subject to the interpretation and application of national law in all regulations, but especially of the Fiscal Code and Fiscal Procedure Code, as well as normative administrative acts in the fiscal field.

### *Managerial strategies with applicability in fiscal management*

An inseparable part of any business management, fiscal management is part of that instrument of action of each manager, which considers in the first place, efficient and effective management of its own expenditure and control in its organization, as well as their permanent monitoring, to remove any related responsibilities, as a result of inadequate measures applied. All these elements lead to the manifestation of the financial balance of the organization in report with fiscal obligations which must be due to the budget state.

Guided by his exposition Estrin, Korosteleva și Mickiewicz (2020) who argue that, improving knowledge through innovation by entrepreneurs has that results the enlargement extent of notions, ideas, information in their field of activity, we may consider it opportune that there could be a

progressive and balanced preoccupation between business development and fulfilling the duties of entrepreneurs.

Before drawing up the appropriate strategies for fiscal management, it is correct to remember that, the system of any type of management, is based on a set of main elements that characterize this activity, and these elements consist of organizational, decision-making, informational and methodological aspects, which, together, determine the achievement of the purpose of setting up the entrepreneurial organization (Hudea, 2020).

To achieve the purpose of the organization, the manager or management team must implement, based on the rules established within the organization, depending on its type and size, the concrete strategies for fulfilling the obligations due to the state budget.

Without claiming that I have covered the entire theoretical support of management strategies, this range being very wide, I try to identify only those strategies compatible with the fiscal management system, from the point of view of the economic and fiscal situation in Romania.

In this sense, a business model, which falls into the category of those entrepreneurs with high sustainability always keep in mind that in the first place the business strategy should contain the medium and long-term perspective of corresponding functionality, from the point of view of the legality of its activity.

According to an opinion from the literature (Nicolescu et al., 1996), the following elements of organizational strategies in a business are identified, representing major components: the mission, the fundamental objectives, strategic options, resources, deadlines and competitive advantage. In consideration a definition ever formulated (Porter, 1996), through which states that "Strategy is an integrated set of option which positions the organization in a particular field to achieve superior long-term results." and in this encouragement support the definition given to the strategy (Nicolescu, 2020) it is emphasized that this represents "the ensemble long-term objectives of the organization, the main ways of achieving this, together with the allocated resources, in the sight of obtain the competitive advantage according to the mission of the organization.", we can identify as a new contribution to this theory the following basic actions, that can constitute fiscal management strategies:

- Strategy for identification, awareness and analysis of fiscal obligations;
- Strategy for assessing the risk of non-payment, within the established deadlines, according to the fiscal legislation;
- The strategy of effective payment of the fiscal obligation.

Reviewing what has been said, correlatively the objective of fiscal compliance, we can affirm that, any contractor must formulate a set of minimum requirements, and depending on the organizational

context, supplement these requirements with regard to the preparation of a budget plan, which of course includes the anticipated income and expenses of the organization.

At the same time, it is not to be neglected that, the financial information and transactions must first be processed and approved, to then proceed by point of view of financial analysis, and depending on the result obtained, to establish the management responsibilities within the respective organization.

From the point of view of the minimum requirements required to be adopted and shown above, it should be noted that, they provide additional guidance depending on the size and capacity of the organization concerned to establish its economic and budgetary indicators, and when it's the case, moving to a revision of the guidelines appears to be a necessity, so that the final goal of the fiscal management strategy is to be achieved based on the assimilated thorough knowledge.

The results of the analysis performed by now, determine the consideration of the existence of a primordial role in the internal control business management, in the sense of following exactly the fiscal management plan carried out at the level of the organization.

If we were to accept the affirmation "organizational culture produces and reshapes behaviors, generates attitudes and determines states of mind, but, at the same time, it influences the manner in which there are configured the systems and the value attributed to them, including to the internal control." (Domnişoru, Ogarcă and Dragomir, 2017), this would mean accepting the opinion of the same authors in the same paper, when argue that for the period 1991-1995 "internal control, according to the level of culture, could be rather sanctioning (in the East) but mostly the promoter of the idea of correctness and, specifically, normality (in the West)." At present, we cannot fully agree to these claims for the internal control of fiscal management, whereas the role and good faith in fulfilling the fiscal obligations of any taxpayers would be volatized, which it enjoys according to the legal norms and the fiscal obligations subjects to payment to the state budget it would be under the rule of behaviors and influences, differentiated according to the geographical location of the taxpayer.

In conclusion, in terms of the effectiveness of the organization's management strategy, we can say that in order to eliminate the errors and possible irregularities that can be committed in order to pay the fiscal obligations, internal organizational control becomes important by indentifying them in time, posterior the occurrence of any event with a financial impact on the part of the competent fiscal authority. In this form, it is realizing an adequate balance between all the duties of the organization and the fulfillment of the legislative consequences established by law.

## **WAYS TO APPROACH EFFICIENT SHORT AND LONG TERM FISCAL MANAGEMENT**

It is known that, entrepreneurial activity is the most important segment of national economy, thesis (Global Entrepreneurship Monitor, 2020) arguing “that entrepreneurs contribute to or even lead structural change in an economy, since their new ventures reflect changing tastes, disruption, new technologies and processes as new sectors are born and grow” it seems natural that by addressing efforts to make the organization’s productivity profitable, the focus should also be on the fiscal obligations owed to the state budget. As for us, the need for efficient fiscal management it is justified from the perspective of the multitude and diversity of taxes and duties due to the general consolidated state budget.

In this context and in the light of the above, the potential for tracking fiscal obligations and continuing managerial development, should take into account the following coordinates:

a) From the point of view of creativity, having and finding intuitive and original solutions to the identified problems, with reference to the legal provisions, constitutes a major force in the internal activity of business administration. Also, imagination and flexibility in approaching problems support the manager's ability to fulfill obligations;

b) Innovation - a significant element of its activity, is the process of interconditioning with creativity, in the sense of simplifying the architectural scheme of fiscal obligations, but at the same time, does not omit any of these obligations. By avoiding setting ambiguous goals and meeting unforeseen events, with tact and diplomacy, I believe that this managerial capacity can be achieved;

c) Ability to plan and manage in order to achieve the objectives: having regard to all conditions and restrictions in the external and internal environment, the short and long term trajectory of the business can be established, performance objectives, by developing strategies, as well as the action plan specific to each business;

d) Assumption risks: in this context, I consider that, maintaining an intelligent perspective on the identified situation and the application of effective measures to prevent difficulties, contributes to improving the performance and ability to identify judicious solutions.

Skills and specialized knowledge in financial-fiscal law by a competent person is an effectively condition for deploying on a commercial activity, whereas the proposed solutions to the problems, the analysis of the portfolio of fiscal obligations, presentation of answers and recommendations, as well as the formulation of information for all the factors involved in the commercial activity, lead to a higher quality level of fiscal management.

Also, not a few times, the manager has the duty to develop conformation skills, according to the financial-fiscal legislation, which is imposed by the rapid technological, economic and social developments in contemporary society.

## DISCUSSIONS ON ETHICAL VALUE

Alvarez and Barney (2007) talk about the varieties of risk-taking of entrepreneurs associated with decision-making in particular, which from the perspective of the principles of taxation regulated in the Code of Fiscal Procedure, we appreciate that by adding the value of profitability on venture capital (Alperovych, Hubner, 2013), these decisions are related to the ethical conduct of the manager.

The ethical values of a fiscal manager are strongly highlights, by the interest and concerns it must have, both the company as an ensemble and its subordinates, by making effectiveness use of fiscal education and its the sphere of digitization concerns in order to fulfill the compliance process in the fiscal field.

The ethical values of a fiscal manager are identified by fulfilling the following obligations:

- a) Declaration of taxable goods and revenues or, as the case, a taxes, fees, contributions and other amounts due to the consolidated state budget;
- b) Payment on legal terms, calculation and registration in the accounting and fiscal records of taxes, fees and social contributions, as well as other amounts due;
- c) Payment of interest, late payment increases and late payment penalties, related to all fiscal obligations due to the state budget;
- d) Any other obligations incumbent on taxpayers, physical and legal persons, in the application of the normative acts in effect in the fiscal field.

On relatively similar coordinates Cox et al. (2018) speaks, as a result of experimental studies, non-existence of independence between the fiscal obligations of entrepreneurs in relation to sellers/buyers, as well as on the effects of market institutions, which ultimately determines a correspondence attention in both direction. Thus, it follows implicitly that the fiscal authority being excluded from this axiom, it has the prerogative to pretend what it deserves, according to the legal regulations in force.

Therefore, in view of the need for internal and external funds, sufficient for the activity of entrepreneurs, (Baeyens and Manigart, 2006), result implicitly in my opinion that, based on the ethical values shown and assumption general responsibilities of a manager in the fiscal field and from the legal point of view, these responsibilities have a special particularity; being able to be register the following elements:

- a) Consistent monitoring of policies, regulations and normative acts at local, regional and national level, and when present relevant to the business, at international level;
- b) Accurate and efficient fulfillment of the organization's objectives;

- c) Monitoring, supervision and management of financial problems;
- d) Adoption of conclusive managerial decisions, timely and at time.

In applying the specific duties of fiscal manager, by choice with a predilection for effective behavior (Ortiz-Ospina, 2016) and without changing its „behavior in response to taxes“ the manager must consider the ability to adopt new technologies and digital platforms in the field of public sector taxation to strengthen the collection of fiscal obligations, for reducing and eliminating fiscal evasion, by increasing fiscal transparency, resulting in the quality of public spending.

As he claims Jingnan et al. (2017) that the benefit of the IT sector in the tax system creates a “reducing tax collection costs and increases administrative efficiency” as well as “the behavioral implications of any implementation of digital technology for the administration of taxes must be examined to avoid undesirable consequences.”, serves as a support for bringing pro-digitization arguments. In order to strengthen the reasoning set out, we say that integrated informatics systems allow their users, simplification of fiscal obligations so that, by capitalizing on these advantages, to be able to accurately improve the administration of taxes and duties, making public spending and eliminating fiscal evasion (Goulder, 1990), as well as other irregularities (Carfi, Fici, 2012), such as for example money laundering and terrorist financing.

With respect to Romania, the fulfillment and exercise of the specific attribution of performing by digitalization the payments of the fiscal obligations- component part of fiscal management, this activity is still to be expected, as fiscal digitization is slowing down, the degree of fulfillment being 33%, and the European average of over 50%, and the lack of coherent public policies, contributes to this state of affairs (Diaconu, 2019).

All these values constitute elements of honesty, respect and responsibility of managers, in the fiscal segment, and all the rules of moral conduct, which governing the relationship between managers and fiscal authorities, they can be improved, through their awareness, in order to adopt behaviors, habits and attitudes in accordance comply with the letter and spirit of the law.

It is necessary that the representatives of the fiscal authority to listen to the company manager to express his point of view on the difficult facts and circumstances the company is going through, this being done before a final decision is taken to start its execution, as well as for the situation when the company is obliged to pay the accessory fiscal obligations: interest, late payment penalties and late payment increases.

## CONCLUSIONS

In view of the above, I consider that the multitude of businesses would be diminished, which after the first year of operation, they reach one of the forms of insolvency provided by Law no. 85/2014 on

insolvency prevention and insolvency procedures, as subsequently amended and supplemented, and often, the end is bankruptcy. In the sense shown, a proposal to amend Romanian legislation, by lege ferenda, I consider that it is necessary to amend the Fiscal Procedure Code, in article 9, paragraph 2, letters c) and d).

In parallel with those presented, the forecast quality of the fiscal manager resides in the real anticipation of his financial situation, so that, he can submit the necessary diligences to the fiscal authority to save his organization.

I consider that by all these norms, a pro-active spirit can be reached on the part of the fiscal authorities, whereas the financial results of the organizations can prove this, thus leading to the idea that "Financial innovation can change effective risks and change the stability of public sector finances." (Oldani and Savona, 2005). Removing any concepts and ideas that produce fraudulent acts and fiscal evasion, constitutes financial crime (national and/or international), it is a beneficial way for the awareness of the obligation to rigorously fulfill the fiscal obligations towards the state.

From the examination presented, I concluded that the implications of fiscal management, as a component part of entrepreneurial management behavior subsists congruently and the basis of a fiscal manager's training, from the creation of the business, to the development and removal of elements harmful to the business is achieved by mastering fiscal management strategies, internal control, coordinates for tracking fiscal obligations, ethical and moral values, as well as the responsibility for efficient fiscal management, which leads to prosperity and well-being, both of the organization and of all employees. It follows, therefore, the positive influence of the position of "fiscal manager" in the entrepreneurial activity, as a continuous support and supervision of what happens in the organization from a fiscal and budgetary point of view.

<sup>2</sup>Department of Economics, University of Campania "Luigi Vanvitelli", Capua, Italy

### ABSTRACT

Digitalization and servitization are two important phenomena that are redefining the competition and forcing companies to rethink their entire business model. Despite the connection between servitization and digital technologies is not recent, the link between them is still far from being exhaustively investigated. Servitization and digitalization are two literature fields that are now merging into one mainstream. The aim of this paper is to contribute to this emerging mainstream. We start analyzing the two topics separately, identifying their main trends and defining their characteristics. Then we focus on the literature dealing with the intersection of digitalization and servitization proposing the IDEO's Business Model Canvas Lenses as a framework to investigate it. The analysis shows that three fields such as customer segments, channels and cost structure are still uncovered, and they can represent future areas of research.

*Keywords: digitalization, servitization, ICT, business model, canvas, value creation*

### DIGITALIZATION

Our life has gone digital and the economic and social paradigms are changing due to the significant influence of digitalization (Lopatkova et al., 2019). The aim of this paper is to contribute to the literature dealing with the intersection of two phenomena: digitalization and servitization. The fields of digital transformation and servitization are still new and emerging and the literature dealing with their intersection is emerging as well.

The term digital transformation (also known as digitalization) refers to the use of technological potentials to change business models and value chains to better meet customers' need and provide products and services more efficiently (Schallmo and Williams, 2018). Thus, if digitization is a technical process, digitalization is a socio-technological process of applying digitization techniques to broader social and institutional contexts that render digital technologies infrastructure (Sussan and Acs, 2017).

The digital transformation has four main levers (Roland Berger Strategy Consultants, 2015): 1) *Digital Data*: capturing, processing and analyzing digital data to do better predictions and make more informed decision; 2) *Automation*: combining traditional technologies with artificial intelligence creates systems that work autonomously and organize themselves reducing errors and operating costs; 3) *Connectivity*: interconnecting the entire value chain synchronizes supply chains and abbreviates production lead times and innovation cycles; 4) *Digital Customer Access*: the (mobile) internet allows direct access to customers that experience full transparency and new services.

This transformation has brought changes such as digital data, automated production processes, interconnection of value chains and digital customers. These changes have affected sales and productivity, brought innovations in value creation and new forms of interaction with empowered customers. As a result, entire business models have been reshaped or replaced (Downes and Nunes 2013) due to several factors (Henriette et al., 2015):

- Competition's pressure: companies must undertake deep transformations by digitizing assets in order to stay competitive as technological shifts have broken down market barriers for new disruptive competitors (e.g. Netflix, Uber, etc).
- Market expansion: digital skills are necessary to conquer new markets and business models need to be adjusted accordingly.
- Customers' expectations: technology savvy customers demand cutting-edge technologies to receive customized services.

Thus, considering the complexity of this digital transformation and its implications, companies need to establish management practices and procedures to govern this disruptive change. A common approach for companies is to formulate a digital transformation strategy that serves as a central point to coordinate and implement the digital transformation. According to Matt et al. (2015) there are four critical dimensions of the digital strategy:

1) Use of technologies, which indicates the familiarity of a company with new technologies and the way they are implemented. Companies can decide to either become technological leaders or simply use technologies that others develop; 2) changes in value creation, inevitable caused by different business models where the value proposition changes and the power of customers as well; 3) structural changes, which are needed in order to adapt the corporate structures and 4) financial aspects that are preliminary to the previous three points as capital is either driver or limit for the digital transformation.

The formulation and implementation of a digital transformation strategy has become a key concern for many organizations, considering the deep impacts of digital technologies on almost every aspect of an organization's inner and outer environment (Chanas et al., 2019).

## SERVITIZATION

The advance of services is a general trend of the modern economies with their value added that accounts for the 65% of the global GDP. In many industries the percentage of manufacturing firms committed in the provision of services is very high (Neely, 2009; Crozet and Milet, 2017). Manufacturing firms have been changing their offering based on the only product into a bundle of tangible and intangible components also known as product-service systems (PSS) (Vandermerwe and Rada, 1988; Tukker, 2004; Baines et al., 2009).

The phenomenon of adding services is called servitization (Vandermerwe and Rada, 1988) and it is a new competitive strategy by which manufacturing firms (Baines and Lightfoot, 2013) respond to many changes coming from both the offering and the demand.

Starting from the offering, the market saturation has pushed manufactures to explore the service market in order to capture new profits and seek new growth opportunities (Wise and Baumgartner, 1999; Kowalkowski et al., 2017). By adding services, firms pursue the offering differentiation to overcome the commodity trap and build a competitive advantage (Baines et al., 2017; Kowalkowski et al., 2017). From the demand side, the provision of tailored PSS can answer to the demanding requirements of customers that are interested in services to use products to their full potential and to be supported during the consumption (Baines et al., 2009; Visnjic Kastalli and Van Loy, 2013; Cusumano et al., 2015). Thanks to services, firms can lock customers in long-term relationship so that their loyalty can increase over the time (Kowalkowski et al., 2017) and firms can benefit from revenue streams over the time (Baines and Lightfoot, 2013).

Furthermore, servitization is conceived also as opportunity to promote new business models that are more environmentally sustainable allowing the reduction of the material flow (Goedkoop et al., 1999). Thus, those reasons have pushed firms to enter the service market and to move downstream along the supply chain by carrying out small-scale vertical integration (Baines and Lightfoot, 2013). Manufacturing firms start to perform new activities that previously were conducted by customers or third service firms reconfiguring and stretching their value chain (Wise and Baumgartner, 1999; Baines and Lightfoot, 2013; Rabetino and Kohtamaki, 2018). In this way they capture more value along the value chain and across the entire product life cycle (Bustinza et al., 2015) as well as they can improve their control on the customer requirements (Rabetino and Kohtamaki, 2018).

As told the adding of services change the firms' offering that can assume several configurations along a continuum whose extremes are pure product and pure service (Baines et al., 2009). This transition towards more intense service offering is often conceptualized as a forward and unidirectional process carried by stepwise stages (Oliva and Kallenberg, 2003) or by the gradually adding of services (Baines and Lightfoot, 2013; Benedettini and Neely, 2018). However, other works suggest that the transition is

characterized by continuous revisions (Kowalkowski et al., 2012) or by radical change (Brax, 2005) that undermine unidirectional and gradual models. Furthermore, the route is also affected by environmental factors (Finne et al., 2013) and the industry life cycle (Cusumano et al., 2015). Finally, firms can also move back to more product-oriented business model due to servitization failures (Valtakoski, 2017). In fact, servitization is very challenging from an organizational point of view (Baines et al., 2009; Martinez et al., 2010) and manufacturing firms often do not gain what expected falling in the so-called “service paradox” (Gebauer et al., 2005). In particular, servitized firms often struggle to increase in the profitability rates due to the high costs of implementation (Neely, 2008; Min et al., 2015) and they risk to go bankrupt much more than the pure manufacturing firms (Benedettini et al., 2015). Furthermore, the performance is not linear, but it depends on the intensity of servitization. Only certain degrees of servitization meet improvement of performance (Fang et al., 2008; Kohtamaki et al., 2013; Visnjic Kastalli and Van Looy, 2013).

As told before, the implementation of servitization is not easy and it entails the shift from a product-oriented business model to a service-oriented one focused on the value in use where the customer takes on a central role (Baines et al., 2009). This shift requires a profound revision of many firm’s aspects that need to be adapted to the new service orientation such as the corporate culture (Gebauer et al., 2010), the organizational structure (Homburg et al., 2003; Gebauer and Kowalkowski, 2012) and the management of the human resource (Antioco et al., 2008; Baines and Lightfoot, 2013; Zhao et al., 2017).

The implementation causes firms to develop new capabilities, such as the relationship management with both suppliers and customers (Kohtamaki et al., 2013; Bohm et al., 2017), slack resources (Fang et al., 2008) and enablers such as ICTs (Baines and Lightfoot, 2013).

## **SERVITIZATION AND DIGITALIZATION**

The link between servitization and digital technologies is not recent. Seminal works about servitization point out how technologies can support the service provision by manufacturing firms that embed digital technologies in their own products (Vandermerwe and Rada, 1988; Wise and Baumgartner, 1991; Neely, 2008). The role of digital technologies is widely acknowledged in case of advanced services’ provision, outcome-based contracts and other PSSs (Smith, 2013; Baines et al., 2017; Visnjic et al., 2017). ICTs are fundamental for servitized firms to perform several activities during the provision such as (Baines and Lightfoot, 2013):

- monitoring of products or components to collect data;
- transmission of collected data and fault codes to the manufacturer;
- store of data;

- analysis of data;
- repair and maintenance in case of product failure.

Different digital tools are used by manufacturing firms to support servitization such as the cloud computing (Sultan, 2014; Wen and Zhou, 2016), the predictive analysis (Ardolino et al., 2018), the Internet of Things (IoT) (Ardolino et al., 2018; Rymaszewska et al., 2017; Boehmer et al., 2020), remote monitoring technologies (RMT), and the big data (Opresnik and Taisch, 2015).

Although servitization can do without the digital technologies in many cases, the intersection between service strategies and digitalization has not been much investigated (Kohtamaki et al., 2020). Digital technologies are often conceived as enabler of the broader phenomenon of servitization (Baines and Lightfoot, 2013; Cenamor et al., 2017) and thus the conceptualization of digital servitization is recent (Kohtamaki et al., 2020). Servitization and digitalization are progressively seen as two trends that are merging into a new mainstream that groups those works that study the interplay between the two phenomena (Lerch and Gotsch, 2015; Coreynen et al., 2017; Kohtamaki et al., 2020). According to Vendrell-Herrero et al. (2017), digital servitization deals with the provision of services that are based on digital components embedded in products.

From the initial literature that is based on the intersection of the two trends, it emerges that digitalization by its numerous tools furthers the implementation of service strategies as well as the conception of revolutionary services (Baird and Raghu 2015; Coreynen et al., 2017). Furthermore, digitalization allows servitized firms to boost the value creation (Belvedere et al., 2013; Grubic, 2018) guaranteeing the building of a protected competitive advantage and new potential revenue streams (Opresnik & Taisch, 2015; Sanchez-Montesinos et al., 2018).

Indeed, the literature dealing with the intersection and reciprocal influence of servitization and digitalization phenomenon, has been focused on two macro areas: Business Model and Strategies affecting the Business Model.

We used the Business Model Canvas (BMC) in order to better understand how the literature is studying the impact of servitization and digitalization on business model. More specifically, we applied the IDEO's *Three Lenses of Innovation* (Fig. 1) as they group the BMC boxes into macro areas that represent a good way of examining the different aspects of a business. Each lens highlights different strengths and weaknesses, and by looking at the intersection of all three, companies can find strong ideas to succeed.

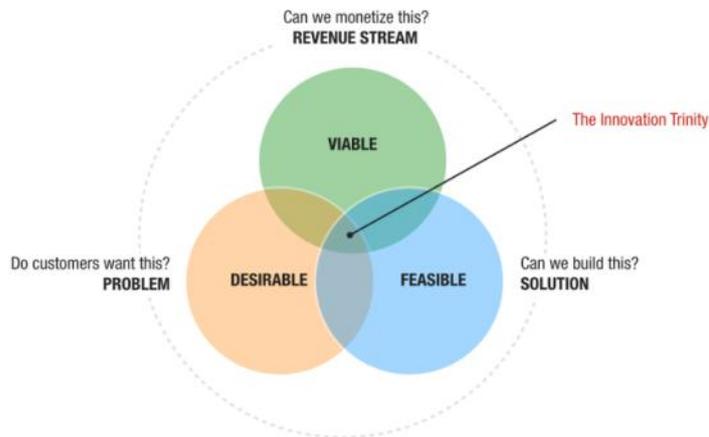

Figure 1. IDEO's Business Model Canvas Lenses

As Figure 2 shows, *desirability* refers to the portion of the BMC dealing with the understanding of what customers want, what motivates them, what is their pain point in order to engage them, complete the transaction and eventually build a relationship.

*Feasibility* answers the question: is this technically and organizationally feasible? This section of the BMC helps companies understand and plan their needs in terms of capabilities, resources, tools, partners and right set of activities.

*Viability* refers to the portion of the BMC focused on money, on the ratio between inflow and outflow.

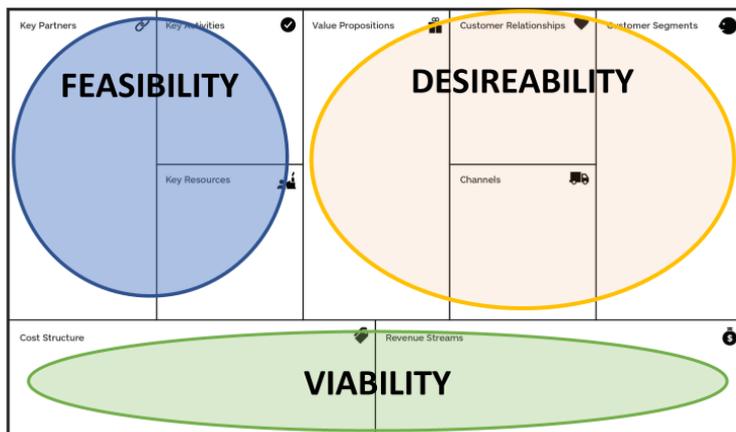

Figure 2. The IDEO's Three Lenses of Innovation

The servitization-digitalization literature has studied elements in all three sections with a stronger focus on feasibility and desirability (Fig. 3).

Starting with the desirability, the literature has analyzed topics related to value creation, value co-creation and customer benefits, focusing on how Internet of Things and digital capabilities can support value creation in servitization business model (Lenka et al., 2017; Rymaszewska et al., 2017; Sjodin et al., 2020) and how the superior responsiveness of operating processes, possible thanks to ICTs and machine learning technology, is impacting value creation (Belvedere et al., 2013).

Moving to feasibility, the literature is especially focused on the key resources and capabilities needed to adapt the business and succeed in the servitization model (Parida et al., 2015; Bustinza et al., 2018). Part of the research has also been focusing on supply chain dynamics and the changes that digital technologies have brought to it (Vendrell-Herrero et al., 2017; Boehmer et al., 2020).

Last, moving to the viability, the attention is focused on general financial performance of the companies moving to servitization model in a digital economy (Ojala, 2016; Kohtamaki et al., 2020).

Figure 3. *Digitalization-Servitization literature topics on BMC*

Additionally, a part of the literature is focused on overall strategies needed in order to make the business model successful and somehow it defines the key activities to succeed. Topics are entry barriers (Sanchez-Montesinos et al., 2018), competitive advantage definition (Opresnik and Taisch, 2015; Sanchez-Montesinos et al., 2018), service centricity approach (Sklyar et al., 2019), green servitization (Opazo-Basáez et al., 2018), organizational shifts (Tronvoll, 2020;), and big data management (Opresnik and Taisch, 2015; Turunen et al., 2018).

The literature dealing with servitization and digitalization has not deeply investigated yet the definition of customer segments, channels and specific cost structure that companies should adopt in order to adjust their operations to the new business model.

## CONCLUSION AND IMPLICATIONS

The aim of this paper is to contribute to the literature dealing with the intersection of two phenomena: digitalization and servitization.

The digitalization literature is focused on the one hand on the concrete description of the digitalization-digitization phenomenon and its dynamics, on the other on the attempt to develop theories to explain digital transformation and its consequences (Sharon and Barney, 2008).

The servitization literature is huge and fragmented and it is difficult to systematize such a complexity. However, the acknowledgement of emerging new business models due to the servitization and the need for ICTs as enabler for the services provision is generally assumed, but the analysis of the ICTs' role by servitized firms in a managerial perspective is not investigated as much as other issues.

Going to the interplay between servitization and digitalization, which is not recent, it is clear that this link has not been deeply analyzed (Kohtamaki et al., 2020). Servitization and digitalization are two literature trends that are merging into a new field that groups those works that study the interplay between the two issues (Lerch and Gotsch, 2015; Coreynen et al., 2017; Kohtamaki et al., 2020).

In this vein, from a theoretical point of view this paper contributes to this emerging field by proposing the IDEO's three lenses of innovation of the Business Model Canvas as a framework to observe and study the intersection between digitalization and servitization. Given the impact of these phenomena on the companies' business models, this framework allows to identify the areas more affected and the type of impact. Six areas of the BMC are being addressed to differing degrees by the researchers' work namely: value proposition and customer relationship for the desirability lens, key partners and key resources for the feasibility lens, and revenue stream and partly cost structure for the viability lens. Thus, the following areas of concern seem to emerge: product-service differentiation; competitive advantage, competitive strategies; customer value; customer relationships, financial performance. This tendency emphasizes a strategic point of view of digital servitization where scholars tend to analyze how new digital business models can enhance the firms' competitive advantage by caring the customer relationship, and to evaluate the financial benefit coming from the implementation of the strategy.

Given that venture management in such a complex environment means rethinking existing business models, from a managerial point of view this paper proposes to use the BMC as a tool to identify the key areas that need immediate attention and highlights the type of change that can help shape a successful model.

This study also points to some interesting questions for further research as some areas of the BMC have not been further investigated, more in particular: customer segments and channels in the desirability lens, and a detailed cost structures in the viability lens. Considering the great organizational changes and the general reshuffle of competition brought by digital servitization, more

studies and tools need to be suggested to deepen the customer segments, the channels that with the fourth industrial revolution are profoundly reshaped and the cost structure that is inevitably affected by great organizational changes as it is already pointed out by several works about servitization.

As for the key activities of the feasibility lens, they have been addressed in a more general way through the analysis of the overall strategies needed in order to adapt operations to the new business model.

Thus, companies wanting to compete in this digital servitized era are challenged to re-think and re-shape their business model in order to survive and effectively compete.

## INNOVATION AND EDUCATION CLUSTER IN THE REGION: STAFF POTENTIAL DEVELOPMENT

Ivanenko, Larisa<sup>1</sup>; Timoshchuk, Nina<sup>2</sup>; Zotova, Anna<sup>3</sup>

<sup>1</sup>Staff management department, Samara University, SU, Samara, Russia

<sup>2</sup>Customs management department, Samara Polytech, SSTU, Samara, Russia

<sup>3</sup>Applied management department, Samara State University of Economics, SSEU, Samara, Russia

### ABSTRACT

The work shows that innovative processes: digitalization, modernization, clustering, communications, the introduction of information technology, etc., could not be implemented without the participation of human resources. Today, national projects are an instrument of economic and social development of the country. Implementation of national projects also takes place with the help of human resources. In this regard, an innovative approach to the development of the personnel potential of the region is required. To this end, the article proposes to form an innovative educational cluster. The rationale for creating an innovative educational cluster in the region is presented. Also, the practical example of performing such approach to clustering these processes is presented taking Samara region National Educational Centre as an example.

*Keywords: innovations, digitalization, clustering, communications, human resources, national projects, innovative and educational cluster, national educational centers.*

### INTRODUCTION

Currently, the entire economic space not only of the country, but of the region is undergoing various changes associated with such innovative processes as digitalization, modernization, clustering, communications, the introduction of information technologies, etc. Without the active participation of human resources, these changes could not be implemented.

In addition, today the instrument of economic and social development of the country elected national projects, the implementation of which also occurs with the help of human resources (Bednyakov, 2019). Translated from Latin, "potential" means strength, power, power, opportunities, and personnel is a practical resource, qualified and educated specialists, i.e. people prepared for a particular type of activity, in accordance with education and work experience.

However, it must be emphasized that the degree of development of human resources to a large extent determines the power, level of development and the real strength of the personnel potential of the region.

## **METHODOLOGICAL APPROACH TO MAIN DEFINITIONS.**

It should further be noted that there is an obvious relationship between the concepts of “staff potential” and “human resources”.

Traditionally, the content of the concept of the staff potential of a region can be defined as joint skills, abilities, talents, abilities, competencies, i.e. these are opportunities that human resources possess and which can be used not only for the effective development of a given territory, but also for improving the living conditions of the population.

Analyzing the essence of the concept of the personnel potential of a region and its components, it is worth noting that in the center, it is based on human resources as the main force that defines goals and develops strategic and tactical plans for the economic development of this territory. In addition, the theoretical and practical aspects of this concept have qualitative and quantitative characteristics, and their economic assessment can also be revealed. Thus, the following indicators relate to indicators, characteristics and assessments of human resources, as forming and making up the personnel potential. Firstly, the characteristic of personal qualities: own health; acquired education; level of professionalism; ability to work; results achieved; a penchant for creativity and the presence of creative abilities; high level of morality; interpersonal communication; interdisciplinary versatile development; active life position.

Secondly, the most important indicators of personnel potential: structure and number of personnel potential; knowledge and skills; practical skills; qualification; implementation of management functions; age; professional staff; available manufacturing experience.

## **THEORETICAL BASIS OF FORMING INNOVATIVE EDUCATIONAL CLUSTER.**

A characteristic feature of current development of Russian regions is national projects and the introduction of digital technologies - these are the most important innovations in the life of the country and the region.

To implement Decree No. 204 “On National Goals and Strategic Tasks of the Development of the Russian Federation for the Period until 2024”, signed by the President in 2018, it was proposed to implement thirteen national projects: “Healthcare”, “Education”, “Demography”, “Culture”, “Safe and high-quality roads”, “Housing and urban environment”, “Ecology”, “Science”, “Small and medium business”, “Digital economy”, “Labor productivity and employment support”, “International cooperation and export”, “A comprehensive plan for the modernization and expansion of the main infrastructure.” (Decree, 2018).

Accordingly, for each of these projects in the regions, regional projects and municipal programs are additionally developed considering the current situation and the existing staff potential. There is no doubt that in the process of implementing these projects and programs innovative mechanisms, methods and techniques are used.

In this regard, an innovative approach to the management and development of the personnel potential of the region is necessary. Personnel potential, as the main "engine" of national projects in the region, should not only correspond to the dynamics of the implementation and implementation of the results of national projects, but also provide a reasonable lead to their own innovative development. For this, it is important to formulate targeted development of career growth and the development of innovative professional competencies. This determines the significant success of national projects. It is known that the main purpose of human resource management is the rational and efficient use of the creative capabilities of human resources.

It should also be noted that the implementation of national projects gives dynamic development to the region and requires appropriate staffing. At the same time, participation in national projects contributes to the development of human resources, which involves the mandatory formation of professional competencies necessary for the implementation of innovative activities.

The implementation of national projects essentially represents the innovative development of the region, which cannot be carried out without the use of innovative human resources. Practice shows that to create innovative human resources, even highly professional knowledge is not enough, you must be prepared to apply innovations, be able to generate innovations yourself, use innovative experience, and, most importantly, apply all this in your own activities.

In the context of the implementation of national projects in the region, considering the need and importance of improving the skills of human resources and the formation of innovative human resources, the article proposes the creation of an innovative and educational cluster that will ensure the transition to an innovative learning model (Smirnov, 2010). The formation of an innovative educational cluster is confirmed by the need to combine innovations and the educational process and their integration for the implementation of national projects in the region. Consider the content of this educational structure.

The term "cluster" was first proposed by the American scientist M. Porter. He gave the following definition: "A cluster is a group of geographically neighboring interconnected companies (suppliers, manufacturers, etc.) and related organizations (educational institutions, governing bodies, infrastructure companies) operating in a certain area and characterized by common activities and complementing each other" (Porter, 2008).

There are many points of view on the definition of the term “innovation cluster”. For example, this is of particular interest.

Innovative is a cluster that has the ability to quickly and efficiently distribute scientific developments, computer and digital technologies, achievements and inventions, innovations, i.e., to all enterprises, research organizations, higher education institutions, other educational institutions and other cluster members. new knowledge.

Another definition of the term “innovation cluster” is as follows.

An innovation cluster is a specially created group of enterprises or organizations that include innovation training centers for highly qualified specialists, research centers that generate scientific knowledge and ideas, as well as startups and business centers that ensure commercialization, implementation and implementation of innovations.

However, the authors of this work offer the following content of this concept: innovation cluster is a group of innovative organizations which purpose is the organization and conduct of fundamental and applied research, the development and implementation of innovative digital, computer technologies to solve pressing socio-economic problems in the region.

An educational cluster is a combination of higher education institutions in the region, as enterprises of one technological chain, into an appropriate cluster structure, the purpose of which is to create a common regional educational infrastructure designed to more efficiently organize the process of innovative education and satisfy the need for a highly educated personnel potential. Now we turn to the content of the innovative educational cluster. This article proposes to consider such a definition of innovative educational cluster

An innovative educational cluster is a combination of a group of innovative organizations and higher educational institutions, as enterprises of one technological chain, into a single cluster structure, the purpose of which is to create a common regional educational infrastructure, taking into account the development of innovative digital computer technologies and the introduction of innovations in the traditional universities the content and teaching methods, as well as to ensure a more efficient organization of the process of innovative education of personnel potential for solving pressing socio-economic problems in the region.

Educational technologies implemented in universities in such a cluster will be constantly optimized and will receive innovative development. In addition, it should be noted that in the innovation and educational cluster, all the necessary resources are integrated to provide innovative training, namely: an industrial park, a technology transfer center, a media center, and a business incubator.

- teams of scientists - researchers and researchers for fundamental and applied research;

-groups of designers to develop projects of new technologies and further commercialization of intelligent innovative products;

- Interdisciplinary teams of teaching staff with pedagogical innovations for the formation of the learning chain: scientific developments-digital technologies- production or business structures.

It must be said that for the implementation of national projects in the region, an innovative educational cluster will serve as the main generator of practice-oriented knowledge.

It is impossible to create an innovative educational cluster in the region without close cooperation between universities and research structures, without the participation of authorities and investors.

For the formation and further construction of an innovative educational cluster, a project is required. Signs and conditions of the possibility of implementing this project in the Samara region are, first of all, the presence of a pronounced educational space, as well as related and auxiliary enterprises, research and development organizations, consulting firms, universities and other structures included in the clusters.

The scientific and innovative potential of the Samara region is represented by all components of the innovation system - academic and university science, scientific departments of industrial enterprises, innovative organizations - and is developed to a much greater extent than the average for the Russian Federation: the third is the specific number of personnel engaged in research and development; 70% more a greater proportion of innovatively active industrial organizations in their total number; more than twice the share of expenses for science and research in the GRP of the Samara region exceeds the similar Russian indicator.

## **PRACTICAL BASIS OF FORMING INNOVATIVE EDUCATIONAL CLUSTER.**

The approach to forming innovative educational clusters is widely being tested now in various regions of the Russian Federation and Samara region is included in this list. The main instrument of practical realization of this idea is to organize on the territory of the region the so-called National Educational Center.

In general, National Educational Center is a consortium of leading educational and research organizations with organizations of the real sector of the economy, the result of which is to obtain new competitive technologies and products with their subsequent commercialization, as well as training for solving major scientific and technological problems in the frame of the Russian Federation scientific and technological development prior goals.

The main idea is not only to train and retrain the professionals, but also the most important thing in such infrastructure creating will be the creation of new technologies, new products that could then be implemented and produced at enterprises in the scientific and educational center. The goal of such

structure creation is cooperation of science, education and business to create world-class demanded commercial projects and develop human resources to solve large scientific and technological problems.

The main tasks that should solve National Educational Center are:

- Integration of scientific and educational organizations with organizations of the real sector of the economy for conducting world-class research and development.
- Creation of technological innovations and preparation of new engineering teams capable of using developments in real production.
- Training for solving major scientific and technological problems in the interests of developing branches of science and technology according to the priorities of scientific and technological development of the Russian Federation.
- Obtaining new technologies and products and their commercialization.

The educational space of the Samara region includes 22 higher education institutions, 16 of which have the status of state and 6 - non-state. Of particular importance are such universities as:

Samara National Research University (Samara University);

Samara State Technical University (Samara Polytech);

Samara State Medical University;

Samara State Social and Pedagogical University;

Samara State University of Economics and others.

Three universities of this list were included in the National Educational Center of Samara region. The reason of gathering these educational institutions into NEC lies in main areas which are targeted by the center:

- new aerospace systems, technologies, materials and digital solutions;
- new medical technologies, materials, systems and digital solutions;
- advanced transport systems, materials, technologies and smart solutions.

By the moment National Educational Center of Samara region has 8 key partners representing the industrial foundation of Samara region.

## CONCLUSION

In conclusion, it should be noted that the Samara region has a high level of clustering, as powerful clusters successfully operate on its territory: aerospace, automotive, innovative, and several others. In the Samara region, there are all the necessary conditions for creating an innovative educational cluster, so necessary for the development of human resources in the context of national projects.

## MEDIA REPRESENTATION OF TOURISM ON CROATIAN NEWS WEBSITES

Kalajžić, Vesna; Ražnjević Zdrilić, Marijana; Grzunov, Jurica

Department of Tourism and Communication Studies, University of Zadar, Zadar, Croatia

### ABSTRACT

The phenomenon of tourism has been the subject of various studies by many scientists and experts from all fields of scientific study, especially economics. Tourism is undergoing a profound change as a result of the dynamic socio-economic development of many countries where it represents an important link in the economic chain of a particular country. In this paper tourism is researched in the context of the media using the example of the Republic of Croatia. The aim of this paper is to research articles on tourism on the pages of the most widely read Croatian news websites in order to gain insight into the media representation of tourism in Croatia, its neighboring countries, Europe and the world from the point of view of Croatian national news websites. The paper is based on articles on tourism that were published in July and August on the following news websites: Index.hr, 24sata.hr and jutarnji.hr, which are the most popular news websites in the Republic of Croatia according to Alexa.com. The research period of the paper is from 1 July to 31 August 2019 as the greatest tourist movements in Croatia are recorded during those months. The research results showed that the Index.hr news website published the most articles on tourism; that the geographic focus of articles was mainly on Croatia; that tourism offer was the most well represented topic and that, taking into account the entire body of research, negative views and opinions with respect to the researched subject predominated.

*Keywords: tourism, the media, news websites, content analysis, Croatia.*

### INTRODUCTION

In the modern age tourism constitutes one of the most important industries in many countries and therefore has a considerable impact on economic development. The advent of tourism occurred in the second half of the 20th century, with its surge and an exceptionally dynamic growth and development (Čavlek *et al.*, 2011:23). Tourism also follows the socio-economic development in an effort to meet the ever-growing needs of a large number of tourism consumers (Weber and Mikačić, 2003:3). It has consequently become the subject of interest of many scientists and experts from all scientific areas of study, especially economics. This has resulted in many different definitions of the term tourism and

tourist. In order to define the term tourism the authors of the textbook "Tourism – economic fundamentals and organizational system" stated four criteria that need to be met: 1. spatial component, 2. characteristics of a tourism trip, 3. time component and 4. purpose of a trip (Čavlek *et al.*, 2011:25). From the many definitions of tourism this paper chose the UNWTO's (World Tourism Organization's) definition which states that "tourism comprises the activities of persons traveling to and staying in places outside their usual environment for not more than one consecutive year for leisure, business and other purposes not related to the exercise of an activity remunerated from within the place visited" (Čavlek *et al.*, 2011:30). The second key term associated with the term tourism is tourism market, i.e. the place where the subjects of tourism supply and demand meet as its fundamental elements (Čavlek *et al.*, 2011:52). Tourism market comprises "a set of relations of tourism supply and demand created by the exchange of money-mediated tourism goods and services" (Weber and Mikačić, 2003:20). In scientific and peer-reviewed literature tourism is explained as a complex phenomenon, i.e. its complexity, reflected in its many goods and services, or rather the diversity of the tourism offer, is highlighted. Weber and Mikačić list the principal groups of tourism expenditure i.e. all the goods and services that the visitors of a particular destination can acquire to satisfy their tourism needs (tourism consumption): travel organization (e.g. provided by tour operators/travel agents), accommodation (e.g. hotel, hostel, holiday apartment, camp), meals (restaurant), transport (automobile, airplane, train, ship), activities (cultural, recreational, sports, entertainment), shopping (souvenirs, clothes, footwear, marketplace) and so forth (Weber and Mikačić, 2003:22). Of the tourism expenditure items listed we will highlight transport which is explained as an "integral component of tourism development" (Čavlek *et al.*, 2011:190) which allows tourists to reach their desirable tourist destinations (Čavlek *et al.*, 2011:189). According to Šolman there are six roles of transport in tourism: "it ensures the availability of a tourist destination by means of transport infrastructure facilities; it ensures "quality of travel" – a tourist has to experience their trip as comfortable, fast, safe and affordable (economical); it transforms a trip into a tourist experience - a tourist has to have a memorable experience of a tourism trip (e.g. a vacation), remember it as interesting, new and unforgettable and part of the tourism offer; it ensures tourist mobility within a particular tourist destination; it ensures that a tourism destination is well supplied – tourists spend and purchase at their destination, as well as during the inbound trip, which necessitates a timely, sufficient and efficient supply based on modern logistical principles (just-in-time, door-to-door etc.) and transforms special types of transport services into a "tourist attraction" in "tourist destinations" (Šolman, 2010:233). Along with transport, the complexities of the tourism market have resulted in the emergence of tourism trade intermediaries – travel agents and tour operators. Some of the most important functions of tour agencies are listed as follows: intermediary function (connecting tourism supply and demand), informative-consultative function (providing a wide range

of various travel information to tourists), advertising function (various promotional tourism materials) and organizational function (entrepreneurship of travel agencies) (Čavlek *et al.*, 2011:218-219).

As previously mentioned tourism affects the economic development of a country by providing the following economic benefits: an increase in income, employment, capital investment and public revenue as well as an incentive to regional growth and development (Čavlek *et al.*, 2011:237). After Croatia became a full-fledged member of the European Union on 1 July 2013 its positioning on the European tourism market increased. According to Hitrec, prior to its accession to the EU Croatia was somewhat isolated, i.e. the trends in Croatian tourism began to change after the EU and other integrations started to open to Croatia (Hitrec, 2000:118). Tourism was incorporated into EU legislation relatively late – in 1992 the Community Action Plan to Assist Tourism was adopted which features prominently as one of the documents serving to highlight the European dimension of tourism (Hitrec, 2000:120-121). In scientific and professional literature Europe is often defined as the most powerful global tourism destination and tourism represents the third economic activity in the EU, while the tourism industry directly employs around 5% of the workforce (Jasprica, 2012:116). The stated demonstrates the significant contribution of tourism to the economic benefit of a particular country. Croatia ranks as one of the most desirable tourist destinations in Europe and the world owing to its natural, cultural, historical, capital and human potentials, and all of the above mentioned underscores Croatia's importance to the EU in terms of tourism (Vuković, 2006:35).

The media have always exerted a powerful influence and hold on society. They influence all aspects of its activities by effecting changes. Due to the development of technologies today information spreads lightning fast and is immediately available to everyone in almost all corners of the world (Lekić *et al.*, 2015:145). The media nowadays also share a close connection with tourism, which is why today we are witnessing the significant role of the media in tourism, their correlation and the impact of the media on tourism. The development of information and communication technology often runs parallel to a discussion about the impact of modern social media on tourism. In his paper "Role of Media in the Promotion of Tourism Industry in India" Praveen Kumar classifies three types of media: 1. Communication channels through which news, entertainment, education, data or promotional messages are disseminated; 2. Broadcasting medium such as newspapers, magazines, TV, radio, billboards, direct mail, telephone, fax, and internet; 3. The growing popularity of the internet and social sites such as Facebook and Twitter, social media is now an important channel that allows messages to be spread to the public (Praveen Kumar, 2014:189). He also stresses the correlation between the media and tourism with regard to revenue and states that "Media contribute to 80% of tourism revenue and tourism contributes to 25% of media's revenue" (Praveen Kumar, 2014:189). In addition, he points out the complex relationship between the media and tourism noting that the media greatly influence a

traveler's choice of tourist destination (Praveen Kumar, 2014:189). Živković, Gajić and Brdar mention the social media as an important tool “for the analysis of tourists’ attitudes and this is confirmed by the increased purchases and recommendations to other users” (Živković *et al.*, 2014:759). When discussing the role of social media in the promotion of a specific tourist destination, their positive role is often highlighted. The internet is one of the most common and best sources of information on many things today, including tourism products, and has become one of the most important actors in the promotion of tourist destinations: “Each tourist organization, destination or company that wants to follow the course of time is present on the web. Besides internet pages and different sites, there is an increasing number of web portals, virtual magazines etc.” (Lekić *et al.*, 2015:147). Along with the positive aspects of tourism and those portrayed in the media there are the negative aspects or consequences of tourism development as well which include deviant behaviors, i.e. crime, among other things. Deviant behaviors and crime are often portrayed in the media and paint a poor promotional picture of a particular tourist destination.

With regard to the methodology of this paper several scientific articles will be mentioned which share similarities with the researched subject of this paper. In the article titled “Content Analysis of Newspapers' Travel New” the author elaborates the aim of the paper in the summary, which is the content analysis of newspaper articles about travel journalism in the most widely read Korean newspapers. The research period spanned 53 days in 2013, and the following categories were defined: type, theme, and writer of the news stories and the degree of promotional information in the news stories. Research results showed differences between newspapers which were reflected in the degree of promotional information in the news stories (Park, 2014). One of the research topics with respect to methodology that is similar to this paper is the analysis of the influence that the media i.e. media representation have on the choice of a tourist destination. It underscores the media influence on the creation of the image of a particular tourist destination which in turn impacts the tourists' decision-making process during the selection of a destination. A research was conducted, based on 162 international media websites, which studied the distribution of tourist destinations and established both positive and negative influences of the media on the image of a particular tourist destination (Scharl *et al.*, 2008). The media representation of tourism was also analyzed in an article titled “Newspaper Coverage of Tourism: A Content Analysis of the Daily Graphic and the Mirror” where the author, using the content analysis method, analyzed two Ghanaian newspapers: The Daily Graphic – the most reliable and widely read newspaper in Ghana and the Mirror – the most widely read Ghanaian weekly. The research comprised editions of the aforementioned newspapers from 2013 and 2014. Of the 628 issues of the Daily Graphic 104 issues were analyzed, as well as all the issues of the Mirror. The following types of news stories were researched: straight news stories, features, editorials

and letters to the editor. The research results showed that tourism accounted for only 184 articles, or 1.08% of all the articles analyzed, i.e. that the Mirror dedicated more column inches to the topic of tourism compared to the Daily Graphic. The topic of tourism included the following subtopics: cultural heritage, nature tourism, economic benefits, tourism development, environmental management and international tourism (Adolga-Bessa, 2015).

Although attempts have been made for years by scientists and experts to ensure a more even distribution of tourist arrivals throughout the year, the Republic of Croatia still records the greatest number of arrivals and overnights in the months of July and August. In 2017 there were 4 346 419 arrivals and 25 291 870 overnight stays recorded in Croatia in July, while in August 4 205 544 arrivals and 26 826 651 overnight stays were recorded in commercial accommodation. In 2018 a total of 4 333 377 arrivals and 25 918 243 overnight stays were recorded in July and 4 369 121 in August. According to the first release of the Croatian Bureau of Statistics: "In July 2019 a total of 4.3 million arrivals and 25.5 million overnights were realized in commercial accommodation facilities..." (Croatian Bureau of Statistics 2020b). According to the first release of the Croatian Bureau of Statistics on tourist arrivals and overnights: "In August 2019 a total of 4.7 million tourist arrivals and 27.8 million overnights were realized in commercial accommodation establishments..." (Croatian Bureau of Statistics, 2020c). The reported data on tourism turnover and realized overnight stays suggest that Croatia has a significant concentration of tourists in July and August.

| Month     | 2017      |            | 2018      |            |

Table 1. *The total number of tourist arrivals and overnights in the Republic of Croatia in 2017 and 2018 (source: Croatian Bureau of Statistics, 2020)*

In July 2013 the Croatian Parliament adopted the Tourism Development Strategy of the Republic of Croatia until 2020 which states that the Republic of Croatia is a country marked by a pronounced seasonality and whose path to modernization is rendered more difficult by the political situation at the

end of the previous century (Tourism Development Strategy of the Republic of Croatia until 2020, 2013). It also notes the characteristics of Croatian tourism: “a lack of innovative and high quality products for visitors; growth based mainly on the expanding private accommodation sector; lack of high quality hotel offer combined with insufficient investment activity; poor connectivity by air and sea; static system of national marketing; too few branded destinations that are globally recognizable; inadequate tourist infrastructure at destinations; long-standing orientation of the local population towards seasonal trade” (Tourism Development Strategy of the Republic of Croatia until 2020, 2013).

## METHODOLOGY

The aim of the paper is to research articles on tourism on the pages of the most visited Croatian news websites in order to gain insight into the media representation of tourism in Croatia, its neighboring countries, Europe and the world from the point of view of Croatian national news websites. Bearing in mind that Croatia generates significant revenue from tourism and taking into consideration the role of the media in shaping public opinion, we wanted to analyze and enhance the understanding of the media representation of tourism on Croatian news websites by analyzing media articles on tourism. Even though Croatia devotes a great deal of effort to extending its season, the greatest concentration of tourists still occurs in the summer months, especially in July and August. We therefore chose the months of July and August 2019 as our research period. The paper is based on the articles on tourism that were published in July and August on the following news websites: Index.hr, 24sata.hr and jutarnji.hr, which are the most popular news websites in the Republic of Croatia according to Alexa.com. Articles were chosen based on the key word tourism, and were published during the research period from 1 July to 31 August 2019. The articles were analyzed using the method of quantitative content analysis in order to try and provide answers to the following research questions: what is the publication frequency of articles on tourism on the three most popular news websites in Croatia; what is the geographic focus of the articles (to what extent was the topic tourism in Croatia, compared to tourism in neighboring countries and the world); which topics in the field of tourism were represented in the body of research and to what extent; what views and opinions can be discerned from the articles and do the researched websites differ with regard to opinions and topics. Newspaper articles were categorized as follows: general, tourism offer, crime, policies, promotion, high prices, tourism turnover, soft news, employment and other topics. The definition of tourism offer from the Croatian language lexicon includes three groups of elements: “attractive elements (biotropic or anthropogenic goods that determine the tourist quality of a space, the degree of its attractiveness and the possibility of tourist validation, traffic or communication elements (means of transport and traffic infrastructure that serves to connect tourist destinations with potential markets) and receptive elements

(the measure of tourism development – hotel industry, restaurant business and all other establishments and services that serve tourists indirectly)” (tourism, tourism offer, 2020); crime – which can be defined as: “the commission of illegal and dangerous acts (misappropriation of assets, violation of physical integrity of another person etc.); crime (criminality, 2020). The term policy can be explained as: general management, planning and government of the activities of a particular area of social, national, economic, cultural etc. life (municipal policy; financial policy; monetary policy; social policy etc.; the policy of rural, island, tourism development (policy, 2020). The term promotion can be explained as: “a) the first presentation of a thing (film, book etc., b) one of the four elements of marketing whose aim is to create an awareness of the presence of certain goods on the market, generate interest in them, encourage consumers’/buyers’ preference for them etc., c) the promotion of an idea, attitude” (promotion, 2020). Tourism turnover referred to articles focused on the number of tourist arrivals and overnights. The category general included articles that did not focus on a specific topic but rather reported on tourism in general terms, while in the category other topics we included articles that were fewer than five, which we agreed upon as the minimum for the establishment of a category.

Criteria for a positive rating: positive with respect to the topic researched, tourism (e.g. extending the season, growth in tourism turnover, increase in overnights); criterion for a negative rating: negative with respect to the topic researched (e.g. devastation of tourism areas, decline in the number of overnights and tourism turnover, unfavorable political/legislative measures, such as an unfavorable VAT) with respect to tourism. The criterion for a positive/negative rating (both positive and negative aspect are represented, for example growth in tourism turnover as well as the risk of mass tourism). The criterion for a neutral rating (articles where neither a positive nor a negative opinion or view could be discerned, for instance the mention of tourism without any additional content).

## RESEARCH RESULTS

During the research period 350 articles on tourism that meet the previously enumerated criteria were published.

| News websites | July |        | August |        | Total |         |
|---------------|------|--------|--------|--------|-------|---------|
|               | N    | %      | N      | %      | N     | %       |
| 24sata.hr     | 44   | 12.57% | 30     | 8.57%  | 74    | 21.14%  |
| Index.hr      | 79   | 22.57% | 79     | 22.57% | 158   | 45.14%  |
| jutarnji.hr   | 55   | 15.71% | 63     | 18.00% | 118   | 33.71%  |
| Total         | 178  | 50.86% | 172    | 49.14% | 350   | 100.00% |

Table 2. *The total number of articles by each news website included in the research (source: author’s work)*

The 24sata.hr news website published the fewest articles compared to the other news sites, 74 articles (21.14%) in total. In July it published 44 articles (12.57%) and in August 30 articles (8.57%). Jutarnji.hr

published 118 articles on tourism in total (33.71%). It published 55 articles (15.71%) in July and 63 articles (18%) in August. The Index.hr news website accounted for the greatest proportion of articles in the body of research. It published a total of 158 articles (45.14%). In both July and August it published 79 articles (22.57%).

| News websites | 24sata.hr |        | Index.hr |        | jutarnji.hr |        | Total |
|---------------|-----------|--------|----------|--------|-------------|--------|-------|
|               | N         | %      | N        | %      | N           | %      |       |
| Croatia       | 70        | 94.59  | 143      | 90.51  | 102         | 86.44  | 315   |
| Region        | 0         | 0.00   | 3        | 1.90   | 3           | 2.54   | 6     |
| Europe        | 1         | 1.35   | 7        | 4.43   | 7           | 5.93   | 15    |
| World         | 3         | 4.05   | 5        | 3.16   | 6           | 5.08   | 14    |
| Total         | 74        | 100.00 | 158      | 100.00 | 118         | 100.00 | 350   |

Table 3. *Geographic focus of the articles (source: author's work)*

The articles of the body of research were divided based on the variable of the geographic focus. Table 3. shows that the articles were sorted not only into Croatia, Europe and the world but also neighboring countries because a significant number of tourists from neighboring countries visit Croatia. Viewed in total, the articles were focused mostly on Croatia, 90%, whereas a smaller proportion of the articles was focused on Europe, 4.29%, the world, 4.00% and neighboring countries, 1.71%. Analysis of the geographic focus by news websites from Table 3. shows a predominance of articles focusing on the Republic of Croatia; 24sata.hr, 94.59%, Index.hr, 90.51% and jutarnji.hr, 86.44%. The neighboring countries, Europe and the world are also significantly less widely represented in the individual analysis.

| Category   | crime | policies | prom o | tour. offer | tour. turnover | high prices | soft news | employ | general | other topics | Total |

| Total      | 18.57 | 18.0     | 3.43   | 24.0        | 14.0           | 6.29        | 5.14      | 2.57   | 3.71    | 4.29         | 100.0 |

Table 4. *Analysis of the articles by topic and tone (in %) (source: authors's work)*

Analysis of the topics represented on the news websites 24sata.hr, Index.hr and jutarnji.hr in the research period with respect to tourism (as presented in Table 4.) shows that the most widely covered topic was tourism offer, in 24.00% of the articles. This is followed by crime, 18.57%, policies, 18.00%, and articles on tourism turnover, 14.00%. Fewer articles were published on high prices, 6.29%, soft news, 5.14%, other topics that were fewer than five and therefore could not form a separate topic, 4.29%, general, 3.71%, promotion, 3.43%, and employment, 2.57%.

By analyzing the topic of the articles by news sites the research showed that the 24sata.hr news website wrote about tourism mostly in the context of policies, i.e. 24.32% of the articles. Tourism offer was the topic of 21.63% of the articles. More than half of the articles expressed a positive opinion, 55.25%, and more than a third of the articles, 37.50%, expressed a negative opinion. There were 6.25 articles with a neutral opinion, and no articles on tourism offer that voiced both a positive and negative opinion. On the topic of crime the 24.sata.hr news website published 14.86% of articles stating a negative opinion during the research period. The topic of promotion was represented with 10.81% of articles. The articles with a positive opinion predominated with 87.50%, compared to 12.50% of those expressing a negative opinion. Soft news in the context of tourism, covered by 5.14% percent of articles, was mostly written about in a positive tone, 75.00%. The remaining 25% of articles were neutral in tone. High prices were the topic of 4.05% of articles, all of which expressed a negative opinion. Tourism in general was the topic of 2.70% of articles, while the tone was positive in 50.00% of the articles and both positive and negative in the other 50.00%. The remaining topics account for 1.25% of the articles and the opinion they expressed was negative. The topic of employment was not represented. During the research period the Index.hr tourism coverage focused mainly on policies, 21.52%, and more than half of the articles, 55.88%, were negative in tone. There were 23.53% of articles that were both positive and negative in tone, 17.65% were negative and 2.94% were neutral in tone. Next come articles on crime which voiced a predominantly negative opinion, 20.25%. There were 9.38% of articles on crime that expressed both a positive and negative opinion. Tourism turnover was the topic of 18.99% of articles on tourism on the Index.hr news website. A negative view was put forward in more than half of the articles, 60.00%. In 23.33% of the articles the view was positive, and in 16.67% it was both positive and negative. The topic of tourism offer was represented in 11.39% of the articles; of those, 38.89% expressed a negative view, 33.33% a positive one and 27.78% of the articles presented both a negative and positive view. All the articles on high prices, 8.86%, expressed a negative opinion. Of the articles assigned to the category other topics, 5.06%, the majority expressed a negative opinion, 75.00%. In 25.00% of the articles both a positive and negative opinion can be discerned. The proportion of articles on soft news, employment and general was equal, 4.43%, but different views and opinions were stated. In articles on soft news both positive and negative opinions were most commonly expressed, 42.86%,

followed by positive and neutral with 14.29% each and 28.57% of articles expressing a positive opinion. Employment was mostly written about in a negative tone, 85.71%. A positive opinion could be discerned in 14.29% of the articles. On the topic general more than half of the articles voiced a negative opinion, 57.14%; 28.57% expressed both a positive and negative opinion, and 14.29% of the articles expressed a positive one. The jutarnji.hr news site published the most articles on tourism offer in the context of tourism, 42.37% of articles, most of which expressed a positive opinion, 60.00%. There were 16.00% of articles that expressed both a positive and negative opinion, and 24.00% a negative one. This is followed by the topic of crime, 18.64%, where all the articles were negative in tone. On the topic of policies, 9.32%, the articles were predominantly positive in tone, 45.45%, both positive and negative 18.18%, neutral 9.09%, and negative 27.27%. 6.78% of the articles reported on tourism turnover. Half of those articles expressed a negative opinion. 25.00% of the articles expressed both a positive and negative opinion. 12.50% were both neutral and positive in tone. 5.93% of the articles wrote about soft news in the context of tourism. More than half of the articles expressed a positive view. In the remaining articles other opinions are equally represented with 14.29% each. There were 4.24% of articles on high prices. A negative opinion predominated, in 80% of the articles. In 20% of the articles a positive opinion could be discerned. 33.33% of the articles expressed both a positive and negative opinion, whereas 16.67% expressed a negative opinion. With regard to the coverage of general topics, 3.39% of the articles stated a negative opinion, 50.00%. The topic of promotion was represented with 2.54% and all the articles voiced a positive opinion. The topic of employment was represented with 2.54% of articles, which expressed a positive opinion.

| Tone               | neutral | negative | positive/negative | positive | Total   |
|--------------------|---------|----------|-------------------|----------|---------|
| Number of articles | 7       | 192      | 49                | 102      | 350     |
| %                  | 2.00%   | 54.86%   | 14.00%            | 29.14%   | 100.00% |

Table 5. *Number of articles by tone (source: author's work)*

Table 5. suggests that, taking into consideration the entire body of the articles, a negative opinion could be discerned in 54.86% of the articles, both positive and negative in 14.00% of the articles, neutral in 7% of the articles and a positive one in 29.14% of the articles.

## CONCLUDING OBSERVATIONS

The phenomenon of tourism has been the subject of various studies by many scientists and experts from all fields of scientific study, especially economics. When we talk about tourism in Croatia, it is important to point out that it represents the most important link in the economic chain of Croatia, i.e. Croatia's economy is by and large based and reliant on the tourism industry, which is not an ideal situation. The current situation, i.e. the COVID-19 virus pandemic which has temporarily, as in other

countries around the world, halted tourist movements, can serve as an example. It should be mentioned that the development of Croatian tourism has changed since Croatia became a full-fledged member of the EU. Legislation has been introduced which regulates the framework within which tourism operates and Croatia has opened up to EU countries but also to other integrations. In 2013 a document was introduced in Croatia with great significance for the development of Croatian tourism titled Tourism Development Strategy of the Republic of Croatia until 2020, whose aim is to find solutions to reduce the seasonality of Croatian tourism as one of its negative characteristics, i.e. to extend the tourism season beyond the months of July and August.

The focus of the paper is placed in the context of the correlation between tourism and the media, described by much of the scientific and professional literature as the fourth branch of power, which shows the influence of the media on all aspects of social activity, including tourism. Today, with the development of information and communication technologies, new, modern forms of the media are created, such as social media, which influence the user's choice of a desirable tourist destination as well as the image of a particular destination. The body of research comprised the three most widely read news websites in the Republic of Croatia: 24sata.hr, Index.hr and jutarnji.hr. Of the 350 articles in total that were analyzed, the most articles on tourism were published by the Index.hr news website, 45.14%, while the 24sata.hr news website published the fewest articles on the topic, 21.14%, spanning the entire research period of the months of July and August 2019.

By researching the variable of the geographic focus articles were sorted into the following categories: those that focus on Croatia, the neighboring countries, Europe in a wider context and the world. The results of the research of this variable showed that the greatest proportion of articles dealing with this variable focused on the Republic of Croatia, 315 or 90% of the articles making up the total body of research. The fewest articles focused on the neighboring countries of the Republic of Croatia, only 6 articles or 1.71%. By comparing the number of articles published on each website it was established that the Index.hr news website published the most articles dealing with the geographic focus of Croatia, i.e. 94.59, whereas the 24sata.hr website published the fewest articles, 90.51%. It was also established that all of the researched websites had the most articles published in the category of Croatia as the researched geographic focus, while the values in other categories were different.

By analyzing the category of the topic represented on the researched news websites it was established that the topic of tourism offer was the most well represented, i.e. the proportion of articles was 24%, followed by crime with 18.57% and policies with 18%, and the fewest articles focused on employment, with 2.57% of the articles.

From the aspect of the news website the research showed that the 24sata.hr website published the most articles dealing with the topic of policies, 24.32%, and the fewest articles on other topics, 1.35%. On the

same website no article covering the topic of employment was published. As for the Index.hr website it was established that the most well represented topic was policies with 21.52%, followed closely by crime with 20.25% of the articles. The least well represented topic was the promotion of tourism with 0.63% of the articles. The jutarnji.hr news website focused most on the topic of tourism offer, with 42.37% of the articles, and least on the topic of employment in the tourism sector with a mere 1.69%.

By analyzing the opinion of each website with respect to the topic the research results showed that the 24sata.hr website expressed a wholly negative opinion in the categories of crime and high prices whereas the least negative opinions were expressed in the articles focusing on promotion, 12.50%. There was no negative opinion evident in the categories of soft news, employment and general. A neutral opinion was stated most often in the category of soft news, with 25% of the articles, and least often in the category of tourism offer with 6.25%. In all other topics a neutral opinion was not present. A positive/negative opinion was most present in the category of general, 50%, and least present in the category of tourism turnover, 9.09%. In all other categories there were no articles expressing a positive/negative opinion. A positive opinion predominated in the topic of promotion, 87.50%, and soft news with 75% of the articles, and was least present in articles on tourism turnover, 36.36%. There was no positive opinion expressed in the categories of crime, high prices, employment and other topics.

All the articles published on the Index.hr news website in the category of high prices expressed a negative opinion, i.e. 100% of them, and 90.63% of articles in the category of crime also expressed a negative opinion. The fewest articles expressing a negative opinion were published in the category of soft news with 14.29%. A neutral opinion was not recorded in other categories. A positive/negative opinion was most present in the topic of soft news, 42.86%, and least present in the topic of crime with 9.09%. In the categories of promotion, high prices and employment, no positive/neutral opinion was recorded. A positive opinion predominated in the articles on promotion, 100%, and tourism offer, 33.33%, while in the topic of soft news, employment and general it accounted for just 14.29%. A positive opinion was not recorded on the topic of crime, high prices and other topics.

On the jutarnji.hr news website all the articles on crime expressed a negative opinion, as did 80% of the articles on high prices, which was to be expected considering the crux of the matter. The fewest articles expressing a negative view were published in the category of soft news with 14.29%, while no articles voicing a negative opinion were recorded in the category of promotions. A neutral opinion was predominant in the articles on tourism turnover, but to a much lesser extent, with 14.29% and on tourism turnover, with 12.50%, while in the categories of crime, promotion, tourism offer, high prices, employment, general and other topics no article expressing a neutral opinion was recorded. A positive/negative opinion was most present in articles on general topics with 50%, and least present in soft news, 14.29%. No positive/negative opinion was recorded in the following categories: crime,

promotion, high prices and employment. The largest percentage of positive opinions was recorded in the category of promotions, in all articles, and in the category of tourism offer, 60% of the articles. No positive opinion was recorded in the categories of crime and general, while the fewest articles stating a positive opinion focused on the category of tourism turnover, 12.50%. A collective analysis of the views and opinions expressed on all the researched news websites suggests that, in total, in July and August 2019 on the 24sata.hr, jutarnji.hr and index.hr news websites a neutral opinion could only be discerned to a lesser extent, 7%. Less than a third of the articles expressed a positive opinion, 14% of the articles expressed both a positive and negative opinion while in more than a half of the articles a negative opinion could be discerned.

Considering the role of the media in society and their influence on public opinion, future research of media content within the framework of tourism should also focus on a qualitative content analysis in order to gain insight in the specific problems in tourism with regard to which the media expressed a negative opinion and thus encourage tourism management to reflect on them.

The current situation in the Republic of Croatia and the whole world caused by the virus COVID-19 impacts all industries, especially tourism, which is closely tied to foreign travel. It would therefore also be interesting to analyze articles on tourism in the media in the upcoming, in all likelihood very uncertain, tourist season in future research.

### ABSTRACT

In contrast to Lean Warehousing (LW), the Lean Manufacturing approach is a commonly acknowledged and numerous successful implementations testify its effectiveness (Achieng (2018; Kotcharat, 2020; Srisuk et. al. 2020; Bukhari et. al, 2020; Sobanski, 2009). Representing a crucial research gap, LW has systemic flaws due to a lack of understanding and integration of corporate philosophy and culture, leadership and change management as well as, so far, not considered factors in Warehouse Management. This paper explores the relation of these factors to the level of Lean Maturity Index (LMI) and depict the *lean drivers* and *lean showstoppers*.

The study starts with a narrative literature review to identify the scientific gaps and factors, which affect the sustainability of Lean warehousing approach. The results will be synthesised by an initial model followed by research hypotheses and finally validated by further empirical research. The data collection process starts with conducting semi-structured expert interviews. The qualitative findings inform the following quantitative research stage. This research approach pursues the quantitative survey and qualitative case study methods to triangulate the research results, which leads to higher levels of reliability and validity (Weyers et al., 2011). The synthesis of both research results – the quantitative and qualitative research sequence – will then lead to a final model of Lean Warehousing. This methodology considers conducive to the development of new knowledge in the field as former studies either used case studies or quantitative surveys and not both.

### INTRODUCTION

Today's supply chains have to cope with volatile markets and extremely high customer demands in a highly competitive global market. Furthermore, global incidents like the latest outbreak of coronavirus disrupt supply chains and companies starting to mount over their stock as they afraid not to meet contractual obligations. On the same time supply chain partners have shortages on products whereas e-

commerce companies have shortages in personnel (Hasanat et. al, 2020; Fernandes 2020). In general, there is trend in consumer and purchase behavior to place smaller orders but more often, but during the corona pandemic quite the opposite has happened and consumers started to buy much more than they need for their daily life to pile up a safety stock for staple food and cosmetics etc. This all leads to an extreme increase in data information and goods movement in warehouses. Against this backdrop, traditional warehousing is no longer capable of tackling these challenges, but it is vital to include warehouses in the definition of a supply chain as managing inventories is a key component of effective supply chain management. (Patil et al., 2016) Production is faced with the same challenges as complexity in production systems which is increasing more and more (Hofmann, 2014). Reasons are increasing demand in quality, shorter lead times, shortened product life cycles and finally the high increase in variances and lot size one. (Hofmann 2014). Therefore, organisations are striving for low inventory in warehouses to reduce costs and increases profitability at the same time. (Holweng, 2013) Hofmann (2014) proclaims a four-step process mature model. Following this model production systems started in the early nineties with Computer Integrated Manufacturing (CIM) followed by the Lean Management or Lean Production integration to the segmented and fractal factory. The last step is the so-called industry 4.0 or smart factory. This last step could also be solved with the Lean philosophy and automation (Lean Automation). An analysis of digitalization effects on the usability of lean tools by Pekarčíková, M. et. al. (2019) allows to note the great influence and compatibility of lean tools with Industry 4.0 tools and is also confirmed by Stefanic, A., et. al. (2019). So not only logisticians in distribution centers but also manufacturing warehouses have to deal with this complexity to serve their customers (internal or external) best.

“The experience shows that a high performant logistics and fast material flow systems make the difference between success and failure especially in this sector (logistics). But it is also shown that the traditional distribution system is no more capable to meet the requirements and if then just with poor satisfaction” (ten Hompel and Schmidt, 2010, p. 18).

This means logistics are the backbone of global supply chains (Pejić et al., 2016) and companies need to have a high-performance IT infrastructure and specialised software (Warehouse Management Systems) in place to be connected with supply chain partners and to execute complex warehouse operations. WMSs can manage, monitor and optimise these complex warehouse and distribution systems and do track the whole internal material flow. Further, they are interacting with other software systems like SCE (Supply Chain Execution) systems, by which they are contributing to transparency and efficiency in the overall supply chain. However, the potential of warehousing is still underexploited, and in order to be compatible and profitable companies are looking for strategies and methods tapping the full potential. Also, customer's expectations regarding delivery speed and accuracy demand even more

accelerated and error-free logistics processes. "One efficient strategy for coordinating within and between firms with a focus on eliminating waste, achieving efficiency, or overburden and creating value in products is the concept of lean management." (Patil et al., 2016, p.354)

Therefore, the latest approach called "Lean Warehousing" adopts Lean Production theory onto warehousing. Through the introduction of lean techniques like 5S, KANBAN, MUDA and KAIZEN, the efficiency in warehouse logistics processes should be further improved.

The results of the literature review show that current WMSs are already supporting many of the lean methods on a tactical level, but the elements of analysing and implementing at a strategic level are missing. At the same time, numerous failed attempts in integrating Lean Warehousing point to systemic flaws such as the lack of philosophy and a corresponding leadership style. Only 5 to 7 percent of the companies that attempt to implement lean do so successfully. (Byrne, 2004 p. xxi) Garza-Reyes et al. (2018) investigated the adoption status of Lean Manufacturing in the Transport and Logistics sector. They come to the conclusion that the application of Lean in this specific sector is still relatively unknown especially compared to the manufacturing sector. They also found out that the barriers for implementing Lean are the "...organizational structure, misalignment between the goals of individuals and their companies as well as a lack of sustainment of a lean culture..." (Garza-Reyes, et al., 2018). Further reasons for failed attempts or not to implement are the lack of understanding the Lean Philosophy and a lack of knowledge and experience. Most of the companies therefore trust in technology-based tools to improve logistic operations.

## LITERATURE REVIEW

### *Warehouse Management*

"Process management is the essence of successfully managing warehouse operations. Mapping out the dynamic flow of goods and the accompanying value-added services (VAS) that occur in an active warehouse is the first step to attaining management success. Eliminating process variations and ensuring full employee understanding of the process - particularly their specific portion of process - is imperative. Establishing and tracking metrics along with the integration of available technology can enhance the efficiency of warehouse operations by enabling continuous improvements to processes" (Keller and Keller, 2014, p. 87).

This definition of Warehouse Management makes clear, that warehousing is a very complex area of business operations which need a permanent monitoring by measuring KPI's and also needs highly motivated operators to be enabled for a continuous improvement. Ramaa et al (2012) provide a more technical definition of WMS in stating that "...a warehouse management system (WMS) is a database driven computer application, to improve the efficiency of the warehouse by directing cutaways and to

maintain accurate inventory by reducing warehouse transactions.” The warehouse efficiency improvement was proved by case study (Ramaa, et al, 2012).

Richard (2014) has more simple definition of warehousing. “A warehouse should be viewed as a temporary place to store inventory and as a buffer in supply chains. It serves, as a static unit — in the main — matching product availability to consumer demand and as such has a primary aim which is to facilitate the movement of goods from supplier to customers, meeting demand in a timely and cost-effective manner” (Richard, 2014, p. 6). The definition of Richard seems to be simpler as he is not mentioning that it needs highly flexible and efficient process to meet the customer demands but makes clear that a warehouse does play a vital role in the supply chain and is not an isolated link.

#### *Lean Warehousing*

LW is based on the techniques of Lean Production (Spee and Beuth, 2012) with aiming at increasing efficiency and effectiveness of warehouse operations. This means it is using the same methods which are shown in following figure 2 and were used for Lean Production just with the application on warehouse processes. A simple definition for lean warehousing quoted by Chua and Katayama (2009, p. 3) “...would be a warehouse that is capable to operate in such manner that the throughput is optimized for warehousing activities”. Furmans and Schwab (2014) are stressing specifically the systematic and sustainable idea of lean warehousing in defining LW as “...leadership concept for continuous systematic analysis and sustainable, measurable improvement of warehouse processes.”

A further definition of Lean Warehousing by Dehdari et al. (2011) goes beyond the operational level and embraces the employee engagement explicitly.

#### *Lean Leadership*

Lean warehousing is a leadership concept. This concept aims at a permanent, systematic, analytic, sustainable, and measurable improvement of processes in the warehouse environment. This postulates a contribution of all employees and that employees are gaining awareness of perfection in each corporate operation. (Mustafa, M.S., 2015; Ghimire, M., 2017. Sobanski, E. B., 2009) Besides the aforementioned lack of conceptualizations, Lean Warehousing is afflicted with mistrust, prejudices and lack of knowledge about the real lean philosophy (Kuther and Schaaf, 2013; Dombrowski et al., 2012). Hines et al. (2008) explain this by the Lean Iceberg model with the visible top of an iceberg as lean technology, tools, techniques and processes and the invisible part of the iceberg under the waterline representing strategy alignment, leadership behavior and engagement. This model implies the gap of corporate culture aspects, but ignores that the current Warehouse Management technology is also not sufficient for a sustainable Lean Warehousing introduction Womack and Jones (2003, p. 10) also point to the strategic aspect of Lean Warehousing by stating: “... managers had drowned in techniques as

they tried to implement isolated bits of a lean system without understanding the whole." The Toyota Production System (TPS) philosophy is to see the value of produced goods or services from a customer perspective as a starting point of all improvements.

Womack and Jones (2003) call this the first principle of lean. The whole organisation including the senior management has to focus on the place, where the value is created - the shop floor. Arndt (2015) pointed out that to make Lean a core part of the corporate culture a company also has to follow the strategic management model bottom-up. Chandra (2013, p. 36) states in this context: "Since the entire organization is affected, cultural assumptions need to be addressed in order to ensure compliance with new organizational requirements. To deal with this gap, a transformational leader or "Lean Champion" is required (Vitalo et al., 2009; Hobbs, 2011; Alukal, 2006).

## **METHODOLOGY**

This study will be conducted by the view of a critical realist, which combines positivism and phenomenology to gain a comprehensive picture of the Lean Warehousing theory as earlier studies used mainly structured questionnaires. However, "...the critical realist's position is that the social world is constantly changing is much more in line with the purpose of business and management research which is too often to understand the reason for phenomena as a precursor to recommending change" (Saunders et. al, 2009, p.115). The critical realist, also recognises the importance of multi-level study (e.g. at the level of the individual, the group and the organisation) and of a greater variety of structures, procedures and processes (Saunders et. al., 2009).

The study started with a narrative literature review gathering data about Lean Warehousing methods and the standard functions of WMS, corporate philosophy and culture (Mann 2015; Hermalin, 2013), change management (Kotter and Seidenschwarz, 2013; Doppler and Lauterburg, 2014) and transformational leadership (Vitalo et al., 2009; Liker, 2011; Givens, 2008) to identify the scientific gaps. The search was using several internet search engines like Metager, WorldCat as well as databases like EBSCO, ProQuest and Emerald and conducted secondary research in the libraries of the University of Nicosia and at the University of Applied Sciences Landshut.

The results were then synthesized by an initial conceptualization and research hypotheses to be validated by further empirical research. The data collection process starts with conducting a pre-determined sample size of 15 semi-structured expert interviews with logistics managers, WMS vendors and consultants specialised in lean transformation. This means once more a using triangulation in this research by mixing the groups within the same sample and same sample method. In each group five interviews are conducted as the qualitative research focus on the views of less people in greater depth (Curry et al., 2009). As a specific research objective for the qualitative stage this procedure is promising

to enclose eventually missing factors for a lean warehousing model which are not mentioned in the literature until now. The sample size is in line with Baker and Edwards (2012), Denzin (2012) and Back (2012) who are following the data saturation pattern that the majority of information comes from initial interviews and less and less new information by later interviews. The transcription of the voice records will be analysed with software programs like Nvivo or MaxQdata in form of a content analysis.

The qualitative findings will then inform the following quantitative research stage and eventually missing factors will be incorporated into a structured questionnaire to investigate the general research question and to tackle the research objectives. The results will be analysed with SPSS (regression analysis) and will disclose the specific demands and reasons of failed lean implementations for the groups manufacturer, suppliers and logistics service provider to consider the relation to multiple stakeholders.

This research approach pursues the quantitative survey and qualitative case study methods to triangulate the research results. This combines the respective advantages of both methodologies and will lead to higher levels of reliability and validity (Weyers et al, 2011).

The synthesis of both research results - the quantitative and qualitative research sequence - will then lead to a final model of Lean Warehousing.

This methodology is considered conducive to the development of new knowledge in the field as the aforementioned studies only used observed case studies or surveys respectively.

## FINDINGS AND DISCUSSION

### *Qualitative research – Expert Interviews*

The digital recorded interviews were uploaded to MaxQdata for analysis. Instead of a full transcription of all 12 interviews each interview was transcribed through colored markings on the audio spur. This technique is called “Direct Audio Transcription” and has the advantage that latter analysis of the data is supported by various statistical methods. For analysing it is not important to have the detailed context of speak but moreover regards to the thematically content. Similar to the method of selective transcription it is suited for researches with huge amount of data (Laforest, 2009; Kurzrock, 2014). As the interviews with 12 interview partners resulted into nearly 14 hours of voice data the method of summarising transcription is best suited even more as the categories respectively research objectives were already built. The transcription in comparison to the traditional transcription process itself is still very intensive as the researcher listens to short sections of the audio records again and again to define the codes and sub-codes and to assign the heard section accordingly. One answer could fit to more than one code or sub-code. The image below shows one example of a section which is marked in two different colors (code groups) and three markings in total. In this case the marked section respectively

the answer of the interviewee is pointing as well to the codes *Enterprise Size, Economical Reasons* as to *Organisation* and therefore will be counted one times for each code group.

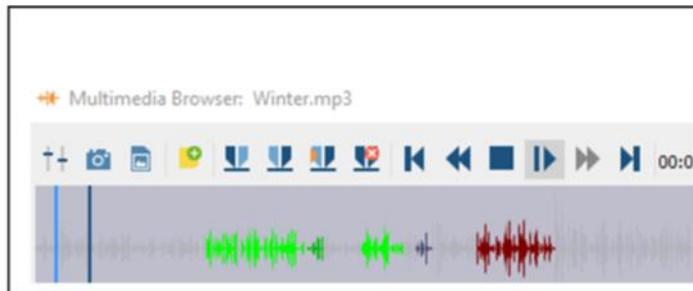

Figure 1. Example of "Coding" an audio data file of an interview

The identified factors from the literature review build the framework for the codes and it turned out that they could be clustered into 6 major codes and several sub-codes. During the procedure of coding some new factors were found which has to be considered.

| Codes                                       | Sub-Codes   |
|---|---|
| Warehouse Management                        | WMS (1), Automation (2); Warehouse Techniques (3), Missing Functions (4)  |
| Applicability of Lean methods in warehouses | Training (1), Not or just partially applicable (2), Applied Lean Methods (3), Publicity of Lean (4), State of Research (5), Complexity of Lean Methods/Philosophy (6)   |
| Internal Factors (Enterprise)               | Change Management (1), Industry sector (2), Size (3), Asymmetric relations (4), Organisation (5), Culture (6), Product (7), Strategy (8), Leadership Style (9), Employee (10)   |
| External Factors (Stakeholder)              | Supplier (1), Environment (2), Society (3), Competitor (4), Customer (5)  |
| Lean Showstopper                            | KPIs, (1) No support from Top Management (2), Cost intensive (3), Departmental thinking (4), Outsourcing of logistics (5), organization (6), High margins (7), Employee knowledge (8), Weakness of logistics department within the organization (9)   |
| Lean Drivers                                | Quality (1), Transparency (2), Organisation (3), Flexibility (4), Standardised processes (5), Reduced throughput-times (6), Reduced waste (according lean philosophy) (7), Reduced stock (8), Economical reasons (9), Optimised production (10), Turnover rate (11), Optimised usage of warehouse spaces (12) |

Table 1. List of Codes and Sub-Codes

The table below shows the result of the interviews per code and sub-code. Thereby these figures being an indicator about the power of influence each factor or independent variable has on the dependent variable Lean Warehousing Maturation (LWM).

| Code  | Sub-Code |    |    |    |    |    |   |    |    |    |    |    | Total No. in Code-Group |
|---|----------|----|----|----|----|----|---|----|----|----|----|----|-------------------------|
|   | 1        | 2  | 3  | 4  | 5  | 6  | 7 | 8  | 9  | 10 | 11 | 12 |                         |
| Warehouse Management                        | 25       | 37 | 2  | 34 | -  | -  | - | -  | -  | -  | -  | -  | 98                      |
| Applicability of Lean methods in warehouses | 9        | 15 | 55 | 12 | 5  | 14 | - | -  | -  | -  | -  | -  | 110                     |
| Internal Factors (Enterprise)               | 8        | 43 | 13 | 3  | 15 | 20 | 5 | 9  | 14 | 8  | -  | -  | 128                     |
| External Factors (Stakeholder)              | 8        | 2  | 1  | 5  | 13 | -  | - | -  | -  | -  | -  | -  | 29                      |
| Lean Showstoppers                           | 1        | 15 | 13 | 7  | 16 | 24 | 5 | 19 | 8  | -  | -  | -  | 108                     |
| Lean Drivers                                | 3        | 3  | 16 | 6  | 6  | 3  | 3 | 3  | 13 | 3  | 1  | 4  | 64                      |

Table 2. Total Number of Codes and Sub-Codes

The ten strongest sub-codes which seems to have a strong influence on LWH are:

(1) Applied Lean Methods with (55 codes)

All interviewees knew about several lean methods like 5S, KANABN, milkrun, supermarket etc. and report about how they are practicing it in daily operation. This means Lean in general is commonly known and accepted and practised at least some single methods. However, each of the terms is a lean method to stabilise lean once it is introduced. This could be seen as a hint, that Lean is seen as toolbox with methods and not a philosophy as no method for analysis or procedure was mentioned. Furthermore, this indicates that there is just a superficial knowledge of Lean methods and no knowledge about Lean as a holistic philosophy as no methods for the management level were mentioned.

(2) Industry sector (43 codes)

Obviously, the industry sector is very strong factor to implement lean sustainable. The automotive sector is still seen as a one of the leading industries with deep knowledge in lean manufacturing and therefore predestinated to establish LWH as well. Further industries with good preconditions are industries with strict legal guidelines like pharmaceutical, chemical or food industry and also the mechanical engineering industry. Processing industry, wholesale, logistics services as well as fashion and textile traditionally have in general no or even small knowledge of lean methods.

(3) Warehouse Automation (37 codes)

“Its easier to invest in a machine or in automation as the output and the productivity is calculable and predictable. Therefore, managers tend to shy away from investing in people and a lean initiative, because the return on invest (ROI) is unknown.” This statement by an interviewee who worked as a manager for an automotive supplier reflects the view of all interviewees who gave similar answers. Of course, it is given, that an automation is suited to increase productivity, but probably not the best in the long term. Automation in warehouses are most often inflexible systems like a mini-load or a high-bay warehouse in combination with conveyors. These kinds of systems are not easy to adapt to new processes and therefore often stay in the same state over years.

(4) Missing Functions in WMS (34 codes)

By literature review several aspects could be identified like graphical control and process workflows, prioritising and traceability of orders, Displaying of relevant indicators (KPI's), visualisation (e.g. Andon-Boards), Shop-floor-Management, CIP integration, Knowledge platform (WMS Tutorial, Lean Methods, Warehouse Management etc.). These lacks were confirmed by most of the interviewees.

(5) WMS (25 codes)

Beside the functional lacks in the last section, there are also some general lacks. “Sometimes WMS are extreme customized and not standard anymore and this makes it difficult to change settings regarding kaizen. (Interviewee. 8) Another statement from Interviewee 7 confirms this in stating that “...process optimisation takes place during the first WMS implementation and after that moment just little changes are done for about 10 years.” But in contrast to the lack of functionality there it was also mentioned that “WMS software is providing all functions it needs for a lean warehouse and could be adopted from time to time but it isn't used.” (Interviewee 7) Another statement also points in that direction in stating that “...most often the smaller software vendors respectively systems are best of breed but the IT manger decides to go for the big names.” (Interviewee 9)

So, there is not a common view about WMS. There are positives as well as negative aspects, but due to this controversial point of views it is definitely a topic that matters and should be focused for an LWH model.

(6) Organisation – as Showstopper (24 codes)

Organisation in this context was mentioned as number one reason to be a showstopper for LWH. This underpins numerous sources (e.g. Liker, 2011) which all claim that Lean Philosophy is a holistic approach and should be the guiding “North Star” for a company and this would also mean to adjust the organisation accordingly. This could be parallel structures to the formal

organization like teams, project groups in a matrix organization or new functional cooperation networks or even internal ventures. (Smeds, R. 1994)

(7) Culture (20 codes)

Also, the sub-code culture is a basic variable for a sustainable LWH. In a nutshell “Culture is key to lean” (Interviewee 3) but therefore a “...change of mindset about logistics as a crucial element in business must take place.” (Interviewee 11).

Concerning Koenigsacker (2013) culture is straight linked to leadership as the organisational culture is defined by the behaviors or habits of its leaders and therefore the code organisation points also to leadership. When you add lots of these “What they do’s” together, you see the fabric of a new culture.” (Koenigsacker, 2013 p. 94)

(8) Employee knowledge (19 codes)

The employee knowledge is also seen as an important factor as most of the interviewee’s responses say that the people on the shop floor are mostly “...less educated people” (Interviewee 1) which was confirmed by Interviewee 7, Interviewee 9, Interviewee 11 and Interviewee 3. Interviewee 4 spoke about workers who “...are overburdened and have not the knowledge and competence in lean methods. Furthermore, companies very often have a temporary worker (Benvegnú, 2018; Moric, 2020) at the logistics operation and according interviewee 3 and Interviewee 9 these people also don’t have the knowledge about the products and processes and don’t see the full context. In addition, they are not motivated to question the existing processes. Moreover, there is not only a lack in the blue-collar level but also in the white-collar level. Interviewee 5 even sees a general lack of competence and knowledge in the companies whereas Interviewee 7 claims that manager are afraid of the change and do not listen what the consultants and specialists tell them to do. On the other side “Managers don’t have the deep knowledge in operational procedures and also don’t know the lean approach” (Interviewee 10).

So, all these statements point to a lack of knowledge about the lean philosophy throughout the whole company and also confirm the lack in culture which is open to changes and allows new ideas even if they are not fruitful at the end.

(9) Organisation – as Lean-Driver (16 codes)

The factor organisation could also be a big driver for lean if you find corresponding conditions in a company like a separate department for SCM and logistics and ideally even at the board of directors. (Interviewee 7, 1, 4 and 12). This indicates that concerns have and advantage towards SME’s as they usually don’t have such a wide range of management positions. (Interviewee 7 and 6)

(10) Outsourcing of logistics (16)

“Lean prevents outsourcing” (Interviewee 1) and would also mean to lose control and knowledge as logistics is “...important for the whole process understanding” (Interviewee 1). Regardless “Outsourcing is still very common” (Interviewee 11) because “logistics processes getting too complex and companies start to outsource this task to 3PL provider” (Interviewee 5). 3PL “...have established lean principles...” (Interviewee 7) as the companies who assigned these tasks to 3PL and expect high quality and low prices (Interviewee 10). Sometimes quite the opposite is the case as the customer dictates how the processes have to look like and which software they have to use. Outsourcing could also be a big pressure for the internal logistics department as they have to cope with them in order not to risk the job. (Interviewee 7)

*Quantitative research – Online and paper-based Survey*

Before an online questionnaire is distributed, it is essential to inspect the questions derived from the literature review and it is constituting the survey instrument in order to gain its validity and reliability (Brace, 2018). Reliability threats like subject or participant error, observer error, subject or participant bias and observed bias were addressed through a test pilot as recommended by Robson and McCartan (2016).

In total 127 usable responses were obtained. Based on similar studies the sample size of 127 was considered acceptable to draw conclusions and link them to the findings from qualitative data sampling in the pre-executed expert interviews. Observer bias and error were not applicable to this survey as the questionnaire was designed with questions for which interpretation was not possible with fixed alternative answers. Thus, observer bias was irrelevant for this study (Binti et al., 2016). The table below shows the statistics of the sample concerning company size, warehouse type, industry sector and the LMI.

| Company size              | % in sample | LMI  |
|---------------------------|-------------|------|
| SME                       | 25,20 %     | 2,16 |
| concern                   | 73,23 %     | 2,43 |
| "don't know"              | 1,57 %      | 0,00 |
| Market /Strategy          |             |      |
| national                  | 10,24       | 1,46 |
| international             | 23,26       | 2,60 |
| multinational             | 0,00        | 0,00 |
| transnational             | 0,00        | 0,00 |
| global                    | 28,35       | 2,31 |
| "don't know"              | 37,80       | 2,25 |
| Industry Sector           |             |      |
| Pharmaceutical and Pharma | 1,57        | 1,57 |
| Textile and Fashion       | 4,72        | 2,40 |
| Machine Building          | 22,05       | 2,36 |
| Logistics                 | 26,77       | 2,26 |
| Consulting                | 0,00        | 0,00 |
| Food, Drinks and Tobacco  | 8,66        | 2,72 |
| Automotive                | 11,81       | 1,93 |
| Distributor               | 11,02       | 2,21 |
| Processing                | 4,72        | 1,67 |
| Electronics and other     | 8,66        | 2,64 |
| Warehouse Type            |             |      |
| Distribution warehouse    | 19,42       | 2,25 |
| Retail Warehouse          | 17,15       | 2,19 |
| Production Warehouse      | 25,24       | 2,38 |
| Transshipment Warehouse   | 11,33       | 2,20 |
| Central Warehouse         | 16,50       | 2,16 |
| Buffer Warehouse          | 10,36       | 2,44 |
| Automation Grade          |             |      |
| Grade 1                   | 8,66        | 1,73 |
| Grade 2                   | 8,66        | 1,45 |
| Grade 3                   | 23,62       | 2,07 |
| Grade 4                   | 38,58       | 2,59 |
| Grade 5                   | 18,90       | 2,58 |

Table 3. *Sample Statistics in comparison to LMI*

The analysis of the sample statistics was evaluated and resulted into some first findings by comparing the median value for the LMI. Concerns do have a higher LMI than SME's and also companies with an international market strategy do have the highest LMI with a grade of 2.60 in comparison with companies doing business only in the national market. Concerning the industry sector surprisingly companies within the food, drinks and tobacco sector have the highest LMI with 2.72a, although literature and the interviewees claimed the automotive industry should have the best preconditions due to the historical advantage that Lean philosophy was created by Toyota. Also, Electronics, Textile, Logistics, Machine Building industry and Distributor have a higher LMI. Just pharmaceutical and chemical and processing industry have a lower LMI. In the category of warehouse type the level of LMI is more or less the same and fluctuates between 2.16 and 2.44. This means the warehouse type seems not to be a crucial indicator for a high or low LMI. In contrast the automation grade there is a clear relation to the LMI. The higher the automation grade the higher the LMI.

*Reliability and Validity*

Reliability analysis was applied by examining the survey values of Cronbach's Alpha.

| Reliability Statistics |                                    |              |
|------------------------|------------------------------------|--------------|
| Cronbachs Alpha        | Cronbachs Alpha standardised items | no. of items |
| ,804                   | ,796                               | 33           |

Table 4. *Sample Statistics in comparison to LMI*

Values greater than 0.9 means that the survey achieved an excellent consistency. Values above 0.7 are generally considered as acceptable. The Cronbach's Alpha here reached 0.804 which confirms a good reliability. Setting the confidence interval at 95%, the results of ANOVA test (Table below) provides an F-test value for the null hypothesis. The result of  $F = 1.582$  for the independent variables proves a relation to LWH satisfaction grade. However, based on the analysis, Null hypothesis can be rejected. A further test like T-Test is not necessary.

| ANOVA           |                           |          |                |        |        |       |
|-----------------|---------------------------|----------|----------------|--------|--------|-------|
|                 | sum of squares            | df       | median squares | F      | Sig.   |       |
| between persons | 692,252                   | 126      | 5,494          |        |        |       |
| within persons  | between items             | 2078,037 | 32             | 64,939 | 60,172 | 0,000 |
|                 | not standardiesd residual | 4351,417 | 4032           | 1,079  |        |       |
|                 | total                     | 6429,455 | 4064           | 1,582  |        |       |
| total           | 7121,707                  | 4190     | 1,700          |        |        |       |
| total median    | 2,87                      |          |                |        |        |       |

Table 5. *Sample Statistics in comparison to LMI*

However also explanatory analysis was conducted to search for outliers within the sample to check for validity and to explain the reasons behind this. Outliers would influence the standard error and also the t-test and could finally lead to a survey which is not significant.

The result of the explanatory analysis in SPSS detected in total 15 variables with outliers which are marked with an "\*" in the box plots but for no variable the standard error crossed the critical value of 0,7 or higher. The maximum number of outliers for a variable were 6 participants from a total population of 127, which means a maximum deviation of 4,57%. An analysis of the outliers did not show a specific pattern and it was deduced that the answers are realistic and right even the statistic says they are extreme values. As they also do not affect the significance of the whole sample it was decided to include these outliers to achieve the full perspective and consider all data. Moreover, these outliers could also help to understand the correlation to the independent variable *Lean Warehousing Maturity Index* (LWI). The outliers were found in the sections *automation grade*, *warehouse management*

system, *internal stakeholder* and *external stakeholder*. In the sections *company size*, *industry sector*, *company strategy* and *applicability of lean warehousing* there were no outliers.

Figure 2. Example for a box-plot with variable 18 (automation grade) in relation to dependent variable 62 (LMI)

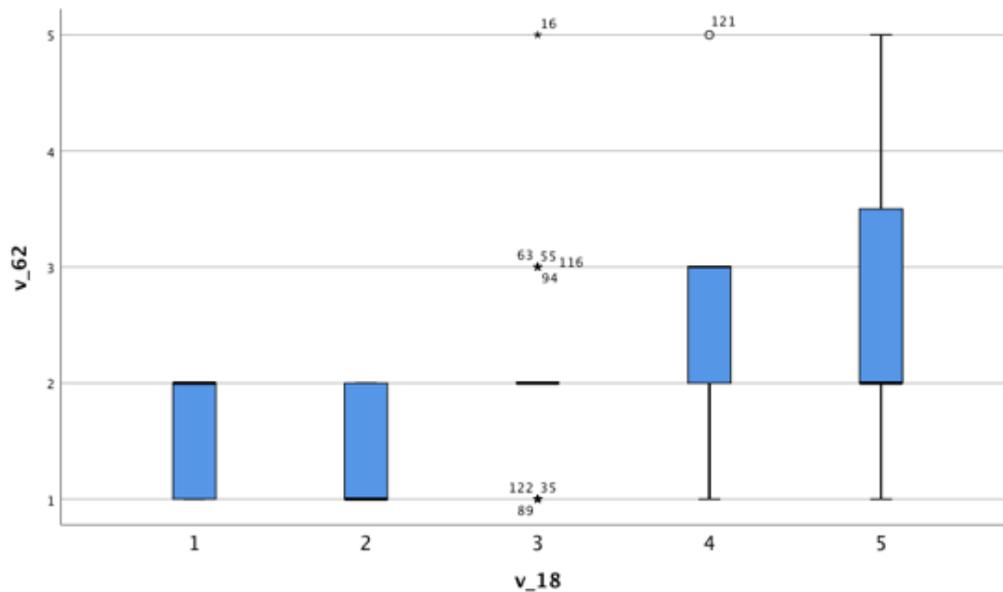

Figure 16: Example for a Box plot variable 18 (automation grade) in relation to dependent variable 62 (LMI)

For an overview and explanation, the data were clustered in median values for the group which reached the highest level (5) in LWHMG, the group with the lowest value (1) and a theoretical group with the overall median value. The table below shows all results which will be discussed and explained in more detail in the following.

Table 9: Exploratory analysis of median values comparing highest and lowest group in LWHMG

| section               | variable abridgement | highest LWHMG (lvl 5) | Overall median | lowest LWHMG (lvl 1) |
|-----------------------|----------------------|-----------------------|----------------|----------------------|
| automation grade      |                      | 4,4                   | 3,5            | 2,7                  |
| wms satisfaction      |                      | 3,4                   | 2,7            | 1,9                  |
|                       | KPI's                | 4,6                   | 3,1            | 2,0                  |
|                       | missing functions    | 3,4                   | 2,7            | 1,7                  |
|                       | configuration        | 2,8                   | 2,6            | 1,8                  |
|                       | support              | 2,6                   | 2,4            | 1,9                  |
| applicability of lean |                      | 2,0                   | 2,2            | 2,2                  |
|                       | cost intensive       | 1,8                   | 2,6            | 3,0                  |
|                       | lean methods applied | 5,0                   | 3,5            | 1,9                  |
|                       | lean too complex?    | 1,6                   | 1,7            | 2,3                  |

|                  |  |     |     |     |
|------------------|--|-----|-----|-----|
|                  | LWH not fully researched                           | 1,2 | 2,2 | 1,9 |
|                  | LWH has no effect on overall SC                    | 1,2 | 1,5 | 1,8 |
|                  | low employee knowledge and cost intensive training | 1,2 | 1,8 | 2,1 |
|                  | external trainer needed                            | 2,0 | 2,1 | 2,6 |

|                  | customer   | 2,8 | 3,5 | 3,5 |

Table 6. *Explanatory Analysis*

Explanation per section:

1. Automation grade

The values show a higher grade for automation in the best group which clearly predicate a correlation between this independent variable on LHWMG. The median value is also higher than the worst group which means that the higher the automation grade the higher the LHWMG. But this effect has to be analysed in more detail in a further detailed survey, as it did not consider when the automation was established. Usually before such invest is done the company conducts a detailed analysis of the internal logistics and the material flow either by internal or external consultants. This means during the introduction of automation system also the processes will be analysed and most often new designed. So eventually the gained improvements are only last over a

short period of time and are not consequently questioned and improved by a continuous improvement (CIP) according the LWH philosophy. Bucki (2019) investigated Lean Warehousing on cost-based approach and concludes that manufacturing cost can be lowered by replacing human labour by robots which pays off in a defined period of time, but another option would be reducing fixed and operating costs by means of lean tools without doing costly investments.

## 2. WMS satisfaction grade

The overall median value for this section and all single median values for each subcategory clearly indicates a higher grade of satisfaction of the WMS within the best group of LWHMG compared to the lowest group. This could be reasoned by having a state-of-the-art WMS in use, which is suited to manage and monitor the warehouse processes. The sub-category *KPI's* featuring a big difference in the values 4.6 and 2.0 and also in the sub-category *missing function* (3.4 versus 1.7). This implies that companies with a higher LWMG do have more modern WMS or at least with updates and adaptations on a regular basis in use which are able to meet the requirements better and help to support to apply methods according the LWH philosophy. This should be confirmed by further surveys.

## 3. Applicability of LWH

This section has sub-categories where a low or a high value could be interpreted differently. Therefore the overall median in this section is not suited for a global relation to LWHMG. For the question if the implementation of LWH philosophy is cost intensive the best group negates this statement with a value of 1.8 whereas the worst group tentative support it (value 3.0). In contrast to that the sub-category *lean methods applied* shows the highest value of 5 for the best group and comparable extreme value of 1.9 for the lowest group. This example confirms also validity in the data as the group who claims to have reached LWHMG level 5 also have the highest level of applied lean methods and inverse ratio for the group with the lowest LWHMG. An interesting result is that both groups don't think that the LWHM philosophy is too complex to be not applied. This underpins the hypothesis that all companies could and should apply LWHM to improve the overall efficiency for their warehouses. Further both groups think LWHM is more or less full researched. Also, both groups confirm that it is worth to strive for a holistic LWHM implementation as it has significant improvement effects also in context with the full supply chain. Studies from Hadrai (2019) and Vanichchinchai (2019) confirms this positive relationship between supply logistics, and competitive performance (operational) and supply performance. Hadrai (2019) further determined that lean processes are partially mediating this relationship and showed the importance of internal and external processes of companies' operations in an integrated manner

in which supply chain management acts through key internal processes to impact competitive performance.

#### 4. Internal Factors

For the external factor there is no general pattern, but between the group with the lowest and the highest LMI partially there are great differences. Some factors which are rated very high in the group of highest LMI are *Support by Top Management*, *strength of logistics department*, *employee motivation* and *culture* whereas the other group rated these factors relatively low. IN contrast some factors which the group with the lowest LMI rated some factors very high e.g. *product* and *change management* which allows to draw the conclusion, that the companies with a lower LMI do underestimate the influence of the relevant factors and rates other factors to high.

#### 5. External Factors

In this section nearly all factors were rated higher in the group with the lowest LMI. This pattern indicates that in general external factors do not have as much influence on the LMI. In big contrast the factors *asymmetric commercial relationships* were rated with 2,8 for the group with the lowest LMI opposite to 1.0 for the group with the highest LMI.

### *Multivariate Analysis*

In order to determine the relationship between dependent variable and the set of multiple independent variables a multivariate linear regression analysis is conducted. This procedure is used to determine the influence of independent variables on dependent variable and to what extent or even which variable(s) may even have no relation to the dependent variable. The general formula for the regression analysis is:

$$Y = F(x_1, x_2, \dots, x_n) + e$$

| Model Summary |      |          |                    |                            |                      |               |
|---------------|------|----------|--------------------|----------------------------|----------------------|---------------|
| Model         | R    | R-Square | Corrected R-Square | Standard Error of Estimate | adjusted in R-Square | adjusted in F |
| 1             | ,880 | ,775     | ,701               | ,503                       | ,775                 | 10,539        |

Table 7. Summary of of multivaraitre refression analysis

### ***Inferences***

The Model Summary includes multiple correlation coefficient R and its Square and also the adjusted version of this coefficient as summary measures of the model fit. The Linear Regression Coefficient R= 0.880 indicates that there is very strong correlation between dependent and independent variables (a closer figure to 1.000 means a stronger correlation). In terms of variability, the value amount of R<sup>2</sup>= 0.775 or 77.5% explains the variability within the population. So, 77,5% of the population in the sample agree on the correlation between the given variables.

Further the Standard Error of Estimate value reflected in the Table is 0.503 and represents the mean absolute deviation and is moderate considering the LMI ranges from 1 to 5.

## CONCLUSIONS AND LIMITATIONS

The study shows a very strong correlation between the LMI and the automation grade which indicates that Automation and Lean Philosophy does not exclude each other although it needs a further study to figure out in detail what kind of automation has the greatest impact and if the LWH was introduced and applied in a holistic and sustainable way. Furthermore, by triangulation of the survey groups with Managers in the qualitative survey and with operators at the quantitative survey it could be shown a lack of understanding between the importance of single factors. According to that the group of managers tend to underestimate the role of leadership and culture whereas operators ascribe a high influence on that factors like the literature does.

## FAILURES IN INTERNATIONAL PARTNERSHIPS: THE ROLE OF SEW IN FAMILY FIRMS

Kampouri, Katerina<sup>1</sup>; Plakoyiannaki, Emmanuella<sup>2</sup>; Hajidimitriou, Yannis<sup>1</sup>

<sup>1</sup>dept. of Business Administration, University of Macedonia, UoM, Thessaloniki, Greece

<sup>2</sup>faculty of Business, Economics and Statistics, University of Vienna, Vienna, Austria

### ABSTRACT

This study aims to answer the following research question: Why international partnerships (IP) of family Small and Medium Enterprises (fSMEs) fail? In doing so, it builds on the network theory and the Socio-Emotional Wealth (SEW) theory and investigates: 1) the factors that trigger IP failures in the context of fSMEs internationalisation and 2) the role of SEW in IP failures of fSMEs. To address the research question, this study employs a multiple case study design of six fSMEs operating in the Food and Beverages sector. The case study evidence indicates that *bureaucracy issues* and *institutional restrictions* (external factors), as well as *unfulfilled expectations* related to financial agreements and brand placement (internal factors), led to failures in IP of fSMEs. The case study evidence also indicates that the *family owners' identification with the firm* drove decision-making in IP strategic decisions. The contribution of the case study is twofold. It informs the international networking literature by presenting a framework of potential environmental (external) and individual (internal) factors which trigger IP failures in the context of fSMEs internationalisation. Furthermore it brings into light potential SEW dimensions (the *family owners' identification with the firm*) that drive the decision-making underlying family owners' IP strategic decisions.

*Keywords: family firms internationalisation, SMEs, international partnerships, failures, SEW*

### INTRODUCTION

The overarching objective of this study is to investigate why International Partnerships (IP) of family small and medium enterprises (fSMEs) fail. FSMEs are businesses having up to 250 employees (European Commission, 2003) “*in which family members have substantial ownership and take an active role in management*” (Hennart *et al.*, 2019, p. 8). International partnerships (IP) constitute ongoing international business (IB) relationships “*between diverse actors based on mutually agreed objectives*” (Brinkerhoff, 2002, p. 1286). IP are of particular importance to fSMEs since IP can provide benefits to fSMEs, such as the necessary resources (human capital, social capital, etc.) that fSMEs lack and hence

they can help fSMEs to compete in the international arena (Cesinger *et al.*, 2016; Kraus *et al.*, 2016; Stieg *et al.*, 2018; c.f. Sharma *et al.*, 2019).

Until recently, IB research on IP have mostly focused on the investigation of the factors that lead to successful IP (e.g. Hajidimitriou and Georgiou, 2002; Mohr and Spekman, 1994) and fewer studies have explored the factors that trigger failures in IP (Rajan and Dhir, 2020). Nevertheless, empirical research indicates that more than half of IP fail (Kale *et al.*, 2001; Schrank and Whitford, 2011).

Although, there is IB research on IP failures in various contexts such as joint ventures or strategic alliances (cf. Nummela *et al.*, 2016; Park and Ungson, 2001; Westman and Thorgren, 2016), research on why IP of fSMEs fail in the context of Family Firms (FF) internationalisation seems to be limited (e.g. De Farias *et al.*, 2009). The FF internationalisation literature has omitted to explore the factors that trigger IP failures of fSMEs and the factors underlying the decision-making in family owners' IP strategic decisions (e.g. De Farias *et al.*, 2009; Pukall and Calabrò, 2014). Nevertheless a research on IP failures in the context of fSMEs is important since factors that trigger IP failures *may be different* for fSMEs mostly for the two following reasons.

*First of all*, existing IB studies that examine IP failures have mostly focused on large or medium-sized enterprises without explicitly mention if the results of those studies refer to fSMEs or not. Nevertheless, researchers should refer to the context of their study (FFs or non-FFs) in order to avoid contradictory findings in the literature (Kampouri *et al.*, 2017).

In particular, fSMEs are shown to behave differently when they take important decisions compared to firms with different ownership structures (Cesinger *et al.*, 2016; Stieg *et al.*, 2018; Scholes *et al.*, 2016). This different behaviour of fSMEs derives mostly from the family owners' priority on the preservation of the Socio-Emotional Wealth (SEW), i.e. the non-economic rewards that owners may derive from their fSMEs such as the maintenance of control or the identification of the family with the fSMEs (Berrone *et al.*, 2012). Hence, the decision-making underlying fSMEs' international IP strategic decisions and thus the factors that trigger failure in IP of fSMEs may be different, compared to non-FFs, due to SEW dimensions that may influence fSMEs' decision-making on IB partners.

*Second*, the existing IB studies, that have investigated IP failures, have mostly focused on IP failures of large or medium-sized enterprises which have occurred in high-committed relationships (e.g. international joint venture partnerships) (e.g. Meschi and Wassmer, 2013; Zineldin and Dodouva, 2005). Nevertheless, fSMEs prefer mostly non-equity modes to internationalisation (e.g. exports) and develop low-committed IB relationships (e.g. IB relationships with intermediaries during exportation) due to risk avoidance and fear for potential economic losses (Eberhard and Craig, 2013; Kontinen and Ojala, 2011; Scholes *et al.*, 2016). Failures in low-committed IB relationships may hinder the fSME's entrance and/or their maintenance to foreign markets and thus their international growth. Also, the

threat of IP failure represents a critical situation not only for fSMEs' international but also for their domestic survival, as the pursuit of the entire family wealth is at stake (Berrone *et al.*, 2012; Gómez-Mejía *et al.*, 2011).

Taking these into account and also the literature calls for an exploration on IP failures of fSMEs (De Farias *et al.*, 2009) and for international networking activities of fSMEs (Leppäaho and Metsola, 2020), the research question driving this study is the following: *Why IP of fSMEs fail?* To address this research question, this study draws on (i) the network theory and (ii) the Socio-Emotional Wealth (SEW) theory and aims to investigate: 1) *the factors that trigger IP failures in the context of fSMEs internationalisation* and 2) *the role of the SEW in IP failures of fSMEs*. Such an exploration is important since it may enhance our understanding on the behaviour of fSMEs in international networking activities and thus on their internationalisation (Cesinger *et al.*, 2016; Leppäaho and Metsola, 2020; Pukall and Calabrò, 2014). Such an exploration may also help family owners to develop suitable practices and avoid certain pathways which may lead into IP failures.

## THEORETICAL BACKGROUND

### *The Network theory on the study of International Partnership Failures*

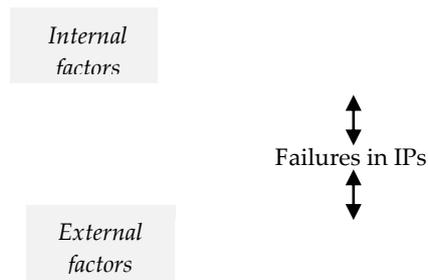

According to the network theory, internationalisation is “a process of initiating, developing, and maintaining IB relationships” (Johanson & Mattsson's, 1998, p. 288). As already stated, the IB relationships among diverse actors which “are based on mutually agreed objectives” constitute IP (Brinkerhoff, 2002, p. 1286). IP are at the core of internationalisation given that internationalisation depends on a firm's international relationships (Johanson & Mattsson, 1988; Johanson & Vahlne, 2009). Indeed IP are important because they constitute the usual means for resource exchange (Meschi and Wassmer, 2013).

IP failure refers to the “*the unintended/unplanned termination or (perceived) unsuccessfulness of a relationship*” (Oerlemans *et al.*, 2007, p. 197). IP failure does not only mean termination of an -up to a certain point - successful relationship, yet it implies international relationship *instability* or *unsatisfactory goal accomplishment* as well.

IP failure can occur in any stage (or else step) during the IP relationship development process (Dwyer *et al.*, 1987), but most authors agree that failure is most likely to occur during the screening stage (Duisters *et al.*, 2011). Regardless the step that IP failures may occur, factors that trigger failures in IP may include individual (internal) factors and/ or environmental (external) factors (Nummela *et al.*, 2016; Ooghe and De Prijcker, 2008; Park and Ungson, 2001). With regard to internal factors, IP failure may occur as the result of a *strategic, deliberate decision*. This decision may be due to *under-performance*,

*strategic change* and/ or *personal disengagement of the entrepreneur* (Matthyssens and Pauwels, 2000; Welch and Welch, 2009).

IP may also fail because of the *opportunistic hazards* as each partner tries to maximize its own individual interests instead of collaborative interests (Park and Ungson, 2001). Such opportunistic hazards may influence the trust between business partners and their commitment to the IP, hence increasing the likelihood of IP failure (see figure 1).

**Figure 17:** Factors that trigger IPs failures (preliminary theoretical framework)

(Source: developed from Nummela *et al.*, 2016; Park and Ungson, 2001)

Also, extant research has related failure to *managerial incompetence*. Entrepreneurs of fSMEs may suffer from necessary resources, such as human capital resources, or they may even do not use the necessary resources wisely. Such managerial incompetence may negatively impact upon IP success and increase the likelihood of failure (Nummela *et al.*, 2016).

Finally it should be noted that, some entrepreneurs may be viewed as victims of changing circumstances in which failure results from *external* factors often beyond their control. To illustrate, IP may fail when governments cannot create macro-environment conditions conducive to international growth (Nummela *et al.*, 2016). Moreover, external factors, such as technological shifts may trigger IP failure (Welch and Welch, 2009).

Although the extant literature offers insights into IP failures (e.g. Pauwels and Matthyssens, 2004), the studies focusing on the factors that trigger IP failure in the context of FFs internationalisation are limited (e.g. De Farias *et al.*, 2009). Given that the decision-making in fSMEs differ mostly due to SEW preservation tendencies (Berrone *et al.*, 2012), the factors that trigger failures in IP may be different for them. Such knowledge is important since it may prevent fSMEs from potentially mistakes when selecting an IB partner.

#### *The Socio-Emotional Wealth (SEW) Theory*

The SEW concept emerged from Gómez-Mejía *et al.* (2007) and over the last years many studies on FFs have been rooted in what has been termed as the SEW theory (e.g. Cesinger *et al.*, 2016; Pongelli *et al.*,

2016). The root of SEW theory is the behavioural agency theory (Wiseman and Gomez-Mejia, 1998). The SEW theory suggests that depending on the situation they are facing, FFs are making important strategic decisions and choices, always with SEW dimensions as the main reference point (Berrone *et al.*, 2012, p. 259). SEW dimensions that influence FFs managerial attitudes are: 1) the ability and the desire of family members (usually the owner) to exert control and influence over FFs' strategic decisions, 2) the strong identification of FFs with the family name (e.g. family members care to perpetuate a positive family image and reputation), 3) FFs' social relationships, i.e. the sense of belongingness which is shared not only among family members but also among non-family employees, promoting a sense of stability and commitment to the firm, 4) family members emotions that permeate the organisation, influencing the FFs decision-making process, and 5) the intention of handing the business down to future generations (Debicki *et al.*, 2016, Berrone *et al.*, 2012, p. 279).

The fact that ownership characteristics between fSMEs and other types of firms with different ownership structures may differ, could impose specific constraints on fSMEs' ability to engage in certain strategic moves, including also their international decisions to maintain or terminate IB relationships with foreign partners. Indeed, research has shown that important strategic decisions on IP are influenced by SEW preservation tendencies (Cesinger *et al.*, 2016; Stieg *et al.*, 2018; Scholes *et al.*, 2016). For example, past research has shown that fSMEs select non-equity modes to enter foreign markets and are unwilling to develop high-committed IB relationships due to the fear of not being able to maintain control of the foreign business (Pukall and Calabrò, 2014). Research has also highlighted that when fSMEs develop an IB relationship, they try to maintain this relationship mostly due to the preservation of the family harmony (Scholes *et al.*, 2016).

Nevertheless, the literature has also provided mixed results with regard to the behaviour of FFs' IP development. For example, although scholars have emphasized that FFs avoid risky options and internationalise by reactively responding to demands from foreign customers (Graves and Thomas, 2008; Kontinen and Ojala, 2011), other scholars have reported that there are FFs that may carefully select IB partners to develop committed relationships with them, and hence those firms carefully evaluate the potential IB partners' characteristics (e.g. Kao and Kuo, 2017; Kao *et al.*, 2013;). However, it seems that those studies which show that the investigated FFs develop highly-committed IP are of a large size (e.g. Kao and Kuo, 2017; Kao *et al.*, 2013) whereas those studies which show that the investigated FFs develop low-committed IP are of smaller size (e.g. Graves and Thomas, 2008; Kontinen and Ojala, 2011). Regardless the type of the relationships (high or low committed relationships) many IP of fSMEs are failing and the relevant research is limited with regard to the factors that trigger such failures (e.g. De Farias *et al.*, 2009) and the SEW dimensions that may influence family owners' decision-making (Cesinger *et al.*, 2016).

## METHODOLOGY

To address its twofold purpose, this study employed a multiple case study design. A multiple case study design allowed capturing the “how” and “why” IP of fSMEs were terminated or perceived as unsuccessful (Eisenhardt and Graebner, 2007; Fletcher *et al.*, 2016). It also served to illuminate the complex and under-investigated phenomenon of IP failures of fSMEs by facilitating the collection of rich data from multiple sources of evidence (Dubois and Gadde, 2014; cf. Yin, 2009; Welch *et al.*, 2011).

The selection strategy was criterion sampling (Fletcher and Plakoyiannaki, 2011) and fSMEs met the following criteria: 1) had at least one IP that had been terminated, 2) operated in the Food and Beverage sector, and 3) had 100% percentage of ownership. This study aimed to include case study firms that had at least one IP terminated in order to collect retrospective accounts on “how” and “why” FFs decided to terminate the IB relationship (Craig-Lees, 2011). Context sensitivity is also important, as macro trends can influence IP success and failure and internationalisation (c.f. Dimitratos *et al.*, 2010). In order to limit the effect of external factors in this study, the cases were drawn from a single industry. The Food sector was selected given its dynamic nature and its growth potential in foreign markets (Karipidis *et al.*, 2020). Moreover, this study aimed to include fSMEs with 100% percentage of ownership because this type of firm places a priority to the preservation of SEW tendencies (Mensingh *et al.*, 2016). It should be also highlighted that this study examined one member of the IB relationship (the fSME) since dissolution is more often generated unilaterally (Dwyer *et al.*, 1987).

The criterion sampling strategy generated a pool of 20 fSMEs. All fSMEs were contacted through telephone or e-mail and nine of them agreed to participate in this study. From those nine fSMEs, six were selected for this study since they were willing to provide information on the *unsuccessful* IP. The case study firms were of medium (Firms A and B) and micro size (Firms C, D, E and F). Moreover, six failed IP of six fSMEs with their foreign wholesalers and/or distributors were examined (Table 1).

| FSMEs  | Size   | International partnership failures (type and country) |
|--------|--------|---|
| Firm A | Medium | - IP with distributor (Belgium)                       |
| Firm B | Medium | - IP with wholesaler (Germany)                        |
| Firm C | Micro  | - IP with wholesaler (USA)                            |
| Firm D | Micro  | - IP with wholesaler (Germany)                        |
| Firm E | Micro  | - IP with wholesaler (France)                         |
| Firm F | Micro  | - IP with wholesaler (Belgium)                        |

Table 1: Information on the investigated fSMEs

Following Yin’s (2009) suggestions data were collected from multiple sources. In particular 18 in-depth, open-ended personal interviews were gathered. The interviews were all tape-recorded and

ranged from 60 to 90 minutes. Interviewees were invited to elaborate freely on questions such as: “*Why did your most recent IP fail?*”

In each firm, the owner (usually the founder of the firm) or CEO was contacted and constituted the primary respondent of the study. The primary respondent was requested to identify other key respondents who were included in this research using snowballing sampling (Miles and Huberman, 1994). These respondents were chosen due to their direct experience with the fSMEs’ international networking activities (cf. Polkinghorne, 2005). Such a selection enhanced the collection of nuanced accounts associated with the purposes of the study. Secondary materials, such as web pages and documents (e.g. internal presentations) were utilized as well. The secondary material was used to understand the history of each firm as well as to triangulate with the insights gleaned from the interviews (Yin, 2009).

Data analysis was conducted in two phases: first, within-case analysis that included write-ups for each investigated fSME and second, cross-case analysis that involved the identification of cross-case patterns (Eisenhardt, 1989; Miles and Huberman, 1994) across our dataset. Specifically, we followed an abductive approach to analyse rich case study data (Dubois and Gadde, 2002; 2014). This process involved iterating between the data and the existing body of knowledge (Miles and Huberman, 1994). To organise the data collected from multiple contexts, our analysis of qualitative data followed three stages, namely: 1) categorisation, 2) abstraction and 3) integration stage (Spiggle, 1994).

In the categorisation phase, data emerging from interviews plus secondary data were coded. In vivo coding used in order to organise the data and to facilitate the identification of themes across the different sources (Saldaña, 2013). We then employed thematic analysis in order to unveil similar thematic aspects across data sources. In the following stage of data analysis, namely the abstraction stage, the themes were linked into conceptual categories (cf. Dimitratos *et al.*, 2010; Spiggle, 1994). In this stage, the emerging themes related to the theoretical framework reviewed and refined, so as to ensure the quality of the findings, by investigating the relationships between “the everyday language” of the empirical data and the concepts in the existing literature (Dubois-Gadde, 2002, p. 555). In the final stage of data analysis, i.e. integration, we connected the empirical findings with existing theory. Particularly, in this phase it was crucial to examine the emergent themes and concepts in light of the relevant literature so as to illuminate aspects of IP failures of the fSMEs.

## FINDINGS

### *Factors that trigger IP Failures of fSMEs*

Most failures in IP of the investigated fSMEs occurred as a result of a *deliberate decision* of the family owners (IP of firms A, B, C, D and F). In particular a *personal disengagement of the family owners* (Welch and Welch, 2009) occurred due to external and internal factors (Nummela *et al.*, 2016; Ooghe and De Prijcker, 2008; Park and Ungson, 2001).

Our case study evidence highlighted that external and internal factors led to failures in IP at a very early stage during the relationship establishment process (IP of firms B, D and F) whereas only internal factors led to failures in IP at a later stage during the relationship establishment process (IP of firms A, C, E). As quoted below:

*“Sometimes we are urged to **end a potential international partnership because of bureaucracy**. We terminated an emerging partnership in Japan because **the government asked for too many certifications** ... But here in Greece we do not even know how to develop those certifications given that there isn't any appropriate service for these issues...”, CEO and family owner, Firm F*

From the above quotation we understand that most fSMEs stopped the communication with potential IB partners due to *bureaucracy issues* and *institutional restrictions* in the exporting country (c.f. Nummela *et al.*, 2016). Nevertheless, when there were no external restrictions, IP usually failed due to internal factors. As one of our interviewees mentioned:

*“A business from Belgium wanted to develop an international partnership with us... In Belgium when a business sells a branded product, the etiquette should be in two languages English and France. Hence, we had to transform the information in our etiquette accordingly. We did all the necessary things that we were asked to, and **although we had agreed upon the price of exportation, when we were ready to export our products the international firm wanted a discount on the price...** We immediately stopped the communication, although we had spent enough money to do the necessary steps for exportation”, CEO and family owner, Firm D*

From the aforementioned quotation we understand that family owners' personal disengagement of the partnerships was mostly due to problems in *unfulfilled financial agreements*. Unfulfilled financial agreements led to termination of the emerging IP. This finding is in line with the existing literature highlighting that economic benefits drive decision-making in partner selection (Shah and Swaminathan, 2008).

IP of firms A, C and E also failed due to *opportunistic hazards* between partners (internal factors) (Nummela *et al.*, 2016; Ooghe and De Prijcker, 2008; Park and Ungson, 2001).

As quoted below:

*“We had an international business partnership in Belgium many years ago. Nevertheless, this partner had other brand labels of honey as well... Our partner **promoted those brands with higher profit, regardless the fact that he realized that our product is of higher quality...**”, Employee at the export department, Firm A*

In particular the family owners realized that the IB partner tried to maximize its own profit (by searching for other products) without paying attention to the promotion of the fSMEs' product (c.f. Park and Ungson, 2001). This behaviour of the international partner led to fSME's reduction of international activities with the international partner.

#### *The role of SEW in IP Failures of fSMEs*

Our case study evidence highlighted that a specific SEW dimension, namely the the identification of the family with the fSMEs drove decision-making in already established IP.

Family owners chose to terminate their IP in case they had realized that the placement of the product was not the one expected. FSMEs expected from the international partners to behave to the brand with the same way as the family did, to appreciate the brand and to promote it accordingly. In case family owners of the investigated fSMEs realised that the IB partner did not respect the brand, they reduced their exportation activities with foreign partners, even if the financial agreements were fulfilled.

*“Our international business partner did not handle the promotion of the product in an appropriate way... **The placement of the product was not the one expected... Nevertheless, our IB partners should respect our brand... The brand is the image of our family...** ”, Employee at the export department, Firm A*

In the aforementioned quotation, it is highlighted that the placement of the brand was an important goal for especially those fSMEs that were exporting branded product (firms A and C), since they link the family's name with the brand. Family owners aimed to perpetuate a positive family image and they linked the brand name with the family's reputation in the foreign markets. This finding highlighted family owners' identification with the firm (Debicki *et al.* 2016). The *identification of the family owners* with the firm led the family owners to re-evaluate their IP and to terminate other IP that were not perceived as successful to the fSMEs. This re-evaluation enabled the fSMEs to learn from past mistakes (Baumard and Starbuck, 2005) and to develop new criteria when selecting a partner to enter new international markets and helped them to build more successful IB relationships on other new foreign markets (Cesinger *et al.*, 2016).

## CONCLUSIONS AND DISCUSSION

This study provides a twofold contribution. First it informs the international networking literature by presenting a framework of potential environmental (external) and individual (internal) factors which trigger IP failures in the context of fSMEs internationalisation (figure 2).

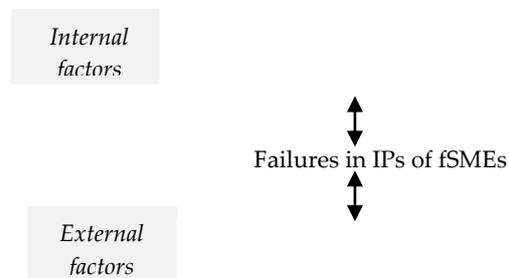

Figure 18: Factors that trigger IPs failures in fSMEs (source: the authors)

In particular, our case study evidence showed that *bureaucracy issues* and *institutional restrictions* (external factors) as well as *unfulfilled expectations* related to financial agreements and brand placement (internal factors) led to failures in IP of fSMEs. Second, it brings into light that family owners' identification with the firm drove decision-making in IP strategic decisions, hence extending the FF internationalisation literature on the role of SEW in strategic IP decisions (e.g. Cesinger *et al.*, 2016).

With regard to its limitations, this study delimits the investigated firms to one specific type of FFs, namely fSMEs in which family ownership is 100% and the intensity of the preservation of SEW high. Hence, this study does not consider IP failures of other types of FFs with lower percentages of family ownership. Nevertheless, the exploration of this type of FF is important since this type of firm places a priority to the preservation of SEW tendencies (Mensching *et al.*, 2016). Moreover, this research draws on fSMEs from a particular country and sector. Although this study purposefully investigated one single sector from one single country in order to limit the effect of external factors in this study (c.f. Dimitratos *et al.*, 2010), future research may investigate IP failures of fSMEs from various sectors located in different countries.

## CITIZENS AS ACTIVE CONSUMERS IN THE ONGOING TRANSITION TO THE CIRCULAR ECONOMY

**Karagouni, Glykeria; Mormori, Androula; Papadopoulos, Ioannis; Trigkas, Marios**

Laboratory of Economics, Marketing and Entrepreneurship, University of Thessaly, Greece

### ABSTRACT

Contrary to the linear production model, circular economy (CE) is designed to close loops changing waste to valuable resources. Among the core principles of CE are the preservation of products for longer periods of time, repossession and reuse and a transfer from possession to service provision. However, such principles delineate emerging CE models, implementing significant reformations in markets and requiring consumers to make quite brave decisions to change habits, tastes and ways of living and seeing the world. At the same time, there will be changes at macro-level such as in the structure of the cities, in the means of transport, in agricultural cultivations and in dietary changes among others that will impact the life of individuals as both citizens and consumers.

Bearing in mind that these changes have already started taking place and expecting them to intensify in the immediate future, the main research question of the present study is if citizens-consumers are willing to adopt such changes in the name of the environment and the globe, and, if yes, how ready they are to respond to the emerging markets, products and services. Furthermore, it purports to detect the risks entailed in the implementation of the circular economy principles and the transition to new economic and social structures including potential rigidities, desires and concerns or potential signs of reaction.

This paper will present the theoretical background, the research questions and the research methodology of the investigation. The primary research was conducted in Greece in late 2019.

*Keywords: Circular Economy, renewable resources, waste, citizens-consumers, sustainable development, attitudes, barriers, consumption, sharing economy*

### INTRODUCTION

After World War II, the countries belonging to the Western Coalition experienced the golden age of capitalism or, simply, the long boom (1945-1973). The continuous production of new consumer goods and the development of technology seemed to justify the view that the advancement of human knowledge, science and technology is able to ensure uninterrupted growth and prosperity in humanity. The way the economy is organized in the post-war period was based on the business

practices of the Industrial Revolution. The core principle has been the stable economically sustainable supply of resources. Thus, a linear economic model of resource-production-consumption-disposal extraction was built which depends on the small life cycles of products and maximization of sales.

However, the linear economic model has led to the increase of the ecological footprint a trend which, if continued, will create the need for resources of two Earths by 2030 and of three Earths by 2050, for the humankind to properly function (Pollard et al., 2010). The significantly negative impacts of the “take–make–waste” models have almost imposed the need to shift to a new paradigm which could promise a new business model to decouple economic growth and environmental pressure (Stahel, 2016). The solution appeared to be the circular economy (CE) concept which appears to gain momentum worldwide (Ghisellini et al., 2016). “Hence, there is a pressing need for the current business economy to transition towards CE, which envisages the global economy as regenerative and restorative by intention and design (Ellen MacArthur Foundation, 2017).

Businesses models incorporating CE principles regard the circular flow of materials in the production and consumption phase (Edbring et al., 2016) which have introduced business strategies such as collaborative consumption and industrial symbiosis (Sign and Giacosa, 2019). However, CE application is not only a matter of production but also a matter of acceptance; while there are many detailed analyses on the general socio-economic implications and the benefits, it appears that there is little interest on the ways the society will change (Hobson and Lynch, 2016). Yet, the European Commission announcements on the CE do not separate consumers from citizens; this means that we all have to participate in ‘[i]nnovative forms of consumption’ (Tukker, 2013: 7) such as the much-lauded sharing economy and forms of ‘collaborative consumption’ which have been highlighted as excellent solutions to the above-mentioned problems, but they seem to be rather questioned by consumers. While CE has been widely promoted through the concepts of recycling, reuse and the much promising “food for all” motto, there are many CE sides which appear to be kept in the dark or being presented only in positive ways. Debating on the sharing economy, Shor states “At the same time, the critics are too cynical” (Shor, 2014, p. 11).

CE addresses citizens and the everyday life and consumption practices and not only targeted markets. It appears that there is a need for widening the debate on what a CE society should look like, allowing the public a voice in the consideration of the socio-economic values, practices, norms, forms and processes that could get us there. The present research is purporting to shed some light on this issue; the willingness of citizens-consumers to engage in the proposed model of life, sacrifice tastes or even rights and change habits.

This will be the main contribution of the study; despite existing research that shows the challenges and limits of the CE models, the study will highlight the fundamental role of the citizen-consumer to

accept or reject new and diverse business models, and to indicate gaps, weaknesses, adjustments and redirections for re-jigged product and service lines and their life cycles. Findings and their analysis will advance our understanding of sources of hesitation or even denial and the subsequent barriers or even highlight weaknesses of the model that might be early addressed in order to prevent any dark sides of a CE and thus improving it.

## LITERATURE REVIEW

The circular economy (CE) concept is trending both among scholars and practitioners as the solution to the decoupling of economic growth from environmental pressure (e.g. Stahel, 2016; Ghisellini et al., 2016; Preston et al., 2019). Linear production models have led so far to significant resource shortening and environmental problems. Visions of a CE are the replacement of these models with new ones that promise “abundance without (much) waste” (Hobson and Lynch, 2016) and “balance economic development with environmental and resource protection” (Murray, Skene and Haynes, 2017).

The main activities for a transition to a CE are cascading, renewability, longevity, reuse, upgrade, repair, capacity sharing, dematerialization and refurbishment (Lacy et al., 2014). Waste is thus revalued and turned into a resource (EC, 2015) or “Everything is an input to everything else” (Merli et al., 2018) without, however, identifying CE with recycling (Trigkas, 2017). The Circular Economy is therefore considered an important mechanism for sustainable production that will lead to positive industrial transformations. It will radically alter economic activities and free them from dependence on non-renewable energy sources (Korhonen et al., 2017).

The increasing interest and enthusiasm for the circular economy seems to be clearly rooted in beliefs that capitalism and the environment can be effectively and efficiently combined to produce sustainability (Roberts & Colwell, 2001). In other words, circular business models can make us “both rich and green” (Monbiot, 2015) introducing a type of shift wherein market forces are the central agent in delivering change. Therefore, it appears that “the circular economy is here to stay” (PricewaterhouseCoopers, 2017) and this fact presents significant challenges not only for the businesses but also for governments and of course consumers and citizens. The shift to CE is not only a major revolution in production but also in global consumption which requires changes in the consumer behavior as well (Delbecke, 2016).

The circular economy promises a variety of potential environmental benefits such as reduced carbon dioxide emissions and pollution in general, energy generating opportunities like the use of only renewable sources or energy production out of waste, together with business benefits such as

increased growth and profitability. According to McKinsey and Company (2015) a circular economy “would allow Europe to grow resource productivity by up to 3% annually” providing a net economic benefit of 1.8 trillion Euros by 2030.

Policy makers together with industrial sectors and a respectively growing number of companies are today translating the circular economic concept into international trends, new business models and novel corporate strategies. In the transportation sector, for example, companies try to pursue circular economy by the design and production of “circular cars” which is translated into zero pollution, use of renewable energy, recyclability and other environmental benefits, as well as the development of new business models that will provide the re-use of their spare parts (Baines et al., 2017). At policy level, integrated transport systems are promoted in which public transport and multi-user cars (such as uber) coexist, together with car-sharing systems, carpooling and so on.

Food is another important area for the CE; based on current data and the rate of the population growth, around 26 billion people will live on the globe by the end of the century (Pietzsch, 2017). There have been many aspects researched in order to foster a CE approach in the food sector such as the recovering and reusing of materials otherwise wasted along the supply chain (e.g. Coderoni and Perito, 2020), the water–energy–food nexus (e.g. Del Borghi, Moreschi, & Gallo, 2020) or attempts to produce proteins from insects (Cappelozza, et al., 2019). At macro level, circular economy involves the redesign of industrial and infrastructure systems as well as the socio-cultural systems resulting in eco-cities and collaborative systems (e.g. Ghisellini et al., 2016; Fusco and Nocca, 2019).

Furthermore, when it comes to benefits, these are mainly environmental, economic, operational and social, according to the relevant literature. According to Sehnem et al. (2019), most cited CE environmental benefits since 2010 refer to the reduction in use of raw materials and the minimization of waste lower carbon and greenhouse gases emissions and energy use reduction. In the same vain, the literature claims substantive financial profits when moving from linear to circular production, by value creation due to reduced costs as well as increased revenues (e.g. Nassir et al., 2017; Paquin et al., 2015). Financial profits result also from the operational benefits since CE contributes to raising productivity and increasing efficiency in resource management by the optimization of both natural and human resources (Linder and Williander, 2017; Missemer, 2018). However, it should be mentioned that most findings rely on empiric papers that rely on single company case studies and they generally focus on a particular environmental issue (Sehnem et al., 2019) while the number of companies truly implementing CE is still relatively small.

Quite astonishingly, there is scarce literature regarding the impacts of CE systems on social issues such as human rights, social inequality, or welfare of vulnerable populations. Murray et al. (2107) is

perhaps one of the few theoretical papers to analyze social impacts of CE focusing on social equity (intragenerational and inter-generational).

Circulating from high-level policy settings like the EU to environmental programs and NGOs, the global reach of CE thinking appears to have almost exclusively been developed by practitioners, i.e. policymakers, business consultants and business associations (Korhonen et al., 2018) and to have shifted to a mainstream political, economic as well as social agenda of structural change (Preston, 2012). Valenzuela and Bohm (2017), for example, suggested that “the circular economy has been one of the main references for rebuilding a political economy of sustainable growth”. Accordingly, the emerging CE-society will be quite different from the existing one; but do citizens really want all norms, values and core actors as they have been presented so far?

For example, there is much work done to provide clearer information on the environmental impacts of consuming behavior initiatives to develop and promote more responsible environmental attitudes. However, according to empirical research so far, price is widely seen as a main factor in buying behavior (Jones and Comfort, 2017). On the other hand, several other efforts, besides information, such as eco-labelling and other instruments for green consuming appear to find a place in consumers’ buying judgements while new collaborative consumption models support the shift to CE.

Based on a shared ownership canvas, bartering, renting and other forms of sharing (e.g. Van Meter, 2013) constitute forms of the emergent sharing economy and support the transition from the ownership-based current consumption model (Tukker, 2015). Such models seem to open niche markets and consumers (especially millennials and younger generations), to invest in selling services instead of selling product and to embrace collaborative consumption mainly in digital and internet business such as website-based networks sharing music, art and fashion. For-profit peer-to-peer services, like Airbnb and Uber, have been argued as reshaping production and service delivery (Sundararajan, 2013). Lifestyles change rapidly while environmental sensitivity grows among younger generations who appear to value access over possession and experiences over ownership. According to Cooper and Timmer’s (2015) estimates, the Sharing Economy will be worth up to \$335 billion in revenues by 2025.

Yet, loss of ownership constitutes one of the most significant barriers for a transition to CE systems (Ghisellini et al., 2016). One cannot underestimate the emotional bonds with objects, otherwise known as product attachment (Mugge et al., 2005) or the motives of self-identity. For example, private dwelling creates a feeling of security and familiarity which is threaten by the sharing concept. According to Edbring et al.’s (2016) empirical research, consumers may accept sharing models, but the majority appears rather reluctant in consenting to access-based types of consumption. Furthermore,

dependence on internet services and sharing platforms questions the level of our control over the nature and content of our online 'sharing' interactions (Vanolo, 2014).

Another important issue to be addressed is the perceived social pressure already imposed or assumed to be imposed in the future for the sake of circular economy in order to adapt certain behaviors (Singh and Giacosa, 2019). Ownership or possession of certain objects forbidden by law, such as forbidding of private land use or enforcement of home sharing by law are threats that emerge quite easily when people hear about the necessity of sharing economy. In the same vein, one should not forget that we all develop habits and behaviors that we do not want to change; we love routines and we are usually unconsciously satisfied with the status quo. Passive resistance is rather unconscious and pure awareness and information on CE and its positive impact on environment is not capable alone to remove any form of it.

Consumers are also rather skeptical towards circularity in the form of remanufacturing or use of alternative sources of food (e.g. Wang et al., 2013). Indicatively, from the perspective of sustainability, insects are promoted as useful for food, feed and other purposes. A number of papers argue that health benefits when well communicated can entice consumers to drop their conservative attitudes and turn to such new environmentally-friendly trends (e.g. Aiking, and de Boer, 2019). However, edible insects are not part of the traditional European diet at least. Using edible insects as food and feed requires consumers' willingness-to-eat, overcoming disgust and neophobic reactions, besides taste and other sensory aspects (Rumpold and Langen, 2020).

When it comes to second-hand products, there is a significant level of hesitation (Machado et al., 2019); the majority would not avoid thinking of the former user of these products; most of us do care about who previously handled them and what they were used for. Consumers' willingness to buy re-used products has been related to the perceived risk that the products are of lesser quality, either functionally or cosmetically (Abbey et al., 2017), especially if these products are household appliances, TV and audio or computers.

All in all, there is a small but steadily growing empirical literature investigating consumer concerns regarding their participation in the CE while little is still known about consumers as citizens' acceptance of the CE as a whole. Furthermore, empirical studies so far have primarily focused on individuals who are already active in specific CE schemes. It certainly appears that there is a need for a wider debate involving consumers as human beings and citizens and a more thorough investigation regarding the aspects of a circular economy that should be fostered or reconsidered. Which are, actually, those realities that may be embraced towards a better life although they involve "a sacrifice of our current, tangible needs and desires, in the name of a better but uncertain future" (European Commission 2012)?

The present research will try to investigate a part of the above big puzzle. The main research question is

are citizens - consumers willing to adopt such changes for the sake of the environment and the transition to circularity”,

How ready are they to respond to the emerging markets, products and services, and accept them for the sake of our globe and the environment?

What are the risks entailed in the implementation of the circular economy principles and the transition to new economic and social structures? Which may be the potential attitudes, rigidities and fears or the potential signs of reaction? What are the motives to promote the change of consuming behavior?

## **RESEARCH DESIGN AND METHODOLOGY**

The primary research for this exploratory study focuses on Greek citizens-consumers over 16 years old. The key tool of this investigation was a structured questionnaire, specially designed to obtain a broad understanding of the investigated issues. The data was collected by both using the Google Forms app and by distributing the questionnaire in paper form.

The questionnaire was structured in such a way that at the outset it included questions aimed at determining citizens-consumers' attitudes to issues relating to the saving of natural resources and, by extension, the protection of the natural environment. The second part of questions in the questionnaire aim to explore consumer preferences as well as consumer thoughts towards changing attitudes regarding several products' consumption, and finally the third group of questions refer to the citizen-consumer profile. The questions are close-and-open-ended while quantitative and qualitative characteristics are explored.

The research aims to record citizen-consumers' desires for CE products, as well as to explore incentives that would push consumers to change their consumer habits. Consumer views on human rights issues and their tolerance for limiting them in the name of a better future are given great weight. Attempts are also made to identify opportunities that could be exploited by citizens-consumers, for policy-making in regard of businesses and the state. Some questions indent to identify well- hidden or unconscious attitudes that could jeopardize the implementation of the circular economy as well as potential threats related to changes in the social structure.

The questioner is actually based on the “rethinking direction”; rethinking products, ownership, waste, lifestyle and business in order to rip the benefits of the CE implementation such as to reduce carbon footprints and resource use or to achieve equitable access to previously unaffordable goods and services. However, a range of deep-seated concerns and issues are also provided to respondents,

highlighting practical, economic and social conditions that would need to be met if the circular economy for a desirable future.

In the preliminary stage of the study, the questionnaire was pre-tested on 35 citizens-consumers, in the period between 25 and 30 September 2019. Consumers were selected non-randomly, on accessibility basis and in an effort to represent age, sex, different incomes and the other socio-demographic variables. The consumers who participated in the questionnaire's pre-test phase have not been included in the final sample. The questionnaire's pre-testing led to changes in the questionnaire, such as regrouping and reformulating some questions, in order to reduce the size of the questionnaire, since the majority of the respondents appreciated the difficulty and the time length to complete the questionnaire a little high.

The data collection took place from October to end December 2019. The final number of respondents was 385, but 20 responses were incomplete. Therefore, the final sample counts 365 respondents, representing a response rate of 94.81%. 193 questionnaires were answered by social media and e-mail. The data will be recorded, processed and analyzed using the IBM SPSS Statistics 25 special statistical program, as well as the relevant frequency checks (Frequencies), descriptive statistics and correlations (Norusis, 2007).

## CONCLUSIONS

A transition to the circular economy will certainly constitute a gradual but dramatic change in the way in which citizens - consumers will approach products and services challenging their social value. Established opinions and habits make it difficult for many of us to buy into second hand or reusable patterns of consumption, share cars or eat insects. Practically, citizens-consumers are already at the heart of the circular economy and behavioral changes are according to literature not easy to achieve. However, at present, the citizen-consumer perspective takes a rather narrow position in the CE literature. In spite of the growing literature on CE, the aspects of consumption are under-addressed (e.g. De los Ríos and Charnley, 2017) with limited attention on the individual, social and cultural aspects.

This paper indicates that there is a pressing need to open up a broader and more nuanced debate on the role of the citizen-consumer within the CE framework, since consumer behavior is difficult to change. It places the citizens- consumers at the center stage and explores their various biases as barriers to the transitions to the CE. Debates on the CE so far, treat consumers as passive consumers and pathetic recipients of EU and governmental policies.

The research findings will add to the limited existing empirical knowledge on the conceptualization of the citizens-consumers and the barriers they experience due to the limited fulfillment of their socio-cultural needs by existing CE systems, assigning them an active role as both citizens and consumers.

Thus, the paper will contribute in several ways: a) it will add to existing empirical knowledge on CE, advancing the understanding of why consumers are reluctant to adopt some forms of CE creating respective barriers to the transition towards a CE and, on the other hand, how they are likely to respond to relevant attempts regarding CE ; b) it will offer new insights into the management literature in general, providing empirical evidence on the context of individuals' concerns, attitudes and expectations and thus allowing for the formation of novel business models and the design of relevant and better accepted products and services within the CE system; c) it will allow policy-makers to find more suitable ways to enable transition to the CE and "usership" instead of ownership, and design proper roadmaps for producers, retailers and brand owners to reframe their relationships with consumers; d) it will add to the bridging of theory, policy-making and practice within the CE area.

## THE ROLE OF ECO-CERTIFICATES AND LABELS IN SUSTAINABLE TOURISM DEVELOPMENT: A CASE STUDY FROM CROATIA

Klarin, Tomislav; Miočić, Božena Krce; Vidić, Gabrijela

University of Zadar, Department of Tourism and Communication Studies, Zadar, Croatia

### ABSTRACT

The application of eco-certificates and labels in tourism is an indicator of the implementation of the concept of sustainable tourism, which is aimed at protecting and preserving the environment at a given destination. Eco-certificates and labels of a destination have a positive effect on the ecologically responsible behavior and awareness within the tourism supply, which in turn introduces quality and distinctness on the tourism market. Other than promoting ecologically conscious behavior, eco-certificates stimulate tourism demand for products with a reduced negative effect on the environment.

The aim of this paper is to determine the role of eco-certificates in sustainable tourism development. A research was conducted across eight urban destinations in the Republic of Croatia on several stakeholder groups in each destination (the public and private sector, local population and tourists). A semi-structured questionnaire on 2,300 respondents shows attitudes toward the influence of eco-certificates on tourists' decisions when choosing a destination; specifically, the tourists' readiness to pay extra for eco-certified products and services at a destination. Variance analysis was used. The respondents generally show a positive attitude toward eco-certificates, with visible differences in stakeholder attitudes on the level of a particular destination, differences between different stakeholder groups, and differences for each particular eco-certificate. The results indicate an increasing importance of eco-certificates on the tourism market, as well as the need to understand their role in the destination's sustainable tourism development. Consequently, it is to be expected that these certificates will increase in application, which is why further research in this field is necessary.

*Keywords: eco-certificates and labels, sustainable tourism development, tourism destination*

### INTRODUCTION

Sustainable tourism development, quality improvement and standardization impose the need for the application of eco-certificates and labels in tourism. In academic and professional community there are various aspects of study on this topic. The aim of this paper is to determine the role of eco-certificates in sustainable tourism development. The research conducted within this paper should be

considered as research in the process, considering the current knowledge on the role of eco-certificates and labels in tourism, but also the methodology applied in the paper and given results. A research was conducted across eight urban destinations in the Republic of Croatia on the main stakeholder groups in the destination. The results generally show a positive attitude of stakeholders towards eco-certificates, with visible differences in stakeholder attitudes. The results indicate an increasing importance of eco-certificates on the tourism market and the need to understand their role in sustainable tourism development.

On the EU level, the number of eco-labeled products and services has increased fourfold in the last ten years. Last year alone there were 1,623 ecolabels assigned per 77,358 products and services, which is nearly twice as many compared to 2016 (European Commission, 2020). In this respect, Spain, Italy, France, Portugal and Germany take first place. Eco-certificates and labels in tourism have been created in order to emphasize or confirm whether a given tourism supply has adopted sustainable business practices. Sustainable tourism labels, eco-labels, certificates, awards and recognitions; ecological awareness, socially responsible business practices, as well as various educational campaigns – these are all strategically created in order to direct tourist behavior towards responsible and sustainable tourism (Budeanu, 2007), largely because tourism business practices have become an instrument of diversification and competitiveness on the tourism market (Blancas et al., 2015). In fact, sustainable tourism supported by the relevant eco-certificates and eco-labels also means more effective management practices; more innovative and diverse tourism products, as well as better visibility on the tourism market. Eco-certificates and labels refer to a reduced negative effect on the environment, so they represent the implementation of the concept of sustainable tourism.

## **MEANING OF ECO-CERTIFICATES AND LABELS IN TOURISM**

There are certain differences between eco-certificates and eco-labels. Eco-certificates refer to standardized business processes directed at preserving and protecting the environment. These processes do not change; rather, the management and employees conform to them. Eco-labels, on the other hand, are tools for ensuring efficiency when it comes to an organization's environmental protection efforts, and they are also used to provide consumers with relevant information (Ayuso, 2007). Eco-certification implies stricter rules for implementation, since it requires complete transformation in management and total standardization when it comes to the quality of an entire array of business processes directed at environmental protection and preservation. Eco-labels designate a certain degree of reducing negative effects on the environment and the tourism product related to it. The shared aspects of both eco-certificates and eco-labels certainly have to do with a deliberate and voluntary determination to preserve and protect the environment, which, however,

directly incurs increased expenses for implementation and maintenance (Mihalič, 2001). There are, on the other hand, decreased long-term business expenses and an improved corporate image. This also promotes changes in behavioral patterns, which in turn has an effect on consumer behavior.

Despite the distinct similarities and differences between eco-certificates and eco-labels, relevant sources often use the two terms interchangeably. This is partly due to the large and varied number of eco-certificates and labels, along with the differences when it comes to their application and interpretation; in fact, in 2010 alone in Ireland there were six distinct programs for certifying sustainable tourism development (Conaghan et al., 2010). Some sources use the term *certified ecolabel*, which is confusing indeed (Eco Label Index, 2020). Marx (2014) draws similar conclusions after conducting a comparative analysis of 426 eco-certified systems. Ultimately, this variety and variance problem is evident in the Eco Label Index database (2020), which contains and catalogues a total of 458 eco-certificates and labels across 199 countries and 25 business sectors, including 135 eco-certificates and labels pertaining to tourism. Eco-certificates and labels are used in all aspects of the tourism industry; they have increased in number as well as implementation on a global scale. For instance, the well-known Blue Flag eco-label was implemented in 3,850 beaches and marinas across 46 countries in 2012, whereas in 2020 thus far this number has increased to 4,560 across 47 countries (Blue Flag, 2020). According to 2019 data, the largest amount of eco-labeled products came from the tourism industry, with 22% of those being related to accommodation (European Commission, 2020).

## **THE ROLE OF ECO-CERTIFICATES AND LABELS IN SUSTAINABLE TOURISM DEVELOPMENT**

Karlsson and Dolnicar (2015) find that the application of eco-certificates and labels is still statistically insignificant, because the cost of eco-certificates is too high, whereas returns on investment are still unclear, with eco-certification still not having a potential competitive advantage on the market. This was also found by Ayuso (2007), as tourism managers in Spain seemed to report only the expenditures related to attaining an eco-label, revision strategies and membership fees, while on the other hand there was no noticeable increase in consumer demand. In this respect, Buckley (2012) states that certification programs in tourism have limited application on the market, because of their low reliability and lack of transparency for the consumer.

On the other hand, the research by Segarra-Oña et al. (2012) and Molina-Azorín et al. (2015) shows that in the Spanish hospitality industry, employing eco-certificates boosted overall efficiency, productiveness and employee satisfaction, as well as the quality of service and customer satisfaction, all of which in turn lowered the overall business expenditures. This also increased their visibility on the market and had a positive effect on the tourists' behavior. Capacci et al. (2015) tracked Italian

coastal destinations and states that the number of Blue Flag beaches has increased from 73 to 131 in the period of thirteen years. These Blue Flag beaches have become more attractive, which increased international tourist visits and revenue compared to other Italian destinations which are not Blue Flag labeled. Furthermore, Medina et al. (2012) reports this same positive correlation between the implementation of the Blue Flag label and increased international arrivals and revenue when it comes to coastal destinations in Portugal and Spain. However, Chamorro-Mera and García-Gallego (2019) conclude that even though tourists are very aware of the Blue Flag label, they are still disinclined to pay for the more expensive rates for accommodation which is located near a Blue Flag labeled beach. Barbulescu et al. (2019) find that the majority of hotel managers in Romania believe that the EU Ecolabel represents a competitive advantage for their hotels, even though they have never considered applying for the Ecolabel certification. Most commonly, this is due to the lack of information about the EU Ecolabel; the difficulty of satisfying the required criteria (especially when it comes to energy, waste and water management); or the lack of awareness and interest from the buyers for the Ecolabel. Conaghan et al. (2010) find that tourism businesses are usually unclear about the aim and purpose of eco-certificates because there are so many of them, and they do not see any direct personal and competitive benefit in implementing them. However, the authors also find that in Ireland there is a positive correlation between eco-certificates and labels, and demand for destinations where these certificates and labels have been implemented. Similarly, Cucculelli and Goffi (2016) also find this to be true for several smaller Italian destinations. Testing the Ritchie and Crouch (2000) model of destination competitiveness on Italian destinations of excellence, the authors report a positive effect of eco-labels for the destinations (Orange Flag, Blue Flag, Blue Sail and Most Beautiful Villages in Italy), increasing their competitiveness. Ultimately, Blancas et al. (2015) propose the Sustainable Tourism Country-Brand Ranking as a globally recognizable system of certificates which would allow transparency and comparison between destinations. The destination in turn attains an improved image, with a better position on the tourism market while also affecting tourism demand, as well as providing tourists with the assurance that their products and services are of high quality.

As for changes in demand, Dolnicar (2004) shows that in Australia there is a considerable niche of tourists who are interested in preserving and protecting the unique natural landscape and environment. These tourists stay at tourism destinations for a longer time, they spend more, they are more satisfied, and they want to return to the destination and recommend it to others. This niche of tourists has a different worldview, they behave ethically and responsibly when it comes to the environment, and what is more, they are ready to pay extra for services which correspond to their principles (Dolnicar and Long, 2009). Subsequent research by Karlsson and Dolnicar (2015) found that eco-certificate influence certain profiles of tourists; they conclude that there is a specific market

segment which responds to this influence – these consumers have different interests and knowledges, which is why they are ready to pay a higher price. In this respect, Ardoin et al. (2015) identify a certain positive effect on tourists who travel to destinations with marked by sustainable tourism development and then return to their usual surrounding. The changes in behavior become evident in their shopping, expenditures, demand for eco-products, using public transportation, proper waste disposal, volunteering, making donations, etc. The authors conclude that the changes in attitudes and behavior can be traced to the individuals themselves and their desire to learn, but even more so it can be traced to the tourism product which offers them the relevant knowledge and targeted information presented in a way as to really entice demand.

## RESEARCH METHODOLOGY

Research on the influence of eco-certificates and labels on supply and demand in the tourism industry was conducted in eight urban destinations in Croatia. The criteria for selecting a given city were their scope and the degree of tourism development of the urban destination. The Republic of Croatia is divided into two NUTS 2 regions (Adriatic Croatia and Continental Croatia) and 21 counties (NUTS 3), with a total of 128 cities. Adriatic Croatia is significantly more developed when it comes to tourism than Continental Croatia (CBS, 2020); it accounts for circa 90% of the total tourism arrivals in Croatia. The number of tourist arrivals and overnights are not only the basic indicators of tourism development (Vukonić and Čavlek, 2001) but also indicators for the tourism carrying capacity of a given destination (along with some other indications). Based on these criteria, the sample covers cities with the largest number of overnight stays according to 2015 statistical data covering Continental and Adriatic Croatia (Table 1).

| DESTINATION | NUMBER OF OVERNIGHTS | TOUR. DENSITY | TOUR. INTENSITY | TOUR. FUNCTIONALITY |
|-------------|----------------------|---------------|-----------------|---------------------|
| Krapina     | 5,473                | 125.73        | 0.43            | 0.89                |
| Karlovac    | 39,834               | 99.09         | 0.72            | 0.79                |
| Osijek      | 84,806               | 498.86        | 0.78            | 0.99                |
| Varaždin    | 50,882               | 855.73        | 1.08            | 2.30                |
| Zadar       | 1,433,701            | 7,390.21      | 19.10           | 29.16               |
| Split       | 1,339,598            | 16,886.40     | 7.52            | 12.02               |
| Mali Lošinj | 1,827,232            | 8,193.87      | 217.84          | 288.04              |
| Rovinj      | 3,141,925            | 35,703.69     | 219.81          | 257.74              |

Table 1. Sample of cities as the urban destinations included in the research (according to 2015 data)

Source: made by the authors based on the CBS, 2016 data

The table shows that the selected urban destinations differ in terms of their tourism development. Cities in Continental Croatia fall significantly behind the cities in Adriatic Croatia, and they are still in the phase of exploring and entering the tourism market. At the same time, urban destinations in Adriatic Croatia are faced with an overload in carrying capacity and sustainability as a tourism destination.

There are four basic stakeholder groups in a destination: the public and private sector (tourism supply) as well as the local population – being the stakeholders within a destination’s immediate surroundings – and tourists, being the stakeholders from the outer surroundings of a destination (Byrd et al., 2009; Waligo et al., 2013). These four groups of stakeholders were given a semi-structured questionnaire and asked to rate the influence of eco-certificates on tourists’ decisions when choosing a destination, as well as their readiness to pay the higher rates. The research was conducted in 2015 and 2016. The relevant stakeholders of the destination were included in the tourism supply sample (the public and private sector and the civil society). The local population and tourists were randomly chosen. Table 2 shows the sample of respondents according to stakeholder group and city.

| Stakeholder group | Continental Croatia |          |        |          | Adriatic Croatia |        |             |        |          |
|-------------------|---------------------|----------|--------|----------|------------------|--------|-------------|--------|----------|
|                   | Krapina             | Karlovac | Osijek | Varaždin | Zadar            | Split  | Mali Lošinj | Rovinj | Total    |
| Tourism supply    | 22.00               | 19.00    | 25.00  | 33.00    | 35.00            | 43.00  | 22.00       | 31.00  | 230.00   |
| Local population  | 80.00               | 99.00    | 125.00 | 101.00   | 250.00           | 189.00 | 123.00      | 135.00 | 1,102.00 |
| Tourists          | 54.00               | 78.00    | 86.00  | 104.00   | 323.00           | 107.00 | 114.00      | 102.00 | 968.00   |
| Total             | 156.00              | 196.00   | 236.00 | 238.00   | 608.00           | 339.00 | 259.00      | 268.00 | 2,300.00 |

Table 2. *Sample of respondents according to stakeholder group and city*

Source: *made by the authors*

The questionnaire was offered in eight different languages. It contained other questions; however, these are not relevant for the current paper. For the purposes of the questionnaire and for the sake of clarity (large number of eco-certificates and labels), the eco-certificates were made generic, and were placed in relation to basic tourist capacities (accommodation, restaurants, etc.) Variance analysis was used in order to determine the attitudes of each stakeholder group in the eight urban destinations, asked about the influence of an urban destination having an eco-certificate on tourists’ decision to visit the destination and pay extra for it.

## RESEARCH RESULTS

Attitudes on the influence of eco-certificates on tourists' decisions when choosing a certified destination was rated from -2 (extremely negative influence) to 2 (extremely positive influence). The total ratings (mean values) are shown in the next table.

| Eco-certificate  | Stakeholder group | Continental Croatia |          |        |          | Adriatic Croatia |       |             |        | Total |
|--|-------------------|---------------------|----------|--------|----------|------------------|-------|-------------|--------|-------|
|  |                   | Krapina             | Karlovac | Osijek | Varaždin | Zadar            | Split | Mali Lošini | Rovinj |       |
| Eco-certified food in restaurants and accommodation capacities | Tourism supply    | 1.00                | 1.20     | 1.31   | 1.25     | 1.23             | 1.06  | 1.29        | 0.93   | 1.16  |
|  | Local population  | 1.07                | 1.04     | 1.23   | 1.32     | 1.10             | 0.95  | 0.93        | 0.97   | 1.08  |

Table 3. Stakeholders' attitudes toward the influence of eco-certificates on tourists' decisions when choosing an urban destination which holds an eco-certificate (mean value)

Source: made by the authors

There are no negative mean values for the urban destinations and stakeholders, with more than half of the mean values going over 1 (positive influence). Therefore, it may be stated that there is a widespread attitude that eco-certificates have a positive effect on tourists' decisions when choosing an urban destination. Positive perceptions of respondents indicate increasing environmental awareness, and the presence and importance of eco-certificates in tourism (Eco Label Index, 2020; European

Commission, 2020). It is also evident that eco-certificates vary in ratings across urban destinations; regionally speaking, it is interesting that the highest ratings are given to continental destinations, which are significantly less developed in terms of tourism. The reasons for this may be ascribed to a lower level of tourism development and perception about the importance of eco-certificates in future development of a destination. The level of tourism development in a destination should not be necessarily a condition for the implementation of eco-certificates, however it can be one of the tools for destination development or a mean of diversification and competitiveness in the tourism market (Medina et al., 2012; Segarra Oña et al., 2012; Blancas et al., 2015; Capacci et al., 2015; Molina Azorín et al., 2015). Furthermore, on the level of all urban destinations, the tourism supply gave the highest rating to the influence of the eco-certificates in question; therefore, it seems that there is an awareness regarding the importance of having an eco-certificate at the destination. This is also in accordance with previous research where tourist supply clearly recognized the importance of eco-certificates and labels, although it did not always see the direct benefits of their application (Ayuso, 2007; Conaghan et al., 2010; Buckley, 2012; Karlsson and Dolnicar, 2015; Barbulescu et al., 2019), while tourist were not ready to pay extra for a product, service or destination which had an eco-certificate (Chamorro Mera and García Gallego, 2019). Somewhat lower ratings in confirmation of this were given by tourists when asked about the importance of eco-certificates in choosing a destination, as eco-certificates signal a certain level of quality and uniqueness in doing business. The local population gave the lowest ratings on average, which suggests possible misconceptions about the role of eco-certificates in tourism. Such results are not surprising considering the large number of different certificates which are often unrecognized and understood by the users (Marx, 2014). Ultimately, eco-certified products in restaurants and accommodation capacities were rated the highest on average, while eco-certified public transportation was rated the lowest. This is due to the fact that local and ecologically produced food has become an important factor of a lifestyle and living healthily (Tselempis et al., 2019). Furthermore, on the level of each urban destination, it was also tested whether there are statistically significant differences in attitudes across stakeholder groups when it comes to the influence of eco-certificates on tourists' decision when choosing a destination (Table 4).

| p-values, with significance levels of 5%                       | Continental Croatia |          |        |          | Adriatic Croatia |       |             |        |

Table 4. Differences in attitudes of stakeholders in each destination with regard to whether tourists are ready to pay extra for a product or service which has an eco-certificate (ANOVA, p-values,  $\alpha=0.05$ )

Source: made by the authors

With 5% significance level and the corresponding degrees of freedom and empirical F-ratios, it may be concluded based on the p-values that there are generally no statistically significant differences in attitudes of stakeholders in each particular urban destination with regard to whether tourists are ready to pay extra for a given product, service or destination (food, accommodation, products in stores, public transportation, overall destination) which holds an eco-certificate. This is particularly evident in continental destinations. When it comes to Adriatic destinations, which are on the higher level of tourism development, the situation is reversed. However, it should be noted that it is only in Mali Lošinj that there are no statistically significant differences in attitudes across stakeholder groups. In fact, Mali Lošinj being so oriented towards sustainable tourism and eco-certification has led to a certain consensus among all stakeholders that paying more for ecological products is to be expected. Variance analysis was also done on the level of all urban destinations according to stakeholder group, in order to determine whether there are differences in stakeholder attitude with regard to a specific eco-certificate (Table 5).

| p-values, with significance levels of 5%                       | Tourism supply | Local population | Tourists | Across stakeholder |
|--|----------------|------------------|----------|--------------------|
| Eco-certified food in restaurants and accommodation capacities | 0.000          | 0.004            | 0.000    | 0.579              |
| Eco-certified accommodation capacities                         | 0.000          | 0.004            | 0.000    | 0.108              |
| Eco-certified beaches  | 0.001          | 0.000            | 0.000    | 0.044              |
| Eco-certified products in stores                               | 0.000          | 0.189            | 0.000    | 0.001              |
| Eco-certified public transportation                            | 0.000          | 0.000            | 0.000    | 0.000              |
| Eco-certified tourism destination                              | 0.000          | 0.163            | 0.000    | 0.503              |
| Certified energy efficient accommodation                       | 0.000          | 0.000            | 0.000    | 0.503              |

Table 5. Differences in individual stakeholder group attitudes toward the influence of eco-certificates on tourists' decisions when choosing a destination (ANOVA, p-values,  $\alpha=0.05$ )

Source: made by the authors

On the level of all urban destinations in question and the same group of stakeholders, it can be concluded that there are major statistically significant differences in rating individual eco-certificates – the same stakeholder group rates the significance of a given eco-certificate differently (except when it comes to eco-certified products in stores and eco-certified tourism destinations in the case of the local population). However, if the attitudes are compared across stakeholder groups, it is evident that there are no differences for four of the eco-certificates, whereas there are statistically significant differences

in attitudes across stakeholder groups regarding the influence of eco-certificates on tourists' decisions when choosing a destination. Therefore, some eco-certificates are equally important to all stakeholder groups, whereas this is not the case with other eco-certificates.

Finally, having an eco-certificate is associated with the readiness on the part of the consumer to pay a higher price for the same type of product. This is why respondents from each stakeholder group gave their opinion with regard to whether tourists are ready to pay extra for a product, service or destination which has an eco-certificate. The respondents were allowed to express either a positive or a negative attitude about this, or otherwise, express uncertainty. The majority of the respondents thinks that tourists are willing to pay extra for eco-certified food in restaurants and accommodation capacities (64%), with as high as 78% of these being respondents from the tourism supply. Respondents also believe that tourists would pay extra if the tourism destination in question owned an eco-certificate (53%) as well as eco-certified products in stores (52%). Additionally, it is the attitude of the respondents that tourists are least likely to pay for eco-certified public transportation (33%). Just as is the case with influencing tourists' decisions, a positive attitude in that respect is the most prevalent in continental destinations (particularly for Karlovac), whereas in the Adriatic region Mali Lošinj stands out. This may be due to the fact that Mali Lošinj has been awarded several world-renowned awards and certificates for sustainable tourism (Green Destinations Collection, 2020). It is no surprise, therefore, that tourists in Mali Lošinj are aware of that. Furthermore, on the level of urban destinations, a positive attitude is most pronounced in the tourism supply, whereas tourists are on average the least ready to pay extra for the eco-certificate. The tourism supply respondents found that tourists are ready to pay extra for eco-certificates in every category, whereas tourists' attitudes indicate they are significantly less likely to do so. These findings correlate with other past research (Chamorro Mera and García Gallego, 2019). Thus, a different value perception of an eco-certification category is also visible here. Eco-certificates are most important for the tourist supply, but it does not mean they have implemented them in their business. The attitude of tourists regarding the readiness to pay a higher price for eco-certified products and services raises the question of their presence in the tourism market and the real benefits they provide to their users, but also the awareness of all stakeholders on sustainable tourism development.

## **IMPLICATIONS AND PROPOSITIONS FOR FUTURE RESEARCH**

Based on these findings, it can be concluded that the implementation of eco-certificates and labels correlates with a higher level of tourism development, whose focus is development control, quality improvement and other monitoring measures. According to Butler's (1980) concept of a tourist area cycle, the destination rejuvenation phase (higher level of tourism development) could be achieved by

adopting the principles of sustainable tourism which certainly include implementation of eco-certificates and labels. Different attitudes of destination stakeholders pointed out the necessity for further research and different approach focusing on a particular stakeholder group, aiming to better understand their needs and real benefits of applying eco-certificates and labels.

These results also indicated there are certain preferences for a particular eco-certificate related to environmental awareness or living standards and lifestyles. In this context, each destination can choose its niche to be diversified and recognized on the tourism market. In doing so, the destination can select certificates which are recognized in individual inbound tourism market. Since certificates in this research were generalized, the importance of certain eco-certificate at the global, regional and local level should be examined in further research.

Finally, these results also gave a space for further research on tourists to find a niche of tourist demand regarding the pro-ecological behavior, a specific area of ecological certification or globally recognized eco-certificates. The commitment of entire destination and unique communication towards the tourism market is very important, which is shown by the example of Mali Lošinj, which succeeded in that.

## CONCLUSION

Even though eco-certificates and labels have been around for years on the tourism market, it seems their role is not widely understood and accepted. This may be due to the wide variety and number of certificate and label programs. The large number may, however, point to their growing significance on the tourism market, which is why programs are continually being developed on a global scale, which facilitate visibility and comparability between various certificates and labels. Furthermore, the number of national certification programs is also growing, probably due to easier management and goal achievement for each particular program of eco-certificates and labels. Research also shows a certain degree of their implementation in a given destination; however, practical and real benefits for the tourism product are not particularly clear or visible. On the other hand, demand in the tourism industry changes behavioral patterns, and a growing ecological awareness leads the tourism supply to satisfy those specific needs. In order for specific elements of a tourism product – or in fact the entire destination – to get certified, a balance needs to be achieved between the wants and needs of the consumer on the one hand, and their fatigue when it comes to being constantly exposed to calls for sustainability. The research conducted within this paper is considered as research in the process. The aim of this paper was to determine the differences in attitudes toward eco-certificates from particular stakeholder groups in tourism destinations across varying degrees of tourism development. The stakeholder groups in tourism destinations were defined as tourists, the tourism supply and the local

population. The interests of these stakeholders are usually conflicting within a given tourism destination, which is why it was particularly interesting to explore their attitudes toward eco-certification and their inclination to value that form of action better.

The research conducted on different stakeholder groups across eight urban destinations in Croatia shows a generally positive attitude toward eco-certificates. However, there are visible discrepancies in stakeholders' attitudes when it comes to the influence of eco-certificates on tourists' decisions when choosing their destination; specifically, their readiness to pay extra for eco-certified products and services at a given destination. These differences are visible on the level of each particular destination, with the stakeholders' attitudes being more positive in continental destinations which are less developed when it comes to tourism. Variance analysis also shows differences in attitudes between different stakeholder groups, with the tourism supply being the most aware of the importance of eco-certificates for a destination. On the other hand, when choosing their destination, tourists are not particularly influenced by a destination having certification, and they are not inclined to pay extra. The importance of a particular eco-certificate was also valued varyingly, which is why the most important eco-certificate in total was eco-certified food in restaurants and accommodation capacities, whereas the least important was eco-certified public transportation. Finally, among the Adriatic destinations, Mali Lošinj stands out as a destination oriented towards implementing sustainable development, which was confirmed by every stakeholder group.

The results of this and previous research indicate a growing presence and importance of eco-certificates and labels on the tourism market. This is due to the fact that many tourism-developed destinations are faced with negative impacts which require mitigation, especially by preserving and protecting the environment as that resource which is fundamental for any and all tourism activities. Adopting eco-certificates and labels facilitates and promotes ecologically aware behavior in the tourism industry. This is also a means of communication on the tourism market, as destinations can signal that they are different and ecologically responsible. Consequently, this stimulates tourism demand for eco-certified products which guarantee quality and have a reduced negative effect on the environment. Therefore, considering the fact that the principles and goals of sustainable tourism are increasingly becoming competitive elements on the tourism market, it is to be expected that the application of eco-certificates and labels in tourism will be of great importance in the future. In this respect, this subject and similar issues need to be further studied in destinations which develop different forms of tourism. It is also recommended that this same and expanded methodology be used for research (measurement instruments, etc.), in order to measure in more detail some of the characteristics of the behavior of tourists and other relevant stakeholders in the context of sustainable tourism.

### ABSTRACT

Capital-based economies and firms define their entrepreneurial purposes fundamentally considering debt and equity costs at the basis of the decision-making about business investments. Although basically divided into risk-free compensation and risk premium, the cost of capital calculation has attracted the interest of much research, essentially attributable to a business economics approach and a financial economics approach, but many profiles concerning this concept and its related calculation methods remain still unexplored. This theoretical paper examines how the cost of capital can be analyzed from a knowledge management perspective, and in this respect a conceptual comparison method has been adopted. Through speculative reasoning, the economic profit ratio, using as denominator the total assets and not the turnover, has been detected as potential measure of the differential knowledge management, with consequent scientific and managerial implications.

*Keywords: Cost of capital; Capital structure; Risk premium; WACC; Knowledge management; Economic profit.*

### 1. INTRODUCTION.

The cost of capital is a significant category of business and financial economics. It determines substantially the minimum required profit of the entrepreneur and gives also financial evidence for the break-even point calculation, where total revenues cover total costs, including the risk-adjusted expected return for the entrepreneur, considered on behalf of the firm as the cost of the provided equity.

In fact, the cost of capital includes not only the short, medium, or long term loans rate, but also the estimated price of the capital that has been invested by the owner structure, calculated as sum of the risk-free interest/compensation rate and the required risk-premium rate. As a risk-free rate,

government bonds yield is usually considered: put it practically, it is the amount of money which would be earned by the lender/owner of the capital if the money would not have been invested into the business but into the government bond with assumably the lowest (perhaps even zero) risk.

Naturally, taking business also means an additional risk that needs compensation. The entrepreneur requires a risk premium for her/his invested capital that arises as an extra profit requirement compared to the investment into government bonds, even superior also to the cost of the lended capital, which at the same time needs embedding a risk-premium component on the basis of the contextual investment situation.

Moreover, calculating the global value of the cost of capital is an operation that is strictly connected to the determination of the opportunity cost, to be intended as the amount of money that is immolated when capital has been invested into a specific business and not into another business/opportunity, which then becomes a benchmark for the calculation of the opportunity cost; basically, in fact, it is the best alternative opportunity with almost equivalent or even minor risk. Naturally, the above-mentioned approach about the opportunity cost is specific for every single sector, and then, in order to determine it, it is generally reasonable to choose as benchmark the average profit of the enterprises operating in the given or in the nearest industry: if the actual yields do not reach regularly the risk-adjusted expected return, investors (most of all stockholders, but even lenders, being both source insurers) could leave the investment and look for other options.

In advanced market economies, where the tracking of profitability is ever more essential (Szóka, 2018), companies are organized typically on a capital basis, meaning that, apart from few peculiar exceptions, mostly due to extraordinary decisions about fiscal and/or monetary policies, money represents a scarce resource; that is why the decision-making system of whatever organization is determined essentially by capital owners – also in a public company, at the end, the board of directors have to respond to the shareholders' assembly – should they be oriented to profit or non-profit purposes. Thus, the comparison with alternative investment options is capital-based fundamentally, meaning that the cost of capital is determined usually on a financial basis for capital-based ownership firms, summarizing both the risk-free and the risk-premium expectations (also for loans, but specifically for equity).

However, with the evolution of mature economies, the concept of 'capital' has been object of further consideration and reconsideration, most of all in the light of immaterial assets, feeding an innovative category of capital that is recognized universally as 'intellectual capital', which nowadays can contribute dramatically to business success (Chen et al., 2005; Baklouti et al., 2010). In this process, a

fundamental role has been exerted by business knowledge, that allows analysing, understanding, and managing capital issues evaluation, nonetheless those related to the cost of capital, with ever more attention, awareness, and efficiency (Velmurugan, 2010; Fathollahi et al., 2017): thus, general aim of the research is to analyze the potential influence of knowledge management on the evaluation of the cost of capital, while specific purpose is the detection of a possible indicator for appraising, always from a knowledge management perspective, the opportunity cost in particular.

In this respect, the paper is structured as follows: after a literature review focused on traditional approaches to the calculation of the cost of capital, a theoretical reasoning/framework is proposed for solving potential bias of these approaches, with peculiar emphasis on knowledge management processes. Subsequent implications, even though mitigated by some limits of the investigation, complete the study.

## **2. LITERATURE REVIEW ON TRADITIONAL APPROACHES TO THE COST OF CAPITAL CALCULATION.**

When reasoning about how attracting and compensating the money that is necessary for the organization functioning, both debt costs and equity costs must be taken into consideration. And again for both, opportunity cost is a fundamental concept: although it is evident also for debts (for example, a bank that should decide which enterprise to finance with minor risk, or major return, or better risk / return ratio), the opportunity cost is indeed a typical category of entrepreneurial cost, and quite probably the most insidious to calculate.

As aforementioned, the first parameter to take into consideration is the industry average profit – or if missing the nearest industry one – but it is understandable that the risk of a specific company may even differ from the industry average: these individual factors can be included in the calculation if the risky part is adjusted with a single risk value, which usually is expressed by the  $\beta$  value, as will be analysed in details further. In fact, it is generally assumed that if  $\beta < 1$ , then the risk under consideration falls below the industry average risk (and thus also the expected return, as mirror of the opportunity cost, should decrease), whereas if  $\beta > 1$ , then it raises above (Illés, 1997).

In this respect, the most common formula for calculating the required rate of return for an equity investment, or the cost of the equity capital, or also the opportunity cost from the stockholder point of view, is the Capital Asset Pricing Model (CAPM) (Sharpe, 1964), which can be represented with some adjustments as follows (Juhász, 2012):

$$(1) \quad i = r_f + (r_m - r_f) * \beta$$

where

|             |   |  |
|-------------|---|--|
| $i$         | = | required rate of return (%)  |
| $r_f$       | = | government bonds yield as risk-free investment (or the least risky) return (%) |
| $r_m$       | = | historical/expected/average return of the given market (%)                     |
| $\beta$     | = | specific risk for a given firm   |
| $r_m - r_f$ | = | risk premium of the given market over risk-free rate                           |

However, there is no unified scientific opinion on which capital elements are universally valid in this context, because the above formula could be adopted from a methodological point of view also by lenders (and not only by entrepreneurs), although it represents a typical stockholders' concept; moreover, this uncertainty is even truer when assuming the immaterial assets point of view that has been abovementioned and on which the subsequent reasoning will be mainly based (Festa et al., 2017). Two fundamental perspectives are object of analysis in the following scientific literature review, in order to put them at the basis of the theoretical framework that will be developed, i.e. the business economics approach and the financial economics approach.

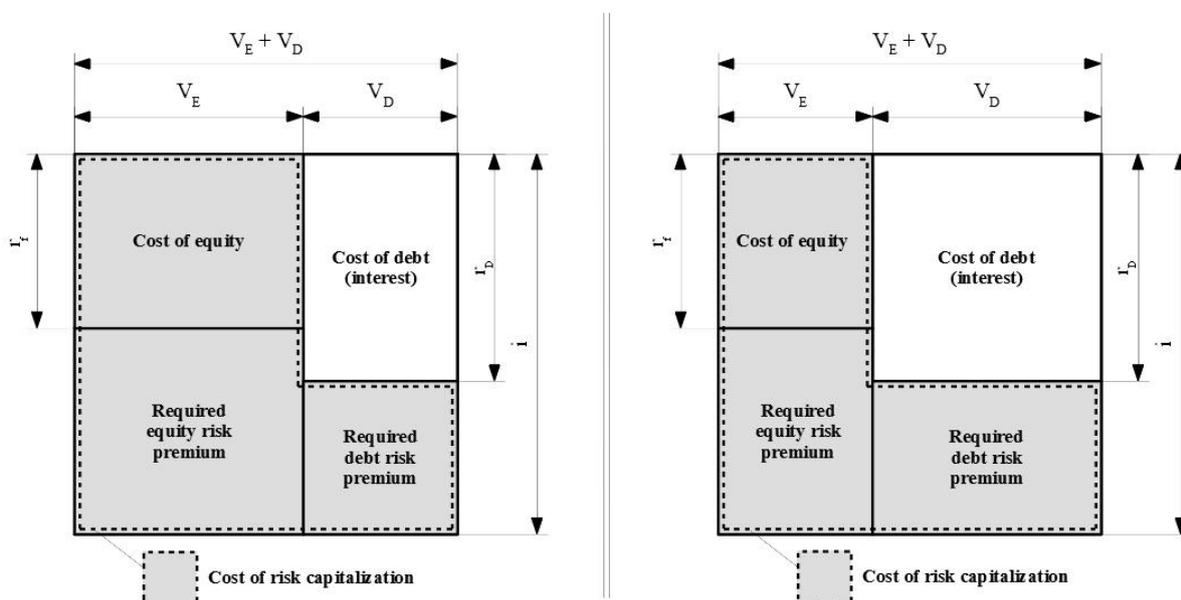

### **2.1. *An internal perspective: The business economics approach.***

The sector under analysis is a relevant element to take into consideration when trying to determine the risk premium to embed into the opportunity cost. According to a business economics approach, it is important to understand where the risk is realised and the consequent risk premium should be charged: in most cases, this evaluation is strictly connected to the entrepreneurial potentiality to be further expressed as competitiveness on the market.

In fact, customers do not consider whether the entrepreneur has financed the business, the enterprise, or the assets using equity or debt: from a commercial point of view, it is indifferent for the market how the capital structure of the company has been built up, and because the risk on the market is determined fundamentally by the decisions of the customers, the capital structure should be indifferent from an external marketing perspective. In other words, the commercial success on the market simply could consider the global cost for the sum of debt and equity as the same: for example to take under control the global cost of capital for a successful pricing strategy on the market, it is quite indifferent for buying individuals if the capital structure is composed of capital belonging to third parties or stockholders or both.

In truth, the difference is that the enterprise pays interests on the debt that constitute expenses, so this part of the global capital return to compensate the lenders can be accounted as a cost: instead, the cost of using equity and the consequent risk premium are not costs to deduct from taxable income but arise as profit requirements. The interest is typically lower than the cost of using equity, but the lender, although not assuming an entrepreneurial or as abovementioned commercial risk, does undertake indeed some risk when lending capital to the enterprise, just because she/he is called to assume an investment decision among different options. This risk does not include the market risk, but only a part of it, considering that commercial risk influences directly the entrepreneurial capacity of solvency and then indirectly the lender risk; whereas this influence is direct for the stockholders, and that is why there is a defined entrepreneurial profit expectation over the interest of third parties capital (Illés, 2004).

Thus, assuming a business economics approach, the total expectation about the global cost of capital is the same for debt and equity when considered as alternatives. However, in the case of debt, its cost appears as a business cost, although discernible between operating and/or financial, thus limiting the overall impact of the cost of capital; then, a capital structure with more debt, as shown in the right section of Fig. 1, should be more desirable from a business point of view ( $r_D$  minor than  $i$ , with further utilities emerging from tax leverage).

*Figure 1. Debt and equity cost in the business economics approach in the case of different capital structures. Adaptation from Kolozár and Kállay (2018).*

It is evident the possible contribution of knowledge management in supporting the decisions about the cost of capital: in fact, if the entrepreneurs and/or managers have the capacity and the ability of building a huge and efficient business knowledge base, through internal and external sources

(Shahabadi et al., 2018), market success could become more likely and/or market failure could be more unlikely (Carneiro, 2000), at least with respect to other enterprises with lesser capacity/ability, thus influencing also the choices about the financial structure composition (Miglietta et al., 2018). In fact, according to the business economics approach, the virtual cost of risk capitalization, considered as potential protection from lack of awareness as opposite of business knowledge, could seem indifferent from the outside if focusing only on the level of capital structure that could be able to sustain market strategies and performances; whereas, as shown in Fig. 1, the real cost of the risk capitalization should seem lower from the inside, if considering a major contribution of the debt and if the risk premium due to major indebtedness is sustainable. As further consequence, all other conditions being equal, this situation could also permits financing intellectual capital assets with lesser cost, so activating virtuous circuits (Gao et al., 2008) between the knowledge that can be used for minimizing the impact of the global cost of capital and the knowledge that can be used for maximizing the potentiality of the global return of capital (at the end, assets and liabilities naturally coincide).

## 2.2. *An external perspective: The financial economics approach.*

The explicit expectations of capital owners constitute a very important aspect to take into consideration when estimating the global cost of capital. When adopting a financial economics approach, this evaluation claims that the cost of capital as calculated in (1) is applicable only to equity owners, whereas the lenders of the debt should expect 'only' interests as required rate of return (Illés, 2016).

This means that the return requirement depends only on the capital structure, and that the expectation is also influenced by the proportion of equity and debt. The widely used indicator for this approach should be the weighted average cost of capital (WACC) – even though small and medium sized enterprises seem to still limit the concept of the cost of capital to the interest rate (Rossi, 2014) – which globally considers the impact and the proportion of capital loans and capital stocks (Koller et al., 2010).

$$(2) \quad \text{WACC} = \frac{V_E}{V_E + V_D} * i + \frac{V_D}{V_E + V_D} * r_D * (1 - T_C)$$

where

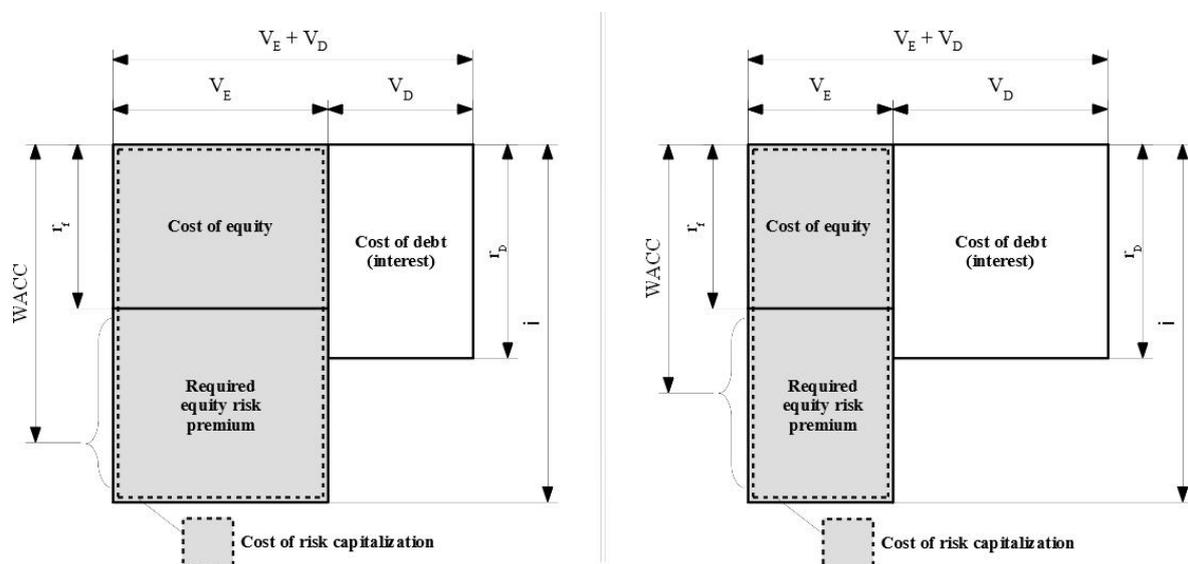

|       |   |  |
|-------|---|--|
| $V_E$ | = | value of the equity (stockholders' capital)    |
| $V_D$ | = | value of the debt (lenders' capital)           |
| $i$   | = | required rate of return (%) as aforecalculated |
| $r_D$ | = | applied rate of interest on the debt (%)       |

$T_c$  = corporate income tax rate

The logic of including the tax rate is that the interest can be accounted as a cost, so the required return on the capital appearing as interest decreases the taxable profit, and thus the consequent taxes in proportion of the tax rate. Moreover, being  $T_c$  a percentage, the impact of the required interest on the net profit can be proportionally reduced by the amount of the tax rate (Rappaport, 1998).

From a strictly financial point of view, while quite relevant from an external perspective (Fatma and Abdelwahed, 2010), it could sound quite indifferent to the enterprise to whom the amount in question should be paid, as a tax to the state or as an interest to the creditor (for example, the bank). In fact, if the cost of capital arises as interest on debts, then it does not generate higher taxes from the taxable income (the enterprise pays the bank and not the state); whereas, if it arises as a return on equity, then it does generate higher taxes from the taxable income (the enterprise pays the state and not the bank).

Adopting the financial economics approach, a higher proportion of third parties' capital means typically a lower (weighted average) cost of capital, because the debts' interest rate is generally lower than the required rate of return as aforecalculated. This consideration could move businesses towards credits and thus to indebtedness (cf. Figure 2) as they should meet lower rates of return when structured with higher debt proportions, naturally all other market and management conditions being equal.

*Figure 2. Debt and equity cost in the financial economics approach in the case of different capital structures. Authors' analysis.*

Also in this case, it is evident the possible contribution of knowledge management in supporting financial decisions about the cost of capital: in fact, if entrepreneurs and/or managers have the

capacity and the ability of building a huge and efficient financial knowledge base, through internal and external sources, financial success could become more likely and/or financial failure could become more unlikely (at least with respect to other enterprises with lesser capacity/ability), thus influencing the choice about the financial structure composition, whose cost of risk capitalization should be, from a financial economics approach, lower if insisting on third parties capital both from a virtual and a real point of view. Naturally, all other conditions being equal, this situation must be managed very carefully, because indebting the financial structure of the enterprise is not costless: first, an appropriate comparison between ROI (Return On Interest, i.e. operating profit on capital invested in core business) and  $r_D$  (considered as overall cost of the debt) should always be indispensable; and second, continuing leveraging on loans would weaken the global financial structure of the enterprise, forcing lenders (banks, for example) to start asking for (higher) debt risk premium.

In this respect, intellectual capital, mostly probably above all in the form of the human (Rodriguez Perez and de Pablo, 2003) and relational (Lucas, 2005) components, could exert a powerful influence (Pew Tan et al., 2007; Maditinos, 2011). As concerns the human capital, the quality of the expertise of entrepreneurs and managers should contribute to find a correct dynamic equilibrium between debt and equity; as concerns the relational capital, the quality of the reputation of the company should contribute to mitigate the expectations of lenders and stockholders concerning their required returns (while most probably amplifying them on the contrary).

### 3. RESEARCH OBJECTIVES AND METHODS.

Moving from the above considerations, the following analysis aims at understanding if it is possible to elaborate a logical construction in which opportunity cost is always appraisable as essential component of the cost of capital, but assuming knowledge management as a pivot perspective for this reasoning. Thus, the research question (RQ) under analysis is the following:

*“In the calculation of the cost of capital, what possible measure of opportunity cost could be directly expressed by knowledge management?”.*

The research, with a theoretical nature, has adopted a method consisting in a reasoning approach that, assuming business economics approach and financial economics approach as pillars for the calculation of the cost of capital, focuses first on possible indicators, and then on possible contradictions in the different formulas. Subsequent reflections should make emerge the evidence through which the contribution of knowledge management could be embedded in a specific measure.

#### 4. THE THEORETICAL ANALYSIS.

##### 4.1. Business performance indicators examination.

One of the fundamental questions in investigating the profitability of a business is how the company can meet the expected requirements in its standard functioning, that is to say, when the normal profit as cost of capital to be achieved by the stockholder, summoned up with all the other costs, let the economic break-even point to be determined. As well-known, this is the level of production or turnover where the profits of the business reach the costs (including required capital returns): in this respect, the correct calculation of the cost of capital is also or even above all a question of which measure to use in the break-even method.

The hypotheses under analysis will be developed theoretically on a knowledge management basis. Starting from this perspective, and considering the two abovementioned approaches, the business economics one and the financial economics one, following comparisons between requirements and performance will be deployed.

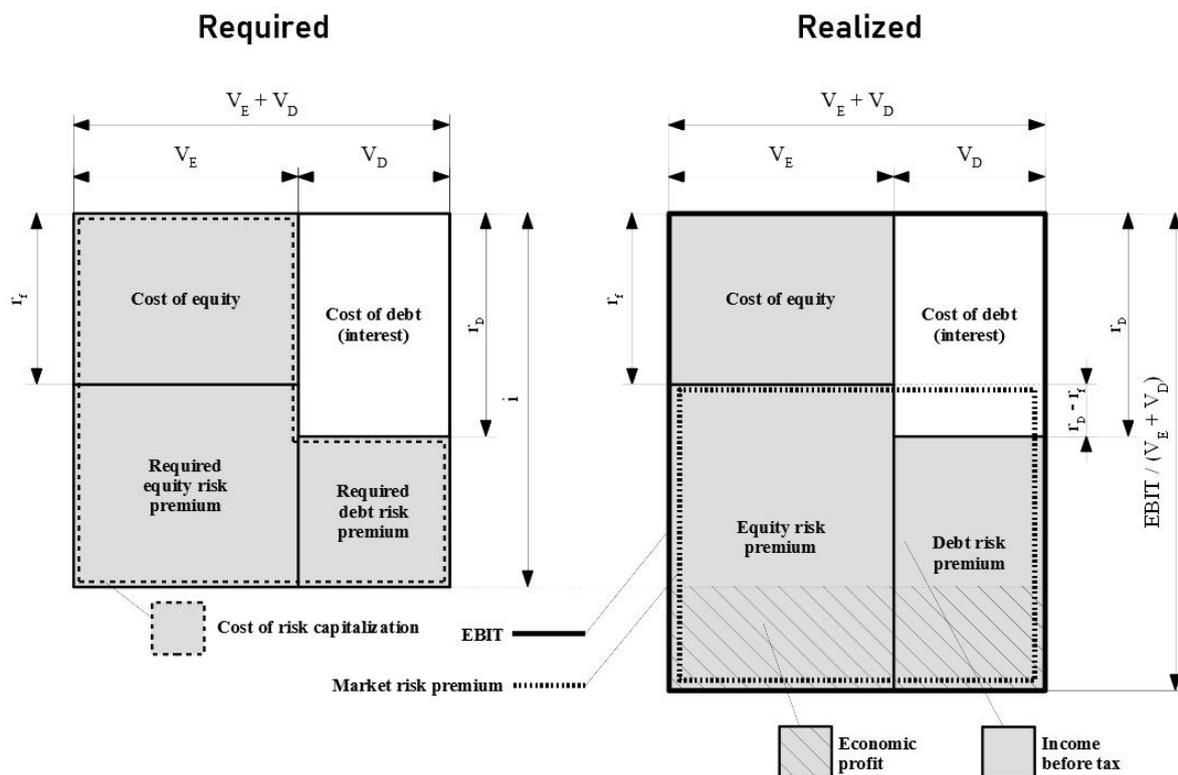

Figure 3. Performance indicators about debt and equity cost and knowledge management returns in the business economics approach. Adaptation from Koloszár and Kállay (2018).

#### 4.2. *Cost of capital measures emerging from differential business knowledge.*

As concerns the business economics approach, the left section of Fig. 3 shows the required rate of return, whereas the right section shows the generated/realized rate of return: some corporate income categories such as EBIT (Earning Before Interests and Taxes), income before tax, market risk premium, and economic profit are marked. The illustrated business situation (the right section) seems to overfulfill the required returns, because an overperforming market risk premium has been realized, embedding economic profit as exceeding value over the expected compensation of the cost of capital. Presumably, this extra quantity has been achievable because the quality of the business knowledge actionable by entrepreneurs and managers has allowed the company to overcome the market competitors, and thus it can be recognized as the return for the superior knowledge management with respect to the sector average. Corporate performances under the required cost of capital can even occur (Kolozsár and Kállay, 2018), giving evidence on the opposite of the inferior knowledge management that has been activated.

Consequently, the 'economic profit ratio', calculated not as economic profit (EP) on global sales revenues (Scherer and Ross, 1994; Asaba and Yamawaki, 2004) but as EP on total capital (similarly to Meghouar and Ibrahim, 2020), which naturally includes also the parts of the intellectual capital that can be appraised and at the end calculated as sum of liabilities and equity, represented as follows:

$$(3) \quad EP / (V_E + V_D)$$

could emerge as potential measure of the efficiency of the differential business knowledge that has been enabled, thus providing first evident answer to the RQ under analysis. Subsequent comparisons of these ratios would highlight the evolution of the business knowledge management through the years.

#### 4.3. *Cost of capital measures emerging from differential financial knowledge.*

As concerns the financial economics approach, the left section of Fig. 4 shows the required rate of return, whereas the right section shows the generated/realized rate of return. As in the previous example, also in this case the hypothesis under investigation provides results exceeding the expectations; because the required return of the capital depends on the capital structure, the realized return should be proportionated and thus not compensating potential major risk for the major debt, differently from the situation illustrated in Figure 3.

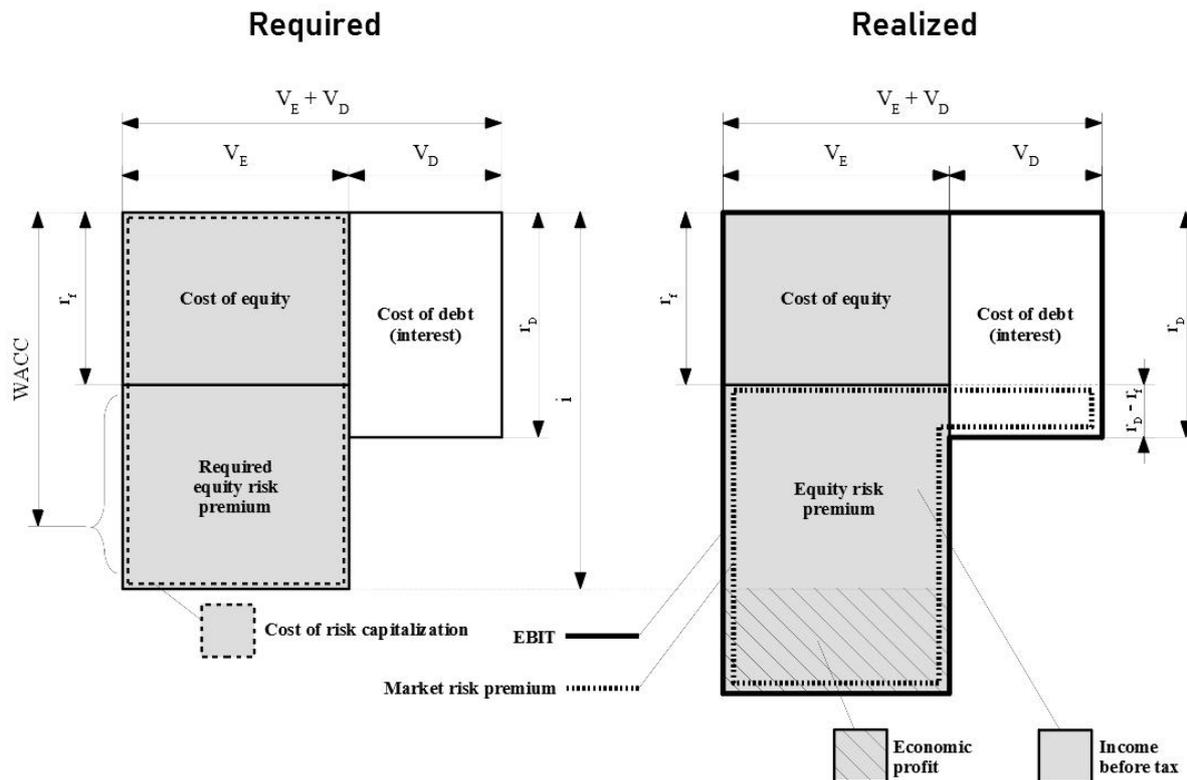

Figure 4. Performance indicators about debt and equity cost and knowledge management returns in the financial economics approach. Authors' analysis.

When calculating the required WACC using (2), with contextual application using (4), it is visible that the resulting quantity from the left side in Fig. 4 is inferior with respect to 'i'. Therefore, in the case of realized return on capital on the right side, WACC must be coherently compared with EBIT divided by the total capital (5) in this approach.

The only element that could be misleading when formulating these requirements is the value of the interest reduced by the tax rate: for correct comparison, this should be applied also to the realized return side and that is why the use of NOPLAT (Net Operating Profit Less Adjusted Taxes) has been advisable, deducting the taxes not only from the interests but also from the income. Unfortunately, this would be correct only if there was an overall, unique, and comparable amount of taxes, but this is clearly impossible because of the complexity, specificity, and variability of the tax legislations; thus, a more correct comparison with WACC should be the quantity that has been provided in the formula (6).

$$(4) \quad WACC = \frac{r_e V_E + r_b V_D (1 - T_C)}{V_E + V_D}$$

$$(5) \quad \frac{EBIT \text{ (or NOPLAT)}}{V_E + V_D}$$

$$(6) \quad \frac{\text{income before tax} + V_D * r_D * (1 - T_C)}{V_E + V_D}$$

In this approach, the return on capital as cost is related only to debt and the return on capital as profit is related only to equity; however, in order to achieve profit, it is necessary to cover all the costs with revenues, so in case of any profit, the interest is definitely reimbursed. This means also that to examine the reachability of the basic or desirable expectations on equity, return on equity (ROE) is a possible indicator; while to examine the reachability of WACC, it is necessary to compare it with (5), as happens for the Economic Value Added (EVA) (Bhasin and Shaikh, 2013).

In all cases, these indicators do not seem to express other knowledge contribution than that one related to the financial structure composition, or maybe that one associated with tax legislation. In other words, it is possible that the financial economics approach could emphasize the utility of the consulting knowledge management rather than the utility of the business knowledge management, assuming that normally an enterprise, above all when small, should have more expertise, also as concerns its intellectual capital, about the core business, and not about financial engineering or tax legislation.

#### *4.4. Theoretical contradictions of the financial economics approach in appraising the opportunity cost from a knowledge management perspective.*

Although both approaches appear to be consistent, with the business economics approach that seems more adequate for business knowledge enhancing, the use of associated concepts and formulas under inappropriate conditions could be misleading. The following reasoning is about how to solve possible contradictions emerging from the two different approaches: most probably, the financial economics approach is more widespread, but its underlying assumptions are not assumable as generally consistent as well (Krishnan and Ramasamy 2011), thus providing consistent opportunity to the reasoning based on the business economics approach.

In fact, the interest rate is typically lower than the required return-on-equity rate, which means that a higher rate of debt can generate lower global return requirements, expressed within the WACC formula. This implies also that the overall cost of capital would be the lowest if only third parties capitals were involved: only theoretically, as indeed will be confuted below, a minimum return of at least  $[i]$  would be required if only equity was involved, while a minimum return of at least  $[r_D * (1 - T_c)]$  would be required if only debt was invested, implying that, depending on the tax rate, even an enterprise with a profitability rate under ' $r_D$ ' can be economical (and in fact, the financial leverage compares ROI and not ROE with the cost-of-debt rate).

If so, why are creditors interested in providing credit also and above all to companies with much higher profitability? For the abovementioned reasons, in fact, the enterprise could find profitability

also with lower ratios, which could even be reinforced by major interest costs through the tax leverage.

And furthermore, why are creditors interested in providing credit also and above all to companies with much higher equity? For the abovementioned reasons, in fact, the enterprise could find profitability also with major debt-to-equity ratios ( $V_D / V_E$ ), which could even reinforce the spread between profitability ratio and WACC.

The essential reason is represented by the risk: in fact, debt owners however take a certain amount of risk about interest return. The primary bearer of the risk of the enterprise is the equity: if the business is not successful, the logical consequence should be the loss of equity; thus, the higher the share of debt, the more likely it means that a potential failure may have some impact on it, so the creditor is anyway interested in finding enough equity in the enterprise to finance for limiting its global risk.

However, in the reality of business it is not logical to assume that if the enterprise would be financed completely with debt instead of equity, the profit expectation will shrink to  $[ r_D * (1 - T_C) ]$  instead of  $[ i ]$ : in fact, the related business risk would not disappear, but it would claim to be embedded in the overall interests, much more risky than before (i.e., in presence of some equity). If a company that earlier has been financed only from equity would increase the debt-to-equity ratio, according to the abovementioned dynamics of the financial economics approach, the WACC will decrease, but the industry's average risk conditions would have not changed, and the consequent business activity can even carry the same risk, logically expanded also to debt owners (with all the limitations of the entrepreneurial responsibility).

In the financial economics approach, this additional risk of leverage is reflected in the beta factor for equity: required rate of return for equity would be based on appropriate calculation, among which the most authoritative is quite probably the CAPM (Modigliani and Miller, 1958; Modigliani and Miller, 1963), which has been already used for the calculation of 'i'. In the beta factor, systematic (market) risk appears primarily, together with consideration also about operating and financial leverage: theoretical consensus is not unanimous on the proportion of the latter (Hamada, 1972; Gahlon and Gentry, 1982; Mandelker and Rhee, 1984), and that is why studies based on the econometric analysis of stock markets data have provided also the exact values of the financial leverage associated with the involvement of debt by distinguishing levered and unlevered beta according to the following formula (Rubinstein, 1973):

$$(7) \quad \text{levered } \beta = \text{unlevered } \beta + \text{unlevered } \beta * (1 - T_C) * \frac{V_D}{V_E}$$

The extra part over unlevered  $\beta$  represents the financial leverage or premium, which is the compensation for the risk on equity due to the involvement of the debt: this risk premium, as part of the levered beta, means that a given asset reacts to market movements on a more sensitive way because of indebtedness. It may be questionable whether in the financial economics approach the beta factor is suitable to handle the overall risk of involving debt: in this respect, as the proportion of equity is reduced to a greater extent, the proportion and influence of the equity ratio is also decreasing to a greater extent, being compensated by significant beta growth.

Moving from all the above considerations, the reasoning that has been presented in Fig. 4 for the financial economics approach needs evolution into Fig. 5: the required debt risk premium is complement of the required equity risk premium according to the above formula about levered beta. However, differently from the business economics approach, the required debt risk premium in this perspective is not an independent or at least indifferent risk element, being not separated from income before tax and more in general from the global functioning of the enterprise, including also equity structure choices (Bouaziz and Bouri, 2012; D'Amato, 2019).

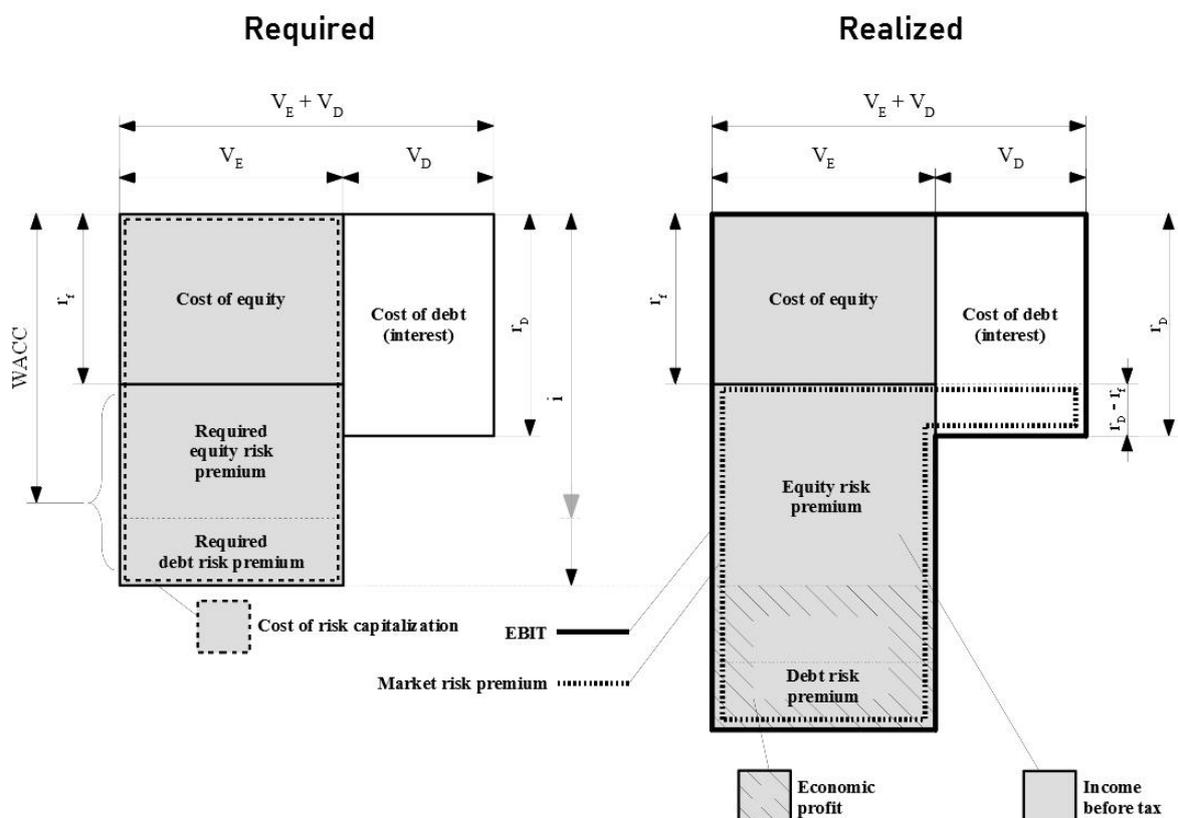

Figure 5. Potential contradictions in the financial economics approach. Authors' analysis.

In a positive situation like the one under hypothesis in Fig. 5, when comparing generated/realized values that are major than the required ones, the required debt risk premium must be subtracted from the realized profit before deducting the cost of equity, and if the remained quantity should be positive, it will compensate the risk premium for the equity. In the financial economics approach higher debt raises profits through various business actions, and even though they may be risky, theoretically the corporate activity could be realized even using only debt, with all the connected dangers (Uzunidis and Laperche, 2011): in this case, however, it seems strange that the surplus generated by the debt increase could be attributed only to the debt expectations and handled as the realized performance of the equity, considering that the outcome of the global business activity, but even that one associated only to a single corporate project, naturally depends not only on the debt-to-equity ratio, and viceversa (Munisi, 2017).

In truth, in addition to the CAPM, several studies have proposed different approaches/formulas, and thus the question about quantification of the beta factor and more specifically about the financial leverage effect have considerable literature: however, the common feature of these scientific studies is that they have worked on the basis of (common) stock markets data, using econometric methods and typically trying to uncover scientifically proven relationships from the side of stock market investors (that is why, for example, they constantly use short-term government treasury rates instead of long-term indicators). Naturally, the stock market conditions are the closest to the definition of an efficient market, but at the same time the wide range of non-listed companies remains out of this potential computation, claiming support for other beta calculations (Britzelmaier et al., 2013).

## **5. RESEARCH LIMITATIONS AND FUTURE DIRECTIONS.**

The main limit of the study is its theoretical nature. Thus, following research will have to be focused first on data analysis for experimenting possible applications of the two approaches, and mostly about the use of the 'economic profit ratio' as potential measure for the opportunity cost from a differential knowledge management perspective.

Quite likely, significant problems could arise in verifying the possible factors determining good or bad knowledge management strategies and methods, but anyway stronger effort in this direction is necessary. In a subsequent study, nevertheless, it may be worth examining the degree of difference between betas and risks determined on the basis of stock markets data and the cost of capital rates calculated using the same data on the basis of a business economics approach.

## **6. SCIENTIFIC AND MANAGERIAL IMPLICATIONS.**

From a theoretical point of view, the research highlights the contribution of knowledge management in evaluating the opportunity cost particularly and the cost of capital more in general, adopting a business economics approach. A specific result in this respect concerns the use of the 'economic profit ratio' as a potential measure of the differential business knowledge enhancing.

From a practical point of view, it is to highlight that the advisory function of the business economics (Illés, 2016) is very powerful for the management of the opportunity cost and more in general for the enterprise financial management, even because this utility can be extended to SMEs, which typically are non-listed companies (with obvious exceptions), thus supporting in overcoming the problem about the beta calculation from a knowledge management point of view (Durst and Runar Edvardsson, 2012; Dezi and Del Giudice, 2014). In these companies, organizational functions are normally less developed, and the operational orientation of each activity of the value chain is usually very strong, thus requiring very specific expertise about the business knowledge to activate (Al-Omari et al., 2014).

Nonetheless, even though recognizing its potential approximations and contradictions, the research seems to suggest that some knowledge management impact could emerge also when adopting the financial economics approach. In this case, however, the knowledge effect seems coming more likely from the outside of the enterprise, concerning financial engineering and/or tax legislation.

## **7. CONCLUSION.**

The financial economics approach may drive businesses towards borrowing debt, and so towards high indebtedness, in order to realize more performing results about net profit, but at the same time business decision makers must be aware that these performance have to be quite appropriate not only from a formal but also and above all from a substantial point of view, considering for every single situation how to reach the economic break-even point when the corporate finance structure would change with debt-to-ratio increase and consequent financial leverage (Zeitun and Saleh, 2015).

Although the financial economics approach quantifies the factors influencing the cost of capital with a strong methodological background, it can be applied entirely only to a limited group of companies. because of the investor (short-term) view of the portfolio and its restrictive application conditions. The business economics approach, on the other hand, proposes a general risk definition that can be used by all companies and perhaps also better supported by knowledge management, with its specific contribution that would be methodologically expressed by the economic profit ratio.

### ABSTRACT

The purpose of this paper is, firstly, to single out the significance level of factors associated with positive supporter attitude and intentions related to sports sponsorship, and, secondly, to compare and contrast these sponsorship outcomes across different generational groups. A self-report structured questionnaire was used to collect data from basketball fans who watched FIBA World Cup 2019 and a sum of 2,752 questionnaires were effectively assembled and analyzed by means of SPSS and AMOS. The findings supported that supporters' degree of attachment with their favorite club as well as the degree of their involvement with sport, along with the perceived sincerity of sponsors, all have a significant effect on fans' awareness of sponsors. Furthermore, the findings of the research highlighted the impact of supporters' awareness of sponsoring firms on their attitude towards sponsors and its subsequent effect of their purchase intentions regarding sponsors' merchandise. Lastly, the results indicated significant differences in regard to supporters' generational group, in connection to sponsorship. This is a novel research, since it indicates the persuasive role of age groups on sponsorship's efficiency.

*Keywords: sponsorship, awareness, purchase intentions, generations.*

### INTRODUCTION

Sponsorship has been consistently developing as a mainstream marketing vehicle during the last 30 years. To be more precise, the amount spent was \$5.6 billion out of 1987 and skyrocketed to \$68.7 billion in 2018, developing more than ten times during the previous thirty years (Statista, 2018). Companies invest in sport sponsorship anticipating that the beneficial attitude that supporters have toward their preferred team will be moved to their brand through sponsor-sponsee relationship and thus advancing sales (Deitz et al., 2012). Nevertheless, being aware of the case that fans are committed isn't sufficient. Marketers must know about the factors which can influence fans' support of sponsoring

firms. In addition, it is significant that marketers comprehend who these fans are, to use sponsorships that will be efficient in enacting these clients. The scope of this study is to supply a unified theoretical framework so as to explicate the aspects affecting fans' awareness of sponsoring firms and its subsequent impact on fans' attitude towards sponsors and its impact on fans' purchase intentions regarding sponsoring firms' goods and services. Furthermore, this research tries to pin-point the degree to which the generational cohorts affect the aforementioned aspects, concerning sponsorship efficiency.

## **THEORETICAL BACKGROUND**

Sponsorship evaluation is an aspect of conflict in the literature, with the recommendation that current techniques neglect to address or comprehend the full impacts of sponsorship activities. The psychological features of buyer behavior are often chosen to be very critical when considering buyer reactions to sponsoring firms. Three central psychological procedures affecting buyer behavior have been suggested, for example the data processing, learning just as change in attitude/behavior (Lobo, Meyer & Chester, 2014).

Sport involvement has pulled in sponsorship researchers' attraction as a precursor of fans' reactions to sponsorship with a two-dimensional methodology. The two dimensions used for the understanding of association, were attraction and centrality. "Attraction" alludes to the significance and importance the activity conveys for a person whilst "centrality" alludes to the degree to which a person organizes different parts of his/her life around an activity (Nassis et al, 2014). Nonetheless, in the field of sport marketing studies, researchers have only sometimes utilized sport involvement as an indicator variable.

Sport supporters are non-typical customers taken into account their unique degrees of dedication and attachment with their preferred team. Previous research supported that fans with high level of team attachment demonstrate a beneficial attitude and therefore a broader consumer acknowledgement toward the sponsors than the spectators with less attachment (Yoshida, Heere & Gordon, 2015). The significant factor in recognizing sponsorship from advertising is that a consumer gets a sponsor's message through the property in a "passion" mode, as opposed to an advertiser's message which is received through the media in an 'interference' mode (Cheong, Pyun & Leng, 2019). Under this reasonable distinction, an overall supposition that will be that the consumers structure favorable or unfavorable beliefs in regards to the benefits of sport sponsorship. Hence, beliefs about sponsorship could influence sponsorship's efficiency.

One additional line of sponsorship studies is sponsor intention that has concentrated on whether consumers observe sponsor motivations as either being true, for society; or self-serving, revenue driven (Rifon et al., 2004). The current proof proposes that corporate sponsorships are probably going to be

seen with some doubt. A few analysts have brought this non-judgment presumption into question, referring to proof for consumer doubt of organization support for not-profit driven causes, yet without experimental backup for a fundamental procedure.

Multi-generational marketing is the act of attracting to the remarkable demands and behaviors of people within more than one explicit generational group, with a generation being a group of people born and existing about a similar time. As per past examinations, four fundamental generations exist dependent on birth date: Baby Boomers (1946-64), Generation X (1965-76), Millennials or Generation Y (1977-1995) and Generation Z (1996 and from that point) (Williams & Page, 2011).

The present study recommends a contemporary framework for the investigation of sponsorship, which is established upon a combination of the literature, while generational cohorts will be studied - for the first time within the sponsorship framework - as conceivable distinctive determinants. In view of the literature, the resulting model and hypotheses are placed:

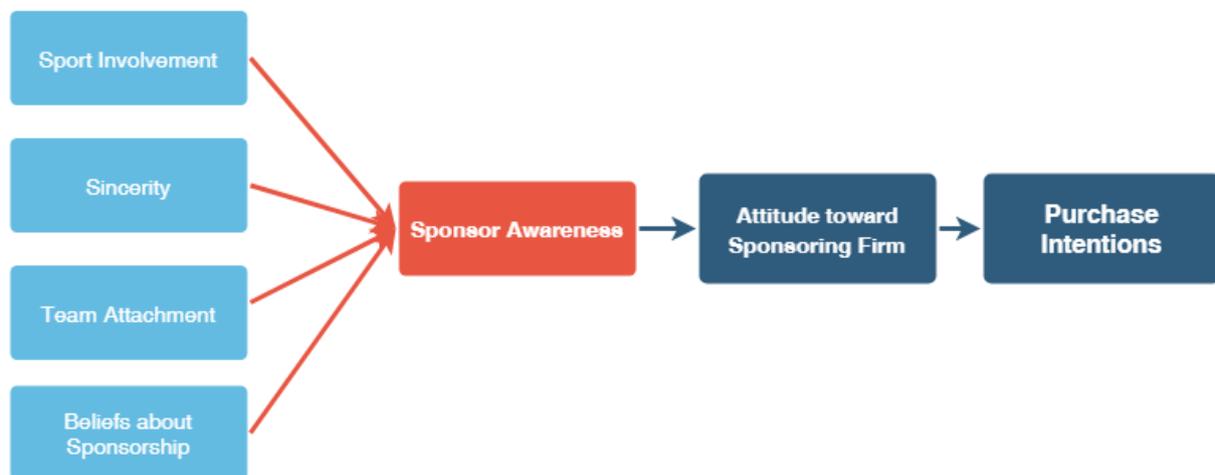

Figure 1. *Sponsorship model*

H1: Sport involvement (centrality and attraction) are expected to influence Sponsor Awareness

H2: Team attachment is expected to influence Sponsor Awareness

H3: Sincerity are expected to influence Sponsor Awareness

H4: Beliefs about sponsorship is expected to influence Sponsor Awareness

H5: Sponsor Awareness is expected to influence Attitude toward Sponsors

H6: Attitude toward Sponsors is expected to influence Purchase Intentions

## METHODOLOGY, RESEARCH DESIGN AND DATA ANALYSIS

The study questions were structured dependent on the strategies utilized by past sponsorship specialists (e.g., Koronios et al., 2016; Biscaia et al., 2013; Alexandris & Tsiotsou, 2012). A quantitative method was used and questionnaires were collected from Greek game spectators of the FIBA

Basketball World Cup 2019, who were enrolled to fill in an online survey with the help of a broadly known sports site. A total of 2,752 questionnaires were successfully completed and analyzed by means of the SPSS & AMOS.

## RESULTS, DISCUSSION AND IMPLICATIONS/CONCLUSIONS

Exploratory Factorial Analysis (EFA) using Varimax method (varimax rotation) was compiled to investigate the factorial structure of the questionnaire. More in detail, EFA indicated an index KMO>0.9 for all scales. The variance of the data explained by factors varied of 75,49% for the 7 scales. CFA showed that all the scales had: Normed  $\chi^2 < 1$ , RMSEA<0.1 and CFI>0.9. The results of the structural equation model (SEM) supported almost all the respective proposed hypotheses (H1-H6). Additionally, model includes the statistically significant effect of centrality dimension of sport involvement scale on sport awareness (b=0.689, p<.001), as well as sincerity (b=0.255, p<.001) and team attachment (b=0.830, p<.001) significant effect on sport awareness. On the other hand, beliefs about sponsorship (b=0.342, p>.001) are insignificant with sport awareness. Also, model includes statistically significant effect of sport awareness on attitude toward sponsors (b=0.934, p<.001) and attitude toward sponsors to purchase intention (b=1.163, p<.001). Finally, the model has values of ( $\chi^2=0.82$ , CFI=0.930, NFI=0.930, RMSEA<0.1). Following results present the linear direct effect of determinants from the above representing model. Sponsor awareness effect significantly purchase intention of fans and attitude toward sponsoring firms.

Finally, SEM analysis regarding age group (Generation Z /19-22, Millennials/23-41, Generation X /42-53, Baby Boomers/over 54) indicate that in "Generation Z" the significant effects are those between attraction dimension of sport involvement on sport awareness (b=0.136, p<.001), sincerity on sport awareness (b=0.146, p<.001) team attachment on sport awareness (b=0.172, p<.05), beliefs about sponsorship on sport awareness (b=0.174, p<.05), sport awareness on attitude toward of firms (b=0.279, p<.001) and attitude toward of firms on purchase intention (b=0.339, p<.001). On the contrary, in "Millennials", the significant effects are those between attraction dimension of sport involvement on sport awareness (b=0.218, p<.05), sincerity on sport awareness (b=0.196, p<.001), beliefs about sponsorship on sport awareness (b=0.174, p<.05), sport awareness purchase intention (b=0.110, p<.001), and attitude toward of firms on purchase intention (b=0.388, p<.05). Different results emerged in "Generation X". In more detail, in this age group the significant effects are those between centrality dimension of sport involvement on sponsor awareness (b=0.081, p<.001), team attachment on sponsor awareness (b=0.142, p<.001), sponsor awareness on attitude toward of firms (b=0.349, p<.001) and attitude toward of firms on purchase intention (b=0.048, p<.05). Finally in the "Baby Boomers" the significant effects are those between attraction dimension of sport involvement on sponsor awareness

( $b=0.193$ ,  $p<.05$ ), team attachment on sponsor awareness ( $b=0.215$ ,  $p<.001$ ), beliefs about sponsorship on sport awareness ( $b=0.379$ ,  $p<.001$ ), sponsor awareness on attitude toward of firms ( $b=0.268$ ,  $p<.001$ ) and attitude toward of firms on purchase intention ( $b=0.189$ ,  $p<.001$ ).

This research's primary contribution is the improvement of a structure which is authenticated hypothetically just as through studies and which can be utilized by sports clubs as well as by real or potential sponsors, so as to fathom the manner by which the effectiveness of the sponsorship can be upgraded. From a practical aspect, the research gives valuable ramifications to sponsors and all the more explicitly marketing managers who are drawing in or wanting to take part in sponsorship bargains so as to create beneficial sponsorship techniques. One of the most important discoveries of the present research, is related with how much of the sincerity is utilized. As referenced before, no past research on sponsorship has been led in regard to the utilization of sincerity. Another excellent finding of the study was the work of generational cohorts as a potential mediator to the connections that were investigated

# THE INFLUENCE OF BRAND INNOVATION, MARKET ORIENTATION AND INTERNATIONALIZATION ON MARKET PERFORMANCE IN GREEK FOOD AND BEVERAGE COMPANIES

Kyanides, Yannis; Krikonis, Konstantinos; Hajidimitriou, Yannis

dept. of Business Administration, University of Macedonia, Thessaloniki, Greece,

## ABSTRACT

Firms' Market Performance is the ultimate goal of all business endeavors. However, there is relatively limited research in the international marketing literature that examines the impact of Brand Innovation activities and market response characteristics, such as the impact of Internationalization and Market Orientation on Market Performance. The main purpose of this paper is to investigate: i) the impact of Brand Innovation on Market Performance, ii) the relationship between Market Orientation and Market Performance, and iii) the relationship between Internationalization and Market Performance. The research model formulated and used integrates four key variables and it is empirically tested in Greek exporting companies in the food and beverage industry. These variables are Market Orientation, Internationalization, Brand Innovation and Market Performance. The findings show that: a) Brand Innovation directly and positively affects Market Performance; b) there is a positive link between Market Orientation and Market Performance, and c) there is a positive link between Internationalization and Market Performance. Furthermore, it is shown that the lack of Brand Innovation affects negatively Market Performance even when Internationalization and Market Orientation are present.

*Keywords: brand innovation, market performance, internationalization, market orientation, exporting*

## INTRODUCTION

Nowadays, Brand Innovation (BI) is one of the most important issues in the area of brand management. Managers are aware of the fact that the only way to maintain the vitality of a brand is continuity of innovation. However, brand innovation receives little attention in the branding literature. Most research studies in the international business literature focus on product innovation. Brand innovation is a field that has not been adequately explored, resulting in a significant gap in the literature, since a clear framework on brand innovation has not been developed (Grant, 2006; Chien and Yuan, 2013). Furthermore, despite a large body of literature on the relationship between firm

innovation in general and Market Performance (MP), there is no reliable conclusion for this relationship (Koc and Ceylan, 2007, Nguyen, 2016). Some scholars found a positive (e.g. Zahra *et al.*, 2000; Camisón and Lopez, 2010), negative (e.g., Oxley and Sampson, 2004), and no direct relationship (e.g. Zhang *et al.*, 2007) between innovation and performance. However, only one study examines the relation between brand innovation and market performance (Nguyen, 2016).

On the other hand, the concept of internationalization is broadly used and examined in international business research (Sullivan, 1994; Hassel *et al.*, 2001; Letto-Gillies, 2002). More specifically, understanding the market performance outcomes of firms' internationalization has been known as a major issue in the strategic management (Marano *et al.*, 2016) and international business literature (Riahi-Belkaoui, 1996). It is one of the questions of common concern (Karabag and Berggren, 2014) and although many researchers have been trying to find a consistent answer for it (Bowen and Rugman, 2007), the degree to which internationalization is contributing to a firm's market performance is still questionable (Garbe and Richter, 2009), since the findings are inconsistent, heterogeneous and contradictory (Ruigrok *et al.*, 2007; Powell, 2014; Marano *et al.*, 2016). Moreover, while several studies have been done on the impact of internationalization on innovation in general, there has been relatively limited research that investigates the relationship between internationalization and brand innovation.

Furthermore, in recent decades Market Orientation (MO) has been a reference point for value offering to the customer. Most of the companies, irrespective of whether they operate in developed or developing countries, consider market orientation as a crucial point in their decision making process. However, although the literature on the concept of market orientation is extensive, there have been only a few empirical studies that examine the relationship between market orientation and innovation in general. In addition, very few studies examine the relationship between market orientation and brand innovation.

As it is stated earlier, there is not enough research in the international marketing literature to examine the impact of internationalization, market orientation and brand innovation on market performance, which is the ultimate goal of all business endeavors. Therefore, the present study aims to fill this important gap in the literature that links market orientation, internationalization, brand innovation and market performance. The model integrates three key independent variables in Greek exporting companies in the food and beverage industry: internationalization, market orientation and brand innovation. Findings provide a foundation for understanding how firms can improve market performance (dependent variable) after ten years of economic crisis, using these three variables.

In this context, the specific goals of this paper are:

- 1) To investigate whether the implementation of Brand Innovation exerts a significant, specific and direct effect on the Market Performance of Greek export companies in the food and beverage industry.
- 2) To investigate the influence of Market Orientation on Market Performance in the Greek food and beverage exporting companies.
- 3) To investigate the influence of Internationalization on Market Performance in the Greek food and beverage exporting companies
- 4) To verify and understand whether Market Orientation, mediated by Brand Innovation, exerts a significant, specific and indirect mediating effect on the Market Performance of Greek export companies in the food and beverage industry.
- 5) To verify and understand whether Internationalization, mediated by Brand Innovation, exerts a significant, specific and indirect mediating effect on the Market Performance of Greek export companies in the food and beverage industry.

Given these goals, the hypotheses examined are the following (Figure 1):

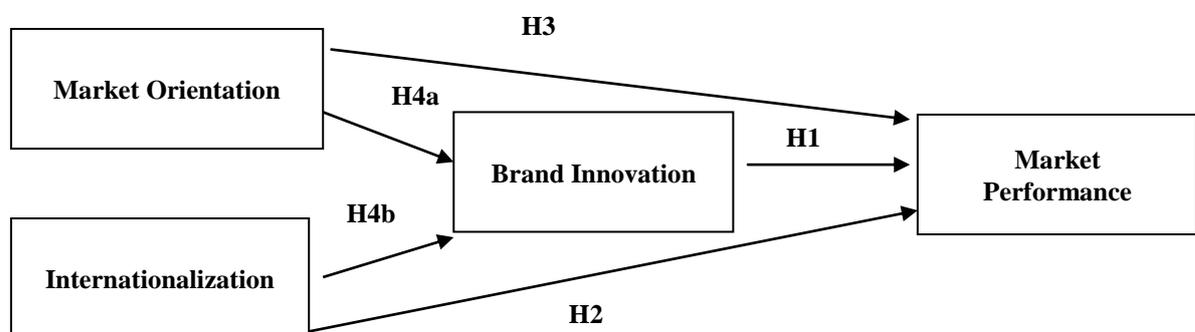

**H1:** Brand innovation positively affects Market Performance in Greek food and beverage exporting companies.

**H2:** Internationalization is positively related to Market Performance in Greek food and beverage exporting companies.

**H3:** Market orientation is positively related to Market Performance in Greek food and beverage exporting companies.

**H4a:** Brand innovation mediates the relationship between Market Orientation and Market Performance of Greek export companies in the food and beverage industry.

**H4b:** Brand Innovation mediates the relationship between Internationalization and Market Performance of Greek export companies in the food and beverage industry.

**Figure 1: Research Conceptual Framework**

The food and beverage manufacturing sector is important for Greek manufacturing because it contributes significantly to the Greek economy, while being one of its most competitive sectors. In

large economies the food and beverage industry accounts for 10% to 20% of manufacturing, while in Greece it reaches 30%. The food sector is the largest manufacturing sector in Greece, while together with beverages they represent 29% of the manufacturing sector's total production value (Eurostat, 2016).

## LITERATURE REVIEW

### *Brand Innovation*

There are several definitions of brand innovation in the relevant literature. Grant (2006) defined brand as a cluster of strategic cultural ideas. In this context, he considered that a brand is just like a story, being a key that drives cultural logic, establishes the continuity and association in order to have every new concept added to a brand's benefit and make the brand alive in the hearts of people. In this context, brand innovation lends innovative concept activities into an existing brand and it consists of eight items: (1) Concept of New Tradition; (2) Faith; (3) Human Herd Instinct; (4) Connection, (5) Neo-Luxury, (6) Time, (7) Excitement, and (8) Control. From the aspect of cultural evolution, every new concept can be added to a brand's benefits and make the brand alive in the hearts of people.

Furthermore, Chimhundu *et al.* (2010, p. 10) concluded that the term brand innovation "*captures all innovative activities ranging from incremental to radical; thus the entire continuum from minor product or packaging changes to the introduction of totally new products/brands is taken into account, as well as the marketing activities associated with the innovation*". Restricting brand innovation, though, to the concept of cultural innovation does not take into account the many other methods by which the brand can inspire, innovate and lead the business. The concept of brand leverage, developed by Aaker (1996), offers a particularly important framework for achieving this goal. According to this framework, brand innovation types are: (1) Brand Stretching, (2) Brand Extensions and (3) Co-branding.

Keeley *et al.* (2013) agree with Aaker's (1996) approach and enrich it by concluding that brand innovation can be distinguished in the following types: (1) Brand Extension, (2) Co-branding, (3) Component Branding, (4) Private Label, (5) Brand Transparency, (6) Brand Leverage and (7) Brand Value Alignment. According to Nguyen *et al.* (2016), brand innovation is defined as advancements in brands that result in fundamental changes to existing practices and markets. Overall, Aaker's (1996) perspective, combined with evidence from Grant's (2006) theory, is adopted in this study for the brand innovation definition and classification.

### ***Internationalization***

The concept of internationalization is broadly used and examined in international business research (Sullivan, 1994; Petri, 1994; Hassel *et al.*, 2001; Letto-Gillies, 2002). Internationalization refers to the progressive and gradually increasing pattern of business expansion into the foreign markets (Fan, 2008). It can be defined as the action or effect of making something spread out to several nations (Ferreira *et al.*, 1999). According to Prashantam (2005), internationalization is the process of adapting firms' operations to international environments (Calof and Beamish, 1995: 116). After taking under consideration the various definitions formulated in the literature, Melo *et al.* (2017) define internationalization as the involvement of the company in cross border activities. In addition, the process of internationalization has been approached in the literature by different schools of thought, such as the Foreign Direct Investment (FDI) theory, stage models, and more recently the network perspective.

The Degree of Internationalization (DOI) could also be viewed from various perspectives. Many researchers have shown interest in the ways it can be measured (Vahlne and Nordstrom, 1993; Thai and Chong, 2008; Tuselman *et al.*, 2008; Asakawa and Rose, 2013). Hassel *et al.* (2000; 2003) consider internationalization as a two-dimensional construct: the real dimension (production) and the financial dimension (corporate governance). Sullivan (1994) developed a measurement of a firm's degree of internationalization on the basis of three dimensions: (1) Performance (conditionings occurring abroad); (2) Structure (resources abroad) and (3) Attitudes (top management's international orientation). In this study, and based on the multidimensional approach developed by Sullivan (1994) and Nguyen *et al.* (2016), internationalization is measured with the three items described before.

### ***Market Orientation***

In recent decades, market orientation has been a reference point for value offering to the customer. The literature on the concept of market orientation is extensive. Market orientation has been empirically determined by focusing on customers, competitors and organizational issues (Kohli and Jaworski, 1990; Narver and Slater, 1990). Market orientation as a business philosophy is largely based on the premise that the marketing concept and market orientation are identical (Bruning and Lockshin, 1994). Consequently, market-oriented companies are considered those for whom the concept of marketing is the driving business philosophy.

Kohli and Jaworski (1990) define market orientation as the process of generating and disseminating market intelligence for the purpose of creating superior buyer value. The information gathered about the market should be evaluated in the context of (1) external market factors (e.g. competition, environment) that influence the needs and preferences of customers, and (2) current and future

customer needs. After creating market knowledge, it is necessary to disseminate this information internally to the organization (Kohli and Jaworski, 1990).

Narver and Slater (1990), based on Kohli and Jaworski's (1990) conceptual framework, consider that market orientation contains three major behavioral components: (i) "customer orientation" - the continuous understanding of the needs of both the current and potential target customers and the use of that knowledge for creating customer value, (ii) "competitor orientation" - the continuous understanding of the capabilities and strategies of the principal current and potential alternative satisfiers of the target customers and the use of such knowledge in creating superior customer value, and (iii) "interfunctional coordination" - the coordination of all functions in the business in utilizing customer and other market information to create superior value for customers (Narver and Slater, 1990). Finally, Deshpande and Farley (1997, pg. 213) define market orientation as "*The set of cross functional processes and activities directed at creating and satisfying customers through continuous needs-assessment*". This study adopts Narver and Slater's (1990) multi-dimensional perspective which suggests three main dimensions of effective market orientation, namely, customer orientation, competitor orientation and inter-functional coordination, because it allows to capture a more combined perspective of market orientation.

### ***Market Performance***

Performance is often used as a dependent variable in marketing literature. In general, performance points out how successful a company/brand is in the market and aims to evaluate its strategic successes. Most researchers divide performance into two components: 1) customer performance and 2) financial performance (Homburg and Pflesser, 2000; Matear *et al.*, 2002; Lee *et al.*, 2008). *Customer performance* can be defined as the performance that can be enhanced by the continuous relationship between a customer and a brand (Lee *et al.*, 2008). More specifically, customer performance includes measurement items such as customer acquisition, customer maintenance, customer satisfaction, brand awareness, brand image, brand relationship related performance and so on.

*Financial performance*, on the other hand, can be defined as the evaluation of financial ratios related to a brand by a marketing manager or a brand manager (Lee *et al.*, 2008). Measurement items of financial performance can be sales growth, margin, market share and return on investment. In this paper, a five-item scale of *international performance*, which was adapted by Nguyen *et al.* (2016), is used because it covers both customer and financial performance (Homburg and Pflesser, 2000; Lee *et al.*, 2008; Lu *et al.*, 2010; O' Cass and Ngo, 2007).

## METHODOLOGY

### *Questionnaire design*

The questionnaire in this study was compiled on the basis of multi-dimensional measurement. On a 5-point Likert Scale, the answers were measured with 5 denoting *Strongly Agree* and 1 denoting *Strongly Disagree* and the score grows in proportion to the degree of agreement. The 10 item questionnaire on the measurement of Brand Innovation was patterned on the basis of the brand innovation dimensions proposed by Aaker (1996), Grant (2006) and Nguyen (2016) (Table 1). Furthermore, the three –item questionnaire on internationalization was based on Nguyen *et al.* (2016) multidimensional approach and includes the sub-factors, international experience, degree of internationalization and exporting, to address limitations typical to internationalization measures (Ramaswamy *et al.*, 1996).

Market orientation was measured based on Cadogan *et al.* (2001), conceptualized by Narver and Slater (1990). A four-item scale was used, as it was adapted by Nguyen *et al.* (2016), rooted in the mainstream market orientation studies with the sub-dimensions competitor, interfunctional and customer orientations, which were previously showed to be reliable and valid in the Chinese context (Murray *et al.*, 2007).

Market Performance measurement focuses on two aspects: financial performance and customer performance (Homburg and Pflesser, 2000; Lee *et al.*, 2008). A five-item scale of international performance, which was adapted by Nguyen *et al.* (2016) was used, because it covers both customer and financial performance (Homburg and Pflesser, 2000; Lee *et al.*, 2008; Lu *et al.*, 2010; O' Cass and Ngo, 2007). More specifically, market growth, market share, return on investment and profitability were utilized as financial performance indicators. Concerning customer performance measurement, customer satisfaction, which has been widely used in the literature (e.g. Lee *et al.*, 2008), was adapted.

**Table 1. Measurement Items**

The reliability of our questionnaire was evaluated using the following criteria: a) Internal consistency reliability criterion that was examined using the Cronbach's coefficient which is  $>0.7$  in every subscale and b) Test-retest reliability criterion, using the Pearson correlation which is  $>0.7$ .

### *Data Collection and Analysis*

Primary data were collected from questionnaires sent to Greek exporting companies operating in the food and beverage industry. Regarding the sampling method, random selection was followed. The size of the sample is 317 companies. The questionnaires were sent to 980 firms obtained from the listings of the Federation of Industries of Greece (SBBE), the Greek Exporters Association (SEVE) and the Thessaloniki Chamber of Commerce and Industry. 345 questionnaires were returned, however 28 of them were not usable as many questions had not been answered. As a result, the effective rate of response was 35.2%. As shown in Table 2, the majority of the firms were small and medium size enterprises. It is worth noting that the proportion of large companies (7.8%) responding to the survey was significant.

|                 | Million Euros | N   | %      | Company Size |

| Annual Turnover | <=2           | 148 | 46.7%  | Very Small   |
|                 | >2-10         | 55  | 17.4%  | Small        |
|                 | >10-20        | 48  | 15.1%  | Medium       |
|                 | >20-30        | 28  | 8.8%   | Medium       |
|                 | >30-40        | 11  | 3.5%   | Medium       |
|                 | >40-50        | 3   | 0.9%   | Medium       |
|                 | >50           | 24  | 7.6%   | Large        |
|                 | Total         | 317 | 100.0% |              |

**Table 2: Sample Profile (N = 317)**

Concerning the internationalization type, the large majority of the firms (87.6%) had permanent export activity with direct exports. Only 22.4% of the companies surveyed had occasional export activity, as shown in Table 3.

| Type of Internationalization                      | %    |
|---|------|
| Only occasional export activity                   | 22.4 |
| Permanent export activity through representatives | 12.6 |
| Permanent export activity with direct exports     | 87.6 |
| Exports through a branch in a foreign country     | 1.4  |
| Creation of a commercial subsidiary               | 1.4  |
| Production in a foreign County                    | 6.1  |

**Table 3. Internationalization Type**

The relationships between study parameters were investigated using the Pearson product moment correlation coefficient ( $r$ ). The data were analyzed with the SPSS 20 statistical package (Statistical Package for Social Sciences) and significance was set at  $p < 0.05$ .

## FINDINGS

Table 4 presents the Pearson's correlation coefficients between the four variables. In every case, positive correlation, varying from medium to high effect, was found between each pair of the four variable scores. More specifically, the results indicated a weak but statistically significant positive relationship between Brand Innovation and Market Performance ( $r^2 = 0.106$ ), thereby providing support for H1. Furthermore, the results indicated a significant positive relationship between Internationalization and Market Performance ( $r^2 = 0.263$ ), thereby providing support for H2. Regarding the third hypothesis (H3), findings confirm that there is positive correlation between Market Orientation and Market Performance ( $r^2 = 0.222$ ).

Moreover, path analysis to test hypotheses H4a and H4b (Figure 2) was used. The results showed that there is a positive relation between Market Orientation and Brand Innovation as well as between Internationalization and Brand Innovation. The relationship between Brand Innovation and Market Performance was also found statistically significant ( $r^2 = 0.32$ ). Therefore, hypotheses H4a and H4b were also supported. Furthermore, path analysis showed that the significant direct effect on Market Performance comes from Brand Innovation. More specifically, if the value of innovation was increased by one standardized unit, while internationalization and Market Orientation remain fixed, then the value of Market Performance would increase by 0.32 standardized units.

|                      |                     | Market Orientation | Internationalization | Brand Innovation | Market Performance |
|----------------------|---------------------|--------------------|----------------------|------------------|--------------------|
| Market Orientation   | Pearson Correlation | 1                  |                      |                  | 0.222**            |
|                      | Sig. (2-tailed)     |                    |                      |                  | 0.000              |
|                      | N                   | 317                |                      |                  | 317                |

Table 4. Hypothesis Testing

Figure 2. Path Analysis

### CONCLUSIONS

The present study examines the relationship between Internationalization and Market Performance, the relationship between Market Orientation and Market Performance, as well as the relationship between Brand Innovation and Market Performance. The field of the study is the Greek exporting companies active in the food and beverage industry. Concerning the relationship between Brand Innovation and Market Performance, the analysis shows that Brand Innovation directly and positively affects Market Performance in Greek food and beverage exporting companies. This result agrees with Nguyen (2016). Furthermore, concerning the relationship between Market Orientation and Market Performance, the analysis confirms that there is a positive link between them. Moreover, concerning the link between Internationalization and Brand Innovation, data analysis confirms that the firm's

degree of Internationalization directly and positively affects Market Performance in the Greek food and beverage exporting industry.

Furthermore, the mediating role of Brand Innovation between Market Orientation and Market Performance as well as between Internationalization and Market Performance was also verified. This result partially contradicts the findings of Nguyen *et al.* (2016) who confirmed the mediating role of brand innovation between internationalization and market performance in Chinese high-tech service industry, but not between Market Orientation and Market Performance. That could be because high-tech service industry and food and beverage industry have different characteristics, as well as that the management of Chinese firms has different attributes compared to Greek managers.

Finally, our path analysis led to the formulation of an important relational model, which can predict the impact on the company's Market Performance (in the food and beverage industry) from a change in brand innovation by one standardized unit, keeping all other variables (internationalization, market orientation) constant.

## LIMITATIONS AND FURTHER RESEARCH

We acknowledge that there are some limitations in this study. First, our sample of Greek food and beverage exporting companies may limit broader generalizations to other industries and countries. More industry and country studies are needed to investigate these relationships. In addition, future studies should examine whether the quality of innovation (incremental or radical) has any influence on market performance. Given the fact that incremental and radical innovations require different resources and core competencies, it may be appropriate to investigate each of the two innovation types individually. Finally, the impact of brand innovation as a mediator on other interesting and critical variables, such as brand equity, should also be investigated in the future. On the other hand, the mediating role of other variables, such as strategic types and corporate competence, should be considered in addition to brand innovation.

## THE IMPACT OF NARCISSISM IN START-UPS ENTREPRENEURS' CHOICES: DIFFERENCES AMONG WOMEN AND MEN

Leonelli, Simona<sup>1</sup>; Masciarelli, Francesca<sup>2</sup>

<sup>2</sup>Department of Business Administration, "G. d'Annunzio" University, Pescara, Italy.

### ABSTRACT

The paper explores the role of narcissism on entrepreneurs' decisions in terms of organizational choices, discussing gender differences. Start-ups creation and management is a complex process and it is strictly influenced by entrepreneurs' personality, capabilities, and cognitive orientation. Analyzing an Italian sample of 207 entrepreneurs and using ANOVA and generalized linear models methods, we test our hypotheses in order to understand whether and how narcissism affects R&D expenditure, patent ownership, and the presence of a specialized team in organizations led by women and men entrepreneurs. We find differences in management and organizational choices of narcissistic women entrepreneurs compared to their men counterparts. First, results show that women entrepreneurs are less narcissistic than men. Second, our findings show that gender moderates the effect of narcissism on the choice to have a qualified team into the start-ups. This means that narcissistic women entrepreneurs prefer being surrounded by qualified employees and peers than narcissistic men. Third, we find that narcissistic women entrepreneurs engage less in risk-taking activities, such as R&D expenditure, and narcissistic women entrepreneurs patent more their idea than narcissistic men entrepreneurs. The paper contributes theoretically to the entrepreneurship and management fields moving forward previous researches on the organizational impacts of narcissism and women entrepreneurs. Also, the paper has some practical implications for governments and policy makers.

*Keywords: Narcissism, Gender, Entrepreneurs, Start-ups, R&D expenditure, Qualified team, Patent ownership.*

### INTRODUCTION

The paper aims to analyze the conditions under which entrepreneur narcissism leads to different management of start-ups and whether the entrepreneurs' gender brings to act differently regarding organizational and managerial choices. Start-ups creation and management is a process full of difficulty and failure (Venkataraman *et al.*, 1990). Previous studies suggest that entrepreneurs' personality,

capabilities, and cognitive orientation have a significant influence on their willingness to persist in entrepreneurial activity and face off difficulties (Gatewood *et al.*, 1995, Nga and Shamuganathan, 2010, LeBrasseur and Zinger, 2005). For example, entrepreneurs who believe they can control the environment through their behaviors will be more likely to persist in entrepreneurial activities when difficulties are faced. The emphasis on entrepreneurial personality has led to consider both the bright and the dark side of personality traits by showing both the positive and negative effects on firms' outcomes (Resick *et al.*, 2009). In this paper, we focus on the controversial trait of narcissism, without considering the pathology and the extreme manifestations that can lead to misconducting behaviors. Narcissism refers to a set of self-centered behavior, such as high self-esteem, self-promotion, and self-enhancement (Leonelli *et al.*, 2019a). However, few studies have examined gender in the context of entrepreneurs' narcissism despite the prescribed differences in entrepreneurship between men and women (Ingersoll *et al.*, 2019).

Specifically, the paper aims to analyze whether narcissism is more prevalent among women or men entrepreneurs and whether narcissistic women entrepreneurs invest more, less, or equally in R&D, in protecting ideas and in the presence of a specialized team, compared to narcissistic men entrepreneurs. Drawing on upper echelon theory (Hambrick and Mason, 1984) and social role theory (Eagly *et al.*, 2000), we analyze 207 Italian entrepreneurs and start-ups in order to understand whether and how narcissism affects firm-level practices in organizations led by women and men entrepreneurs. In doing so, our work advances two heretofore-distinct studies: research on the organizational impacts of narcissism and women entrepreneurship, also giving useful, practical implications for governments and policy makers.

## **THEORETICAL BACKGROUND AND HYPOTHESES**

### *Entrepreneurs' narcissism*

Research on entrepreneur narcissism generally is linked to upper echelons theory, which posits that organizations are reflections of their manager's priorities and values (Hambrick and Mason, 1984). According to this theory, the personality of entrepreneurs and CEOs shapes organizational outcomes because of their capability to exert influence over firm strategy, policy, and practice (Hambrick, 2007). That influence is amplified in micro firms, such as start-ups, in which the entrepreneurs are surrounded by few peers and employees and also serve as CEOs, having formal and informal powers to explore and implement promising ideas (Abebe and Alvarado, 2013, Leonelli *et al.*, 2019a).

Previous research on entrepreneurs' narcissism has indeed revealed that their personality can have significant and lasting impacts on organizations (Galvin *et al.*, 2015, Leonelli *et al.*, 2019b, Leonelli and Masciarelli, 2019, Erkutlu Hakan and Chafra, 2017). The name narcissism comes from the Greek

mythological character Narcissus, known for his beauty, that fell in love with its reflection and drawn trying to reach his beloved. For this reason, it is still today associated with the concepts of sense of superiority, self-centeredness, entitlement, and a strong desire for authority and personal power (Galvin *et al.*, 2010). In this paper, we consider narcissism as a personality dimension, not a clinical disorder. Personality traits are generally stable over time and explain why people act differently in the same situation (Leonelli *et al.*, 2016). Narcissism per se contains different facets that are fundamental for effective leaders (Judge *et al.*, 2009). Narcissistic entrepreneurs need continuous approval from their “followers,” even if they tend not to show their insecurities. They describe themselves as having a strong personality, but at the same time, they would get upset if people do not notice how they look while they go out in public. Narcissism is, therefore, a complex personality dimension and includes both bright and dark sides, as each personality trait. Studies related to the narcissistic dark side, show that narcissists tend to act in insensitive and hostile ways because they tend to see others as inferior. Furthermore, they have a self-serving bias in interpreting information and often make decisions based on how these will reflect on their image and reputation. Therefore, they tend to lack empathy, have manipulating patterns in the conversation towards their interests and accomplishments (Judge *et al.*, 2009, Chatterjee and Hambrick, 2007). On the other side, the narcissistic bright side is associated with the idea of “charismatic leader”. The organizational goals will reflect the narcissistic entrepreneur characteristics, thus, entrepreneurs will share with peers and employees their enjoyment in doing a task and their apprehension during the challenge (Maccoby, 2012). Moreover, narcissistic leaders have grandiose visions for the company, and they manage to attract many followers due to these great visions (Maccoby, 2000).

#### *Gender differences in entrepreneurship*

Biological and behavioral differences characterize gender differences (Popescu, 2012). Biological determinism shows that the differences between women and men are attributed to their different biological nature. Behavioral differences refer to the differences between women and men taught. Summarizing women and men behave differently, and this impacts on the way they manage their organizations. Previous studies on gender differences in entrepreneurship underline several aspects that characterize differently men and women entrepreneurs (Adachi and Hisada, 2017, Vassakis *et al.*, 2018). The first aspect is the motivation of starting a new business. While men desire is to accept the “challenge”, women would start because of their “job satisfaction”. Men decide to create a new business to make things happen and accept the challenge to control their destiny. On the other hand, women decide to start a new venture due to a high degree of dissatisfaction with the previous occupation. The second aspect relies on the demographic differences. Women entrepreneurs are generally older and more educated than the men counterpart, which is almost ten years younger and

possesses more technical qualifications. Indeed, women in the lower-middle-income category tend to create new ventures, respect men that belong to the middle and upper-income category. The third aspect refers directly to the characteristics and management of the firm. Women are more likely to start a venture in the service industry, while men are more likely to prefer the manufacturing or high technology industry. Moreover, women tend to implement a safer strategy than men in terms of fundraising. Indeed, women start enterprises with smaller investment amounts than men. This because it is harder for women entrepreneurs to access finance than men. They generally have less capital and are more reliant on owner equity than men. There is also a large body of research that points to gender-based differences in credit terms, such as higher collateral requirements and interest rates, despite controlling for characteristics like industry and business size. Women are also less confident in accessing start-up financing. They do not apply for loans because they believe their business will not be successful. The fourth aspect relies on culture and society that often are unsupportive of women's entrepreneurship. According to Hamilton (2013), the bias roots of thinking that entrepreneurship is appearance traditionally associated with men are still sustained by cultural, social, and economic processes. Moreover, family policies can discourage female participation because women are affected by family obligations such as childcare and eldercare. Finally, the fifth aspect refers to the psychological differences between women and men. Even if they are both energetic, goal-oriented, and independent, men entrepreneurs show their self-confidence more than women. Furthermore, women seem to be more anxious, nervous in the face of uncertainty, but they are more altruistic, available, and well-disposed than men (Weisberg *et al.*, 2011). Women tend to perceive that they lack entrepreneurship skills, knowledge, and experience to start a business than men. Lastly, women have smaller and less effective entrepreneurial networks such as family, friends, and educators that can hinder the growth and development of their businesses, compared to the male counterpart that includes in their networks business services providers or other entrepreneurs (Shaw *et al.*, 2009).

#### *Entrepreneurs' gender and narcissism*

Narcissism is not an egalitarian phenomenon between gender, in fact, previous studies show that men are more narcissistic than women (Ingersoll *et al.*, 2019, Grijalva *et al.*, 2015). Men leaders fully reflect the values of grandiose narcissism, showing characteristics such as superiority (i.e., everything is due) and the need to appear or assert in order to achieve goals (Tschanz *et al.*, 1998). According to Morf and Rhodewalt (2001), differences in the levels of narcissism between men and women depend on the social roles they cover. Social role theory posits that behavioural sex differences spring from the differential social roles inhabited by women and men, especially those concerning the division of labour (Eagly *et al.*, 2000). Because women face significant limitations on their ability to display typical leadership qualities such as dominance, competitiveness and assertiveness, women's path to top

leadership is constrained and distinct from the path that men leaders follow (Glass and Cook, 2016). We consider gender differences focusing on the three best-known mechanisms linked to entrepreneurs' narcissism - *leadership*, *exploitation*, and *exhibitionism*. *Leadership* is linked to the desire to exercise authority and control over others. Men entrepreneurs show a greater desire for power; they are more motivated to obtain managerial roles and to emerge as leaders than women (Grijalva *et al.*, 2015). *Exploitation* refers to the levels of aggressiveness, the implementation of counterproductive behaviours, and the propensity to cheat. Men entrepreneurs show a great ability to assert themselves with the persuasion and exploitation of others than the women counterpart. Moreover, men are rewarded for public displays of anger because they are perceived as demanding and deserving. At the same time, women are often punished for similar behaviour because they are viewed as hysterical or too emotional (Ingersoll *et al.*, 2019, Brescoll and Uhlmann, 2008). Finally, *exhibitionism* relies on vanity and the desire to be at the centre of attention. However, while men are rewarded for self-promotion, women are evaluated negatively (Livingston *et al.*, 2012). Therefore, women in order to do not violate the stereotypical gender role expectations, they are discouraged from an early age to avoid narcissistic behaviour. Moreover, if they possess narcissistic characteristics (e.g., an inflated sense of self-importance, dominance, and lack of empathy), they prefer to do not openly display them. Thus, we state:

Hypothesis 1. Women entrepreneurs are less narcissistic than men entrepreneurs.

#### *Entrepreneurs' gender, narcissism and start-ups dynamics*

Regarding the start-up's dynamics, we consider the amount that start-up invest in R&D (i.e., Start-up R&D expenditure), the presence of a qualified team (i.e., Start-up qualified team), and the patent ownership (i.e., Start-up patent ownership). Narcissistic entrepreneurs see the start-ups as an extension of themselves and tend to seek out extreme and grandiose strategies that put their organizations at risk (Chatterjee and Hambrick, 2007). However, the decisions about investments in R&D are more important for start-ups entrepreneurs than for large companies (Whalley, 2011). In general, the evaluation of investments in R&D is complicated because it relates to uncertainties associated with the eventual profitability of the R&D project. Not only is the value of the output of the R&D project generally uncertain, but there is often even greater uncertainty over the expected cost to completion of the R&D project (Whalley, 2011). However, women are more risk-averse than men. Women entrepreneurs generally avoid constraints that limit their ability to drive organizational initiatives, particularly those that are risky, novel, or harmful to the organization. As a result of these constraints, we predict that narcissistic women entrepreneurs - unlike their male counterparts - will be unable to pursue high-risk practices such as invest more in R&D expenditure. Thus, we hypothesize:

Hypothesis 2. Gender moderates the effect of narcissism on the amount of R&D expenditure of start-ups such that narcissistic women entrepreneurs will invest less in R&D than narcissistic men entrepreneurs.

The presence of a qualified team inside a start-up is a surplus. Skilled team members can offer extensive knowledge, access to resources not available internally, and can contribute broad experience (Kor, 2003). Entrepreneurs' personal characteristics impact on the presence or not to a qualified team inside start-ups and on the relationship that those entrepreneurs will have with the team. Narcissistic entrepreneurs may feel threatened by the presence of a qualified team because they prefer to act independently (Maccoby, 2000), impose their view on the team (Rosenthal and Pittinsky, 2006), and being the centre of attention (Lumpkin and Dess, 1996). Hence, the presence of competent people may obscure the magical aura.

However, there are differences in the levels of narcissism between women and men entrepreneurs. Women entrepreneurs show less narcissistic characteristics than the men counterpart, and, because of their intrinsic features, they might prefer being surrounded by qualified peers and employees. As we said, according to Shaw *et al.* (2009), women have smaller and less effective entrepreneurial networks than men, thus the presence of a qualified team can contribute to achieving more resources and information (Witt, 2004, Menzies *et al.*, 2006). For this reason, we state:

Hypothesis 3. Gender moderates the effect of narcissism on the presence of a qualified team in the start-ups such that narcissistic women entrepreneurs prefer more the presence of a qualified team than narcissistic men entrepreneurs.

Discovering new technologies is a challenging task, but create a start-up based on such discoveries requires additional tenacity and a stronger sense of control (Markman *et al.*, 2005). Entrepreneurs should convert their new technological discoveries into working prototypes and also transform them into rent-yielding products and services (Markman *et al.*, 2005). Self-efficacy and self-belief are core characteristics that favour entrepreneurs in make discoveries but also in obtaining patents that are frequently refuted before attaining patent status (Gist and Mitchell, 1992, Bandura, 2001). Since the process of discovery is overspread of technological obstacles, success in obtaining patents rests heavily on strong self-belief (Markman *et al.*, 2005). Hence, determination, perseverance, the ability for problem-solving, and tolerance for failure are fundamental in order to achieve the patent goal (McKay, 2001). Those are characteristics that women narcissistic entrepreneurs possess in higher values respect to men entrepreneurs. Thus, we state:

Hypothesis 4. Gender moderates the effect of narcissism on start-ups patent ownership such that narcissistic women entrepreneurs patent more their idea than narcissistic men entrepreneurs.

## METHODOLOGY

### *Sample and procedure*

The study relies on a sample of Italian start-ups enlisted in the Italian Chamber of Commerce register. The initial sample included 500 start-ups randomly selected in the Italian territory. Entrepreneurs are contacted via LinkedIn profile or e-mail address, to outline our project and invite them to be part of it. Those that agreed to participate were sent the link to the online survey. Among them, 207 entrepreneurs answered the questionnaire (28.36% response rate), which is acceptable based on other papers focused on entrepreneur surveys (Block *et al.*, 2013). The survey was administered between September and November 2019; three reminder emails were sent to encourage response.

Data for the analysis consists of survey data and secondary data from a public database, which increases external validity. Entrepreneurs' personal information was collected through the survey, start-ups' financial information was gathered consulting the Aida database, which contains comprehensive information on Italian firms, and information about Patents was gathered from the Italian Patent register.

### *Measure*

#### *Dependent and Independent variables*

Entrepreneur narcissism was measured using the short version of the Narcissistic Personality Inventory (NPI-16) developed by Ames *et al.* (2006) since entrepreneurs are usually time-constrained (Wallace & Baumeister, 2002). We used a five-point Likert scale version adopted by Gentile (2013) removing the non-narcissistic statement from each item. The original survey items were in English, we translated into Italian following the rigorous back-translation technique of Brislin (1980). The independent variables are all dummy variables. *Start-up R&D expenditure* has the value of one if the start-up spends at least 15% of its annual costs in R&D, and zero if it does not. Finally, *Start-up qualified team* has the value of one if the total workforce includes at least 1/3 of PhDs, or at least 2/3 of the team hold a master's degree, and zero if it does not. *Start-up patent ownership* has the value of one if the start-up owns at least one patent, and zero if it does not. It has been decided to use a dummy variable because small firms generally have low numbers of patents.

#### *Control variables*

In our model, we use six control variables controlling for individual, firm, and environment level factors to minimize variances that are not directly linked to our study. At the individual level, we controlled for entrepreneur's education measured on a four-point ordinal scale (i.e., 1=high school, 2=bachelor's degree, 3=master's degree, and 4=doctoral degree), and age measured on a four-point

ordinal scale (i.e., 1<30 years old, 2=between 30 and 39 years old, 3=between 40 and 49 years old, and 4>50 years old). Entrepreneurs with longer/higher education are likely to have access to a greater amount of resources to support their entrepreneurial ambitions, and a stronger ability to recognize opportunities and exploit them successfully (Altinay and Wang, 2011). Entrepreneur age can influence the level of aggressiveness and risk-taking, with older entrepreneurs generally being less aggressive and risk-prone (Bertrand and Schoar, 2003). At the firm level, we controlled for start-up's age measured as the effective years from firm establishment (reference year 2020), and start-up's initial capital measured on a four-point ordinal scale (i.e., 1<5,000€, 2=between 5,000€ and 10,000€, 3=between 10,000€ and 50,000€, and 4>50,000€). The age and the capital of start-ups impact on the choice to invest and pursue innovation, for instance, a higher initial capital can push start-ups to make riskier and more novel investments (Nanda and Rhodes-Kropf, 2013). Finally, at the environmental level, we controlled for industry sector which refers to the SME's main activity and is captured by the industry dummies at the two-digit ATECO code (i.e., classification of economic activities adopted by the Italian Institute of Statistics), and location captured by Italian area dummies (i.e., Nord-west, Nord-east, Center, and South and islands). The exact geographical location of the start-up may provide a cultural milieu affecting the propensity for risk and innovativeness, and the firm owner's entrepreneurial orientation (Kreiser *et al.*, 2010).

#### *Analysis*

Exploratory factor analysis (EFA) was conducted to extract the appropriate number of factors from the narcissism scales. According to Osborne and Costello (2009), we examined the eigenvalue graph to identify natural curves or breakpoints. The graph suggested retaining only one factor because of the noticeable slope between the first and second factor. Cronbach's alpha 0.80. Our first hypothesis is tested using ANOVA and Cohen's D to assess the difference in means from two unequal sample sizes. Given the unequal sample sizes, we also performed a matched-sample test of Hypothesis 1. To test Hypotheses 2, 3, and 4, we employed generalized linear models. We specified a Gaussian (normal) distribution with an identity link function. This same approach has been used in prior studies examining the effect of CEO narcissism (Chatterjee and Hambrick, 2007, Chatterjee and Hambrick, 2011).

#### *Results*

Descriptive statistics and correlations of the examined variables are presented in Table 1 and Table 2.

Table 2. Table 11. Correlations (\*\*= $p < 0.05$ )

Hypothesis 1 predicts that women entrepreneurs will be less narcissistic than men entrepreneurs. Specifically, in the mean comparison within Table 2, women entrepreneurs scored substantially lower on the narcissism measure than the men counterpart (-0.39 vs. 0.35). However, our findings support Hypothesis 1 showing that there is a statistically significant difference between groups as determined by the one-way ANOVA test ( $F(1, 205)=42.44, p=0.000$ ). The Tukey test revealed that entrepreneurs' narcissism is statistically significantly higher in men entrepreneurs compared to women entrepreneurs ( $0.74 \pm 0.11, p=0.000$ ).

Table 3 presents our generalized linear models results, column 1 reports the results for the total sample, while columns 2 and 3 present cross-sectional analyses by gender. Hypothesis 2 suggests that gender moderates the effect of narcissism on the amount of start-ups' R&D expenditure such that narcissistic women entrepreneurs will invest less in R&D than narcissistic men entrepreneurs. In Panel A section, the not significant interaction between gender and narcissism ( $p=0.569$ ) allows us, as a start, to reject Hypothesis 2. Considering the results showed in columns 2 and 3, we can see that only in the female sample, narcissism has a negative and statistically significant effect on start-ups' R&D expenditure. This result could be linked to the different ways of dealing with risks between men and women, confirming that more narcissistic women entrepreneurs engage in significantly fewer risky activities, allowing us to support our Hypothesis 2 partially. Hypothesis 3 suggests that gender moderates the

effect of narcissism on the presence of a qualified team into start-ups. This means that narcissistic women entrepreneurs will prefer being surrounded by qualified employees and peers than narcissistic men entrepreneurs. In Panel B section, the interaction term between gender and narcissism is negative and statistically significant ( $p < 0.1$ ), suggesting that the gender attenuates the effect of narcissism on the presence of a qualified team. Women entrepreneurs with high levels of narcissism prefer being surrounded by qualified employees and peers than their male counterparts. The results in columns 2 and 3 confirm that narcissism has a positive and statistically significant effect on the propensity to work in and with a specialized team in our women entrepreneur sample. Finally, Hypothesis 4 suggests that gender moderates the effect of narcissism on the start-up's patent ownership. In this vein, narcissistic women entrepreneurs patent more their idea than narcissistic men entrepreneurs. In the full sample column of the Panel C section, the interaction term gender and narcissism has a negative and not statistically significant result, and this, at first sight, leads us to reject our Hypothesis 4. However, the result in the female sample column confirms that narcissism has a positive and statistically significant effect on patents' ownership. Still, this result is not significant in the male sample, showing that as the level of narcissism increases, women have a higher propensity to patent than men.

In sum, our results support Hypothesis 1 and 3, and partially Hypothesis 2 and 4.

## DISCUSSIONS AND CONCLUSIONS

The paper analyzes whether narcissism is prevalent among women entrepreneurs and the differences in narcissistic women entrepreneurs' behaviors in the management and organizational choices of their start-ups than men counterparts. Findings demonstrate that women entrepreneurs are less narcissistic than men. Additionally, our results suggest that gender moderates the effect of narcissism on the choice to have a qualified team into the start-ups. This means that narcissistic women entrepreneurs prefer being surrounded by qualified employees and peers than narcissistic men. Regarding the R&D expenditure and the patent ownership, our hypotheses are partially confirmed, showing that narcissistic women entrepreneurs engage less in risk-taking activities, such as R&D expenditure, and narcissistic women entrepreneurs patent more their idea than narcissistic men entrepreneurs. The current study extends the existing literature by applying a gendered lens to entrepreneurs' narcissism in order to interrogate whether they behave and manage their start-ups differently. To date, research on entrepreneurs' narcissism has focused almost exclusively on men because most entrepreneurs are men. Few studies have analyzed whether entrepreneur gender changes the way to manage start-ups. Filling this gap in our understanding is important for two reasons. First, there is evidence that the manifestation of narcissism varies by gender and that narcissistic behaviors are differently perceived when displayed by women than by men (Grijalva *et al.*, 2015). Further, narcissism may manifest differently among entrepreneurs due to the social construction of gender norms and the disparate treatment between genders (Ingersoll *et al.*, 2019). For instance, women entrepreneurs who display narcissistic personalities are perceived by men employees as less effective leaders than equally narcissistic men entrepreneurs (De Hoogh *et al.*, 2015). This suggests that narcissistic women entrepreneurs may face biases that narcissistic men entrepreneurs do not.

In practice, the paper has important implications for governments and policymakers, especially in times of global crisis. Women are more able than men in managing and changing their businesses to survive because they are always forced to rely on their resources (see the difficulties in obtaining loans) (Pines *et al.*, 2010). Furthermore, to increase the number of women entrepreneurs, governments and policymakers should create special funds for them, encourage networking, offer business and financial support for industries that have special relevance for women (i.e., businesses on the internet or local tourism), and give them the opportunity to be supported in managing nonworking commitments. The

study originality relies on the sample that is composed of entrepreneurs' real data. We do not use unobtrusive measures of narcissism, such as analysis of CEO photographs and firms' reports. However, the present study shows some limitations that suggest avenues for further research. Our results are based on an Italian sample, and in this vein, future studies can consider the impact of different cultures on the level of entrepreneurs' narcissism.

### ABSTRACT

The aim of the current study is to analyze tourist engagement with music festivals and their psychological well-being is achieved through surprise consumption, positive affect, arousal delight and satisfaction. A sample of 394 usable questionnaires allow us to understand that surprising consumption, arousal, positive affect and satisfaction are very important drivers to engage visitors to music festivals. Engaged tourists are more willing to reach a positive psychological well-being.

*Keywords: tourist engagement, surprising consumption, emotional states, Psychological well-being, music festival*

### INTRODUCTION

Music festivals are a big phenomenon all over the world (BBC News, 2019). People travel for attending music festivals because they are a perfect opportunity to share live music with their peers and even with strangers that they can easily know for being all in the same context. Indeed, music festivals provide plenty chances for socializing, listening to music, and to participate in social activities (Packer and Ballantyne, 2011; Wakefield, 2016).

Despite growing interest, the literature about festivals and events tourism is still in an initial phase (Laing, 2018). In addition, very few studies have been carried out with the aim to find what makes a festival outshine in the visitors' minds, as well as to look for their benefits (Ballantyne, Ballantyne, and Packer, 2014).
